

# Rapid Assessment of Ash and Elm Resources in Minnesota Communities

Resource Assessment Unit, Forestry Division  
Minnesota Dept. of Natural Resources  
413 SE 13<sup>th</sup> Street, Grand Rapids MN 55744

## Introduction

In the early 21<sup>st</sup> Century, resurgence of Dutch elm disease (*Ophiostoma ulmi*) put populations of elms (*Ulmus* spp.) in Minnesota towns at the greatest risk since the epidemic infections of the 1970s and 1980s. The U.S. Forest Service has attributed the renewed outbreak to decreasing community vigilance, together with buildups of insect vectors and host trees in the wild (Haugen 1998). All native elm species are susceptible to some extent.

The same period saw the introduction of a new urban forestry threat in the shape of emerald ash borer (*Agrilus planipennis*), a beetle introduced from Asia, larvae of which kill ash trees (*Fraxinus* spp.) by feeding on the inner bark (McCullough and Katovich 2004). The insect has destroyed millions of trees in Michigan, Ohio, Indiana, Illinois and southern Ontario, in the face of costly eradication and quarantine efforts since its establishment around 2000. All native Minnesota ash species are susceptible, though the borer has not, as of 2006, been detected in the state.

Efforts to combat such urban forestry threats often involve inventories to assess the size and distribution of the populations at risk or under actual attack. Bloniarz *et al.* (2003) describe applications of modern geographic information system (GIS) and Global Positioning System (GPS) technology in the context of urban forest inventory. Public and private agencies as far apart as Washington D.C. and Alberta have used these and more traditional tools to inventory and map threatened elms (see web accounts at [http://www1.agric.gov.ab.ca/\\$department/deptdocs.nsf/all/prm4494](http://www1.agric.gov.ab.ca/$department/deptdocs.nsf/all/prm4494), <http://www.cps-scp.ca/pathologynews/dutchelmdisease.htm>, and <http://www.caseytrees.org/pdfs/ElmFactSheet061406L.pdf> describing these and similar elm inventories.)

In response to emerald ash borer infestation, Michigan investigators in 2005 undertook inventories of threatened and attacked *Fraxinus* species (<http://www.forestprod.org/smallwood06weatherspoon.pdf>). The states of Illinois ([http://dnr.state.il.us/conservation/forestry/urban/IAA\\_1020\\_06.htm](http://dnr.state.il.us/conservation/forestry/urban/IAA_1020_06.htm)) and Ohio ([http://www.dnr.state.oh.us/forestry/eab/pdf/EABmanagement\\_plan032406.pdf](http://www.dnr.state.oh.us/forestry/eab/pdf/EABmanagement_plan032406.pdf)) include inventories of threatened species in their community action plans. Researchers at a recent U.S. Forest Service conference on ash borer management in the U.S. and Canada (Adams and Sapiro 2004), describing inventory requirements for establishing an extensive "reduced ash zone" to inhibit spread and impact of the pest, remark that conventional

Forest Inventory and Analysis (FIA) data are of limited utility in urban forestry applications:

Urban areas or areas classed as “non-forest” are currently not well-represented in FIA, creating a need to capture additional information on ash density where FIA plots do not exist.

In particular, any economic analysis of potential ash and elm impacts comparable to that performed by Nowak *et al.* (2001) on the possible toll of the comparatively omnivorous Asian longhorned beetle (*Anoplophora glabripennis*) would require more specific and better-localized data than FIA provides.

## Objectives

Many smaller communities in Minnesota have little or no information on species composition and health of street and yard trees. In 2006 we undertook a project intended to characterize at low cost the abundance, size and condition of the *Ulmus* and *Fraxinus* resource in residential and commercial areas of Minnesota municipalities. We conducted on-the-ground sample surveys of more than 750 separate communities across the entire state to gather the data.

## Methods

*General:* Field survey was obviously necessary to accomplish the aim; no available remote technique would provide the required discrimination of tree genera, or detect trees in the sapling (1-5" diameter) class. Three two-person crews with vehicles were deployed to conduct a "windshield" survey during summer 2006. Residential and business streets were used as our sampling frame: crews would drive a specified distance along streets in each municipality, visually tallying all ash and elm individuals within one chain (66') of the pavement edge in the following classes:

<i>Genus</i>	Ash	<i>Fraxinus</i> spp.
	Elm	<i>Ulmus</i> spp.
<i>Size class</i>	Sapling	1-5" diameter breast high
	Pole	5-12" diameter
	Sawtimber	>12" diameter
<i>Condition</i>	Healthy	< 30% visible crown damage
	Discoloration	>30% of crown affected
	Dieback	>30% of crown affected
	Dead	

*Delineating Areas of Interest:* The survey was intentionally confined to residential neighborhoods and main business corridors within municipalities. Primary interest lay in

street and yard trees in these areas, not in woodlot trees in areas of low population density. This meant that legal limits of municipalities could not be relied on to define the area under study, as in many rural communities these encompass a great deal of land and water remote from residential/commercial neighborhoods. In each of the 789 communities to be sampled, street maps were overlaid on 2003 aerial photography, and a GIS was used to delineate a study area boundary including only roaded residential and business areas as far as they could be distinguished. Sample results would be expanded to the area enclosed by this boundary.

