Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Susan B. Padgett 413 E. 16th Ave #2 Anchorage, AK 99501 Sincerely, Susan Padgett 413 E 16th Ave Apt 2 Anchorage, AK 99501-5255 (907) 258-1620

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs susan prom 189 Sag Lake Trl Grand Marais, MN 55604-2057 (218) 388-9930

Susan Rom Zuriff 20045

I'm no expert, but I grew up in Ely. I can't envision that any amount of economic development, especially toxic mining, can make it into thriving commercial center. It's too far from business activity, with only 2-lane road access, no commercial airport, no long-distance buses and no rail connection. It's sad, but to think that the only activity that will keep it going is mining that may pollute a national treasure for up to hundreds of years is senseless. The effect on long-range state finances is imperiled if that happens. And the number of jobs may be many fewer than anticipated with the expansion of technology, especially robotic. Susan Rom Zuriff 4300 W. River Parkway, #253 Minneapolis, MN 55405

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Susan Rowe 6401 Bethia Ln Brooklyn Park, MN 55428-1716 (952) 303-2902

Susan Scherer 16178

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Susan Schurke 18080

My name is Susan Schurke. I'm from Ely, Minnesota. Most of us will never work for a copper mine, however -- most of us in Northern Minnesota, anyway. However, all of us are taxpayers. I'm very concerned about the financial assurance in the SDEIS. Who can ever figure out what the cost of the cleanup will be for 500 years. Who will pay this? Who -- what is the amount they could possibly -- that can be put forward to replace something that can never be replaced; our clean water that we desperately need? Copper mining in a watershed does not seem to be a good idea. The proposed sulfide mine and tailings dump would pollute streams, wetlands and drinking waters for hundreds if not thousands of years. I believe that issues that haven't been analyzed at all in the SDEIS, like impacts on workers' health, be studied before the EIS is finalized. I request that common-sense alternatives like putting liners under the permanent waste-rock pile and the tailings piles be analyzed before the EIS can be finalized. I am concerned that the high value peat lands on the mine site are irreplaceable. The vast majority of wetlands mitigation is outside the Lake Superior Basin and there is no plan to replace most of the indirectly-affected wetlands. I am concerned that cumulative impacts of the PolyMet Project, and other existing and expanding mines, would impair wild rice, fish and aquatic ecosystems and violate the treaty rights of Indian tribes to hunt, fish and gather in the Superior National Forest lands ceded to the United States. I'm concerned that PolyMet's water and air pollution from mine pit, waste rock and tailing piles, and PolyMet's excavation and changing hydrology and wetlands would increase mercury loading to wetlands and streams and increase mercury bioaccumulation in fish putting human health at risk. I'm concerned that PolyMet's discharge would increase carcinogenic arsenic in Hoyt Lake's drinking water and release arsenic, lead and manganese, chemicals that impair brain function, into the ground water. I am concerned that PolyMet's water pollution from the permanent mine site waste-rock pile would need treatment for at least 200 years and pollution from the tailings piles would require treatment for at least 500 years. Pollution seeping out of the pits would continue in perpetuity, forever. Who is going to pay for this and how can we ever replace our precious water? I am not against iron ore mining, but copper mining does not seem to be a reasonable thing in the watersheds of North America.

Susan Shawn 52212

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Susan Solterman Audette 43313

Dear Minnesota Department of Natural Resources, I am writing to register my opposition to the permit for the PolyMet Mine. Northern Minnesota needs economic development that does not risk polluting surrounding surface waters with a mix of acid and heavy meta PolyMet, as proposed in the Supplemental Draft Environmental Impact Statement, creates a new ongoing water pollution source in the headwaters of the St Louis River, the largest American tributary to Lake Superior, which contains 10 percent of the world's fresh water. PolyMet's own data show it is expected to generate water pollution for more than 500 years. Treating the polluted water requires a complex and untested mechanical system of pumps, pipelines, and filters, which would need to operate indefinitely. The plan does not consider the possibility of mechanical or human failure. PolyMet has no contingency plan for predictable mechanical problems such as pipeline failures, extreme weather or human error. These considerations remain unaddressed in the SDEIS and should not, ultimately, be overlooked by our State’s designated environmental managers and stewards. Susan Solterman Audette HYPERLINK "mailto:ssolterman@gmail-com"ssolterman@gmail-com 651-260-7040

Susan Soule 38413

As a Minnesota resident and northern Minnesota native, I want to express my strong opposition to the Polymet mining project for the following reasons: WATER is a precious resource. Besides being the foundation for much of Minnesota's recreational industry, it is essential to the life of our entire ecosystem from the lowliest life forms to human beings. Its scarcity is already a source of friction, concern and conflict worldwide. Look at California's current and frequent droughts and past proposals that a pipeline be built from Lake Superior to the desert southweSt The idea that we would risk centuries of pollution and the staggering costs of cleanup (provided that is truly possible) to one of our most basic and essential resources for a few hundred jobs lasting two or three decades is beyond belief. The idea that we would allow Polymet and its affiliates to do this, with their horrendous track record, is equally terrible. I implore you to stop this project. Sincerely, Susan Soule 7324 West Shore Drive Edina, MN 55435

Susie Kleusch Parkhurst 40104

_____ From: Susie Parkhurst [susieparkhurst@msn-com] Sent: Monday, March 10, 2014 3:10 PM To: *Info (DNR) Subject: SDEIS-PolyMet Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155 HYPERLINK "mailto:info.dnr@state.mn.us"info.dnr@state.mn.us Dear Lisa Fay, My name is Susie K Parkhurst and after many years living away from the Iron Range, I have returned home and now live in Palo MN. I would like to submit my comments concerning the environmental impact of the proposed PolyMet Mining project. First I would like to say that while I am not an advocate of Local, State or Federal Government regulating our entire lives, I do trust and rely on entities such as the FDA, EPA and MN DNR to have done their due diligence to assure that they have done all they can to protect and preserve all that they are charged with protecting. An example would be that if the MN DNR states that they need to limit the number of deer hunting licenses because of an overall drop in the deer population, I trust that the MN DNR to have done their due diligence to impose the restrictions for the good of our eco system. I feel comfortable with the levels of guidelines that are currently enforced and that will be enforced in the future to protect our environment and the environment of the world. Currently we depend on foreign countries for so many of the precious metals that are vital for technology, equipment and industry. The more precious metals we can mine and process here in the United States, the less we are dependent on other countries to provide the vital precious metals. Those precious metals are needed for components that are used for such things as personal and business computers, IPads, cell phones, televisions and all manner of personal and industrial equipment. I am not comfortable with the levels of restrictions and guidelines enforced to protect the environment in other countries. The more we depend on foreign countries to provide vital metals the more we rely on them to be good stewards of our environment. The world is truly a small place. Consider the fact that the debris in the ocean from the Sendai Japan earthquake took just 1 year to reach Hawaii and California. It has polluted the Oceans and Seas and is having a negative impact on fish and mammals worldwide. The radiation of the Fukushima Power Plant arrived much more quickly. My brother lived in China for a time and saw mercury being dumped in a local river. It is better for the environment of the Iron Range, the United States of America and the entire world that we mine these minerals locally where we can be monitor whether we are being responsible stewards for the environment. The positive economic impact of a PolyMet Mine on the Iron Range and Minnesota relates to the environmental impact in that the more economically stable an area is, the more highly educated that population is. The more highly educated a population is, the more they become good stewards of their environment and humanity at large. Susie Kleusch Parkhurst 5660 Palo Rd 41 Aurora MN 55705 218-780-0628

Suzanne Birch 39633

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Do not do this in Minnesota-we should be leaders in clean enviormental issues.Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Suzanne Birch 16015 Elgin Ct Faribault, MN 55021-8568 (507) 334-3023

Suzanne Bowman 4038

To Whom it May Concern: As the General Manager of the Country Inn of Hoyt Lakes, I would like to express my strong support for Polymet Mining to open a plant in Hoyt Lakes, Minnesota. I am very anxious to hire new employee's as the result of Polymet opening. Not only will the plant hire, but the vendors who supply the mine will hire, and we will see a much needed increase in hotel stays therefore I will be able to hire. I trust our EPA and other government agencies that we will be as environmentally safe as can be. I love the idea that the plant will be recycled from the old LTV plant. - Suzanne Bowman General Manager Country Inn of Hoyt Lakes t:218-225-3555 f:218-225-3234

18237

Suzanne, S-U-Z-A-N-N-E, Bowman, B-O-W-M-A N. I'm from Hoyt Lakes. I moved away from Hoyt Lakes for quite a while, ended up going to Florida and to Pennsylvania because my husband worked in the mines and because of the difficult times in the '80s and him not being able to keep a job. My family became ill and I moved back and took care of them. Why I'm for PolyMet is because I am an environmentalist, also. I want to use the environmental statement that they did and trust the -- I want to trust the scientists and what they've done for the statement. I want to keep it in Minnesota where we have the strict environmental. I do not want it to go to another country where they'll pollute the whole world and they don't have environmental regulations at all. I believe that we need the precious metals very much and we cannot have it dependent on another country, especially China and Japan because they are looking to go to war between them. It was just announced. And I'm a cancer survivor and all of the copper and the precious metals that are needed for medical reasons, I really think that it should come from the United States and from Minnesota, especially with our strict regulations, and I think they did a wonderful job on the environmental statement. Thank you.

Suzanne Candell 34383

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have spent much time in the wilds of Northeastern Minnesota over the 40+ years I have called Minnesota my home. There is no place on earth quite like it. I am terribly saddened by the prospect of possibly hundreds of years of environmental contamination due to this project. Although the project offers jobs in the immediate term, they are transitory. The long-term damage that such a project will inflict environmentally and economically on the area means that the legacy to future generations may be a loss of tourist income, illness and spoilage of the natural beauty of the area. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Suzanne Candell 15804 Holdridge Rd E Wayzata, MN 55391-2146

Suzanne Dunham 42426

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Suzanne Dunham 518 S Blackhawk St Janesville, WI 53545-4204

Suzanne Glad 41949

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Suzanne Glad Bloomington, Minnesota

Suzanne Maras 41894

Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereStIs there anyplace ypou wont try to polluite to get yopur holy dollar. We here in Mi. are proud of our Great lakes and want to keep them perfect and you're coming in and ruining it al isn't in any of plans. Get out and stay out and take your pollution right along withyou along with all your destruction. Sincerely, Suzanne Michael 12401 Railroad Rd Clio, MI 48420-8231 (810) 547-1496

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Suzanne Ross 11840 Falls Trl Lonsdale, MN 55046-4530

Suzanne Sette 16169

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Suzanne Shuckhart 3169 230th St Marshall, MN 56258

Sven Hoaglund 44459

Dear Ms Fay, I am writing to show my opposition to the PolyMet NorthMet Mining Project. As someone looking to relocate to the Arrowhead, it's an important issue for me. I think that its great that for 20 years there might be a few more jobs in a pretty cash strapped region of our state, but in all reality it is not sustainable and after the 20 years of mining are up the residents of northern MN will be in the same place they were before this. It' also absurd that we might be cleaning up waste from these 20 years of mining for an eternity or 500 years which is close enough. None of this mentions the possible environmental effects, not just the ones we know will happen. I just don't think that it's worth it and I think that a majority of the citizens of MN agree with me. - Sven Hoaglund Wild Moon LLC C: (608) 799-9731 F: (270) 342-3505 Representing: Woolrich Outdoor Research Eagles Nest Outfitters Farm To Feet Optic Nerve / M-Shades Exped USA

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Sydney Fisher 210 Meserole St Brooklyn, NY 11206

Sylvia Ruth Gray 38723

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Sylvia Ruth Gray 315 E 1st Ave Apt 5 Salt Lake City, UT 84103-2609

Sylvia Winkelman 40734

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, sylvie carpentier aloe paris, ot 75018 FR

T & S Wright 38976

My Name is Shirlee Wright and my address is:315 S. 2nd St E., Aurora, MN 55705 I am totally and 100% behind Polymet and have been since the very beginning. Both my husband and I were born and raised on "The Range". In 1984, after the mines went down in 1981, and my husband had been laid off, and finished a 2 year program at the local vo tech, we moved to the Minneapolis area. Our dream was always to move "back home" to "The Range" but we never knew if it would ever happen or not, because economics on The Range in our area was very "Iffy" at beSt BUT after 26 years and our 2 daughters raised and through college .in 2010 we made the BIG move "back home" to Aurora. Especially because of where we've been and lived .I truly believe that PolyMet is vital to our region's longevity and the future is depending on Polymet to help breathe life back into the local economy that has NOT been here since the late 1970's.. Just take a ride down Main Street of Aurora or Hoyt Lakes any given Saturday night .OMG it almost makes this native Auroran cry to see such a desolate economy. And while I have no background in environmental in any way, I have to trust, and I do trust that Polymet has done all of the reasearch and environmental studies required to ensure complete safety in all areas of environment and personal well being for all involved. This company has invested so much money in this project by all of its studies, proposals and lobbying that I would find it hard to believe it would jeopardize that all by not being environmentally responsible in the end. Please, please, please listen to us that live here now and who have had to move away once because of economics, don't force us to have to do that again. We are here because we truly believe in this region and we too love this region for its woods, water and air quality and know that Polymet is doing all it can to help re-vitalize what our forefathers built and believed in also. Thank You..

I strongly oppose the idea of mining. The fact that we need to discuss and learn about how to clean up this toxic process and consider clean-up efforts for at least the next 100 years, likely more if it's possible at all, should be reason enough to stop this conversation here and now. Can anyone provide substantive proof that no harm will come to the areas proposed in the mining. I have not heard any such evidence. What I have heard is evidence that this type of mining allowed in other states has resulted in significant damage and pollution. We have taken far too much for granted in terms of our environment and now some people want to consider purposely harming and polluting it further. It seems to me the answer is obvious, stop it now and do not let the process of mining to continue. It will be a very sad day for MN and for human kind if this is allowed. Shame on us for thinking we can destroy the beautiful space in which we live without having long-term and significant consequences. This land and our environment belongs to everyone, not just those who want to profit from it regardless of impact. Thank you for your time and consideration. Tammy Olsen 1710 Broadway Street N Stillwater, MN 55082

T Pratt 57282

Please accept these comments on the Poly Met Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative.

T Wilson 36936

Since we have spend billions chasing around Afghanistan, a country rich in Copper, why does poly met not go there and obtain the copper. Please show me a study which displays the demand for copper and the need to destroy our ecology for this myopic enterprise. Also, I feel the offshore companies should not be allow to mine on US soil. They too easily escape the responsibility for proper clean up after the rape has occurred. Jobs. the few actual jobs for the locals is far outweighed by the damage to the ecology for what 20 jobs. Nonsense. We know and see exactly what this is.. Shame on you, you greedy bastards Todd Wilson 130 Manor Circle Orono, MN 55356

T. Chandler 44182

The Supplemental Draft Environmental Impact Statement is Inadequate This mine will result in hundreds of acres of permanent habitat destruction. Important natural resources, from clean ground water to animals such as moose and lynx, will be permanently affected or destroyed. Many costs associated with this project have not been addressed: costs of health effects due to increased pollution in water and air, depressed real estate values (which has already occurred in the area), costs of future perpetual cleanup which will be born by taxpayers (this site will end up as a Superfund site costing billions of dollars), costs of lost influx of revenue (new residents/tax base, tourists), costs of road and other public infrastructure maintenance, costs of abandoned buildings/homes when the mining company stops operations, and all other costs that will be born by taxpayers. These and all other external costs must be calculated and defined in the SDEIS. Air, ground water, and surface water pollution will all occur if sulfide mining is allowed. No state or federal rule or law can prevent it from occurring. No company or government action has ever prevented water contamination from sulfide mines from occurring. No company has ever been able to completely clean up the contamination once it occurs nor is it possible for any company to continue with cleanup for the hundreds of years remediation would take. Once the ground water and surface water contamination starts, it will not be possible to stop it. The SDEIS does not address how contamination will be prevented, nor does it adequately address how clean up of the certain contamination will be handled. The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The SDEIS does not address how on-site or off-site spills or leaks of fluids, ore and waste materials and other accidents will be handled to prevent contamination. The SDEIS does not adequately address the prevention of air contamination from dust, particulates, emissions from machinery, and emissions from power generating plants. Just one of many examples as to how the SDEIS is inadequate and deceitful has to do with blasting and excavation. The SDEIS states “The NorthMet Project Proposed Action would cause noise, affecting some sensitive receptors. Nearby residences or other permanent sensitive receptors would not be affected, and some wildlife may avoid the area at times.” Yet the SDEIS also states that blasting will occur every 2-3 days. It is clear that sensitive receptors, including wildlife, residents, and tourists will be affected by the blasting and will permanently avoid the area, not just avoid the area “at times.” The SDEIS fails to provide details of how the monitoring and maintenance of pollution prevention measures would be handled for the hundreds of years needed to Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. The stockpile covers and liners are not adequate to prevent migration of contaminants to air, surface water, and groundwater. The SDEIS fails to address how the pollution prevention measures would be maintained over the hundreds of years necessary to prevent contamination. Mining companies are notorious for abandoning projects once the ore is extracted, leaving cleanup to the taxpayers. The EPA currently lists 547 non-NPL abandoned mine sites on the CERCLIS list – these are mine sites that have had removal or emergency response cleanup action undertaken on-site. The EPA also lists 117 mining sites proposed for and listed on the NPL as well as mining sites being cleaned up using the Superfund Alternative Approach. These numbers do not include Superfund sites being handled directly by the stat

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. As a long time resident of Minnesota, I am saddened and frightened by the lax enforcement of environmental standards, and the weakening of our processes for oversight at the state, local, and citizen level. Please do not continue down the path of unsustainable damage to our environment and rape of our lands. Do not approve the PolyMet mine requeSt Sincerely yours, Tamara McGehee Tam McGehee 77 Mid Oaks Lane Roseville, MN 55113

Tamara Few 41864

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tamara Few Burnsville, Minnesota

Good Evening, Please do not mine for copper sulfides in the BWCA. It is a beautiful, pristine landscape, a treasure of our great state. This type of mining has never been done without pollution and our land cannot take the hit. Yes it would bring in millions of dollars to our state in revenue, but at the expense of one of the last remaining wild places. All of our children and their children need to experience this natural area at least once in their lifetime - do not take that opportunity away. Sincerely, Tami Limberg - Tami Limberg Great River School A2 Science Guide, A1 Occupations Guide

Tammy Ashley 40429

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Tanner Bailey 43742

To whom it may concern, I believe no mining should be allowed in our National Forests. Please keep the forests in their natural state. Thank you. Tanner Bailey 19476 Halwood Road Glenwood, MN 56334 Tanner J. Feb 27, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (Lynx canadensis). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as "speculative" in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only "Special Status Species" for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a "Special Status Species" in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states "Lynx utilize snow packed trails and roads as travel corridors," while on p. 5-366 it says "this species does not rely on roads for travel." 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. We need to learn to share do not destroy my back country Sincerely, Mr Tanner Lucas 3070 202nd Ln NW Oak Grove, MN 55011-5011

Tanya Bachmann 54563

Please, please, please do NOT approve SDEIS! As a mother, daughter, and grand daughter I am VERY concerned about PolyMet’s proposal and the impact on Minnesota’s water, Minnesota’s environment, and Minnesota’s citizens/guests for years and years to come! DO NOT TRUST their proposal!! Our water will not remain safe, clean or maintenance free! As a taxpayer of this great state I beg of you.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. Here below are my own words on the proposal: Last night my friend and I went to the hearing in Duluth, a first of three around Minnesota, about the proposal to let a big mining conglomerate, Polymet, leak sulfuric acid and a mess of other toxic overflow into the Lake Superior watershed in order to get at the copper, nickel, platinum and other mineral wealth that underlies this area our hearts draw sustenance from. She said we were witnessing a piece of history. It's left me with the same feeling I think I remember from when I first heard on TV that people are warming up earth's climate, or when as a girl I first heard my dad say the builders were coming sooner or later to put apartments in the pasture. Selfish, said one of the men who testified at the hearing last night, critiquing the motive of everybody taking a stand on whichever side of the debate , but I mostly disagree; I think everyone who takes a stand in a public controversy feels like a representative for some group of others who aren't vocal or privileged enough to be there. The others can be people or they can be manifold living things with whom we don't share a language. The non-profit organization WaterLegacy in a brief emailed review of the hearing pointed out that about two thirds of the testimony given was from opponents of the mine, and that while many opponents cited specific flaws or gaps in Polymet's supplemental draft environmental impact statement, the supporters just called on their faith or intuition that the review, the future mining technology or the industry in its great professionalism could be trusted. I was glad of the evidence that somebody else had been keeping track of opinions for and against the project, since I had been keeping my own tally on paper during the testimonies my friend and I heard from about 7 p.m. till nearly 10:00- For most of the evening I found that the opponents led by nearly two to one, but as the room emptied it seemed more and more the boosters for local mining were the people remaining. At the crux of the proposed mining scheme is that the various metals termed sulfides, including copper, gold, nickel and platinum become toxic, turning to sulfuric acid, when exposed to air and water after being dug from the open pit mines. I say mines because Polymet's proposed mine located near the Embarrass and Partridge Rivers, which would wash the pollution into the St Louis River and thence Lake Superior, is not the only proposed sulfide mine. Twin Metals is a joint venture between a Canadian and a Chilean company that wants to dig another mine barely three miles from the Boundary Waters Canoe Area near Ely, Minnesota. Yet-to-be-named venture capitalists are and will be watching. To them, sulfuric acid is a risk factor, an abstract liability in a bright-eyed betting game. Not vinyl, not clay, not metal set in the ground to hold the drainage in storage ponds or divert run-off from towering piles of dug-up rock, wood rubble and dried-out peat will keep the acid waste water from where we don't want it to go. The soils are largely sand and peat, boulder and gravel. The questions are when, how soon and how much effluent will make its way where-all and how far. No company, whatever formal arrangements it puts on record, will retain squadrons of river guardians or pit watch personnel past its own dissolution, or past all caring once the blue coldwater lakes of legend or the fishing streams are discolored or pretty well devoid of healthy aquatic life. Arguments made by citizens in favor of mining are that we need the copper that the region has, that no other mining region of the world has the robust environmental oversight found among Minnesota agen

48954

Mar 10, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. My whole life has been a love affair with this region. I cherish its spectrum of birds and wildlife, including fish, none yet driven to extinction. Also I use its fish for food in summer. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. There is every assurance that despite all promises and prescriptions they will here too. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. This whole region is underlain by percolating water which will begin to run with soluble metals including mercury, getting into lakes, marshes and rivers, harming wildlife scarce already including the threatened lynx and our declining moose populations. The Polymet scheme is a rich corporate affair that in no way benefits anyone except those who measure well-being in dollars. A hoax is being perpetrated on the job-poor promising them work at the expense of everything else in the region. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Tanya Beyer 10431 Bachelor Square Rd Meadowlands, MN 55765-8103 (218) 260-6767

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Tara Skar 54537

The Boundary Waters and the surrounding National Park/Forests are more than important tourist attractions and recreation areas—they are historically and culturally integral to Minnesota’s identity. Our solution to low employment can’t infringe on future generations’ environmental health.

Polymet does not have a plan for mediating environmental disasters if they occur. Polymet's primary investors have a long history of environmental destruction and failure to clean up messes such as the BP oil spill. If any contaminated water is released (which Polymet acknowledges will occur), the wild rice crop will see severe negative effects. Wild rice is a cultural and economic staple to many native communities in Northern Minnesota. The majority of profits will not remain in the state of Minnesota, and Polymet provides insufficient details as to financial assurance needed to protect taxpayers in the future. Its not worth the risks, Poly-Met sulfide mining as currently planned should not occur in Minnesota. Minnesota's young people want a clean and vibrant future void of pollution. The youth say no to sulfide mining. Ted Benson 38946

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Ted Benson 1248 Como Blvd E Saint Paul, MN 55117-4009

Ted Donahue 54520

Keep the Boundary Waters pristine. I want to continue to spend my vacation dollars there.

1- We use many products using copper/nickel 2- MN has deposits of copper/nickel 3- MN has a reputation for environmental integrity and oversight Unless you want to ban copper/nickel products in the state, MN needs to live up to it's responsibility to responsibly mine these minerals. It is hypocritical to use these products but declare it is unsafe to mine them. MN can do this better and safer than probably most states/countries in the world. I support the project with rigorous oversight applied. Ted Heller 1021 7th St S Waite Park Mn 56387

Ted Mattison 38954

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Isn't it time we humans started thinking about the earth. Fresh water and topsoil give us life. Without them, humans would cease to exiSt All the money in the world will not bring them back. There has NEVER in history been a "safe" sulfide mining operation. Do us all a favor and find 10 mines whose operations were successful ten years after they closed up. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Ted Mattson N10794 Karnopp Road Wausaukee, WI 54177 Sincerely, Ted Mattson N10794 Karnopp Rd Wausaukee, WI 54177-9109

Ted Wahl 44589

As a young youth in Minnesota, building a mine close to the boundary waters that's only providing 50-100 jobs for the economy, is NOT worth the 500 years of clean up. I hope the DNR makes the right choice Thank you for your time. Ted Sent from my iPod

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, tegwin moye 3310 69th st e inver grove heights, MN 55076 6515527148

Teresa / Aaron Alto 45519

Name: Teresa Alto Legal mailing address: 21995 Mishawaka Rd, Grand Rapids, MN 55744 I felt it was important to write as a resident of the Iron Range who feels we must go only slowly, cautiously, and skeptically into copper and nickel mining in our region-if at all. It seems almost criminally shortsighted to go into a mining project forecasted to operate and provide jobs and extract resources for just 20 years and that requires a period of cleanup too long to adequately plan for. The mining of these metal resources threatens another resource: water and clean and healthy watersheds and watershed ecosystems, which are truly becoming scarce and invaluable globally. Not only should it cause us grave concern that the company has provided no information on its methodology and no explanation of its estimated projected costs, but it is patently impossible to plan for 500 years of cleanup, no matter how much funding the company puts aside as financial assurance. Five hundred years ago there was no United States, nor was there any significant European settlement in the Americas; democratic government did not exist in any developed society, and the population of the world was a tiny fraction of what it is now. How can we plan for continued cleanup for the next 200 years on some parts of the mining area and for 300 more years after that on other parts. Already, we know that aquifers and freshwater worldwide are dwindling and cannot meet the projected growth in demand. How can we know how that will affect governments and water resources even 100 years in the future. How can we know that we will have a stable economy and national government for all this time. And yet the rivers and lakes and land will still be here, and animals and plants and forests will still be here, and we hope that people will still be here. The land has a moral claim on our actions, and so do future people and the world they will inherit from us. Northern Minnesotans want economic opportunity and stability, but we also want to be able to fish and hunt and canoe and ski and enjoy the outdoors. People here have a strong culture of living in part off the land, and a strong culture of valuing the recreation, bounty, solace, and beauty of the land and water around us. It is the land and sense of community that make people want to stay here and to move here. The beauty and outdoors recreation are key to the economic and social vitality of our communities. And they are one of the most significant contributors to our economies through tourism and related industries. So this is not a "jobs v. the environment" issue, and I certainly do not believe the "jobs and the environment" image touted by Polymet. We are talking about short-term jobs, so the jobs are not offering long-term vitality to our communities. And we are talking about a necessary cleanup—according to the company's own materials—required for too long for human companies or governments to plan for or fund. The unknowns are impossible to account for. I am adamantly opposed to the Polymet mining project.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, teresa haskell 3800 14th ave D168 lacey, WA 98501 US

terra forshier 42079

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, terra forshier Minneapolis, Minnesota

Terrell Brown 57945

The idea that we would allow a project that may require 500 years of remediation is crazy. There is no way to guarantee that the money will be available in even 100 years or project what the costs may be at that time. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. 1 have grave concems about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Terrence and Marge Smith 57200

We have 4 grandchildren, and our vision for them is clean waters, clean air, and land. We oppose sulfide mining for the dangers it presents on so many levels. Please Protect!Terrence & Marge Smith1428 Belmont RdDuluth, MN 55805

Regarding: Big Picture considerations and actions for immediate permits issuances for the Northmet/PolyMet East Iron Range Minnesota Project and all others similar. With over 1200 active volcanoes on Earth and over 25,000 miles of ocean volcanic rift emissions, all of humanities emissions are less than 1% of Earth nature's emissions. From Wikipedia on line, probably any encyclopedia and google search under "ocean rift volcanism", first two pages of 20 plus below. It is beyond foolish and extremely wasteful to remove toxins from industrial or any other human process unless they are a direct health threat. Or trying to clean or clean up 1% of any problem will not and can not clean up the remaining unrelated 99% natural pollution; leaving nature's 99% pollution still there causing the same probleMs The EPA and the MPCA have now wasted over 8 years of study on a less than minuscule part of the less than 1% human part of the problem. This is fraud by any definition. Fortunately for these obstructionists, they will all likely be dead from old age before government agencies will be able to prosecute this fraud. But worse, future generations will look at this incredible foolishness and obstructionism with at least great disdain, probably outright contempt for acting so outside the law, or not accounting for the above reality in decision making. I urge all organizations everywhere to bring these facts out everywhere possible to help stop the foolishness and the fraud in air and water pollution control. Because nature is the 99% problem, except for direct health threats, humanity's pollution will never be an issue compared to the 99% pollution output of nature. Please urge everyone to demand the necessary permits for the Northmet/Polymet Project be issued immediately to put a stop to this environmental fraud and farce obstructing the Northmet/Polymet Project in Northeastern Minnesota and others. Open circulation of this letter and submission to the environmental reviewers is strongly urged to put a stop to this criminal obstructionism of the Polymet Project and others. Terry D. Welander 2 West Parkway Virginia, MN 55792 email: HYPERLINK "mailto:tdwelander@gmail-com"tdwelander@gmail-com Google Search below on "ocean rift volcanism", 2 pages below of over 20 available; for everyone's reference in support of the above letter. PS Snowfall in this area and other areas on Earth has around 50 parts per billion Mercury. Or after a dozen or so snowfalls, particularly during snow melt, the amount of natural Mercury can approach toxic levels for humans and animals. Why any consideration of human Mercury sources is irrelevant to the point of fraud. Rainfall in this area and other areas on Earth is around 25 perts per billion Mercury. Or after a rainfall season, natural Mercury levels can approach toxic levels for humans and animals depending on distribution. Also why any consideration of human Mercury sources is irrelevant to the point of fraud in nearly all instances. And with all the volcanic sourced atmospheric toxins raining down on the planet downwind from all volcanic eruptions, any human sources are almost always less than insignificant. Or in practically all instances, human sources of pollution are irrelevant compared to nature. NorthMet SDEIS The US Corps of Engineers jurisdiction is limited to commercially navigable waters. The closest being the Duluth docks and harbor 60 miles away from the project. Or the US Corps of Engineers does not and has never had jurisdiction on this project. The US Army Corps of Engineers needs to remove themselves on jurisdiction and other grounds as necessary. A completely acceptable mining and refining plan was in place before the MN DNR became involved in the Polymet project. And the MN DNR, not being or having pollution jurisdiction should not be involved in the Polymet permitting. Any land swaps must be treated separately, the sole reason the MN DNR would be involved; and at the sole convenience of Polymet. The MN DNR needs to remove themselves from this project permitting. Only the MPCA should be involved and should immediately issue permits based on the 99% pollution sources on the planet being the 1500 active volcanoes and their beyond huge emissions affecting practically all air on Earth. Nothing in the Polymet process even registers on the total pollution rained on the planet from these 1500 active volcanoes. Since the big picture and most relevant pollution problem of the 1500 active volcanoes on Earth have been ignored to date by this highly erroneous review process, the only realistic alternative is immediate issuance of the Polymet permits by the MPCA; all other entities not having any jurisdiction due to pollution considerations being the only relevancy for this project. Snow fall in NE MN and other places has 50 parts per billion Mercury; most likely from all those 1500 natural volcanic emissions. Or after a dozen or so snow falls and some snow melt, nature provides a nearly toxic environment making nearly everything humanity does irrelevant and less than miniscule on any total and big picture measure of pollution. A variety of other volcanic toxins precipitate out of the atmosphere during snowfall and rain further negating any consideration of the less than minisicule contribution of humanity to any pollution. Stop the foolishness and irrelevancies of humanities less than miniscule pollution emissions compared to nature now, now, now, not later, to keep future generations from viewing this process and the people involved in it with utter contempt for being so selectively biased and blind not considering the 99% natural Earth pollution problem silently and hiddenly causing death and destruction everywhere. Based on nature being the 99% pollution problem as detailed above, all government agencies except the MPCA need to remove themselves from this review process immediately. And the MPCA needs to issue the necessary permits for the Polymet project immediately. Terry D. Welander email: HYPERLINK "mailto:tdwelander@gmail-com"tdwelander@gmail-com 2 West Parkway Virginia, MN 55792 PS Google Search below on " Earth Volcanism", 2 pages below of over 20 available; for everyone's reference in support of the above letter. Negation and Refutation of the suggested Bonding Requirements for the Proposed Polymet/Northmet Hoyt Lakes Copper Nickel Project. Where is the accounting of the emissions from the 1500 volcanoes dropping toxins everywhere downwind (which is nearly everywhere on Earth) and on the surface in NE MN in particular. It has not been provided and is 99% source of the surface toxins problem coupled to natural daylighted (surface exposed) ore toxins. Where is the accounting of the emissions from the daylighted natural ore bodies in numerous locations in NE MN. It has not been provided and is part of the 99% surface toxins, particularly nitrates; and practically all other toxins of the periodic table of elements. Or nature or natural pollution is the 99% problem negating the need for bonding of any human projects. Nature has and will clean up all of human pollution problems over geologic time; as nature has cleaned up its own environmental messes over time. Also why bonding of humanities projects is not required. The deliberate ignoring of the 99% plus natural pollution problem from nature by supposed environmental groups is criminal negligence and needs to be exposed as high negligence of reality and needs to be set aside from consideration for ignoring the 99% natural Earth pollution problems in the Polymet/Northmet NE MN Copper Nickel project and all similar. Additionally; copper is a sanitizing (anti bacterial and anti viral) agent for all of the animal and plant kingdoMs Or limited copper exposure as nature provides is a cleansing agent for all of the animal and plant kingdoms is highly desirable. Mimicking nature by adding limited amounts of copper to the environment will make it a better environment for plants and animals. There is currently no nickel mine in North America. Providing nickel production in North America is a national security requirement negating practically all of the environmental concerns. Nickel is a civilized world necessity from food tin can linings to any machine requiring heat resistance. Modern humanity can not live without a supply of nickel. Immediate issuance of the necessary permits by the MPCA to Polymet is urged in the strongest possible terms to make this review lawful and avoid formal criminal court complaint from local governments for the deliberate ignoring of nature's 99% pollution reality. Terry D. Welander 2 West Parkway Virginia, MN 55792 --- Forwarded message --- From: Terry D Welander Date: Wed, Jan 29, 2014 at 11:40 AM Subject: Additional Details on the Followup Plan on the Big Picture Support of the PolyMet East Iron Range Minnesota Project and all others similar- Urging immediate permit issuance by the MPCA and removal of all other government agencies from this process as detailed below To: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us NorthMet SDEIS The US Corps of Engineers jurisdiction is limited to commercially navigable waters. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Terry Ford 3404 Aldrich AveS. Minneapolis, MN 55408

This seems like a short-sighted project that could be very detrimental for our environment. There does not seem to be a reasonable plan for all the harm that could ensure. No one will be responsible for 500 years. This is not a reasonable or practical or responsible proposal. I would vote no until the company can find a way to mine without producing pollutants.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Based on my reading, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my conclusion. Neither the SDEIS nor the sulfide mine project are based on accepted science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its optimistic predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real base flow is two to three times higher than the number used in the SDEIS. Base flow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone using a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Terry J. Williams 4170 Brigadoon Drive 4170 Brigaoon Drive, Shoreview, MN 55126 Shoreview, MN 55126

Both tribal hydrologists and MDNR staff have determined that the real base flow is two to three times higher than the number used in the SDEIS. Base flow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone using a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Terry J. Williams 4170 Brigadoon Drive 4170 Brigaoon Drive, Shoreview, MN 55126 Shoreview, MN 55126

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Based on my reading, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my conclusion. Neither the SDEIS nor the sulfide mine project are based on accepted science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its optimistic predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone using a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real base flow is two to three times higher than the number used in the SDEIS. Base flow affects pollution seepage and impacts on wetlands and streaMs • The SDEIS must be redone using a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Terry J. Williams 4170 Brigadoon Drive 4170 Brigaoon Drive, Shoreview, MN 55126 Shoreview, MN 55126

Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The proposed Land Exchange serves only the private interest of a foreign corporation, not the public intereSt The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The Supplemental Draft Environmental Impact Statement [SDEIS] does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: • Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. • Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. • Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. • Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. • Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: • The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. • The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. • The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lyn

To All Concerned: I am a small-business owner of a family-owned company in Hibbing that has been in existence for 50+ years, and am writing to you to comment on the SDEIS for PolyMet Mining's proposed NorthMet project. We are impressed with the great deal of depth contained in the completed study and are convinced it shows the safety and viability of the project. We also believe that the future of Northeastern Minnesota and those of us who choose to live and work here need this project to be allowed to go ahead in order to secure our future viability, as long as reasonable environmental safeguards are met. I am concerned that some media have misconstrued the data regarding the groundwater flow model, giving the general public the impression that the 200 to 500 year figures indicate that the project will still need expensive treatment 500 years from now. On the contrary, the thorough study indicates the extremely slow rate of travel that the water will filter down through the bedrock, and that water quality standards will still be met even that far out on the timeline. We are blessed with a rich deposit of minerals in northern Minnesota, and the minerals that would be mined by PolyMet are and will be in high demand by the world's economy. Let's not squander the opportunity to be the suppliers of these precious resources that will also bring to our state so many new jobs (360 full-time and 600+ related) and considerable added revenue for the State of Minnesota. Because of stringent oversight and federal and state regulations of our environment in Minnesota, as demonstrated by the thoroughness of this study, we in Northeastern Minnesota can produce and supply these needed resources in a much safer and more environmentally friendly way than anyone else in the world. PolyMet and companies like them that comply with all state and federal regulations should be granted the necessary permits to conduct their operations in our state. My review of the EIS and the great amount of detail included within it tells me that you have thoroughly evaluated this potential project and it's impact, and I strongly urge you to permit this project to go ahead. Sincerely, Terry Miller cid:542390115@02102013-2AD6 1723 First Ave – PO Box 544 Hibbing, MN 55746 tel: 218-263-8958 fax: 218-263-8583 cell: 218-969-0949 HYPERLINK "mailto:tmiller@bmillerproducts-com"tmiller@bmillerproducts-com HYPERLINK "http://www.bmillerproducts-com/"www.bmillerproducts-com

Terry Nevalainen 21992

To Whom It May Concern: After reviewing the SDEIS and visiting the Polymet site, a former mining site, I support the regulatory process in approving the Permits necessary for Polymet to begin operations in the State of Minnesota. Further negativity from the opposition is unfounded. Polymet has more than answered all questions asked of them and addressed all regulatory requirements. Why should Polymet be further subjected to previously addressed issues and unfounded opinions. It is time the MNDNR, EPA, MNEPA and the USACOE move forward and provide Polymet with its needed “Permits to Operate”. Allowing Polymet to operate will definitely help the local, state and federal governments fund further projects and aid with financial support from Polymet and local businesses through taxes created from the employment of the public. At this time in our age we need all the employment help we can get. PLEASE, ALLOW POLYMET TO HELP US HELP OURSELVES. Terry Nevalainen Civil Engineer 217 NW 10th St Chisholm, MN

