3615 One thing that I have been taught is think before you act. It is the same thing with these mines in that we need to take a step back and measure up the pros and cons to see which way to go. I can see why mining companies are really intrigued especially in this economy to mine these parts of Minnesota.

3596 To Whom It May Concern: I just moved to this state 2 years ago, and am a voter here. I have visited the Boundary Waters several times, and they are beautiful. The idea that the state could allow short term profits to ruin the most beautiful area of the state disgusts me. This mining project would be a travesty. Please consider future generations and do not approve this project.

219 I definitely support the Polymet Mining Northmet Project. This project is needed and is necessary to the Iron Range area. The taconite mining industry has drastic up and down cycles. We currently are in a severe down cycle with two mines currently closed. The Northmet project would help the local economies deal with the ups and downs of the taconite industry. We could also keep more of our educated young people in the area instead of watching them leave and never return. My other reasons for supporting this project are as follows: - There are going to be approximately 400 jobs created at the mine sight. - There are going to be hundreds of spine off jobs created. - Polymet has the latest technology to help control any air and water pollution. - Polymet will contribute millions of needed tax dollars to the local and state governments.

1575 I attended the showing of "Precious Water" at the REI in Roseville this week and am disturbed to see that the mining process has already started. I recently read some thing about it, and then the Nick Coleman column caught my eye. How can the government approve such activity where there could be such a risk to our protected waters? The PolyMet people were there to talk against the discussion following the Precious Waters video. I would like to see more public hearings on this subject. and more literature.

424 Further, wetlands are a major sink for carbon. Almost every scientist today understands the need to keep carbon out of the atmosphere and sequestered in the ground.

1540	Know that I understand that the importance of using mining products. Any real wealth created comes from what the earth provides us. But wealth and jobs cannot be allowed to pollute our water with methylmercury and related compounds. You need go no farther than the Duluth harbor to see the effects of unmitigated and sloppy handling of mined products. It is absolutely critical that the long term costs of this operation are factored into any current equation. 'Superfunds' should not have to exist. Please look to northern Europe and other wealthy countries for models on how to properly assess life cycle costs.	PD4

3649	I liked the video and I want to help. Tell me how sabybaby99@hotmail.com.	RFI
<b>Sender Last Name:</b>	Aeschlimann	<b>Submission ID:</b> 3303
3597	Mining always has negative unforeseeable impacts on the environment, on water, on the economy, and on people. Open pit mining is a destructive technique that impacts systems – especially of water – in uncontrollable, uncontainable ways. The Boundary Waters, the lakes, and water system of the Arrowhead region and its people are unique vital, and irreplaceable. Allowing sulfur mining in this area would be a great crime.	EOO,G2,G7A
<b>Sender Last Name:</b>	Alexander	<b>Submission ID:</b> 3268
3578	I'm writing because scientific studies have revealed that the potential negative effects of such mines were underestimated in a number of cases. In others, capitalization was not enough to pay for reclamation in case the company went belly up. I am sad to learn of potential loss of wetlands and wildlife habitat in our beautiful BWCA region, but the thing that most concerns me is this: It's not just Polymet we're talking about now. I read that Antofagasta of Chile is involved, and (from a Reuters report last year) that they are not only involved in Bolivia/Chile water wars but that they're tapping water sources there and selling the water. Do we have guarantees that this won't happen here? See <a href="http://www.minesandcommunities.org/article.php?a=9525">http://www.minesandcommunities.org/article.php?a=9525</a> Thanks for letting me comment. Please take time to look at these issues carefully before moving ahead.	G4A,G7C,G8C

1	I also think there has been inadequate risk assessment from noise and light pollution. I have land that's about ten miles away from the Ely Airport, and there is a light tower that rotates at Ely Airport.	WI2,VI3,N1
2	Ten miles away, in the wintertime, when we are looking at Aurora Borealis, that light is pollution that interferes with our enjoyment, ten miles away. That light is frequently a problem.	VI3
3	I also think that they haven't taken into account the advances of technology, which are going to have an impact on needing fewer people because they will have bigger machines or more efficient machines, more automation, to get work done. So I think the benefits are exaggerated.	SE3
10	The costs are being underestimated. According to the study, some of the waste from this mine will be around for 2,000 years. And I can see nothing in the project that takes into account climate change, the impact on -- the economics that are going to pay for maintaining this site for the next 2,000 years after the project is closed down.	WR2A,WR2B,PD3,PD4

122	I am very concerned about this project. I think the benefits have been exaggerated and the risks are being underestimated. On the benefit side, I understand that the project has, basically, taken the word of PolyMet regarding the number of jobs that are going to be created. My understanding, talking to PolyMet, is that jobs are going to be created over time, as different aspects of this project go online. So I think there is an exaggeration, the number of jobs being created.	G1
715	Please extend the comment period for to 180 days for the public to comment on the Draft Environmental Impact Statement for the proposed PolyMet NorthMet open pit sulfide mine project. This is an important proposal that is worth taking extra time for the public to review and consider	PRO6
2853	The State of MN will stoop to the lowest of the low if they allow the sulfide mining in the pristine area of the Boundary Waters! How dare your state even consider this. I am not a citizen of MN, but this is a matter of a national treasure ! Please take all actions against this outrageous plan and STOP THE GREED!	EOO

**Sender Last Name:** Allison **Submission ID:** 209

209 I am writing this letter to voice my support for the NorthMet PolyMet Project in Hoyt Lakes, Minnesota. I am a life long resident of NE MN and have traveled and lived in others areas of the country. After ten years living in other areas of the country, fifteen years ago I decided to return to NE MN to start and raise a family. The decision to move back to the area I grew up was a very simple decision. I went to school, played, hunted, fished... in just the area where PolyMet resides. I have many great memories of my younger years hunting, fishing, and camping in this area as I have done in recent years with my family. I understand there needs to be a balance in the uses of the minerals & resources we are so fortunate to have. I have also lived a large part of my life in the heart of the mining, power generation, pulp & paper industries and feel strongly that the MN Department of Natural Resources has done an outstanding job monitoring and managing the minerals and resources in NE MN. The energy, resources and research that has gone into this project is exactly what I would have expected from the MN DNR and that is part of why I believe this is as sound of a project as one could find in the manufacturing world. The minimal environmental impacts that this project would create I believe are a very safe tradeoff for the long term gains NE MN will see from this project. So if we truly are concerned about the future of NE MN and its ability to remain a strong manufacturing hub not only the USA, but for the entire global economy, then the answer is clear...Support the NorthMet/PolyMet Project. Now if we want to listen to a small minority of people of which are the same people that would like to see NO manufacturing, then we have all really missed the boat. This is a sound project, not only by its economic return, but by its minimal environmental impact to the lands and air that I too love and share everyday of my life.

**Sender Last Name:** Ament **Submission ID:** 1147

1260 Please take this into consideration. It is important to many people in this area. Thanks! EOO

**Sender Last Name:** Amis **Submission ID:** 3196

737 I am concerned about the possible environmental impact of the PolyMet Project and believe, strongly, that a careful, inclusive, public process should be followed. For that reason, I respectfully request that you extend the time allowed for review of the EIS by an additional 30 to 45 days, include more public hearings in more locations than you currently have planned, and allow for public statements and discussion at the public meetings. Thank you for considering my request. Sincerely, Bob Amis PRO6

23	-Economically this is not sustainable for the community or state of MN. Boom and Bust is mining history, and has not historically built strong sustainable economies. Economic prosperity is short lived with 20 years maximum for this mine. What about the strong outdoor and ecotourism economy this region depends on that could be affected forever. The risks could have perpetual costs, many others have! Strong sustainable economy is what MN needs. Here is a great MN mining economic report that puts benefits into perspective: <a href="http://www.mncenter.org/LinkClick.aspx?fileticket=6MOOTaRssSY%3d&amp;tabid=60">http://www.mncenter.org/LinkClick.aspx?fileticket=6MOOTaRssSY%3d&amp;tabid=60</a>	SE3,SE4
601	-Destruction of 1500 acres of valuable wetlands cannot be mitigated without having very substantial affects. This is destruction of an enormous healthy ecosystem.	WE3
901	-Polymet has proposed using a tailings basin that already has stability problems and has also predicted contamination at year 65 and other flaws in the containment of toxins.	GT2
1851	-This type of mining has never been done without causing pollution, which would pollute waters that we depend on with toxic heavy metals released by even very small quantities of sulfuric acid.	WR1E
1852	-The geology and hydrology of the area make it highly prone to spreading water contamination. Water is interconnected all over this region. Being a low grade ore body with substantial sulfide concentrations and being low in acid-neutralizing carbonates. Sulfide mining operations have polluted even very arid landscapes where this mining is more common.	WR1E
2046	-The original land agreement stated this land could not be used for mining, right? Also this is public land being used to benefit a private company, with potential to cause harm to private and public lands, as well as public health	PD1
2047	With this in mind: 100% of mines surveyed in one study said they wouldn't pollute .... 76% did. Also financial assurances for the worst case scenario should be in place ... could the company even pay these, forever?	PD3,PD4
2136	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on the natural environment, the local economy, and the state of MN as a whole.	EOO
2137	Extensive environmental testing to insure that impacts are within acceptable limits, can be predicted, and can be controled without a doubt. The DEIS does not show this!	G8C,G10
2138	Mining plan should be worked out to NOT produce ANY toxic runoff or leaching...if this can be done then it is an option to consider. If not...WE are opening the door to pollution and impacts that will forever diminish what this area of Minnesota is, pristine unpolluted beauty. The DEIS does not show this either!	G7A,G8B,G10
2139	Finantial assurances that make the company front the money for any possible mitigation that could possibly be nessecary. This means they pay to have this assessed and then are held accountable for the damages they could create, before they ever begin work. The DEIS does not show this either!	G4A
2140	The public should be informed on this and get to vote on it...This affects Minnesota as a whole, and most people don't even know about it. This should be brought to public attention.	G10
2141	It is in the DNR mission statement "to provide for commercial uses of natural resources in a way that creates a sustainable quality of life". According to the facts about this type of mining, and Polymet's own statements in the DEIS; allowing this type of mining in MN would NOT create a sustainable quality of life. Until we have assurance that it will this proposal should not even be considered.	G8C

2672	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about human health, area economic prosperitv. ecosystem health, biotic organism' s health. "Our mission is to work with citizens to conserve and manage the state's natural resources, to provide outdoor recreation opportunities, and to provide for commercial uses of natural resources in a way that creates a sustainable quality of life." -This is the MN DNR mission statement which I thought was notable to keep in mind while contemplating the new venture of sulfide mining in Minnesota. Based on facts I wouldn't say sulfide mining "creates a sustainable quality of life".	G2
2673	Technology is only as strong as its weakest link and this involves permanent storage of toxic materials on liners which have historically failed.	EOO
2674	This mine is not a solution for a stable sustainable economy. It threatens beautiful and useful ecosystems MN citizens depend on and cherish systems the DNR is responsible to protect. Minnesotans and people from elsewhere associate our state with clean vast waters and pristine landscape. This drives a great deal of MN tourism and is something Minnesotans want to hold on to! Minnesotans just made it very clear how important clean water and the environment is to them by saying YES I will pay more sales tax to support the environment by voting in the Clean Water, Land, and Legacy amendment. How much is this mine going to do for Minnesota .... and is that worth more than our environment?	G1,G11

2465 PROTECT MINNESOTA NATURE FOR THE PRESENT AND FUTURE!!! EOO

**Sender Last Name:** Anderson **Submission ID:** 3747

1 3.) The DEIS acknowledges that overflow from the West Pit is predicted to exceed surface water quality standards at least initially. The DEIS does not explain what time frame is meant by “initially” nor any reason why the exceedances are expected to be finite. At closure, potentially contaminated hydrometallurgical drainage as well as waste rock stockpile drainage will be routed to the East Pit, which eventually will flow to the West Pit, which will overflow into the Partridge River. MODFLOW modeling in the DEIS predicts hydrometallurgical drainage to gradually decrease to zero by Year 34. “Waste rock stockpile drainage would continue to receive chemical treatment at least until the West Pit fill around Year 65. At that time, water quality monitoring of the West Pit overflow would determine whether continued treatment would be necessary” (DEIS pg. 4.1-67). But Dr. Chambers believes the conclusion that water treatment will be unnecessary after 65 years is not a reasonable one. “...the assumptions used in determining the scaling factors...for the release of contaminants from the waste rock piles could easily contain inadvertent errors (for example in the choice of particle size, temperature, fraction of rock flushed by infiltrating water and the upper limit of contaminant concentrations) that could cause a significant departure from the predicted contaminant loads assumed in the EIS” (Chambers 2010). The scenario that water treatment of West Pit drainage will be necessary beyond 65 years is strongly possible. In fact, analyses of mines over the past two decades have shown poor abilities in accurately predicting post-mining water quality and quantity. In a review of 25 EISs for hardrock mining, 89 percent of those that experienced AMD had predicted low AMD potential in their EISs. “Therefore, nearly all the mines that developed acid drainage either underestimated or ignored the potential for acid drainage in their EISs” (Kuipers et. al. 2006). Recommendation: The duration of “initial” exceedances for West Pit drainage of surface water quality standards must be defined in the EIS. Contingencies should be put in place to fund long-term water treatment beyond the assumed 65 year limit. Given the poor record of predicting water quality post-mine operations, financial assurance calculations should be made conservatively for water treatment.

Comment ID	Comment Text	Theme Codes
1	<p>2.) Another concern for West Pit overflow comes from oxidation of West Pit rock wall that is predicted to be a significant source of contaminants in the pit lake (see Comments II.C.). As the pit gradually fills with water after closure, the exposed rock wall may oxidize and release metal contaminants into the filling lake. One mitigation measure explored is to more rapidly flood the West Pit. “The likely source of water to expedite flooding of the West Pit would be Colby Lake” (DEIS pg. 4.1-166). But, as the DEIS notes, Colby Lake already has elevated concentrations of mercury. If this method were used, mercury contamination in the West Pit overflow “could make it more difficult for the West Pit overflow to meet the Lake Superior surface water standard for mercury. This potential mitigation warrants further consideration” (DEIS pg. 4.1-166). Recommendation: The EIS should study this approach further and provide information describing its findings. Measures that involve elevated mercury levels being discharged from the West Pit should be rejected. The EIS should present other methods to achieve West Pit filling without mercury contamination.</p>	PD4,WR2F,WR2A
1	<p>C. East Pit Category 4 Exposed Rock Wall When mining the East Pit is complete, approximately 5,000 linear feet of the north wall of the East Pit will consist of “Virginia Formation or other Category 4 rock material” (DEIS pg. 3-40). The DEIS notes, “If left exposed to the air, oxidation of this surface would occur, resulting in elevated concentrations of dissolved salts (sulfates) and metals entering the East Pit surface water” (DEIS pg. 3-40). The Proposed Action calls for applying a layer of limestone against the rock face to neutralize the acidity, and installing a geosynthetic membrane cover system over the rock surfaces. The DEIS, however, acknowledges that “successful application of this measure has not been demonstrated. The groundwater quality modeling discussed below assumes these mitigation measures are successfully implemented” (DEIS pg. 4.1-66). Recommendation: Relying on an untested method to contain significant pollution is not acceptable. The EIS must contain analysis of field and laboratory tests of this technique. It must also model impacts to groundwater quality should this technique fail.</p>	WR2E
1	<p>4.) The DEIS lays out several potential corrective actions should water quality of the West Pit drainage exceed standards. It does not, however, indicate which actions would be required and which are simply recommendations. It does not indicate what conditions would trigger specific corrective actions. The DEIS notes that if actions failed to improve water quality in the overflow, that “...the West Pit overflow structure could be altered to route flows to the WWTF for treatment before discharge...” and that “...it is recommended that the water quality of the West Pit be monitored regularly after Closure...” (DEIS pg. 4.1-167). Recommendation: The EIS must make it clear which corrective actions are required. Triggers for mitigation actions must be clear and outlined. Routing contaminated overflow to the WWTF must be a requirement rather than a recommendation. Monitoring overflow water quality post-closure must be a requirement rather than a recommendation. The duration of “initial” exceedances of surface water quality standards must be defined.</p>	WR1A,WR3C

Comment ID	Comment Text	Theme Codes
2	<p>N. Sulfate and Mercury in Water Both the mine site and the tailings basin will discharge high sulfate concentrations in seepage and overflow that could lead to the methylation of mercury. This is a process in which the biologically active form of mercury is mobilized from stored mercury in rocks, soil, peat and vegetation. This form of mercury can accumulate in fish and is toxic to humans and wildlife. “Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent ‘high risk situations’ for mercury methylation. There is some uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard” (DEIS pg. S-9). In addition to methylating mercury from high sulfate discharges, mercury can be released to water bodies by exposing rocks that contain mercury and by clearing vegetation, especially peat. “Disruption of peat deposits, such as proposed excavating and stockpiling of peat at the Mine Site...may increase the mobility of the stored mercury” (DEIS pg. 4.1-123). The DEIS notes, “The Proposed Action would result in increased sulfate loadings via groundwater to both the Partridge and Embarrass Rivers” (DEIS pg. 4.1-125). At the tailings basin, much of the groundwater seepage is expected to upwell into the wetlands complex north of it. “The sulfate transported by this seepage would have a long contact period with wetlands before actually reaching the Embarrass River. All of these factors may create favorable conditions for mercury methylation” (DEIS pg. 4.1-126.) Liner leakage from the hydrometallurgical cells “is predicted to have a very high sulfate concentration” (DEIS pg. 4.1-118). “Increasing the sulfate load from the Tailings Basin could increase the potential for mercury methylation both in the wetlands north of the Tailings Basin and at the downstream lakes” (DEIS pg. 4.1-126). Dr. Engstrom notes, “This tailings-basin leakage poses the project’s greatest risk of increasing mercury methylation and methylmercury export to downstream aquatic environments...The configuration of the Embarrass River wetland complex make it especially susceptible to sulfate-enhanced mercury methylation. Not only would these bogs/poor fens be sulfate limited (and hence sensitive to additional sulfate), but the anticipated discharge would upwell through a mercury and carbon-rich anoxic environment ideal for SRB. Such groundwater discharge at the upland-wetland margin has been identified as creating sites of intense mercury methylation...The increased ground-water and surface discharge toward the Embarrass River would also increase mercury transport from sites of methylation to the river itself where the methylmercury load could then impact downstream aquatic systems” (Engstrom 2010). Some of the tailings basin leakage is also predicted to occur toward the Partridge River. Dr. Engstrom notes that the DEIS downplays the risk of sulfate-enhanced mercury methylation to the Partridge River, but he states that the risk may be higher than portrayed in the DEIS. “...the Partridge River is described as having ‘a very well-developed floodplain along most of its reaches’ with ‘many beaver dams along the entire length...which create wide pools.’ Recent studies have shown that beaver impoundments provide conditions suitable for active mercury methylation and represent net sources for methylmercury in riverine systems...It thus seems likely that the risk of enhanced methylation from sulfate discharge into the Partridge River may be greater than is concluded in the DEIS” (Engstrom 2010). The Proposed Action calls for routing mine leachate through the artificial East Pit wetland, which may also lead to additional methylation of mercury. “...Constructed wetlands...could function as a source for methylmercury production” (DEIS pg. 4.1-123). Dr. Engstrom’s comments note that a lack of information about the proposed constructed wetland</p>	WR1E,WR3I,WR4A,WR4B

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2	6.) Another concern highlighted by Dr. Siegel is that the modeling of subsurface flow assumes a flow to the Partridge River, which may be inaccurate. Unknown, for example, is if groundwater flow actually might pass below the river in bedrock. This scenario is not modeled at all, and the lack of real field data fails to provide helpful information. Dr. Siegel states, “For example, if subsurface contaminated water by passes the Partridge River, it could move north towards the larger regional lake hydrologic discharge zones within the Boundary Waters Wilderness” (Siegel 2010). Subsurface flows that might enter the federally protected wilderness would pose significant impacts that have not been modeled or analyzed. Recommendation: The EIS should include: 1. Modeling and field data to assess the risk of subsurface flows into the Boundary Waters Canoe Area Wilderness. 2. Direct measurements of head and water chemistry to provide ground truth with respect to the degree of leakage and solid transport that might occur. This should include likely retardation rates for metals. 3. Direct measurements of recharge rates through till by hydrograph separation methods to understand the potential for contaminants to enter the Partridge River through groundwater flow. 4. Direct measurements of potentiometric surfaces of the bedrock aquifer, and characterization of the degree to which groundwater moves vertically naturally. 5. Additional modeling that includes the list in Dr. Siegel’s report (pg. 23) for items to include in a groundwater or solute transport model.	WR2A
3	These and other concerns outlined in detail in our comments below are not minor. The flaws of this project pose unacceptable risks to human health and the environmental well-being of a potentially large area of northeastern Minnesota. Given this level of risk, the Friends cannot support the PolyMet project as it is currently proposed. We recommend the “No Action” alternative be the selected outcome for this project. We urge the agencies to consider the detailed recommendations provided here, which we believe would greatly improve this proposed project.	EOO,G2