*Sampling intensity:* Time and resources precluded a complete census of all residential streets in all communities. Instead, the sample was proportioned to the total street mileage in each town:

<b>Total street mileage</b>	<b>Percentage sampled</b>
< 1 mile	100%
1-2 miles	75%
2-4 miles	50%
4-6 miles	33%
6-10 miles	25%
10-15 miles	20%
15-20 miles	15%
20-30 miles	12%
30-45 miles	10%
45-75 miles	7%
75-200 miles	5%
200-350 miles	4%
350-1000 miles	3%
>1000 miles	2%

Street miles to be surveyed were calculated on this basis for each of 789 municipalities. An orthophoto road map of the study area was prepared for each, and distributed to field crews. A general map of the communities surveyed appears as Figure 1 below, and a sample municipal orthophotomap surveyed appears as Figure 2.

*Field methods:* Crews drove their assigned street mileage in each community, recording all ash and elm trees observed within 66 feet from either edge of the street. The data form used appears as Figure 3 below.

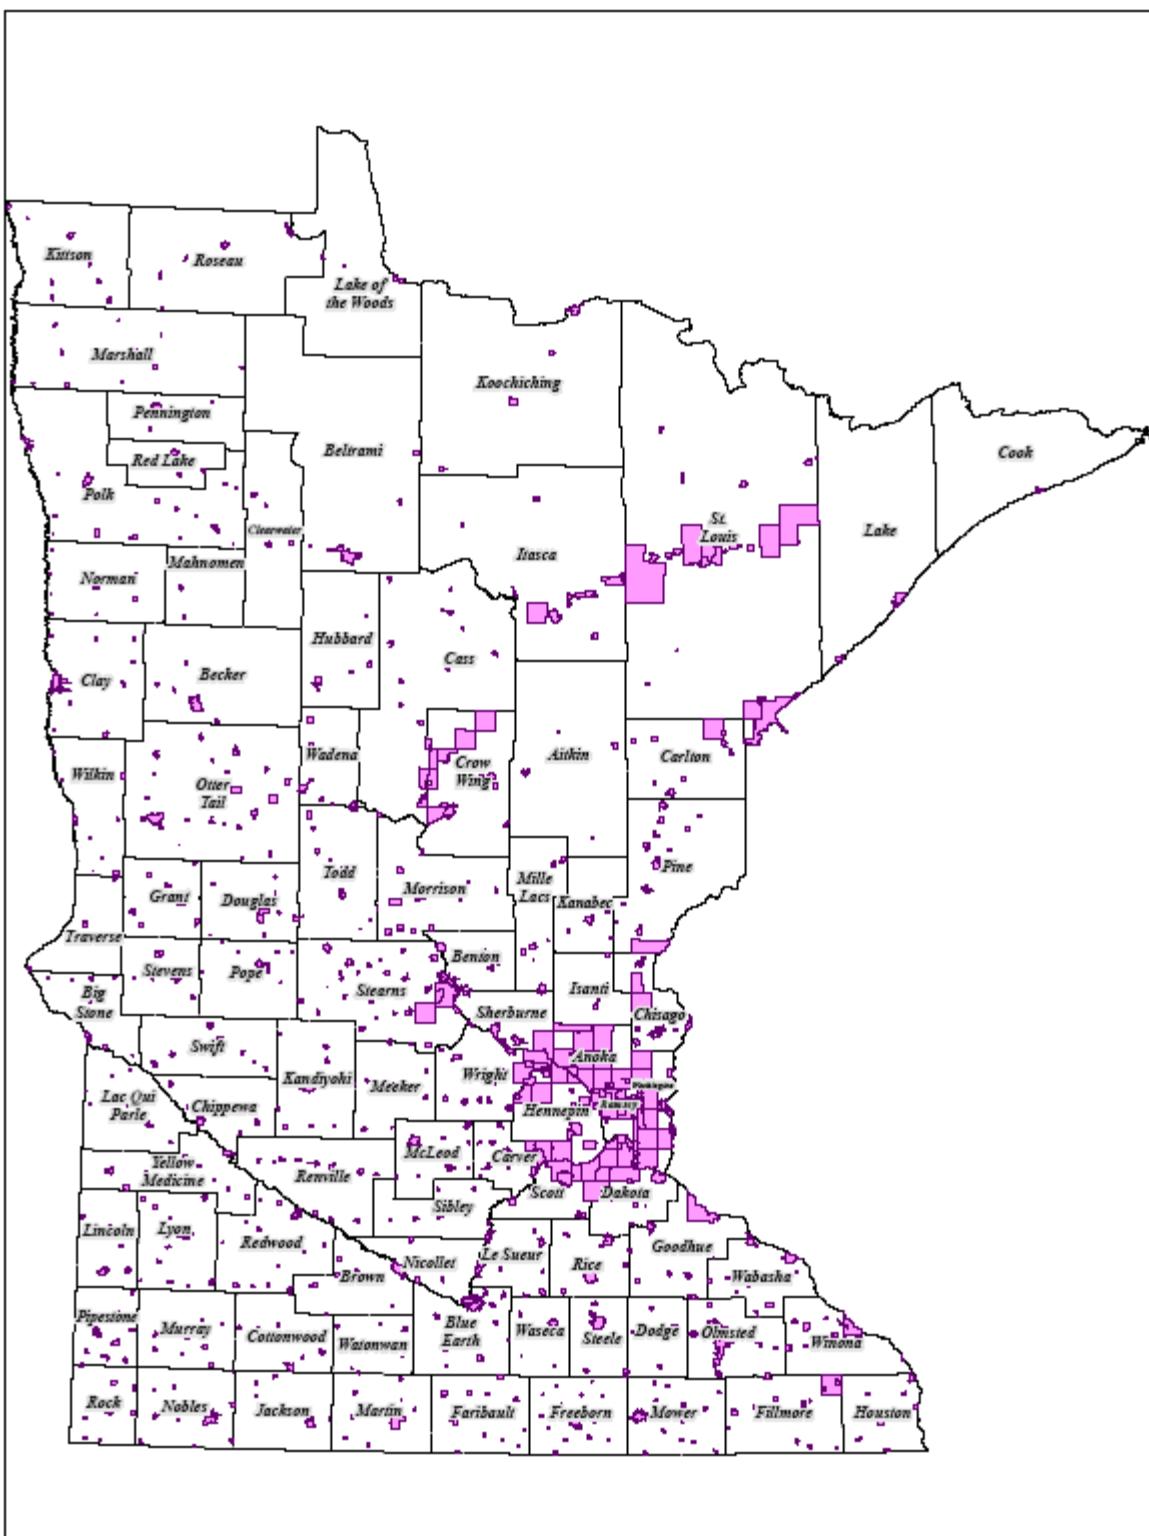

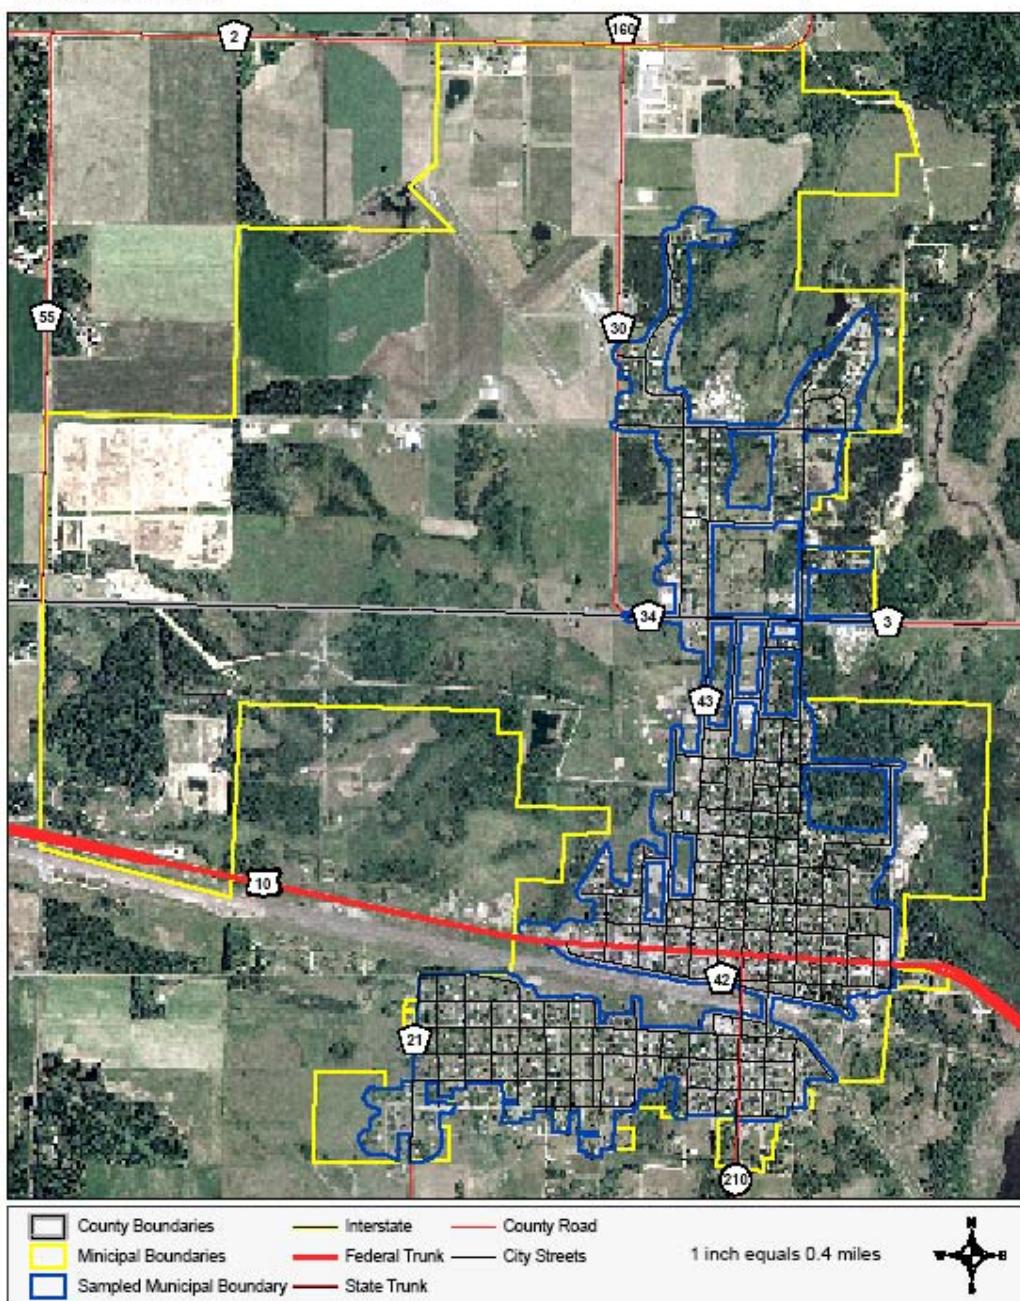

Figure 1. Map of communities surveyed. Outlines show legal boundaries.

Population: 3104

Print Date: Dec 07, 2008

## Wadena County City of Staples

Drive **2.9** Miles of  
City Streets in this Town

*Figure 2.* Orthophotomaps like this were the primary navigational tool used by field crews in making the survey. The yellow outline represents the legal boundary of the municipality; the blue outline delineates the residential-commercial area of interest, to which sample data were expanded.