---Original Message--- From: archtttmo@hotmail-com [mailto:archtttmo@hotmail-com] Sent: Thursday, March 06, 2014 10:30 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing boaRd Dear Ms Fay: The PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) is fatally flawed . We should not burden future generations with toxic water pollution and cleanup costs from a sulfide mine. Once our sacred and natural Minnesota lakes, rivers and aquifers are polluted from a toxic spill, there is no way to ever recover what we loSt PolyMet would operate for 20 years but, according to PolyMet.s own data, would pollute water for over 500 years at the tailings basin, and over 200 years at the mine pit. The modeling results provided in the SDEIS show that PolyMet and the DNR did not look beyond 500 years. The SDEIS does not say when the mine pit and tailings basin will stop polluting our water. This is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models . or require PolyMet to run the models . long enough to show when pollution of our water by PolyMet.s mine would cease. Again, we can not recover what we could lose from quality of life, natural habitat, economic benefits of tourism and the livability of the local communities. PolyMet proposes a complex mechanical system of pumps, pipelines, and filters that it says will capture and hold back the water pollution from getting into our rivers. PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long after the mining has stopped. Mechanical systems like pumps, filters and pipes eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality. Polymet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment. By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine. In addition, if the company declares bankruptcy, who would be left to repair the damage and restore the communities and habitat. Please reject the SDEIS. Reject PolyMet's plans flawed with predictable failures in the water pumping and treatment system and the power supply to run that system. Reject the lack of fiduciary responsibility for a failure that is irreparable to OUR delicate balance in Minnesota. Long after the mining has stopped, PolyMet would pose an ongoing risk to fresh water. The Embarrass, the Partridge, and the St Louis Rivers, as well as Lake Superior, are far too precious to be put at risk for the profit of PolyMet. PolyMet should not be permitted. There is no way to guarantee when the proposed mining stops, that the groundwater and surface water would be left in a clean condition, and surrounding streams, rivers, and Lake Superior would be safe from risk of sulfide mine pollution. The PolyMet SDEIS suffers from many major failings. The SDEIS needs to be withdrawn and rejected. Sincerely, Terry Olsen 542 Pelham Blvd Saint Paul, MN 55104-4938

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404 " Clean Water Act Permit that would allow wetlands destruction in the Superior National ForeSt PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation " wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please: • Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance. • Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS. • Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions. • Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect " wetlands losses. • Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin. • Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive $17-3 million and the state and local governments would receive $14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately $30 million, and the state and local governments would receive approximately $39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of $15-6 million and federal taxes of $64 million for 2011, a number far larger than the $30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of $3-12 million of state taxes and $12-8 million in federal taxes, increased by 500% to $15-6 million and $64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Terry Richmond 2900 County Road 19 Maple Plain, MN 55359-9386

Terry Smith 13656

I will be gone the week of 2/11/14 through 2/18/14 .please hold all email. Thank you. Terry

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Terry Williamson 27011

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt On a personal note, my son canoed in this area two summers ago and it continues to be one of his most memorable experiences as an adolescent. As an adult providing supervision to Boy Scouts on their trips into the outdoors, I am always impressed about the maturity they exhibit and the growth that happens when these young men are given the opportunity to govern themselves in wilderness areas. I don't know of any other place where this happens on this scale. All of our communities will be lessened to the extent that we allow the limited wilderness that now exists to be further diminished by mining and industrial pollution. Sincerely, Terry Williamson 768 Belhaven St Jackson, MS 39202-1705

Tersenia Schuett 46588

The MN Department of Natural Resources must guard and protect our most valuable resource above all-water. Down the road the value of water will pale compared to "precious metals." Water is indeed precious. Unforseen, predictable and unpredictable incidents and accidents are not addressed in Polymet's proposed water treament plan. All the financial assurance dollars in the world are not worth taking the risk of impairing MN waters. In light of this, I see JOBS as a four-letter woRd Don't let ~350 short-term jobs, the heft of big business, and dollar signs cow the DNR into submission. Sincerely, Tersenia Schuett 1410 Goodrich Ave StPaul, MN 55105

Tess Zangrilli 34016

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. We are heading in a direction of severe water shortages across the world due to global warming and population explosion. It is in the public's interest that water, which is vital to life be protected. I know this on a personal basis, living in the fracking hellscape that is Pennsylvania. We need to have one part of this country where water is protected. Sincerely, Tess Zangrilli 203 Lytton Ave Pittsburgh, PA 15213-1409 (614) 725-2911

Tessa Hill 16165

Hi there, I am a young student at prior lake high school. To be completely honest with you guys although this May look like a good idea now, I am way too nervous to take action. I don't trust the possible outcomes that this could create/affect in the long run. Thank you for hearing what I have go say. Sent from my iPhone

The Bremicker-Bartels 42963

the Maloney Family 43254

Opposed. Minnesota does not need the open pit copper-nickel mine. This potential mine is not a good investment in our state's future. Four hundred jobs for twenty years traded for a sulfide tailings is not worth it. It is not even going to produce that much in minerals. The mine is a short sighted silly idea. I have stood in the bottom of Bingham Copper Pit. Nothing grows around these mines. The pH is wrong for plants. The ore deposit is not going anywhere. Let us leave it for our future Minnesotans with improved technology to decide if they want to mine the ore. Ann Maloney 8293 Paradise Beach Court Brainerd, Mn. 56401

The Mowans 38548

A nightmare is about to happen if the Northmet Mining Project is approved. I cannot add anything to the science as a concerned citizen. I read the facts and listened to experts who will not profit financially, I am saying that the facts of science prove this project should never be allowed. History of copper mining must be included because the price was paid elsewhere and there is no going back. We are fools not to learn from the pain of others. Water is one of the most precious commodities on this Earth. This fact appears everyday in news reports when disaster after disaster created by human beings has spoiled our waterways. I do not believe any mining company should be permitted to desecrate the forests and watersheds of our beautiful state. 90% of everything mined will produce tailings in an untold volume. How many piles 20 stories high. How much water is used for the chemical bath. What are the chemicals in the bath. Is it a secret like the chemicals used in fracking which is legally kept a secret from the people whose land is being flooded. Right now tailing piles from the old LTD taconite site create pollution that is exceeding current MN water quality standards. Mercury has been found in children. What will it cost MN in health care for known health concerns. Polymet is the next "invasive species" leaving the increasing devastation forever and ever. Three-hundred jobs will never justify what the pits, up to 700 feet deep and the sulfur piles 20 stories high will do to the environment, FOREVER. After the 20 year run when all the wealth leaves this country these miners will again be jobless . Hy-Vee will build a grocery store in New Hope MN that will hire 400 employees. How can anyone with a conscience use jobs as an excuse to ruin MN. Only a few jobs for a few years what is left is the Hell that would be created in our Northland. The DNR should be the guardian of our natural resources for all Minnesotans. Lost to profiteering is unforgiveable. We need pristine places to live and retreat to. What has been saved for us took some warriors in the paSt Please don't be responsible for 500 years of destruction by sulfuric acid. The lost of forests that filter our air is another important factor in pollution. I do not believe any politician or state employee has the right to give away MN. I think of Judas, what price to pay for materials to manufacture products that will eventually end up in landfills. Why does Polymet a foreign corporation that has a history of ravaging the earth in Canada deserve the right to reap havoc here. Their financial backers have a history of illegal dealings and world wide pollution. These facts are a part of the entire package. F. Sigrid Mowan 4186 E Shamineau Dr Motley MN 56466

December 19, 2013VIA U.S. MAILLisa Fay, EIS Project ManagerMDNR Division of Ecological and Water ResourcesEnvironmental Review Unit500 Lafayette Road, Box 25Saint Paul, Minnesota 55155-4025Douglas Bruner,U.S. Army Corps of Engineers- Saint Paul District180 5th Street East, Suite 700Saint Paul, Minnesota 55101-1678Tim DabneyU.S. Forest Service- Superior National Forest8901 Grand A venue PlaceDuluth, Minnesota 55808Dear Ms. Fay, Mr. Bruner, Mr. Dabney:On behalf of the Minnesota/North Dakota/ South Dakota Program of The Nature Conservancy, I request an extension to the public review and comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) for an additional 90 days beyond the current end date of March 13, 2014. The Nature Conservancy is a nonprofit conservation organization that works in all 50 states and 35 countries and has a membership of approximately one million. The mission of The Nature Conservancy is to conserve the lands and waters on which all life depends.The longer review and comment period is warranted by the length and complexity of this document. The quality of comments that the Conservancy and the public will be able to provide will improve with additional time.Sincerely,Margaret LadnerMinnesota State Director

Theo 43082

Do not allow the copper mines in Minnesota. It will wreck everything-such as the land, water and tourism. I worry about what it will be like when I am an adult, will the BWCAW still be the same. will I be able to go swimming and eat the fish I catch. No safe gaurd is 100%. The mines are also ugly and destroy the land. Theo Anderson (8th grade) 2150 Mailand Road St Paul, MN 55119

Theodore Gorney 39614

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Theodore Gorney 5572 Brookdale Dr N Brooklyn Park, MN 55443-3015

Theresa Flynn 38948

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Theresa Flynn 794 Holton St Saint Paul, MN 55104-1315

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am proud to be a Minnesotan because of this state's history of valuing nature and the preservation of our natural resources. To allow copper nickel mining, especially when this mine's projected lifespan is only twenty years, destroys my trust in the DNR and makes me question the values of my fellow Minnesotans. It is the DNR's job to protect Minnesota's environment and take care of our natural resources, and allowing mining that has the potential to pollute for hundreds of years is a direct contradiction of this. I do not understand how anyone, especially a government agency that is supposed to put public interest first, can think that a relatively small increase in jobs and economic output for twenty years outweighs the potential for catastrophe and pollution for hundreds of years. Minnesota is known for its clean lakes and rivers, but fresh water is not an infinite resource and we should not be actively working to jeopardize the local watershed and Lake Superior, which is what would happen if the PolyMet mine is approved. I am extremely disappointed that the state government, which is supposed to act in the public's best interests, could consider this mine to be a viable option. It is absolutely not in the public's interest to allow mining that could pollute any watershed for hundreds of years. Even if there is some way that PolyMet could guarantee it can pay for clean-up of a catastrophe, Minnesota has only been a state for a little more than 150 years and it would be crazy to knowingly create a situation that leaves us cleaning up water pollution for twice as long as we have been a state. Sincerely, Theresa Gerber 817 Hilltop Rd Mendota Heights, MN 55118-4324 (651) 788-2484

57983

I don't understand how someone can look at the numbers objectively and feel it makes economic sense to go ahead with this project. How can the mining company guarantee that if something does go wrong, they can pay for cleaning water for 200-500 years? Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. 1 have grave concems about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Theresa Johansen 10691

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Theresa Johansen 10355 Greenfield Rd Greenfield, MN 55357

Theresa Nelson 43232

To The State of Minnesota's DNR, It is inconceivable to me that anyone who has any concern for the natural resources of Greater Minnesota, would allow or would ever think of allowing mining to occur in this irreplaceable environment. Please be a leader, please think of future generations, please think BIG .big enough to understand that the ways of the world are changing, and people need and want us to take care of our resources. And they are resources, it is why I live in this state. I spend $1000 every year in Greater Minnesota exploring natural area's, patronizing local businesses and paying permits. So far I estimate I have spent $20,000 in the BWCA area in my adult lifetime, and I plan to spend just as much and even more in my years to come. And let's be clear here, my annual salary is $40,000 .I'm by no means rich, but choose to spend my money here in order to experience the BWCA as it is. BUT not if, I even think for a moment that the water is being contaminated, the animals lives are being compromised or the local economy doesn't value protecting this most incredible resource. Think about it, there is a lot at stake, and you and I am responsible for what happens. Say to NO to Polymet in Minnesota. “The eyes of the future are looking back at us and they are praying for us to see beyond our own time. They are kneeling with hands clasped that we might act with restraint, that we might leave room for the life that is destined to come. To protect what is wild is to protect what is gentle. Perhaps the wilderness we fear is the pause between our own heartbeats, the silent space that says we live only by grace. Wilderness lives by this same grace. Wild mercy is in our hands.” - Terry Tempest Williams Sincerely, Theresa Nelson HYPERLINK "mailto:theresa.f.nelson@gmail-com"theresa.f.nelson@gmail-com HYPERLINK "http://www.linkedin-com/in/theresanelsonmn"www.linkedin-com/in/theresanelsonmn 612-655-5662

Theresa Rokusek 14955

Dear Theresa, Thank you for contacting me about the proposed PolyMet copper-nickel mine. I appreciate your email and the Star Tribune article link. As you may know, the Department of Natural Resources (DNR) can authorize the mine without legislative approval. However, a project of this size is required to complete an Environmental Impact Statement (EIS) under state and federal law to evaluate the comprehensive effect of the project on the environment, local communities, and the economy. Currently, the DNR is taking public comments on the proposed EIS HYPERLINK "x-apple-data-detectors://0"until Thursday March 13, 2014- More information about the project, including submitting your comments, here: http://dnr.state.mn.us/input/environmentalreview/polymet/index.html Thank you again for your email. For my part, I will continue to support policies that protect our state’s world-class lakes, rivers, and groundwater for generations. Best wishes, Debra Hilstrom >>> 2/9/2014 2:51 PM >>> http://m.startribune-com/news/.id=244570531andc=y Please refer to above article. My husband Dennis Johnson and I, Theresa Rokusek, are vehemently opposed to this or any other company coming into MN to do mining. They will promise to follow safe rules and policies should they be okayed to do so. Of course they promise all kinds of jobs to the financially depressed region. How many are guaranteed to US citizens. Allowing this potentially environmental killer into our beautiful state is ludicrous based on dollars and cents. Haven't we learned enough from the BP explosion, the recent chemical disaster in Virgina releasing deadly chemicals in the river nearby, and the opposition to building the KXL pipeline thru our country by a Canadian company. If it's so safe, why not build it through their country.. If we care anything about keeping our waters and lands safe, we cannot allow promise of big $$$ to cloud Minnesota's safety and beauty. From: Theresa Rokusek and Dennis Johnson 2557 Brookdale Lane Brooklyn Park HYPERLINK "tel:55444-2336"55444-2336 763-560-0169

Theresa Sprung 42083

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Theresa Sprung Center City, Minnesota

Theresa Zaydel 30091

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I submit these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement because of serious concern for the health of the Great Lakes region of the United States and Canada. Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on the Great Lakes fresh water system, the Great Lakes region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, and the cumulative impacts from mining. It is not in the public interest or the best practices to protect our natural and fragile environment to allow a Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine. Sincerely, Theresa Zaydel 13967 Ashton Rd Detroit, MI 48223-3531

Therese Gimmestad 41668

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Thomas A Leaf 40931

Ms Lisa Fay and DNR, I am writing to express comments on the SDEIS for the proposed NorthMet Mining Project and Land Exchange. We Minnesotans have before us a proposed project from an outside company which stands to obtain large economic gain. This corporate gain comes at the expense of Minnesotans permanently selling off one of our natural resources. The benefits for Minnesotans are some construction jobs for a few years and a few mining jobs for a twenty year time period. There appears to be no pressing need at this time for copper and nickel. These metals are not being mined for use by our state. The detriments of this project as I see them are; We will soon be left with an abandoned mine, the transient jobs are gone and we have clean up and monitoring of the site for centuries. We will have spent our resource. The amount of money to be set aside has been only vaguely defined. It is quite impossible to plan monitoring and clean up for several hundred years. Recent water quality data regarding sulfate water contamination confirm original studies that suggest we have native wild rice and potentially many other species are very sensitive to increased sulfates in the water. We are contemplating the possibility of adding pollution to the largest freshwater lake in the world. The detriments in my opinion would appear to far outweigh the short term benefits. We do not have an economy that is so destitute that we need to consider this project. The decision needs to be based on science and a clear thinking view to our state’s future, not to short sighted political or economic gain. Sincerely, Thomas A. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The dollars earned by providing jobs for a number of people pales when you consider the damage to the environment and the potential cost of cleaning up the water and land that will result for MANY YEARS. The studies that say we could subsidize a number of people for as many years as they would make a living on jobs provided would be much fewer dollars spent by our taxpayers than what will be needed if and when the mining companies disappear from the scene. MINNESOTANS WILL BE LEFT HOLDING THE BAG AND OUR PRISTINE LAND AND WATER WILL BE RUINED. PLEASE STOP THIS PROJECT NOW Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. We have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Thomas and Charlotte Meinz 210 9th Ave S Princeton, MN 55371-1723 (763) 389-1660

I believe the risks or potential risks are too great. Northern MN may be forever changed struggling with ground water polution for hundreds of years. But I fear big money & promises to care for our land will win out! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Thomas Cahoy 45444

Greetings, Please do not approve the PolyMet sulfide mine plan. There are waaaay to many unanswered questions. PolyMet says waste water will need treatment for 500 yrs minimum. How much longer after that. Where are the assurances from PolyMet that treatment will be financed for a minimum of 5 centuries. Where are the contingency plans or financial guarantees in case of accident or emergency. I attended the 1/28/14 RiverCentre public meeting. I have read up on the issue. I consider myself well informed. I have concluded that those that supporting the mine are willing to risk anything for jobs for 20 years. The risks that sulfide mining poses are often acknowledged and not refuted. No sulfide mine has ever been operated without polluting. PolyMet should be required to prove themselves elsewhere prior to operating in Minnesota. Our state's heritage should not be put at risk in perpetuity for a mere 20 years worth of jobs. Do not approve the PolyMet sulfide mine plan. Thank you, Thomas Cahoy 16501 30th Ave N Plymouth, MN 55447 (612)616-0507 tommycaho@Q-com

Thomas Donaghy 15304

Please reject the PolyMet mine. The economy of northern Minnesota is now built on tourism, which is based on the natural beauty of the area. PolyMet would undermine that beauty - and the economy that relies on it - for centuries. The Boundary Waters and surrounding areas are also a Minnesota treasure that, once destroyed, could not be restored in our lifetimes or even the lifetimes of our grandchildren. We need to think long term. We need to stop this mine before it starts. Tom Donaghy Saint Paul resident

I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. Our society has come to expect a standard of living and quality of life dependent upon the critical metals PolyMet will supply. I believe it can be done right in Minnesota. Thomas Donofrio 3985 Willow Place Hermantown, Minnesota 55811 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

thomas erzar 41086

My name is Tom Erzar and my address is 1163 Jesse L Blvd., Eagles Nest, Minnesota. My mailing address is 1163 Jesse L Blvd, Ely, MN 55731 I'm submitting a comment regarding the SDEIS for PolyMet Mining's proposed North Met project. I trust your agency will thoroughly evaluate the project and address any environmental concerns. I believe the environmental review process has been very thorough. I know that your agency and the federal agency will make sure that the project design will address any possible environmental impacts so it meets with all applicable state and federal regulations. All projects have risks. There are many kinds of risks but today we are focusing on environmental risks. I believe that PolyMet has addressed the environmental risks and with modern- day technology will mitigate those risks. State agencies will make sure that there is compliance with the most stringent regulations in the country. We have an asset of a world- class deposit of copper , nickel, platinum, palladium and gold . This should be mined; it is an opportunity that should not go untapped. PolyMet can mine these metals in an environmentally sound way with the use of modern technology. This mining project would create hundreds of jobs for the middle class and an economic stimulus for the local communities and the state of Minnesota. We need these jobs .We want these jobs. It is time to permit this project and enjoy many of the benefits it will provide. By the way I am a person who enjoys and uses the BWCA and Lake Superior and am not concerned that this project will have any adverse affect these natural resources that I love and enjoy. Sincerely' Tom Erzar

Thomas Geiger 44314

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Thomas Geiger Rr1 Box 1000 Kingshill, VI 00850

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Thomas Gille Cromwell, Minnesota

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Thomas Gretch 3030 Cavell Ave S Saint Louis Park, MN 55426-2916 (612) 735-5959

Ponder the SDEIS while reading the 2/3/14 Nation magazine article – page 22. After 100+ years the river in El Salvador runs red in toxicity. With several companies also waiting (Duluth NewsTab 1/17/14) we'd be overrun with such mining. Just as all the waters in northern MN are interconnected, Polymet's promo campaign and all the heavy hitters brought in to replace all form of CEOs and department heads are interconnected to push their mining through; sparing no cost, even to new/ads on AM radio touting that of 10,000 comments no question has seen unanswered. The greatest presumption is the kids hockey games shamelessly co-opted with their ads, and they're not even up and running yet. History repeats itself at the expense of the last of our clean water in a region held hostage by perpetual economic blackmail. Like all that oil being pipelined, trucked across the country and shipped off for profit to China while our gas prices only rise. Who is really getting the minerals and the profits.Thomas Jeffery Heinonen101 Artavia StDuluth, MN 55811

I attended the January 16th meeting in Duluth and was not chosen to speak. I have read the portions of the SDEIS of concern to me and believe I have good understanding of what I read. My concerns are these: Past experience with mining companies has indicated to me that any entity engaged in sulfide mining will escape any responsibility, whether legal or financial, by simply dissolving or filing bankruptcy, as has happened in our paSt In the case of a projected 200 year or 500 year liability, I am saying that all entities will escape ANY liability with the simple stroke of a pen. There is no provision whatever to assure and insure that any entity of any kind will actually be forced to exist and remain liable for all costs that will otherwise be externalized as has always happened in the past and to date. The proposal is to use reverse osmosis for the removal of certain mining-caused pollutants from the water effluent. This process is clumsy, expensive and extremely high maintenance, as is resin bed ion exchange. I am distressed that more effective chemical buffering methods have not been proposed. At least one such method has been used in former sulfide mining operations in Montana. ref. CESR process of Hydrometrics, Inc., 2727 Airport Road, Helena, MT 59601; wateronline-com/doc/a-new-process-for-sulfate-removal-from-indust-0001 Why isn't any limestone placed with all sulfur-bearing rock to neutralize subsequent acid formation. Will any limestone be placed in the tailings basin. There is no mention of the location of the Poly-Met hydromet facility, where phase two nickel concentrate will be sent, nor any description of the chemical nature of that treatment and its wastes. Autoclaving of concentrate and oxidation under pressure is mentioned, but no description of the chemical nature of the solutions used. Limestone is apparently added to this spent solution, but what of the consequent sulfates. Pit linings are notoriously short-lived and leaky, as demonstrated by other pit linings. There is no mention of mitigation of other heavy metals that will be released in the water effluent, in excess of current water quality standards. The parent rock body will be fractured by blasting, and there is no mention of how to prevent ground water from entering these fractures and producing acidic drainage into the aquifer. I am a simple railroad track worker, retired. If a layman like me can find weaknesses and complaint with one small portion of the SDEIS, just how flimsy is the actual fabric of the entire document. The foremost and greatest weakness and objection is the inability to hold any entity responsible for the proposed duration of this enterprise - by its own definition, up to 500 years.. Reserve Mining evaporated out from under its financial obligations in less than sixty years. I am strongly opposed to the proposed sulfide mining enterprise mainly because I know that no one but the taxpayers will end up paying for the damages that will absolutely happen as a direct consequence of sulfide mining as currently proposed. Respectfully, Thomas V. Koehler 814 5th Avenue Two Harbors MN 55616 218 834 4891 - home landline voice

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Thomas Koehler 814 5th Avenue, Two Harbors, MN Two Harbors, MN 55616

Thomas La Point 13907

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. The SDEIS proposes no mitigation for the direct impacts to the 900 acres of wetlands and indirect impacts to an additional ten square miles of wetlands. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Dr Thomas La Point 1900 Highland Park Cir Denton, TX 76205-6932

Thomas Lambrecht 20229

Hello, Please accept my support for this project and the economic impacts resulting from this investment in NE Minnesota. The reason below will highlight our general support for the acceptance of the SDEIS report and the next steps required to move the project forwaRd I trust the DNR and Federal Agencies to study copper-nickel mining and keep our communities safe. The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them. Copper-nickel mining will contribute to the local and state economy at a time when we really need the jobs and economic benefit. Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and education system. The SDEIS points out that cumulative impacts have been adequately reviewed. Thanks, Tom Lambrecht, LEED AP Manager Economic Development Services Great River Energy 12300 Elm Creek Boulevard Maple Grove, MN 55369 direct: 763-445-6105 / fax: 763-445-6905 / cell: 612-850-3660 www.GreatRiverEnergy-com * Please consider the environment before you print this e-mail. NOTICE TO RECIPIENT: The information contained in this message from Great River Energy and any attachments are confidential and intended only for the named recipient(s). If you have received this message in error, you are prohibited from copying, distributing or using the information. Please contact the sender immediately by return email and delete the original message.

Thomas Latham 23745

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt I have personally been to Boundary Waters, and spent seven days there in a canoe. I have never seen a more pristine area before in my life and I believe that nothing should be allowed to jepordize this. I am a 64 year old electrician at The City of Atlanta Aviation Department and have beautiful memories of my experience there. Recently I have had thoughts of revisting that area with another canoe trip. To think that that area may not be there as I remembered would be devastating to me and I know may others. Don't let this happen PLEASE Sincerely, Thomas Latham 6530 Rivertown Rd Fairburn, GA 30213-2729 (770) 617-5549

Thomas Lichtenstein 39611

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Thomas Lichtenstein 11520 Ravoux Ave Burnsville, MN 55337-3232 (952) 890-5069

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Tom Morgan - HYPERLINK "http://resources.css-edu/collegecomm/images/StandardLogo_fullcolor_Fill.png"signature Dr Thomas W. Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Thomas Rosch 1840 Wisconsin Ave N Golden Valley, MN 55427-3963 (763) 591-1610

Thomas S. Falkowski 14836

My Name is Thomas S. Falkowski, 12260 Ash Dr, Rogers, MN 55374 My Comment: I am concerned that the official report does not clearly identify the costs associated with the ongoing monitoring of both the mining site and the plant site, as well as what may be required as potential remedies if monitoring identifies probleMs The significant lengths of monitoring would require a financial reserve that would likely exceed both the revenues of the state from the mining company and any economic stimulus of employees that would pay state or local taxes. There should be adequate financial reserves that are both prepaid prior to initiation, and also accrued during the years of operation that account for all 500 years of MN tax payer exposure. I am also concerned that although the report identifies the communities and water sources that may be affected by the movement of water during and after operations, I did not see a clear statement as to the populations of the communities and the total number of people that could be affected for the duration of the exposure. By highlighting only the number of jobs to be gained for the relatively short productive years of the operation, the potential negative impact to many more people is not stated or estimated. Thank you.

Thomas Schellinger 41058

I support the PolyMet Mining project and believe that the environmental review process has been carried out thoroughly. Please enter my name in support of the PolyMet plan. This project will be of benefit to the State of Minnesota and provide jobs and a source of income to the area without undue damage to the environment. Thomas P. Thomas Sullivan 9581

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Thomas Sullivan 3467 Wilshire PL NE Minneapolis, MN 55418

I'm very concerned over the prospects of copper-sulfide mining in Minnesota. Please consider your responsibility to safeguard the environment and to assure quality of life for the seventh generation. Our water is too precious to gamble with. I have little confidence in the promises of mining companies.Thomas Wallace Morgan4801 Tioga StDuluth, MN 55804

Thuan Thai 54230

Dear Ms. FayIt has come to me and other students concern that the mining company drawing the map was not credible and was cut off of original map. The map was cut off so that the people look at the mine site and would think that the mine site would not affect other lakes, swamps or rivers. From that point of view, people would approve of the mining construction but the map was correct to the BWCA which is could affect to environment. And the mine releases phosphate to the swamp which will react with water and form sulfuric acid and if the sulfuric acid goes to the BWCA and eventually will pollute those BWCA. And as the student of Humboldt High School, I would really like to go to boundary water to visit and enjoy the nature. But if the mining begin the sulfuric acid would go to BWCA which could destroy the ecosystem. This is unacceptable to destroy the nature which and where we are living in.Sincerely,Thuan ThaiHumboldt High School Student449 Sherburne AveSaint Paul, MN 55103

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, tiffany breiner minneapolis, Minnesota

Tim Gihring 15345

Dear DNR, As a Minnesota journalist for nearly 20 years, I have traveled all over the state, reporting on the people and places that make this region special. And perhaps no place is more special than the Boundary Waters ecosystem that would be affected by the proposed Polymet mining. Those who support the mining in the Ely area remember the iron mines of a generation ago, long for those boom times, and in many cases feel compromised already by environmental protections that they feel have yoked them to a tourist economy. But as the environmental review makes clear, the proposed Polymet mine is not like the old Pioneer or Zenith mines. The costs are greater, the stakes much higher. The wilderness, if it's protected, is forever. The mine is for a few decades and the damage potentially forever. This is not just the wrong place, it's the wrong mine. It's not right to risk the benefits of future generations to appease the narrow, nostalgic demands of this one. Thank you for listening. Tim Gihring 241 Russell Ave S. Minneapolis, MN 55405

Tim Glenn 38785

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Tim Grebner 10196

I think it unwise to jeopardize water supplies for 500 years for short term jobs. Mining built the iron range communities and Minnesota has benefited from mineral extraction. But this type of mining is simply too risky. How can we sacrifice the water quality for 500 years. Who will pay for the ongoing water treatment. The length of water treatment is longer than our nation has existed. The proposed mine is simply wrong for our state and future generations.

Go Polymet. Minnesota with out mining would be much different, it's what has allowed generations to live in this great state. Now we are faced with a new type of Minnesota mining with more oversight than ever before. Mining, it's in our blood, culture, it's who we are. Go Polymet. Tim Harrison 612-363-6496

Tim Haussner 39143

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Tim Haussner 205 Fireweed Ln Grand Marais, MN 55604-2153 (218) 370-2154

Tim Iverson 44267

Dear Sir or Madam - I am very skeptical that Polymet's projected environmental impact will be minimal. You can count me in as a citizen against the mine going forwaRd I am originally from the Iron Range, and actually worked for a period of time at the old Erie Mining Company located where Polymet wants to mine now. LTV took over the Erie mine. After LTV closed, 6-5 million has already been spent to deal with the sulfide runoff from the Dunka mine pit. The original estimate was far less, as I'm betting the same for the cost of environmental cleanup with Polymet. No one can be sure of the consequences when copper and other like metals are mined. The backbone of the Iron Range, the mining of iron ore, is far less passive than the natural oxidation of metal sulfide materials resulting in sulfuric acid. The Dunka mine proves that mining even iron ore can result in the release of sulfuric acid, due to trace metals in the exposed waste rock. So, we get 300 new jobs, in exchange for decades of inevitable cleanup of the water, soil, and probably air. That hardly seems like a good tradeoff. I've been told by my brother-in-law, who lives in Virginia, to butt out because I live in Duluth and the mining is done on the Range. Well, my answer to that is the exposed rivers, Partridge and Embarrass eventually flow into the St Louis River, which flows into Lake Superior, which Duluth is located on. Lake Superior is now just getting her health back after years of dumping by other mines and Honeywell barrels. And now we are asked to trust Polymet. Tim Iverson Duluth MN

Tim Johnson 42999

Dear Ms Fay, Last night a group of us met at our church as part of our faith in action work during Lent. We took time during worship to write letters about issues of particular concern. I have chosen to write to you about the PolyMet mining issue. That letter is attached. Sincerely, Dr Timothy M. Johnson Cherokee Park United Church 371 W. Baker St St Paul, MN 55107 cpuc@usfamily-net 651-227-4275 www.cherokeeparkunited-org

Tim Karst 38647

To Lisa Fay, I am writing this email in support of PolyMet Mining's proposed NorthMet project. The jobs that will be created and the taxes that will be collected are needed to keep Minnesota an economic leader. I am not from northern Minnesota but these jobs are needed for the livelihood of the families that live there. The Minnesota DNR has the most stringent mine permitting process in the country and I have confidence that this mining can be done safely with no damage to the enviroment. Hopefully this will be decided by good science and not be political. Thank you for the opportunity to comment. Tim Karst 3180 Abert Ave NE Buffalo, MN 55313

I have reviewed the scientific documentation regarding the PolyMet copper nickel mining proposal and I do not believe that approval of this project is in the best interests of Minnesota. As a supporter of iron and taconite mining, I understand the challenge of balancing of environmental concerns and local economic interests. The PolyMet mining proposal, however, has far more long range negative environmental impacts than iron mining ever has. Water quality will be impacted for centuries and we have no experience in knowing how to deal with this for such an extended time. The track record for similar mining operations in our country is filed with failures. These failures include serious water pollution, corporate bankruptcies, insufficient dollars for environmental remediation and mismanagement. It is folly to even suggest that the DNR or any other agency can develop a plan that will "guarantee" water treatment for centuries to come at no cost to the taxpayer. The relative few number of jobs this project would create and the fairly short life span of the mine do not justify the long term financial and environmental liabilities that this proposal would create for Minnesota's citizens. It is for these reasons that I firmly oppose this PolyMet project. Please reject this and all cooper nickel mines in this part of Minnesota for the good of all Minnesotans. Thank your for considering my views. Tim Lundahl Lakeville, MN Sent from my iPad

tim mikkelson 12156

TIM R. MIKKELSON, 813 Olaf Ave NW. Willmar, Mn. 56201 I will keep this short. I am greatly opposed to sulfide mining in northeastern Minnesota. This area is one of Minnesota's finest and is visited by people from the world over. To think that the mining would produce millions of pounds of material that would have to be monitored and treated for many, many lifetimes (and would most likely end up being the taxpayers responsibility, as with most mines) is TOTALLY UNACCEPTABLE.

Tim Minotas 23726

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt I simply can not let you pollute such a pristine lake and any water way. Everything on this planet is interconnected. Humans are not above everything else. We need the environment and its healthiness in order to survive in the long run. Enough is enough with dirty mining and energy practices that not only contributes to climate change, but damages many people's and species way of life and health. The Great Lakes and its surrounding systems are one of our most vital resources, we can't afford to degrade. Sincerely, Tim Minotas 3622 Oakmonte Blvd Rochester, MI 48306-4791

I work within the Environmental Remediation field; providing services, equipment, and technologies for removal of organics and inorganic contaminants from contaminated groundwater and surface waters for potable, non potable, NPDES discharge, and water reuse. In my experience, I have not seen ANY hard rock mining operations that have successfully provided treatment during and after their mining operations. The 30+ Superfund hard rock mining sites that the EPA has is testament to this. Though I make my living treating this contamination, it makes more sense to me to eliminate the contamination in the first place; ie remove or completely eliminate the source. The various hard rock gold and precious metal mines, dating back to the middle 1800's have proven that our human nature is to make a profit irrespective of the environmental impacts. And their legacy is being borne on the backs of taxpayers, based upon ARRA funding, local bond issues, increased local water costs, etc The ASARCO and Anaconda mines continue to be problems without (easy) solutions that, because of their chemistry, will continue to generate soluble heavy metals into already contaminated discharge. Only recently, the Pebble Mine, a precious metal mine proposed in Alaska, but located near a strategic salmon fishery, is being reviewed and/or delayed/restricted because of its potential environmental impacts. Why, I ask therefore, are the impacts to the Superior National Forest and/or the Boundary Waters Canoe area, if PolyMet is allowed to do their open pit mining, not of the same strategic value. Clearly, these were designated as strategic wilderness areas and in this evaluation, went through years of public and private scrutiny for this designation. The coals mines within British Columbia, operated by Teck Coal have contributed significant heavy metals contamination to the various watersheds that drain into Lake Koocanusa in NW Montana. Though this is not hard rock mining, the resultant heavy metals released into the environment are having a significant effect. This is also true for the phosphate mining occurring on the Snake River in ID. My point is that the mining industry is only recently working to start compliance with their discharges. Heretofore, it has been too easy for them to litigate for delays or claim insolvency to avoid their environmental responsibilities. I believe that PolyMet has included all of the "patently right" answers to questions in their SEIS review. These are more politically correct than environmentally correct. I don't believe that taking the waste sulfide-bearing rock and encapsulating it with water within a pit is the best or even a good alternative for disposal. There is no GOOD disposal alternative to eliminate the possibility of anoxic growth of sulfur-reducing bacteria, outside of maintaining an aerobic environment and/or presence of some sort of bacteriostat. I work with Reverse Osmosis systems all of the time and I can testify that they 1). Require a significant amount of maintenance, 2-) Have a long track record of plugging from precipitation of inorganics and silicates on the membrane surface, and 3-) Are prone to bacterial fouling, particularly in bacterially active waters, such as will be developed at this site. Without some sort of additives (pH control, sequestrants, cleaning systems, etc) which could impact the environment (I didn't see any discussion of this within the SEIS), they will fail. Without some form of redundancy, they are not reliable. The SEIS indicates that there will be no impact to water flow within the Boundary Waters - that all water flow will be to the St Louis river watershed and ultimately to Lake Superior. Given the volume of water to be used within this facility and the wastewater discharge points, there will be considerable reversal of flows within the various rivers, changing the hydrology of the area. There is proof of this in many of the hard rock mines that are presently operating and/or disch

Dear Minnesota DNR, My Wife Susan and I are unable to attend the St Paul River Center meeting concerning Polymet's Open Pit proposal for mining in Northeast Minnesota but we want to go on record in opposition to Polymet's proposal. As land owners in Lutsen Township in Cook Co.,we know first hand how precious and fragile the water resources are in the Lake Superior watershed, the surrounding Superior National Forest and the BWCA. We oppose Polymet's proposal for the following reasons: 1) Polymet's SDEIS water model is seriously flawed. The most recent MN DNR report shows the actual rate of groundwater base flow is 200-300% higher than the rate used in Polymets SDEIS. Accurate groundwater rates are crucial to predict pollution and seepage of waste into the Partridge River. The SDEIS must be re-modeled to make it accurate. 2) The long term treatment of waste water at the mine sites and processing plant of possibly hundreds of years and the cost of which that would be put on the backs of future MN generations is outrageous. The jobs that Polymet is proposing are far outweighed by the environmental cost of the cleanup that will have to take place over a very long time. 3) Lake Superior is an international gem bordered by exceptional lands in Northeast Minnesota. The Lake is under siege in so many ways. Water compacts between the Great Lake States and Canadian Provinces in the Great Lake watersheds are trying to protect these natural wonders. The BWCA is Minnesota's most pristine wilderness area. Why would we want to risk this truly special area to the degradation that this type of mining would certainly impose. Please extend the comment period and take a closer look at the true impact that Polymet and those mining companies that will follow on our state's precious water resources and our most pristine wilderness areas. Sincerely, Timm and Susan Frankowski 4928 Chowen Ave S. Minneapolis, MN 55410 e-mail: HYPERLINK "mailto:frankowtimm@gmail-com"frankowtimm@gmail-com 24 Alpine Overlook Lutsen, MN 55612

Timothy Bassett 16504

Feb 19, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Timothy Larson 43967

Dear Ms Fay, Dear Federal and State Agency Leaders: I lived through the Reserve Mining controversy of the 1970s and hope we will never see such abuse of our waters by the mining industry in our state again. The PolyMet proposal and others could create less direct but equally significant probleMs One issue that concerns me is mercury. The SDEIS briefly claims that that mercury will not leach into the Partridge River at the site of mines and waste rock sites, but the assurances are contradicted by admissions that metals could be affected by groundwater flow-which has not been adequately assessed. What really concerns me is the source of power for this very energy-intensive kind of mining. The state of Minnesota has clean energy standards that we should be striving to meet, including reducing emissions from coal-fired power plants in a part of the state that is already troubled with mercury in our waters. This issue needs discussion. Mining in Minnesota should make our state a better place. The mineral resources of our state could help us to achieve our clean energy goals. Owners of mineral rights do not have the right to pollute our land, air, and waters-directly or indirectly. The issue of mercury is not adequately described in the SDEIS. The PolyMet SDEIS is still inadequate. Thank you for considering this comment. . Respectfully, Tim Larson Duluth, Minnesota Timothy Larson 3113 Wellington Street Duluth, MN 55806 (218) 724-6963

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, These are my comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining, never done before in Minnesota, threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Everywhere else sulfide ore has been mined, it's polluted the waters with acids and heavy metals. I have serious concerns about this project's potential impacts on the region's natural resources and public health, including risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Tina Rhea 3 Ridge Rd Unit E Greenbelt, MD 20770-2958

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Todd Bergerson 3191 1/2 Domich Rd Ely, MN 55731-8405

Todd Burras 38834

To whom it may concern: As property owners on White Iron Lake near Ely we believe the PolyMet SDEIS is inadequate and we oppose any mining project, including the one being proposed, that threatens the water quality of the Kawishiwi watershed and the Boundary Waters Canoe Area Wilderness. I think the PolyMet operation, and all similar proposed operations do not adequately address the long term and short term impacts of the pollution that will be produced. I think these operations should not be allowed to proceed. We cannot build an economy on processes that destroy the environment. Thank you.Todd Ernest Barkus4570 Merganser DrMinnetrista, MN 55375

Todd Johnson 40283

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Todd Johnson 322 River Woods Ln. Burnsville, MN 55337 US

Todd Lyden 7399

To Whom it May Concern, I am confident that the Supplemental Draft Environmental Impact Statement (SDEIS) gives regulators the information they need to issue PolyMet Mining permits to operate while protecting natural resources. The PolyMet project has been designed to minimize environmental impacts. It reuses an existing site (the old LTV mining site) and existing infrastructure, minimizes the disturbance of wetlands, and utilizes multiple safeguards to protect the environment. PolyMet will also have dramatic, positive socioeconomic impacts to a region that has been built on mining. This project is located in an area that supports mining and the jobs it will bring. An added benefit is the land exchange with the US Forest Service will open up new public recreational opportunities for all Minnesotans. Todd Flankey 19996 Rendova ST NE East Bethel, MN 55011 Bullet points that I feel are important and in support of Polymet are as follows: *I support PolyMet Mining and believe they will build and operate a mine that complies with all regulations and protects the environment. *PolyMet will contribute to the local and state economy at a time when we really need the jobs and economic benefit. *I'm proud that my investment dollars are being spent here in Minnesota by Minnesotans. Our economy needs these jobs. *PolyMet will be a domestic supply of critical metals needed in medical applications, electricity, catalytic converters, cell phones, computers and other essential products. *Enough is enough; let's get on with permitting this mine. We want jobs. Regards, Todd Flankey

Todd McGillivray 10721

Ms Lisa Fay I am writing in support of the PolyMet project and the SDEIS. My family and I live on Sabin Lake (the 1st of the chain of lakes on the Embarrass River). We have been following the project for 9 years. We built our dream home there 3 years ago. We support the project. The SDEIS is an amazing document. Comprehensive, informative, complete. It's time to move on to the Permitting process. One comment about the Public meeting system. I don't believe people should be allowed to speak when their presentation is full of lies and inaccuracies. Public comment at the meetings would be much more informative and useful if one or all of the lead agencies would have time to respond to the speakers presentation with factual information. The system that was used was very unfair to the PolyMet project. Todd McGillivray 6525 Voyageur Trail P.O. Box 531 Biwabik, MN 55708

Todd Saatoff 47150

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. P.s I was laid off last march after working in the printing industry for over thirty years. I am attending Hibbing community college and taking the industrial system technology program in hopes that I can find a local job in mining, we need these jobs. I can't count on getting unemployment like I was promised while I'm in a retraining program that I now can't afford thanks to my government. Having never drawn on unemployment, after working for over thirty years, where is my aid when I need it. I don't want a hand out, I want a job. Todd Saatoff 510 east 25th street Hibbing MN 55746 Sent from my iPod cause I can't afford an I

Tolvo Sober 54157

Poly Met's proposed copper-nickel mine has the potential to pollute our environment for hundreds of years, far beyond the life of the company. The mine should not be allowed. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Tom 20080

I am writing this email comment in support of the Polymet Mining project. I am a geologist who has worked in the environmental consulting industry for the past 20 years, and have lived on the iron range most of my life. Although my employer has no contracts with Polymet and I have not worked on any projects for Polymet, I support the project based on a review of the SDEIS documents. Minnesota has some of the most protective environmental regulations in the nation, and the SDEIS outlines how Polymet's mine and plant operations will meet these standards. I believe the plans for the lined stockpile areas, in-pit subaqueous waste disposal, and treatment of tailings pond effluent provide key methods for reduction of potential impacts of waste rock and wastes generated by the project. In addition, the land swap provides for mitigation of biologic and wetlands impacts. Financial assurance laws in Minnesota outline standards that will ensure Polymet will honor its responsibility for long-term treatment and reclamation of the site. As a geologist I see the value of mining these strategic metals, especially Ni, Co and PGE elements, of which the US does not have a ready domestic supply. The Polymet project will provide valuable jobs on the iron range, where metal mining has been conducted in a safe, sustainable manner for over a century. I believe that the Polymet Mine will be an asset to the state and the country, and can be operated with an eye toward environmental stewardship. Respectfully, Tom Muhich, PG, CHMM 7957 Horseshoe Lake Dr Eveleth, MN 55734

Tom and Dana Vogen 43570

Comments submitted by; Thomas Vogen 21621 Oldfield Ave N., Scandia MN 55073 I believe it is unconscionable to create pollution that would need to be treated for centuries if it can even be done effectively. If we make decisions based primarily upon jobs and money, the destruction of the earth will continue unabated. My opinion is that a healthful and beautiful planet will take care of us physically and psychically and I sincerely hope this mine permit is not approved.