3 D. Wildlife Impacts 1.) Canada lynx are a federally-listed threatened species. The DEIS acknowledges that portions of the mine site lie within the recently revised boundaries of federally designated critical habitat for lynx. It also acknowledges that “the Project would result in the loss of...1,454 acres of lynx habitat” (DEIS pg. 4.4-10). The DEIS also says, “Habitat loss at the Mine Site, however, would result in fragmentation of lynx habitat in a portion of its current range” (DEIS pg. 4.4-10). At least 20 individual lynx have been identified within 18 miles of the mine site. The U.S. Forest Service has designated Lynx Analysis Units (LAUs) within the Superior National Forest “that comprise landscape-scale analysis areas for lynx management” (DEIS pg. 4.4-3). The mine site is in LAU 12. About 94% of LAU 12 provides suitable lynx habitat. Critical habitat was designated for the lynx as part of a process to reverse this species population decline. The Endangered Species Act defines critical habitat for endangered or threatened species as: “(i) the specific areas within the geographical area occupied by the species, at the time it is listed...or on which are found those physical or biological features (I) essential to conservation of the species and (II) which may require special management considerations or protection; and (ii) specific areas outside the geographical area occupied by the species at the time it is listed and that are essential for the conservation of the species” (Endangered Species Act 1973 Section 3(5)(A)). The loss of critical habitat from this project’s activities is detrimental to the recovery of this species and violates the provisions of the Endangered Species Act. Maps created by the Minnesota Center for Environmental Advocacy (Maas 2010) using data published in the Journal of Wildlife Management (Moen 2008), indicate that the PolyMet mine site contains large amounts of suitable lynx denning sites (see attached maps prepared by the Minnesota Center for Environmental Advocacy). The tribal cooperating agencies note, “the tribal cooperating agencies disagree with the conclusion that the effects on statewide lynx populations would be insignificant; this analysis does not consider the possibility that the Mine Site might include critical components of lynx habitat present such as den sites” (Tribal Cooperating Agencies, DEIS pg. 4.4-10). Reclamation work at the mine site may also make this critical lynx habitat more suitable as bobcat habitat than as lynx habitat. “It is the tribal cooperating agencies’ note that this restoration of ‘lynx habitat’ initially creates good bobcat habitat. Bobcats are superior competitors to lynx and thus may prevent lynx from returning to the site” (Tribal Cooperating Agencies, DEIS pg. 4.4-11). The proposed project may therefore diminish critical lynx habitat long into the future. The DEIS also notes the increased risk of the project resulting in lynx-vehicle collisions. Nevertheless, the DEIS states that, “Although the Proposed Action would result in a loss and fragmentation of lynx habitat at the Mine Site, the effect on statewide lynx populations would be insignificant since no individual lynx or pair of lynx would be significantly affected by the habitat loss” (DEIS pg. 4.4-10). It is not clear what data support this conclusion in the DEIS. The DEIS contains no biological assessment or completed consultation with the U.S. Fish and Wildlife Service (USFWS). It does not analyze the cumulative impacts on the species. The DEIS notes that on-going consultations with the USFWS are taking place, but states that USFWS comments have not been received (DEIS pg. 4.4-9). Recommendation: The EIS must present the results of a biological assessment, consultation with the USFWS, and an evaluation of the cumulative impacts on the lynx’s survival and recovery as required by law. It is not sufficient for the DEIS to provide conjecture that the project presents no risk to the lynx’s population;

3 C. Mitigation of Wetland Losses and Greenhouse Gas Emissions The DEIS describes plans to mitigate wetland losses and greenhouse gas impacts associated with the wetlands destruction by “restoring high quality wetland communities of the same type, quality, function and value as those impacted by the Project” (DEIS pg. 4.6-33). And yet, the mitigation plan described fails to achieve that goal. The DEIS notes that, “Given site limitations and technical feasibility, it is impractical to replace all impacted wetland types with an equivalent area of in-kind wetlands” (DEIS pg. 4.6-33). Despite the fact that most of the wetlands to be destroyed are open bogs and coniferous bogs (peatlands) the off-site mitigation acreage is “expected to exceed impacted acreage for all wetland types except for Type 8 (open bog and coniferous bog)” (DEIS pg. 4.6-33). So the type of wetland most impacted and most important for carbon sequestration, will be the least mitigated type of all. This is a significant flaw in the wetland mitigation plan. The off-site wetlands selected for mitigating the NorthMet project’s wetlands are at two distant sites near Aitken and Hinckley, Minnesota. These wetlands Dr. Glaser feels contain very different characteristics than the wetlands to be destroyed by the project. He cites five concerns about the mitigation sites selected and described in the DEIS: 1. The two sites selected for mitigation efforts have “different environmental settings with respect to climate, depth to bedrock, and glacial deposit than those at the PolyMet project site” (Glaser 2010). 2. The selected wetlands are probably significantly different from the PolyMet wetlands because the Aitken and Hinckley sites “are located at the extreme southern fringe of the boreal and mixed-conifer hardwood peatlands of the northern portions of Minnesota” (Glaser 2010). 3. The DEIS did not provide geographic coordinates for all the sites evaluated for mitigation, so they could not be located and evaluated. 4.Replacement of the mine site peatlands cannot be achieved. “It is impossible to replace a peatland ecosystem within the lifetime of human beings since it takes centennial to millennial time scales for peatlands to form and develop into raised bogs” (Glaser 2010). 5. The DEIS failed to consider restoring and protecting “an exceptional complex of wetlands north of the town of Alborn in the Saint Louis River watershed that contains peatlands and wetlands very similar to those found in the PolyMet site” (Glaser 2010). Dr. Glaser also notes that the DEIS did not provide adequate documentation of all the sites evaluated for mitigation, making it impossible to determine why so many sites within the St. Louis River watershed were rejected. The U.S. Army Corp of Engineers St. Paul District requires a wetland compensation ratio of 1.5:1. In other words, for every acre of wetland lost, 1.5 acres of wetlands must be replaced. The tribal cooperating agencies note that “the large acreage of wetlands to be directly impacted and the high quality of the wetlands warrant a mitigation ratio of greater than 1.5:1” (Tribal Cooperating Agencies, DEIS pg. 4.2-29). Recommendation: The EIS should include a table containing the geographic coordinates of all the wetlands considered for mitigation and the rationale for rejecting each of these sites. The wetland complex north of Alborn described by Dr. Glaser should be given serious consideration and analysis. Mitigation sites should be selected that are as close to the PolyMet project wetlands as possible, “because the closer sites have the highest probability of containing wetlands that are similar to those that will be directly impacted by the PolyMet mine” (Glaser 2010). Wetland mitigation should replace Type 8 (peatlands) wetlands in excess of the peatland acres to be destroyed. The EIS should consider a replacement ratio greater than 1.5:1. The EIS should include an evaluation of how the wetland mitigation plan will affect statewide g

4	<p>3.) Other wildlife species are potentially at risk from the project. Bald eagle, wood turtle, heather vole, yellow rail, and tiger beetle are some mentioned in the DEIS. But the DEIS predicts no adverse effects to these species. The DEIS fails to assess impacts to many of these species from the predicted water contamination that is likely to spread from the site. For example, mercury contamination has been identified as a high risk for occurring, but no method for preventing or containing mercury pollution has been described in the DEIS. And the DEIS fails to analyze the risk of wildlife exposure to mercury. As the tribal cooperating agencies note, “impacts to bald eagles could result from eagle feeding sites within or adjacent to the project area. Contaminants from the mine site, specifically mercury and heavy metals, could affect prey species thus having secondary impacts on eagle reproduction” (Tribal Cooperating Agencies, DEIS pg. 4.4-13). When discussing the known wood turtle population downstream from the mine site, the DEIS says, “the Project would not result in exceedances of surface water quality standards in the Upper Partridge River; therefore, there would be no significant project-related changes to water quality and no indirect effects on downstream habitat where wood turtles are located...”(DEIS pg. 4.4-13). It is hard to understand how the DEIS can draw this unequivocal conclusion. The DEIS has acknowledged predicted water quality exceedances, the un-tested effectiveness of the East Pit wetland treatment system, and that untreated seepage will be released into a tributary of the Partridge River. The DEIS has failed to properly analyze groundwater flow, and has likely mischaracterized the hydrologic connectivity of the adjacent wetlands with groundwater. With these inadequacies in data, it cannot be stated that there will be no significant project-related changes to water quality. Therefore, the full impact to wood turtles and other wildlife has not been evaluated by this DEIS. Recommendation: The EIS must provide the required full assessment of impacts to wildlife from this project, including all Regional Forester’s Sensitive Species. This must consider scenarios for water quality exceedances, situations which are probable. This assessment should more fully examine impacts to more common species, such as moose, which are experiencing a statewide population decline and for which preserving wetlands may be important.</p>	WI1,WI2
4	<p>2.) The gray wolf is a federally-listed threatened species and a Minnesota species of special concern that has also been identified as potentially occurring within the project area. The project is located within Zone 2 of the gray wolf’s federally-listed critical habitat. “Radio-collared wolves were documented to the north and northeast of the Mine Site in 200, 2005 and 2008; and calling surveys located wolves south of the Mine Site in 2004...”(DEIS pg. 4.4-4). The DEIS notes, “Observations indicate the likelihood of a single wolf pack whose territory includes the Mine and Plant Sites” (DEIS pg. 4.4-12). The development of the mine site by the Proposed Action would remove 1,454 acres of wolf habitat, about 1-10% of a single wolf pack territory. Without providing supporting data or a biological assessment, or a completed USFW consultation, the DEIS arrives and this unsupported claim: “This reduction in available habitat is relatively small and is not expected to significantly affect the wolf population in the region...” (DEIS pg. 4.4-12). As with the lynx, vehicle collisions with wolves are noted as a potential risk from project activities. Recommendations: The EIS must present the results of a biological assessment, consultation with the USFWS, and an evaluation of the cumulative impacts on wolf survival and recovery as required by law. It is not sufficient for the DEIS to provide conjecture that the project presents no risk to the wolf population; conclusions about potential impacts must be based on scientific assessments and the appropriately completed consultations with the USFWS.</p>	WI1
5	<p>E. Inadequate Sampling of Fish and Macroinvertebrates The impacts of the project on fish and macroinvertebrates cannot be fully understood due to an inadequate sampling effort. The DEIS notes that the nearest known occurrence of northern brook lamprey is far from the project area. And yet, the tribal cooperating agencies note, “...no conclusion about the presence of northern brook lamprey can be made in this analysis without specific surveys in the Project Area. Tribal fisheries biologist have definitively identified this species in the Dark River, just a few miles to the west of the St. Louis River watershed” (Tribal Cooperating Agencies, DEIS 4.5-2). The creek heelsplitter, a state mussel species of special concern, was also not adequately sampled to determine its presence. “The tribal cooperating agencies position is that thee was not adequate sampling effort to determine the presence of the creek heelsplitter in the Project Area, particularly for a species that is already known to be limited in numbers or distribution. While the detection probability is low for each site, tribal fisheries biologists have sampled this species in the headwaters region of the St. Louis River, approximately a mile downstram of Seven Beavers Lake...in 2008” (Tribal Cooperating Agencies, DEIS pg. 4.5-5). Recommendation: The EIS should present the results of a more thorough sampling effort for fish and macroinvertebrates.</p>	FM2

5	A. Mercury Emissions 1.) Dr. Chambers notes the potential exists for mercury emissions to occur from the project's air exhaust of the autoclaves. He cites mines in Nevada where this has been a significant problem. While these mines have higher mercury content than the mercury content of ore in the NorthMet project, the risk for this project still must be acknowledged and addressed. "...the concern is that high temperature processes like the autoclaves can volatilize mercury..." (Chambers 2010). Dr. Chambers notes that mercury must be captured through appropriate equipment on the autoclave exhaust. "One of the major concerns with these capture systems is ensuring that they are performing as planned" (Chambers 2010). He points out that only Nevada has air emission standards for mercury, and that the US EPA is still developing mercury air emission standards. Dr. Chambers highlights a need for mercury emissions monitoring to occur with enough frequency to effectively evaluate problem emissions: "Under Nevada's standards mercury emissions from autoclaves are mostly monitored only once a year, and are sometimes based on manufacturer's specifications with no monitoring. Once a year measurements will not provide enough data to ensure statistically reliable measurements of the efficiency of mercury capture systems" (Chambers 2010). Recommendation: Dr. Chambers recommends: "In order to ensure that the mercury capture systems on the autoclaves are functioning as designed, a monitoring scheme should be required that will provide statistically reliable data on the autoclave mercury emissions" (Chambers 2010). He notes that the technology for measuring mercury frequently is available and is economically practical.	AQ5

5	<p>B. Class I Airsheds The Project is located within 300 km of four Class I regions. Under the Clean Air Act, Class I airsheds were established as areas where emissions of particulate matter and sulfur dioxide are to be restricted. Class I areas include federal wilderness areas exceeding 500 acres and national parks. These are places that are allowed only the smallest incremental pollution levels above baseline conditions. The four Class I areas within the vicinity of this project are the Boundary Waters Canoe Area Wilderness, Rainbow Lakes Wilderness, Voyageurs National Park, and Isle Royale National Park. The emissions modeling described in the DEIS for the NorthMet project, shows this project contributing 30 tons per year (tpy) of SO<sub>2</sub>, 159 tpy of NO<sub>x</sub> and 1,175 tpy of PM<sub>10</sub>. These emissions would come primarily from crushing and grinding ore, handling reagents and materials and the flotation and hydrometallurgical processing (DEIS pg. 4.6-53 and 54). The DEIS acknowledges that these emissions will cause visibility impairment for as much as 23 days a year in the Boundary Waters Canoe Area Wilderness. The NorthMet project may result in a 5% visibility impact in the BWCAW for 23 days a year, and as much as a 10% impact for one day a year (DEIS pg. 4.6-37). This is not an insignificant level of impairment from a single project. The Minnesota Regional Haze State Implementation Plan (SIP) is a plan developed by the Minnesota Pollution Control Agency as required by the Regional Haze Rule of 1999. The goal of the SIP is to reduce haze in Class I areas affected by Minnesota emissions, and to reach natural visibility conditions by 2064. The SIP was submitted to the EPA for review on December 30, 2009. The Haze SIP notes that a 5% or more contribution to visibility impairment from an entire state would be considered significant. The NorthMet project, as described in the DEIS, would contribute a 5% visibility impairment for as many as 23 days, and a 10% impairment for one day per year. Emissions contributions of this level are keeping Minnesota from making progress toward the goals outlined in the SIP. Even the DEIS concedes that the state is not likely to reach the visibility goals. "Current MPCA estimates indicate that emission reductions at power generation facilities and additional reasonably foreseeable projects in northeastern Minnesota are not enough to meet the current Regional Haze SIP goals" (DEIS pg. 4.6-54). The air visibility quality in the BWCAW shows a trend of becoming worse, not better. Between 1992 and 2006, visibility in the wilderness on the 20% worst days showed a worsening trend. The NorthMet project will add to the downward trend for air visibility quality over Minnesota's Class I Areas and impede reaching the goal of natural visibility conditions by 2064 as the Regional Haze Rule requires. Within the DEIS, mitigation measures are discussed, but many eliminated from further discussion without explanation. The DEIS mentions the use of low-NO<sub>x</sub> burners in the heaters, the conversion to electric heating, and the use of waste heat for work space heating requirements. But each of these was eliminated and excluded from modeling. Missing are explanations for why these measures were found to be "infeasible or non-viable" for the project. While PolyMet, MPCA and the Federal Land Managers continue to "evaluate additional potential control measures that may be applicable to the Project" (DEIS pg. 4.6-37), this analysis should be available within the EIS for full disclosure and public review. The DEIS also fails to adequately evaluate the cumulative effects on air quality of the NorthMet project when combined with foreseeable projects. Not included in the analysis are the impacts from on-going and future hardrock mineral exploration in and near the Superior National Forest. Nonferrous mines in advanced stages of exploration and development (including projects by Duluth Metals and Franconia Minerals) were not evaluated for their im</p>	AQ5,AQ9
5	<p>4.) The DEIS acknowledges that the NorthMet project will impact identified wildlife travel corridors. The DEIS cites a study by Emmons and Olivier Resources Inc. (2006) that identifies 13 major wildlife travel corridors connecting large roadless blocks along the Iron Range. The study considered the loss of any one of these wildlife corridors "significant" (DEIS pg. 4.4-30). The NorthMet project area includes Corridors 11 and 12. The DEIS acknowledges that Corridor 11 is already obstructed and "not likely to be heavily used by wildlife" (DEIS 4.4-31). This would increase the significance of the remaining corridors for wildlife travel. But Corridor 12 is likely to be heavily impacted by the project. "Operations at the Mine Site would indirectly impact the corridor by reducing the size of, and acting as a source of noise and activity near, the large habitat block southeast of the corridor" (DEIS pg. 4.4-31). As the tribal cooperating agencies note, "#12 will likely be degraded as a corridor by the Project; these impacts should be considered significant" (Tribal Cooperating Agencies, DEIS pg. 4.4-32). Recommendation: A biological assessment and consultation with the USFWS must be conducted to assess impacts to wildlife travel corridors. The EIS must analyze the loss of Corridors 11 and 12 under the scenario that these are long-term or permanent losses.</p>	WI1,WI5

6	Please take time to research other Gold and Copper mining. Living/working on a homestead the water would be contaminated by sulfur for me, my boss and the 45 dogs that are supplied by it. Please make a responsible decision for the people it will affect.	EOO
6	C. Noise Impacts The proposed mine is on public land in the Superior National Forest, and may generate noise that could be heard beyond the project area. While the DEIS describes “noise sensitive areas or receptors” (e.g. campgrounds, wilderness areas) in the vicinity of the project, no noise contour maps were prepared for the document. “Noise contour mapping would allow reviewers to assess the impacts of noise to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the mine site” (Tribal Cooperating Agencies, DEIS pg. 4.7-2). Recommendation: The EIS should include an analysis of noise impacts that uses noise contour mapping for a more thorough assessment.	N1
7	I have a business in NE MN, Very close to Aurora that is dependent on preserving our natural resources and clean water. I am very concerned that environmental protection has not been adequately addressed. Everyone talks about Jobs! What about those of us who already live here, have jobs and pay taxes?	EOO,G2
8	The PolyMet project would use unproven technology, starting in a watershed with waters that already have too much sulfate, mercury, and other metals. It would destroy thousands of acres of wetlands and forests, put endangered species at risk and place the burdens of environmental harm disproportionately on Indian tribes who have rights to the land that would be most impacted. It is likely that the PolyMet project would increase mercury levels in fish and adversely affect wild rice growing downstream.	EOO,WR4A,WR4B,WR4F,
8	The DEIS is inadequate in many ways. The information on current water quality problems and the polluted site that will be used for dumping wastes from the processing plant is inadequate. The DEIS ignores real historical impacts of local mines, rather than admitting the risks of the project, and contains no proof that either the public interest in Superior National Forest land or tribal interests in treaty lands will not be irreparably harmed.	WR1E,PD2,G3,CR1,CR4
8	I incorporate by reference WaterLegacy comments: "The EIS Must Analyze the Cumulative Impacts of the PolyMet Project on the Functionality of Wetlands throughout the St. Louis River Watershed." As a resident of Rice Lake Township in rural Duluth, I treasure the wetlands on my own land. My understanding is that the DEIS pertaining to the PolyMet proposed mine does not adequately protect the wetlands that will be impacted if PolyMet is allowed to proceed. For one thing, the DEIS comments regarding wetlands are focussed almost entirely on areas at the mine and plant sites and wetlands immediately adjacent to these sites which make up approximately 1,522 acres. From PolyMet's viewpoint, the water in the area already violates state standards due to the LTV legacy. However, as I understand it, no modelling has been conducted for the area downstream from Cloquet, which includes Thomson Dam and the St. Louis River Estuary. Thomson Dam is a prime candidate for methylation of mercury. An even greater victim, if this PolyMet project were to go through, would be the St. Louis River Estuary because the estuary presently contains all of the nutrients needed to methylate mercury, except that sometimes sulfate is a limiting factor on methylation of mercury. (Less than 8 mg./liter is limiting for methylation.) However, the PolyMet proposal would add MILLIONS of POUNDS of sulfate to the St. Louis River watershed. Our lonely planet, our beloved Mother Earth, is under attack already from threats from every corner. How can we contemplate exacerbating planetary degradation by allowing such a destructive plan to proceed? Do future generations have no rights to a clean and livable planet?	WE5,WE8
8	I oppose the PolyMet project because it is likely that the mine and processing plant will pollute Minnesota's precious waters for hundreds or thousands of years to come and have serious impacts on the environment, human health and tribal rights. I agree with the tribal cooperating agencies and the U.S. EPA that the DEIS is incomplete and does not demonstrate that the proposed mining and processing operations could be done without harming the environment and tribal resources and without putting taxpayers at risk for substantial ongoing cleanup efforts that would be needed at such a massive disturbance of sulfide rock. The tribes and the EPA have pointed out many inadequacies of the PolyMet DEIS. Before this sulfide-mining project is even considered for permits, these gaps must be completely filled.	EOO,G3A,G4A,G7,G8