LUG:		Date:	Miles Surveyed:		Crew:			
	# Elm					% Elm in LUG:		
	Healthy	Stressed			Dead	Remarks		
		Dieback	Discoloration	Dieback & Discoloration				
Saplings (1 – 5 inch)								
Pole (5 – 12 inch)								
Sawtimber (12 inch plus)								
Total								
	# Ash					% Ash in LUG:		
	Healthy	Stressed			Dead	Remarks		
		Dieback	Discoloration	Dieback & Discoloration				
Saplings (1 – 5 inch)								
Pole (5 – 12 inch)								
Sawtimber (12 inch plus)								
Total								

Figure 3. Field tally sheet used to record tree observations.

*Data quality control:* A blind check of crews' survey results was run in 69 of the 789 communities surveyed. Crews other than those who gathered the original data, including supervisory personnel, conducted the checks. The checks uncovered substantial differences in crews' ability to distinguish and count target trees. One crew's communities were resurveyed on account of discrepancies identified in field checks.

## Results

At an approximate cost of \$75 for fieldwork and \$65 for office work per community, basic data on presence, size, and condition of ash and elm trees in residential areas of nearly 800 highly diverse municipalities across Minnesota were generated. These data are presented in map form in Figures 4-9 on the following pages. Statewide summary data appear in Tables 1-4 at the end of this report. A complete tabulation of ash and elm in all communities in each county is given in a separate Appendix.

Field checks indicated that ash were undercounted by 14 percent and elm by 33 percent statewide, taking field-check counts as the basis (Table 4.) Most of the variation occurred in the sapling (1-5" diameter) class. Excluding this class, statewide ash field check totals differed from the initial count by 1 percent, while elms were underestimated by 18 percent. We had hoped that community-by-community field check figures would be within 30 percent of original count data in two-thirds of cases; ash counts met this goal in 68 percent of communities, but elm counts did so in only 43 per cent.

Preliminary calculations using benefit-cost tables from the USDA *Midwest Community Tree Guide* (McPherson *et al.* 2005) suggest that the elm population identified in this survey provided approximately \$29 million, and the ash population \$20 million, in net public benefits in the year 2006.<sup>1</sup>