Tom and Julayne Johnson 45248

The answer to mining for copper and nickel and other minerals by PolyMet is very simple: If they cannot 100% guarantee that there will be no environmental damage and especially to our water supplies and Lake Superior, then mining should not be and never be allowed. Even though employees will be living in the affected areas, I'm sure the upper management will not be and therefore not be affected by any damage. My drinking water comes before any job. Tom and Julayne Johnson

Tom and Mary Schutz 44295

Dear Ms Lisa Fay, I feel very strong that there should be NO MINING I support the MEPA and the Minnesota Environmental Rights Act (MERA) prohibit state agencies from permitting projects that will cause pollution, impairment, or destruction of the environment. Just because they can does not mean they should. Our country does not need this mineral. This is just another get rich quick idea that will leave pollution expense that they, the company, will not be around to clean up and pay for the pollution expense later. We the people, our country and the planet earth does not need this kind of waste and havoc to our land, water and environment. Thank you for hearing my concerns. Sincerely, Mary Schutz 03-13-2014

Tom Anderson 7145

Three hundred some jobs for twenty years . For the trade off of polluted sulphite contaminated water that will possibly need to be treated for up to four to five hundred years The proposal would be laughable if it weren't being actually seriously considered. At what point do you just say no It is Minnesota Water Not some murky crappy silty Colorado River water. It is the North woods The Land of 10,000 Lakes NOT the land of 10,000 sulfite mining polluted lakes. Despite the "best" safeguards industrial accidents happen all the time. Spills happen. No matter how careful companies say they can and will be, there continue to be spills and accidents. Is one of the states most precious resources worth tainting and polluting. Since every living thing cannot survive without water, just how much pollution is acceptable for the entire ecosystem If you are truly the Department of Natural Resources, then you would do well to protect the RESOURCE that no living thing can live without . Water "The best way to keep the camel out of the tent is to not let him put his nose in to begin with." I say no to this kind of mining in the State of Minnesota. Most sincerely, Tom Anderson 10745 Penn Ave South Bloomington, Minnesota

To Whom it May Concern, As complex an issue this is, and without sounding absurd, I feel it is my responsibility to voice an opinion that might reflect the voices of the mute. . . the flora and fauna of northern Minnesota. We are the only species on the planet that can declare the health of the planet. That is a might responsibility. Consequently, I am opposed to any mining that compromised the natural systems found there. I realize I am part of the problem because like all Americans, I am a consumer. But I am willing to step back, consume less, cheer for innovation and work towards a future that honors all life. Thanks for the opportunity to share. my best, Tom Anderson 8010 275th Ave NE North Branch, MN 55056 - Tom's Blog: http://www.aligningwithnature-com/ Buy this book from: AMAZON HYPERLINK "http://www.amazon-com/s/ref=nb_sb_noss.url=search-alias%3Dstripbooksandfield-keywords=Things+that+Bite.+.+.+Great+lakes+editionandrh=n%3A283155%2Ck%3AThings+that+Bite.+.+.+Great+lakes+edition"Things that Bite: The Truth about Critters that Scare People Four regional editions available: Great Lakes, Gulf Coast, Southwest and Rocky Mountain)

Tom Anderson and Kathryn Hagen 36387

Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for your consideration. The Boundary Waters and adjacent areas are a precious natural resource benefiting the entire state and should be protected. Kathryn Hagen 4603 Drexel Ave Edina, MN 55424

Tom Bittinger 21635

Dear Ms Fay, Dear Ms Fay, I am writing to urge the rejection of the sulfide mining projects in northern Minnesota. It is extremely disappointing to me that something as potentially harmful to the natural legacy, health, and economic well being of current and future generations should even be considered by those with the responsibility of looking out for the interests of all citizens. The negative environmental impacts that result from these mines are more than common, they are almost inevitable. Allowing this activity in an area of such natural beauty and environmental uniqueness would be wrong even if only considering the protection of this important natural resource. To take these risks where so much of the area’s economic livelihood depends on those unspoiled natural qualities seems unconscionable. The benefits of projects like these are temporary and most of them (corporate profits) go elsewhere. I would also like to express my belief that short public comment period on the Supplemental Draft Environmental Impact Statement (SDEIS), as well as the timing of the limited public meetings, certainly gave the appearance that there wasn’t any real interest in what the public thinks about this issue and that a decision has already been made. Having such a short and limited opportunity for public comment on this long, confusing, contradictory and misleading statement was unfair. I am very concerned that this important issue will turn out to be another example of how those making policy decisions that effect everyone often operate in ways that benefit powerful corporate interests over ordinary citizens. Sincerely, Tom Bittinger 133 Sawmill Drive P O Box 186 Lutsen, MN 55612

Tom Carious 18162

Hi. My name is Jim Leuthner, L-E-U-T-H-N-E-R. And I'm from Carpenters Local 322. And I'm going to yield my time to Tom Carious. TOM CARIOUS: Good evening. My name is Tom Carious. I live here in St. Paul, Minnesota. I want to thank each of the agencies involved for participating in this process, for producing this rigorous and thorough SDEIS, and for taking citizen input in consideration. One of the things that makes this a great place to live is the lively civic engagement, governmental transparency, and democratic participation that we enjoy. We also enjoy high standards of living, clean water, strong unions, a beautiful environment, and well-functioning, corruption-free governmental agencies. These are all things that I value highly. Other people have spoken tonight about the reason that we need copper, nickle, and other precious metals. So I won't go into detail, but I do want to point out that those of us that are concerned with reducing our carbon footprint specifically rely on copper for our wind turbines, for the solar panels in the parking ramp across the street, for the electric car charging stations in the parking ramp, and the power of the light-rail trains that will open this summer in St. Paul. In fact, we in the US are among the world's leading consumers of copper. We consume significantly more than we produce or can recycle. I haven't heard anyone tonight or throughout this debate deny this fact. There's no movement to stop the use of copper or any of these metals. So if it's a given that we're going to continue to use copper and other strategic metals, the only question is: Where should we get it? Right now some of the biggest copper mining countries in the world are Chile, Peru, China, Indonesia, Russia, Zambia, Poland, Kazakhstan, and Iran. I believe that we here in Minnesota and the United States are very privileged to demand that companies looking to open a new mine go through this very thorough process and be subjected to the level of scrutiny that all of us are applying to them right now. I'm concerned that some opponents of this proposal want to enjoy the benefits of copper without considering where it from, what the conditions for workers are in those places, what environmental regulations are in place there, or what the process is for citizen input those countries have. Do we think that public agencies in Russia, China, and Iran hold public comment periods and respond in a meaningful way to citizen input? Is it just or equitable to say that we can't produce the metals safely here in Minnesota while continuing to drive the demand for them. I believe that we here in Minnesota and the United States are in the best position to mine these metals. Better than any of the existing mines in any of the other countries that produce them. We have the strictest environmental regulations to protect our water; the strongest unions to ensure worker safety and good wages; we have public agencies full of technical experts controlled by democratic processes that value citizen input. I trust the DNR and the partner agencies to ensure that PolyMet mines responsibly in this state. I'm sure we can do it better than anywhere else.

Tom Casey 42960

Dear Ms Fay, Attached please find my client’s comments. Please acknowledge receipt of this e-mail. Thank you. Thomas E. Casey Attorney at Law 2854 Cambridge Lane Mound, MN 55364 telephone: (952) 472-1099 e-mail: tcasey@frontiernet-net

Tom Clarke 57954

We cannot allow massive copper nickel sulfide ore mining in NE MN. The threat to air and water especially the St. Louis River watershed & Lake Superior is too great. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. 1 have grave concems about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Tom Diener 44187

Hello, I would like to provide a few comments regarding the proposed Polymet Mine operation in Northern Minnesota. I have attempted to learn as much as is reasonably possible in order to understand the issues involved and the nature of the concerns, objections, and benefits. As an earth science teacher and a seasonal Minnesota DNR parks worker, I attempt to understand, and when required present the issues in an even-handed and balanced manner. I appreciate the care, rigor and science that has gone into the proposal. Broadly speaking, there is much at risk with this project. Taking a historically dirty industry and operating it close to a nearly pristine wilderness area seems absuRd If I could be assured that there is adequate protection in place I could support the plan but as I understand it, the level of funding for protection of the environment will be not be determined until after the plan is approved. It feels like a backward approach. Funding for unforeseen problems needs to be addressed now. Although it could apply to other situations, enforcement of regulations safeguarding the environment including water quality is an important consideration. Who will be the enforcement agency, several hundred years from now, to deal with harmful tailings runoff if they occur. Thanks, Tom Diener 5818 Morning Star Drive Duluth, Minnesota 55804

TOM DIMOND 43109

Tom Dimond 2119 Skyway Drive Saint Paul, MN 55119 March 13, 2014 RE: Comments on PolyMet - NorthMet SDEIS My family came to America in the early 1600's. Their survival was dependent on finding a way to make a living. Thankfully, our founding fathers and mothers did not choose to pollute the land such that we would still be working to clean up their mess nearly 400 years later. Part of my heritage is Mohawk. A strong Native American tradition is we are caretakers of mother earth and we should respect and protect our natural resources for the benefit and enjoyment of future generations. My comments are based on the understanding that the quality of our lives are in great part the result of actions of our ancestors and our actions will impact future generations. What we decide to do today will affect generations that are not born yet and have no voice in these decisions. They will however live with the pollution and natural resource degradation they had no say in. We must be their voice. Some have suggested we should create 500 years of pollution for short term jobs and the latest electronic gadget. We all have to ask ourselves if a gadget that is outdated in year or a job that disappears in 20 is worth polluting our State for 500- The negative impacts to our State greatly outlast the short term benefits. The SDEIS does not include the full economic picture. Tourism is a major employer in Minnesota. Attracting and retaining businesses is Minnesota is highly dependent on the quality of life and the natural environment. Degradation of the environment and potential financial liabilities from 500 years of cleanup could cause job losses that greatly exceed any temporary gains. The Cumulative Effect or Cumulative Impact has not been adequately considered. The proposal indirectly impacts 6,498-7,350 acres of wetlands, and directly impacts 912 acres of wetlands. The proposal impacts 1,741 acres of MN high biodiversity significance and 698 acres of imperiled or vulnerable native plant communities. The Federally listed Lynx will be affected by fragmentation. A large black spruce, tamarack, and cedar wetland, a lake, creek and river are impacted. The impacts can be 200 to 500 years or permanent but the jobs only last 20 years. In order to maintain the jobs it requires approving another project every 20 years. This would have a cumulative effect of 10 times the impacts of this project before any of the polluted site is cleaned up. This ever expanding area of pollution can have significant impacts on the attraction and retention of business in the State. These impacts are not adequately considered in the SDEIS. Cumulative effect also applies to the protected publicly owned land in the Superior National ForeSt Much of the proposed mine site is federally protected land in the Superior National ForeSt The Weeks Act protects this land. PolyMet proposes swapping privately owned lands in the Superior National Forest for the 6,650 acres of federally protected public land. This proposal is contrary to protection of the wetlands and natural resources within the boundaries designated. The land they want to trade is not currently threatened. If the US Forest Service does not agree to the swap the amount and quality of wetlands will not diminish within the boundaries of the Superior National ForeSt If the US Forest Service does agree to the swap there will be thousands of acres of wetlands lost or degraded within the boundaries of the National ForeSt This proposal does not call for the restoration of wetlands that have been loSt The US Forest Service should not support a proposal that causes a net loss and degradation of existing wetlands. The Forest Service should consider the cumulative effect. State law calls for mine closure to be stable and minimize hydrologic impacts, release of substances, and maintenance free. The modeling for water flow and assumption that 99% of the flowage and seepage will be treated

The Iron Range is my favorite place in the whole world. We have a cabin on Lake Vermilion that has been in my wife's family since 1936- We took that property over in 1991- There are 3 different watersheds in the Duluth complex. Polymet has mitigated the problems in the watershed where they operate. This area is an economic wasteland without this project. This project will transform the area into a vibrant and sustainable economy with jobs and services for over 100 years, possibly 200 years. This area is mining rich with other projects on the horizon. They all depend on the same infrastructure and many of the same resources. As a result of the mining trust that benefits the public schools the MN department of education will become richly funded for a century or two. This deposit is possibly the largest in the world. Developing countries are starving for these raw precious metals. The timing could hardly be better to pursue this. India's electric grid failed 18 months ago leaving half the country dark for a week. They need trillions of copper. China consumes 38% of the world's supply of copper. India is going to consume MORE copper than China to meet their development goals. That will drive the price north. Petroleum and copper are sympathetic to each other in price, meaning one goes up the other goes the same direction. Exporting copper is a perfect hedge against importing oil although indications point to a massive surplus in the near future for the US. A commodity surplus is never a bad thing as long as there is a shortage elsewhere in the world. I believe Washington has recognized this as evidenced by their veiled support in the arrowhead area. Polymet is seeking a 20 year permit to mine. My understanding is they will be upside down at the end of the first 20 year because of the funding for product deal worked out with their primary funding partner. For that reason I am confident Polymet WILL ensure they are a model permittee in that first 20 years so they will receive a second 20 year permit. Don't waste our fantastic resource mining provides the great state of MN. The time to act is NOW. GRANT the permitting process and if Polymet meets those conditions grant them the 20 year permit to mine. HYPERLINK "http://www.mytelepath-com/"MyTelepath LogoTom Drill, MyTelepath, Inc. Tom Ehlinger 21326

I am writing to register my opposition to the proposed PolyMet mine in northern Minnesota. I know the arguments for the mine and I do not minimize the need of people in that area to have good paying jobs. But the idea of putting our fresh water at risk for hundreds, if not thousands of years, for at most several decades of jobs, is utterly astounding. It rises to the level of madness. We're talking not just jobs but the very essential elements of life. Water - fresh water - is what makes life itself possible on this planet. We have a finite amount of water - earth is a closed system and more water will not be created. Recycled from form to form and place to place - yes. But once it is contaminated, it will take generations upon generations to gradually clear up. Hubris has been the downfall of every great civilization. We know that every great culture throughout history has overreached its grasp - all the time thinking that they were capable of controlling the world they lived in. Over the past millenium, humankind has come to think that it can always find a technical solution to every problem. But we can't - especially it we think that we can forecast what will be possible over the next 500 years. The United States has not even been in existence that long. Please, for the sake of my children, grandchildren, great grandchildren, and great-great grandchildren, prevent this mine from being created. Tom Ehlinger 9937 Alabama Road Bloomington, MN 55438 952-897-1749 HYPERLINK "mailto:tomehlinger@gmail-com"tomehlinger@gmail-com

Tom Elisekson 57971

Sulfide mining is notoriously environmentally hazardous. The last place to approve a mine like this is near environmentally sensitive areas. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. 1 have grave concems about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Tom Fiero 38703

Dear Sirs, In regard to the PolyMet NorthMet SDEIS: Polymet states that the actions it has agreed to take to mitigate water contamination are unprecedented in scope. However, this is not good enough-if mitigation efforts end before the threat to water quality ends. Polymet's modeling for contamination and mitigation stop at year 200 for the mine site, and year 500 for the plant site-ignoring the fact that contamination will continue after these end dates. Will the state of MN and its taxpayers then assume the burden of continuing the necessary mitigation actions. Furthermore, the SDEIS modeling of groundwater movement at the mine site uses a Partridge River estimated baseflow of 0-51 cfs, which is not realistic. Actual measurements east of the mine site establish a baseflow that is several times higher. As a result, SDEIS predictions for the amount of sulfates and other pollutants entering the river are probably low. Significant quantitative errors in the SDEIS need to be corrected, and the corrected document should then be subjected to further review. In addition, Polymet must guarantee adequate permanent funding for pollution mitigation actions, rather than assuming that the problem of water contamination by copper, lead, mercury and sulfates will disappear after some arbitrary end date. 200 or 500 years seems like a long time to you and me, but this is only the span of a few human lives. We need to consider how our actions today will affect future generations. Thank you, Tom Fiero 271 Devil Track Road Grand Marais, MN 55604

Tom Finholt 40417

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tom Finholt 212 Timber Wind Dr Wildwood, MO 63011 US

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: This may be a form letter but it expresses my concerns perfectly. I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public intereSt The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lyn

Tom Howell 19875

Feb 28, 2014 Ms Lisa Fay MN Dear Ms Fay, I have traveled by canoe and camped in the Boundary Waters area. It is a special place with rich biological resources and beautiful scenery. The waters were so clean that we could safely drink from any lake or stream. Places like that should be protected and preserved. Too much of our country is being polluted by chemicals produced by industrial processes. Many companies promise not to pollute, or to clean up the pollution they produce, or to "restore" the land to its previous condition. The record for fulfillment of these promises is replete with unsatisfactory results. Some of the companies go out of business before fulfilling their promises, others never live up to the promises - perhaps they never intended to, or didn't realize what the full costs of those promises would be. Too often taxpayers and local residents and local businesses are left to deal with the pollution problems and the costs of cleaning up - if, in fact, it is possible to clean up the damage in any meaningful way. With far too many pollution problems the damage can last for decades. In some cases, where livelihoods, living conditions, business opportunities, water resources, and biological resources are damaged, possibly for one or several generations, there is little that is done, or can be done, to repair the lives of those who have been adversely affected. We do not place enough value on our natural biological resources and on the clean water resources that nature provides. Those resources appear to be free of charge to us. We seldom think about the millions of years it took to produce those water resources or to produce the intricate and complex interdependent webs of plant and animal life that make up our forests and other natural habitats that provide us with many things that make our lives possible - and make our lives worth living. Once they are damaged, or destroyed, the value of those biological and water resources become more apparent. It is much easier, and more cost effective, to preserve biological and water resources before damage is done than to try to repair those resources after they are damaged. Once waterways are polluted with sulfates and heavy metals it will be a very long time before the adverse effects on fish and other aquatic life forms diminish. If fish advisories already exist for waters of the area, there should be vigorous efforts to reduce pollution rather than support for projects that will make things worse. I am very concerned with protecting our clean water. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. Wild-rice farming will be endangered. That will affect those who depend on those crops, as well as their customers. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of year

Tom Jahnke 47214

From: Tom Jahnke 3403 56th St NE Buffalo, Mn 55313 I am writing to express my opposition to proposed mining operations in NE Minnesota. I have worked as a professional forester for over 40 years within the state and have never witnessed a successful recovery of natural resources following any kind of mining operation. Statements to protect water have been misleading in all instances. The scar upon the landscape never heals. In my home county of Wright, there are at least 40 old gravel mines that have never been "healed" after the minerals were removed. It is disgusting and a waste of our treasured lands. If the rare minerals of northern Minnesota are truly so valuable, there best be a method by which those who operate the mines can safely protect the environment and afford to pay all expenses to recover the lost resources "up front". If that is not possible, this mining proposal should be stopped in its tracks. Travel to Ladysmith, Wisconsin and Sudbury, Ontario to witness firsthand the devastation created by these types of mining operations. I always lament the use of "BORROW PITS", as mining operations refer to their sites. They never return what has been borrowed. If they must borrow something from us, let them borrow our cats. That way, we might have a chance of a few of them getting back. Thanks for allowing me to express myself. Sincerely, Tom Jahnke

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I don't know,but it seems that $rules over life especially our precious lakes and rivers..I know land has been mined on land near the Great Lakes for centuries.This effort seems to be an accident ready to happen. Try to live in an area like West Virginia or Ohio that was hill top strip mined for years and is still going on in W.VA.and Kentucky. The water is not safe to drink ..the latest spill in W.Va. had nothing to do with the mining but was directly related to not being able to drink the water in the in the first place as a result.Pollute the Great Lakes and see how much money you can come up with.Are the Koch Brothers in on this. Do they have as much money as PGandE. How many people in Minnesota are aware of this I wonder. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Tom Jordan 601 Lawton Rd Marietta, OH 45750-1123 (740) 516-8188

Tom Kapsner 42632

Tom King 16357

To whom it may concern: I am against the polymet project or any other project that starts sulfide mining near the BWCA and lake superior water shed. I don't believe we have the technology to safely do this kind of mining at this time. Also we do not need to tap into these resources and can save them for a later time when the need will be greater and the technology more advanced. We are responsible for keeping our water and lakes safe for our children. Starting the type of mining at this time will jeopardize that. We should not be making some corporations and people rich at the expense of our heritage Regards Tom King 7259 Old No. 7 Rd Virginia, MN 55792

Tom Kolodzinski 18295

Tom Kolodzinski. My concern is that the project has not looked enough at the impact on White Water Lake. In the small bay, by the diversion works, there is a potential drop of up to 12 feet of water in that small bay, when pumping into Colby, in the initial stages. So, as a homeowner in that area, especially if it is during drought time, that ruins our opportunities or that impacts greatly, severely our opportunities in enjoying the water and what we built. And that's my concern, that they haven't paid attention to what the impact is going to be or how they are going to address it. The statement that I wish to make is that it is a simple choice. Nobody wants to see damage to the area. The mine is certainly, with that kind of money, the mining company, 600 million, isn't going to want to see damage. And those that do not support the mine have not shown evidence that this model will cause the damage. So, my suggestion is just proceeding, because we don't know, and have the safe guards to control it.

What I have been reading and hearing about the proposed PolyMet NorthMet open pit heavy metals mine is of great concern. I have either led or participated in over 50 BWCA overnight canoe trips, including two successful moose hunts and two unsuccessful bear hunts, plus have hunted, fished, camped, backpacked, boated, and paddled in the Superior/Quetico region for much of my life, giving me great concerns about the known water quality issues associated with the proposal. Having read and listened to industry representatives and project supports, I find their comments to be shallow, short-sighted, and unsubstantiated. There does not appear to be a concrete water protection/treatment plan in place, but just vague promises that all will be taken care of. There seems to be no dispute of the number of years the mine will operate (20), the number of local full-time jobs (90), and the number of years requiring water protection/treatment (500). This is boom and bust to the max, and it does not add up. It's a ridiculous compromise to the 33,000-plus tourism jobs already in place, and that presently sustain many communities in the area. It is argued that iron mining was and is a vital part of that area of Minnesota for many years, and that the area still has clean air and water that draws many annual tourist to the area (a quarter-million annually to the BWCA alone). But this is different. The dangers associated with acid mining are astronomically larger and longer lasting that the iron and taconite mines, and the industry's track record is dismal at best – terrible in reality. We all want good jobs for everyone. I work in the HVAC industry, and we depend on plentiful work. But, again, this is different. These are very short-term jobs for a very low number of families, with the vast majority of mining profits leaving not just our state, but our country. Tom Kranz 47068

The YMCA of the Greater Twin Cities (YMCA) offers life-changing wilderness experiences through a variety of year-round camp programs, placing thousands of young people and families every year in the public waters of the Boundary Waters Canoe Area Wilderness (BWCAW) and nearby lakes and rivers. This pristine wilderness area has clean water and healthy forests and it is in everyone's interests for the BWCAW to remain unspoiled and unpolluted. The YMCA is aware of proposals to mine sulfide ore in the watershed of the BWCAW. In considering the permitting of any proposed sulfide mining operations, we urge decision makers to be certain that the following clean water and environmental protection principles can be guaranteed: 1- BWCAW waters and nearby lakes and rivers remain safe and clean 2- Strong safeguards are in place in the event anything goes wrong 3- Mining companies must leave the site maintenance free (in accordance with existing MN mining rules) The YMCA is committed to preserving the natural environment in and around our camps and in the BWCAW, for generations to come. We are also concerned that one of our camps, YMCA Camp Warren, operating for 87 years on Half Moon Lake south of Eveleth, is within the downstream catchment zone of the proposed PolyMet Mining NorthMet Project Site. We strongly urge careful scrutiny of proposals that have the potential to disturb or pollute the BWCAW and nearby lakes and rivers. Tom Kranz Vice President of Camp Operations YMCA of the Greater Twin Cities 2125 East Hennepin Avenue Minneapolis, MN 55413 (C) 651-295-5790 HYPERLINK "mailto:tom.kranz@ymcatwincities-org"tom.kranz@ymcatwincities-org The Y: We're for Youth Development, Healthy Living and Social Responsibility Comments Comments will be accepted until 4:30 PM CT on Thursday, March 13, 2014- Email: Submit comments to: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us. Comments and submittals will not be edited to remove any identifying or contact information; therefore, the Co-lead Agencies suggest that commenters not submit information that may cause the commenter concern if publicly disclosed.

Tom Lenarz 22052

My name is Tom Lenarz. My full address is 1123 Summit Ave Cloquet Mn 55720 I would like to submit a comment in support of the Polymet project. I have been following this process for the last 7 years. While I agree that keeping the environment safe is important, I think the management for this project has gone above and beyond to show that they can do this in a safe manner. I would like to see this comment period come to a conclusion and the permits needed to continue the project approved. Thank you for your time. Tom Lenarz

Dear Sir/Madam, Please be advised that I wholly support PolyMet Mining and their bid to open the NorthMet mine. Sincerely, tom lewis

Tom Lindquist 42443

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Tom Lindquist 1115 Magnolia Ln N Plymouth, MN 55441-4637

Tom McMullen 57719

I am submitting this e-mail in favor of the PolyMet project and other mining opportunities in the State of MN. I am an environmental engineer by trade and an avid outdoorsman. However, I feel the process to approve the PolyMet Mining project has been dragged out long enough. This is a valuable project for the state of MN, we have already lost enough jobs (tax base..) from our state. All of the so called “environmentalists” who are fighting this will never be convinced these mines are a good idea even though they sure enjoy their i-phones, laptops, etc the devices are all driving up the demand for precious metals. I feel the DNR has done an adequate job of holding the mining companies responsible, they have done their due-diligence, let’s move forwaRd Sincerely, Thomas McMullen, PE Industrial Reps 112 Lookout Point Buffalo, MN 55313 Cell: 612-819-3591 e-mail: HYPERLINK "mailto:tom@industrialreps-com"tom@industrialreps-com

Tom Neiman 43798

I am adamantly opposed to the proposed copper mining site in northern Minnesota. Satisfying short-term business opportunities does not serve the long-term best interests of Minnesota/the upper Midwest or its people/land/animals/agriculture. Reserve Mining is a good lesson to keep in mind. Tom Neiman 3712 France Ave S. Tom Pliska 39744

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Tom Pliska 5341 41st Ave S Minneapolis, MN 55417-2227

Tom Plocher 46110

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Glencore should be a responsible party for financial assurance in PolyMet's mine plan To Lisa Fay, MN DNR, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. It's interim chairperson is none other than Tony Hayward, who led BP to the worst safety record among major oil refining companies. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billions in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. Annually, 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated. The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. Thanks,

Tom Roth 16609

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Tom Roth 1989 Wellesley Ave Saint Paul, MN 55105

Tom Rukavina 18194

My name is Jeff Huberty. I'm a business agent with St. Paul Plumbers Local 34, and I would like to concede my time to Tom Rukavina. Thank you. I am Tom Rukavina, R-U-K-A-V-I-N-A. I'm a third-generation Iron Ranger, and I've got a fifth-generation granddaughter who lives 10 miles from this mine and I want the same thing for her and all of our grandkids that I had, and that's a good middle-class American life, and on the Range, that means a good union mining job. We've been mining on the Range for 132 years -- I'll correct everyone tonight -- 132 years. We're proud of what we do and who we are. We are miners. And you know, right now, as we're sitting in this room, there's four mines in the Superior National Forest that are churning out all the metals we want. They do such a good job that you people who go up to the Boundary Waters, you drive right by them, and you don't even know they're there. So we're the best miners in the world, and for the next 132 years, we're going to be mining because Minnesota's been blessed with some of the richest mineral deposits in the world. Now, everyone in this room uses all the metals that we're talking -- and minerals we're talking about tonight. So we're all polluters, but we all want to be good environmentalists. Nobody's got a monopoly on the environment. This project, think about it, is the biggest recycling project in the history of the State of Minnesota. We're not talking about pop cans and beer bottles on the curbs here, folks. No, we are talking with a plant that has a coarse crusher – coarse crusher, fines crusher, concentrator, railroads, tailings ponds, pipelines, haul roads. They're already there. We're going to make a new mine on an old mine. What in the heck makes more environmental sense than that? Come on. You know. Here's the fact: In fact, because of it, this mine will pollute and harm Mother Earth less than any other mine that's past or present planned right now. So that alone should be a major factor for our regulators over there, whom I know a few of them, when they make the decision, because this mine makes the most sense environmentally. So let's work together. You know, we've got the brain power. We've got the technology. We even have the environmental regulations to make this mine one of the showcase mines in the world. PolyMet is the perfect fit for this mine. It's already there. You know, and for all you anti-mining folks in the room, I got a paper bag here, and my friends in the back of the room, we brought some for you. We'll collect your car keys and your cell phones and your iPads at the door because all of these projects, or all of these little gadgets that you have are made from minerals so, you know, you can export your pollution to China, or you can have slave labor in Africa, but right here, you can have good union mining jobs in the United States of America.

Tom Rukavina 44812

Attention: Lisa Fay I have followed the progress of the Polymet/Northmet proposal for almost 10 years, both as a citizen and former State Representative representing the area where the proposed mine would be located. I strongly support the project I grew up on the edge of a mine on the Northside of Virginia. At the time, Virginia had a population of 14,000 people. Almost everyone on our block had a father or grandfather who worked in the mines. Mining is what we have done on the Range for 132 years. And I proudly point out that while we have altered the landscape with our mining culture, we have not damaged the environment. In fact, people come to visit or live here because of our pristine atmosphere. A mine can only exist and operate if the metals are there to mine. Minnesota has been blessed with not only one of the largest iron deposits in the world, but also one of the largest deposits of copper, nickel and preciuos metals. It makes economic and environmental sense to locate this Northmet mine in the Hoyt Lakes/ Babbitt area. The towns that will house the workers are already there and are capable of accomodating the influx of workers needed to build and operate the mine. As a State Representative, I passed the law that preserved the infrastructure at the old LTV taconite mine for the day when a new mine would locate there. That new mine should be Polymet. When LTV (Erie Mining Company) was built, it was a 350 million dollar investment in 1952 dollars. Today that would equal around 2 billion dollars of investment. By using all the old course and fine crushers, concentrator, power lines and sub-stations, railroads, haul roads etc, the NorthMet project will save the environment by not having to mine for the metals that built this minesite the first time around. This should be a major consideration for all the agencies charges with approving this project. The human race and the citizens of the USA need the resources that will be mined at the Northmet site. In order for the human race to move away from the fosil fuels that cause global warming, we need the copper and nickel and platinum, palladium etc that will be mined at this site. We know how to mine on the Iron Range of Mn and we know how to do it correctly. Modern technology and modern regulations will insure that this mine will be one of the most environmentally sensitive mines in the world. We can not bury our heads in the sand and pretend that the mines that are currently supplying all the metals we use in our daily lives are doing it properly. We know that here in the USA, you regulators will make sure that we put all the safeguards in place to make this mine the safest in the world. The experts at the Natural Resourses and Research Institute at the University of Minn/Duluth, have indicated to me that we can mine the Copper Nickel etc ores safely and properly. They have indicated that the reverse osmosis process proposed by Polymet to treat their waste water will work and not pose a threat to our area. In fact, many of the communities on the Range get their drinking water from the old natural iron ore pits. The sulfides in those pits has not turned to sulfates. People drink this water and don't get harmed. People in the Eveleth/Virginia/Gilbert/Mt.Iron area live under the shadows of three different mines operating near their communities and they live healthy long lives. The U of Mn has completed a 5 year/ 5 million dollar study on mesothelioma and found our air is cleaner than the air in downtown Minneapolis. We have not polluted our environment. Please approve the NorthMet project. America needs to make and manufacture things in this country. We need to mine the resources we all use in this country, not export our desires for these metals to another place where the environment will be abused. Iron Rangers are hard rock miners. Don't destroy or try to change who we are and what we do. We have mined correctly for 132 years. We have the resources to mine for hundred

Tom Sharkey 40321

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tom Sharkey 2 Arrowwood CT Granby, CT 06035 US

Tom Steigauf 4874

To who it may concern, Thank you for the great work the MN DNR has done in the past and continues to do today. I am proud to say that I'm from MN "The land of 10,000 Lakes". I believe our DNR has done an incredible job of conserving and maintaining our natural resources. After all, these resources don't belong to us we are leasing from our children and grandchildren. I wish to voice my concern about the PolyMet mining proposal. This type of mining; often called sulfide or acid mining has never been conducted in a way that preserved the natural landscape, habitat, or wildlife in the adjacent areas. That track record speaks for itself. People travel from all over the United States and even the world to visit MN for our lakes; the BWCA being a prime example. They don't travel here to see our mines. My in-laws have a lake home in Ely. We regularly host friends and family up there from all over the USA and Germany. The PolyMet mine will create jobs but how many and for how long. PolyMet will run the mine for 10 years or so then leAve The jobs will be lost and MN will be left with the environmental mess. The fact is a relatively small number of jobs will be created and most of the money will leave the state. Companies will promise anything and everything to get their way. Remember the repair hub and call center Delta promised to build in the Range. It would be far better to develop tourism and create jobs around tourism. These would be long-term jobs that would continue on for generations. I realize this makes it seem I don't care about the people living on the Range. The truth is I do care. I care a great deal about them. That is why I have the courage to challenge them and you to reject this easy way out. The PolyMet mining operation will damage our beautiful natural resources. It is that simple. People deserve to have jobs but not at this awful price. The mine will create very few jobs in the grand scheme and damage the number one major resource we have; our beautiful lakes and forests. Thank you for your time and consideration. Best regards, Tom Steigauf 6944 Stevens Ave So Richfield, MN 55423-2410 763-526-6362 HYPERLINK "mailto:tom.steigauf@gmail-com"tom.steigauf@gmail-com

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Please extend the comment period for the Polymet Northmet Supplemental Draft Environmental Impact Statement from 90 days to 180- The Statement is not something that most people can just read overnight or even several days and understand. The time allotted included one of the busiest holidays of the year for people and some of the most frigid and snowy weather seen in many years. Many, including myself, live out in the areas being impacted where life has slowed because of the weather. Getting chores and going to town to do errands has been more time consuming. I have a Duluth address but live 30 miles north of it and must drive there to do business and shop. The Polymet Northmet project will have extensive impact on lives. Having quality time to investigate this document is important. Please extend the time period to give adequate time to go over this huge document. Thank you for your consideration. Tom Thompson 1370 White Lake Drive Duluth, MN 55803

Tom Uphaus 40617

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Tom Uphaus 2650 N Pine Creek Rd La Crescent, MN 55947-9619 (507) 895-2152

Tom Witt 7037

To whom it may concern: Greetings. I'm a long-time resident of Minneapolis, but a frequent visitor to northern Minnesota. I'm writing to add my voice to those opposing the PoyMet Sulfide Mine. For a time I lived on site at an abandoned copper mine in Washington State, which now more than 50 years after its closing is still a Superfund site with toxic danger surrounding it. That experience has caused me to err on the side of caution when considering permit requests for future large mines. As the SDEIS analysis point our, strip mining brings with it a host of environmental damages that are not worth the number of jobs that PolyMet promises: Danger to water quality Discharge of sulfates Harm to wildlife Destruction of wetlands We have been given an incredible gift of amazing natural resources in Minnesota's Arrowhead Region. Let's not pollute it for the sake of some jobs, but rather let's do the harder work of finding more jobs that don't have such a harmful effect on our environment. Thanks for listening. Thomas W. Witt 2416 E. 22nd Street Minneapolis, MN 55406 HYPERLINK "mailto:twwitt@gmail-com"twwitt@gmail-com

We cannot continue to make short term decisions that have long-impacting and negative repercussions for our future. I understand that people need work in the Range. Let us put our efforts toward finding work that does not ruin the water we drink and the soil from which our food comes instead of spending millions of dollars on lawyers and studies to try and make something that is clearly bad look not so bad so a ruthless corporation can make more money for their shareholders. We the people are becoming educated and we are tired of politicians who are in the pockets of these businesses on the one hand and wanting to quickly assuage the need for gainful employment for their constituents on the other hand coming up with “fixes” that fix nothing. Put this project up for a vote by the people – all the people who will be affected by the project, during the next election. That would be democracy. I guess you know how I would be voting. Thank you, Marie Malanaphy-Sorg 165 Western Avenue N. #205 Saint Paul, MN 55102

Toni McCray 41635

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Toni McCray 6329 Brightlea Dr Lanham, MD 20706-2865

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Toni Watt 18238

My name is Toni Watt, T-O-N-I, W-A-T-T. And I am a proponent of no mining allowed in the Boundary Waters. I really don’t think it’s safe, and I don’t think they can guarantee that the water there will not be polluted. I don’t think it’s a good investment to look for 20 years worth of jobs, maybe, and 500 years worth of pollution, you know, and there’s -- and the mining companies do not have a good track record, and we raised our children in the Boundary Waters for summer trips and it’s a very beautiful, pristine wilderness, and I really -- and if Minnesota doesn’t keep its Boundary Water Canoe Area, it’s going to lose big time, financially, and the country will lose that beautiful asset that we have here. We need to be very, very cautious about preserving the waters of Minnesota. We are at the beginning point of three different river shed areas here, and we can’t afford to pollute our water. Thank you.