8	I am writing to you as a citizen of Minnesota concerned about the damage to northern Minnesota's environment and communities by the PolyMet sulfide mining project and the impact of not just this one, but multiple sulfide mining and taconite expansion projects being operated or planned in the region.	EOO,G8C
8	Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage, causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet DEIS provides no financial assurance to protect taxpayers from potentially hundreds of millions of dollars in costs to clean up pollution if the Poly Met company goes out of business, leaving seeps and wastes behind.	PD4
9	I am writing to you as a citizen of Minnesota concerned about the damage to northern Minnesota;s. environment and communities by the PolyMet sulfide mining project and the impact of not just this one, but multiple sulfide mining and taconite expansion projects being operated or planned in the region.	EOO,G8C
9	Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project would use unproven technology, starting in a watershed with already-polluted waters. The DEIS is inadequate because cumulative impact of proposed PolyMet activities can be accurately assessed only when the baseline pollution has been adequately characterized and the data collection done to ensure robust estimates of water-quality parameters, and when ALL of the other factors are included.	WR1E
9	I simply oppose the PolyMet project because it has not been demonstrated with certainty that the project will not pollute Minnesota's precious waters for hundreds or thousands of years to come. By the DEIS' own admission, it is highly likely that this first sulfide-mining project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, interfere with tribal rights guaranteed by Treaty and with tribal resources, like wild rice, increase air pollution that results in regional haze and create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs.	PD2,PD4
10	2.) Related to the inaccurate characterization of the project's wetlands, the DEIS also assumes that these wetlands have "perched" water tables that are isolated from groundwater flow systems. Dr. Glaser notes, "The basis for this assumption is not clear since the local hydrogeologic setting seems unfavorable for perched water tables to develop" (Glaser 2010). As he describes, perched water tables are more common within deep glacial deposits, such as terminal moraines and till plains. The DEIS indicates that the project area is comprised of a shallow layer of impermeable glacial deposits. The hydrologic connectivity of wetlands to groundwater has implications for the production of methylmercury. "...[T]he assumption of perching should have been based on actual field data or explained more fully" (Glaser 2010). Recommendation: The EIS should provide data to support a claim of a perched water table or eliminate references to this in the document. "Erroneous explanations for perching contained in this report (e.g. 4.2-2 'slow movement through soils causing the perched wetland water tables') should be deleted" (Glaser 2010). The EIS must include additional field tests to determine the hydrology of these wetlands, such as monitoring nests of piezometers to determine hydraulic head gradients and pore-water chemistry in response to snowmelt and precipitation. Dr. Glaser recommends a long-term monitoring plan to detect unexpected changes in the pore-water chemistry that can be related to Acid Mine Drainage and the transport of contaminants from the mine pits, waste rock stockpiles, and the tailings basin.	WE5,PD1,GT2

|----|---|--------------|
| 10 | <p>D. Inaccurate Characterization of Wetlands and Water Table 1.) The DEIS characterizes the wetlands at the mine site as bogs that are “isolated from underlying groundwater, receiving virtually all of their water and nutrient input from precipitation. They receive essentially no groundwater inflow and have extremely low seepage rates to the underlying surficial aquifer” (DEIS pg. 4.1-4). Dr. Glaser disagrees with this characterization of the wetlands as “perched” or “raised” bogs. His assessment is based on using a standard, accepted definition of raised bog which would indicate the project’s wetlands are not, in fact, raised bogs. His analysis of the species composition at the mine site shows these wetlands to be comprised of fen indicators. The DEIS describes the wetlands as dominated by spruce, tamarack and balsam fir, with occasional occurrences of white cedar and deciduous swamp birch. It also describes the presence of speckled alder, raspberry and blue bead lily. “However, balsam fir, white cedar, swamp birch, speckled alder, raspberry, bead lily and all the grasses in Minnesota are reliable fen indicator species that are never found on true raised bogs” (Glaser 2010). Finally, Dr. Glaser’s own visits to the PolyMet site leads him to characterize the wetlands as fens. “I have made 2 trips to the PolyMet site in 2006 and 2009 to see the existing facilities, vegetation, and general environmental setting of the project areas” (Glaser 2010). Tribal cooperating agencies also disagree with the wetland characterization in the DEIS, and argue that no data support this conclusion. Correct wetland characterization is important because wetland type conveys information about the degree of hydrologic connectivity. The DEIS asserts that as perched bogs the wetlands have little to no connection with underlying groundwater. This would mean potential contamination might be less likely to spread through groundwater flow and that there would be less risk of the methylation of mercury. However, as fens, the wetlands may likely be influenced by groundwater transporting dissolved sulfate from the waste rock or tailings basin. And this additional supply of sulfate could increase the production of methylmercury. Dr. Glaser notes: “Since the species composition provided for the bog vegetation types within this Draft EIS includes species that are clearly fen indicators, it is impossible to say that these wetlands are disconnected from groundwater flow systems as stated in this report. It is also illogical to conclude that these wetlands are ‘perched’ since many of the wetlands in the PolyMet site are probably forested or non forested fens poor fens that are supplied at least partly by surface or ground waters that has percolated through mineral soil” (Glaser 2010). Recommendation: The EIS should use more generally accepted definitions for bogs, fens, marshes, peatlands and other types of wetlands “so they conform to international scientific literature and also the scheme adopted by the Minnesota DNR’s County Biological Survey’s treatise on the native plant communities of Minnesota” (Glaser 2010). Dr. Glaser’s report highlights four criteria that help define raised bogs that the EIS should use. The EIS should properly characterize these wetlands and fens. The EIS must provide supporting data for any further claims that little to no groundwater inflow and seepage rates occur in the wetlands at the mine site. Samples of surface waters in the wetlands of the proposed project should be collected and analyzed for pH, alkalinity, and dissolved solutes (particularly calcium) to help distinguish bogs from fens and to determine the ability of these wetlands to neutralize acid. Further analysis and field tests should be conducted to examine the hydrologic connectivity of the mine site wetlands.</p> | WR1E,G8,WR5A |
| 11 | <p>Warren Anderson, Hibbing, Minnesota. I’m definitely in favor of this project. It’s on a brown-field site. The environmental impact can only be positive. Down the road, turn this around to a very nice facility, provide a lot of jobs for the area. Thank you very much.</p>   | EOO          |

12	<p>E. Poorly Defined Wetland Treatment System 1.) At closure, the Proposed Action calls for allowing the water level in the East and Central Pits to fill above the level of the waste rock that will have been backfilled into the pits. When the filling is complete, approximately one year after closure, “the top of the backfilled pit would be designed to function as a treatment wetland” (DEIS pg. 3-12). This created wetland is expected to passively treat stockpile drainage. It is unclear from the DEIS, if stockpile drainage would first be treated at the WWTF and then sent to the East Pit wetlands, or first discharged into the wetland and sent to the WWTF only if the discharge still exceeds limits. Two apparently contradictory statements are provided in the DEIS: Pg. 3-41: “If stockpile drainage ceases or meets water quality discharge limits via treatment through the East Pit wetland treatment system, the drainage would not be collected for treatment at the WWTF. However, as long as there is drainage that does not meet discharge limits after wetland treatment, that drainage would be conveyed to the WWTF. Effluent from the WWTF would then be pumped for final polishing to the East Pit wetland treatment system.” Pg. 3-42: “Water draining from the stockpile liners and water collected in the stockpile foundation underdrains after Closure would be monitored and returned to the WWTF for treatment if necessary, and ultimately discharged to the East Pit treatment wetlands.” The statement on page 3-42 does not mention the initial discharge to the wetland before going to the WWTF. Recommendation: The EIS must clarify if stockpile drainage after closure will first go to the wetland or first to the WWTF. Where this water goes first is important, given the lack of supporting information for the effectiveness of the wetland system (examined in sub-section 3 below). The EIS must also explain what “final polishing” of effluent means. If this means the water leaving the WWTF still needs additional treatment, then it must explain what contaminants remain post-WWTF treatment. The EIS should provide information and field tests to support the belief that the wetland treatment system is capable of removing contaminants.</p>	ALT8,PD10
13	<p>2.) The East Pit wetland system is planned to receive pore water from the Hydrometallurgical Residue Facility at the Plant Site, but does not describe the potential impacts for water quality. Recommendation: The EIS should describe what the composition of the pore water is expected to be and show supporting data for the ability of the WWTF and the East Pit wetland to adequately treat this.</p>	WR1A
13	<p>F. Waste Rock Liner and Cover Systems The permanent waste rock stockpiles will have engineered liners to prevent acid mine drainage and metal leaching. The DEIS acknowledges concerns about the ability of the liners to perform their functions long-term: “However, concerns remain regarding the ability of this liner system to permanently maintain these design criteria..., the potential for the geomembrane liner to degrade over long periods of time, and the adequacy of the proposed overliner buffer thickness...to protect the liner from accidental tears or rips during waste rock placement. These concerns suggest that the use of the low and average liner leakage rates for purposes of groundwater modeling could underestimate the rate of liner leakage and result in underestimates of the solute loading to groundwater” (DEIS pg. 4.1-75). The DEIS describes these liner characteristics in Table 3.1-9 as ranging in permeability from 5x10-7 to 1x10-5 cm/sec. Dr. Chambers raises questions about how this permeability will be achieved. “How will this specification be tested during construction? What methods will be employed if testing indicates that the target permeability is not being attained?” (Chambers 2010). He notes that achieving this permeability, especially the lower values, may be difficult unless the subgrade material consists of significant clay content. Recommendation: Maintenance of these liners must be perpetual to prevent the establishment of woody plants and rips and tears. Even with this maintenance, WWTF will likely need to be permanently functional to handle what will be on-going water contamination problems. Analyses should be based on high liner leakage rates. A thorough testing program for verifying the target permeability of the various subgrade barriers should be required. The EIS needs to outline a plan for initiating corrective measures if testing shows the specified permeability is not being achieved.</p>	WR3C,WR2E,WR2A

13 3.) PolyMet has not demonstrated that a created wetland system can effectively function as a water treatment system. Despite this lack of supporting data, the Proposed Action relies heavily on the assumption that it will work. The DEIS states: “PolyMet assumed wetland removal efficiencies in the East Pit passive wetland system would range from 50 to 80-90% for six parameters (DEIS Table 4.1-63). Constructed wetlands have proven effective at removing various pollutants, but the results have been variable” (DEIS pg. 4.1-112). Results at the nearby Dunka Mine, where constructed wetlands were used to remove certain metals, show that concentrations of zinc and nickel actually increased. The DEIS states, “Metal removal effectiveness of these wetlands also had strong seasonal variability. Sulfate removal was highly variable” (DEIS pg. 4.1-112). And the DEIS acknowledges that a literature review “also reveals a wide range of variability in the pollutant removal effectiveness of constructed wetlands treating mine drainage and other pollutant sources” (DEIS pg. 4.1-112). The DEIS also notes, “Constructed wetlands performance, however, is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards” (DEIS pg. 4.1-113). Dr. Glaser notes: “The Draft EIS proposes that wetlands could be used to treat acid mine drainage that leaks from the tailings basin and/or other sources. Although wetlands are often used to consume the acidity and immobilize metals arising from AMD they are not always effective in this capacity” (Glaser 2010). Dr. Glaser’s report provides examples of mines discharging into wetlands with little effectiveness. “The term wetland covers a very wide range of ecosystems that are characterized by very different sets of physical, chemical, and biotic properties. It should therefore not be surprising that their capacity to neutralize the acidity and remove contaminants from different types of pollution sources varies depending on the type of wetland considered and its hydrologic setting” (Glaser 2010). Dr. Glaser further notes that the PolyMet proposed mine site has glacial deposits with low carbonate content, which may limit the capacity of the wetlands to neutralize acid drainage. Recommendation: Given the lack of supporting data for the effectiveness of created wetland treatment systems at removing contamination in mine drainage, it is irresponsible and unwise for this project to rely so heavily on this method as an integral component of its water treatment. The EIS must present new data to show that this method can work, or it must eliminate this method as a significant component of this project’s water treatment. Other more reliable designs or techniques should replace this method. One option is that the WWTF would remain functional in perpetuity. Given the DEIS’ conclusion that wetland systems can never be counted on as the primary treatment method of water, then de-commissioning the WWTF will be impossible as long as contamination remains in waters emanating from the mine and tailings basin. And as the DEIS notes this contamination may continue for 2,000 years, then the WWTF should be functional for this same time period. The EIS should incorporate the cost of running the WWTF in perpetuity into its reclamation plan and cost estimates. If the wetland system is used, a long-term monitoring plan should be outlined in the EIS that includes testing the system’s effectiveness at remediation of Acid Mine Drainage. The EIS should also include a contingency plan should the wetlands be ineffective at treating the drainage.

WR3I,WR3L

13 G. Non-Contact Stormwater Runoff At the mine site, any stormwater runoff that has not come in contact with sites having mining activity (undisturbed and reclaimed vegetated areas) would be routed to the Partridge River. At the processing plant (except the tailings basin), stormwater runoff would be routed to Second Creek, a tributary of the Partridge River. The DEIS acknowledges that stormwater management facilities might be needed to handle the predicted sediment that will be associated with this runoff. It does not, however, propose such a facility at this time. The lack of managing this sediment, the DEIS concedes, could lead to “increased pollutant loadings to the Partridge River” (DEIS pg. 4.1-110). The DEIS recommends, but does not require, that stormwater management controls be installed. Recommendation: The EIS should require stormwater runoff management controls. As Dr. Chambers notes, “This is good pollution prevention practice” (Chambers 2010).

EOO

14	<p>I. Problematic Transportation of Ore PolyMet plans to transport ore from the mine site to the Processing Plant by rail, using three trains consisting of rail cars with hinged sides and open tops. The DEIS acknowledges the risk of fine ore particles escaping through the hinges of the cars, and larger ore pieces falling over the tops of the cars into the environment surrounding the rail line. The tribal cooperating agencies contend that “the amount of ore that could escape from the rail cars would not be small” (DEIS pg. 3-18). Fallen ore and fugitive dust have the potential to contaminate wetlands and soils along the rail line, leading to acid drainage and metal leaching in nearby water bodies. The DEIS suggests loading finer sized ore at the center of the car, with larger pieces on the outside to inhibit the release of spillage through the hinges. It also states that track maintenance efforts would include searching for spilled ore pieces along the tracks. But the DEIS offers no supporting data to show the centerline loading method will adequately contain spillage. And identifying and recovering spilled ore pieces along the rail line will not likely be easily accomplished. Dr. Chambers also highlights concerns about the likely risk of this uncontained spillage. He finds the effectiveness of the centerline loading method “quite frankly, not good” at containing spillage. “Unless rail cars are designed to be completely enclosed, there will be spillage and most probably metals contamination along the rail haulage-line. Given time, spillage from the rail cars could be spread from the rail line across a wide area by wind” (Chambers 2010). Recommendation: The risk of widespread contamination from ore spillage during uncontained rail transport, is alarming and unacceptable. The risk of localized contamination along the line must also be prevented. The EIS must require the use of completely enclosed rail cars. This is an easily solved contamination risk through the use of properly designed rail cars. Soil monitoring along the rail line should also be required. Mine closure may need to include the removal of the top one foot of soil as part of reclamation actions.</p>	PD5
14	<p>H. Geotechnical Stability of Waste Rock Stockpiles The DEIS raises the concern about the stability of the waste rock stockpiles. “Proposed heights and slope angles in the preliminary waste rock stockpile designs are within typical mine engineering practice, however a slope stability assessment has not been completed. Further design and analysis would occur during permitting to ensure that the proposed construction meets acceptable design standards” (DEIS pg. 4.13-2). Dr. Chambers notes: “As implied in the quote...analysis of these critical questions is not being conducted as part of the EIS” (Chambers 2010). Instead the DEIS indicates that geotechnical stability will be analyzed first in permitting. A failure in stability for these enormous reactive stockpile could result in significant water contamination problems. Recommendation: Analysis of the geotechnical stability of the waste rock stockpiles is too critical to leave to permitting, and is essential in understanding the environmental impacts of the project. This is evaluation that must be conducted and the issues resolved as part of the EIS process. The tribal cooperating agencies concur with this recommendation. “The lack of a stability analysis for the stockpiles is a serious gap given the serious environmental consequences of a structural failure of a stockpile” (DEIS pg. 4.13-2).</p>	GT1
15	<p>J. Concentrate Shipping Dr. Chambers notes that the concentrate that will be produced by the processing plant and will be loaded for transport, “poses significant risk for contamination because of its high metal content and the small particle size of the concentrate material” (Chambers 2010). He notes that the pneumatically sealed rail cars or rail cars with rigid covers that are proposed are appropriate methods for transporting this material. Recommendation: Soil monitoring at the concentrate loading facility and along the rail line should be a requirement outlined in the EIS to detect any soil contamination that may occur.</p>	PD2

Comment ID	Comment Text	Theme Codes
16	<p>K. Stability of the Tailings Basin 1.) The DEIS admits that “the NorthMet Tailings Basin and hydrometallurgical residue facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin” (DEIS pg. S-10). Despite this alarming and dangerous condition, the Proposed Action intends to use the existing tailings basin for the mine project’s own tailings wastes. Studies of the existing basin show the peat and clay soils under the dam have the potential to become unstable under certain conditions. “There are also layers of loose saturated slimes (fine silty tailings)...which are subject to liquefaction under certain conditions and therefore may create instability of the perimeter dam” (DEIS pg. 4.13-1). There is an especially low margin of safety for Cell 2E, the area where the NorthMet tailings would be deposited, due to extensive peat in the foundation and weak slimes close to the dam face. Also concerning is that it is not known if the weak, unstable slimes layer occurs under the Hydrometallurgical Residue Facility, the part of the tailings basin that would hold the most toxic waste products of the project. Should the tailings basin dams fail, significant and potentially long-lasting pollution would be released, entering surface and groundwater, and spreading possibly within the watershed. Dr. Chambers also raises concerns about the tailings basin construction design. “Upstream-type tailings dam construction, which was used for the existing taconite tailings, poses a long-term stability risk to the proposed hydrometallurgical residue cells. Upstream-type construction will also be utilized to contain the project’s flotation tailings, and again poses a long-term risk....” (Chambers 2010). Dr. Chambers notes that most tailings dam failures have been associated with upstream dam construction. Dams using two other methods, known as “downstream” and “centerline” methods, are much safer. Upstream construction is at high risk for “seismic and static failure of tailings dams” (Chambers 2010). Recommendation: Regarding the geotechnical stability of the tailings basin, the DEIS says further design and analysis would occur during permitting to ensure that construction would meet acceptable design standards. The MN DNR recommends that a dam break analysis and risk assessment be conducted at permitting. It is incomprehensible why the MN DNR would not insist on this analysis and risk assessment in the EIS. This is an unacceptable delay in analysis of a design already deemed dangerously flawed. The function of the DEIS is to outline potentially significant environmental impacts. The DEIS appropriately identifies an environmental risk from the failure of the tailings dam, but then does not provide information about what the environmental impacts of this would be. The EIS must include this information. Dr. Chambers notes, “a thorough analysis of the risk associated with tailings dam construction has not been done, and needs to be conducted as a part of the EIS” (Chambers 2010). The EIS needs to include analysis for a centerline design for the tailings basin, as this has been identified as a more stable design. The hydrometallurgical residue cells will contain the project’s most hazardous waste products. A failure of the dam for these cells would subject humans and wildlife to unacceptable toxic pollution. “Given the nature of the material to be stored in the hydrometallurgical residue cells, these cells should be designed to withstand the maximum credible earthquake” (Chambers 2010).</p>	GT1,GT2
16	<p>-High risk of mercury and sulfate contamination to Minnesota water bodies, with the risk of the bioaccumulation of mercury in fish, and human health implications; no identified method for preventing this contamination.</p>	WR4B,WR4C,FM1,FM4
16	<p>2.) The Tailings Basin Alternative presents an approach that incorporates certain mitigation measures. The Alternative calls for increased rock buttressing for the northern outer embankment side slope for Cell 2E to increase its stability. “Further investigations, design and analysis would occur during permitting...” (DEIS pg. 4.13-3). Recommendation: Any effort to increase the stability of the tailings dam is desirable. However, this design and analysis should be done prior to permitting. Supporting data should be presented in the EIS providing for a design in which the public can have confidence. Contingency plans should be described in the EIS for tailings dam failures.</p>	GT1

17	<p>M. Existing and Future Seepage of Contaminants at the Tailings Basin 1.) The existing LTVSMC tailings basin releases contaminated seepage into groundwater and surface waters that ultimately reaches the Embarrass River. Sulfate concentrations are high for this seepage. Monitoring data indicate that mercury levels and possibly aluminum concentrations do not meet surface water quality standards at several monitoring stations (DEIS pg. 4.1-41; Table 4.1-29). Concentrations of calcium, manganese, nickel and total dissolved solids increase as they seep from the tailings basin pond to the toe of the tailings basin. Groundwater quality monitoring at wells at or near the toe of the tailings basin show elevated aluminum, iron and manganese concentrations, as well as elevated sulfate, fluoride, molybdenum and total dissolved solids. “Based on these results, NTS (2009) concluded that groundwater has been impacted by the Tailings Basin” (DEIS pg. 4.1-14). The tribal cooperating agencies note that only limited groundwater monitoring has actually occurred, and that the full extent of existing contamination is not yet known. PolyMet would assume responsibility for 29 of the 62 identified “Areas of Concern” and “will investigate and remediate as necessary these AOCs on a schedule approved by the MPCA” (DEIS pg. 4.1-16). The MN DNR has indicated that “any associated clean up costs for the legacy AOCs would be included in the financial assurance requirements for any Permit to Mine issued to PolyMet...” (DEIS pg. 4.1-16). Recommendation: The EIS must include a remediation plan and schedule to address the existing pollution problems at the tailings basin. The EIS should include a full analysis of existing groundwater contamination that includes the results of additional groundwater monitoring. Financial assurance calculations must include clean up costs for current pollution from the tailings basin and must be fully delineated in the EIS.</p>	WR1A,WR1E
17	<p>L. Hydrometallurgical Cell Liners The hydrometallurgical residue cells at the tailings basin would be lined to minimize leaching from these cells containing highly hazardous wastes. But as Dr. Chambers notes in his comments, “There is no drawing of the ‘composite liner’ so it is assumed that this is not a double liner with leak detection, but merely a synthetic liner placed directly on top of a GCL liner. A double liner with leak detection would be the most protective liner design approach” (Chambers 2010). Recommendation: Dr. Chambers offers this excellent recommendation: “A better description of the composite liner for the hydrometallurgical residue cells should be included in the EIS. The additional cost associated with a double liner with leak detection for the hydrometallurgical residue cells is not cost prohibitive. A double liner with leak detection would provide maximum protection for the residue material, and should be required” (Chambers 2010).</p>	PD7