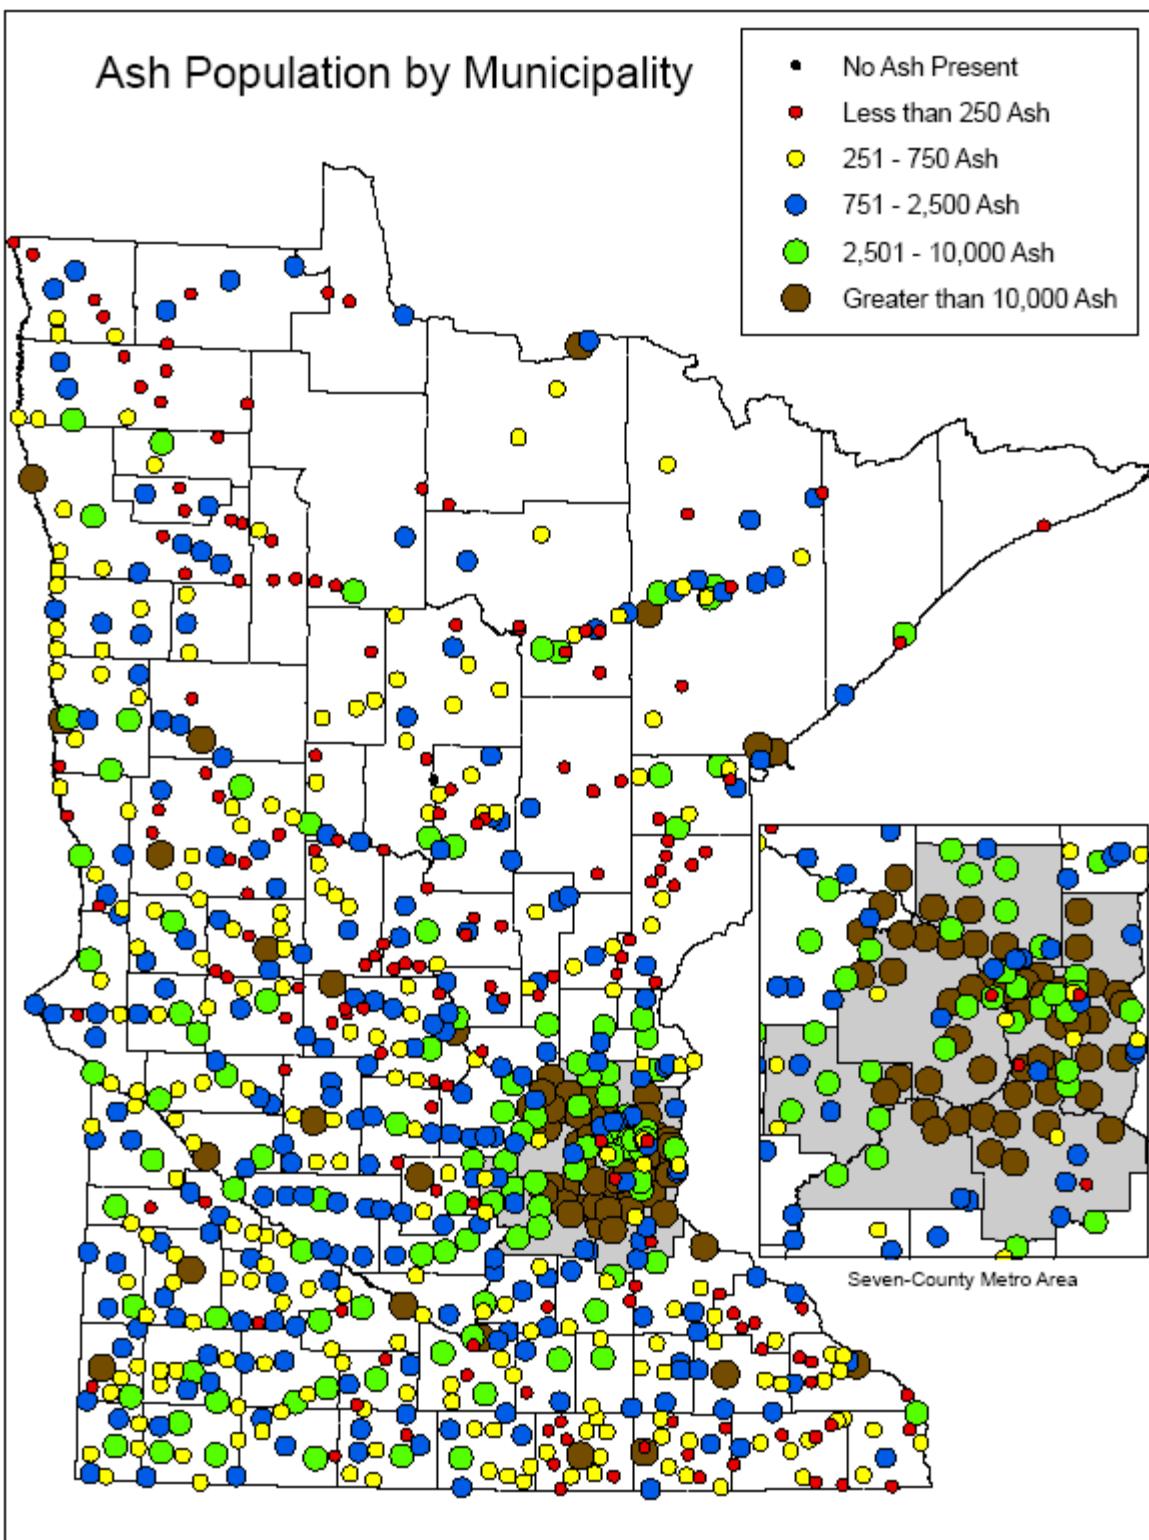

## Discussion

The survey achieved its primary objective: cost-effective field estimates of the distribution, size and condition of two at-risk tree genera in a large number of communities. The results represent the most thorough estimate of residential ash and elm ever attempted in Minnesota; they will be of value in evaluating future tree health measures relating to these genera, and will facilitate communication with legislators and policymakers considering investments to protect urban trees.

This type of survey could be conducted on a continuous basis, and its scope expanded to include all major tree genera in Minnesota communities. Costs per municipality could be expected to rise to approximately \$330, amounting to about \$272,000 statewide, or \$68,000 annually for a four-panel continuous program.

---

(Inset shows Minneapolis-St. Paul metropolitan area at enlarged scale.)