There needs to be a balance in regard to the ecology and the economy. The SDEIS for the Polymet mine project does exactly that. Ten years of DNR work has gone into this document. After ten years it is time for this project to move forwaRd The Range, the state of Minn., and the United States need the excellent paying jobs that this Mine will provide. Minn. has the strongest Mining environment laws in the United States. It will be done safely. Everyone in the state will take nothing less. Thank you Anthony M. Colarich 1011 East White St Ely,Mn. 55731

Tony Jordan 9845

My Name is Tony Jordan, and I live at 3754 Rustic Place, Shoreview, MN 55126- Although it has been 8 years since I've been to the BWCA, I know it to be a true "water world". The flow of the visible water through passages connecting lakes for 100 miles or more is a sensitive provider of all forms of life in the area. The flow of the water that we can't see underground is even more intricate and sensitive. The minerals are not going anywhere and their value will only increase. We should wait for technology to be developed to offer the possibility of mining them without the accompanying destruction that future generations will pay for. I am against the mining proposal because of the irreversible damage that will be done to the area. I am in favor of an additional user fee for the BWCA that would be shared with the residents of the area to compensate for their not getting the 300 some jobs that come with the destruction of the area. Thank you, Tony Jordan (651) 482-9608

Tony Nelson 10266

As the Chair of the Dakota County Planning Commission, I understand the push for more jobs. Especially in an area that needs them. But, I am also the Habitat Chair for the Twin City chapter of Trout Unlimited and I understand the community's desire for clean air and water. The technology is there to extract the minerals but there are no known examples of a case where the waste is handled in a safe way. This type of mineral extraction will leech sulfuric acid from the tailing sites. There are no examples of an existing mine that does not have this problem and the timeline to control this is for hundreds of years. Are the mine owners willing to put the money up front to cover the entire cost for this cleanup. We must not get caught in a situation where the owners file bankruptcy after the mine is played out and the citizens are stuck with the bill. I know there will be extreme pressure placed on all the agencies to push this through, but the people of Minnesota are relying on your agencies to look at the science and the limitations of the existing technologies to make a decision that protects the land, the water and our children. You are caught between a jobs and profits over-rule all and a "NIMBY" mindset but you must rule on the facts that you hAve Can you permit a mine and preserve the water quality that currently exists. The decision is yours. Both sides want you to do your jobs, so do them. What does current science tell you. Tony Nelson, 890 Redwood Drive, Apple Valley, MN 55124; 952-486-2282

Tony Terwey 41891

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tony Terwey Richmond, Minnesota

Tonya Kjerland 18269

My name is Tonya Kjerland and I am from Northfield, Minnesota. I am a graduate student at the University of Minnesota. I have done extensive studies with wild rice in the field. And I would like to state that in order to determine what a rice water is, the state should consider simply the presence of wild rice. Looking at historic data, such as it is, is very difficult at this time since we have not yet collected enough density data to determine how wild rice populations change over time. I know from experience of looking at the data that does exist from the 1854 Treaty Authority, it is clear that rice can fluctuate extensively in density as well as spacial presence. I would also like to say as a native person that the wild rice is more than just a plant. It is a sacred medicine. And that this is not just for the native people, it is for everyone. Tracey Smallwood 40293

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tracey Smallwood 1322 harwich dr Waldorf, MD 20601 US

Tracy Alfson 16995

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Tracy Alfson 6037 Country Club Road Houston, MN 55943

Tracy Fredin 42464

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness and Lake Superior Ecosystem. It does not provide enough economic benefit for the cost to our quality of life. There are other, more economically effective paths to follow. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Tracy Fredin 4506 Nawadaha Blvd Minneapolis, MN 55406-4036 (612) 729-3802

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tracy Kraemer Blaine, Minnesota

Tracy Mallon 40360

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tracy Mallon 4136 Freeland Ave Philadelphia, PA 19127 US

Travis Barnes 54172

The mine is a bad idea. It will cause a lot of pollution and kill a lot of wildlife. You could mine somewhere not important like Canada.

Travis Durkin 20017

I am against the new mine. I live in Ely and I am very concerned about out watersheds. I do not feel that there is sufficient evidence to keep our waters safe from pollution. Please do not approve this operation. Thank you. Travis Durkin 16 N 8th Ave E Ely, MN 55731 - Travis ;-)

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Travis Mazerall 19 South St Brighton, MA 02135-5167 (857) 383-8062

Trevon Clay 54177

I don’t think they should build the mind because there is many places to mind besides doing it right next to a wildlife area. The minding will destroy fishing, the water, the sulfuric acid will destroy all most everything in the water that would be another wildlife destroy. Just because they want to get copper and nickel. The wild habit will be destroyed we need animals to survive like fish and other animals. The acid will make the [ILLEGIBLE] the go down.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Trilby Busch 42439

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, When I first moved to Minnesota in 1968, a controversy arose about the dumping of taconite tailings containing asbestos into Lake Superior. The practice was finally stopped, but only after tons of carcinogens were put into the water. I beg you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Trilby Busch 2648 Emerson Ave S Minneapolis, MN 55408-1222

Trish 49559

Congratulations on your retirement .BUT before you leave, please and forward these notices to Supervisor Periman It's possible.. PolyMet may have some good points, but it will also destroy the wetlands.. And leave us with a mess when they pull out. Trish In a message dated 2/28/2014 8:14:10 P.M. Central Standard Time, tdabney@fs.fed.us writes: On Tuesday, March 4, I begin my retirement. Contact Deputy Forest Supervisor Richard Periman at rperiman@fs.fed.us or 218-626-4303 for assistance. Tristan McCormick 41253

As someone who has studied natural resource economics, environmental policy and biogeochemistry a fair amount I know that these issues can involve many important stakeholders with conflicting but valuable objective functions where policy makers face difficult tradeoffs and non-pareto improving solutions. This is not one of those times. As I'm sure you know, unlike iron ore mines, the impact of which is huge but containable, sulfide mining tailings produce highly acidic runoff. The upper Minnesotan hydrological system is so interconnected that this would mean centuries of catastrophic and un-manageable ecological costs in what might be the combined most beautiful, ecologically valuable, and visited lake ecosystem in the Union. Which is to say nothing of the negative externalities imposed on anyone who has ever gone or will ever go to the BWCA in this or any coming generations. But they'll clean it up, right. Even if they DID commit the appropriate amount of fund (which is probably, you know, hundreds of billions of dollars since the runoff would need essentially indefinite treatment), there is a nearly flawless record of companies like this almost immediately raiding those funds/hiding behind bankruptcy protection. Then who pays for it. No one. But what about the jobs. The few thousand jobs created over the next decade will be nothing compared to the job and revenue losses in the tourism industry that will almost certainly result as people are less inclined to visit a lake system with a pH of 5 Obviously I exaggerate. The pH wouldn't be that high. But it would be too high for fish. Like walleye. I love walleye. These companies aren't even American. Which might be the WORST possible reason to reject this mine but the money isn't even staying in the state. It's going to some international mining conglomerate acting through shell corporations.. I didn't even know that was actually a thing. What is this a Jean le Carre novel.. Anyway. Please. For once, can the good guys win. Please call me if in any way I can help convince you to take the high road. Seriously though, I'm 23 and I'm gonna have to explain this shit to my kids. Cheers, Tristan

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years and beyond. I was born and grew up on the Iron Range. After living away from the area for a number of years, I recently made the decision to return to MN and have since moved to Duluth. As a young professional with specialized skills, my career aspirations have long implied that I should seek out opportunities in a larger urban center on the East or West CoaSt However, return trips to visit family and friends over the years have convinced me that the place I want to be is in Northeastern MN. Foremost among my reasons for wanting to return to the area to live, work, and grow my small start-up company are the pristine lakes and waterways of the Arrowhead region. I know many peers of my generation with similar stories. Motivated, energized young people who have stayed or returned to the area, inspired by the unique and treasured natural recreation opportunities afforded by the area's forests and lakes. I am a firm believer in the potential for this region's innate cultural and recreational resources to usher in an era of economic revitalization for the Arrowhead. I also believe that short-sighted decision making based on short term profits for the few can undermine and negate this potential. As such, I view the PolyMet project as currently proposed, planned, and outlined in their SDEIS to be a major threat to Northeastern MN's long term economic vitality, rather than as an opportunity. Specifically, I agree with WaterLegacy's findings and assertions, as outlined below: The PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to calculate whether PolyMet’s seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the “evaluation locations” used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant f

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms tye block PO Box 19 Cordova, SC 29039-0019

Tyler Lies 47423

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. I have camped in the Boundary Waters multiple times with friends and family and every time I visit I discover something new in the area and within myself. This is only possible due to the pristine condition this natural area has been preserved in. I'm also an Environmental Geoscience major at UND though I live in MN, and I understand the type of effects that this could have on the environment, though not to the degree as the people doing the testing. I would love to have the ability to continue visiting this area in the condition that it's in for years to come, and this won't be possible if it becomes polluted and disrupts the ecosystem that is currently in place. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Tyler Lies 716 169th Ln NE Ham Lake, MN 55304-4891 (612) 423-1282

Tyler Nord 18334

My name is Tyler Nord. I live here in Duluth. I am also a taxpayer and also study political science and economics at UMD. There is a lot to be said about this in regards to the economic situation, the amount of waste copper, scrap copper that we are exporting that is highlighted by the Bloomberg Business Group, the same people that audited the Federal Reserve Bank. They have shown that we are sending (inaudible) scrap copper to China to fuel their growth. Since 2007 they fueled the majority of their growth from our scrap copper. The economics aside, I would like to address the SDEIS. I would like to request that it is rejected and reanalyzed. I would ask that Section 404 is rejected and reanalyzed. And I would like to ask cumulatively that at that point there is no reason for the Land Exchange until these other things are stopped. When you take a wetland out from one area, you can't just have another one happen somewhere else. Any technologist can tell you that. Any geographer can tell you that. It might be a similar size of wetland, but the service it provides to your economy isn't the same, if in a specific location, you filter more water than in another location. So, just adding more wetlands somewhere else while destroying the wetlands on the other line won't work. Now, in the SDEIS -- in the EIS they demonstrate that they will be using the LTV site. (Inaudible) it drains from the bottom into three separate streams. It was designed that way. They are just going to pile a different type of waste on top. I will remind you that this type of mining has never been done safely and we live in a high-water content area, however you want to say that. Now, what we are looking at here is when we had that flood a couple of years ago, whatever year it was, it doesn't matter, it was a 500-year flood, it was a 200-year flood; well, I'm from Fargo, North Dakota. They are putting in a diversion. Lots of stuff going on with the water management there. Now, they said it was a 100-year flood in '97. Oh, then it was a 200-year flood in 1999. Oh, now it's a 500-year flood. Now, PolyMet doesn't acknowledge 500-year floods or 1,000-year floods, 2,000-year floods at the site. It doesn't matter. The main flaw in the EIS, the acronym that applies here, it is that it doesn't show what happens if the pumps at the edge of that tailing pond fail. It doesn't show the alternative scenarios. It doesn't show that 21 gallons per minute that leaks from the LTV site, that they admit will be leaking 21 gallons per minute, that is -- first of all, that's never been demonstrated before. They acknowledge that untreated water will be leaving the waste site. Thank you.

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Tyler Reid 34232 N Bluestem Rd Round Lake, IL 60073-5245

Tyson Nguyen 41919

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tyson Nguyen Brooklyn Park, Minnesota

Dear Sir or Madam, Please see the attached letter from the United Transportation Union, Rail Division of the Sheet metal, Air Rail and Transportation Union, (UTU-SMART-TD). This letter has also been hand delivered to the DNR Offices in St Paul. On behalf of our 1200 active and many retired railroad workers in Minnesota, we support the acceptance of the proposed Polymet Mining Environmental Impact Statement without any further delay. Please add our UTU-SMART-TD letter dated March 8th, 2014, to the DNR, to the public comment docket. Thank you. Phillip Qualy UTU-SMART-TD SLD Minnesota 651-222-7500

V Brandt 40336

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, V Brandt 28 W.10th New York, NY 10011 US

Valerie Murphy 21181

Dear DNR, I am writing to let you know I am completely against the proposed Polymet mine in northern MN. Mining destroys the land and water that we rely on for survival and recreation. Even if it could be cleaned up, the clean would be required for hundreds of years, at enormous expense, an expense that may or may not be paid for my the mining company. And there will surely be irreparable damage. The area if miner, would never ever be the same. I believe no potential number of jobs is worth destrying this priceless, beautiful area located near the pristine BWCA. Once it's gone, it's gone. It is not worth it. Thank you for considering my comments. Valerie Murphy White Bear Lake, MN

Valerie Stoehr 45005

Dear Ms Fay, Federal and State Agency Leaders: I am writing to urge you to reject the PolyMet SDEIS and deny permits. I am concerned about the lack of return on investment given that the cost of environmental safety hazards may dwarf the economic benefits. In particular: 1- Copper and nickel mining is better suited to an environment different from the projected northern MN site. 2- Polymet's revised draft (SDEIS) is inadequate. There is no consideration of alternate methods (like underground mine, putting liners under the waste dumps), no guarantees of who pays for routine monitoring/treatment after mine closes—and no consideration of spills, etc 3- The computer model for treating wastes and handling pollution is based on poor data and requires revision. I am working with our elected representatives to urge consideration and adoption of other methods to bring economic opportunities to the Range. PolyMet is not in our best interests. Please deny the permit. Thank you for your attention. Sincerely, Valerie Stoehr Afton, MN Valerie Stoehr PO Box 395 Afton, MN 55001

Valkyrie PenDragon 17068

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Valkyrie PenDragon 3802 Polk Ave Bemidji, MN 56601

Vance Anderson 57336

Vance Anderson, from Cromwell, Minnesota. I am a business representative for Roofers Local 96. I support the PolyMet mining and believe them that they will build and operate a mine that complies with all regulations and protects the environment. I trust the multiple state and federal agencies involved in preparing the document. Okay. Based on the extensive documentation as outlined in the SDEIS, I am confident that impacts to the air, water and land will be minimal, if any, and that the land post-closure will be reclaimed to protect natural resources over the long-term in compliance with the law. The SDEIS demonstrates that PolyMet can develop this resource in a sustainable manner and there will be logical engineered solutions proposed for potential impacts. I am impressed by the extraordinary precautions proposed by PolyMet, such as a reverse osmosis, and look forward to having them as a new neighbor. The SDEIS shows that mining, recreation, tourism, and other land and natural resources can be -- can co-exist. The PolyMet project has been designed to minimize environmental impacts, reusing the Brownfield site, reusing existing infrastructure, minimizing disturbance of wetlands, and utilizing multiple safeguards to protect the environment. PolyMet will control and manage stockpiled water and use proven technologies found in liners, water collection systems and cover systems. PolyMet will not discharge water to the environment that has not been treated with reverse osmosis. PolyMet will provide financial assurance to cover all closure costs. PolyMet will utilize the best available emissions control devices on mobile mining equipment. Some foreign suppliers of metals PolyMet will provide don't necessarily follow the sound environmental practices, creating a greater global environmental impact. That's a mouthful there. PolyMet has demonstrated they can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. PolyMet will be a domestic supply of critical metals needed in medical applications, electricity, catalytic converters, cell phones, computers, and other essential products. I use these metals every day. If we are to maintain our modern way of living, we need to continue to find and extract these metals. And just as well we do it in Minnesota, where we find them in abundance, where there are sound regulations in place and where we have a ready and available workforce. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity expanding and diversifying our mining economy. PolyMet can produce these metals in an environmentally sound manner and create hundreds of jobs that can support families and sustain communities. I trust the multiple federal, state and federal agencies in preparing the document. The Minnesotans trust the DNR to do the copper-nickel mining and to keep our communities safe. PolyMet will produce these metals in an environmentally sound way that generates significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and our educational system. It is irresponsible to import these metals from countries that do not have strict environmental standards, when Minnesota has an opportunity to mine responsibly. The environmental review process has been lengthy and thorough. The Supplemental EIS addresses potential environmental impacts and how to mitigate them. It is irresponsible to import these metals and export jobs, when we can mine safely here in Minnesota.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Vanessa Hooper 2358 Cedar Crest Blvd Dallas, TX 75203 US

No BP in BWCA! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. 1 have grave concems about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

First, in a macro sense, the observation (and evidence) that no sulfide ore mine, anywhere, has been operated without serious or extensive water pollution problems, demands that regulatory agencies invoke the "Precautionary Principle," that is, that it is incumbent upon the mining company to prove unequivocally PRIOR to mining operations that that pollution standards will not be violated. The Northmet SDEIS, with its probabilistic/statistical modeling, does not satisfy this common sense standaRd The stakes are simply too high — especially within this water rich environment — to allow a "trial and error" approach for demonstrating that pollution incidents will not occur. An additional factor exacerbates this concern: The SDEIS is replete with statements (indications, admissions.) that water quality problems (violations) are, indeed, likely to occur, or could occur. What follows those statements is what is really egregious, and that is the repeated, summary if not "dismissive" comment: "if detected, adaptive water management measures would be implemented." Another variation of this statement which is "arrogant" in tone within the context of this critical question of protecting water quality within a precious environment, is the phase, "If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be taken to reduce those effects." "Steps COULD be taken." As a citizen, I am insulted. I demand that the company declare their commitment that "steps WILL be taken" to not only reduce (another weasel term) but to mitigate the problem such that water quality criteria are, indeed, met. Examples of these statements occur on Page 5-98, Page 5-144, and Table 8-0, Sections 1, 2, 9, and13 (Page 8-4 to Page 16) to cite only a few. The SDEIS contains no detailing of what these "adaptive water management measures" or "steps" would consist of. Additionally, and more importantly, there is no assessment as to the efficacy of such adaptive measures. Thus, the Polymet SDEIS is grossly incomplete (inadequate)l. This is tantamount to giving the mining company a "back door" to escape designing and validating not just the preventive but the remedial measures in the event a water quality standard is violated. To repeat, the SDEIS narrative conveys the general sense that there is a significant likelihood that water quality violations will occur. This is all the more reason to invoke the Precautionary Principle. ie, "prove it first." Vern Simula 5491 Bluebell Avenue Mt. Iron, Minnesota

18324

My name is Vern Simula, S-I-M-U-L-A. I live in (inaudible) US Steel and Minntac Plant. Many of my neighbors work there and the various mines in the area or mining business. Many of my neighbors, especially young working, are desperate for jobs in our Iron Range communities. Our downtown businesses also depend upon a strong local mining base. We need those jobs desperately and deservedly. That's why so many mine workers are here tonight. But the need for such short-term jobs, or more precisely the asserted economic contributions they propose will be provided, the 20 years, must be considered irrelevant for the purpose of this hearing. That issue is out of bounds. Not germane. Because the fundamental issue here is what is at the proposed mining project can be done safely without harm to the natural environments or to human health. Again, the fundamental issue is the safety of the mining -- the proposed mining operation. And to look at that question, that's a highly technical question. And I for one -- many of us as citizens we really don't have -- you know, miners and folks that have come here tonight we really don't have the expertise to look at the very complex issue of the various scientific questions surrounding will this mine pollute or not. Additionally, a number of citizen organizations have retained professional scientists in various areas and expertise to address the many aspects. And the resulting reports distributed by these organizations gave enormous doubt whether this mining project can be done safely. And also, even the EIS itself is not conclusive. In chapter 8 it contains a litany of major differences of opinion. If indeed there are doubts or disagreements, unanswered questions, or probability that if one of the criteria of the safeguards cannot be met then the only reasonable, prudent decision for our regulatory agencies is to invoke what I call a precautionary principle. According to my handy-dandy Wikipedia, a precautionary principle states that if an action or a policy has a suspected of risk of causing harm to the public or the environment, in the absence of scientific consensus that the action or policy is harmful, that the most prudent type of thing is to invoke (inaudible).

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Two thoughts: 1- There has been tremendous political pressure urging approval of the SDEIS, because the Northmet Project will create "jobs" for the Iron Range. The pressure is so clamorous that leads one to think that the "Range" is solely dependent upon this project for additional jobs. Not so. The Iron Range Resources and Rehabilitation Board (IRRRB) just in the last three years has, according to their report, created 1,894 permanent jobs, supplemented by 2,800 construction jobs, jobs that do not contribute to potential serious environmental hazards. 2- Numerous statements in Chapters 5 and 8 of the SDEIS "admit" that water quality violations will likely occur. These statements are followed with the rather "flippant" comment that in the event of such occurrences, measures will be taken to remediate the violation. There is no description or evaluation of the efficacy of such remedial measures. This is unacceptable. It gives a potential polluter a free pass. Please reject the SDEIS on a "No Action" basis. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Vern Simula 5491 Bluebell Ave Virginia, MN 55792-4009 (218) 591-5722

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Verna Alt 5115 42 AVE S Minneapolis, MN 55417

Vernon Baker 46988

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Lisa, I'm writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. First, I want to express my confidence in your agency to thoroughly evaluate the project, and its ability to design the mitigation for potential environmental impacts. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. Additionally, I'd like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country. Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. We cannot afford to miss this job opportunity. This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Based on my review and the level of detail included in the draft EIS it appears that a thorough evaluation of the project and potential impacts has been completed. Sincerely, Vern Baker Chaska, MN 55318

Veronica Erickson 54179

I don't think you should mine in the area of the boundary waters. The sulfur in the rock mixed with air creates sulfuric acid. Acid kills most aquatic life. This means no more fishing. Many people go to the boundary waters for peace and quiet, but the drill noise along is hard on the ears. This area has been protected since 1989, and if you plan to mine for 20 years, it will do damage to our water for much longer than that. The contamination from this mine will threaten all water bodies connected to it. The PH of the water will be 4, 3, 2 even 1. Aquatic life dies below a PH of 4. These are just a few reasons you shouldn't mine near the boundary waters.

Veronica Smith 57344

My name is Veronica Smith. I am from the Fond Du Lac Reservation. I am a band member. And my concern is, of course, is the waters and the streams and the lakes that come down from where the mines are going to be. What I have the most concern about is the wild rice. Our Manoomin -- the creator has given us manoomin. Do you need to know how to spell that? M-A-N-O-O-M-I-N. And that's what is my concern. It is the waterfowl and the plants, and of course my concern is the state grains in Minnesota, protecting that to the fullest. And that's what my concern is. Alright? Thanks.

Vicki Andrews 17164

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Vicki Andrews 31135 Sunny Beach Road Grand Rapids, MN 55744

45098

I am writing to urge you to reject the PolyMet proposal to build a copper-sulfide mining operation in Minnesota's Lake Superior Basin. This plan is bad for the environment, a potential disaster to Minnesota communities, residents, land and water. PolyMet's proposed location increases risks of pollution and harm to public health - 99% of what is dug out of the ground will be waste. It would impact irreplaceable high value wetlands in the St Louis River watershed- destroying 913 acres and indirectly affecting another 7,228 acres. Tailings will be dumped in an unlined tailing basin. It is almost certain to result in contamination of surface and/or ground water with sulfates and toxic metals. The risk to the environment is simply not worth it. We need to protect Minnesota's land, water, and communities. Please reject this proposal. Protect Minnesota. Thank you, Vicki Andrews 31135 Sunny Beach Road Grand Rapids MN 55744 218-259-4254

42015

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms vicki Bonk 5629 45th Ave S Minneapolis, MN 55417-3018

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Vicki Culver 8200 38th Ave N New Hope, MN 55427-1113

Sulfide ore mines providing employment is a RELATIVELY SHORT TERM FIX of a problem. Sulfide ore mines polluting water and wilderness is LONG TERM DESTRUCTION of a precious MN resource. Clearly, this kind of mining is not the same as taconite mining. It has more long-lasting and serious consequences to the land and water. It is not possible to guarantee safe mining practices. Once the damage is done, we can not back up on this decision. MN needs to provide incentives for non-destructive industries to move north to provide jobs. Vicki Effertz 8086 Curtis Lane Eden Prairie, MN 55347

Vicki Ericson 57972

I have concerns about the runoff from the holding ponds to the Embarrass River watershed & the 100 mile swamp. Those regions articulate with the Boundary Waters. Please protect them! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. 1 have grave concems about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Vicki Everett 9502

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Vicki Everett 11 Elizabeth St #26 Duluth, MN 55803

Dear Sirs:Minnesota is one of the most beautifulest states in USA. I have focused on keeping it that way my whole life. I do dispose of dangerous chemicals properly, recycled everything I should. I never litter, etc etc. I know we need to keep our water, air, etc clean of any dangers. It is all we have. Our children, grandchildren deserves better. They are our future. We need to focus on ways to stop toxic pollution and anything that will threaten our water supply, air or land. Sulfide mining in northeastern Minnesota will be a very big mistake. Please protect our children. This mine could create more illnesses that could lead to death. Anything toxic will destroy life. MN will not benefit from sulfide mining. Thank you and I apologize for my messy letter.Vicki M. Gustafson121 Carlisle AveDuluth, MN 55803

Why do we need to move ahead with the permitting of the proposed copper mine. We do not have to do so We should understand by now that the resulting damage to our environment does not let us even consider such an effort. What can possibly keep the mercury contamination from eventually moving into the groundwater and causing major changes in the quality of the groundwater involving a huge part of our natural world. We need to look far ahead and try to understand what will be critical for our quality of life in the future. We may be forced to live a much more basic existence where technology will not be as much a part of our lives. The quality of natural resources such as our water will take on new meaning for our existence. We should begin to put more consideration into living with and carefully maintaining much of what already exists, particularly in our corner of the world. Vicki Sanville Duluth, MN

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Victor Hemmy III 771 kealahou street Honolulu, HI 96825 US

Victor Walter 40812

Hi, my name is Victor Alan Walter. I live at 18975 Valley View Road in Eden Prairie Minnesota, 55346- I have lived in the Twin Cities area most of my life. I was born in Virginia Minnesota in 1956- I live in the Cities but my heart lives in Northern Minnesota. I can't afford to live up there. I have a family down here. I know most people that live on the range have one or two jobs to support their family. Travel is horrible in the winter. All stores are far away and the produce sucks. But there is a reason people live up there. The beauty of the land. Easy access to forests, swamps, open fields, rivers, lakes and swimming. People live up there for a reason. Because they love living there. The water moves as freely as the air. Life is not easy, financial security is not easy. We don't need more mining jobs in northern Minnesota. Our tourism will be worth much more in the long run for our states financial security. Any degradation of our water will be a slow death for our state. Please do not mine for copper in Northern Minnesota. I love our state. I want to stay here. I want to live here. I want to visit my homeland. Please.

Victoria Bloch 42454

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents completely unacceptable environmental risks it should not be allowed under any circumstances. This dangerous sulfide mining operation threatens to pollute Minnesota's water with sulfuric acid and heavy metals for 500 years (or so, give or take a decade or three), and endangers both clean water and habitat in the Lake Superior basin. Lake Superior is a precious national resource, as is every significant body of fresh water in our country. With fresh water at a growing premium, any threat to water represents a threat to our economy, our citizens' health, and our nation. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Victoria Bloch 2556 Granville Ave Los Angeles, CA 90064-2804

Victoria Morrison 39763

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Victoria Morrison 74 Noland Dr Clyde, NC 28721-9299 (218) 341-8294

Victoria Oakey 14370

Feb 13, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting their clean water. I and they have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This irresponsible trade-off is not worth the risk. Sincerely, Miss Victoria Oakey 18 Cogges Hill Road Witney Oxfordshire, None OX28 3FP 4401993708832

Victoria Singer 40878

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, I'm not a Minnesotan. I live in Washington State. But I am a part of the planetary ecology, and this proposed mining project is of some concern to me. If our landfills were mined for precious metals, and manufacturers pressed to create more from recycled products, there would be no need to open new mines. There would be no need to risk the health and home of all living things. Open pit mining is (or should rightly be) obsolete. Hold the line. Say no to PolyMet. Sincerely, Ms Victoria Singer 705 Lyle Ave # 1 Lyle, WA 98635-9061 (509) 557-5456

Victoria Turke 18254

My name is Victoria Turke, V-I-C-T-O-R-I-A, T-U-R-K-E. The supplemental draft environmental impact statement is inadequate in several areas and should be gone through to thoroughly answer questions in detail. We cannot let this report define the future of our clean water. The SDEIS uses a small bit of data from 1984 to address the water flowage and its impact concerning the issue of how much and how fast our groundwater, streams and lakes will be polluted. The report is using data that does not reflect what the conditions actually are at the proposed site. The report does not reflect the impact that this project will have on our clean water. This report does not adequately answer the question of how this perpetual need for taking care of the polluted waters is to be paid for, and when questioned, they say those details will be addressed during the permitting process. This just is not sufficient. This is our time to voice our concerns about the PolyMet mine that is proposed. We deserve to have all of the details now, not when it’s too late. These questions are far too important to put off. The SDEIS does not answer these questions and should be sent back. Thank you.

19527

My name is Victoria, V-I-C-T-O-R-I-A, Turke, T-U-R-K-E. I live at 1004 Trenton Circle North in Plymouth, Minnesota, Zip Code 55441.I'm concerned about the PolyMet sulfide ore mine that is being proposed for the Hoyt Lakes area. Computer models show that the water from the mine and processing plant will be contaminated with toxic metals and sulfate. I spend most of my time in Northeastern Minnesota and own property on a beautiful lake. I am concerned that PolyMet will not be able to capture and treat all of the contaminated water before it reaches the St. Louis River and Lake Superior. A great majority of us are downstream from this project. We need to ask more questions about how PolyMet can possibly keep its word about protecting our waters. PolyMet's own plan admits that millions of gallons of polluted water will seep offsite. The SDEIS does not completely address this subject. How will PolyMet be able to treat the polluted water for 500 years? How will they pay for it? We need more answers. Thank you.

Vincent Graziano 48718

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I would like for once the State and DNR actually protect the natural resources that they are supposed to protect and not just hand over our future to corporations and especially foreign corporations. Examples are the Minnesota River, one of the most poluted in the country, moose hunting when moose are going extinct, wolf trophy hunting, not protecting wetlands, on and on and on. Their own simulations say polution for 500-years, in other words FOREVER. If this kind of mining does ever become safe (which I doubt), then it will be worth even more in the future. To the unions who I usually defend: not every job is worth doing if it destroys your future. Northern Minnesota has the golden goose. Defend it, don't blindly pander to the "jobs" message. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Vincent Graziano 121 Otis Ave Saint Paul, MN 55104-5635 (651) 644-4388

During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Vincent Trovato 7501 Ontario Blvd Eden Prairie, MN 55344-1889

Vincent W. King 45163

I am a native of north-central Minnesota and have been camping, hiking, skiing and working in the area near the Polymet site for 44 years. I worked as a wilderness guide in the BWCA. During my time in the northland, I have become familiar with its fractured geology, clean waters, and extremely fragile biomes. Essentially every body of water there is connected to every other body of water, both on the surface and in the subsurface. It is simply ludicrous to suggest that any amount of human engineering, or any amount of money, can prevent a disaster from occurring, resulting in the acid mine drainage entering the surface and underground waters in the area. Apparently the duration of necessary treatment is subject to some debate, but from what I have read treatment will be necessary for many decades, if not several centuries. No human-devised system can stand up for the period of time needed to treat this water. Northern Minnesota's lakes, streams, marshes and bogs are an irreplaceable resource. The short-term economic gains from sulfide mining are far outweighed by the long-term risk. I urge you to reject any permit for sulfide mining in northern Minnesota. Thank you. Vincent W. King 1941 Ashland Ave St Paul, MN 55104 Please consider your environmental responsibility before printing this e-mail. virgene haas 38799

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms virgene haas 1057 26th Ave SE Minneapolis, MN 55414-2643 (612) 331-2877

Virgil Sohm 17825

I am an enrolled member of the Lake Superior Band of Ojibwe at Nett Lake Reservation in the State of Minnesota. I express grave concern for our water,wildlife and fauna of the northern region of the Arrowhead landbase. Culturally this is our medicinal,hunting and wild rice harvesting territory. The Federal Government and State government has a fiduciary responsibility to honor the rights our grandfathers were promised in the Treaty of 1854- Sulfide mining profits will benefit only the Glencore XStrata Corporation and the Polymet Mining subsidiary company. We do not have to trust their words on keeping our environment safe. Toxic waste labelled as reject concentrate is approximately 99% of the earth they will dig up to extract less than 1% of copper and other precious metals.Keep in mind that the released toxins will disseminate in the water and the air in every direction. The Polymet Environmental impact statement is submitted for public comment prior to March 13,2014- I'm not a scientist but treating the poison water for 500 years is not financially or ecologically sound advice for Native Americans,Iron Rangers,tourists, wildlife or wild rice. Clean water is paramount to all life. Our brother the wolf has been hunted and trapped for two winters now, our moose population has declined to the point of decision where the Grand Portage, Bois Forte and Fon du Lac tribes are not allowed a ceremonial use permit for a moose.Our lakes are the source of the fish populations. Our wetlands were left here by the receding glacier of the Ice age. We can not reduplicate this process. We as Anishinabeg stand together as stewards of Mother Earth. In review of the SDEIS, the fact that there are inaccurate data and the need to keep our National forests sustainable;I urge you to reject any and all plans for sulfide mining. Miigwech, Virgil D Sohm PO Box 662 Tower,MN 55790

---Original Message--- From: dalev1@earthlink-net [mailto:dalev1@earthlink-net] Sent: Monday, March 10, 2014 10:45 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing boaRd Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing probleMs The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Virginia Dale 2430 Irving Ave S Minneapolis, MN 55405

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Virginia Mattson 4917 Andrew St St Bernard, OH 45217 US

Virginia Nichols 57444

I will be brief - this plan is short sighted, and will irrefutably negatively affect the waters that Minnesota is famous for. It is astounding to me this mine is even under serious consideration, given the obvious risks. Virginia Nichols 330 S. 4th St Ames, IA 50010

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Lake Superior is connected to the other 4 Great Lakes; together they hold one-fifth of the world's fresh water supply. It would be CRIMINAL to allow a corporation to risk polluting this vital resource, only for a business to make a short-term profit. Millions of people rely on the Great Lakes for their drinking water, and there is also a large (billions of dollars) fishing industry that requires clean water. Would we acquiesce to the risk if such open-pit mines were to be opened on Canadian shores. NO, we would not. We cannot permit these open-pit mines to operate on the shores of the Great Lakes. Thank you. Sincerely, Virginia Rosenbaum 1133 Judson Ave Evanston, IL 60202-1314 (847) 864-5514

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I don’t think having a mining project by the boundary water is a good idea in the long run. I personally enjoy sightseeing in the boundary water and canoeing in that region. Having a mine up there can potentially damage the aquatic ecology and the natural habitat of many species. Also, I would like you to review and take a look at the mining project extra cautiously. Thank you in advance!

W Clinton Jurgens 16935

Ladies and Gentlemen: Please accept the attached comments on the NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement (SDEIS) . If you would prefer a Word document, I can forward that as well. Thank You. W. Knox 47037

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, W. Knox 3156 23rd Ave S Minneapolis, MN 55407

Wade Christensen 18095

My name is Wade Christensen. I am a long-time member here, in Northern Minnesota. I believe to GPM, Incorporated. We have a number of our guys here supporting this project. I want to thank the Army Corp of Engineering, the Department of Natural Resources, and the -- there's another one in there, I know. I can't remember which one it is. I want to thank you for your due diligence in this project because this is very important to us. I was going to come up here and talk about financial assurance as it relates to what PolyMet has to do to get this project off the ground. I'm going to do that in a little different way and I'm going to ask a couple guys to stand up. One of them is Bill Moraski. Bill, can you stand up? Adam Christianson. And David Hughes. Stand up. This is my vision -- Bill, please, no, stay standing. This is my vision of financial assurance. Number one, I do have to point out, it's amazing how Bill, at 75, looks younger than Dave. I wanted to point that. Here's what financial assurance looks like to me. I called on Bill 25 years ago and I probably haven't seen Bill in 20 years. Adam, my son up here, will be calling on Dave, and you could replace any one of us with 20, 30, 40 other vendors that are here tonight, and it's the same process. It's the process that financial assurance is that the Iron Range is evolving. Taconite is always going to be here, but we have the opportunity, with PolyMet, to do something completely different, and to take that next step in the evolution of mining. We support PolyMet 100 percent. We thank you for the commitment that you've done in good science and preparing them for this project. So thank you, and thank PolyMet for being a part of this. BECKY SAHR I'm Becky Sahr and I defer my time to Bud Stone.