Comment ID	Comment Text	Theme Codes
18	<p>4.) Groundwater seepage from the tailings basin will not be collected in the Proposed Action. Nevertheless, DEIS modeling shows groundwater seepage is expected to exceed groundwater evaluation criteria for aluminum, antimony, arsenic, fluoride, iron, manganese and sulfate, and possibly beryllium and thallium. A second model predicted aluminum exceedances for as much as 500 years. The hydrometallurgical cell liners are expected to leak, resulting in seepage from Cell 2W that is predicted to be high in sulfate concentration. "Groundwater seepage from Cells 1E and 2E would be the primary input of sulfate into the Embarrass River during low flows in all mine years" (DEIS pg. 4.1-120). The DEIS states, "the unrecovered seepage rate is predicted to increase to a maximum of approximately 3,800 gallons per minute in Year 20..." (DEIS pg. 4.1-65). The DEIS also states that, "because of the generally flat topography and extensive wetlands, much of this water would be expected to form ponds and inundate wetlands" (DEIS pg. 4.1-65). Dr. Siegel notes significant deficiencies in the DEIS' groundwater modeling that call this expectation of ponding and inundation of wetlands into question: 1. The degree to which groundwater and possible contaminants might leak from the tailings basin was not appropriately characterized by modeling due to assumptions used and "uncertainties in material properties of the porous media along the flow path" (Siegel 2010). 2. The degree to which possible contaminants from the closed mine may get into the Partridge River through groundwater flow was inadequately documented. "There was no consideration of possible migration of contaminants in bedrock under the Partridge River..." (Siegel 2010). 3. Groundwater flow is not likely to be only horizontally dispersed "given the probable subvertical and acute fracture fields which likely evolved in the tectonic setting of the emplacements" (Siegel 2010) 4. The model used in the DEIS to predict how groundwater will flow, MODFLOW, is widely recognized as "very limited in what it can do to determine how water moves in a fractured media at the scale of this investigation" (Siegel 2010). The DEIS predicted rates for seepage from the tailings basin into groundwater is high. The potential for this large quantity of unrecovered groundwater seepage to spread contamination is troubling. Recommendation: Further analysis of likely seepage rates, flow, spread and level of potential contamination should be conducted prior to permitting. More detailed field examinations of existing seepage characteristics are needed to in order to predict what new seepage from the Project might do. Dr. Siegel's evaluation of the DEIS cites the need for conducting more field tests to better understand potential environmental impacts. He notes that a major flaw in the DEIS is its reliance on models based on likely inaccurate assumptions. "...The opportunity was there to actually calibrate such a model against real field data... I have the same concerns with the modeling PolyMet did from the tailings basin as with the other groundwater models done by PolyMet: poor documentation of results, assumptions that cannot be tested very well because of insufficient instrumentation, and inarticulated logic behind the work. This is a missed opportunity if I have ever seen one" (Siegel 2010).</p>	WR2A
18	<p>3.) At closure, seepage to Second Creek, which flows into the Partridge River, would no longer be collected, and would be permitted to drain to the River. Recommendation: The EIS must provide an analysis of the water quality of this seepage that will be permitted to flow into Second Creek at closure. It must examine the downstream impacts of potential contamination in that water.</p>	WR1E
18	<p>2.) The DEIS acknowledges that when PolyMet begins adding its own tailings to the tailings basin, seepage will continue to occur. This seepage will move into the Embarrass River and also into Second Creek which flows into the Partridge River watershed. During the life of the mine, the surface water seepage will be collected and returned to the tailings basin. Groundwater seepage would not be collected. The DEIS states that at closure, surface seepage would continue at first but "seepage collection would be occurring at progressively reduced rates" (DEIS pg. 3-44). The DEIS notes it expects either the seeps to dry out, or that seepage will meet water quality limits and that drainage from the hydrometallurgical residue cells to eventually end. But the DEIS does not provide a rationale for these expectations. Cap and liner systems leak, and over time develop additional leaks. There are no data given to support the assertion that seeps will dry out or somehow meet water quality standards. Recommendation: The EIS should include an explanation for the assumptions that tailings basin seepage collection will gradually become unnecessary. It must also provide a plan for the scenario that the assumptions are wrong. And it must include calculations for financial assurance to deal with long-term contaminated seepage.</p>	WR1A,WR1A

19	5.) The DEIS assumes the average tailings sulfur content will be 0.13%. But the DEIS acknowledges the potential for this rate to be higher, with pollution consequences. "Predictions made from kinetic testing suggest that water reacting with NorthMet tailings could become acidic when sulfur content is between 0.14 to 0.17% (Day 2008). During the small scale plant testing, some of the tailings exceeded 0.13% sulfur and were within the critical sulfur range. As a result, these tailings could produce lower pH, which would increase metal mobility. Test work by both the MN DNR and PolyMet have shown increased release of nickel and cobalt as pH begins to decrease" (DEIS pg. 4.1-95). Dr. Chambers notes that it is commonly understood that even neutral or basic pH conditions can produce metal leaching contamination. The risk of Acid Mine Drainage and metal leaching from the tailings basin is not fully explored and analyzed in the DEIS. Recommendation: "More discussion and verification should be given to the findings that the sulfide sulfur content of the tailings is and will remain under 0.13% and non-acid producing" (Chambers 2010). The EIS must include scenarios for AMD and metal leaching from the tailings basin.	WR2E
20	-Lack of useful data on which to base predictions of methylation risk. Sampling of lakes, wetlands, and streams was inadequate.	WR1E
21	-Predicted water pollution lasting possibly 2,000 years.	WR1E
21	-Inadequate sampling done of the water chemistry of area lakes to assess existing sulfate leaking; an adequate sampling effort is needed to use as a comparison and predictive tool for the NorthMet project. Dr. Engstrom notes about Barr Engineering's sampling methods, "It is one of the unfortunate outcomes of Barr's stream sampling scheme that no water samples were apparently collected within the wetland complex north of the tailings basin (except at its toe). Such sampling would have provided a picture of current (legacy) groundwater discharge and associated sulfate and mercury levels by which a better understanding of the effects of increased groundwater discharge might be derived" (Engstrom 2010).	WR1E
22	-The assessments of mercury methylation risks by PolyMet's consultant, Barr Engineering, are scientifically biased and use inappropriate models and incorrect assumptions.	WR4A
22	-The DEIS fails to examine the methylation risk from sulfate discharges to key locations in the watershed, including the St. Louis River estuary, the wetland complex north of the tailings basin, the bottom waters of the Embarrass River chain of lakes, and beaver impoundments along the Upper Partridge River.	WE8
23	-The DEIS lacks a contingency plan for effective monitoring and adaptive management.	WR1E
23	-The DEIS provides little in the way of mitigating sulfate discharges and the mercury methylation potential. No consideration is given to alternatives that might sequester sulfate.	WR3I,WR4C
24	-The plan for monitoring focuses on water samples, without including sampling biotic communities such as fish as indicators of mercury in the system.	WR4C,FM4

Comment ID	Comment Text	Theme Codes
25	<p>O. Tailings Basin Alternative 1.) The DEIS provides a Tailings Basin Alternative as a modification to the Proposed Action. The main focus of the Tailings Basin Alternative is that, unlike the Proposed Action, it would attempt to capture groundwater seepage and improve surface water collection. It proposes to capture 95% of the seepage from the tailings basin by installing a series of vertical wells on the lower-most bench of the tailings facility. But captured seepage would not be treated at the WWTF, but instead discharged directly to the Partridge River. The DEIS states that “Based on current water quality modeling, the discharge of seepage would meet all surface water quality standards and no treatment would be needed” (DEIS pg. 3-13). But apparently contradicting this conclusion that no water treatment would be needed, the DEIS describes modeling that identifies 9 parameters as having the potential to exceed groundwater evaluation criteria: aluminum, antimony, arsenic, beryllium, fluoride, iron, manganese, sulfate and thallium (DEIS pg. 4.1-152). Additional modeling showed aluminum exceeding groundwater evaluation criteria. And the wild rice standard for sulfate is predicted to be exceeded. Discharging untreated tailings basin seepage to the Partridge River when this discharge has been modeled to contain contaminants exceeding water quality standards, is not acceptable. The tribal cooperating agencies agree, noting “...discharging untreated tailings basin water to the Partridge River will have significant adverse impacts” (Tribal Cooperating Agencies, DEIS pg. 4.1-153). They note the presence of several wild rice beds immediately downstream of the proposed discharge point. Sulfate concentrations above 10 mg/L can adversely impact wild rice (see Comments I.N.). The DEIS contends that, “if it were determined upon further analysis during permitting, or during operational monitoring, that pre-treatment were necessary prior to discharge, a treatment facility would be installed” (DEIS pg. 3.52). But it does not state what conditions would trigger the requirement for pre-treatment or what water quality standards the discharge would need to meet. The U.S. EPA in an August 2009 letter also indicated its concern about discharging tailings basin water into the Partridge River. “...The effects of these discharges to the Partridge River are not clear. We recommend the DEIS describe impacts to the Partridge River from this discharge. . . We have several concerns about the discharge of this water to the Partridge River or to the unnamed creek also mentioned. We recommend that impacts from discharges and mitigation discussions be evaluated as part of this decision-making phase and not deferred to some later discussion outside the NEPA process” (U.S. EPA August 2009). Recommendation: The Tailings Basin Alternative is an improvement from the Proposed Action in that attempts to collect groundwater seepage are made. But discharging this untreated seepage directly to the Partridge River should not be permitted. The EIS must present an alternative that both captures and treats this discharge. The EIS should clearly state what levels of contamination would trigger discharge treatment and what standards the treated water would need to meet prior to final discharge into the Partridge River. Sulfate discharges resulting in concentrations exceeding the wild rice standard should not be permitted.</p>	WR2C,WR3I,WR4C,WR4F
25	<p>Recommendations: The EIS must provide a better approach to address issues of mercury and sulfates that may enhance the production of methylmercury. It is clear from Dr. Engstrom’s report that a much more thorough sampling program must be enacted to fully understand existing and future discharges. The full geographic extent of potential impacts – all the way down to the St. Louis estuary – must be examined. Alternative approaches should be explored to deal with potentially dangerous mercury and sulfate discharges. Dr. Engstrom in his report suggests exploring the potential for using the mined-out pits as sinks for mercury and potentially in removing methylmercury. Sampling of fish and other biotic indicators of mercury should be included in any monitoring program. Wild rice mercury standards should be adhered to in developing this project, and wild rice waters protected from increased levels of sulfates. Contingency plans should be included in the EIS for situations when mercury and/or sulfate concentrations exceed what is expected. A rigorous monitoring plan should be outlined in the EIS.</p>	WR1E,WR3I,WR4C,WR4F
25	<p>Dr. Engstrom believes the discharge of sulfate-laden waters from the PolyMet project is “among the most serious environmental risks posed...Based on a large body of experimental and observational evidence, it is my view that these discharges are likely to increase the microbial methylation of mercury somewhere in the watershed of the St. Louis River, either in wetlands or lakes proximal to the mining/processing operations or possibly downstream in its estuary with Lake Superior. This increase in methylmercury production will be transferred up the food chain to increased levels of mercury in game fish, with the attendant increase in human and wildlife exposure” (Engstrom 2010).</p>	WR4B,WR4B
26	<p>P. Omissions in Data Collection and Disclosure Please see Comments I.F. for our concerns about the water pollution risks from gaps in data collection and disclosure.</p>	WR1E

*Alphabetical by sender's first name*

**Comment ID    Comment Text    Theme Codes**

26 Q. Hydrologic and Geochemical Issues Dr. Siegel’s report on the hydrologic and geochemical issues in the DEIS should be read in its entirety for a full description of these issues. Several of these have been noted in Comments I.F. in Omissions in Data Collection and Disclosure. Others of Dr. Siegel’s observations are highlighted below: 1.) The DEIS describes recharge rates of precipitation and snowmelt through till using calibration of mathematical models. But Dr. Siegel contends that these values for recharge “seem many factors less than probable as determined by the USGS. . .The amount of water calculated to potentially discharge to the mine may be factors too low, which could lead to unanticipated mine discharges to streams” (Siegel 2010). Dr. Siegel laments the missed opportunity for PolyMet to have “directly determined the order of magnitude of the amount of recharge to both bedrock and surficial groundwater systems from changes in the water levels in their observation monitoring wells, coupled to appropriate specific yields of the materials” (Siegel 2010). Recommendation: Recharge rates should be directly determined from hydrograph analysis in monitoring wells installed in glacial till at the mine site.

WR2F

26 -Repeated omissions in data collection and disclosure that prevent a full understanding of the risks of the project.

G8

26 2.) The DEIS notes that under the Tailings Basin Alternative, a demonstration test will be conducted of a “Passive Reactive Barrier” (PRB). During mine operations at a location north of the tailings basin, the PRB would be installed to determine its effectiveness in reducing constituents of concern such as sulfate, antimony and arsenic, from the tailings basin seepage. If effective, “a PRB could be built as a vertical unit and/or horizontal surface (i.e. constructed wetland) through the flow path of the seepage from the Tailings Basin” (DEIS pg. S-13). The DEIS states this PRB would be installed to provide final treatment of the groundwater seepage, if needed. . .” (DEIS pg. 4.1-148). The PRB is an untested water treatment system. While the demonstration test will be important in determining the effectiveness of the PRB, the EIS provides no contingency plan for if it is not. If unsuccessful in the demonstration test, it will clearly no longer be an option for large-scale, long-term treatment of the tailings basin seepage. And if the PRB tests succeed, the PRB itself would need to be replaced and maintained at regular intervals for as long as water treatment is needed, possibly hundreds or thousands of years. This is long-term maintenance that does not comply with Minnesota’s goal of a maintenance-free closure.

WR1A

27 2.) PolyMet failed to collect important hydrologic information needed to characterize the mine site. “Without this data, no direct means can be used to characterize groundwater flow in the vertical direction, up or down, from the water table or surface waters under natural or perturbed conditions. As a result, there is no means to determine the accuracy of the broad results of PolyMet’s groundwater modeling efforts” (Siegel 2010). Recommendation: Additional piezometers should be installed in “clearly isolated within presumed hydrostratigraphic units in bedrock” (Siegel 2010). The results of this additional data gathering should be presented in the EIS.

WR1E

Comment ID	Comment Text	Theme Codes
27	<p>A. Indirect Wetland Impacts The DEIS concedes that the NorthMet Project would result in the direct destruction of 854.2 acres of wetlands and 667.9 acres of indirect impacts to wetlands. Indirect impacts are likely to result from hydrologic changes in the project area from activities such as pit excavation, pit dewatering, and the development of dikes and ditches. As described in Comments I.D., there is strong evidence to suggest that the DEIS has mischaracterized the wetlands in the project area. If the wetlands are not perched bogs but rather fens with connectivity to groundwater, there is a great likelihood that indirect impacts to wetlands could be greater than described in the DEIS. In addition, the tribal cooperating agencies point out that no reliable groundwater model for groundwater drawdown impacts of the project have been provided. “The estimates of groundwater drawdown are currently based on anecdotal observations and analysis of historical aerial photography. Therefore, there is not quantitative assessment of mine related drawdown of the regional water table. This serious data gap has prevented an adequate indirect impact assessment for wetlands from being conducted” (Tribal Cooperating Agencies, DEIS pg. 4.2-18). Dr. Siegel also found groundwater modeling and data collection that was insufficient to properly analyze groundwater flow. “I found that PolyMet installed insufficient ground water monitoring wells and piezometers in bedrock to either characterize where and how ground water moves across the mine site, or how it interacts with the Partridge River” (Siegel 2010). Dr. Glaser disagrees with the assumption in the DEIS that the wetlands within the project area have perched water tables and are isolated from the groundwater flow system. “The hydrology of representative wetlands should be determined by monitoring nests of piezometers...It should not be assumed that the wetlands within the entire project area are isolated...” (Glaser 2010). The lack of collected field data to measure hydrologic connectivity of the wetlands and groundwater and the mischaracterization of the mine site wetlands are serious flaws that could lead to a much greater impact on the hydrology of nearby wetlands than has been projected in the DEIS. Recommendation: The indirect impacts to wetlands from the project are likely to be much greater than portrayed in the DEIS. The EIS must re-characterize the project’s wetlands as fens, and then re-evaluate the indirect impacts to wetlands. Included in this analysis should be reliable groundwater modeling and filed data collection.</p>	WE1,WE2
27	<p>4.) The DEIS models force all subsurface flows to the Partridge River, an assumption Dr. Siegel finds unsupported by data. A lack of supporting data means the potential remains for this flow to pass below the river in bedrock. Dr. Siegel notes, “...knowing the true flow path directions and if groundwater in bedrock flows under the river may be important. For example, if subsurface contaminated water bypasses the Partridge River, it could move north towards the larger regional lake hydrologic discharge zones within the Boundary Waters Wilderness” (Siegel 2010). While Dr. Siegel states that the volume of water in this scenario would likely be slight, the possibility of this occurrence should still be analyzed and addressed. Recommendation: Knowing subsurface flow from this proposed project is critical. The EIS must include an appropriate level of collected field data, analysis, and consideration of all possible flow paths. Contingency plans should be included for if there are deviations from expected flow paths.</p>	WR2A
27	<p>3.) When modeling aspects of groundwater flow, PolyMet failed to provide important information to provide a proper analysis. “PolyMet produced no water table maps or potentiometric surface maps during the mining operations, no MODPATH simulations to show groundwater velocities and flow paths before or during mining, and no hydrogeologic cross sections showing vertical flow directional and velocities” (Siegel 2010). Dr. Siegel notes, “Given these modeling uncertainties in recharge rates, flow rates, flow velocities, effective porosity, dispersivity, and calibration points...the modeling does not provide certainty in forecasting. In the absence of proper and multidisciplinary field calibration using chemistry and water levels, there can be no assurance the models, in fact, worked” (Siegel 2010). Recommendation: The EIS must include the results of additional data collection. The models in the EIS should be supported with enough information for the public to do a proper analysis. The models should be calibrated to field data.</p>	WR2A

Comment ID	Comment Text	Theme Codes
28	<p>B. Loss of Peatlands and Global Warming 1.) Over 900 acres of the wetlands at the mine site are coniferous bog and open bog peatland communities. If the project projections are correct, about 586 acres of peatlands will be directly impacted (destroyed) at the mine site by operations. Another 266 acres of peatlands are projected in the DEIS to be indirectly impacted, although as described in Comments III.A. above, the indirect impacts are likely to be higher than this figure. Combined, at least 852 acres of peatlands will be destroyed by the mine's operations. Peatlands are wetlands that form over hundreds and thousands of years. They consist of the decayed remains of plants, accumulating in stagnant, low-oxygen conditions that prevent the normal decomposition of vegetation. Peat bogs function as a natural water filter, preventing flooding. Many support rare plants and animals. Peatlands are important terrestrial environments in the sequestration of carbon that would otherwise contribute to climate change. These are wetland systems that take millennia to form. And the peatlands at the mine site have already been identified as part of the "100 Mile Swamp," an important natural area within its landscape. There can be no mitigation of the loss of these peatlands. Recommendation: The EIS should highlight that these are wetland systems that can never be replaced by mitigation actions. Their value and loss should be placed in a statewide and regional context within the EIS.</p>	WE2,WE3,WE5,AQ5
29	<p>2.) As noted above, peatlands have been identified as crucial ecosystems in storing carbon that would otherwise contribute to global warming. The destruction of peatlands can release large quantities of previously sequestered CO<sub>2</sub> into the atmosphere. The PolyMet project's peatland impacts would be at a minimum nearly 900 acres, and likely much higher (see Comments III.A.). Scientists have calculated that the loss of 1,000 acres of Minnesota peatlands translates to a release of approximately 2.7 million metric tons of CO<sub>2</sub> to the atmosphere. This is an increase in Minnesota's total annual emissions of CO<sub>2</sub> by approximately two percent (above 2005 levels) (Anderson et al., 2008). PolyMet's impacts on Minnesota's carbon emissions are likely to be close to this level, given their peatland impacts are nearly 900 acres and perhaps higher. In 2007, the Minnesota State Legislature requested that the University of Minnesota produce an assessment of the potential capacity for carbon sequestration in Minnesota's terrestrial ecosystems. The Minnesota Terrestrial Carbon Sequestration Project, an interdisciplinary research group, was organized to produce that assessment. The team analyzed existing scientific literature, land existing in broad land use categories, and the role of current state policies and programs on carbon sequestration potentials. In February 2008, the Project produced a report titled, "The Potential for Terrestrial Carbon Sequestration in Minnesota." Some of the key findings and recommendations of that team of researchers are: - Peatlands in Minnesota contain the largest carbon stocks in the state, in excess of 4 billion metric tons - Release of this carbon to the atmosphere as CO<sub>2</sub> can result from peatland drainage and conversion - Release of this carbon to the atmosphere would accelerate global warming and require greater reductions in CO<sub>2</sub> emissions elsewhere - Destruction of 1,000 acres of peatland in Minnesota from mining or other activities would increase the state's total CO<sub>2</sub> emissions by 2% over 2005 levels □ The top recommendation of this research group: "Preserve the existing large carbon stocks in peatlands and forests by identifying and protecting peatlands and forests vulnerable to conversion, fire, and other preventable threats" (Anderson et. al 2008). In December 2006, Governor Tim Pawlenty announced the state's "Next Generation Energy Initiative," including the development of a comprehensive plan to reduce Minnesota's emissions of greenhouse gases. The Minnesota Climate Change Advisory Group, a broad-based group of Minnesota citizens and leaders, was created to develop state-level policy recommendations to the Governor. In April 2008, the Advisory Group released its report titled, "Minnesota Climate Change Advisory Group Final Report: A Report to the Minnesota Legislature." Some of its key findings and recommendations include: □ - "Wetlands have among the highest potential carbon-sequestration capacities for any type of land cover in Minnesota. Peatlands are likely Minnesota's largest single carbon sink, containing 37% of all carbon stored in the state..." (Minnesota Climate Change Advisory Group 2008). - Recommendation: "Protecting these enormous carbon reservoirs (peatlands)...is critical" (Minnesota Climate Change Advisory Group 2008). The policy goals from the Advisory Group included: - Protect and restore northern peatlands. - By 2015, identify peatlands at risk of releasing greenhouse gases because of lowered water table or industrial uses such as mining. - Design policies to protect peatlands and wetlands from drainage and other carbon-releasing land uses. The destruction of the peatlands at the PolyMet mine site runs counter to the recommendations of both of these government-initiated studies. The DEIS acknowledges the impacts in CO<sub>2</sub> emissions from wetland losses and other destruction of vegetation. "In addition, secondary emissions from the change in the existing land cover are projected. CO<sub>2</sub> emissions fr</p>	AQ3