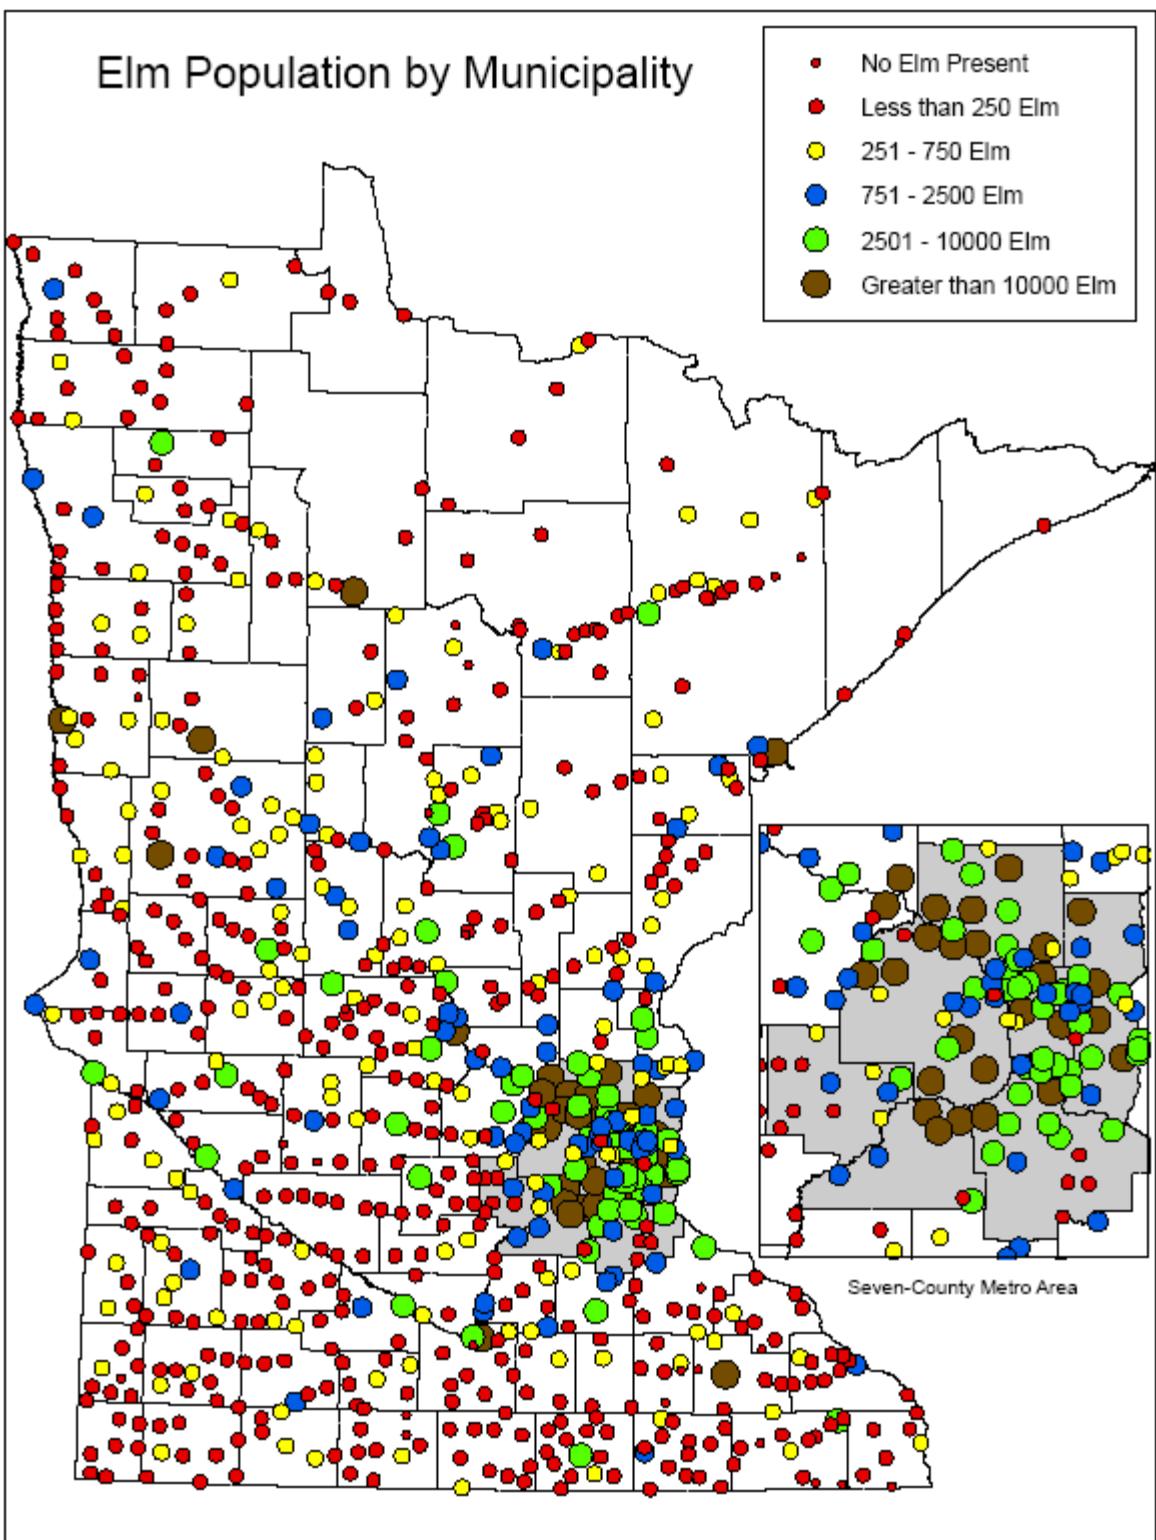

Figure 5. Elm populations in Minnesota municipalities.