Wade Johnson 40443

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. There is enough destruction taking place on this planet already for the sake of easy money. When it gets to the point of sacrificing our environment as the Polymet proposal does, it must end. I have enjoyed lots of time spent in northern Minnesota and hope to continue to do so. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Wade Johnson 4720 13th Ave S Minneapolis, MN 55407-3558

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, Northern Minnesota is a special place because of its clean water and valuable wildlife habitat. I am fortunate to have visited several times, and I hope to do so again. Therefore, I have major concerns about PolyMet's plan to mine sulfide ore in the region as described in the Supplemental Draft Environmental Impact Statement. I believe the SDEIS is insufficient and should not be approved because it proposes no mitigation for indirect damage to wetlands and is lacking vital information about long-term water treatment needs and how they will be paid for. This information is necessary to fully assess the environmental impacts of this proposal. PolyMet seeks to mine in high quality wetland habitat that is presently in federal (that is, public) ownership as a part of the Superior National ForeSt The mine, if built, will destroy more than 900 acres of wetlands, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream and into Lake Superior, an important resource in itself. Beyond the inadequacy of the SDEIS cited above, the damage to wetlands and forest habitat will affect many kinds of wildlife directly, including four bird species identified as of greatest conservation need: spruce grouse, black-backed woodpecker, northern goshawk, and boreal owl. In addition, birds that depend on fish and other aquatic organisms for food, including belted kingfishers, hooded mergansers, common terns, and common loons, will be harmed by the decline in water quality both locally and downstream. For these reasons, I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this dangerous proposal by PolyMet to mine sulfide ore. Thank you for considering my comments. Sincerely, Mr Wallace Elton 36 Curt Blvd Saratoga Springs, NY 12866-8913

COMMENTS ON POLYMET SDEIS JAN 22, 2014 Revised 2/26/2014: Only 10% of the water in the world is fresh water. The second largest fresh water lake in the world is Lake Superior. Fresh water is essential to all forms of life. We cannot survive without fresh water but we can survive without precious metals until they have proven technology available to insure non-pollution. New high temperature and acid leach extraction techniques make precious metals mining doable and profitable, but also polluting. The POLYMET representative stated that the acid is absorbed by the metal – is this true. The MPCA should halt mining production immediately once the pollution hits a minimum level if Polymet is allowed to mine. Lake Vermilion is already considered an impaired lake with fish consumption advisories regarding mercury. Also the Vermilion River. The pollution levels are already above minimums due to the Minntac mine. I would like to know if and how many mines the MPCA has stopped from production when the pollution minimums allowed are reached. Stopped until the problem was solved. How many precious metal mines are there in the world that have pollution probleMs The one in Finland is one for example of sulfide mining having probleMs If Polymet is interested in the environment, instead of all their advertising, they could have spent the money cleaning up the two polluted ponds at the mine site. This would have been a much better advertisement to show their interest in the environment. It would please me more to see greater effort to develop non-polluting technology before beginning mining. Thank you, Marcie Moe 3331 Nisen Dr Tower, MN 55790 P.S. I really would like for the St Louis River be tested for pollutants to establish a baseline. Plus, it makes no sense to use all the taxes Polymet will be paying to pay for the cleanup of the pollution left behind. The effect of mines in Finland at the present time: Talvivaara Mining Company plc (HYPERLINK "http://en.wikipedia-org/wiki/Finnish_language"Finnish: Talvivaaran Kaivososakeyhtiö Oyj) is a HYPERLINK "http://en.wikipedia-org/wiki/Finland"Finnish-based HYPERLINK "http://en.wikipedia-org/wiki/Nickel"nickel mining business operating in HYPERLINK "http://en.wikipedia-org/wiki/Finland"Finland. Listed on the HYPERLINK "http://en.wikipedia-org/wiki/London_Stock_Exchange"London and HYPERLINK "http://en.wikipedia-org/wiki/Helsinki_Stock_Exchange"Helsinki Stock Exchanges, the company is a constituent of the HYPERLINK "http://en.wikipedia-org/wiki/OMXH25"OMXH25 index. Sulphate emissions vastly exceed limits. Neighbours complain about dust and odours from Talvivaara mine print this "Are we supposed to sit quietly and suffer from the dust and odours. Our houses, land, and shoreline are worthless", says Salme Kananen, 67, as she bakes bread in her house in the village of Taattola in Sotkamo in the east of Finland. Nearby is Lake Hakonen, whose surface has started to bubble in a strange manner. The Talvivaara nickel mine is five kilometres away. "There are three large anthills on the shore of the lake. Last summer all of the ants disappeared. I have walked along the lakeshore since I was a child, and I have never seen anything like this", Kananen says. Salme's husband Juhani Kananen, 68, shows the rainwater collectors in the back yaRd Kananen says says that samples are taken from the collectors once a month. "Not much has been found. In the winter the snow is like a layer cake with layers of black graffiti duSt The prevailing winds are from the southwest where the mine is located." When the smell is strongest he will not even venture out to the mailbox. He says that the hydrogen sulphide aggravates his asthma. "We were hoodwinked when they set up the mine. They promised that the extraction of metals involves a closed cycle, and that nothing would spread beyond the mine area", complains neighbour Alpo Partanen. Partanen is a member of the Sotkamo municipal council. The council visited the mine on Tuesday bec

Walt Moe 18076

I am Walt Moe. First, I want to thank everybody for the efforts they put out the SDEIS. I downloaded that into my computer. It was quite lengthy, all 2,169 pages of it. But searching the SDEIS, I have found no concrete actions being proposed to be taken in case of things going wrong at the PolyMet mine causing irreparable harm to the waters of the Embarrass and Partridge Rivers, river watersheds and surrounding thousands of acres around these watersheds. The mining operation is predicted to last 20 years, and the remediation efforts to last at least 200 years, more likely 500 years, or even into perpetuity. To me, this is a poor tradeoff for the people of Minnesota. Murphy's Law states that if anything can go wrong, it will. Having spent my working life as an electrical engineer, dealing with making sure that if Murphy's Laws comes true, which it will, in whatever we do, we must have fail-safe triple-redundancy backups to avoid catastrophic disasters. My questions are how much monitoring is going to be required? For how long? How will it be handled? How quickly is a response going to occur? Who's going to make the decisions to curtail operations, and who's going to decide if it operations are allowed to presume -- or resume? As I understand the procedure, the above is to be spelled out in the actual permitting process, which I'm not sure will be subjected to the same scrutiny as the EIS. If it isn't, I would certainly like it to be. Again, I think that the approximately 300 jobs for 20 years versus 200 to 500 or more years of remediation is an extremely poor choice unless other alternatives can be explored. I don't think we're in a do-or-die situation yet where we can't exist without mining these precious metals. Thank you.

Walt Niemiec 38933

This is an amazing story and I'm bewildered at the potential of this becoming reality. The DNR gets into such a tizzy about slot limits on walleyes to the point of total buffoonery yet something as deliterious as this mining operation seems to be a definite possibility. I'm for economic development, people need jobs, but this cost is far too high. I believe it should wait unless and until a less obtrusive mining procedure can be developed. Walt Niemiec 16740 Upper 1st st so Lakeland Shores, MN 55043 651 436 5650

Walt Seibert 18240

It’s Walt, W-A-L-T, Seibert, S-E-I-B-E-R-T, 345 Edgewood Avenue South, St. Louis Park, Minnesota, 55426. My comment is that I don’t want us to stand in the way of progress, but I also want to be very sure that we know that the standards that have been created are correct and will prevent damage to the either land, rice, water, air, and I guess also I’m concerned about the sound pollution, as well. And that’s it. I just want to make sure that the standards that have been created have been created in a thoughtful process, and have been signed off on by all of the appropriate agencies with the needed knowledge. And of course, I am out of the ‘60s and I’m skeptical. Thank you.

Walter Prentice 39203

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Walter Prentice 1850 Vermilion Rd Duluth, MN 55803-2509 (218) 730-9973

Wanda Ballentine 9665

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Wanda Ballentine 1181 Edgcumbe Rd 314 St Paul, MN 55105

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Minnesota has never permitted a project that would destroy this many acres of wetlands. Wetlands are of enormous value and so many have been destroyed throughout the US. They are PARTICULARLY necessary as we are getting both more floods and drought. Wetlands can hold water during floods and maintain water during droughts. Further, they filter the water and increase it's purity. And then, the idea that following the close of the mine would require hundreds of years of treating polluted water.. Always there is the statement that jobs are the necessity for any proposed business. How long will the jobs last - a lot at first, but much fewer later - relative to the years of treating the polluted water. Will PolyMet PAY for treatment. Or - as so often happens - will they go bankrupt and leave it up to the taxpayers . The decisions about PolyMet will have ramifications right up to the edge of the Boundary Waters Wilderness. There is sulfide mine exploration and development happening along the South Kawishiwi River and on the shore of Birch Lake right now. If Minnesota allows this industry with an unbroken record of water pollution into this area, the pure water that is the lifeblood of the Boundary Waters would be severely threatened. According to what I read, PolyMet's studies contain inaccurate water data that must be corrected - this lack is true of I don't know how many extraction proposals made in this country. They always come through saying there are minor risks - but major risks are found after the fact when it's too late. I keep thinking of Fukushima, Duke Energy, Freedom Works in West Virginia, etc Likewise, the mine plan lacks analysis of human health impacts from mercury and asbestos-like fibers - then I think of Deepwater Horizon and the health disasters caused the people there - though they were told everything was safe, or the fish from waters near Fukushima - but also to California, of the tremendous problems caused by "fracking"with water and air pollution. Governments and corporations will always swear things are just fine, but observing all the health and environmental disasters that occur regularly, there is no reason to believe them. Sincerely, Ms Wanda Ballentine 1181 Edgumbe Rd St Paul, MN 55105 (651) 200-3093

Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Wanda Ballentine 1181 Edgcumbe Rd 314 St Paul, MN 55105

warren 41249

Lisa Fay MN DNR Lisa, My findings are that the Draft EIS(SDEIS) does in fact cover all areas of environmental concerns and the PolyMet Mining Project should be allowed to proceed. Thank you, Warren Johnson 1003 South 2nd Ave East Ely, MN 55731 218-365-6360

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Warren Fries 2941 Corte Diana Carlsbad, CA 92009-5913 (949) 487-0830

The monitoring of the mine site will required hundreds years of support. The mining co and the government will more than likely not fulfill its obligations for cleanup and mitigation …. This is the pattern for most mining and industrial pollution sites historically. The trace off is too great … 200 jobs and 20 years of extraction vs centuries of pollution and destruction. I do not trust the corporation to fulfill its obligation once it has extracted all the metal wealth … short term $ long term problems.

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Dear Mrs Fay, I am greatly concerned with the future prospect of what the Polymet Mine means to our great states water resources and the overall health of our states environment. I understand that there is a great need for high paying jobs in the northern iron range area, but I feel that the potential costs that the Polymet proposal holds are so huge that the possibility of several hundred high paying jobs for twenty years pales in comparison to the enormous negatives that this project represents. At a time when the world is running out of drinkable water, we are looking at the possibility of one our our states watersheds being poisoned for potentially hundreds of years is absolutely insane. I feel that the potential costs of this project are so large that the process of reviewing the proposal should be stopped immediately. But I also understand that the corporations, both domestic and foreign, hold so much sway that our regulartory agencies cannot simply stop and protect the public without a lengthy review. That being the case I would like at a minnimum that the DNR do the following: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I do not want the resources of our state to ber squandered for this and future generations so that a twenty year windfall can be realized by a few interests.

58107

The proposed project by PolyMet Mining is a rash and irrational proposal. The questions raised by the speakers regarding the inaccuracies of the watershed in the area around the proposed site need to be addressed and possibly investigated as to why the watershed was not shown correctly. The insanity of this proposal and the cost environmentally of proceeding with this project far exceed the benefits that will be realized for an estimated 20 year period.

wayne sheridan 40365

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, wayne sheridan custer sf, CA 94124 US

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Wayne Veasey 54211

I believe you shouldn’t build a mind because it’s gonna pollute the air and also flood the lake with mud and bad chemicals. It’s gonna hurt people and ruin the nature. It affects lakes, rivers. Over just getting copper. You can get copper somewhere else.

Wehr Jeff 21355

I have owned land and fished the ely area for the last 20 years. Big birch lake was one lake that was mined over the years and since then the fishing has been bad. These people did not bring the jobs that they claimed to bring to the state.I no longer fish that lake because of the mining.What makes you think this company will bring any jobs to the area.Problem with big mining is the ones setting back collecting all the cash do not care about and they don’t come out and look what they have done to the state environment they just sit back and laugh and lie to people.We as the people of this great state of Minnesota should have learned long ago about these people instead of letting big money win all the time.The walleye is the most reason why people come vacation to the state.Are these waste ponds going to be controlled for runoff.The problem with that is by the time we find out about runoff it is to late and giving them a fine ha they have so much money they don’t care.I am going to go to one of these public meeting to see if I can put one of these people on the hot seat and see what the answer are.These mining people do not care about the state and we need to send them on there way and they can mine in there own backyaRd Thank You. Jeff Wehr

Wendy Griffin 18146

My name is Wendy Griffin. G-R-I-F-F-I-N. I live in Lake Elmo, Minnesota, which is on the east side of St. Paul. I am a natural resource specialist. And for the better part of my career I have been doing water quality testing on the east side of the metro area. And I'm sure we're all aware of some of the water issues that are going on down here in the metro. People that live east of me have been dealing with bad water, groundwater, for a number of years as the plume is moving closer to the Saint Croix. I'm asking that the state step up their control and oversight on the PolyMet site. If the state can step up and do their job, it should be a good go for both of us. The state was built on the backs of agriculture, tourism, and mining. I would like to think that we in this state, who voted for an increase in taxes to keep our water clean and clear and useable for our future, would be able to get through this issue that we all can get along peacefully and still make an income and keep our clean water. I'm speaking behalf of a friend of mine who is from Stillwater, Minnesota, who is now living in Spain. They had a television program that said, "If you had 24 hours to live, what would you do?" She said, "I would get on a plane and go to the Boundary Waters for the last eight hours of my life." It's a great place to go. It's peaceful. It's wonderful. It's a gem. One of the gems of the world. And I would like to see it stay that way. But I would also like to see the fact that we would be able to keep people employed not only in the mining area but also out in the outstate of Minnesota, who people in agriculture are also losing jobs as their young people are moving to the metro. Thank you. And thank you all for coming.

Wendy Haldorson 6196

I truly would like to see the permits issued and to have this project move forwaRd I grew up in Silver Bay MN and my father was a miner all of his life. Having come from a family with six children and raised on the wages of one mining job, all six of us kids work and pay taxes in the state of MN. We are all married, have children and all of our children also work and pay taxes in the state of MN. I own my own company in Duluth MN, operated it for 21 years as of today. I have has several employees through the years. My oldest brother founded/owns a company in MPLS for the past 30 plus years, employing over 100 employees, mostly high paying engineers, all paying state taxes, etc Again, all from the one mining job my father was blessed with for nearly 43 years. If it was not for that one mining job, we would have potentially been raised in another state where mining is more accepted and I can guarantee we wouldn't be living in this state as we probably would have stayed in the state we were raised. It is extremely important to let PolyMet prove the can mine safely in this state with the technology we have today. Not only does our state need jobs and revenue, our country needs this. Thank you, Kirk D. Haldorson Sent from my iPad

Wendy Hansen 44397

I am writing to state that I am against the proposed PolyMet Copper Mine in Northern Minnesota. I don’t feel that putting jobs ahead of public safety can be justified. I have made my living in Grand Marais, Minnesota and our economy is founded on clean water. Please don’t let a company from India put our safe, clean water at risk. Thank you. Mark Hansen, boatbuilder 1217 Old Shore Road Grand Marais, MN 55604

Wendy Jerome 4190

Dec 22, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The public may be easily misled into welcoming sulfide mining into the state, since we have a long history with iron ore mining and taconite. However, sulfide ore mining will change the face of northern Minnesota forever. Our watersheds are huge porous underground resources that sustain a world-celebrated wilderness. 100% of sulfide mines leak toxic carcinogens and sulfuric acid. The ancient Greek and Roman mines around the Mediterranean are still leaking today. We can count on the death of aquatic life and the terrestrial life - including human beings - dependent on it, if sulfide mining is allowed in Minnesota. Some think that sulfide mining would bring jobs to MN. On the contrary, it would bring a few hundred part time and full time jobs, that would be intermittent, given world ore prices. The mining would last 20 years. Minnesota would loose a slowly, but steadily growing recreation economy - and wilderness that is a world treasure for the world. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Rev. Wendy Jerome 37 Upton Ave S Minneapolis, MN 55405-1943

58111

Thank you for the care and detail in the studies done to date. I believe permitting sulfide ore mining in MN is a risky undertaking that is nearly certain to destroy a growing recreation economy, water quality, wildlife, plant life and aquatic life and a natural heritage we preserve for the world. 100% of mines leak. Exchange of mine lands for private lands still robs wild life and future human visitors. They lose ultimately, irretrievably with land exchange.

Wendy Moylan 40188

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. I am very sympathetic to the need for jobs in northern Minnesota, however I strongly urge to you stand strong in supporting ONLY projects that will move forward the goals to reduce greenhouse gas emissions. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Thank you for your consideration of my position. Sincerely, Ms Wendy Moylan 800 Lakeview Ave Saint Paul, MN 55117-4022 (651) 731-5370

Wendy Paulsen 46979

Please accept my comments regarding The PolyMet NorthMet Supplemental Draft Environmental Impact Statement (“PolyMet" / "SDEIS”). As an organic inspector I constantly observe and work with the push and pull of utilizing natural resources rationally, reasonably and as sustainably as possible while simultaneously maintaining productive and successful businesses. The organic agriculture industry provides examples which show that with good intention it is possible to find reasonable middle ground. It is clear that natural resource extraction such as mining and logging are necessary and it is quite clear that there are better and worse ways of doing them. Equally, if not more important, is that there are better and worse places to do these activities. We do not log the ancient Sequoia trees or other timber in our national parks. Likewise, mining sulfide containing ore in a wet, pristine environment like northern Minnesota is akin to grazing dairy cattle in the deserts of Arizona - some things just don't make sense. Obviously technologies and circumstances do change over time making things possible and reasonable where they were not previously - for example where 200 bushel corn was unheard of decades ago, it is common now. But there are too many concerns and not enough changes in technology or circumstances to experiment with mining in a place as spectacular and unique as northern MN. First I would like to say there are parts of the proposal that I do very much appreciate - including the re-use of the existing mine buildings. and the use of Reverse Osmosis, however there are simply too many open questions and issues to allow mining to proceed as proposed. Among my concerns are: 1- PolyMet would pose an ongoing pollution threat to the St Louis River and Lake Superior, long after the mining stops. The company’s own models show that hundreds of years after the mine closes, water at the site will be polluted with heavy metals and sulfates from the mine. Unless all of this water can be captured and treated, the mine will pollute groundwater and surrounding streams and rivers. Unfortunately, even the company admits that millions of gallons of polluted water will escape untreated every year. And it is my understanding that fractures in bedrock have not been adequately addressed. The SDEIS has no contingency plans for mechanical break-downs in the complicated filtration system that PolyMet proposes to treat the polluted water, even though that system would have to operate for centuries. PolyMet's water treatment system isn't prepared for the super-storms that are growing more frequent due to climate change. Planners used old climate models to assess impacts of heavy rain on the operations and pollutants. As the 2012 flood in Duluth showed us, we need to be prepared for much more severe storms to happen more often. Worse, PolyMet’s model doesn’t even prove that the pollution stops after 500 years. Instead, the company simply stopped modeling at 500 years. In other words, the pollution could go on for even longer. 2- In the PolyMet mine plan fails to discuss financial assurance adequately - there are no details of the amount and type of damage deposit adequate to cover the cost of treating polluted water for hundreds of years. Minnesota has never permitted a mine that would require hundreds of years of expensive water treatment. This public comment period is the best chance for the public to weigh in on whether the financial assurance required of PolyMet would be adequate, but there is only a brief mention of it in the mine plan. 3- The tax estimates in the PolyMet mine plan lack detail and are full of discrepancies. From one draft of the mine plan to the next the estimated taxes jumped 500% without explanation. This is important, since the state taxes that would apply to a copper-nickel sulfide mine have never been used before. The copper-nickel mining industry is exempt from several state and local taxes, s

Wendy Robertson 18349

Wendy Robertson. R-O-B-E-R-T-S-O-N. I am trying to sound as clear as I can with a bit of laryngitis, but I am a retired Duluth educator for the Duluth schools and also was a coach for the St. Louis River Watch Program, where I supervised students that work with monitoring the St. Louis River, with help in various scientific projects hands on. I currently live in northern Fairbanks Township, which is south of the PolyMet mine site, St. Louis River. I am also concerned and alarmed of the SDEIS plan to mitigate the 930 million (phonetic) acres that wasn't previously mentioned. The wetlands that will be eliminated by PolyMet's infrastructure, mine, waste piles (phonetic), et cetera, it is crucial that we take a look at it. The Federal US Army Corp of Engineers' mitigation role requires that (inaudible) before mitigation, which replaces the loss of wetlands, function within the same Hydrological Unit Code, HUC. The word to focus on here is "function." And the digit code refers to the St. Louis River Watershed and the Lake Superior basin. With this plan, functions of the wetlands will be lost by having the mitigation outside of our area. Having the compensatory sites in Simm (phonetic), Aitkin and Hinckley will not replace the loss of wetlands' functions to nature and the public. We are losing the services of these wetlands, which took nature thousands of years to develop, by accepting this plan's proposal to have 60 to 70 percent of the wetlands replacement in credits (phonetic) and other areas. The lands surrounding these wetlands are also indirectly altered and these will not be even considered in the total. The loss of wetlands' function will be a part of rampant and ongoing human and wetland destruction that is happening worldwide. I urge the Army Corps of Engineers to reject this SDEIS and require that Section (inaudible) insist on proper mitigation for the disturbance and destruction of these wetlands within the St. Louis River Watershed. If the people regard public input as vital to their decision making, I also request that the lead agencies extend the time for public comments by three more months; 108 days. And 2,000 plus pages is a lot to digest and make educated comments. Lastly, I protest having these three public hearings in January, which is the coldest winter month. The cold and icy weather may impair comments by the elderly, sick and the disabled. You are disenfranchising these groups. A public hearing does not expect to be disenfranchising the public.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Polymet SDEIS Commentary This brief commentary addresses several omissions, failures, shortcomings, and oversights within the Polymet SDEIS. First, this document fails to place the prospective mine within a larger historical, economic, and environmental perspective-the big picture (tbp)-necessary for comprehensive understanding and evaluation of its proposals; without such contextual broadening the document is reduced to a mere roster of data. Indeed, the SDEIS itself eschews any such contextual analysis (p. 6-1, "It is not possible, however "). Second, and as a result of the first, it fails in a host of particulars. TBP: AWOL from the SDEIS The primary failing of the SDEIS is that, seen from a broader perspective, it is internally inconsistent, reflecting a larger social schizophrenia wherein we demand both economic growth and a functional environment. Because the planet is already over-populated and over-engineered, environmental impact must inescapably accelerate as function of economic growth. The proposed mine is but an increment in both these latter processes. All economic activity necessarily involves material and energy transactions with our environment. These are three: 1) sourcing materials and energy (depletion), 2) spacing (eviction of nature), and 3) sinking (pollution). These requirements follow from the first two laws of thermodynamics, to which all technology is subordinate. That is, to manufacture any material object one has to source the constituent matter and transformative energy from the environment (the conservation law), make room for it within the environment (the conservation law), and release a compensatory waste stream into the environment (the entropy law). Each of these imposes environmental impact. Historically environmental impact has been of sufficiently small scale-reflecting a smaller human population and its required supporting economy-so that the impacts of the above transaction streams have been of little concern and have imposed few to no costs on the human population. With the meteoric growth of industrial society and the resulting impact, it has become increasingly evident that a degraded environment has serious implications for human well-being. At some scale the costs of growth outweighs the benefits and additional economic expansion becomes irrational: we end up poorer rather than richer, worse off rather than better off. This is happening because many costs are not being internalized, primarily, though not exclusively, environmental. The function of the SDEIS is to give the conditions under which mining is permissible, namely, that external costs will be adequately internalized. Approval of the SDEIS is neither a denial nor a mandate to mine. It is up to Polymet to make that decision-to balance expected costs and revenues under the stated conditions of the permit document. Only upon the condition of cost internalization does the interest of the company reflect the interest of society. If all costs could be internalized, the profit motive would be an effective "hidden hand" assuring that society's interests are being met, but costs-especially environmental costs-are complex and difficult to quantify, even difficult to understand and predict. Also, there is a historical complication to consider. Except for a passing remark in reference to iron mining (6-92, first full sentence), the SDEIS fails to explain the historical and geologic dilemma which all non-renewable resource (herein, nrr) extraction faces. Most people have heard of "peak oil" but do not understand the reasoning behind it, nor realize that this same reasoning applies, not just to petroleum, but to all other nrrs. Humans have been extracting and employing nrrs for thousands of years. As these are geolog

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 March 8, 2014 I live in NE Minnesota just SE of the Polymet mine and processing site. I harvest wild rice, venison, waterfowl and have an organic garden to sustain my family for the year. I live 1 mile from mineral exploration drill sites on land in the Superior National ForeSt For 33 years, I taught science in the Duluth Public Schools and supervised the St Louis River Watch Environmental program that provides monitoring and water quality bi-yearly as an after school program in co-ordination with Fond du Lac College. The focus is water chemistry and macro-invertebrates studies related to the health of the river and streams that are part of the St Louis Watershed. I was honored by Friends of the St Louis River as their 2006 educator of the year. The SDEIS has several issues in watershed mitigation that are not addressed. I related these concerns during the public hearing in Duluth at the DECC. I was fortunate to be selected as one of the 80 plus speakers to give testimony. Given that many others did not have the opportunity to speak only reflects the insufficient amount of time for public comment at hearings and the refusal to extend the comment period on this SDEIS. I am asking that the agencies involved to extend the comment period for an additional 90 days. The SDEIS does not address the cumulative effects of the additional mining companies that are waiting in the wings for future permits. They are watching to learn what happens as the Polymet process breaks ground in asking to be permitted. By ignoring this glaring omission, I can only conclude that you are not reading the investment brochures of mining companies that are seeking worldwide investors currently. Please read excerpt from next page. Excerpt from: press release 3/3/14 Duluth Metals Limited [mailto:HYPERLINK "mailto:info@duluthmetals-com"info@duluthmetals-com] Duluth Metals Continues to Identify Additional PGM Mineralization in the East Shore Area of their Exploration Lands Duluth Metals Limited is committed to acquiring, exploring and developing copper, nickel and platinum group metal (PGM) deposits. Duluth Metals has a joint venture with Antofagasta plc on the Twin Metals Project, located within the rapidly emerging Duluth Complex mining camp in north-eastern Minnesota. The Duluth Complex hosts one of the world's largest undeveloped repositories of copper, nickel and PGMs, including the world's third largest accumulation of nickel sulphides, and one of the world's largest accumulations of polymetallic copper and platinum group metals. Aside from the joint venture, Duluth Metals retains a 100% position on approximately 40,000 acres of mineral interests on exploration properties adjacent to and nearby the Twin Metals Minnesota LLC joint venture. I am asking you as a taxpaying resident in obviously the “emerging mining camp area of NE MN” for the state to not permit Polymet project. The SDEIS is inadequate in addressing the cumulative effects of additional mining proposals in the Lake Superior Basin. To deny that other national and international mining companies are just waiting to be the next in line for this extraction of finite resources is a crime of untruthfulness. All permitting agencies need to subscribe to the publications of the “Economist” magazine and Mining News if you doubt my comments. Respectfully submitted, Wendy Robertson 1998 Fairbanks Rd Brimson, MN 55602 218-848-2940

Dear DNR friends, I am writing to express my strong opposition to the PolyMet mine for the following reasons. 1- ENVIRONMENT Natural beauty and a healthy natural environment are not only important to the health and well-being of Minnesotans, they are also a crucial component of state, local and regional economies. A. Duluth recently reported $7-6 million in total tourism revenue in 2013- Certainly the primary draw for these tourists is natural beauty. Duluth is merely one of Minnesota's many tourist destinations. B. In the coldest winter in 139 years, over $10M has been spent by visitors of the Apostle Island ice caves, because of the powerful human desire to get outside and the human thirst for clean and beautiful places. These are but two small examples. Minnesota boasts countless beautiful natural spaces; it is what draws people to Minnesota and what holds them here. Therefore, preservation of clean water and wilderness will provide a more sustainable economic stimulus to state, local, and regional economies than mining. 2- SHORTSIGHTED ECONOMIC BENEFIT History has proven that mining is a boom and bust industry. With so many uncertainties surrounding this project, why would we take this risk with the potential burden falling on such irreplaceable forces as clean water, robust ecosystems, and human health. A. There is a tremendous market for copper scrap metal. A copper scrap metal recycling project would be a sustainable alternative to the boom and bust cycle of mining. Copper scrap metal fulfills 1/2 the US demand for copper. The US provides 23% of the world's supply of recovered copper. B. PolyMet "promises" jobs for iron range communities. How many of these jobs are a guarantee. What percentage of these jobs will actually be allotted to local workers. What percentage of the vast profits of mining will actually fall into the hands of Minnesotans versus a few wealthy individuals who arrive along with the mine and leave when it closes its doors. Minnesota does not deserve to bear the burden of so much risk when likely so little lasting benefit, economic or otherwise, would exiSt 3- BURDEN ON INDIVIDUAL MINNESOTANS The current PolyMet review fails to address in particular what potential burdens the individual Minnesotan might bear as a result of the mining project. A. TAXPAYER BURDEN - Once again, there are many unanswered questions here. Hundreds of millions of dollars have been spent in efforts to clean up industrial pollution of the St Louis River and cleanup is still not complete. Meanwhile, as a part of the Great Lakes Restoration Initiative, momentum has been recently building for significant federal funding (TAXPAYER DOLLARS) to be directed towards Great Lakes cleanup projects. Despite these ongoing projects, we are mulling over the possibility of a mining project that we acknowledge will pollute regional waterways for a minimum of 500 years.. B. HUMAN HEALTH RISKS - Mercury contamination is already a problem in area lakes, posing a major problem to humans and animals who consume fish from these waters - we already know that this is especially dangerous to pregnant and nursing mothers, infants, and young children. Sulfide mining is known to increase mercury levels in water. C. HEALTH RISKS TO POLYMET MINE WORKERS - The WHO lists 10 chemicals of major public health concern. Sulfide mining involves 5 of them: mercury, arsenic, lead, asbestos, and air pollution. All Minnesotans could potentially suffer the ill effects of these chemicals, but this is especially of concern to potential future employees of the mine. The current review is insufficient and leaves many unanswered questions, most specifically in regard to human health, environmental impact, duration and nature of cleanup and how the cleanup will be funded. Without knowing precisely what the risks are to the health of Minnesotans, the health of Minnesota's beautiful forests, wetlands, and waterways, and the burden on taxpayers, it woul

Wendy Schlueter 10936

On behalf of the Babbitt City Council, we strongly support the PolyMet copper-nickel project. We have utmost confidence that the State and Federal Agencies involved are extremely competent and thorough in their studies. We are also confident that the mining company and its entities will be in compliance in every aspect to promote this very important and necessary economical job source to Minnesota. The City of Babbitt also thanks PolyMet and the State of Minnesota for being open to the advanced technologies and compliances adhered to for fulfilling and challenging employment opportunities the mine will provide. Reported by Wendy F. Schlueter, Administrative Assistant

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Wendy Smith 9788

Dear Department of Natural Resources, Please do not issue mining permits to Polymet. I am concerned and quite fearful of the multiple negative impacts that the operation will have on our state. About a year ago I drove to North Carolina through West Virginia and was so saddened to see the economic and personal degradation that mining has left in an otherwise beautiful portion of our country. Several weeks ago, I narrowly missed being personally poisoned when I chose to drive to North Carolina circumventing West Virginia because of weather and road conditions. Listening to media reports of the impacts to the region during the week I was in North Carolina and now seeing that the leaks are far greater than initially reported is horrifying. My first concerns are about water supply both current and centuries long, and I shudder to think that Minnesota would invite an industry into essentially pristine environment on the short-term profit of so few when we know the consequences are so drastic in the multiple times this has happened to our neighbors in West Virginia. Please have the courage and confidence that you are backed by many, to say no. Thank you very much, Wendy Smith wendywally@msn-com 5017 3rd Ave S Minneapolis, M 55419

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Once the resources are affected cumulatively, short-term, and long-term, it takes a long time for recovery. Permanent damage stays with us for a long time, especially in the ground water and seeps into the food chain. It's not just the purity that's lost but the quality of all life as well. Try to think about this in terms of the land as having its own right to exist because it is the land who takes care of us. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Wenonah Skye 2537 Mutchler Rd Fitchburg, WI 53711-7011 (920) 857-8401

Wes Bailey 43244

I am writing to register my total opposition to PolyMet’s proposed copper-nickel mine near Hoyt Lakes. My wife is originally from West Virginia where they have so many dead rivers and creeks due to acid mine drainage. These rivers and streams ran clear, beautiful, and brimming with life for thousands of years until companies came along and extracted a couple decades of short-term profits from the land. The jobs and companies are long gone, but the rivers still flow dead- and in some cases yellow and orange. We CANNOT risk this happening in northern Minnesota. The short-term gains (the vast majority of which will go to out-of-state shareholders) are absolutely not worth the risk to our state’s clean and living waters. Thank you, James Wesley Bailey 2505 Elida Dr Grand Rapids, MN 55744

March 13, 2014 Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit Dear Ms Fay ~ My comments on the PolyMet mining proposal tell a different story than the two being told. My story does not now question the accuracy of information provided by the SDEIS and environmental groups, though it might in the future. It is not meant to sway you and the DNR one way or the other. Rather it is meant to ask you consider a third story. One of the existing stories is about environmental damage and a tourist-based economy. The other story is about economic vitality brought by hard rock mining. 31% of Minnesotans in a recent poll published by the Star Tribune (Feb. 21, 2014) say we are not sure of either story. So I am asking you to consider a third story. This story is about patience Minnesota used to get it right without doubt. It is a story about sulfide mining in Minnesota that is being done without any concern of acid mine drainage, because hard rock mining techniques and technologies have been refined and proven many times over elsewhere. It is a story about northern Minnesota communities having attracted job creation industries and businesses with the help of environmental groups that finally understood they must be a part of the solution to job growth. It is the story about how an antiquated 1872 Mining Act was finally abolished and how Minnesota reaped far greater profits from its minerals. It is the story about how the Minnesota DNR took a stand against impatience, and how it was able to say to Minnesotans that in the realm of the copper and other precious metals under our northern lands, a few or twenty more years will make no difference, but getting it wrong now will. And, it is the story about how environmental groups finally did something about the greatest threat to our natural treasures on our northern lands and waters, and helped find jobs that could compete with hard rock mining jobs. Sincerely, Wever D. Weed 2582 County Road 24 Long Lake, MN 55356 763-218-1849

White, Paul 15792

I am a proud graduate of the Ely Voyageur Outward Bound school. I have canoed, hunted and hiked in the area for decades. My sisters live in Embarrass and Edina. It is time to have jobs in the USA again instead of exporting our jobs and importing metals from foreign countries that pollute our planet. We cannot be a debtor nation for ever. We need jobs for all Minnesotans that want to work, not public aid because the government gets in the way of progress and employment. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its operations are legal and safe. The project should proceed. Thank you, Paul White 1104 Sanctuary Lane Naperville, IL 60540

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive $17-3 million and the state and local governments would receive $14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately $30 million, and the state and local governments would receive approximately $39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of $15-6 million and federal taxes of $64 million for 2011, a number far larger than the $30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of $3-12 million of state taxes and $12-8 million in federal taxes, increased by 500% to $15-6 million and $64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. To Lisa Fay, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive $17-3 million and the state and local governments would receive $14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately $30 million, and the state and local governments would receive approximately $39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of $15-6 million and federal taxes of $64 million for 2011, a number far larger than the $30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of $3-12 million of state taxes and $12-8 million in federal taxes, increased by 500% to $15-6 million and $64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differ

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action To Lisa Fay, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit B

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. To Lisa Fay, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. To Lisa Fay, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (Lynx canadensis). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as "speculative" in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only "Special Status Species" for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a "Special Status Species" in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states "Lynx utilize snow packed trails and roads as travel corridors," while on p. 5-366 it says "this species does not rely on roads for travel." 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. To Lisa Fay, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (Lynx canadensis). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage To Lisa Fay, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. To Lisa Fay, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk To Lisa Fay, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity To Lisa Fay, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." To Lisa Fay, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment To Lisa Fay, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standaRd The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this teSt PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. To Lisa Fay, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standaRd The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this teSt PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untre

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. To Lisa Fay, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. While receiving and looking at other research and the current Polymet Environmental Review, the danger of pollution brought on by sulfide mining is something that needs to be closely examined in the review. In the review it is stated that potential exists for the release of amphibole mineral fibers from the proposed operations, which could pose a potential public health risk of uncertain magnitude” this is extremely alarming to me. The fact that, that statement can be made in a project’s Environmental Review should let alone be the deciding factor in not approving sulfide mining in Minnesota. The health risks from mineral pollution isn’t accurately reported in the review, but should be required from Polymet, for the health of my state depends on it.Whitney Morgan1220 – 102nd Ave WestDuluth, MN 55808

57249

While reviewing and looking at other research of the current Polymet Environmental Review, I believe the detrimental effects from mercury that would be emitted is not accurately reported. In a letter approved by many Duluth area physicians it is stated that the review doesn’t report the amount of mercury that will discharge into our local watersheds. Due to this lack of information, the review is not complete for mercury pollution is extremely dangerous to our communities health and eco systems. Being a lifelong citizen of Duluth, I am so grateful for Lake Superior and its water supply. It is unjust that the quality of our watersheds would be threatened due to sulfide mining.Whitney Morgan1220 – 102nd Ave WestDuluth, Mn 55808

57250

While reviewing and looking at other research on the current Polymet Environmental Review, I believe the health effects of sulfide mining is not accurately reported. Many Duluth area physicians have come out to state that the review doesn’t properly deserve all of the health impacts that would come with sulfide Mining. As a lifelong citizen of Duluth and current UMD student, sulfide mining would threaten my entire communities health by exposing lead, arsenic, lead, asbestos and mercury pollution into our air and water. These threats need to be included in the projects environmental review, along with the major health impact they will have on my family, friends, and community.Whitney Morgan1220 102nd Ave WestDuluth, MN 55808

Will Mayer 39869

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Will Mayer 1883 N Ruby Ct Eagan, MN 55122-2173

Will Munger 13652

To: Lisa Fay, EIS Project Manager MDNR Division of Ecologicl and Water Resources Environmental Review Unit 500 Lafayette Rd St Paul, Mn 55155-4025 To submit comments by email, send to: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us Attached please find my written statement stating opinions and recommendations on the NorthMet SDEIS. Sulfide Mining Testimony Comments to the Supplemental DEIS February 12,, 2014 Presented by: Will Munger 401 Snively Road Duluth, Minnesota My name is Will Munger and I live in Duluth, Minnesota. I own and operate the Willard Munger Inn in West Duluth. This business has been in our family for over 50 years and depends upon people coming to Duluth to experience our natural areas. These activities include but are not limited to fishing on the St Louis River, hiking the Superior hiking Trail, Bicycling the Willard Munger State Trail, skiing and other out door recreational activities at Spirit Mountain and birding on the Western Waterfront Trail. Being in the hospitality business I fully understand the need for the encouragement of job creating development in our area. At the same time I fully understand what makes this area attractive for people to live here, visit here, and grow business here. Those qualities are, the abundance of clear clean water, beautiful albeit diminishing unspoiled forest areas and a natural habitat which produces bountiful and varied wildlife. In our country's short history there are fewer and fewer places within the continental United States where you can still experience vast wilderness areas that are available to large population centers. One such area is the water rich area of Northern Minnesota. This fact must be consideredwhen we consider permitting any activity that will effect this. One way I have chosen to work for the preservation and protection of our beautiful North Country is by serving as an active member of the following organizations: Save Lake Superior Association, St Louis River Alliance, Issac Walton League, Clean Water Action and the Superior Hiking Trail Association. While I do not speak now for these organizations I can say that the vast majority of the membership of these organizations share my concerns about the effects of Sulfide mining on this area. While all contamination of our water and air is and should be a concern, a specific concern that I would like to voice is in regard to the Lower St Louis River which very much impacts everyone who lives in Duluth. Currently we have fish advisories on this portion of the river which recommend consumption limits for eating Walleye and other game fish caught in the river because they already have high levels of Mercury. I am concerned that with the introduction of Sulfide mining this problem will only be exacerbated. With this in mind, I would like to see the EIS specifically address issues that can assure us that conditions, with specific regard to water quality, can continue to improve or at least be maintained on the river if permitting of sulfide mining is approved. It is my understanding that the Minnesota DNR was originally put in place to manage and protect our states natural resources. It is unfortunate that the DNR, is often now perceived, rightly or wrongly, as an agent or advocate of pro-mining interests. The DNR is perceived to willingly weaken it's own regulatory powers. With this in mind I would like to call for the contracting of an objective third party consulting firm to evaluate all aspects of the permitting process to insure that a fully objective evaluation process for approval or disapproval is done. As part of this I would like to request that a cost benefit analysis be done of the proposed North-met Project to determine if the benefits of sulfide mining outweigh the seeming high risk experienced with this kind of mining and the known impacts that such mining is known to hAve While I have many concerns about the EIS as presented, I have not been to the propos

will perry 38534

Water, not minerals, is the real resource of Northern Minnesota. I am concerned that over time pollutants will leach into the water and work their way into Lake Superior and other water systems in the area. I read in the reclamation section that PolyMet will engage in "Capturing and treating affected water using mechanical and/or non-mechanical methods for as long as needed". And that "Financial assurance (provided by PolyMet) would ensure that environmental management, including planned water treatment needs, would occur for as long as needed to meet environmental standards". I have several concerns with the "as long as needed" part of these statements: How, exactly, for the long run of years necessary to fully reclaim this site, will PolyMet remain financially available to pay the continued costs of reclamation. Will there be the political will to continue the monitoring of this site into the future. Will there be an economic downturn that leads to siphoning the funds for other needs or a drying up of the funds. As much as I respect engineers and what they do (my daughter is a civil engineering student at the U of MN) we all know that the best laid plans sometimes can go awry. Things fall apart or don't hold up. What can we learn from the 35W bridge collapse. What can we learn from the collapse of the dam above Jay Cook State Park. Was it natural wear and tear, lack of political will to engage in up keep, inherent engineering miscalculations or shortcuts, design flaws, economic downturns that bled out repair and upkeep funding, or a perfect storm of multiple impacts. Will there be a climate change that leads to unforeseen impacts. The plan looks good on paper. But we are talking about long-term impact on a precious resource in exchange for short-term gain. I think there are too many areas in which something could potentially go wrong for this project to occur in this vulnerable area of our state. Sincerely, Will Perry 13415 Europa Ct. N. Unit 8 Hugo, MN 55038 651-246-0084