38	why would the state risk the huge losses? And why does a large company get to come in and kill our renewable economy(tourism)? We know the waters(surface and groundwater) will be polluted, and we know we will lose far more jobs and money than this mine will ever produce. Please oppose this mine so we can still find life in our waters, and drink the water without heavy metals. Please listen to real Minnesotans and the facts, not companies and	EOO,SE4
273	How can you guarantee the tailings basin will not leak given the “liner” may fail or tear – even from the unstable existing tailings present.	GT1
292	We are writing, as Iron Range business owners, to support PolyMet's mining and production efforts. The lengthily environmental review process that PolyMet has gone through, with both the Federal and State regulatory agencies has not only been thorough but offers the potential environmental impact and how to mitigate it. PolyMet has proved that they will mine and produce copper, nickel, platinum, palladium, gold and cobalt in an environmentally sound way. Income generation to the potential 400 employees plus hundreds of spinoff jobs will not only lift up the depressed state of the Iron Range but it will provide millions of dollars in local and state taxes. All the affected areas need this type of financial boost in order to support the communities and educations systems. It is very clear that the people of PolyMet are Minnesotans committed to living, playing and protecting our state's environment. We cannot ask for a better business model in our state, at this time, at this place and in our state's future.	EOO
315	Recently is has come to my attention that the Polymet Northmet permitting process is in review. I wanted to make sure you understand that I support this project moving forward. I believe Polymet is taking the required steps to protect the environment while creating more than 300 jobs and \$15 million in state tax revenues per year.	EOO
357	Another health issue that has not been adequately addressed is air quality. Some of our family members, who live on the Iron Range, have had life-threatening asthma attacks. This project would add to the particulate and nitrogen oxide load and further degrade their air quality and quality of life. As a nurse in this area, I am all too familiar with the horrible damage of mesothelioma. The EIS cannot adequately address the project's contribution to this epidemiologic nightmare until the study of the topic is completed by the on going study at the University of Minnesota.	AQ4C,AQ6
546	What happens when these “pit” (they are ugly!) fill (To overflow) with groundwater like the canister pit in Bosey-Coleraine? Overflow or seep into the Partridge or Embarrass River would be devastating.	WR2C
556	9. What is the impact of the increased methyl mercury in the St. Louis River (resultant from both the new mercury released into the air and water by the mine and the increased sulfates released by the mine into the river) on fish throughout the watershed, specifically catfish in the Brevator area of the St. Louis River between Brookston and Cloquet? As the fish and waters in this area are already impaired with excessive mercury levels why is the release of additional mercury into this watershed legal under environmental law? Why is there no analysis of the effects of this increased mercury in the St. Louis River on fish found in all the communities downstream of the proposed project (Forbes, Floodwood, Brookston, Brevator, Cloquet, Thompson, Gary, Duluth)?	RF1,WR1E,WR4B,FM1,FM
617	Next, I want you to consider the duck hunting family I have on the Iron Range. They love duck hunting and eat everything they shoot. Some of the best hunting on the Range is the wild rice stands at Norway Point on the St. Louis River. Norway Point is just a few miles, as a duck flies, from the lake which will be perched on top of the tailings basin. Because of the toxic combination of heavy metals in that lake and the chain link fence around the whole area to keep people out of it, local people have already named it the "Embarrass River Toxic Wildlife Refuge". During the heavy hunting pressure of fall season, (duck season starts for these kids in the middle of September and ends in the middle of November), the resting areas for waterfowl will be the "Refuge" of this toxic lake. The feeding areas will be the wild rice stands where the hunters gather to unknowingly reap a toxic harvest. I can't imagine that this issue was not even important enough to be given one paragraph in this EIS. How can we mitigate this potential public health problem?	WI2,WI3

1162	The impact of this mining project on migratory waterfowl must be addressed in this environmental impact statement. A particular concern is the impact of this project on the black duck. The impacted lands associated with this mine reside within the black duck migratory and nesting range within the state of Minnesota. The Minnesota DNR has recently published an article in the conservation Volunteer detailing the special concern for the northern boreal forest and associated animal and plant species residing in this habitat. This forest type is at risk for fragmentation, degradation and elimination under certain long-term climate change predictions. The Northeastern Minnesota boreal forest provides some of the only nesting habitat for the black duck in the state of Minnesota. Therefore, the degradation, fragmentation and elimination of this habitat is of special concern for this species.	WI2
1163	Specifically, the EIS should include an assessment of the following potential impacts on the local and migratory black duck populations. 1. What is the toxicologic and pathophysiologic effect on black ducks landing on, and ingesting, the surface water encompassing the proposed mine pit lake and tailings pond? 2. What is the toxicologic and pathophysiologic effect on humans handling and ingesting the meat of legally harvested (hunted) black ducks that have resided on and ingested the water of the proposed mine pit lake and tailings pond? 3. If this water is unsuitable for black duck habitation and contact what strategies will be employed to keep these ducks from directly contacting this water? If deterrent strategies will be employed what will be the impact of these strategies on other animal species and humans that reside in the vicinity of this site? 4. What is the long-term impact of carbon generated by the mining process released into the atmosphere, on the habitat of the black duck? 5. What is the long-term impact of the loss of carbon sequestering peat bogs on atmospheric carbon dioxide and the subsequent effects on the habitat of the black duck? This extent of this specific habitat is not going to be replaced in the proposed project. 6. What is the effect of this mining project on the migratory routes taken by the black duck?	WI2,WI3
1164	My entire family fishes and hunts in parts of the entire St. Louis River watershed. There is nothing we like better than the traditional "shore lunch" of catfish fillets. With the mercury in the fish presently so high, this project must not be approved if it raises the mercury level in the fish of the St. Louis River or its tributaries. My sons and husband are of the age where increased mercury in their system raises the risk of heart disease, which is a problem in our family. (Salonen et al. 1995, as cited in USEPA 2001a).	WR4B,FM1
1164	7. In addition, what is the effect of this mining project on wading shore birds? Will variations in the water levels in the proposed tailings pond result in the generation of mud flats attractive to wading birds? What will be the impact of contacting contaminated water in the mud flats/shore or eating food living in the contaminated water have on these birds?	WI3
1165	8. What are the toxicologic and pathophysiologic effects on blue herons, bitterns, osprey, kingfishers, Canada geese, hooded mergansers, wood ducks, ring neck ducks and other birds landing on, and ingesting, the surface water encompassing the proposed mine pit lake and tailings pond?	WI2
1166	10. On page 4.4-1 second paragraph second sentence reads "Most of these species are relatively common in Northern Minnesota and would likely relocate to other, nearby habitat; therefore, loss of tribal access to Project lands would not affect use of these species." This sentence is without factual basis and is an embarrassment to the Department of Natural Resources wildlife personnel who supposedly read and approved this document. Unless proven otherwise the surrounding lands are already at carrying capacity for the animal species that will be displaced by the mine site. Therefore, while the animals will certainly move off the site once the land is destroyed, the overall numbers of these animals in Northern Minnesota will not stay the same, rather they will be reduced, as the carrying capacity of the surrounding lands will be exceeded once the displaced animals move in. Please correct this significant inaccuracy in the EIS and revise any predictions concerning impact of the mine on wildlife that were dependent on this incorrect assumption. Do the applicants know what the carrying capacity of the surrounding lands are for each species of wildlife that will be displaced by this project? If not, the cited statement must be amended and the analysis of carrying capacity performed.	WI5
1272	How many jobs will be taken by Canadians?	E00

1858	Finally, as a consumer of ground water by way of our drilled well, it seems to me an inherent right to expect clean water from our water well. This is not the case for many homeowners caught in the poisonous plume of ground water emanating from the old LTV tailings basin. In December of 2008, Barr Engineering sampled residential wells north of the old LTV tailings basin. (Technical memorandum to Stuart Arkley, January 27,2009). Granted, this is an inherited ground water problem from the previous owners, but the Polymet plan is to pile further waste on top of this basin. In these well tests, manganese concentrations were high and exceeded evaluation criteria at eight of the sampled wells and I quote, "Manganese concentrations ranged from 0.66 ug/L in sample 4488 to 4,710 ug/L in sample 4400 and exceeded NorthMet DEIS evaluation criteria at eight of the sampled wells. The current MDH HRL for manganese is 100 ug/L and the EPA sMCL is 50 ug/L". A further confirmation of the 50 ug/L standard is found in the journal article by Xenophon G. Kondakis, M.D. et al. "Possible Health Effects of High Manganese Concentration in Drinking Water", (Archives of Environmental Health, May/June 1989 vol. 44, No.3, page 178). They say, "Manganese concentration in drinking water may be harmful to health. Given the information to date, the limit of 50 ug/L established by EEC seems to be correct." Manganese has been associated with neurological symptoms and schizophrenia.	WR2C
1859	I also noted a troubling quote from the RS31- Pit Water Quality Model, Executive Summary in paragraph 5. It says, "Virginia Formation exposures along the north wall would have a significant effect on water quality. Therefore, these walls will be treated with lime during the flooding phase". The Virginia Formation contains arsenic sulfide. In the journal article in Geochimica et Cosmochimica Acta, Vol. 69, "Geochemical modeling of arsenic sulfide oxidation kinetics in a mining environment", 2004, Lengke and Temple say this in conclusion: 4. "Prevention of AMD by mining arsenic sulfide-containing rocks with limestone may not be an effective method of limiting the release of As from arsenic sulfide because the presence of limestone increases solution pH. At higher pH values, As release rates from arsenic sulfide solids are higher". Please address the relationship between arsenic solubility and limestone. The US Agency for Toxic Substances and Disease Registry has listed arsenic as a chemical of concern.	WR3G
2100	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. I would also like to add that I have been enjoying the Northern Minnesota area for over a decade now and it is very important for me to be able to continue vacationing/exploring in the Northwoods and to share this wonderful area of Minnesota with my children and in the future with my grandchildren. I believe we need to weigh both the pros and cons of the new mine proposal, but we also need to realize that any project of this size will absolutely cause a serious negative impact to all areas whether it be water/air quality, pollution, wildlife, tourism, or whatever. I do realize that a project of this magnitude would generate great revenue for the area and create many jobs, this is really the only good thing I can see coming out of this. We need to take care of our people and economy, but we also need to take care of the environment.	EOO,G8C,G11
2617	MR. ANDERSON: I am a business representative for Roofers Local 96. The reason I support the PolyMet project is because of all of the stuff that they have looked into as far as reducing the air pollution and groundwater pollution and I like the way they are going to take care of the property after they use the minerals, I mean filling it back in and replanting and that type of stuff. I am also for it because of the economic impact it is going to have in the northern area; 400 jobs. The construction jobs, that there will be close to 1500 construction jobs that year. The spin-offs, close to 500 other people getting hired as spin-off jobs. Let's see. I like the fact that the tax base will be improved in the area, more money for schools, for the townships, cities in the Iron Range area. (Continued on next page...) Let's see. I like the fact that they are using a plant that was shut down 10, 12 years ago; the LTV plant. It used to be an LTV plant is where it is at. And using the railroad line system that was in place at that time when that business was running. They will actually be probably cleaning up some of the water in that area. There is a high mercury content in a lot of our lakes up there already and they will be reusing a lot of this water and doing a lot less in the lines of pollution compared to the stuff that is done in Russia or some of the other countries that pollute so heavily right now, which probably causes a lot of our mercury -- I mean our mercury related air up there right now. I guess that's about all I have got right now.	EOO,G2,G6

3128	I am a 45 yr old nurse from Glenwood,MN who has been going to the BWCA for 15 yrs. My kids are 10 and 13 yrs old. They are old enough to enjoy and learn how to perserve this great resource of ours. I have pounded in the statemnet, "cleaner than when we arrived", for years. I don't see any of this attitude in regards our northern Minnesota land. Please reconsider and have more study of the 'long term effects" mining near this area we love. Thanx for your time and consideration on this matter.	G6
3181	I have a deep admiration and love for the state of Minnesota as it has been my home all of my life. I especially have respect and love for the North Shore-Duluth area and I think the proposed mine by PolyMet Mining Corp. would greatly harm the beautiful wilderness areas of Northern Minnesota. Our neighbor Wisconsin has already banned such mining practices in which this corporation wishes to conduct and I think that we shouldn't allow this type in Minnesota as well. Minnesota is known for our beautiful lakes, wetlands, and forests and to ensure their survival a mine would not be in the best interest for our state's natural resources and especially the Northern Minnesota area in St.Louis County. Keep Minnesota beautiful by not allowing such mining practices here, The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	EOO,G2C,G7,G12
3213	Page 4.1-24 Comment: Draft EIS indicates evaporative loss via cooling towers at Laskin. Minnesota Power operates once-through cooling only at Laskin Energy Center. The only evaporative loss driven by plant processes would be those water volumes exiting via the stack. Page 4.1-37 Comment: Draft EIS states exceedances observed for copper and arsenic at Laskin. Minnesota Power monitors Lamella clarifier discharge water for both parameters as part of our NPDES permit; however, our records show no permit limit exceedences for either copper or arsenic.	COR
3771	To Whom IT May Concern, I am a retiree who lives, camps, canoes, fishes, breaths, drinks tap water, [and tap beer for that matter] in and from northern MN! I worked in the late 60's at the US Steel mill in Duluth as a lab tech. in the chemistry lab.[another long gone boom bust job.] I am totally against this "experiment" with sulfide mining in a region that is the source of so much of the midwest's UNPOLLUTED !!!!!,FRESH!!!!!! Di-hydrogen oxide!!!! Please include a copy of the letters on page3 of LABOR WORLD WEDNESDAY JAN 6 2010 as exhibit A and B. THANK YOU, Wm J Andersen	EOO,RFI

**Sender Last Name:** Anderson and Pastika **Submission ID:** 1317

1357	As stated in the attached Resolution from the Babbitt City Council, the City of Babbitt supports the proposed PolyMet Mining Project and Draft EIS. The proposed PolyMet Open Pit Mine will be located in Township 59N, Range 13W, within the Babbitt Corporate City Limits and will directly affect the City. The proposed project will bring several hundred construction jobs and 400 full time, high paying jobs to Babbitt and the surrounding communities. The City of Babbitt will receive direct tax revenues from the operation in the form of a percentage of the net revenue tax to be imposed on the operation. In addition Babbitt will receive propoerty tax revenues from PolyMet for lands that are currently tax exempt. The Draft EIS is adequate in scope and detail and sufficiently demonstrates that the proposed PolyMet operations at the Mine, Plant and Tailings Basin can be done in an environmentally safe manner. The City urges the respective agencies to issue a determination of adequacy for the PolyMet Draft EIS.	EOO

1091	The DEIS states that review of historic aerial photos and visual observation have proven that the dewatering of the nearby Peter Mitchell pit has had little, if any, impacts on the nearby wetlands and Mud Lake. Visual observation is not sufficient to see the actual impacts such as water quality and soil quality. Also, how long ago was the Peter Mitchell pit dewatered? If it was five years ago, it might not have been sufficient time to see the potential effects that the dewatering can have on the surrounding water and environment (4.1-62).	WE2,WE5
1092	LTV waste rock seepage is already affecting the groundwater in the area and is draining into the wetlands. Has there been any impact from these tailingsseepages on the surrounding wetlands? Any significant changes that impact wildlife, aquatic life, or water quality?	WE2,WE5
1093	Have results from these tests been reported and do these results conclude that these technologies do indeed decrease leaching of metals and AMD?	WE2,WE5
2000	LTV waste rock seepage is already affecting the groundwater in the area and is draining into the wetlands. Has there been any impact from these tailingsseepages on the surrounding wetlands? Any significant changes that impact wildlife, aquatic life, or water quality?	FM1
3341	The EIS needs to address the aquifer and bedrock more because of the high potential of acid mine drainage (AMD) and metal leaching. When referring to the groundwater transport model, the DEIS used three evaluation points along one flow path north from the tailings basin (4.1-91). This is only one direct flow path of groundwater that was evaluated. If there is a steadier, faster groundwater flow path from the tailings basin, this flow path should be evaluated as well. If a higher concentrated flow path is examined, high concentrations of leakage would be found and seen, and the issue can be dealt with in a timelier manner. From examining Figure 4.1-4 and Figure 4.1-26, the areas of concentrated flow seem to be to the west of the tailings basin as well as to the south. Also, looking at Figure 4.1-13, the past and current seepage from the tailings basin is shown to be concentrated directly to the west of the tailings basin and to the southwest. If current and past seepage from the tailings basin (Cell 2W especially) is concentrated in these areas, then a groundwater flow path to the west and to the southwest should also be included in the groundwater transport model when examining dissolved constituents. PolyMet can then watch for plumes of seepage (if they do occur) and neutralize them before they do any irreparable damage (4.1-	WR1E,WR2A
3342	The DEIS states that from “reports” the contours do not show any high permeable outwashes that could serve as groundwater conduits (4.1-4). What reports and who is reporting? If there are groundwater conduits in the area,	WR2A
3343	The DEIS states that seepage from Pit 6 has very high sulfate concentrations and that Pit 6 will be dewatering into First Creek, Second Creek and then joins with the Partridge River to increase the sulfate concentration. The DEIS states that sulfate concentrations at Partridge River start at 30.4 mg/L, flows through Colby Lake, and downstream to the confluence of First and Second Creek where the sulfate concentration is 475 mg/L (4.1-39). Increased concentrations of sulfate in the Partridge River could influence wild rice and promote AMD. Mitigations should be taken for the increase of sulfate concentrations	WR4F
3344	The DEIS does not have firm conclusions based on the results of the deterministic modeling and the conflicting Uncertainty Analysis. Modeling of the solute loading estimates from stockpiles and mine pits does not carry forward certain contaminants because their exceedance of groundwater evaluation criteria is attributable to high baseline concentrations (Table 4.1-44). The DEIS does know for sure that several solutes (antimony, manganese, nickel, and sulfate) will exceed groundwater evaluation criteria (4.1-84). These solutes should still be carried through detailed transient flow modeling as to not overlook potential	WR2E
3345	Colby Lake experienced large fluctuations during the LTVSMC mining operations. More explanation should be noted as to how the NorthMet project will affect Colby Lake water level fluctuations and the amount of water that the project would require from this reservoir with regard to inhabitants on the lake and the ecology of the lake (4.1-26).	WR3F

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3346	Under the tailings basin alternative what would be used for the criteria to decide if water is sent back to the tailings basin for reuse or if it is discharged into the Partridge River with regard to all possible impacts on the river system and wild rice (4.1-148)? The recycling of this water for use in processing plant operations would have a large impact on the amount of water needed from Colby Lake over the lifetime of the mine. What would make this water unsuitable for make up water in the processing plant but would also allow for the safe discharge of this water into the Partridge River?	WR3F
3347	There has been no testing of the bedrock in the tailings basin area. If there are fractures and connections of aquifers, leakage of solutes and water from the tailings basin could increase.	WR2A
3348	The DEIS states that LTV tailings will be dug up and compacted as to create a dike around the proposed tailings basin for the NorthMet project. When digging up and moving the LTV tailings, the rock will be introduced to higher	WR2D
3349	The DEIS indicates under the proposed action that tailings would be deposited to tailings basin cells in slurry form by gravity flow over discharge beaches when necessary and subaqueously via diffusers throughout the pond (3.1.5.3). Deposition of the tailings slurry onto a discharge beach creates a significant opportunity for the sulfide-containing tailings to contact air and oxidize. The deposition of the slurry into the tailings ponds also provides significant opportunity for the slurry to cause turbulence and upwelling of the subaqueous material. This could possibly increase oxidation of the tailings and surrounding rock.	WR3A
3350	The DEIS states that review of historic aerial photos and visual observation have proven that the dewatering of the nearby Peter Mitchell pit has had little, if any, impacts on the nearby wetlands and Mud Lake. Visual observation is not sufficient to see the actual impacts such as water quality and soil quality. Also, how long ago was the Peter Mitchell pit dewatered? If it was five years ago, it might not have been sufficient time to see the potential effects that the dewatering can have on the surrounding water and environment (4.1-62).	WR2I
3351	The DEIS states that seepage from the proposed tailings will go through the LTV tailings and that water quality will improve, but there is no presented evidence that this will happen. There is potential that the water quality will get worse. There is no evidence or tests cited to support this conclusion. The DEIS	WR1E
3352	What interactions within the tailings basin will cause the addition of NorthMet tailings to LTVSMC tailings to have improved water seepage quality? The accuracy of the modeling used to reach this point is not discussed so the actual water quality of the seepage will not be known until NorthMet tailings are added to the existing tailings basin. The potential for the seepage to have lower quality than predicted should be accounted for so that the seepage can be treated accordingly and prevented from entering surface or groundwater systems (4.1-54).	WR2D,WR3A
3353	LTV waste rock seepage is already affecting the groundwater in the area and is draining into the wetlands. Has there been any impact from these tailingsseepages on the surrounding wetlands? Any significant changes that impact wildlife, aquatic life, or water quality?	WR5A
3354	With the reuse of LTVSMC tailings basins, how much will surface seepage and groundwater seepage increase and will this seepage be harmful to the	WR2D,WR3A
3355	The DEIS does not clearly state the quantity of untreated groundwater that will be seeping from the tailings basin. Figures 4.1-18 and 4.1-19 only indicate that the amount will be greater than 1000 gpm.	WR2E
3356	The DEIS does not address the potential effects of floatation frother and collector chemicals on groundwater due to untreated seepage from the tailings basin.	WR2E
3357	The DEIS has limited data that says little degradation has occurred to residential well groundwater quality from 50 years of LTV tailings disposal. The DEIS states that limited data was obtained. The DEIS does show some increases of concentrations and exceeds concentrations of aluminum, beryllium, iron, mercury, and manganese (4.1-15).	EOO
3358	What chemicals are entering the groundwater system by this seepage and what are the potential impacts? How will the seepage and impacts be monitored both during and after mining operations?	WR1B,WR2E