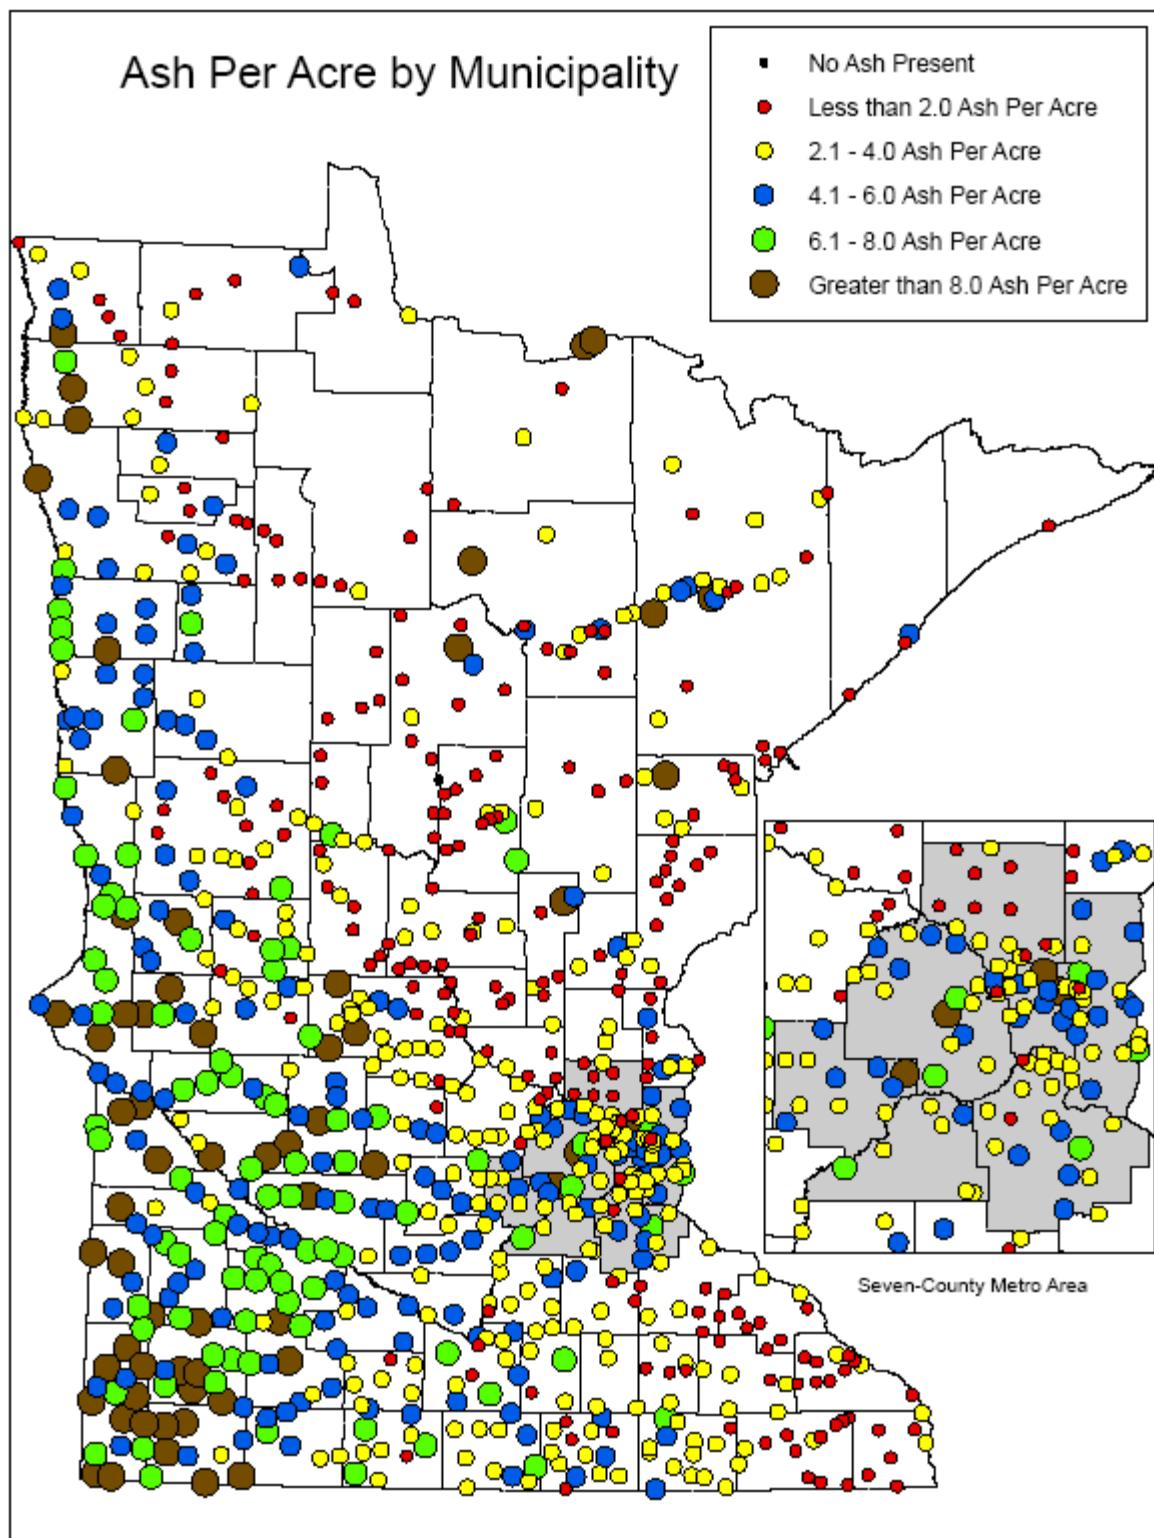

Figure 6. Ash density in Minnesota municipalities.