Will Tajibnapis 7202

Dear Ms Fay, Dear Federal and State Agency Leaders: Amid the swirl of data, claims and counterclaims, one fact that no one disputes stands out: the pollution from mine tailings and waste heaps would last for at least 500 years. Setting aside money and resources, and making plans to control pollution for 500 years or more is simply impossible. So I propose that at this time permits be denied and the plan to mine copper be scrapped. I am confident that in the not-to-distant future technology will become available to mine the copper in a safer manner. Then the mining can commence. The copper isn't going to go anywhere. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Will Tajibnapis 3722 Grand Ave South Minneapolis, MN 55409

Willa Caldwell 42073

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Willa Caldwell Minneapolis, Minnesota

William (Bill) Gramer 43358

Dear DNR It appears that the SDEIS thoroughly vetted all the key environmental issues to insure Minnesota Environment is protected. Great work. I believe now the approval for initial permitting should be accelerated in further assist Minnesota enviroment through new form of tax revenue as the IronRange Job market experiences the positive economic multiplier effect of new safe jobs. Please contact me if you have any further questions. William (Bill) Gramer 7144 Jenner Bay S Cottage Grove, MN 55016-1373

William A Dotter 57218

Check the area north of our border with Canada, north of Hwy #61 to Thunder Bay, for damage to forests and streams from copper mining. We don't need copper that badly. I say no to copper mining.William A. DotterPO Box 3247 E Riverside RdEsko, MN 55733

_____ From: wforsyth@hensonefron-com [wforsyth@hensonefron-com] Sent: Monday, March 10, 2014 5:23 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing boaRd Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing probleMs The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, William And Karla Forsyth 2212 Irving Ave So. Minneapolis, MN 55405-2523

William Cunningham 36344

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Dear Ms Fay, I request that the MDNR allow a longer time for public comments on the SDEIS and a correction of the document to address issues of water flow measurement and mapping as well as the lack of convincing financial assurance for several centuries of monitoring and treating effluents from the project. Since 1970, I've been following the proposals to mine copper, nickel an other precious metals from deposits along the edge of the Duluth Complex in northern Minnesota. The mining companies always say they have "new technology" that will prevent pollution from escaping from the mine site, but I don't believe it's true. I've visited Sudbury, Ontario; Butte, Montana; and other former copper mining and smelting sites to see to see the effects of this process on the environment. I believe there has never been a sulfide ore mine that didn't eventually cause catastrophic pollution to its surroundings, and I don't believe the PolyMet mine will be any different. PolyMet says it will provide adequate insurance to treat effluent from the mine for hundreds of years. I don't believe it's true. Historically, once the ore has been plundered and the profits extracted, mining companies declare bankruptcy and simply walk away, leaving the public to clean up the mess. I think that's going to be the case if PolyMet is allowed to proceed. Glencore, the parent company of PolyMet has an extremely poor history of environmental, human rights, and labor abuses. This is an even greater reason to view PolyMet's claims with suspicion. The company has neither the reputation, financial resources, or responsibility to monitor and ameliorate pollution from their operation for centuries. It's especially important to get this decision right because there are other proposals, as you know, waiting to be submitted once they know PolyMet's fate. If PolyMet is allowed to go ahead, it will be much harder to stop other mines that are closer to the BWCA. It is criminal to consider polluting the water in Lake Superior, and it is even worse to consider poisoning the water flowing through the BWCA. Sulfide releases from mining and processing this ore will destroy important wild rice resources and violate treaty agreements with Native American tribes. The state of Minnesota should enforce strict sulfide pollution standards in all wild rice waters. There are technical problems with the Draft EIS that make it imperative to do a new and more thorough job of assessing the environmental impacts of this project. The fact that water flows in the Partridge River were miscalculated mean the the water model used in the Draft EIS is flawed and needs to be redone. Furthermore, I think there's an error in assuming that no water will flow out of the mine site and processing area into the BWCA. Groundwater contours in the "One Hundred Mile Swamp" where waste rock will be stored, show drainage into Langley Creek, which is a tributary of the Kawishiwi River, which flows through the BWCA and along the Canadian border lakes. Pollution of this waterway is an international issue as well as an environmental disaster. Thank you, William P. Cunningham 1764 Lindig St Falcon Heights, MN 55113

William Daniels 42262

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. I have a strong connection to the region, having worked as a dogsled musher and fishing guide in the area. The thought of ripping a hole in the ground and the other environmental risks that go along with it really make me cringe. Please make a wise decision. Sincerely, Mr William Daniels 1201 Elm St Northfield, MN 55057-2907

Feb 17, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

William Fischer 36314

As a citizen and taxpayer of Minnesota, the available evidence leads me to strongly oppose the proposed PolyMet copper mine. I'm all for creating jobs on the Iron Range, but a simple arm's length look at the situation should lead anyone to the conclusion that the short term projected benefits (mainly geographically specific jobs of dubious long-term value) could not possibly justify the long term likely cost externalities (mainly perpetual environmental costs) associated with the proposal. Unsustainable (one-time) resource extraction industries are precisely the type of industry that MN should be trying to get away from, I would much rather have my tax dollars spent on investing in the people of Minnesota, rather than on consuming our natural resources - and would gladly do so. Furthermore, corporate or business promises of paying for the cleanup are irrelevant - as soon as the mine is no longer profitable it will be closed and the shell company will just be bankrupted leaving MN with the damaging legacy of this project. Even if this were not the case, most companies today that do not employ practiced bankruptcy as a SOP simply do not exist long enough to pay for this type of coSt William Fischer 1070 11th Ave SE Minneapolis, MN 55414

The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

William Hane 18150

My name is William Hane. "Hane" just like the underwear. I'm a concerned citizen. I certainly know that we need jobs. It's nice to have a high-skilled job. I was a high-skilled worker. I'm now a low-paid worker. So I understand that scenario. There's never been a copper-nickle-cobalt mine that didn't pollute. We can't afford the pollution. That area is well polluted enough. Global warming is definitely affecting it and will continue to affect it well into the future. If the mining is so valuable, let's wait a while until we are really desperate and it will be even more valuable.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I’m also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won’t end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won’t allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, William Herzberg 1541 Sheridan st 6971 Cramer Rd Ely, MN 55731

The attachment is the same as below in case there are any probleMs Comments and Questions on the PloyMet SDEIS Full Disclosure I had a fortunate childhood growing up in Buffalo NY because I spent eight summers at a camp just outside Algonquin Park north of Toronto. This camp provided the opportunity to take canoe trips all over the park and instilled in me a deep love and appreciation for the beauty of the natural world. When I moved to Minnesota, it was because the Boundary Waters are here, and we purchased land outside Ely before purchasing a house in the Twin Cities. Now the Boundary Waters are threatened, and I am extremely upset and angry about it. My opinion is not humble. I will begin with general comments on the SDEIS and then move to more specific comments. A Comment about the Oral Comments I am a strong advocate for lotteries, having argued at length that we should be selecting members of the legislature by lot. (Dustin, 1999) However, there was a provision that allowed a speaker selected by lot to cede his/her speaking opportunity to another person. This provided the opportunity for a group of people to enter the lottery with an agreed upon plan to cede their speaking opportunity to a particular individual. This gave that particular individual much greater odds of getting an opportunity to speak. Since there were groups that attended more than one of the public meetings on the SDEIS, it is quite likely that this strategy was employed, particularly at the last of the three meetings. A Comment about Jobs No corporation is in the business of creating jobs. Jobs are just a cost of doing business. However, every rent seeker uses an appeal to job creation and national security (which politicians suck up) to obtain special favors such as tax breaks or the use of a resource. A Comment about No Action There is a built in bias against the No Action Alternative because the idea of no action is unheard of in capitalist economies. If anything, they are hyperactive in using the earth as both a source of raw materials and a sink for the pollutants resulting from their use. It is estimated that we need between three and five earths to support our current levels of consumption. A more nuanced conception of no action is found in the Chinese concept of wu-wei in the Tao Te Ching. (Star, 2001) A Comment about a Permanent Fund The mineral resources in question here are being given away for the permanent benefit of an alien corporation and a temporary economic benefit for a relatively small, but extremely vocal, group of Minnesotans. What has not been addressed is that the proposed action violates the ethical principle of generational equity. Future generations will be deprived not only of the use of the minerals, but they will be handed the negative externalities resulting from the pollution of the environment and opportunity costs in terms of enjoying the beauty of northern Minnesota and seeking recreational and spiritual opportunities therein. Since this low grade mineral resource is not going to get up and walk away, I suggest that, at the very least, permitting be suspended to allow the citizens of Minnesota to consider a constitutional amendment that would establish a permanent fund to compensate future generations for these losses. The fund would work as follows: Any corporation making a profit on the exploitation of Minnesota's resources will be required to make annual royalty payments into the fund. Corporations exploiting non renewable resources would contribute a much higher amount such as one half of their gross revenues. Corporations exploiting renewable resources would contribute a lesser amount, perhaps one quarter of gross revenues. The fund will be managed and audited by entities that are completely isolated from political control. Once the fund has accumulated sufficient assets, it will begin the payment of dividends to all citizens of the state. This will compensa

Feb 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. Mining with sulfide in northern Minnesota would be a short-sighted action that would deteriorate the health of the ecology and quality of life in the area. Long after the resources are tapped, our children will still be dealing with the toxins left behind.William O. O’Neill1702 North 24th StreetSuperior, WI 54880

William R Whiteside 18307

My name is William R. Whiteside. I am from Hibbing. I'm pleased be able stand here today in solid support of PolyMet and the crew of people who have been working so hard to make this a successful venture. They've spent $50 million or more trying to satisfy the demands that this kind of a project requires to assure that we are able to do this in a safe and efficient manner. I'm really pleased that the people who at PolyMet are local people of the highest caliber of talent in mining. It's very comforting to know that we have such fine people working there. And I'm very happy to see as we're looking forward the huge amounts of money -- billions of dollars -- that are going to be available to young people not only of the Iron Range, not only of Duluth, Northeastern Minnesota, but all of Minnesota to assure better educational opportunities, more solid infrastructure, better bridges, highways, hospitals. All the things that are necessary to a healthy and a good environment for people to live in. I still have a minute left. Seems like a long time when you get up here. So I think this is a great opportunity for all of us. I think it's a great opportunity for the people of Northeastern Minnesota. I'm glad that the glaciers have left for a little while and made these resources available to us. And I hope we can go forward as a state and as communities into a future -- I'm very confident in the water quality issues that will have been addressed, all the work that has been done. Thank you very much.

Comment: PolyMet Supplemental Draft EIS From: William Brewster Robbins 2277 Stillwater Avenue East Maplewood, MN 55119-3621 Supplemental Draft EIS is full of general information, but very short on details, especially details relating to control of water pollution and airborne dust pollution. I suggest that the lack of details would not allow a decision maker to know and understand enough to make an informed decision on this project. Control of water pollution: Reverse osmosis (RO) is given lip service in the Supplemental Draft EIS as the "cure" for water pollution. RO could help improve the situation, but only if the RO system is properly engineered, properly operated, constantly monitored and rigorously maintained. Of course, RO only separates the water into a cleaner stream and a more concentrated waste stream. Choice of operating pressure in the RO sets the ratio of flow of cleaner water to flow of wastewater. Without knowing the design operating pressure, a decision maker would not know the following: How much wastewater will have to be stored or treated by secondary methods. The intended size and cost of the RO system, including pre-filtration equipment. The costs of long-term maintenance, monitoring and repair of the RO system. Without adequate maintenance, monitoring and repair, the cleaner water stream will soon cease to meet even the minimum water quality standards. There seems to have been a focus on controlling water effluent from tailings. This is important, to be sure, but the huge amount of water, both meteoric and ground source water from the open pit will likely dominate water flow which needs to be treated, so sizing of the RO system needs to accommodate large, erratic flows from storm runoff. I understand that agencies that write permits and regulations often are expected to resolve many questions relating to operational details, but I suggest that such details are often overlooked by such regulating agencies. Control of airborne dust pollution: All the following generate airborne dust: Removing overburden, mining, transportation, milling to reduce size preparatory to froth flotation, and tailings storage. I found little mention in the Supplemental Draft EIS of sources of dust, design of equipment and engineering processes to minimize dust generation and remediation procedures to contain and dispose of duSt Boom and bust nature of the mining business: By planning for a 40-year period of mining, rather than a 20-year period, the removal rate of copper/nickel would need to be reduced. I understand that the up-front costs would be recovered more slowly, and this would generate reduced profits. Benefits to the long term economy, the people in the area, and the environment would result, and those uncertainties would decrease, issues associated with the long term needs of maintaining the site after active mining operations cease.

William Rudie 27497

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. This has happened within years, not decades or centuries and the impact of this pollution is devastating to our environment. The short form of the environmental impact statement could easily say " the unique and delicate environment of Northern Minnesota will be damaged. Mining companies have been unable or unwilling to do what is required to prevent polution caused by such operations in the past and there is no reason to think that this mine will be any different " As someone who grew up in Duluth and who has spent considerable time in Northern Minnesota, the Superior National Forest, and the Boundary Waters I have grave concerns about this project's potential impacts on our region's natural resources and public health. I appreciate the desire of those living in this area to have an opportunity for economic advancement if only for a limited time but the cost in permanent damage to this land and these waters is simply too high. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, William Rudie 4985 S Las Mananitas Trl Gold Canyon, AZ 85118-1853 (480) 288-5429

William Simmons 35263

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining should not be allowed in Minnesota as it will threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. If Lake Superior is affected so too will the rest of the Great Lakes. We know that acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. There is no reasonable expectation that a different outcome will be seen in Minnesota. With this great danger, I ask that this mine be stopped. It is not in the long term best interests of the United States, or Canada for that matter. As the leader of the World, the United States must take the lead in supplying long term solutions to environmental issues. Sincerely, William Simmons 6326 Van Buren Ave Hammond, IN 46324-1238 (219) 933-7477

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr William Turek 2372Como Ave,#2 Saint Paul, MN 55108 (651) 645-7671

I support the PolyMet mining plan assuming all safeguards to the environment are in place. This is a big assumption, but I trust the agencies and regulatory bodies have done thorough due diligence. I would not support the PolyMet plan if there is a 1% chance that MN could end up with a disaster like what has happened to the Upper Clark Fork River Watershed in Montana as described in Brad Tyer's book Opportunity, Montana. PolyMet must prevent, with 100% certainty, any "oops." in the form of water or air contamination, or any breach to the complete, long term containment of toxic byproducts within the mining operation. We do need copper, and I would prefer it be mined under close government scrutiny in Minnesota, than in other parts of the world where such over site is missing. Regards, William K. Wenger, PhD 500 Robert St N Unit 619 Saint Paul,MN 55101

William Wilton 57215

We cannot let economics or oil exploration and mining of our resources decide whether we will live or not. There is no question that unless topped, life will end or be badly mutated. Research to recycle and reuse what has been already extracted can bring many jobs is just a start. Remember tailings dumped in Lake Superior! Corp's fought responsibility. NO PolyMet! Please protect you and I and everyone.William Wilton524 Anderson RdDuluth, MN 55811

William Youman 58168

As a M.D. physician and BS in Wildlife Biology (MSU)j my research and education on this issue concludes the mining should NOT go forth and be NOT approved due to wildlife, water quality and health issues for local residents and all of MN and the water resources.

Dear Ms Fay and Mr Westlake: MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Ass

My name is Paul Schurke, from Ely, MN, and I'm deeply concerned about recent revelations of a fatal flaw in the PolyMet SDEIS. The situation brings to mind the pivotal scene from the Apollo 13 mission: "Houston, we've got a problem." We've got a huge problem with the PolyMet SDEIS. But this problem is not rocket science. This problem is so alarmingly simple that we should all be pushing the eject button on the PolyMet impact study. For 5 years PolyMet and various government agencies have studied the potential impacts that the nation's most polluting and toxic industry might have on the nation's most water-rich ecosysteMs For 5 years, we've been told to trust the science. Don't worry, they've told us, PolyMet's models will get it right. These models will determine whether a mine slated to operate for just 20 years is likely to pollute a headwaters of the Great Lakes watershed – the world's most significant freshwater resource - for hundreds of years if not forever. But now we learn that PolyMet's models got it wrong. They based the study on the wrong data. Their key parameter, stream flow volume, was incorrect. It's simple: to determine how much pollution might travel from the mine site to Lake Superior, you measure the flowage of the headwater stream that connects the two – the Partridge River. But the scientists we are asked to trust did not measure the flowage. They simply guessed using computer models. They guessed wrong. New data shows that at least 3 times as much water flows down the Partridge River than was wrongly assumed in their study. And here's the kicker: For 5 years scientists with native American tribes who know the lay of the land better than any of us warned the agencies that PolyMet's stream flow data was incorrect. The warnings of the tribal scientists were ignored. Why. Is it because much greater flowage might mean much greater pollution treatment costs than PolyMet is willing to pay. Is it because much great flowage might spread the pollution to a much larger area than PolyMet is willing to clean up. Is it because PolyMet's proposed treatment plants will have to process larger volumes of water for hundreds of years than any financial assurance package could ever possible pay for. If the agencies that prepared this SDEIS could not get a simple key parameter correct – the amount of water currently flowing from the mine site – how can we possibly trust them to accurately predict the impact of this mine on our watershed hundreds of years from now - when it will still be releasing toxins into our surface and groundwater. Because of this fundamental flaw, this SDEIS is fundamentally inadequate. We're told to rely on science to get it right. How can we if the agencies that are doing the science got it wrong. Let's start over before we risk permanent damage to Minnesota's lakes and streams and our nation's most significant watershed."

Wump 45062

To Whom it May Concern, Please reject the Polymet proposal as it would destroy the natural environment and compromise our waters. This cost significantly outweighs any short term financial gain that may result from the copper mine business. Thank you, Leila Jindeel

Wynter George 54182

Dear DNR, I think building a mine is a bad idea because it will effect our environment. It will destroy our rivers and are boundaries water.

Xa Peter Vang 54209

I am a student at Como Senior High School. I think we should not turn the boundary waters into a mine. I believe we should protect an environment that holds such beauty and serenity. The boundary waters is our last and biggest ecosystem in Minnesota. Pollution is a big problem all over the world and we all want to stop pollution, so why build something that will create more pollution. Sulfide mining will have a large impact to the environment; sulfide will turn into sulfuric acid and pollute the boundary water. We even created a low to protect the boundary water. The boundary water has been our largest wilderness since 1978 and it should be kept like that. The boundary waters is the icon behind Minnesota.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Yancy Rowlette 2749 polk St N.E. 28 th ave N.E. Minneapolis, MN 55418

Dear Ms Fay, Dear Federal and State Agency Leaders: The Environmental Impact Statement doesn't tell us how much mercury pollution will be seeping out of the PolyMet tailings into surficial waters. The bottom line is that we need MORE INFORMATION. Our children's health is at risk and people in the North Land aren't willing to risk that kind of potential harm. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Yasmina Antcliff, Honors Student at UMD, Mother of a seven year-old little girl, INFORMED VOTER Yasmina Antcliff 602 E 5th St #203 Duluth, MN 55805 2182607048

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Yasmina Antcliff 602 E 5th St #203 Duluth, MN 55805 218-260-7048

yvonne eckstein 40197

Dear Ms Fay, Dear Federal and State Agency Leaders: I believe PolyMet's open pit mine plan is deeply flawed and my concern as an old Minnesota resident is the long term potential harm to the environment.-water and air pollution from the mine site, leaching of heavy metals into wetlands and lake drinking water, loss of public lands in Superior National Forest, destruction of irreplaceable wetlands. PolyMet should be denied a permit to mine until the potential impacts of their proposal receive further study, and questions such as-will mercury loading in wetlands pose a risk to fish, to human and animal health; what are the actual costs of treating the water pollution from the permanent mine site waste rock and how long will PolyMet pay for it. The groundwater flow rates in SDEIS are inconsistent with "real world" date. What is PolyMet planning to do if their modeling predictions of no risk of water pollution from seepage both from the waste rock pile and the tailings pile do not hold true. I would ask the SDEIS analyze and study the potential impacts of some alternatives to an open pit design-like underground mining, putting liners under the permanent waste pile and the tailings pile. The opportunity to provide employment from the PolyMet project has strong appeal to some residents in the area-and jobs are are a real concern BUT I think the short term benefits of these few jobs are vastly outweighed by the longer term and possibly permanent damage to health and environment of Minnesota residents. Surely there are other better ways to provide employment. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely, Yvonne Eckstein yvonne eckstein 1912 dupont ave so #407 minneapolis, MN 55403

Zabelle Stodola 4698

Jan 6, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Let me say immediately that as a new resident to northeastern Minnesota, I am strongly opposed to the proposed open pit mine and land exchange. My husband and I retired to Duluth in 2013 to live near natural and recreational areas and to be closer to our cabin in the Superior National ForeSt We did not move here anticipating that an open pit mine and its processing facilities would open in the Arrowhead region and pollute the area. Whatever short-term economic gains might accrue regionally are simply not worth the long-term risks to the environment, to residents' health, and to the local tourist economy. I would like to remind decision makers that in the past, the taconite industry put private economic gain over health and environmental protection and dumped waste into Lake Superior with disastrous consequences. It has taken years to deal with that mess. The location of PolyMet's proposed NorthMet open pit mine is near important tributaries such as the Embarrass and Partridge Rivers. Therefore, the potential for acid mine drainage polluting the St Louis River and, crucially, Lake Superior is significant. In addition to the mine itself, the nearby Erie Plant, formerly a taconite facility, will be used for additional processing and will connect to the mine by a private rail system crossing public lands. Even worse, the mine and associated facilities could be expanded later because other deposits exist in the surrounding area. Allowing construction of the NorthMet mine is an open door to further expansion. I am also opposed to the land exchange PolyMet has proposed which would zero out critical federal environmental protections such as the Weeks Act. Strip mining is not permitted on Weeks Act land, so special legislation removing environmental regulations would be necessary in order for PolyMet to move forward with the process. Protection provided by the Endangered Species Act and the National Environmental Policy Act would also be removed by the exchange. Shame. Further, if this project goes forward, we could see legislation in the future that would fast track a land exchange largely to benefit multinational mining companies. The NorthMet Project would occur on land that has never been mined before. I understand that the Swiss corporate mining giant, Glencore, financially backs PolyMet and plans to sell the metals globally. This company, which owns approximately 25% of PolyMet, faces accusations of human rights abuses, environmental damage, and labor violations elsewhere. In short, the proposed pit and land exchange are not benign and will not benefit the area in the long run. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Zabelle Stodola 131 N Hawthorne Rd Duluth, MN 55812-1934

Strip mining is not permitted on Weeks Act land, so special legislation removing environmental regulations would be necessary in order for PolyMet to move forward with the process. Protection provided by the Endangered Species Act and the National Environmental Policy Act would also be removed by the exchange. Shame. Further, if this project goes forward, we could see legislation in the future that would fast track a land exchange largely to benefit multinational mining companies. The NorthMet Project would occur on land that has never been mined before. I understand that the Swiss corporate mining giant, Glencore, financially backs PolyMet and plans to sell the metals globally. This company, which owns approximately 25% of PolyMet, faces accusations of human rights abuses, environmental damage, and labor violations elsewhere. In short, the proposed pit and land exchange are not benign and will not benefit the area in the long run. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Zabelle Stodola 131 N Hawthorne Rd Duluth, MN 55812-1934

Zac Cerwinske 54335

Dear Ms. Lisa Fay, EIS Project Manager,I am writing this letter to let you know that I don't want the NorthMet Mining Project approved. The reasons I do not want the mine is because I am worried about the environment, especially the loss of almost three fifths of our wetlands on the proposed site. Wetlands can decrease flooding, remove pollutants from water, recharge groundwater, protect shorelines, and provide habitat for wildlife.Wetlands act as natural sponges that trap and release surface water over time. This ability to store water during heavy rainfall means that wetlands can help prevent flooding. Wetlands along the Mississippi River used to be able to store at least 60 days’ worth of floodwater, but now can only store 12 days’ worth of floodwater because most have been filled or drained. Without this natural flood protection people will also have to buy flood insurance.Wetlands have the ability to improve the quality of water by filtering runoff, removing sediment, pesticides, metals, and other types of pollutants. Wetlands act like a strainer that filters out the bad stuff. When this stuff enters a wetland, the wetland plants will take many of the harmful substances into their roots and change the harmful substances into safer ones before they are released into the water.As amazing as wetlands are, they do have their limits. A partially filled or damaged wetland can't fully control floods, or help to improve water quality. A badly degraded wetland can lose its ability to remove excess sediments, metals, pesticides, and other pollutants. Wetlands have the ability to provide environmental benefits, but they are not indestructible. If we want wetlands to continue to perform their ecological functions, then we have to do our part to protect them, and this is why I don't want the NorthMet Mining Project to be approved.Thank You,Zac Cerwinske

Zac Kenoyer 54345

Dear Ms. Lisa Fay, EIS Project Manager,I am writing this letter concerning the PGE mining in Minnesota. I have read the Project and Land Exchange Overview, Cultural Resources, And Water Quality Fact sheets on the DNR website. I think PolyMet mining has a good plan. I think they should find a way to minimize the Cultural resources effect They should change their plan so they do not bother the Ojibwe people. I think this mining will benefit Minnesota by creating jobs and getting us needed resources to use or export. Some disadvantages though would be the affect on the Ojibwe people by inconveniencing them during construction and ruining some of their historic land. Also another disadvantage would be the possible affect on water quality and the surrounding area. Some advantages of this project would be the creation of more jobs. Also getting resources that we could export if needed. This will affect cultural resources because it will affect three of five historic places during construction, excavation, filling, etc...Also the 1854 treaty specifies that its reserved for fishing, hunting, and gathering on this land that would be affected. I do agree with the land exchange offer although its affects on the Ojibwe. This will most likely not affect me right now. Depending on the affects of the project and possible pollution there is a possibility it could affect me later when they finish the mining. Although there are disadvantages and advantages of the project, I am in favor of the mining. I think it is good because it will create needed jobs for at least twenty or more years, depending on how construction goes.8th grade student,Zac Kenoyer

Zac Quandt 41926

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Zac Quandt Rochester, Minnesota

Zach Colatch 41142

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Zach Insheep 54190

Building this mine will bring us both positive and negative outcomes. We would be getting a large amount of copper, but the type of miing, sulfide mining, will pollute our watershed. In the process of building the mine we would be destroying natural water filters, wetlands, peat. Which would you rather have, clean drinking water or water that polluted by sulfuric acid? Worldwide we only have 0.024% of clean drinking water. We should not take our water for granted even if it is for copper.

Zach Kunkenborg 54193

I believe that we shouldn't mine – especially if the consequences are going to be bad. I mean we have one of the most pure watersheds up there, near the boundary waters and all, so why would you put a sulfuric mine up there and risk tainting the water? Also you get a lot of waste from this mining, think of all the waste this will create. I want my kids to grow up in a waste free world.

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

Zachariah Mitteness 37824

To whom it may concern, The polymet mine would jeopardize sacred manoomin (wild rice) which Is almost exclusively here in Minnesota, Wisconsin, and parts of Canada. not only that but the polymet mine would have an effect on the serene beauty of the boundary waters. It is one of the last serene places in Minnesota and the country. A high stakes mine such as polymet is not worth the risk. Thanks, Zac Mitteness 609 Bemidji Ave Bemidji, mn 56601

Zachary Behnke 54219

Dear Ms. Fay:I am Zachary Behnke, a 10th grader who attends Humboldt High School. I am writing about PolyMets proposal to start mining. If I don’t stand up and take care of the environmental impacts, we aren’t really a democracy. PolyMet has many problems with their plan and environment impact statement. One of the major problem with PolyMet, is that they re-drew maps to disguise the fact that the runoff from the mine waste piles will enter the BWCA. Not only do they need to get new, ACCURATE maps from the DNR, but they also need to test how much waste will flow to the BWCA and how long it will take to get there. Another major problem is the environmental impact statement shows the water will have toxic levels of metal at LEAST for 500 years. That will need constant treatment to make it safe. The MN DNR needs to get a water model that is capable of telling how many years it will take for the waste water metal levels to drop to the safe range. That being said, the environmental impact statement is a set up deal. It’s a way for PolyMet and people to provide jobs for 20 years at max, for at LEAST 500 years of toxic pollution that will destroy not only BWCA, but also destroy any natural parts of Minnesota left. I hope you do not allow these scandals to ruin generations of the great outdoors, and take away from the Minnesota culture. If you have any questions, or comments, please contact me at (651)-373-6605 or send mail to 2520 Rose Ave East, Maplewood, MN 55119.

Zachary Blankenheim 40036

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The moose is a truly iconic symbol of the Northwoods in Minnesota. The population is already in drastic decline with studies just getting underway to search as to the reasons why. Further decline in moose numbers may also impact the wolf population. Without the moose as a food source the wolf population will possibly rely more heavily on the white tail deer. If the numbers of white tail deer decline that will impact hunters and the amount of revenue that the area receives. Cause and Effect, period. Sincerely, Mr Zachary Blankenheim 3014 142nd Ln NW Andover, MN 55304-3242 (763) 432-6155

Dear Ms Fay, Dear Federal and State Agency Leaders: Back in the 1950s and 60s, there was a push to put dams in the Grand Canyon. Yes, you read that correctly, the GRAND CANYON. There were actually people who thought it would be ok to flood a large section of one of the world's most magnificent landscapes. Why. The promise of jobs and money of course. And, of course, the American public yelled and screamed and protested, and finally after a fight of nearly twenty years, the plan was dropped. Today, just the thought of flooding such a sacred place is almost laughable. How dare they put a price tag on the Grand freaking Canyon. It's America's Sistine Chapel. Well, that's exactly what is happening in the Northland today. One of our holiest landscapes is being threatened by people who just want to make a buck. The Boundary Waters Canoe Area Wilderness, yes, our beloved Boundary Waters, is being threatened by the scourge of Sulfide Mining. Now, it's taken a while for me to speak out against this, because frankly, I didn't think it would get this far. It is the BOUNDARY WATERS after all. I thought the people of the Northland would rise up en masse and scream, "Oh, no. Not here. You can take all your foreign money and mine or drill somewhere else." But apparently dangling this golden carrot has blinded some people to what is really at stake. Now, I could get all into the science behind how this form of mining has never been proven safe and what it could do to wildlife, wild rice, water, etc, but all of that has been written about time and time again. Even with all the evidence, some people are still not listening. There are still money-hungry zombies with dollar signs in their eyes. But I think there is a very simple way to snap them out of their trance and make them understand what is at stake. Just take them there. Take Governor Dayton, Senators Klobuchar and Franken, Representative Nolin and any other person with a stake in this issue and bring them to the Boundary Waters. Put them in a canoe and have them paddle for a week or two - let them listen to the loons, see the northern lights. Have them smell pine needles baking in the sun, feel the fantastic strain of a portage - let them live the "strenuous life" that shaped Theodore Roosevelt into our greatest president - a man who over 100 years ago created Superior National Forest and who would be appalled at the thought of destroying this very land. After spending some time paddling and portaging; sleeping under the stars and sitting quietly upon a rock; returning to their basic primordial rhythms, no one would think any sort of risk to this special place would be a good idea. I dare say that even Tony Hayward himself, the villain of the Gulf oil spill and chairman of Glencore (PolyMet's largest investor) would even say, "Blimey. We need to leave this place alone." Once, while skiing in Utah, I rode a chairlift with a family from Maryland. When they heard I was from Minnesota, the first thing they asked was, "Do you live near the Boundary Waters We go there every year. You are so lucky to live there. It's our favorite place in the whole country." There are many people around the nation who feel the same way. We may not know it, but many around the United States put our BWCA on the same level as Yellowstone, Yosemite or the Great Smokey Mountains. If we screw this up, it will be a national disaster. It'll be like we flooded the Grand Canyon. Sincerely Zachary Johns 7 Southview Dr Apt 7F Hibbing, MN 55746 218 340-8954

ZACHARY LORTON 3225

Dear Minnesota DNR, I am a resident of Minnesota who is 17 years old. I love the work you do and all the resources and wildlife refuges that you manage and care for. I am an avid hunter and fisherman and love to see what you do to keep the pristine wilderness healthy. However, recently I saw on the news that mining in the boundary waters might take place. I have taken it upon myself to research what kind of mining would be permitted and what the effects on the Boundary Waters may be. When mining in Areas near bodies of water it in inevitable that chemicals will reach and contaminate the water. When sulfuric acid leaks out from the metal mines it contaminates not only the lakes but also the groundwater. I can remember from the time I was young how clear the waters of the boundary waters are. I love to fish and have often found that fishing in the boundary waters is some of the best fishing I have ever had. Much of the reason is due to the abundance of fish in the lakes. If the lakes were to be poisoned by chemicals, much like many city lakes, the fish population would surely decrease. I couldn't help but research the effect that mining has had on other wilderness areas and I have found that in all the cases the measure taken to keep the chemicals out the lakes were only practiced at the beginning. No situation ever was able to have the wilderness back that they loSt I ask you to carefully contemplate the risks that you are taking. Will the Boundary Waters still be the same. What will happen to the wildlife. I know that you care a lot about the environment and I hope you can see why I have expressed concern. I love our state and hope that you do too. I wish that you will make the right decision, and help keep the integrity of out Department of Natural Resources. file:///C:\Users\JL-Home\AppData\Local\Temp\msohtmlclip1\01\clip_image002-jpg Here is a Picture from my last trip to the Boundary Waters, I hope when I return it will be the same and I hope that it would stay the same for future Minnesotans. Zachary Nelson 47577

Hello, my opinion is to not go ahead with the mine. The reasons are short and simple. First think of this project in the long term. The US is only 238 years old. At 200 years of clean up, we would just be finishing up Revolutionary War era mining projects. Secondly, the "jobs" created would be shirt term and would put Ely in the same position as Duluth in the 80s when it was dependent on miming and almost died when the industry fell through. Lastly, it is your purpose to protect the environment, period. We only have one northern Minnesota, please help us keep it amazing. Thanks Zach Nelson Duluth, MN Sent from Zach's iPhone

Zachary Pera Cole 39583

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Zachary Pera Cole 3522 Newton Ave N Minneapolis, MN 55412-2314

Zack Heuring 47400

Hello I am writing to you today as a concerned Minnesotan on the subject of the potential Polymet operation in Northern Minnesota. After doing my own research on Polymet, sulfide mining, and the environmental impacts I must voice my objection to this type of mining in Minnesota. My wife's family has deep roots in the Hoyt Lakes and Aurora and thus I've spent quite a bit of time in the area. Her Grandfather and many other family members have and had worked in the mines for years so the mining concept is not unknown to our family. What Polymet is looking to do has not worked in other locations and has almost always ended in huge environmental catastrophe for the area surrounding the mine. This part of our state is beautiful and raw, we cannot afford the hundreds of years of harmful effects for maybe twenty years of jobs. This is a short term fix to a long term problem on The Range and will not serve or state or economy well in the future. Please stand with me and help bring light to the realistic reality of Polymets proposal. Thank You, Zackary Heuring 2168 Cleveland Lane South Cambridge, MN 55008 763-913-6905 Sent from Yahoo. Mail on Android

Zdenek Mestenhauser 21373

TO: Minnesota Department of Natural Resources HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us FROM: Zdenek Mestenhauser, 4800 Lyndale Ave S, Minneapolis, MN 55419 HYPERLINK "mailto:mesten2958@msn-com"mesten2958@msn-com DATE: 2/24/14 I attended the public comment event on Jan. 28 in St Paul. This event was rigged with an intent to skew the outcome. It did not allow equal time for true public comment vs. industry comments. The DNR set the event up to favor industry input by allowing the unions to submit requests to speak, when there was actually no intention to speak and provide public input. The intention was to cede their time to industry leaders and elected official with prepared remarks. Industry has their time to present their side. This invalidated the public input and limited public. The public hearings have to be repeated to allow true public input in order to be valid. It would be immoral to approve this plan that promises the endless pollution of water and our environment. The PolyMet SDEIS has been shown to rely on an inaccurate water model and provides incomplete information about the health and environmental consequences of its proposed sulfide mine in Minnesota. I feel strongly that Minnesota DNR must require PolyMet to provide a plan that addresses the following: 1- Is water value estimated. Value of clean water is not calculated for the next 500 years. Climate/drought will make water more valuable. Climate change impact was not considered in the SDEIS. This need to be analyzed to better understand the long impact such a mining operation would hAve Several scenarios need to be considered. Raising sea levels will displace population; raising temperature will make Minnesota a better place to live. More severe and extreme storms will happen in the future. Calculations for 5,000 year storms need to be considered in the study. The water treatment plants have to be able to withstand those. 2- Reliability of water treatment addressed. As an engineer, I am quite aware that designing a machine with a life span of 20 years is typical. 30 year reliability is difficult. It is virtually impossible to design a system that will last 500 years. The plan has to address this topic to a great detail in order for experts and the public to assess if the design of such a facility would be adequate. The cost of such a facility has to be estimated. 3- Are industry assurances that it could be done safely valid. PolyMET claims that this process could be done safely. PolyMET has to show facts to support this claim. Research shows that there is not a single sulfide mining operation that does not pollute. There is certainly not one operating in such a water rich ecosystem. No approval should be granted unless the technology proposed is shown to be reliable operational for an extended period of time, such as 10 years. Perhaps a demonstration project in a reduced scale to something like 3% of proposed size should be approved firSt Only after this technology is validated on a much smaller scale, could that be increased in small increments. Such a controlled approach is the only responsible way to mitigate the extent of damage to our environment. 4- Is fish mercury contamination evaluated correctly. The DNR currently limits the amount of fish humans can safely consume. The proposed mining will increase the contamination of water with heavy metals including mercury. The SDEIS does not adequately estimate the impact of mercury contamination of fish downstream and including all the great lakes. The cost of mercury contamination in fish and other aquatic species could not be estimated. 5- Does the proposed mine plan keep Minnesota's water safe and clean. The USEPA gave the proposed mine its lowest ranking: Environmentally Unsatisfactory and Inadequate. Polymet's SDEIS clearly shows that after 20 years, there will be three enormous pits up to 696 feet deep full of water polluted with sulfuric acid and toxic heavy metals.

58127

Based on available information, pollution of clean water is inevitable. Today, we are adviced not to eat fish because of mercury pollution. It will only get worse. Financial assurances are insufficient! The cost of investigating pollution will be up to the public. It is not worth the risk. This technique has never been used successfully. Please do not gamble with our natural resources! Do not permit this mining plan. It could not be done safely. Clean water value goes up and will be going up with climate change. Let's not damage it if it is not necessary.