3359	If this water loss from the mine is found to have a harmful impact on the environment what will be done to mitigate the effects and stop further seepage (4.1-147)?	WR1A
3360	During small scale plant testing, the DEIS states that some of the tailings exceeded the critical sulfur range, which in turn can produce a lower pH and increase metal mobility (4.1-95). This is also seen in the waste rock seepage from the LTV waste rock piles, which are composed of the same rock proposed to be mined. Other mines with similar sulfide content and less sulfide content were also found to produce sulfuric acid and acid mine drainage. What will PolyMet do to counteract this? What mitigations, if any, will be used?	RFI
3361	Have results from these tests been reported and do these results conclude that these technologies do indeed decrease leaching of metals and AMD?	RFI
3362	Water that has come in contact with disturbed surfaces will be treated using membrane separation and chemical precipitation technologies. What exactly will PolyMet do? The DEIS is unclear about the amount of residue being chemically precipitated from this process	WR2G
3363	The DEIS is not clear on the effectiveness of the wastewater treatment process. Has this technology been used in other mining operations and how successful was it at reducing environmental impacts?	WR2G
3364	What will be done with the water that washes the electrolyte cathodes?	RFI
3365	Are there any contaminants that the WWTF will need to take into special consideration?	RFI
3366	For how long will the water level of the tailings basin be monitored after closure to reduce oxidation of sulfates?	WR1A
3367	If water quality standards are still not met by the time PolyMet closes down operations at the WWTF, will PolyMet continue to process water? Will PolyMet have adequate money allocated to continue processing wastewater?	WR3I
3368	How long after mining ceases will water levels be maintained and monitored? This includes water levels in nearby rivers and streams, the tailings basin, and groundwater on and around the site after the West pit overflows (3-47).	WR1A
3765	The DEIS indicates under the proposed action that tailings would be deposited to tailings basin cells in slurry form by gravity flow over discharge beaches when necessary and subaqueously via diffusers throughout the pond (3.1.5.3). Deposition of the tailings slurry onto a discharge beach creates a significant opportunity for the sulfide-containing tailings to contact air and oxidize. The deposition of the slurry into the tailings ponds also provides significant opportunity for the slurry to cause turbulence and upwelling of the subaqueous material. This could possibly increase oxidation of the tailings and surrounding rock.	PD2
3766	Why was the lined tailings basin removed in the January 2007 revised project description? Since little data is available on the reactivity and potential environmental damage that tailings from the NorthMet project could produce, it seems reasonable that a liner would be used initially on the tailings basin until more data can be collected (2-4).	PD5,PD11
3767	Category 1 waste rock should be treated as having potential to producing ARD.	PD2
3919	All areas of the mine site will be subject to a Fugitive Dust Control Plan, for managing dust generated at rock dumping and loading locations. How will PolyMet be implementing this plan, and what does PolyMet exactly propose to do?	G2B

3664	Summary of my comments on the poly met project. It appears that significant disagreement exists based upon the hydrologic and hydrogeologic modeling. Assumptions of hrdrogeologic parameters can have large impacts on the modeling results, therefore, it does not appear that the confidence exists for permitting such a large facility. For example, if the vertical hydraulic conductivity is much greater in actuality than what is modeled many more wetlands will be affected than is shown and reported. Impacts to the Partridge river are significant especially during low flows which may only be exacerbated with Climate Change. The huge impact to wetlands will have a profound impact in the area. Due to this impact the underground alternative should have explored farther than it was and not dismissed due to cost without additional analysis. Long term and short term assurance and monitoring is unclear as to how the water treatment and environmental performance of mitigation and treatment technologies will be handled. This has potential to create a long term public liability that may greatly exceed the short term benefits. It appears that during the operation that the staff allocation is very minimal for environmental performance inspection and monitoring.	ALT3,ALT8,WR1A,WR1E,
<b>Sender Last Name:</b> Andresen		<b>Submission ID:</b> 3639
18169	Save Our Sky Blue Waters introduces our comments on the PolyMet DEIS with reference to the above law. The DEIS unequivocally shows that the former LTVSMC mine site being purchased by PolyMet is already leaching contaminants into the watershed, and that PolyMet's operations will add to the load of contaminants. (Tables spread throughout Chapter 4.1) The DEIS, however, has no plan in place to prevent this pollution. The regulatory agency responsibility as set forth in the DEIS is to monitor mining operations. There are no alternative treatment or mitigation plans, and no means of enforcing what is laid out in the DEIS.	EOO,WR1A,G9
18171	The DEIS does not adequately address public health concerns regarding mercury in the St. Louis River watershed, the cumulative health impacts of metal and other contamination due to mining (past, present, and the future opening of a sulfide mining district) in both the water and the air, and potential health impacts of asbestiform fibers.	WR5A,FM3,AQ4C,AQ6
18174	The DEIS does not address a land exchange with the USFS that would be required for PolyMet's proposed open pit strip mines. Any possible Federal land exchange with PolyMet should be part of PolyMet's EIS. NEPA and MEPA require that all potentially significant impacts be addressed in the EIS (National and Minnesota Environmental Policy Acts).	PD1
18175	The DEIS does not adequately address the instability of the LTVSMC tailings basin, especially considering the large amount of tailings that would be added from mining a less than 1% ore body, The DEIS does not adequately address the instability of waste rock pile slopes, especially considering the size due to mining less than 1% ores.	GT1,GT2
18176	The DEIS does not include the Hoyt Lakes – Babbitt Connection Project roadway. This project is currently on hold while waiting further funding. The impacts of this roadway on wildlife habitat and environmental quality need to be addressed as part of the impact of the PolyMet proposed mining project.	G9
18177	Arsenic, cobalt, selenium, copper, nickel, aluminum, beryllium, iron, manganese, and thallium from PolyMet's operations may exceed water quality standards. The DEIS would allow this to happen. The DEIS does not address the cumulative or synergistic impacts upon fish, wildlife, or humans as we ingest water containing all of these pollutants. The DEIS does not address possible hormone disrupters that reach the water supply from plant process chemicals.	WR3I,WR5A
18179	The St. Louis River watershed is already contaminated with sulfates, and the watershed is impaired for mercury. Leaching from PolyMet's tailings would increase the sulfate load within the watershed, resulting in further fish consumption adversaries. The DEIS does not address how the St. Louis River watershed will be able to attain TDML (Total Daily Maximum Load) standards, as required by law.	WR4B,FM1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
18180	Plant closure plans do not account for acid mine drainage and heavy metal leaching that can last for hundreds to thousands of years, requiring “perpetual” treatment. Experience with the Dunka mine site, where LTVSMC stockpiled sulfide bearing rock that it extracted in order to mine taconite underneath, proves that this mineralized complex of rock will leach into the watershed, and that the mining companies and state agencies have not found an efficient or cost effective way to prevent water contamination. The Dunka site has been leaching toxic heavy metals into the watershed for the past 30 years, and has been granted a variance, allowing pollution to continue. Acid mine drainage is the greatest liability, nationwide, when mining sulfide ores. The PolyMet DEIS has ignored mention of this legacy, misleading the public as to the true liabilities of not just PolyMet, but of opening a sulfide mining district in the Duluth Complex of mineralization.	WR1E,WR3I
18181	Determination of the amount of financial assurance that will be required for closure and perpetual water treatment should be included in the DEIS. Bonding is one of the most critical aspects of mine permitting, and one that is least understood and examined by the public. Many of the measures that will be taken to avoid environmental impacts depend on adequate bonding. For instance, the DNR will not be able to assert that a particular remediation plan will be instituted when the mine closes unless bonding is sufficient to ensure the remediation. Bonding is crucial to any determination that potential environmental effects will be avoided. This DEIS is inadequate by its omissions.	PD4
18182	The DEIS allows for loss of open and coniferous bogs within the state, contrary to law. The DEIS allows wetland mitigation to occur out of county and out of watershed. The wetland mitigation plan allows for total loss of wetlands, as wetlands in Aitkin County would be preserved while wetlands in St. Louis County would be destroyed.	WE2,WE3
18183	The most significant lack within the DEIS is neglecting the cumulative loss of wetlands due to taconite mining expansion that is permitted (Mesabi Nugget, Essar Steel), or proposed (Minntac, Keetac, HibTac United Tac, Northshore, and Minorca).	WE5
18184	The DEIS does not adequately evaluate the loss of carbon sequestration by the destruction of over 1000 acres of wetlands. At the same time, mining operations would spew out 767,648 metric tons of CO2 per year (Table 4.6-18).	AQ3
18185	The wetlands at PolyMet’s proposed mine site have been identified as worthy of protection by the USFS and the DNR. This is not addressed in the wetlands mitigation plan. Because PolyMet’s required land exchange with the USFS is not addressed in this DEIS, nor in a separate USFS EIS, the value of these wetlands are not adequately addressed anywhere.	WE1,WE3,WE7
18186	First of all, PolyMet would be mining 99% waste rock. So all of the greenhouse gas emissions from energy sources, vehicles, and plant processes would be attributed to producing 99% waste. If governmental agencies are seeking to reduce CO2 and other greenhouse gas emissions, the DEIS needs to explain how the mining of 99% waste rock can be justified.	AQ3
18187	PolyMet also has a much larger footprint than energy, vehicle emissions, and plant processes. The production of mining equipment has a huge greenhouse track of its own. Truck tires that need to be replaced regularly have their own carbon trail. PolyMet plans to import 200,000 tons of limestone a year. Both limestone and the bentonite clay used in liners have their own mining history, leaving behind their own greenhouse gas trail.	AQ3
18188	In addition, PolyMet’s hydromet produces a semi-finished product which will require further processing at a third party site. There will be an additional greenhouse gas trail left behind as these semi-processed metals are railed to Lake Superior and then shipped to some unknown destination for final processing. The metals must then be shipped somewhere for manufacturing, and shipped again for sale as part of a product.	AQ3

Comment ID	Comment Text	Theme Codes
18189	An additional greenhouse factor in regard to PolyMet is the destruction of approximately 1200 acres of wetlands. The DEIS presented a figure of 23,000 tons per year of CO2 equivalent emissions due to sequestration loss. However, the DEIS does not explain how Barr Engineering reached this figure. The DEIS instead claims that its wetland mitigation plan will mitigate these impacts. There does not seem to be a basis for this claim, given that the wetland mitigation plan would preserve existing wetlands in Aitkin County while destroying wetlands in St. Louis County. The Aitkin County wetlands would be in an entirely different watershed and would be of a different type. The bottom line is that the total amount of wetlands in the area/state would be destroyed, which goes against the Wetlands Conservation Act. European studies claim that the retention of wetlands helps to reduce climate change impacts on a local level by sequestering CO2, helping to moderate warming and giving plant and animal species more time to adapt. Based upon this, the destruction of wetlands in what is now Superior National Forest would have considerable impact because it is an area that has been preserved for its ecological resources.	WE2,WE3,WE7,AQ3
18191	The public expects that our regulatory agencies, such as the DNR and the USFS, are documenting and studying climate change effects in our regions. Such studies need to be included in this DEIS, rather than figures produced by Barr Engineering for PolyMet. The ecological division of the DNR is not holding its own against the DNR Lands and Minerals Division. While Lands and Minerals have spent 30 years studying the local geology and promoting mining, the ecological division does not have an equal amount of information documenting changes or threats to the biodiversity of our forests, wetlands, and watersheds.	AQ3
18217	I wish to also incorporate by reference the Draft EIS comments submitted by Minnesota Center for Environmental Advocacy, Friends of the Boundary Waters Wilderness, Save Lake Superior Association, the Indigenous Environmental Network, the Sierra Club, and Wetland Action Group.	G15
18219	The DEIS is inadequate in many ways. The "No Action Alternative" is the only legal alternative. This EIS is perhaps one of Minnesota's most important ever and the DEIS is filled with speculation and assumptions, many not based on science or past history. The LTV site is	ALT8
18220	currently in violation of federal and state water quality laws. How can putting metallic copper waste on top of leaking iron/taconite tailings basins, clean the site up? It is bad public policy to permit new pollution on top of old. Legacy contamination at the site must be cleaned up before	EOO,WR5A,PD2,G9
18222	We need another regional copper-nickel study to address new and emerging issues related to methyl mercury, wetlands, global warming, etc. The cumulative analysis of the PolyMet project is deficient and fails to address past, present and future issues related to PolyMet and the ecosystem where it is proposed.	PD3
18223	We cannot simply allow a company to do what they wish with Minnesota resources because they have paid money for an environmental review. The NorthMet deposit has been mapped and explored for many years. United States Steel originally planned for an underground mining operation at the NorthMet site. More recently PolyMet plans to mine the deposit in the cheapest way possible, which is to strip mine. The underground option has been eliminated from the DEIS purely because of economic reasons. A DEIS is required to address all reasonable alternatives. Because the company does not wish to spend the added money to have an underground mining operation, is not sufficient reason to exclude other alternatives that would be far less damaging to the environment. The DEIS is inadequate because the underground mining option has been left out of the alternatives, contrary to NEPA.	ALT8
18224	The DEIS is also inadequate because our federal land managers, the USFS, have not fulfilled their statutory responsibility to do an environmental review of the project, which is located mostly on USFS lands. The NorthMet site currently has Weeks Act protections against destroying the surface by strip mining. The USFS has stated that, as their official position in the DEIS, it is postulated that a land exchange will occur sometime in the future which would give PolyMet the surface rights to strip mine. The land exchange is a connected action and the DEIS should include the environmental impacts from such an exchange taking place. The EPA's position is that the land exchange should be addressed in PolyMet's DEIS. The severed estate of the land, with its accompanying environmental restrictions, should have defined the project as an underground mine. Instead we have politicians and federal land managers pretending that this is not the case. The public, as well as PolyMet stock holders, deserve to know that current environmental laws protect this land from strip mining.	PD1

18225	Impacts to endangered and threatened species are not adequately addressed in the DEIS. The project's potential harm to Lynx, Wolf and Moose are inadequately addressed. This is critical Lynx habitat, yet there seems to be no real plan to protect the Lynx and their habitat. Moose have had catastrophic population declines. One of their main habitats is wetlands and bogs. The Minnesota DNR should have, as their priority, saving Minnesota's moose instead of permitting the destruction of their habitats. The effects on the plant species, such as the Botrichium, are inadequately addressed in the DEIS. It is assumed that there will always be another colony of plants, or that the Lynx can go around a mine pit. At what point can the wildlife no longer adjust to the monumental changes to their surroundings with one project after	WI1,WI2
18227	This would be the single largest destruction of wetlands ever permitted by the ACOE in Minnesota. Wetlands (especially peat) sequester CO2 and their destruction has not been adequately addressed in the DEIS. When Marty Vadnis was questioned at the 2008 MN sulfide mining legislative hearings , he was asked why this fact was not addressed in PolyMet's scoping documents. He replied "because no one brought it up during the comment period". The use of wetlands as treatment of metals and sulfates sequestering, is speculative and not supported by the science or past history at the Dunka Mine site. The peat contained in the wetlands will require periodic "recharging". This would involve mining peat and replacing the contaminated peat with fresh peat, and it would need to be done virtually forever. What is the carbon footprint of the destruction and use of wetlands (and peat in particular) in the manner PolyMet proposes? Other treatments proposed to control for Acid Mine Drainage and heavy metal leachate, such as adding limestone as a buffering agent, is also speculative and their lasting efficacy is unproven.	WE2,WE6,AQ3
18229	Using wetlands to sequester metals is an economic and political "solution" to metals pollution from mining. When the MDNR and MPCA first started studying using wetlands as metal sinks, as well as constructing wetlands for treating mine waste effluent, there was dialogue in the agencies as to whether it should be allowed (such as at the Dunka Pit sulfide overburden).It was looked at as mitigation at sites that had legacy pollution. Now the agencies are permitting mines and using wetlands as metal "mops". Should we be allowing this, is this acceptable as a precedent for the permitting of a new sulfide mining district? Also, these wetlands need to be maintained and charged, for a very long time. It is sort of a cheap perpetual treatment option, which is heavily supported by the MDNR. The state agencies do not want active treatment because they realize that ultimately, it is the state that will be responsible for these sites. To be able to use wetlands on the cheap, makes it more palatable to permit these mines which will require near perpetual treatment.	WE2
18230	Groundwater and surface modeling, done by PolyMet, is illogical and incomplete. The Tribes have made important comments on the inadequacy of the DEIS on water modeling and predictions. It seems that PolyMet got the answers that it was looking for in its modeling. The effects to groundwater (and eventually surface water) are perhaps the most troublesome of the project. Hydrological connections and the effects that PolyMet would have on the water resources is not adequately understood, studied, or addressed in the PolyMet DEIS. Heavy metal pollution in violation of federal laws and compacts is predicted to occur as a result of the project. Tribal comments suggest that the heavy metal and sulfate pollution will be much more extensive and persistent than is admitted in the DEIS. The potential for Acid Mine Drainage is virtually ignored in the DEIS. Rock characterization predictions (guesses), are replacing any evidence that would show the project will do irreparable harm to the State's resources. To the	WR1E,WR2A,WR2E,WR2F
18231	Metal, Fiber, and Mineral dispersion into the ecosystem is not adequately addressed in the DEIS. Areas such as Libby, Montana have seen toxic dispersions of asbestos for 20-30 miles beyond the original contamination source. Possible effects to humans, wildlife, fauna, as well as aquatic life, have not been adequately addressed in the DEIS. The probability that various toxic materials, including Amphibole Fibers/Particles or asbestiform fibers, will be dispersed into the surrounding environment and possible negative consequences is not being adequately addressed. It appears that it is the position of the permitting agencies that monitoring for, in lieu of actual protections from, harmful occurrences will be allowed to suffice in the project.	AQ4C

Comment ID	Comment Text	Theme Codes
18232	Mercury and methyl mercury. The DEIS does not adequately address mercury release from the project, both from the tailings piles and mine pits. Not only is the St. Louis River watershed already impaired from mercury, the sulfates from the project will greatly exacerbate the methylation of past, present and future mercury. Exceedances of aluminum and mercury already exist in the Embarrass River. PolyMet will add to this, contrary to EPA rule (40 C.F.R. § 122.4(i).	WR4B,WR5A,FM1,FM3,A
18235	The permitting of PolyMet would be a violation of the Great Lakes Compact of zero discharge of Mercury to the basin. The claim that the project will not contribute mercury to the Lake Superior basin is unfounded and not supported in the DEIS.	EOO,WR4D
18236	Sulfates released into the ecosystem are inadequately addressed in the DEIS. the effects to the areas below and downstream from the project assume there will be little effect from mercury, other pollutants and sulfates. This assumption is speculative and is not supported in the DEIS. Recently the Duluth-Superior harbor has had its steel infrastructures eaten away at the water level It has been speculated that it is from sulfate reducing bacteria from an industrial source of sulfate. It would seem reasonable to assume that legacy taconite mining, with its documented release of sulfates, has contributed to this unexpected and unintended consequence. Who will be responsible for the unintended consequences from permitting a new highly toxic industry in the already impaired system?	PD3,PD4
18237	The Economic model in PolyMet's DEIS is inadequate. It appears to have just addressed any possible benefits without any of the true costs to the region and the state. Mining is historically a boom and bust industry, that is the best you can say about mining economies.	SE3
18238	the Range was booming. Planning for more workers to come into communities and destabilize the existing communities, just makes the bust even more traumatic. The DEIS does not adequately address the potential for the negative social or economic impacts to the area.	SE3
18239	The opening of a new industry, such as copper sulfide mining, in areas that depend on tourism and the natural resources of the area, communities such as Ely, will have a devastating and long lasting effect upon their economic base. In areas that have seen mineral exploration, the real estate market has been destabilized. People do not want to live near a copper mine. North eastern Minnesota is believed to be highly mineralized, much of it by low grade sulfide ores. Most of the ores found here are fairly common. What the mining companies like, is the mining friendly regulators charged with permitting their projects. Although many of the metals are quite common, there are only so many places where you are allowed to so utterly destroy the land and alter the hydrology of an ecosystem. The value of Sudbury, Ontario and Appalachia, to mining interests, is that there are only so many places where you are allowed to forever alter the land and in the process impoverish successive generations.	SE4
18240	Dr. Tom Powers compiled a report on Minnesota's mining economy. Those findings should be included in the DEIS. It is a simple observation that mining communities tend not to be prosperous.	EOO,SE3
18241	Other sulfide mining projects and the planned sulfide mining district is not addressed in the DEIS. The USFS is currently doing an EIS for hardrock mineral prospecting in the Superior National Forest. While the USFS has been slow to address hardrock mining in the SNF, it has begun the environmental review process. The state of Minnesota (MDNR lands and Minerals, NRRI, IRR) is promoting metallic sulfide mining in the state through technical assistance, grants, leasing, etc. The MDNR is the lead permitting agency for the PolyMet NortMet Project, yet they are also the lead promoter of metallic mining in the state. This presents a conflict to those charged with fulfilling the environmental review, this dual mandate to protect and develop the resources should be addressed in the DEIS.	G9
18242	Companies are exploring across NE Minnesota. Those in the advanced stage of exploration and mining near the PolyMet Project should be addressed in the DEIS. That would include Teck Cominco, which just conducted an EAW for a large scale sample project next to the NorthMet site. Franconia Minerals, Duluth Metals, Encampment Resources and Kennecott all are leasing and exploring for mineral targets that the state of Minnesota has spent years geologically defining. The DEIS is inadequate in not addressing the State's own plans for a sulfide mining district.	G9
18243	If Duluth Metals is not a "real" project, why is the responsible party status at the Dunka being transferred to them?	G9