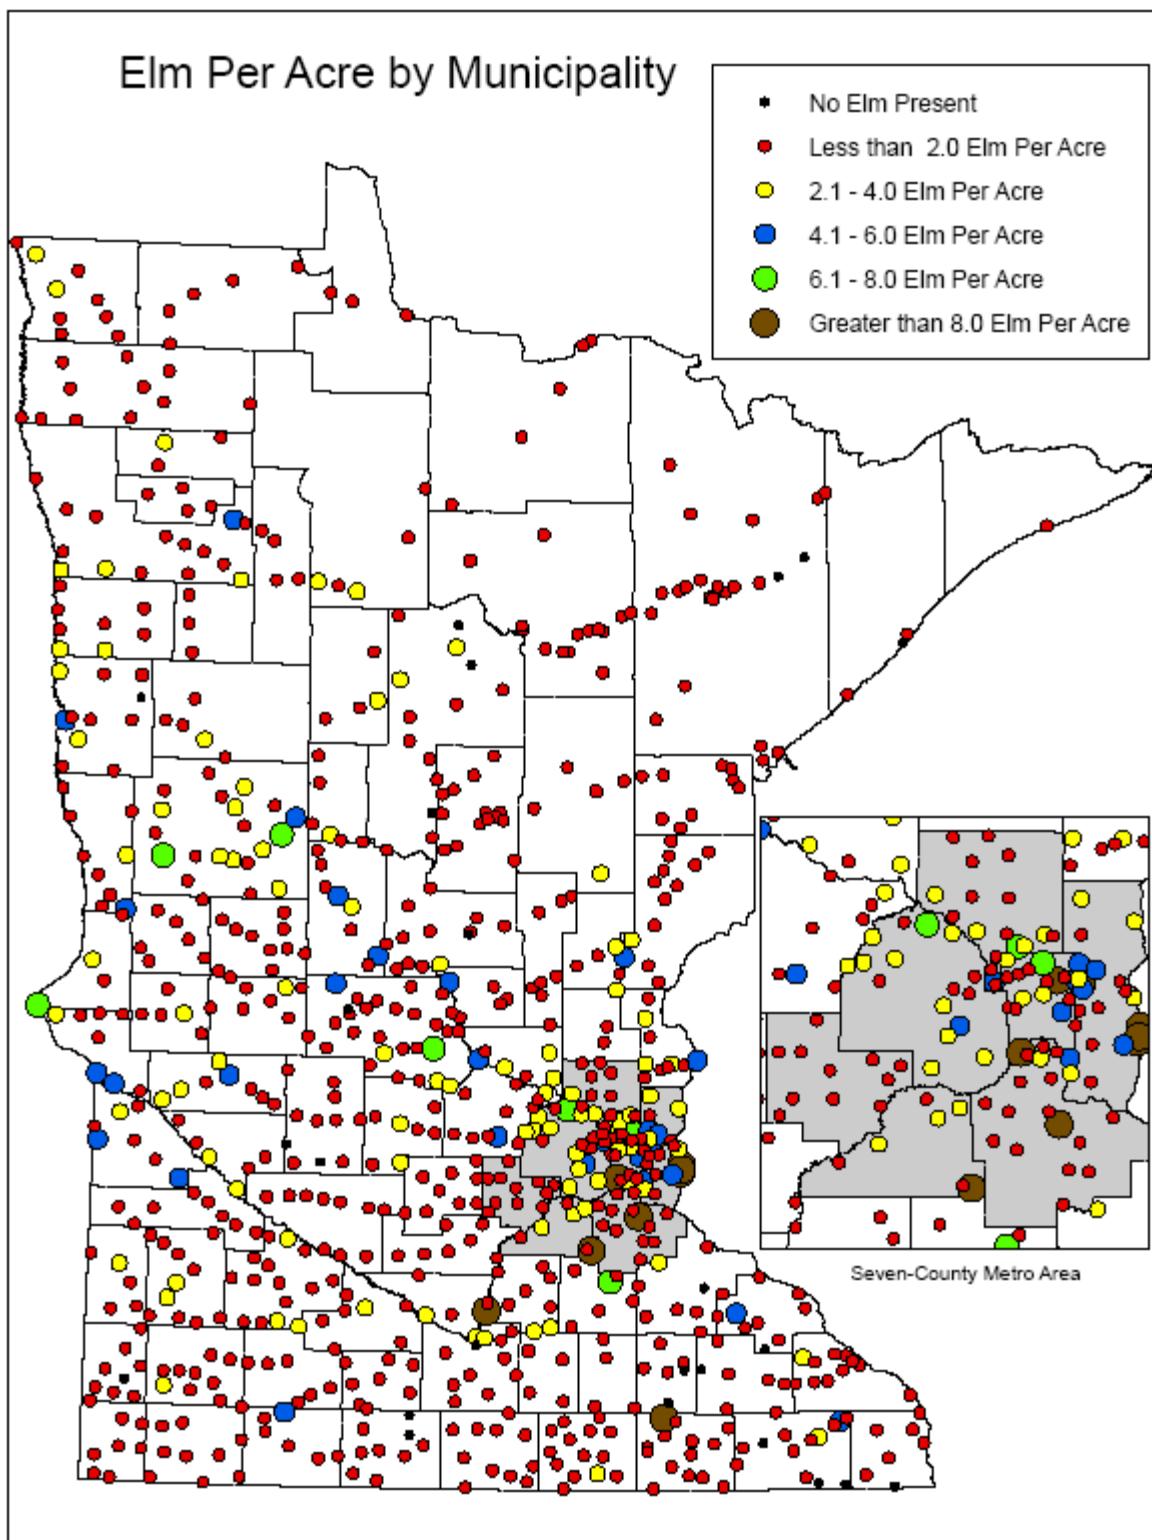

Figure 7. Elm density in Minnesota municipalities.

This survey was designed and implemented at short notice, and improvements were made as work progressed. Some gaps and inadequacies in the survey became evident by the time of completion:

- *Target recognition:* Field checks revealed larger than expected between-crew differences in ability to discern and identify trees of the target genera. One crew's work was re-done as a result of field check data. Better pre-survey training in tree identification is indicated.
- *Tree count:* Counts of target trees became more variable in high-density areas; this was compounded by crews' differing ability to estimate, from the street, the 66-foot width of the sample strip. Future surveys should probably be conducted on foot rather than from vehicles, and laser rangefinders employed to help define transect width. Use of portable data recorders or PDA devices to replace data forms would streamline data flow.
- *Sample strip location:* Within each community, crews chose the particular street segments they would survey, and marked them on the orthophotomap. From the orthophotomap the routes were visually transferred to GIS for measurement and recording. It would probably have been better to pre-designate the street segments on the orthophotomaps, and use GPS to locate start and end points. This would have eliminated ambiguity, and facilitated field checks.
- *Dieback and discoloration thresholds:* A tree was to be tallied in the dieback or discoloration column if 30 percent of its crown was affected. Field checks showed wide discrepancies in interpretation of this threshold value. Unless a higher level of training can be achieved, the threshold should be done away with, and crews instructed to put all trees with any level of dieback or discoloration into the affected columns.
- *Relative stocking of ash/elm and other trees:* Tabulations include estimates of the percentage of total residential/commercial tree stocking represented by ash and elm in each locality. These are purely ocular estimates unsupported by actual enumeration. If this information is desired from a future survey, provision should be made for a tally of all trees in some proportion of the sample strips.