Zindzi McCormick 39588

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Please reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Zindzi McCormick 1128 Portland Ave Saint Paul, MN 55104-6941 (651) 983-5011

Zoerhof Peggie 39755

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Zoerhof Peggie 2530 Bridle Creek Trl Chanhassen, MN 55317-9372 (952) 937-5801

Form Letter 1: Mining Truth: Comments on SDEIS.
Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

2 Sierra Club	
Form Letter 2: Sierra Club. Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely,

3 Center For Biological Diversity	
Form Letter 3: Center For Biological Diversity. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public intereSt In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, ????? ????????	16430

4 Water Legacy: Comments on EIS	
Form Letter 4: Water Legacy: Comments on EIS. Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely

5 Water Legacy: Extend the Comment Period (A)

Form Letter 5: Water Legacy: Extend the Comment Period (A).
Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase.

6 Audubon: Protect our Water	
Form Letter 6: Audubon: Protect our Water Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely,

7 Water Legacy: Unacceptable Water Model		
Form Letter 7: Water Legacy: Unacceptable Water Model Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours,

8 Water Legacy: Tailings Basin Model		
Form Letter 8: Water Legacy: Tailings Basin Model Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles. • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours,

9 Water Legacy: Faults and Fractures		
Form Letter 9: Water Legacy: Faults and Fractures Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours,

10 Water Legacy: Incorrect Assumptions		
Form Letter 10: Water Legacy: Incorrect Assumptions Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. Yours sincerely,

Form Letter 11: Water Legacy: Underestimated Base Flow (B)
Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. Minnesota's interconnected water table, lakes, rivers, streams and watersheds (including Lake Superior) are too precious to the future of Minnesota to allow feckless exploitation. Sulfide producing mines are better managed in dry regions. Please listen to all the scientists who are alarmed by Polymet's proposal and faulty research. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs • The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Sincerely yours,

Mark Bridge		50107

12 Water Legacy: Partridge River Base Flow		
Form Letter 12: Water Legacy: Partridge River Base Flow Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs • The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. Sincerely yours,

13 Water Legacy: Sulfide Mining and Land Exchange		
Form Letter 13: Water Legacy: Sulfide Mining and Land Exchange Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public intereSt The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are threatened, endangered or of significance to tribes. •The SDEIS fails to study cumulative adverse impacts on moose of the PolyMet project and other activities that destroy habitat and increase global climate change. •The SDEIS fails to provide a cumulative analysis of impacts to clean water, plants and mammals that are significant to tribes and protected under treaties, throughout the tribal Ceded Territories in the Lake Superior Basin. In summary, please reject the PolyMet SDEIS as inadequate and reject the proposed PolyMet sulfide mine and Land Exchange as destructive to the public interest and harmful to tribal rights, clean water, vital habitats and the health of future generations. Sincerely

14 Mining Truth: Glencore	
Form Letter 14: Mining Truth: Glencore The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1) Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2) Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3) Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

15 Mining Truth: Moose		
Form Letter 15: Mining Truth: Moose The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of andquot;Special Concernandquot; by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a andquot;regionally common wildlife species,andquot; and a andquot;game speciesandquot; (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. Andquot;Habitat fragmentation and lossandquot; is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of andquot;Special Concern,andquot; and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

16 Mining Truth: Wetlands		
Form Letter 16: Mining Truth: Wetlands The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

17 Mining Truth: Wild Rice		
Form Letter 17: Mining Truth: Wild Rice Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standaRd The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it andquot;would have an acceptably high probability of not increasing sulfate concentrations in these areasandquot; (p. 5-5). The mine plan does not meet this teSt PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

18 Mining Truth: Mercury		
Form Letter 18: Mining Truth: Mercury Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

19 Mining Truth: Financial Assurance		
Form Letter 19: Mining Truth: Financial Assurance The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement andquot;inadequate.andquot; One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. Andquot;EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public andquot; As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

20 Mining Truth: Inaccurate Data		
Form Letter 20: Mining Truth: Inaccurate Data The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

21 Mining Truth: Cleaner Energy		
Form Letter 21: Mining Truth: Cleaner Energy The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1) Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2) Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3) Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

22 Mining Truth: Mesothelioma		
Form Letter 22: Mining Truth: Mesothelioma The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely

23 Mining Truth: Centuries of Treatment		
Form Letter 23: Mining Truth: Centuries of Treatment Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be andquot;maintenance freeandquot; at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that andquot;Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site andquot; Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be andquot;stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free.andquot; The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be andquot;maintenance free.andquot; Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

24 Audubon: SDEIS is "Incomplete"		
Form Letter 24: Audubon: SDEIS is "Incomplete" Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National ForeSt More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely,

Form Letter 25: Environment Minnesota EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely,

26 Mining Truth: Canada Lynx		
Form Letter 26: Mining Truth: Canada Lynx Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (Lynx canadensis). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as andquot;speculativeandquot; in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only andquot;Special Status Speciesandquot; for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a andquot;Special Status Speciesandquot; in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states andquot;Lynx utilize snow packed trails and roads as travel corridors,andquot; while on p. 5-366 it says andquot;this species does not rely on roads for travel.andquot; 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely,

27 Water Legacy: Deny the 404 Permit	
Form Letter 27: Water Legacy: Deny the 404 Permit Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps andquot;Section 404andquot; Clean Water Act Permit that would allow wetlands destruction in the Superior National ForeSt PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The andquot;compensationandquot; wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please: • Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance. • Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS. • Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions. • Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable andquot;indirectandquot; wetlands losses. • Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin. • Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceable wetlands and fresh water resources in the Lake Superior Basin for generations to come. Very truly yours, |John Walsh	20783

28 Mining Truth: Health Impact Assessment		
Form Letter 28: Mining Truth: Health Impact Assessment To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. We need to be vigilant of our precious earth, as we do not have another one. Sincerely,

29 Audubon: Toxins		
Form Letter 29: Audubon: Toxins Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition andquot;Say No to Oozing Toxins in Minnesota's Waters.andquot; on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely,

30 Minnesota Environmental Partnership	
Form Letter 30: Minnesota Environmental Partnership Dear Ms Fay: The PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) is fatally flawed, and needs to go back to the drawing board to be fixed. You should not burden the next fifteen generations with toxic water pollution and cleanup costs from a sulfide mine that hasn't been properly planned. PolyMet would operate for 20 years but, according to PolyMet's own data, would pollute water for over 500 years at the tailings basin, and over 200 years at the mine pit. The modeling results provided in the SDEIS show that PolyMet and the DNR simply did not look beyond 500 years. The fact that the SDEIS does not say when the mine pit and tailings basin will stop polluting our water is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models – or require PolyMet to run the models – long enough to show when pollution of our water by PolyMet's mine would cease. PolyMet proposes a complex mechanical system of pumps, pipelines, and filters that it says will capture and hold back the water pollution from getting into our rivers. PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long, long after the mining has stopped. It should be expected that mechanical systems like pumps, filters and pipes will eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality. But Polymet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment. By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine. PleIn addition, the SDEIS proposes to dump tailings from the mining process on top of the former LTV Steel's tailings basin, which was built in the 1950s on top of three streams, was designed to leak. In fact, the existing tailings basin is already leaking millions of gallons of untreated water, yet the chemical composition of that large volume of leaking water has not been tested and characterized. The failure to test and account for known leaks of untreated tailings basin water from the existing LTV Steel tailings basin is another major problem with the SDEIS. Moreover, the tailings basin and the dam holding it back from flowing downstream are recognized to be unstable. If the tailings basin dam were to fail, vast quantities of contaminated tailings, sulfates, and heavy metals would be released into the headwaters of the St Louis River. In other mines, such tailings basin failures have sent a flood of millions of cubic yards of toxic debris as much as hundreds of miles downstream. The failure of the SDEIS to fully consider the potential for – and the consequences of – a tailings dam failure is a deadly flaw in the SDEIS. PolyMet proposes a large open-pit mine in untouched, high-quality wetlands, that are located on public land owned by the US Forest Service. The SDEIS states that building an underground mine would have "significant environmental benefits" compared to an open-pit mine. However, the PolyMet SDEIS rejects underground mining, stating that in today's market conditions, underground mining is not considered economically feasible. The minerals will be there if and when the market prices are high enough to mine them right. Not fully considering the underground alternative is a major flaw in the SDEIS. Long after the mining has stopped, PolyMet would pose an ongoing risk to fresh water. The Embarrass, the Partridge, and the St Louis Rivers, as well as Lake Superior, are far too precious to be put at risk for so long by PolyMet in its present form. PolyMet should not be permitted unless, when the proposed mining stops, the groundwater and surface water is left in a clean condition, and surrounding streams, rivers, and Lake Superior are safe from risk of sulfide mine pollution. The PolyMet SDEIS suffers from many major failings. The SDEIS needs to be withdrawn, sent back, and fixed before it is returned for public comment.ase send the SDEIS and PolyMet back to the drawing board with directions to include contingency plans for predictable failures in the water pumping and treatment system, and the power supply to run that system.

31 Mining Truth: Alternatives		
Form Letter 31: Mining Truth: Alternatives To [Decision Maker], The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action

32 Mining Truth: Tax Estimates		
Form Letter 32: Mining Truth: Tax Estimates To [Decision Maker], The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive $17-3 million and the state and local governments would receive $14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately $30 million, and the state and local governments would receive approximately $39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of $15-6 million and federal taxes of $64 million for 2011, a number far larger than the $30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of $3-12 million of state taxes and $12-8 million in federal taxes, increased by 500% to $15-6 million and $64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates.

Form Letter 33: Unknown (Letter A)
I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.

34 Water Legacy: Health Risks		
Form Letter 34: Water Legacy: Health Risks Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. • Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: • Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. • Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. • Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. • Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1- Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2- Assessment of potential impacts on residential wells from tailings seepage. 3- Health risk assessment for on-site workers at both the PolyMet mine and plant. 4- Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury in fish. 5- Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis. 6- Assessment of all risks using a 70-year "lifetime" for exposures. 7- Assessment of cumulative risks of multiple chemicals and exposure routes (drinking water, fish, wild rice) on infants, children and the elderly. 8- Assessment of cumulative risk of toxic chemicals (mercury, arsenic) in fish, game, and wild rice on persons who rely on fishing, hunting and gathering for subsistence. 9- Assessment of cumulative risk of methylmercury contamination of fish in the St Louis River and estuary for Lake Superior. • Complete the mercury TMDL study of the St Louis River before finalizing the PolyMet SDEIS or issuing any permits for the PolyMet sulfide mine project. The PolyMet SDEIS is an inadequate assessment of human health impacts and the PolyMet sulfide mine and mine wastes proposal poses an unacceptable risk to the health of fetuses, infants, children and adults in Minnesota. Please reject both the PolyMet SDEIS and the PolyMet mine. Very truly yours,

36 Change.org	

Form Letter 36: Change.org
Dear Lisa Fay, Polymet's plan acknowledges that millions of gallons of polluted water will seep into the environment untreated, and the water they contain will need active treatment for hundreds of years. Polymet does not have a plan for mediating environmental disasters if they occur. Polymet's primary investors have a long history of environmental destruction and failure to clean up messes such as the BP oil spill. If any contaminated water is released (which Polymet acknowledges will occur), the wild rice crop will see severe negative effects. Wild rice is a cultural and economic staple to many native communities in Northern Minnesota. The majority of profits will not remain in the state of Minnesota, and Polymet provides insufficient details as to financial assurance needed to protect taxpayers in the future. Its not worth the risks, Poly-Met sulfide mining as currently planned should not occur in Minnesota. Minnesota's young people want a clean and vibrant future void of pollution. The youth say no to sulfide mining. Sincerely,

37 Unknown (Letter C)	
Form Letter 37: Unknown (Letter C) Our family owns property and resides seasonally near Ely, Minnesota. We believe the PolyMet SDEIS is inadequate and that this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance. We believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. 3) Absence of Planning for Inevitable Accidents and Failures -The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. -The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for Many Centuries -Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. -526 acres of land, covered by more than 167 million tons of waste rock, would be covered by a plastic sheet and surrounded by a system that would supposedly collect contaminated seepage. All would require monitoring and maintenance constantly for hundreds of years to fix leaks, repair perforations, and remove deep-rooted plants. -A mining pit "lake" would require pumping to prevent the toxic brew of acid and heavy metals from spilling into the nearby Partridge River, and a tailings basin pond would require pumping to prevent spillage into tributaries of the Embarrass River. -The polluted water collection system, which includes miles of pipes, would require monitoring and maintenance for centuries. 4) Financial Assurance is Inadequate and Not Credible; The Taxpayers Could Be Left with Enormous Clean-Up Costs; Polluted, Devastated Water and Land; and Economic Disaster -The SDEIS contains no credible information about the actual cost of monitoring, maintaining, and replacing the equipment needed to treat polluted water for 500 years or more. It provides no details about the nature or guarantees of a financial assurance scheme that would remain viable for 500 years, yet it does acknowledge, disturbingly, the possibility of events such as "unanticipated liabilities" and "failure or limitations on the ability of third parties to pay." It does not attempt to explain how a corporate entity could realistically be held accountable over such an absurdly long period of time. -Finally, even though the SDEIS admits that water pollution will last for a minimum of 500 years, its financial assurance section is an exercise in generalities. The actual cost of water treatment, monitoring, maintenance, repair, and reclamation is completely unknowable. The SDEIS says that PolyMet estimates initial closure costs of up to $200 million, with post-closure monitoring and maintenance costs of up to $6 million annually. The Grand Portage Band of Ojibway concluded that PolyMet's numbers are vastly below the actual amounts required. The Grand Portage Band calculates that the minimum amount that should be set aside for financial assurance at the outset, assuming a 3% return on the amount, is $90-5 billion. In summary, we believe the PolyMet SDEIS is inadequate and that this massively risky project should not be allowed proceed as currently proposed.

38 Water Legacy: Underestimated Base Flow (A)		
Form Letter 38: Water Legacy: Underestimated Base Flow (A) Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the U.S. Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams. • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

45 Ironworkers Local 512 (Letter A)		
Form Letter 45: Ironworkers Local 512 (Letter A) As a working member of Ironworkers Local 512, I support the PolyMet North Met project. The professionals at both the state and federal level have done their research as we can see in the SDEIS and I believe that they have exceeded expectations to ensure this is a safe site for workers and the environment. Not only will the PolyMet project be closely regulated for safety concerns, but it will bring work to Northeastern Minnesota. Over 350 stable jobs are expected to be created along with 2 million hours of skilled labor. Our communities need to be able to support our families and should not have to travel across the country to find work. The environment has been seriously taken into concern and the analyses found in the SDEIS show that PolyMet will do everything in their powering, exceeding standards, to ensure the protection of the people and the environment. We are very fortunate to have such pristine nature in the northern part of Minnesota which is why it is so important to let the experts do their job and provide us with the safest, most efficient way to proceed with the project. I am a community member of Northeastern Minnesota and an Ironworker and I support the environmental review process and the PolyMet NorthMet project. Sincerely,

46 Ironworkers Local 512 (Letter B)	
Form Letter 46: Ironworkers Local 512 (Letter B) Being from Northern Minnesota, I understand the concerns that people have with the environmental risks of the PolyMet North Met project. However, after attending the informational meetings about the project, and understanding the detailed analyses found in the SDEIS, it has become evident that PolyMet will not be placing its workers or the environment in any dangerous situations. I support the environmental review and I support this project. There are many positive outcomes to be had by the approval of the PolyMet North Met project. The amount of precious metals that we can recover from this mine can greatly reduce the amount of metals that our country imports each year. Additionally, as many as 1,000 jobs will be created (600 indirectly). This will give the region the tools they need to support their families and keep food on the table. The safety regulations and environmental regulations have been thoroughly addressed and I feel many will agree that this project will be handled responsibly. As a union Ironworker, we rely on professionals and experts to make sure the job will be safe and they rely on us to get the job done. We have become so technologically advanced that there are ways to make this project successful while still protecting the environment and workers. Many places around the world cannot say the same and they will be the ones mining for precious• metals and polluting our environment if we are not granted the opportunity to mine in Northeastern Minnesota. I support the SDEIS, the experts working hard on the environmental review process, and I support this project.

Dear Ms. Fay, The history of sulfide mining is one of toxic environmental degradation with no evidence that mining for copper, nickel, and other non-ferrous metals in the water-rich environment of northeast Minnesota can be done without great harm. Across the country, there is no example where a sulfide mine has been operated and closed without polluting surface or groundwater with acid mine drainage, sulfuric acid and/or toxic metals. The risk of pollution is greatest in a water-rich environment like Northern Minnesota, which contains watersheds for the Boundary Waters Wilderness, Lake Superior and the Mississippi River basin. The PolyMet open-pit sulfide mine is the first sulfide mine proposed in Minnesota. Pollution from this project would impact the Lake Superior watershed for eternity. This mining proposal needs to be rejected! Sincerely,

Re: **NorthMet Mining Project and Land Exchange**
Final Environmental Impact Statement
Notice of Errata Sheet – Reference-Related Corrections to the Final EIS

The Minnesota Department of Natural Resources (MDNR), the U.S. Army Corps of Engineers (USACE), and the U.S. Forest Service (USFS) have jointly prepared the Final Environmental Impact Statement (FEIS) for the NorthMet Mining Project and Land Exchange. The FEIS describes the anticipated environmental and socioeconomic impacts of the proposed PolyMet Mining, Inc. (PolyMet) NorthMet Mining Project and Land Exchange, located near the cities of Hoyt Lakes and Babbitt in northeastern Minnesota. The FEIS also responds to substantive comments received during the public comment periods for the Draft EIS and the Supplemental Draft EIS. The FEIS is posted on MDNR's website at: http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.htm l.

Interested Parties are hereby notified of an Errata Sheet detailing reference-related corrections to the Final EIS. The errata is posted on the MDNR's EIS project website as listed above. A copy of the errata may also be obtained upon request by contacting Lisa Fay, MDNR EIS Project Manager, at lisa.fay@state.mn.us.

Public review copies of the FEIS **and errata** are available at the following locations: the MDNR Library, 500 Lafayette Road, St. Paul; the MDNR Regional Office at 1201 East Highway 2, Grand Rapids; the MDNR-Division of Lands and Minerals Regional Office at 1525 Third Avenue East, Hibbing; the Hoyt Lakes Public Library at 206 Kennedy Memorial Drive, Hoyt Lakes; the Babbitt Public Library, 71 South Drive, Babbitt; the Duluth Public Library, 520 West Superior Street, Duluth; and the Minneapolis Public Library, 300 Nicollet Mall, Minneapolis.

The Co-lead Agencies take the opportunity to note the FEIS is available for public review for the period ending **December 14, 2015** at 4:30 PM CT.

Please submit comments by email to NorthMetFEIS.dnr@state.mn.us. All emails should include a name and legal mailing address. Comments may also be submitted by mail to:

Technical Memorandum

To: Bill Johnson, Minnesota Department of Natural Resources
From: Tina Pint and Jeré Mohr
Subject: Response to Cooperating Agency Comments Related to Peter Mitchell Pit – Version 4
Date: September 14, 2015
Project: NorthMet EIS (23690862.00)
c: Jennifer Saran, Poly Met Mining Inc.

This memorandum addresses comments and questions raised by the Cooperating Agencies related to the potential for groundwater flow from the proposed NorthMet pits north to the Peter Mitchell Pits (PMP) after closure of both mines.[1]

This memorandum focuses on two key points regarding the conceptual model for groundwater flow in bedrock at the NorthMet Mine Site:

1. Based on historic conditions at Peter Mitchell pits, regional information from taconite operations on the Mesabi Iron Range, and professional judgment, it was determined that future mine pits (NorthMet) or mine pits expansions (Peter Mitchell) should not cause significant drawdown in the bedrock units. That determination, in conjunction with the distance between the two mine sites, led to the conclusion that the conceptual model for the NorthMet Project environmental impact statement should not include the potential for groundwater flow north from the NorthMet pit to the PMP. Information on historic conditions at Peter Mitchell pit are discussed in Section 2.1 and Section 2.2, and other regional information is presented in Section 2.3.

2. The determination that groundwater is unlikely to flow from the NorthMet pit to the PMP is further supported by ongoing monitoring of water levels in bedrock at the proposed NorthMet mine site during different stages of mine pit development at Peter Mitchell (presented in Section 3.1), and the results from site-specific aquifer tests (presented in Section 3.2). Based on a review of recent aerial photographs and water appropriations permit pumping records, significant dewatering began in a portion of the Peter Mitchell pit complex near the NorthMet Mine Site in approximately 2003. Water elevation data from NorthMet bedrock wells indicates that this dewatering has not caused a drop in water levels in bedrock at the NorthMet mine site. This data strongly supports the conceptual model that future dewatering and long-term conditions at Peter Mitchell pit will not significantly affect groundwater flow directions at NorthMet.

---

[1] Closure of the NorthMet Mine is anticipated to occur in approximately 2040. Closure of the Northshore Mine is anticipated to occur in 2070.

Even though northerly groundwater flow is not reasonably foreseeable, PolyMet has committed to monitoring water levels in bedrock between the NorthMet Mine Site and Peter Mitchell during operations, reclamation, and long-term closure to confirm the conceptual model. Proposed monitoring locations are discussed in Section 4.2; details on specific monitoring requirements will be determined in permitting. A number of adaptive management options to prevent northerly flow of groundwater are available if future monitoring suggests such flow to the north could occur (see Section 4.2). A list of possible options are as follows:

- control the water level in the West Pit via pumping to insure gradients are inward
- maintain a groundwater mound between the PMP and NorthMet pits by injecting water via wells
- maintain a groundwater mound between the PMP and NorthMet pits by constructing an infiltration trench
- grout fractures in the NorthMet pits to minimize outflow

1.0 Background Data on Peter Mitchell Pits and NorthMet Pits

The information presented in this section provides background on the physical settings of the Peter Mitchell and NorthMet Pits. Large Figure 1 shows the Peter Mitchell Pit areas near the NorthMet project area. Large Figure 2 shows the long-term plan for the Peter Mitchell Pits. In this document, the names used for the Peter Mitchell Pit areas generally follow the naming used by Northshore Mining. Table 1 summarizes the estimated pit bottom and water surface elevations at the NorthMet and Peter Mitchell pits over time.

Table 1 Mine Pit Elevations

Period	NorthMet Pit Elevations (feet MSL)				Peter Mitchell Pit Elevations (feet MSL)(1)			
	West Pit		East Pit		Area 003 West(2)		Area 003 East(2)	
	Ground Surface	Water Surface	Ground Surface	Water Surface	Ground Surface	Water Surface	Ground Surface	Water Surface
Existing	1600	--	1600	--	1530-1580(3)	1624	1530	1568
Maximum Extent of Mining	940	--	920	--	1360-1380(3)	--	1360	--
Long Term (post 2080)	940	1576	1589(4)	1592	1360-1380(3)	1500	1360	1500

(3) PMP Area 003 West consists of two interconnected pit areas with different bottom elevations
(4) Top of East Pit backfill
-- Pit is dewatered

Geologic cross sections through the Peter Mitchell pits and the NorthMet pits, locations of which are shown on Large Figure 1, are detailed in Large Figure 3 and Large Figure 4. These cross-sections show both existing conditions and maximum extents of both the Peter Mitchell pits and the NorthMet pits. At their maximum extent, the Peter Mitchell pits will remain approximately 6,500-8,000 feet (1.2 – 1.5 miles) north of the NorthMet mine pits, and will be approximately 400 feet MSL shallower.

2.0 Data Used to Inform the Conceptual Model

2.1 Peter Mitchell Pit Historic Levels

Water levels in the Peter Mitchell pits are considered surface expressions of the water table in the vicinity of those pits. Information on historical water levels in the various Peter Mitchell pits were used to help inform expected conditions during future operations. Limited public information is available on the water levels within the Peter Mitchell pits. To estimate water levels in portions of the Peter Mitchell pits over time, a combination of aerial photography and topographic data sets (including contour data and LiDAR data) was used. Water levels were estimated for two portions of the Peter Mitchell pits, referred to herein as Area 003 West and Area 003 East (Large Figure 1). The results of this analysis are summarized in Table 2.

Table 2 Approximate Historic PMP Water Levels

Year	Data Sources Used	Approximate PMP Water Level (feet MSL)	
		Area 003 West	Area 003 East
1991	Aerial + 1996 contours(1) + LiDAR	1622	1623
1998	Aerial + 1996 contours(1) + LiDAR	1620	1620
2006	Aerial + 1996 contours(1) + LiDAR	1624	1602
2008	Aerial + 1996 contours(1) + LiDAR	1625	1582
2009	Aerial + 1996 contours(1) + LiDAR	1625	1570
2010	Aerial + LiDAR	1623	< 1568
2011	LiDAR data	1622	1568
2013	Aerial + LiDAR	1624	< 1568

(1) Contour interval for 1996 contours is 5 feet

Pumping records for the water appropriation permits associated with the Peter Mitchell pit were also assessed. There was no water appropriated from the Area 003 West pits since at least 1988 (the first year electronic water use data is available). Since 2003, water has been appropriated from the Area 003 East pits (excluding 2005) at a nearly constant level (reported water usage obtained for Water Appropriation Permit 1982-2097 – 3 from http://www.dnr.state.mn.us/waters/watermgmt_section/appropriations/wateruse.html). This is consistent with the drop in water level observed in the aerial photos between 1998 and 2006.

Since 1991, water levels in the Area 003 West pits have remained relatively constant. It is unclear from aerial photography whether a surface connection currently exists between the two pit areas within Area 003 West, but water levels between the two areas have remained similar. Water levels in the Area 003 East pits have decreased since the late 1990s to less than 1568 feet MSL (the lowest visible contour based on the 2011 LiDAR data) since 2010. If there were a substantial cone of depression associated with Area 003 East pit dewatering, it would be reasonable to expect at least some water level response in Area 003 West, since these two pits are separated by approximately 500 feet at their closest point. No water level response in Area 003 West is apparent.

These observations indicate that the hydraulic conductivity of the Biwabik Iron Formation in the vicinity of the Peter Mitchell pits is low enough to support the large observed pit stages differences noted above. Based on the fact that PMP pits as close as 500 feet show no significant hydraulic connectivity, it is reasonable to conclude that the dewatering and long term closure of the PMP is unlikely to cause lowering of groundwater elevations large distances from the PMP site.

Although the Biwabik Iron Formation is utilized by some Iron Range communities as a water supply, regional information indicates that the formation has relatively low hydraulic conductivity in the area of the Peter Mitchell pits. Reference (2) indicates that "The Biwabik Iron-Formation lies about 3 miles south of Babbitt, but it is not an important aquifer in this area. Highly permeable leached ore bodies are not present east of Mesaba because of the thermal metamorphism by the intrusives of the Duluth Gabbro Complex (Reference (3)). Consequently, the permeability of the iron-formation is low, and ground-water movement through the formation is confined to narrow joints and fractures.

2.2 Lakes near Peter Mitchell Pit

Two lakes are located less than one mile northwest of the Peter Mitchell pits and overlie the Biwabik Iron Formation (the same formation mined at Peter Mitchell): Iron Lake and Argo Lake. Increasing lake water levels observed at these lakes from 1946 to 1980 during mining at Peter Mitchell, combined with the lakes' likely connection to bedrock, strongly suggest that the impact of the Peter Mitchell pits on the bedrock groundwater levels is limited, even in close proximity to the pits.

Iron Lake is approximately 170 acres in size with water surface elevation of around 1760 feet MSL and a maximum depth of about 20 feet. The MGS bedrock elevation GIS dataset estimates the top of bedrock elevation below Iron Lake ranges from 1740 to 1760 feet MSL. The metadata associated with this dataset indicates that the bedrock elevations have an approximate vertical accuracy of +/- 20 feet (Reference (4)). As the maximum lake depth is 20 feet, portions of the lake bottom are likely exposed to bedrock. In addition, a geologic map of the area surrounding Iron Lake shows bedrock outcrops immediately adjacent to the lake along several areas of the shoreline (Reference (5 p. Plate XVI)).

Argo Lake, located northeast of Iron Lake, is about 80 acres in size with a water surface elevation of about 1745 feet MSL. The MGS dataset estimates the top of bedrock below Argo Lake to be between 1700 and 1750 feet MSL. Although the bathymetry of Argo Lake is unknown, the bedrock elevation is approximately equal to the ground elevation along the northwest side of the lake and the regional bedrock map indicates bedrock outcrops along the northern and northeastern shorelines of the lake (Reference (6)), suggesting that at least some portion of the lake bottom is likely connected to bedrock.

Water level data are available for Iron and Argo Lakes from 1946 to 1980. Mining activities at Peter Mitchell commenced in the mid- to late 1950s and have been ongoing since that time. During that time, water levels in Iron Lake and Argo Lake have fluctuated within a 6.3 foot range and a 7.1 foot range, respectively (Figure 1). These ranges are relatively small for lakes without controlled outlets in a region with a net precipitation of approximately 11 inches per year.

Over the 30 year period from 1950 to 1980, the water level in both lakes has gradually increased by 2 to 3 feet. Based on 2011 LiDAR data, the elevation of Iron Lake (1760.2 feet) is 4 feet greater than observed in

1946. The estimated 2011 elevation of Argo Lake is 1745.1 feet, although the relative change from 1946 is unknown due to the use of a local datum from 1946 through 1980. The increase in water levels over time is likely due to the regional net precipitation of approximately 10+ inches and the fact that the lakes are landlocked. The gradual increases in lake water levels at elevations well above those of the nearby Peter Mitchell pits suggest that the nearby dewatering activities in the pits have not had a significant effect on the stages of the lakes. As with the observations of pit stage variations at PMP, the information on Iron Lake and Argo Lake indicates that the dewatering and closure of the PMP will not cause lowering of groundwater elevations at distances of less than one mile from the PMP site.

Figure 1 Historical Water Levels in Iron Lake and Argo Lake and Annual Precipitation

2.3 Regional Data from the Mesabi Iron Range

Historic evidence from the PMP and other open pits on the Iron Range further supports the conclusion that groundwater flow between the PMP and the NorthMet pits is unlikely, and that it is reasonable to expect that a groundwater mound between the two pits will be maintained. While local variability is expected, the geologic setting and characteristics of the sites discussed below are sufficiently similar to

the area near NorthMet and PMP that the findings of these studies are useful in informing the expected groundwater flow directions in the area between NorthMet and PMP. Although bedrock water level data are limited, experience with open pit mining on the Iron Range has shown that the impacts from dewatering pits are realized locally, or within close proximity (within approximately 1500 feet) to the pits. For example, Figure 2 and Figure 3 show groundwater divides are inferred in the surficial aquifer within close proximity to open mine pits located near Chisholm and Eveleth (Reference (7)).

From Cross-section A-A' of Reference (7). *The portion shown has a length of approximately 17 miles*

Figure 2 Portion of a Cross Section Showing Hydraulic Head Contours in the Drift Aquifer Adjacent to an Open-pit Mine

From Cross-Section B-B' of Reference (7). *The portion shown has a length of approximately 22 miles*

Figure 3 Portion of a Cross Section Showing Hydraulic Head Contours in the Drift Aquifer Adjacent to an Open-pit Mine

A hydrologic assessment in the Hibbing area showed similar results. Reference (8)indicates that in the Hibbing area, the groundwater divide in the surficial aquifer north of the mined areas still coincided with topographic divides. South of the mined areas, the groundwater divide in the surficial aquifer was estimated to be located within a few hundred to approximately 2000 feet of the mine pits and to range in elevation from approximately 1520 to greater than 1460 feet MSL adjacent to pits in which the water levels ranged from 1100 to 1175 feet MSL.

The East Range Hydrology Study focused on taconite mine pits in the Hoyt Lakes area and concluded that groundwater inflow to the pits was predominantly from surficial sources (Reference (9)). In addition, regarding refilling of mine pits following dewatering, the authors concluded that substantial groundwater outflow will not occur until the pit stage exceeds the lowest down-gradient water table elevation in the adjacent surficial deposits. These two observations support the concept that flow to a large pit with a low

stage such as the existing and future Peter Mitchell pit would likely produce some water from seepage from the surficial deposits (limited by desaturation in the vicinity of the pit), and minimal groundwater flow from the bedrock, limited by the reduced saturated thickness in the vicinity of the pit. At Peter Mitchell, groundwater flow would be further limited by the lower hydraulic conductivity of the rock types that exist between the PMP and the NorthMet site.

The examples described above show that the hydrologic impacts from pit dewatering on the Iron Range are realized locally, or within close proximity to the pits. Because of this, it is reasonable to conclude that neither dewatering at the Peter Mitchell pits, nor the long-term closure plan for the pit, will have hydrologic impacts at the site of the future NorthMet pit.

2.4 Conclusion

All of the information above was known and available when the Co-leads developed the conceptual model for the PolyMet project. In summary: (1) Observations of water levels in the PMP show that hydraulic conductivity of the Biwabik Iron Formation in the vicinity of the Peter Mitchell pits is low, to the point that even pits as close as 500 feet do not show significant hydraulic connectivity. (2) Increasing water levels at two lakes less than one mile from the PMP—during active mining at the PMP—further demonstrate low groundwater connectivity. (3) Historic data shows that hydrologic impacts from pit dewatering are realized only within close proximity to the pits. For all of these reasons, it was reasonable to conclude as part of the PolyMet project conceptual model that groundwater would not flow north from the PolyMet pit to the PMP. Accordingly, it was not necessary to evaluate changing PMP levels in the Mine Site MODFLOW model that was used to perform certain impacts analyses for the NorthMet Mine Site.

3.0 Validation of the Conceptual Model

3.1 Site Groundwater Elevation Data

Water levels in NorthMet bedrock wells do not show a response to dewatering activities at Peter Mitchell. Water levels have been measured in five bedrock observation wells from 2007 to present. Wells OB-1 and OB-2 (shown on Large Figure 1) are completed in the Duluth Complex, while the remaining three wells are completed in the Virginia Formation. All five wells are 100 feet deep. Figure 4 shows groundwater elevation trends in these five wells compared with pit stages in the Peter Mitchell East Pit. The lack of response in the observation wells during a period of dewatering at the Peter Mitchell East Pit provides recent, direct evidence to support the conclusion that water levels in the PMPs do not have an effect on bedrock water levels at the NorthMet site.

Figure 4 Plots of Groundwater Elevations in Bedrock Wells at the PolyMet Site and Stage in the Peter Mitchell East Pit

3.2 NorthMet Site-Specific Aquifer Testing

Pumping tests were completed at the Mine Site during the Phase II and Phase III Hydrogeologic Investigations conducted in 2005 and 2006 (Reference (10), Reference (11)). During the Phase II Hydrogeologic Investigation, tests were completed in four pumping wells (P-1 through P-4) completed in the Virginia formation, and water levels were monitored in bedrock observation wells (Ob-1 through Ob-5 and a preexisting water supply well). With the exception of Ob-2, which was installed in the Duluth Complex, all the observations wells were completed in the Virginia Formation. Pumping test durations ranged from 35 to 96 hours. During the Phase III Hydrogeologic Investigation, a 30-day pumping test was conducted in well P-2. The majority of the observation wells during this test were installed in the wetland deposits in the wetland north of P-2; however, water levels were also monitored in Ob-2.

The observed drawdowns in the pumping wells and observation wells during the pumping tests are summarized in Table 3 and shown on Large Figure 5. They indicate minimal propagation of drawdown within the bedrock due to its low transmissivity. For example, drawdown at wells P-1, P-2, and P-4 on the

order of tens to hundreds of feet resulted in little to no observed drawdown in bedrock observation wells within a few hundred feet of the pumping wells. Drawdown in observation wells near P-3 was somewhat higher than other locations but, at most, was approximately half the maximum drawdown at the pumping well at a distance of 108 feet from the pumping well.

Hydraulic conductivity estimates from the Phase II pumping tests ranged from 0.0024 feet/day to 1 foot/day, with a geometric mean value of 0.17 feet/day. The low hydraulic conductivity of the Virginia Formation is expected to reduce the propagation of drawdown away from the PMP as the influence of the low stage in the pit spreads south at similar elevations to the pit walls. In addition, as the influence of groundwater inflow to the PMP spreads down-dip in the Biwabik Iron Formation, the high resistance to vertical flow through the Virginia Formation (because the Virginia Formation is a metasedimentary unit that likely have some degree of horizontal stratification) is expected to limit the influence on shallower units.

The fact that aquifer tests at the NorthMet site show minimal drawdown at distances as close as 115 feet further bolsters the conceptual model that changes in PMP water levels—which occur at least 6,500 feet away from the future NorthMet pit—will not cause northerly groundwater flow.

Table 3 Summary of Aquifer Tests Performed at the NorthMet Site

Hydrogeologic Investigation	Pumping Well	Average Pumping Rate (gpm)	Pumping Duration	Observation Well	Observation Well Distance from Pumping Well, feet MSL	Pumping Well Maximum Drawdown, feet MSL	Observation Well Maximum Drawdown, feet MSL
Phase II Hydrogeologic Investigation	P-1	1.5	36 hr	Ob-1	310	324.10	<0.1
	P-2	28	36 hr	Ob-2	274	258.04	4.57
	P-3	40	96 hr	Ob-3	115	41.09	8.66
				Ob-3a	108	41.09	23.22
				Water Well	330	41.09	16.73
	P-4	39	35 hr	Ob-4	1370	36.90	<0.1
				Ob-5	245	36.90	<0.2
Phase III Hydrogeologic Investigation	P-2	22	30 days	Ob-2	274	221.71	4.85

4.0 Adaptive Water Management

4.1 Approach

For the reasons discussed above, the work done to support the FEIS appropriately analyzes the potential environmental effects of reasonably foreseeable activities within the NorthMet Project. Those reasonably foreseeable effects do not include groundwater flow to the north through bedrock, which is highly unlikely to occur. Similarly, because mitigation measures designed to address northerly groundwater flows are highly unlikely to be needed, they also do not constitute reasonably foreseeable actions.

By proactively monitoring its environmental controls and the environmental setting, PolyMet can continuously evaluate environmental impacts. PolyMet will analyze monitoring information and use adaptive management practices[2], as needed, along with associated mitigations, to prevent significant adverse effects. These tools, which are consistent with industry standard practice, have been used throughout PolyMet's environmental review process, and will continue to be used in permitting, operations, reclamation, and long-term closure.

The following sections describe PolyMet's use of monitoring and adaptive management as applied to assessing and addressing the potential for groundwater flow to the north. With early implementation of this monitoring plan, PolyMet will be able to collect and analyze hydrology data in a timely manner. If the data show it is necessary, adaptive management can be employed. Three feasible mitigation measures are outlined below, that could be used separately or in combination with each other, to adequately address any concern that arises.

4.2 Monitoring

PolyMet will monitor groundwater flow through use of proposed bedrock monitoring locations north of the NorthMet mine pit, which are shown on Large Figure 6. While final details on the number and locations of wells will be determined in permitting, PolyMet currently proposes eight wells for the area between the PolyMet NorthMet pits and the Peter Mitchell pits. Two of these wells (the eastern most and the one between the Category 1 waste rock stockpile and the West Pit) are existing wells. The locations of the new wells have been subject to preliminary evaluation by the co-lead agencies. All eight wells will provide key data during operations on the water level in bedrock to help address the question of whether there is the potential for flow between the two mine sites. Four additional bedrock wells are proposed in the area south of the West Pit and the Category 2/3 Waste Rock stockpile for other monitoring purposes. New monitoring wells would be installed prior to operations, which would allow for more than 10 years of water level monitoring prior to any potential for northerly flow (note that northerly flow out of the

[2] *Theodore Roosevelt Conserv. P'ship v. Salazar*, 616 F.3d 497, 517 (D.C. Cir. 2010).

NorthMet pits is only possible once the NorthMet pits start to be backfilled and flooded, which begins in Year 11 for the East Pit).

4.3 Potential adaptive management options

If conditions observed in these northerly wells are not as expected, and a groundwater divide is not maintained between the PMP and NorthMet project areas when needed to prevent flow to the north, PolyMet will be able to implement adaptive management practices to prevent northward flow. This Section outlines three feasible and efficacious adaptive management measures that PolyMet could implement should the need arise.