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
18244	PolyMet is proposing to permit for a third (32,000 tpd) of the plant's 100,000 tpd processing capacity. PolyMet has been touting, in their corporate presentations, the potential for processing adjoining ore bodies in their excess capacity. The planned future use of PolyMet's excess capacity must be addressed in the DEIS. To allow the project to be misrepresented in the environmental review in order to under evaluate the potential for harm, is unacceptable.	G9
18245	Accurate descriptions and predictions of mine closure timelines are not adequately addressed in the DEIS. How long is treatment expected to be required? In the CPDEIS there were numerous references to perpetual treatment. It appears those unpopular references have been removed from the DEIS. In reality the PolyMet Project, if permitted as proposed, is expected to require perpetual treatment. The DEIS must state that fact in order for the public to get an accurate description of what will be required. PolyMet is not expected to be in existence beyond the project's permitted life. That means the burden of perpetual maintenance will fall upon Minnesota taxpayers. If PolyMet follows the path of many metallic sulfide mines, there will be no responsible party and Superfund status will fall on the site with the accompanying public liability for clean up and treatment. Nowhere in the DEIS are the potential financial liabilities discussed. The possible catastrophic economic scenarios are being left out of the DEIS. The DEIS is inadequate by failing to address financial assurance and liabilities for the project.	PD3
18246	It is stated, in the DEIS, that the project will provide the USA with needed supplies of metals. This is not correct and is not supported by the DEIS or PolyMet's own claims to the contrary. PolyMet has joint ventured with and has off take arrangements with international mining giant Glencore to send 100% of the metals from the project out of the country. If the metals at PolyMet's NorthMet site are strategic to our national interest, then they should remain at the site for our own national security and emergency needs. It is disingenuous to argue that the metals are strategic to our national interests and then allow them to be sent out of the country for speculative gain to international commodities traders. The claim that we need these metals is also untrue. The project degrades the very things that we do need, air, water and sustenance. It has been postulated that there are not enough metals in the world to satisfy our perceived "needs". The DEIS is woefully inadequate in its analysis of our needs vs. wants.	G1
18247	There are several key assumptions in the deterministic modeling and Uncertainty Analysis for the Mine Site that warrant further evaluation, including: 4.1-85 "Humidity cell testing is continuing and changes in dissolution rates that may occur over time could affect the accuracy of the groundwater quality predictions." "...the amount of mineral surface area contacted by water passing through the full height of a waste rock stockpile is much greater than the surface area contacted by water passing through a humidity cell." "Clarification is required regarding the methods and data used by PolyMet in determining the acidification factor." p. 4.1-123 "PolyMet proposes to construct an approximately 160 acres wetland at the East Pit once filling is completed, which would receive and further treat effluent from the WWTF (further reduce concentrations of metals). There is very limited data regarding the effectiveness of constructed wetlands in removing mercury. ...Based on the scientific literature, the constructed wetlands would be expected to be variably effective in removing total mercury, and could function as a source of methyl mercury production. From p. 4.1-107 The Proposed Action may affect the water quality of the Partridge and Embarrass rivers and their tributaries that drain the Mine Site and Tailings Basin....several potential pathways for surface water quality impacts remain, including non-contact stormwater runoff, seepage from rock stockpile liners, the hydrometallurgical residue storage area, the Tailings Basin, and pit lake overflows.	WR2E,WR3L,WR4A,WR4
18248	There is an unacceptable level of uncertainty in the project, including but not limited to: rock characterization, hydrology, impoundments, efficacy of long term treatment options, effects upon endangered species, heavy metal dispersion into the environmental, persistent pollution and Acid Mine Drainage, long term ground and surface water quality degradation.	PD2,PD3,PD8,PD10,CR1
18249	In the CPDEIS and the DEIS, there are unanswered questions pertaining to the stability of the LTV tailings basin, this has not been adequately addressed. Tribal and agency comments voice their concerns over the tailings basins, why has the DEIS been released when questions remain as to the safety of the tailings basins? In 1991 the MPCA approved a compliance plan for coal ash disposal site that failed and spilled coal ash over Highway 61 and into Lake Superior.	EOO

18250	The Hoyt Lakes-Babbitt Connection Project has not been cancelled and must be included and assessed in the DEIS, as part of PolyMet's Cumulative Impacts. Millions of dollars have been spent on the design of the project and environmental review has begun, it has been temporarily placed on hold while further funding is sought (according to St.Louis County). During scoping there was a lot of public attention drawn to the project because of the connection to the PolyMet NorthMet project. While funding may be an issue, undoubtedly public scrutiny played a part in the decision to place the Hoyt Lakes-Babbitt Connection Project on hold, at least until the expected permitting of the PolyMet NorthMet project. The PolyMet DEIS does not adequately address the Cumulative Impacts from the Hoyt Lakes-Babbitt Connection Project.	G9
18251	PolyMet's DEIS should get a determination of inadequate and the no action alternative is the only legal option for the NorthMet Project. It would be a violation of state and federal laws, including the Clean Air Act, the Clean Water Act, NEPA, and MEPA if the PolyMet project were allowed to proceed.	PRO7
<b>Sender Last Name:</b> Andrews <b>Submission ID:</b> 147		
138	Basically, I support the mine for a lot of economic reasons, but also, I believe that we need the products, we can produce them here, and we can produce them here with environmental controls. If we don't produce them here, they'll produce them in a third world country, no guarantees on environmental controls. The product'a here, produce it here, keep the jobs here.	EOO,G5
<b>Sender Last Name:</b> Androff <b>Submission ID:</b> 2056		
2491	We already live in a cess pool of toxins and should not be asked by yet another corporation to add to their cummulative effect. Clean water is becoming so scarce that we cannot in clear conscience add to its pollution.	G7
<b>Sender Last Name:</b> Anonymous <b>Submission ID:</b> 3625		
3907	I hope the DNR issuance of PolyMet permits will not reflect an acrobatic accounting of costs and benefits but will include the value of the stream of environmental services currently provided by the 6700 acres of land in question. Some of those [illegible] priced (extractables) and others non-priced (carbon sequestration in living and nonliving biomas, water retention and cleansing, atmospheric gascycling, nutrient cycling, photosynthetic energy [illegible] to the atmosphere ect.) These services yield essential value that is lost in perpetuity. To contrast the benefits of this mine are fintite and of short duration while the external costs of sulfide mining are potentially also in perpetuty. I fully expect that the permits will be issued, reflecting the myopic social choice of sacrificing our sustainable resources for non-renewables in order to power our current demographic/economic binge.	EOO
<b>Sender Last Name:</b> Apter <b>Submission ID:</b> 3013		
3425	Please move forward with this mining project. These resources are critical to the region and the nations future. It would be improper to delay these efforts because of people who have no interest in economic development. I would hope you would see that this is a sound proposal that will help our area. Thank you for your consideration of this project.	EOO,G1

225	I would like to express my support for the North Met project. With 35 years of mining experience at Minntac I saw firsthand how our state and federal agencies were able to effectively regulate mining in Northern Minnesota. I know some of the management at Poly Met and I find these people to be very responsible. I feel that with government oversight and with responsible people at the helm this project can be environmentally responsible and economically rewarding.	EOO
<b>Sender Last Name:</b> Arneson		<b>Submission ID:</b> 3748
1	I object to the inadequacy of the DEIS to demonstrate that the proposed mining and processing operations could be done without polluting and without putting taxpayers at risk for extensive and expensive cleanup efforts that would be needed at such a massive disturbance of sulfide rock.	PD2,PD4
2	I live on the Iron Range of Northern Minnesota and have been following the PolyMet project. I am in support of this project.	EOO
2	I also believe that we need 120 days for a comment period, and we need to have more open meetings where we are able to speak our concerns for the rest of the -- I'm trying to think of the right word. Do -- do you have to put that in too? THE REPORTER: Sure. I write everything down. MS. CARLA ARNESON: Oh, funny. I think it's important to have open meetings where people are allowed to say what their concerns are so the rest of the audience is aware that there are other concerns out there and what they are. And it helps when you write the EIS comments to bring up new information, so I -- I really don't think this was a good idea to have closed comments. As I said, I'd like to have more meetings. I'd like to have 120 days so we have time to really look at this. As I said, I've researched it, and it's still daunting. I intend to read the EIS from cover to cover, and it's going to take quite a while, especially for people who have day jobs. You know, I have a little more leeway because I am retired. I have a little more time to be able to read it during the day, but most people are working, and for them to try and do this in 120 days with all the scientific information is literally impossible. So thank you.	PRO6
3	For several reasons, the DEIS Northmet 2009 is arguably the most important mining project to be considered for north eastern Minnesota. The Project reflects a major departure for Minnesota, from traditional iron ore and taconite mining to hard-rock (Sulfide) mining: “.the first large-scale non-ferrous metallic mineral mine in the State of Minnesota.” (DEIS Northmet: Chapter 3.1, Proposed Action) The DEIS Northmet proposes a form of mining that is highly controversial in Minnesota, the U.S. and globally. (Precious Waters. <a href="http://www.preciouswaters.org/resources/polymet-mining-activity-minnesota/">http://www.preciouswaters.org/resources/polymet-mining-activity-minnesota/</a> ; Sulfide Mining: <a href="http://bwcaboard.com/board/viewtopic.php?f=88&amp;t=1698">http://bwcaboard.com/board/viewtopic.php?f=88&amp;t=1698</a> ; OK Tedi Mine: <a href="http://archive.wri.org/biodiv/pubs_content_text.cfm?cid=1860">http://archive.wri.org/biodiv/pubs_content_text.cfm?cid=1860</a> ; Environmental Impact of Mining: <a href="http://rainforests.mongabay.com/0808.htm">http://rainforests.mongabay.com/0808.htm</a> .) This controversy is fueled in part by a consistent pattern over decades of hard-rock mining companies overstating the benefits of hard-rock mining while understating the true aggregate costs and adverse impacts on the environment and health. (Power TM. Economic Role of Metal Mining in MN, 2007: <a href="http://www.cas.umn.edu/econ/documents/faculty/power_econRoleMetalMining.pdf">http://www.cas.umn.edu/econ/documents/faculty/power_econRoleMetalMining.pdf</a> ; Boulanger A, Gorman A. Hardrock Mining: Risks to the Community, 2004: <a href="http://www.womenandenvironment.org/newsreports/issuereports/Mining_Health_Report_final_lo%230.pdf">http://www.womenandenvironment.org/newsreports/issuereports/Mining_Health_Report_final_lo%230.pdf</a> . For these reasons, the DEIS Northmet should provide clear and convincing evidence that the proposed Project will provide citizens of MN with benefits that exceed the risks. In light of the well-documented deleterious impacts on the environment of hard-rock mining in the U.S., the Project proposers should offer detailed evidence as to why the predictable and often devastating effects of hard-rock mining witnessed at mining sites over the decades will not occur with the Northmet Project. To achieve this goal, the DEIS Northmet should be a transparent and clearly science-based project proposal. The goal of transparency should be advanced by providing detailed information regarding the respective roles of the lead federal and state agencies. The unique, separate and at times, conflicting roles of the Forest Service and Bureau of Land Management regarding oversight and management of the Superior National Forest and mineral resources should be elucidated. The focus, mission and legal underpinnings of these entities are different and goals, objectives, and expected outcomes related to this Project and related projects should be provided.	PD3

Comment ID	Comment Text	Theme Codes
4	While much effort has gone into the preparation of this DEIS Northmet, there are major deficiencies: The DEIS does not clearly demonstrate that Project benefits outweigh the risks; there are major gaps in transparency of the Proposal, with no information provided on disclosures or potential conflicts of interest; and finally, each section of the Draft EIS Northmet contains statements and conclusions that lack supporting documentation of the assumptions upon which these statements and conclusions are based. Profuse generalizations often mask the lack of specific evidence-based answers to critical questions. Much data in this DEIS was provided by consulting organizations, whose science expertise, and relationship with the lead agencies and mining company are not included.	G8
5	4.4.3.1 Proposed Action (Environmental Consequences): It is stated that the Final EIS will include results of consultation between USACE and USFWS regarding potential effects on Canadian Lynx and other federally listed species. I suggest that this consultation summary as well as the “process” be included with specific findings from research, assumptions and methodologies used. What specific efforts have been made at the Project site to identify Lynx? Have trail cameras been deployed? Have there been searches of the site for Lynx den sites. Or are statistical data being used to describe the potential impacts of mining on these species?	RFI,WI1
6	4.4.5 Approach (Wildlife Travel Corridors): The list of projects identified as potentially impacting wildlife corridors does not include the Franconia; Duluth Metals; Encampment and Tech Cominco projects in the nearby Ely area. Please include these projects in your analyses. It is inconceivable that further development of mining in these areas is not relevant to the cumulative impact of the Northmet Project and other human activities in animal corridors in northeastern MN. Will Table 4.4-9 be revised to reflect these projects?	WI5
7	Finally, the cumulative effects analyses are few and incomplete with little information provided about the broader implications of this Project and other hard-rock mining activities in various phases of development and in the queue in the Arrowhead. It is vital that Minnesota take both a focused view of the impact of such projects but also a broader view of the context in which these projects are taking place in northeastern MN. The aggregate effects must be critically examined since science tells us that our current rate of human activities affecting land use are unsustainable. (Foley et al. Our share of the pie. Science, 2005: <a href="http://www.pnas.org/content/104/31/12585.full">http://www.pnas.org/content/104/31/12585.full</a> ; Boakes et al. Extreme contagion...Proc R Soc B, 2009: <a href="http://rspb.royalsocietypublishing.org/content/early/2009/11/25/rspb.2009.1771.abstract">http://rspb.royalsocietypublishing.org/content/early/2009/11/25/rspb.2009.1771.abstract</a> ; Foley et al Global Consequences..Science, 2005: <a href="http://www.sciencemag.org/cgi/content/abstract/309/5734/570">http://www.sciencemag.org/cgi/content/abstract/309/5734/570</a> ; Haberl et al. PNAS 2007: <a href="http://www.pnas.org/content/104/31/12942.full.pdf+html">http://www.pnas.org/content/104/31/12942.full.pdf+html</a> )	CR1
8	4.5.4: Mercury and bioaccumulation in Fish: The DEIS does not include important science regarding metal contamination from hard rock mining and toxicity in fish and macroinvertebrates other than mercury. Cadmium (Cd), lead (Pb) and zinc (Zn) in water and streambed sediment have been found to exceed Ambient Water Quality Criteria (AWQC). This deficiency should be corrected. (Maret TR et al. Fish Assemblages and Environmental Variables. .Trans Am Fisheries Soc 2002;131:865-84. <a href="http://afsjournals.org/doi/abs/10.1577/1548-8659(2002)131%3C0865:FAAEVA%3E2.0.CO%3B2">http://afsjournals.org/doi/abs/10.1577/1548-8659(2002)131%3C0865:FAAEVA%3E2.0.CO%3B2</a> )	FM1
8	4.5.3.1 Proposed Action (Environmental Consequences: Fish): Water Quality Effects p4.5-15: Was the conclusion reached in this paragraph informed by the most recent Climate Change data regarding disruptions in normal cycles of extreme weather events? (WHO; UNEP Intergovernmental Government Panel on Climate Change: <a href="http://www.ipcc.ch/">http://www.ipcc.ch/</a> ) Do the assumptions regarding lack of impact even under extreme low flow conditions include changes predicted by Climate Change forecasts? This question applies to all other sections that have reached similar conclusions.	G14,WE1,WE2
9	Even in MN’s two Class I areas (BWCAW and Voyageurs NP), visibility impairment is being quantified. New construction and development, including mining companies on the Iron Range, threaten to add to the problem. Global sources of air pollutants are increasing. The projected added air pollution from the proposed activities in this DEIS and subsequent proposed sulfide mining must be evaluated in the context of such changes. Fine particles (which have serious human and environmental adverse effects) will clearly be generated from multiple sources associated with this Project including forest disruption, soil erosion, road building, mining, vehicular traffic, etc.	AQ4B,AQ9

Comment ID	Comment Text	Theme Codes
9	4.6.1.1 Existing Conditions: Regional Climate and Meteorology: Surface data are reported from the Hibbing Monitoring Station with estimates of the wind direction, etc. Why aren't other closer monitoring data provided. For example, wind roses for MN and surrounding cities ( <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> ) provide data from Ely, MN Municipal Airport.	AQ4,AQ5
10	The Indian tribes working on the EIS and the United States Environmental Protection Agency have provided helpful information on the inadequacy of the PolyMet draft EIS. Before this sulfide-mining project is even considered for permits, these gaps must be completely filled. Please take the time and do the scientific research to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project actually would have on our State.	EOO,G8
11	According to the DNR's Mission statement, if you are to allow this mining, by this or any other company or agency, and the like, you do not believe in your own mission statement, and what the DNR was created to do. If this is so, being as my tax dollars help pay for the DNR's services, please quit so people who do believe in the sustainability and the preservation of our natural resources can do the job and represent us properly.	EOO
11	I am in support of the Polymet mining Project. I think that the DNR has done a through job on insisting that the project be done in an enviromentally sound method. I believe that the people in the DNR are very qualified. I have read quite a few anti-letters to the editors of papers and I don't believe they have done any studying as to how the project will be done and what regulations are being installed to see that the project will be done environmentally sound. Mining is the life blood of Northeastern Mimmesota. Our people and our schools are suffering. We can also provide minerals that currently must obtained from other countries. We are sending our money overseas. From the DNR studies we can do this mining environmentally sound, so lets get at it!	EOO
12	I worked as a guide in the BWCAW for 4 summers and strongly oppose this mine!	EOO
12	• I support the PlyMet Mining's NorthMet Project, and the adequacy of the draft EIS. • I am employed in the construction industry - the project would bring good construction jobs to the area. • Polymet has demonstrated it's ability to comply with Environmental requirements. • The positive economic impact is of significant benefit.	EOO
13	Mining has a tremendous public health and environmental impact.	EOO
13	We support the new project (Polymet Mining's NorthMet Project). It will be nice to see the old LTV site used and to keep the Iron Range productive and benefiting the state of Minnesota's employment and economy. The DEIS has been a long time coming and at a very high price. It is a very long and comprehensive document and we can only scratch the surface but, it seems to cover all the environmental items we can think of. So let's start construction in 2010 and not wait another 10 years.	EOO
14	It is feared, and has been noted in the DEIS, that there will at some point be problems with the release of toxic materials at some level at this project. To me it seems that the risk dwarfs the rewards. There is nothing there, no mineral or metal, that cannot be gotten elsewhere. As a matter of fact, the only reason this project was even proposed by PolyMet was because the price of the metals had gotten high enough to warrant the project. There are many mines around the world that can produce the same metals with much less environmental risk. Nothing there will change the world because we have more of it. Therefore, why take the risk on something where there is such a great chance of failure? Not only PolyMet, but the other companies who are just waiting to see how this comes out so that they, too, may jump in and proceed with their own projects--each with their own unique risks. My worry is that this project is going forth not on the basis of what is right, what is best for Minnesota, what is best for the conservation of the precious wilderness, but simply because permits have been applied for, draft environmental impact reports have been filed and reviews are in progress. It seems from the PolyMet press releases that this is all a done deal and it is just going through the motions to begin their project. Where is the hard look at this project that should be taking place, where is the real concern about the consequences should this project go bad?	G8,WE5,WE8