4.3.1 West Pit Water Level Suppression

The first option for adaptive management would be to manage the NorthMet pit water levels via pumping to keep the West Pit stage below dewatering level at Peter Mitchell when there is active mining at Peter Mitchell, and below the Peter Mitchell pit lake level thereafter. This practice would result in a long-term pit lake level in the West Pit below 1,500 feet MSL, compared to the currently planned level of 1,576 ft MSL. Water pumped from the pit would be sent to the WWTF and discharged similar to the current plan for West Pit closure.

Water levels in the East Pit would be maintained near an elevation of 1,592 feet MSL so that the backfilled waste rock in the pit remains inundated. Water from the East Pit will flow into the West Pit because of the close proximity between the East and the West pits and because the water level in the West Pit will be below the water level at Peter Mitchell. The resulting hydraulic gradient between the East Pit and the West Pit will be larger than a gradient between the East Pit and the Peter Mitchell Pit. Therefore, water will flow from the East Pit to the West Pit, rather than north toward Peter Mitchell. If needed and based on environmental conditions at some future point, this management option could be combined with other adaptive management practices such as bedrock water level maintenance (see Section 4.3.2) or pit wall grouting to reduce the hydraulic conductivity of a portion of the Virginia Formation (see Section 4.3.3) to further reduce the potential for flow to the north.

This management practice will both be effective at addressing any unforeseen groundwater flow to the north and is technically feasible. While keeping the West Pit water level lower may result in more exposed wall rock load generation, under the current project plans, the water that is pumped from the West Pit is routed to the WWTF to be treated prior to discharge. Based on the current MODFLOW model predictive simulations, groundwater inflow to the West Pit at an elevation of 1,500 feet MSL is expected to be approximately 50 gpm, approximately 10 gpm greater than the expected groundwater inflow at the currently-planned long-term elevation of 1,576 feet MSL. The WWTF, as currently designed, will be sufficient to handle this increase, particularly as the existing plans for the WWTF at closure involve

upgrading the plant from a chemical precipitation plant to a reverse osmosis treatment plant. Therefore, this adaptive management practice will allow PolyMet to fully address any unanticipated groundwater flow to the north and, if needed, will be refined and reviewed by the relevant agencies based on the available data consistent with the NPDES/SDS permit and Permit to Mine programs.

4.3.2 Bedrock Water Level Maintenance

A second feasible option for adaptive management would be to maintain a water level in bedrock north of the NorthMet mine pits that is higher than the long-term water level planned for the pits (shown in Table 1) by artificial recharge. Water level control via infiltration or injection is a proven technology that has been used successfully on other project sites to mitigate hydrologic impacts associated with mine pit dewatering. Rubio and Fernandez (Reference (12)) presents a high level overview of the use of artificial recharge of groundwater in mining, and includes examples of mines that have successfully used infiltration and injection to minimize the effects of mine dewatering at copper, gold, and iron mines across the globe. One example is at the Garzweiler Lignite Mines in Germany, where a combination of surface trenches and injection wells are used to maintain water levels in the various bedrock and surficial units to minimize impacts to nearby wetlands. Huxley et al. provides additional case studies on how recharge features have been successfully used to mitigate the impacts of quarry dewatering (Reference (13)). Injection wells are also commonly used to create barriers to salt water intrusion (Reference (12), Reference (13)). Here in Minnesota, Unimin Corporation conducted a pre-mining field test to evaluate a water level mitigation system to prevent mine dewatering drawdown from impacting calcareous fen wetlands near their Kasota mine in Le Sueur County, Minnesota (Reference (14)). The results of this field test demonstrate that artificial recharge is an effective method of maintaining a higher volume of water in targeted areas in Minnesota's environmental setting.

At NorthMet, an application of this industry-proven method for preventing flow to the north would be to construct an infiltration trench on the north side of the Category 1 Waste Rock Stockpile, extending east along the north side of the cut-off dike, and to the eastern extent of the East Pit. This water-filled trench would extend to bedrock and could have water levels maintained using, among other potential water sources, stormwater runoff from the covered Category 1 Waste Rock stockpile and treated water from the WWTF.

The available water sources should be adequate for this recharge method for two reasons. First, the bedrock has relatively low permeability in this area and only minimal amounts of water would be required to maintain a mound. Screening level analysis conducted by the Co-lead Agencies suggests that approximately 160 gpm would need to be infiltrated or injected in order to maintain a groundwater mound within bedrock (Reference (14)). Second, given the slow velocities for groundwater flow in bedrock (estimated to be 15-30 ft/yr), the infiltration trench would only need to operate during non-

frozen conditions. Therefore, stormwater from the Category 1 stockpile would alone provide a sufficient volume of water to recharge the bedrock. The estimated flow of 160 gpm is equivalent to approximately 5.9 inches per year over the Category 1 Waste Rock Stockpile, which is less than the anticipated stormwater yield available for infiltration (estimated to be 8.5 inches per year with the geomembrane cover).

If the water supply from this water sources is inadequate to maintain water levels in the trench, other water sources would provide a sufficient supply of water. These water sources include treated water from the Wastewater Treatment Plant (WWTP), water retained in a basin, and injection wells in place of, or to supplement the infiltration trench. Based on a preliminary evaluation using the measured properties of the bedrock and the estimated injection rate of 160 gpm, it is expected that between 10 and 50 wells would be needed, with the actual number dependent on localized hydraulic conductivity and depth to the water table. Therefore, in the unlikely event that future monitoring identifies a northerly flow from the NorthMet mine pits, PolyMet will have available sufficient water volume and a combination of options (infiltration trench and injection wells) to recharge the bedrock north of the pits to prevent this flow.

4.3.3 Pit Wall Grouting

A third feasible adaptive management practice that would be effective, alone or in combination with one of the preceding options, is implementation of the Conceptual Plan for Bedrock Groundwater Flow Mitigation (Reference (15)) that PolyMet has outlined. Industrial mining grout (commonly a mixture of bentonite, cement and water) injection can be used to seal or close fractures and faults, which then controls bedrock groundwater flow to and from mine pits. Also, grout curtains can be used for groundwater control in both unconsolidated deposits and fractured rock. A grout curtain is constructed by drilling a series of purposely spaced and oriented bedrock drill holes and injecting grout into the surrounding rock to fill pore spaces, fractures and faults.

Use of grout to control water at mine sites is a widely used and proven mitigation measure. Powers et al. present an overview of grouting methods and applications for groundwater control (Reference (15)) Additional mining applications are presented in Reference (16), Reference (17), and Reference (18). At the NorthMet Mine Site, if appreciable bedrock flow into the pits were to unexpectedly occur, it will be readily apparent as the pits are deepened during mining. At that stage, PolyMet will have the necessary information about site conditions to coordinate with the appropriate agencies and grout those features (fractures, faults) down to the projected maximum depth of the final Peter Mitchell pits before the NorthMet pits are flooded. By grouting to this depth before pit flooding, PolyMet will guard against unexpected northerly flows from the flooded pit toward the Peter Mitchell pits.

4.4 Conclusion

Because the primary purpose of adaptive management is to address unpredicted developments by monitoring the actual effects of a project, it is sufficient under NEPA that such "mitigating measures are described in general terms and rely on general processes."[3]

As part of the permitting process for the NorthMet Project, PolyMet will continue to refine and develop new monitoring and mitigation plans. PolyMet anticipates that the NPDES/SDS permit issued by MPCA will include enforceable conditions regarding monitoring and, if necessary, mitigation of northerly groundwater flow. Through the NPDES/SDS permitting program and the annual reporting requirement under the Permit to Mine, the MDNR and MPCA would have access to the necessary information regarding actual environmental conditions, which will allow those agencies and PolyMet to effectively evaluate the information, and determine the need for mitigation. Adaptive management is an important tool that PolyMet will continue to use during, operations, reclamation, and long-term closure.

ABSTRACT

The vast majority of the world's rivers are now being tapped for their water supplies, yet only a tiny fraction of these rivers are protected by any sort of environmental flow standard. While important advances have been made in reducing the cost and time required to determine the environmental flow needs of both individual rivers and types of rivers in specific geographies, it is highly unlikely that such approaches will be applied to all, or even most, rivers within the forseeable future. As a result, the vast majority of the planet's rivers remain vulnerable to exploitation without limits. Clearly, there is great need for adoption of a "presumptive standard" that can fill this gap. In this paper we present such a presumptive standard, based on the Sustainability Boundary Approach of Richter (2009) which involves restricting hydrologic alterations to within a percentage-based range around natural or historic flow variability. We also discuss water management implications in applying our standard. Our presumptive standard is intended for application only where detailed scientific assessments of environmental flow needs cannot be undertaken in the near term. KEY WORDS: environmental flow; sustainability; Sustainable Boundary Approach; river management; corporate water use; water stewardship; water allocation; water scarcity

Received 7 December 2010; Revised 16 January 2011; Accepted 7 February 2011

Available freshwater supplies are being increasingly strained by growing human demands for water, particularly for irrigated agriculture and urban uses. The global population is growing by 80 million people each year, and if consumption patterns evolve as expected, two-thirds of the world's population will live in water-stressed areas by 2025 (WWAP, 2009). Whereas differing patterns of population growth, lifestyle changes and climate change will pose different scenarios on each continent, water managers and planners are challenged to meet growing water needs virtually everywhere.

At the same time, societies around the world are increasingly demanding that water managers also protect the natural freshwater ecosystems that are being tapped for water supplies. The need to protect 'environmental flows'—defined as the quantity, timing and quality of water flows required to sustain freshwater and estuarine ecosystems and the human livelihoods and well-being that depend on these ecosystems (Brisbane Declaration, 2007)—is now being addressed in many governmental water allocation policies, dam development plans and urban water supply plans. The stimuli for protecting environmental flows are varied and many, including the desire to protect biodiversity, ecosystem services (especially fisheries production), water-based tourism or recreation, economic activities such as hydropower generation and other cultural or spiritual values (Postel and Richter, 2003).

However, many good intentions to protect environmental flows have stalled upon encountering confusing and conflicting information about which method for environmental flow assessment is appropriate or 'best' and perceptions that the more credible and sophisticated methods require considerable investment of time, expertise and money to apply. These real and perceived hurdles have too often resulted in doing nothing to protect environmental flows, leaving the vast majority of rivers on the planet vulnerable to over-exploitation (Richter, 2009).

The environmental flow science community has long been attuned and responsive to the need for more cost-efficient and time-efficient approaches to determining environmental flow needs. Beginning in the 1970s with the Tennant (1976) method and continuing with the recent publication of the 'Ecological Limits of Hydrologic Alteration' (ELOHA; Poff *et al.*, 2010), a long series of efforts have been put forth by scientists to streamline and expedite environmental flow assessment while maintaining scientific credibility. However, widespread environmental flow protection across the planet's river networks has yet to be attained.

Of particular concern and relevance to this paper is the fact that it is proving difficult to implement ELOHA in some jurisdictions even though the approach was explicitly designed to address the issues that have prevented other methods from being applied widely. The four co-authors of this paper have been actively encouraging government entities to apply the ELOHA framework; the difficulties we have experienced in these efforts have provided strong motivation for writing this paper. As we explain later in this paper, we continue to believe that ELOHA provides the best available balance between scientific rigor and cost of application for setting environmental flow standards for many rivers simultaneously. The ELOHA framework is currently being applied in various jurisdictions around the world. However, we are finding that many government entities are unable (or unwilling) to afford the cost of applying ELOHA (generally ranging from $100k to $2M), especially in situations where existing biological data and hydrologic models have poor spatial coverage. Time constraints are an even more frequent hindrance to the implementation of the ELOHA framework, particularly for jurisdictions embroiled in politically challenging situations such as responding to extreme droughts, legislative mandates or lawsuits. We suggest that until ELOHA or some variation can be applied everywhere, a presumptive, risk-based environmental flow standard is needed to provide interim protection for all rivers.

Another strong motivation for putting forth a presumptive standard at this time is the fact that many large water-using corporations are now looking for environmental indicators that can help them screen their operations and supply chains for water-related risks (e.g. SABMiller and WWF-UK, 2009). These corporations are increasingly coming to understand that, when environmental flows are not adequately protected, freshwater ecosystems will be stressed, jeopardizing ecosystem services valued by many people for their livelihoods and well-being. This can lead to conflicts that can ultimately endanger a company's 'social licence to operate' (Orr *et al.*, 2009). Presently, many corporations are using estimates for environmental flow requirements put forth by Smakhtin *et al.* (2004); these estimates range globally from 20% to 50% of the mean annual river flow in each basin. We agree with Arthington *et al.* (2006) that such a low level of protection as suggested by Smakhtin 'would almost certainly cause profound ecological degradation, based on current scientific knowledge'. We hope that the presumptive standard we offer in this paper will replace corporate use of the Smakhtin estimates for water risk screening.

The presumptive standard for environmental flow protection put forth in this paper is intended for use only in situations where the application of ELOHA or site-specific environmental flow determinations (e.g. Richter *et al.*, 2006) cannot be applied in the near future; in other words, it is intended for use as a default placeholder. This presumptive standard is derived from the sustainability boundary approach (SBA) described by Richter (2009), which involves maintaining flows within a certain percentage-based range around natural flows (i.e. flows in the absence of dam regulation or water withdrawals).

Before discussing our proposed presumptive standard in greater detail, we provide a short discussion of the advantages of 'per cent-of-flow' (POF) approaches such as the SBA for expressing environmental flow requirements. We then summarize efforts around the world to apply flow protection standards based on POF expressions. Finally, we propose a specific presumptive standard using risk bands placed around natural flow variability and conclude with management implications in applying this presumptive standard.

APPROACHES FOR SETTING FLOW PROTECTION STANDARDS

A primary challenge in setting flow protection standards is to employ a practical method that limits water withdrawals and dam operations in such a way as to protect essential flow variability. As described by Richter (2009), a large body of scientific literature supports the 'natural flow paradigm' as an important ecological objective to guide river management (Richter *et al.*, 1997; Poff *et al.*, 1997; Bunn and Arthington, 2002; Postel and Richter, 2003; Arthington *et al.*, 2006). Stated simply, the key premises of the natural flow paradigm are that maintaining some semblance of natural flow regimes is essential to sustaining the health of river ecosystems and that health is placed at increasing risk with increasing alteration of natural flows (Richter *et al.*, 2003; Richter, 2009).

Three basic approaches have been employed for setting environmental flow standards across broad geographies such as states or nations: minimum flow thresholds, statistically based standards and POF approaches. The most commonly applied approach to date has been to set a minimum flow level that must be maintained. For example, the most widely used minimum flow standard in the USA is the annual 7Q10, which is defined as the lowest flow for seven consecutive days that occurs every 10 years on average. Whereas the original intent of the annual 7Q10 flow standard was to protect water quality under the federal Clean Water Act of 1972, it has become either explicitly in rule or by default the minimum flow threshold in many states (Gillilan and Brown, 1997; IFC, 2001). The growing recognition that this threshold was not sufficiently protective of aquatic habitats led in the 1980s and 1990s to several states setting higher flow thresholds, such as by setting the minimum level at 30% of the mean annual flow (MAF) or by setting thresholds that vary seasonally, such as at the

Copyright © 2011 John Wiley & Sons, Ltd.

DOI: 10.1002/rra

level of 60% of MAF in winter, 30% of MAF in summer and 40% of MAF in spring and fall (Gillilan and Brown, 1997; IFC, 2001).

More recently, statistically based standards have been used to maintain certain characteristics of the flow regime. For example, such a standard may call for protecting a high flow of a specified magnitude, with specified duration, to occur with a specified inter-annual frequency. The application of a statistically based standard in regulating water use generally involves using computerized hydrologic models to simulate the cumulative effects of licenced or proposed water withdrawals and dam operations on the flow regime; hydrologic changes are allowed to accumulate until the statistical standards would be violated by further withdrawals or dam effects.

Flow standards set in the USA, the European Union and elsewhere in the past decade have increasingly been based on a POF approach (see case studies later in this paper). This approach explicitly recognizes the importance of natural flow variability and sets protection standards by using allowable departures from natural conditions, expressed as percentage alteration. The POF approach has several strong advantages over other approaches. For instance, the POF approach is considerably more protective of flow variability than the minimum threshold standards. Minimum-threshold-based standards can allow flow variability to become 'flat-lined' as water allocation pressure increases and reservoir operations are designed only to meet minimum release requirements. Statistically based standards, although usually more protective of flow regimes than minimum thresholds, can be confusing to non-technical stakeholders, and complex statistical targets have proven difficult for water managers to implement (Richter, 2009). By comparison, POF approaches are conceptually simple, can provide a very high degree of protection for natural flow variability and can also be relatively simple to implement (i.e. a dam operator simply releases the prescribed percentage of inflow, or cumulative water withdrawals must not reduce flow by more than the prescribed percentage).

Sustainability boundary approach

Recognizing that human-induced flow alterations can both deplete and unnaturally augment natural flows to the detriment of ecological health, Richter (2009) expanded upon the POF approach by suggesting that bands of allowable alteration called 'sustainability boundaries' could be placed around natural flow conditions as a means of expressing environmental flow needs, as depicted in Figure 1.

To apply the SBA, the natural flow conditions for any point of interest along a river are estimated on a daily basis, representing the flows that would have existed in the absence of reservoir regulation, water withdrawals and return flows (Richter, 2009). Limits of flow alteration, referred to as sustainability boundaries, are then set on the basis of allowable perturbations from the natural condition, expressed as percentage-based deviations from natural flows. Those withdrawing water or operating dams are then required to maintain downstream river flows within sustainability boundaries. Whereas maintaining flows within the targeted range may be infeasible on a real-time basis in many cases, such management can be facilitated by creating computerized hydrologic models to evaluate what the likely perturbation to natural flows would be under existing or proposed scenarios of water withdrawal and dam operations and by licencing such water uses accordingly.

Figure 1. Illustration of the sustainability boundary approach from Richter (2009; reprinted with permission). The sustainability boundaries set limits on the degree to which natural flows can be altered, expressed as a percentage of natural flows.

DOI: 10.1002/rra

The allowable degree of alteration from the natural condition can differ from one point to another along the same river. This determination for any point of interest along a river requires a negotiation or optimization between the following: (i) the desired consumption or dam regulation of water upstream, which might either deplete or unnaturally augment river flows; (ii) the desired uses of water downstream; and (iii) the desired ecological condition and ecosystem services to be maintained. As such, the SBA forces an explicit integration of environmental flow objectives with water withdrawals and dam operations. We recognize and emphasize that this is a socio-political decision-making process as much as it is a scientific one. As suggested by Richter (2009), the application of the SBA in setting river flow management goals requires transparent, inclusive and well-informed stakeholder engagement.

The basic challenge confronting environmental flow proponents is the difficulty of determining how much alteration from natural flows can be tolerated without compromising ecological health and ecosystem services to an undesirable degree. In the absence of such an understanding, water managers and governmental regulators have focused solely on water withdrawals and dam operations, providing only minimum flow protection or neglecting ecosystem considerations altogether. This highly undesirable situation calls for the adoption of a precautionary approach to fill the gap, until more detailed and regionally tailored studies of environmental flow needs can be completed and used to set flow protection standards.

We believe that sufficient scientific evidence and knowledge now exist to propose an SBA-based presumptive standard that can serve as initial guidance for regulating water withdrawals and dam operations in rivers. In designing the presumptive standard recommended later in this paper, we reviewed numerous other efforts to set environmental flow standards that apply across broad regions and many different rivers.

CASE STUDY REVIEW

The following case studies represent environmental flow policies and management guidelines that are being applied in the USA and Europe to limit flow alteration and to achieve relatively high levels of ecological protection, while allowing for carefully managed water development to proceed. Whereas not all of these cases can be characterized as pure POF approaches, we believe that these case studies illustrate useful and progressive water management policies that fulfill the intent of the SBA. They are described here to demonstrate the feasibility of applying standards in a manner consistent with the SBA and to support our recommendations for the presumptive standard described later in this paper.

Example #1—Southwest Florida Water Management District

Under the Florida state law, the state's five water management districts must determine 'minimum flows and levels' (MFLs) for priority water bodies of the state. Methods to determine MFLs differ among the five districts. The Southwest Florida Water Management District (SWFWMD) uses a POF-based approach that includes use of multiple environmental flow assessment methods, including the Instream Flow Incremental Methodology and the Wetted Perimeter approach (see IFC, 2001 for descriptions of these methods), to inform the setting of percentage alteration limits. The intent of the resulting MFLs is to limit water withdrawals such that physical habitat losses do not exceed 15% (Flannery *et al.*, 2002, 2008). The allowable flow reduction, which is referenced to as previous-day flows at a specified river gauge, can vary with season and with magnitude of flow and includes a 'hands-off' low flow threshold, meaning that all withdrawals are curtailed once the flow threshold is reached (see Rules of the Southwest Florida Water Management District, Chapter 40D-8, Water Levels and Rates of Flow, Section 40D-8.041 Minimum Flows at www.swfwmd.state.fl.us).

These MFLs are used in water management planning and incorporated as water withdrawal permit conditions. The percentage of allowable depletion has been set by SWFWMD for five non-tidal rivers in the district, ranging from 8% to 15% during high flows and 10% to 19% during low flows. Allowable depletions tend to be larger for freshwater flows into estuaries. For example, the lower Alafia River can be depleted up to 19% as it enters its estuary, based on limiting fish habitat loss caused by changes in salinity and dissolved oxygen to no more than 15%. No withdrawals are allowed when flows fall below 120 ft^3/s, based on chlorophyll residence time in the estuary, fish, dissolved oxygen and comb jellyfish. The proposed MFL for the Lower Peace River and its estuary limits withdrawals to flows above 130 ft^3/s, with allowable 16% reduction of daily flow up to a flow rate of 625 ft^3/s, 29% flow reductions in fall/winter and 38% flow reductions in summer above 625 ft^3/s (Flannery *et al.*, 2002, 2008).

Example #2—Michigan's Water Withdrawal Assessment Tool Approach

The Great Lakes–St Lawrence River Water Resources Compact and related state law require limits on water withdrawals to prevent 'adverse resource impact', defined as the point when 'a stream's ability to support characteristic fish populations is functionally impaired'. Zorn *et al.* (2008) documented the work of the Michigan Department of Natural Resources to develop a predictive model of how

Copyright © 2011 John Wiley & Sons, Ltd.

DOI: 10.1002/rra

fish assemblages in different types of Michigan streams would change in response to decreased summer base flows, using habitat suitability information for over 40 Michigan fish species. The approach involved classification of all river segments in the state based on size and temperature regime and the development of a fish response curve that relates assemblage richness to an index flow (median August streamflow) for each of the 11 river classes. This index flow serves as a surrogate for withdrawals as a POF.

Across the majority of river types in Michigan, 'baseline or existing' ecological conditions are predicted to be maintained with cumulative withdrawals less than 6–15% of the index flow, depending on the stream type (Seelbach *et al.*, 2009). This is roughly equivalent to maintaining excellent ecological condition for many rivers, but some rivers that have historically been degraded would only be maintained in their current condition (Paul Seelbach, personal communication, University of Michigan, Ann Arbor). Adverse resource impacts are predicted to occur on most types of rivers with withdrawals greater than 17–25% of index flow. Rivers classified as 'transitional' between cold and cool rivers are very sensitive to withdrawals and are limited to withdrawals of 2–4% index flows before adverse resource impact is predicted to occur.

The Michigan Water Withdrawal Assessment Tool (WWAT) allows estimation of the likely impact of a water withdrawal on nearby streams and rivers using these threshold values. Use of the WWAT is required of anyone proposing to make a (large) new or increased withdrawal from the waters of the state, including all groundwater and surface water sources, prior to beginning the withdrawal. The WWAT is online at http://www.miwwat.org/.

Unlike Florida's POF approach, which references allowable depletions to a percentage of the previous day's flow, the Michigan approach references its withdrawal limits only to the August median flow. Because August is typically the lowest flow month in Michigan and Michigan flow regimes are fairly predictable, it is unlikely that cumulative withdrawals beyond the adverse resource impact level would frequently exceed the percentage guideline in other months. However, in very dry summers, one would expect the adverse resource impact percentage to be exceeded for a portion of the summer.

Example #3—UK Application of the European Union Water Framework Directive

The European Union (EU) Water Framework Directive, passed in 2000, was designed to protect and restore aquatic ecosystems by setting common ecological objectives across EU member states. The Water Framework Directive requires member states to achieve a 'Good Ecological Status' in all surface waters and groundwaters that are not determined to already be 'heavily modified'(Acreman *et al.*, 2006). It is assumed that meeting the Good Ecological Status requires protecting or restoring ecologically appropriate hydrological regimes, but the Water Framework Directive itself does not define environmental flow standards for any country in the EU (Acreman and Ferguson, 2010).

In the UK, a Technical Advisory Group worked with conservation agencies and academics to begin defining environmental standards for physio-chemical and hydro-morphological conditions necessary to meet different levels of ecological status (Acreman *et al.*, 2006). A key part of this work was defining thresholds of allowable water withdrawal as a percentage of natural flow. To achieve this, a literature review was prepared, and numerous expert workshops were convened. Each river in the UK was assigned to one of 10 classes, based on physical watershed characteristics, to facilitate application of withdrawal thresholds (Acreman and Ferguson, 2010).

Withdrawal standards were based on professional knowledge and discussion of the flow needs of various plant and animal communities—primarily macrophytes, macroinvertebrates and fish. Quantitative standards for achieving Good Ecological Status were specified for four groupings of river types, two seasons and four tiers of withdrawal standards based on annual flow characteristics (Table I). The allowable abstraction values in Table I are intended to be restrictions on cumulative withdrawals, applicable to any point on a river of that type.

The withdrawal standards in Table I were derived from an expert consensus workshop approach by using the precautionary principle to deal with considerable uncertainty. Different tolerances to flow alteration were recognized across taxa groups, but a 10% flow alteration was generally seen by experts as likely to have negligible impact for most taxa, stream types and hydrologic conditions (Acreman and Ferguson, 2010). The workgroup also generally agreed upon a Q95 (i.e. fifth percentile) flow as being 'hands-off', meaning that at that flow withdrawal would either stop or be significantly reduced. The recommended allowable withdrawal levels increase with magnitude of flow and in cooler months. Thus, permissible alterations range from 7.5% to 20% in warm months at lower flows (below Q70) and from 20% to 35% during cooler months at higher flows (Acreman *et al.*, 2006).

Example #4—Maine sustainable water use rule

In 2001, the Maine State Legislature passed a law requiring 'water use standards for maintaining instream flows…lake or pond water levels…protective of aquatic life and other uses…based on the natural variation of flows'. The resulting environmental flow and water level protection rule, finalized in 2007, establishes a set of tiered flow protection criteria

Table I. Standards for UK river types/subtypes for achieving Good Ecological Status, given as per cent allowable abstraction of natural flow (thresholds are for annual flow statistics)

Type or subtype	Season	Flow >Q60	Flow >Q70	Flow >Q95	Flow <Q95
A1	Apr–Oct	30	25	20	15
	Nov–Mar	35	30	25	20
A2 (downstream), B1, B2, C1, D1	Apr–Oct	25	20	15	10
	Nov–Mar	30	25	20	15
A2 (headwaters)	Apr–Oct	20	15	10	7.5
C2, D2	Nov–Mar	25	20	15	10
Salmonid spawning and nursery areas	Jun–Sep	25	20	15	10
	Oct–May	20	15	Flow >Q80	Flow <Q80

From Acreman and Ferguson (2010).

linked to different stream condition classes (Maine DEP, 2010a). The environmental flow standards may be established by one of two methods: a standard allowable alteration of flow or a site-specific flow assessment. The standard allowable alteration is based on the natural flow regime theory (Poff *et al.*, 1997; Richter *et al.*, 1997) and was informed by considerable scientific research on environmental flow requirements for the eastern USA (e.g. Freeman and Marcinek, 2006).

For all streams falling into the state's best-condition class (class AA), 90% of the total natural flow must be maintained when the flow exceeds the spring or early winter 'aquatic base flow' (Maine DEP, 2010b). This aquatic base flow is defined as the median monthly flow of the central month of each season (Maine DEP, 2006). In other seasons, withdrawals of up to 10% of daily flow can only occur when daily flows exceed 1.1 to 1.5 times the seasonal aquatic baseflow. No flow alteration is allowed in any season when flows are below aquatic base flow levels. In addition, all rivers and streams that flow into class AA waters must meet the POF standard.

Although used only for those waters with the highest ecological condition goals, which make up approximately 6% of state waters, the Maine standard provides a good example of use of a hands-off flow level combined with a POF approach.

Summary of case study findings

The case studies summarized here have much in common (Table II). In each case, standards were developed with a general intent to avoid ecological degradation of riverine ecosystems. The specifics of management goals vary from case study to case study, but common among them is the desire to maintain ecological conditions that are good to excellent or to avoid ecological harm. Each of these efforts to set standards has utilized the best available science for their region, and each has engaged large numbers of scientists familiar with flow–ecology science, using expert-based decision-making processes.

We found the recommendations for flow protection emerging from these expert groups to be quite consistent, typically resulting in a range of allowable cumulative

Table II. Summary of per cent-of-flow environmental flow standards from case studies

Location	Ecological goal	Cumulative allowable depletion	Considerations	Decision process
Florida (SWFWMD)	Avoid significant ecological harm (max. 15% habitat loss)	8–19% of daily flow	Seasonally variable extraction limit; 'hands-off' flow	Scientific peer review of site-specific studies
Michigan	Maintain baseline or existing condition	6–15% of August median flow	Single extraction limit for all flow levels	Stakeholders with scientific support
Maine	Protect class AA: 'outstanding natural resources'	10% of daily flow	Single extraction limit for all flow levels above a 'hands-off' flow level	Expert derived
European Union	Maintain good ecological condition	7.5–20% of daily flow	Lower flow; warmer months; 'hands-off' flow	Expert derived
		20–35% of daily flow	Higher flow; cooler months

DOI: 10.1002/rra

depletion of 6% to 20% of normal to low flows, but with occasional allowance for greater depletion in seasons or flow levels during which aquatic species are thought to be less sensitive (Table II). These results suggest a consensus that modest alteration of water flows can be allowed with minimal to no harm to aquatic ecosystems and species.

A PROPOSED PRESUMPTIVE STANDARD

Our review of the case studies described above suggests that an appropriate presumptive standard for environmental flow protection can be proposed at this time, subject to some important caveats.

We suggest that a high level of ecological protection will be provided when daily flow alterations are no greater than 10%; a high level of protection means that the natural structure and function of the riverine ecosystem will be maintained with minimal changes. A moderate level of protection is provided when flows are altered by 11–20%; a moderate level of protection means that there may be measurable changes in structure and minimal changes in ecosystem functions. Alterations greater than 20% will likely result in moderate to major changes in natural structure and ecosystem functions, with greater risk associated with greater levels of alteration in daily flows. These thresholds are well supported by our case study review, as well as from our experiences in conducting environmental flow assessments for individual rivers (e.g. Richter *et al.*, 2003, 2006; Esselman and Opperman, 2010). This level of protection is also generally consistent with findings from regional analyses such as the 'benchmarking' study in Queensland, Australia, by Brizga *et al.* (2002) and by a national (US) analysis of hydrologic alteration which documented that biological impairment was observed in some sites with hydrologic alteration of 0–25% (the lowest class of alteration assessed) and in an increasing percentage of sites beyond 25% hydrologic alteration (Carlisle *et al.*, 2010).

This presumptive standard can be represented graphically as shown in Figure 2, using the convention of the SBA (Richter, 2009), with risk bands bracketing the daily natural flow conditions. When a single threshold value or standard is needed, such as for corporate risk screening or water supply planning purposes, we suggest that protecting 80% of daily flows will maintain ecological integrity in most rivers. A higher percentage of flow (90%) may be needed to protect rivers with at-risk species and exceptional biodiversity.

Whereas we believe that such a presumptive standard of limiting daily flow alterations to 20% or less is conservative and precautionary, we also caution that it may be insufficient to fully protect ecological values in certain types of rivers, particularly smaller or intermittent streams. Seasonal adjustments of the per cent of allowable depletion may be advisable. Several of our case studies utilized 'hands-off' flow thresholds to limit impacts to the frequency and duration of low-flow events. This may be an additional consideration where fish passage, water quality or other conditions are impaired by low flows. Also, when applying this presumptive standard to rivers affected by hydropower dams, imposing our suggested limits on daily flow averages may be insufficient to protect ecological integrity because of the propensity for peaking power operations to cause river flows to fluctuate considerably within each day. In such cases, our presumptive standard may need to be applied on an hourly, rather than daily, basis. Adjustments to our suggested values

Figure 2. Presumptive standards are suggested for providing moderate to high levels of ecological protection. The greater the departure from natural flow conditions, the greater is the ecological risk to be expected. This figure is available in colour online at wileyonlinelibrary.com/journal/rra.

Copyright © 2011 John Wiley & Sons, Ltd.

DOI: 10.1002/rra

should be considered when local or regional ecological knowledge indicates that narrower bands of allowable alteration are needed.

Most importantly, continued investment in detailed, site-specific or regional environmental flow assessment is urgently needed. Such research must continue to inform our understanding of flow–ecology relations and refine our presumptions about the adequacy of protecting different percentages of natural flows.

MANAGEMENT IMPLICATIONS

To properly apply our presumptive standard, water managers and other water stakeholders, such as corporations concerned about the sustainability of water use in particular river basins, will need to be able to do three basic things:

- Develop modelling tool(s) to estimate natural (unregulated and undepleted) flows on a daily basis; this provides the natural or 'baseline' flow data illustrated in Figure 1;
- Use the modelling tool(s) to evaluate whether *proposed* withdrawals, dam operations or other changes—when added to already-existing water uses—would cause the presumptive standard to be violated;
- Monitor daily flows at key locations, such as upstream and downstream of major water withdrawals and return flows, and at points of inflow to reservoirs, as a means for verifying and refining the modelling results and for regulatory enforcement purposes.

The capability to evaluate proposed hydrologic changes (second bullet in the above list) enables water managers to avoid issuing water use permits that would cause hydrologic variations to deviate outside of the sustainability boundaries set by the presumptive standard (±20%). Obviously, if a particular river's flow regime has already been altered more than ±20% during part or all of the time, water managers and stakeholders would need to decide whether to restore flows to a level consistent with the presumptive standard or adopt some other standard.

Application in over-allocated basins

Ongoing efforts to develop sustainable approaches to water management in the Murray-Darling river basin in Australia offer a highly relevant and useful example of re-balancing environmental and economic goals in a previously over-allocated basin. In response to considerable ecological degradation, heavy competition among water users, prolonged drought and climate change projections, the Commonwealth Parliament in 2007 passed a national water act calling for the development of a basin plan that would provide for integrated and sustainable management of water resources (MDBA, 2009). The Basin Plan is required to set enforceable limits on the quantities of surface water and groundwater that can be taken from the basin's water resources. These limits must be set at a level that the Murray-Darling Basin Authority, using the best available scientific knowledge, determines to be environmentally sustainable. This is defined as the level at which water in the basin can be taken from a water source without compromising the key environmental assets, the key ecosystem functions, the productive base or the key environmental outcomes of the water source. Considerable scientific analysis is being undertaken to determine environmental water requirements that will inform the determination of 'sustainable diversion limits'. Recent appropriations of federal funding to enable the buyback of historical entitlements can be used to reduce water usage to levels compatible with these diversion limits (Garrick *et al.*, 2009). The scientific assessment and decision-making being undertaken in the Murray-Darling basin exemplifies a situation in which our presumptive standard would have been violated by past water allocations, yet water managers and stakeholders are now striving to restore a level of ecological health and water use sustainability similar to the goals of our presumptive standard.

Technology requirements

The technology and capacity to manage water in this manner exist in many parts of the world, but we acknowledge that many water management institutions and corporations have not yet developed hydrologic modelling tools with the required level of temporal resolution (i.e. daily) to implement our presumptive standard. Similarly, few countries have been able to install and maintain daily flow monitoring networks with adequate spatial distribution to facilitate data collection and regulation of water uses in the manner we suggest. However, recent and ongoing advances in modelling approaches and technologies, as well as improvements in flow monitoring instrumentation, are driving down the expense of implementing this type of water monitoring and modelling programme. Given growing water scarcity and its economic implications, investment in this level of water management capacity should be given high priority by governments at all levels.

We recognize that many water planners continue to use hydrologic models that operate on a monthly time step. We can offer some guidance and caution. Although it is consistent with our presumptive standard to assume for planning purposes that 20% of the natural monthly mean flow can be allocated for consumptive use, this does not mean that a volume of water equivalent to 20% of the monthly mean can be allocated on a fixed basis without violating our presumptive standard. We illustrate this point

Copyright © 2011 John Wiley & Sons, Ltd.

DOI: 10.1002/rra

with a simple hypothetical example. Let us say that the mean monthly flow in July is 100 m^3/s. You allocate a sum total of 20 m^3/s (20% of mean) for that month. Our presumptive standard will be violated each day in July that natural daily flows (recorded upstream or modeled) drop below100 m^3/s, which will be the case during the majority of the time for most river types. Therefore, the only way to be assured that our presumptive standard will not be violated given a monthly allocation will be to subsequently model the system at a daily time step to check for compatibility with the standard under the range of flows typically experienced by the river. Once such compatibility is assured, the water authority can confidently grant water use permits based on fixed amounts (i.e. monthly allocations or continuous rates of use) that provide the water user with desirable certainty.

Utility for water planning

Although implementation of our presumptive standard will require considerable investment in adequate technology and expertise as outlined previously in this paper, we want to emphasize that our presumptive standard will also be quite useful for initial water planning purposes that require less technological investment. As discussed in our introduction, many large corporations have become quite concerned about their water-related business risk and are interested in approaches that can help them screen for such risk across many facilities and parts of their supply chains. We suggest that our presumptive standard will be highly appropriate in risk screening, wherein estimates of water availability and use are available for river basins of interest. Our presumptive standard can be used to identify river basins in which water flows appear to have been altered by more than 20%, thereby posing considerable potential risk. In this sense, we are pleased to see the incorporation of a variation of our presumptive standard in the *Water Footprint Assessment Manual* (Hoekstra *et al.*, 2011), which is already being used by many corporations.

Implications for water supply and storage

We recognize that in most hydrologic settings, storage will be required to enable full utilization of up to 20% of the available daily flow for consumptive use. Creating such storage can lead to ecological impacts (such as impediments to fish migrations or blocking sediment transport) that can undo the ecological benefits that our presumptive flow standard is trying to protect. Therefore, we strongly urge water managers and engineers to employ innovative options for water storage—such as off-stream reservoirs or groundwater storage—that do not involve on-stream reservoirs. Alternatively, in systems in which storage reservoirs already exist, enlarging the capacity of those existing facilities will in most cases be far preferable to building new reservoirs.

Some water managers will feel excessively constrained by having to operate within the constraints of the presumptive sustainability boundaries suggested here. However, managing water sustainably necessarily implies living within limits (Richter *et al.*, 2003; Postel and Richter, 2003; Richter, 2009). We suggest that a strong social imperative has emerged that calls for setting those limits at a level that avoids damaging natural systems and the benefits they provide, at least as a default presumption. Where other socio-economic priorities suggest the need for relaxation of the presumptive sustainability boundaries we suggest here, we strongly encourage governments and local communities to invest in thorough assessments of flow–ecology relationships (Richter *et al.*, 2006; Poff *et al.*, 2010), so that decision-making can be informed with scientific assessment of the ecological values that would likely be compromised when lesser degrees of flow protection are adopted.

In our experiences in working with water and dam managers, we have found that a remarkable degree of creativity and innovation emerges when engineers and planners are challenged to meet targeted or forecasted water demands with the least disruption to natural flow patterns. Solving the water equation will require new thinking about how and where to store water, conjunctive use of surface water and groundwater, sizing diversion structures or pumps to enable extraction of more water when more is available during high flows, sizing hydropower turbines such that maximum power can be generated across a fuller range of flows, and other innovations. When such creativity is applied as widespread common practice, human impacts on freshwater ecosystems will most certainly be reduced substantially.