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
15	I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. That alone should worry everyone involved with this project, should raise a red flag that makes every last person in this chain of decision making stand up. The fact that there must be huge sums of money up front to take care of what has already been deemed the inevitable clean up should alone disqualify this project from going forward. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,G8C,WR1E
15	I support Polymet's NorthMet project. It is good for all of Minnesota.	EOO
16	I believe that our natural resources have far greater economic value if preserved than the return from this form of mining. I think the DNR must be pro-active in preventing the environmental impacts that have been experienced in almost all locations of sulfide mining and are especially risky in the water sheds and geological nature of this area.	EOO
16	I want to continue to enjoy the clean water, the quiet and the natural beauty of this area during my lifetime. More importantly, I want future generations to be able to enjoy these natural resources and for the State of MN and local communities to share in the economic benefits that derive from preserving these resources.	G11
17	My main concerns are for water quality both in near term and for decades to come, for destruction of vital wetlands, fish, and other wildlife, for the disruption to the BWCAW and State Forests as key recreational areas, and to the negative economic impacts to local areas as well as the Minnesota taxpayers.	PD10,G1
17	I whole heartedly support the PolyMet Mining NorthMet project!	EOO
18	I am a former long-time resident of the state of Minnesota and an ex-employee of a mining company on the Iron Range which was shut down by one of the typical Minnesota economic maladies. I have worked in the mining industry most of my life and have closely followed the progress made by PolyMet over the past eight years. It is enlightening to see a spark of life showing up again in the North, especially after seeing other areas in the state reap most of the benefit of good years past. The current worldwide economic situation makes it look quite bleak for the area I used to call home. Housing slumps which have always seemed to hit the Range area hard seem to be gearing up again, and PolyMet has the means and momentum to significantly support the area with jobs, tax revenues and business opportunities. This project needs to get as much support as can be provided. The potential sources of commodities produced in the state of Minnesota, and especially in the North, are not particularly numerous anymore, and the continuing worldwide need of the specialty metals produced by PolyMet will provide a state revenue stream for many future years. I would like to see my friends and relatives share in the good times to return to the Range. Allowing Canada, Russia and China to control the world supply of these metals, when you have them sitting untouched in your back yard, is not an option. You have the good fortune to have a responsible company who has shown the best integrity in identifying and addressing the methods for keeping Minnesota's resource development and production in harmony with the environment. After recently reading about how some of Northern Minnesota schools face extinction due to lack of revenues, I would suggest favorable and timely action to avoid start-up delays at North Met. The solid, dependable work force of the mining areas of the state need to be granted more jobs and the opportunity to assist in the coming economic recovery. Let's help the North get back on track!	EOO
19	I SUPPORT THE POLYMET MINING NORTHMET PROJECT	EOO

20	<p>"One of the biggest factors in the dark history of sulfide mining is how frequently mining companies are wrong about what their impacts on water quality will be. One peer-reviewed study found that, while all projects that were reviewed predicted they would not pollute, at least 76 percent of the time they still did. The same study found that 89 percent of mines that have polluted said they would not. "The industry's track record of not paying to clean up its messes is long and shameful. A few examples include: □ Zortman-Landusky Mine, Montana – \$33 million and counting □ Summitville Mine, Colorado – \$185 million and \$1.5 million/year □ Grouse Creek Mine, Idaho – \$53 million" (-- from Friends of the Boundary Waters' Sulfide Mining page) These and other factual horror stories on the damage already being done by acid mine drainage are welldocumented. For one national source, see EARTHWORKS website search on 'acid mine drainage'. Policymakers should be very careful to guard against repeating these mistakes. In our region, there are few if any examples of successful pollution prevention, especially long-term. □ On Michigan's Keweenaw Peninsula, copper mills discharged an estimated 200 million tons of coppercontaminated waste directly into Torch Lake, reducing its volume by 20 percent and leaving a toxic threat to fish and anyone who eats the fish. Information can be found in the Mining Waste National Priorities List Summary Report, Torch Lake, Houghton County, Michigan. □ In Ontario, the Geco and Willroy mines, owned by Noranda Minerals Inc., near Manitouwadge generate acidic runoff laced with heavy metals that must be treated in perpetuity. Metal loadings will steadily increase downstream over time. Geco operated from 1957-1995 and Willroy from 1955- 1977. According to reports in 1995, Inco's Shebandowan Mine west of Thunder Bay contributes nickel loadings from the minesite (including mine drainage to creeks on site) that are ten times higher than background inputs. From: "under Mining Superior: A Report on Mining Activities and Impacts in the Lake Superior Basin," by Northwatch (Summer 2001). northwatch@onlink.net Flambeau Mine In Wisconsin, the Flambeau Mine has been held up as an example of a clean sulfide operation, but after partial closure, it is sitll polluting the Flambeau River. In July, Wisconsin Resources Protection Council filed a lawsuit to force the Wisconsin DNR to enforce water quality regulations and monitoring requirements. The lawsuit holds the agency and company accountable for ongoing pollution at Kennecott's Flambeau Mine in violation of Wisconsin law as well as the federal Clean Water Act. (Note: Kennecott is exploring heavily in Aitkin County, Minnesota.) Press Release June 18, 2009 Flambeau Mine Causing Illegal Water Pollution Conservationists announce intent to file lawsuit over water pollution from Flambeau Mine</p>	WR5A
20	<p>And relating to air -- air quality, they were talking about the -- the dust generated within the mining operation is going to be pretty much confined to an impact zone. When that dust settles in that impact zone and we have a lot of wind and everything up here, that dust does carry with it a mercury component, so when the wind carries that to another watershed, what is -- what is being done to address that impact of -- of airborne particles outside of the actual mining operation? We have a lot of times when the Boundary Waters, you know, the fires and everything else there, we get a lot of fallout ash and dust and whatever from that, so -- and that's miles and miles away, so it's -- it's a concern that I have in terms of mercury that could be airborne, you know, from the mining operation, what -- what's being done.</p>	AQ4,AQ6A
20	<p>Even though there are no metallic (copper or nickel) sulfide mines in Minnesota, we have our own acid mine drainage (AMD) or acid rock drainage (ARD) hot spot near Babbitt. At the Dunka open-pit taconite mine, LTV Steel removed some sulfide overburden to get to the orebody of interest. The sulfur-bearing waste rock was piled up and ignored at first. For decades, known AMD has been produced by the waste pile and pit walls, polluting Unnamed Creek, which flows into Bob Bay of Birch Lake, which flows into the Boundary Waters Canoe area. Despite mitigation efforts of the company and Minnesota DNR "studying" the site, it is now under an expired Minnesota Pollution Control Agency (MPCA) permit and water quality variance for some of the known seeps. These seeps release lethal concentrations for certain aquatic species, which exceed water quality standards. Yet, for several years, the Commissioner has not required the existing water treatment plant to operate, even during the warm months, citing cost considerations. The U.S. EPA has emphasized that contamination levels at the Dunka Pit are due to Duluth sulfide rock formation, like that in a copper or nickel mine. "The mine waste rock may be, therefore, more analogous to a copper-nickel mine, rather than an iron ore mine." ( Tech Res. Doc. Extraction and Beneficiation of Ores &amp; Minerals, Vol. 3 1994). WaterLegacy members are concerned that if companies are allowed to operate under such variances, there is little point in establishing permit conditions to protect the water quality. WaterLegacy has requested of the MPCA historical and background information on the Dunka pit.</p>	WR1E

21	I am a mother who is very concerned about the proposed PolyMet sulfide mine on public land in the Superior National Forest. As well as being a mother, I have been living long enough to know that corporate interest in extracting the minerals is based solely on the bottom line. The corporation is only interested in what their actions do or leave behind in so much as they are required to be for gaining the permission to mine. I have no say in the corporation's business, but I would like to share my opinions and concerns with you, who will have a say in whether this company is given special permission to extract from and pollute our environment. If you say, "They will not pollute," maybe you should spot yourself in a passing glass window or bathroom mirror to see if you believe yourself or not.	EOO
22	If history and reality speak the truth, the proposed mine will significantly raise methylmercury levels in the Partridge and Embarrass Rivers, due to leaching of sulfates which will increase mercury methylation. It may pollute immediately, or 20, 30, 50, 100 years from now, but it will undoubtedly pollute someday. Raising the levels of methylmercury in the Partridge River and the downstream St. Louis River, which are already impaired by the unsafe levels of mercury, is contrary to Minnesota State Law. The idea of allowing additional water quality challenges to this river system is confusing to me. The impact of sulfate pollution will be on wild rice, the Fond du Lac Band that lives downstream, healthy fish habitat, and ultimately the ground water. I have entrusted you, through our government, to protect our waters. This is your unique role and one that can hold the muster of time, since you should not be tempted with concerns for jobs, profits, "progress" or other short-term potential results from this mine at the expense of the priceless value of clean water. I do believe that the test of time will determine that water is more important than copper.	WR4B,WR4F,WR5A,WR5
23	I ask you to deny the PolyMet mine until a truly pollution free mining option is proven. Minnesota, with its water rich environment, should not be the state to experiment with new untested mining systems. Please consider my plea.	EOO
24	I am extremely concerned about mercury and sulfate pollution associated with the proposed PolyMet mine, which will compromise the wild rice beds, the Partridge and St. Louis Rivers, fish habitat, and eventually the ground water. The St. Louis River is already considered impaired by unsafe levels of mercury. Yet the DEIS does not adequately address this impact, even though Tribal Agencies have raised serious concerns about it.	WR4B,WR4F,FM1
25	There are a lot of environmental concerns for the PolyMet mine, but my concern I would like to bring to you today is about the electrical load. Yes, it will be less than the site used many years ago. And yes, all the wires and equipment are in place, but in 2007, the state of MN passed several energy laws to produce 25% of its power from renewable energy, and to also reduce the electrical load of MN over time. Reduce! My understanding of this legislation is that if we are going to add any electrical service/loads to the grid that a greater level of energy consumption needs to be reduced to allow that load to be added. I am strongly opposed to any additional loads, especially a load of this magnitude. We will never get to a sustainable level of electrical consumption/production if we blindly move forward with projects, not even thinking about the other legislation that has been passed before. Have you considered this in your deliberation? I am asking you to put a moratorium on any new electrical hook ups of this scale until greater clarity can be agreed upon with the legislation because, where I am sitting, this hookup would be a violation of MN state law.	PD8

26	Dear Mr. Arkley and Mr. Ahlness: I am extremely concerned about mercury and sulfate pollution associated with the proposed PolyMet mine, which will compromise the wild rice beds, the Partridge and St. Louis Rivers, fish habitat, and eventually the ground water. The St. Louis River is already considered impaired by unsafe levels of mercury. Yet the DEIS does not adequately address this impact, even though Tribal Agencies have raised serious concerns about it. There are a lot of environmental concerns for the PolyMet mine, but my concern I would like to bring to you today is about the electrical load. Yes, it will be less than the site used many years ago. And yes, all the wires and equipment are in place, but in 2007, the state of MN passed several energy laws to produce 25% of its power from renewable energy, and to also reduce the electrical load of MN over time. Reduce! My understanding of this legislation is that if we are going to add any electrical service/loads to the grid that a greater level of energy consumption needs to be reduced to allow that load to be added. I am strongly opposed to any additional loads, especially a load of this magnitude. We will never get to a sustainable level of electrical consumption/production if we blindly move forward with projects, not even thinking about the other legislation that has been passed before. Have you considered this in your deliberation? I am asking you to put a moratorium on any new electrical hook ups of this scale until greater clarity can be agreed upon with the legislation because, where I am sitting, this hookup would be a violation of MN state law. Before PolyMet can be considered for permits, along with the serious problems in the DEIS, please deny the permit until they can fully meet the environmental standards of MN and the clean water act AND establish that adding this new electrical load will not increase the electrical demand, adjusted for conservation goals established in the 2007 legislation.	EOO,WR1E,WR5A
26	The Polymet issue is not really about jobs or money. It is about survival. Prince Phillip, a person apart from politics, gave a 13 minute speech at the Copenhagen Climate Change Conference (may be seen on Utube) in which he points out that "as our planets life support system begins to fail, our survival as a species comes into question". You can help. Copper-nickel mining is a disaster in the making. Please use your influence to stop its development.	EOO
27	Please help stop the Polymet project. Copper-nickel mining is always a disaster. We are no longer in the 19th Century. We know better now.	EOO
27	We are asking that you make something our state has been doing well even better. A new kind of mining is being discussed in Minnesota. But are current regulations strong enough to protect our taxpayers and our lakes, rivers and streams?	EOO
28	Minnesota needs stronger financial assurance rules for non-ferrious mining, not only to protect taxpayers from being forced to pay for polluters' messes, but to ensure the state can respond to threats to our clean water. Needed improvements to financial assurance requirements include: * Financial assurance should be in cash or cash-equivalent forms and deposited in the state treasure - to be beyond the reach of bankruptcy courts. * Determination of the form and amount of financial assurance should involve not only the Minnesota Department of Resources, but also the Minnesota Pollution Control Agency and the Department of Management and Budget.. * Parent or affiliate mining corporations should be held accountable for clean-up costs. * The public should have a chance to review how financial assurance figures are obtained and adjusted as a necessary protective measure for an industry with high pollution risks.	PD4
29	Please do everything you can to stop the Polymet mining proposed to mine sulfide ore minerals that include copper and nickel found in the Duluth gabbro complex formation. This would be an environmental disaster for this important natural area. This area provides for programs which have affected hundreds of thousands of youth with the opportunity to experience a wilderness where there is clean air and water pure enough to drink. To allow this development in any form would be a mistake that would affect the very soul of our nation!	EOO
29	We believe in paying taxes, but NOT FOR THE YEARS it would take to clean up the irreparable damage that will occur after the mining interests have taken what they can and then leave. What remains is the run off of waste which creates sulfuric acid. That in turn leaches out toxic metals and will pollute nearby lakes and streams.	G7A

30	2.3.1: Potentially significant Issues: It is noted that the “Final SDD determined that the EIS would also address the potential cumulative impacts associated with the combined environmental effects of the Project and of past, present, and reasonably foreseeable future actions relative to: Air Quality; Biological Resources; Water Quality; Economic Impacts and Social Impacts. Nowhere in the DEIS, including Chapter 4.0: summary of the cumulative effects (Section 4.14) are the nearby proposed hard-rock mining operations of Franconia; Duluth Metals; Encampment; and Tech Cominco referred to, yet each of these proposed projects—within <25 miles of the Northmet Project site—are expected to have potentially major impacts in the region. To the extent that all these areas are bound together in regional linked ecosystems, the failure to include reference to these projects as noted in the Final SDD is surprising and suggests that Project proposers do not accept the premises embodied in NEPA and/or the heightened legal protections of BWCA and Voyageurs National Park which will clearly be impacted by hard-rock mining.	G9
30	2.3.4: Issues Incorporated into EIS after Scoping: It is noted that the DEIS will have “greater emphasis” on several areas not anticipated at the time of the Final SDD: these include methylation of mercury; fine particulate emissions and greenhouse gas emissions and climate change, among others. The current DEIS provides inadequate information for judging the validity of assumptions and conclusions regarding these critically important issues. (see below)	PRO3
31	3.2: Project Alternatives: Paragraph 3, p 3-50 states that “NEPA requires that a “range of alternatives” must be discussed...This includes all reasonable alternatives which must be rigorously explored and objectively evaluated...” It is questionable whether either the rigor or objectivity of the project alternative analyses meets the intent of NEPA. For example, failure to include in any analyses in this DEIS Northmet data/information regarding Franconia; Duluth Metals; Encampment and Tech Cominco is problematic.	ALT8
32	3.2.1: No Action Alternative: It is stated that: “This alternative would avoid the environmental impacts associated with the proposed Action; however, the social and economic benefits from the Project would not occur.” Extensive data accumulated over decades indicates that this statement should be modified to include that fact that the highly predictable “bust” cycle that is part of “boom” and “bust” mining cycles would cause “social and economic” hazards as result of this Project.	ALT8
33	4.1.1.2 Groundwater Resources (see 1.6.1 above): The lack of hydrologic data for the Northmet Project that would allow clear characterization of current bedrock groundwater, flow directions at the mine site and tailing basins is outlined. My review of the supporting data does not provide such detail. Question: Do the DEIS Lead Agencies have a disagreement regarding the facts of available data upon which key hydrological estimates can be made? The data is either available for such analyses or it is not available. There should be no “difference of opinion”. Also, on p4.1.5 footnote a similar “difference of opinion” is noted regarding the “underlying surficial aquifer.” If it is the tribal cooperating agencies’ position that any conclusions “..based on this aquifer test data have a great deal of uncertainty given the variability in the results” do the DEIS lead agencies have data that refute the “uncertainty given the variability in the results?” It would seem that variability can be quantified and the degree of uncertainty ascertained. Isn’t it the responsibility of the DEIS and lead agencies to clarify this?	WR1E
33	3.2.3: Tailings Basin Alternative: (1) Vertical wells (to capture and pump Tailings Basin seepage): in this and other sections the term “seepage” is used but not defined (under Definitions iv). The term “surface seepage” is used. It would seem that “seepage” could occur at the “surface” or below the surface from hard rock fractures resulting from drilling, blasting, and other mining operations. While surface seepage could be recognized and recovered, how does this Draft EIS Northmet propose to 1. Detect subsurface “seepage” and 2. Determine the rates, location, directional flow; and ultimate destination of groundwater in aquifers; bogs; streams; rivers; lakes?	WR2A

Comment ID	Comment Text	Theme Codes
34	On p 4.1-8: Groundwater Quality: a quote from MN Rules, pt. 7060.0600 states: “The groundwater may in its natural state have some characteristics or properties exceeding the standards for potable water supplies. Where the background level of natural origin is reasonably definable and is higher than the accepted standard potable water and the hydrology and extent of the aquifer are known, the natural level may be used as the standard.” It is not clear in the accompanying tables and text how this applies to the current DEIS data. How frequently has this been observed in data collected for this DEIS? The definition of “natural state” would be critical since polluted water left to resume a “natural state” could still be polluted and thus require remediation. This raises the question: What is the position of the proposers and lead agencies for managing water quality not in conformance with state quality standards and prior to approving a new mining operation. Shouldn’t the existing water quality variances from standards be corrected before approvals are given for new mining projects?	WR4C
34	On p 4.1-3 note is made of fractures and joints in the bedrock and groundwater flow through fractures. If fractures occur at deep water levels, one could expect potentially contaminated mine waste chemicals to reach areas other than the Partridge and Embarrass River watersheds and perhaps distant sites such as Birch Lake. The geology of this region could allow this scenario. Have analyses been done to explore such possibilities? Contaminated pits will be present for many years during which time extremes in weather will occur; thus a plausible scenario would involve entry of mine contaminants into adjacent watersheds (see Fig 4.2-9). Please clarify this question.	WR2A
35	The goal of transparency should be advanced by providing detailed information for public review of Project principals: the corporation; staff, collaborators; consultants; affiliated organizations, agencies, and universities who participated in all phases of the Project proposal. There should be public review of potential conflicts of interest and/or disclosures of interest. The relationship between Project funding entities and researchers should be known in full. The DEIS Northmet should provide evidence that science-based data and information from independent research institutions were used in preparing the Project proposal. And the project should provide data regarding the extent to which this Project will impact the growing, collective adverse impacts of human activities in the Arrowhead of MN.	PRO3
35	4.1.2.4 Mercury Impact Criteria: Note is made of the relationship between sulfate and production of methyl mercury. MPCA (2006) policies relevant to this issue are outlined and recommendations are to “avoid or minimize the discharge of water with elevated sulfate concentrations to methylmercury “high risk” situations.” It is not clear, however, to what extent the Northmet Project incorporates these recommendations into their operating plans. No details are provided and “high risk” is not defined. This should be clarified.	WR1E,WR4B

Comment ID	Comment Text	Theme Codes
35	4.1.1.3: Surface Water Resources: Mercury in Water: (p 4.1-48). It is noted that “PolyMet is conducting additional sampling in wetlands, streams, and downstream lakes in the Embarrass River watershed under an MPCA approved plan to help better understand mercury dynamics.” It should be noted that mercury is an important water hazard but the MPCA should broaden its project to include detailed quantification of acid mine drainage; sulfates; and other heavy metals. Focusing only on mercury provides an incomplete assessment of impacts of hard-rock mining. Since baseline and current mercury and methyl mercury concentrations in watersheds of this Project are critical to assessing virtually all priority categories of this EIS (Water; Fish; Humans; etc) it is surprising that such data are not available to better inform the water assessments and resulting conclusions. The MN Regional Copper-Nickel Study prepared by the MN Environmental Quality Board (EQB) addressed water quality from mineral mining as a concern in 1979 study of Filson Creek, S Kawishiwi River and environs. Increased metals levels of Nickel, Copper and Zinc were found. Related studies of Unnamed Creek and Birch Lake at Bob Bay related to taconite mining (Erie Mining Company’s Dunka Pit ) documented increased concentrations of sulfates and nickel. Specific information should be included in the final EIS regarding: who is doing the sampling, who will do the measurements and what will be the timetable for accomplishing the assessments. The details of this MPCA plan should be appended to the DEIS. Such attention is needed for this matter given the hazards of mercury, particularly methyl mercury on fragile ecosystems and also the consequences for bioaccumulation of mercury and implications for human consumption of fish. MN has a growing problem with mercury in water and has existing statewide mercury fish advisories that limit human consumption of fish: see <a href="http://www.health.state.mn.us/divs/eh/fish/index.html">http://www.health.state.mn.us/divs/eh/fish/index.html</a> . Seemingly “low” concentrations of mercury in water do not necessarily reflect mercury in the biota and fish tissue concentrations which may be logs higher and directly toxic to humans and on wildlife who feed on fish. The critical importance of these issues has led to creation of proposed national mercury monitoring network: see: <a href="http://toxics.usgs.gov/highlights/mercnet.html">http://toxics.usgs.gov/highlights/mercnet.html</a> . Tables such as 4.1-97 (p 4.1-190) and text (eg, p 4.1-189 and 4.1-193), throughout the Draft EIS Northmet, contain measures of mercury and methyl mercury concentrations. Since there are significant methodological issues involving such measurements of mercury, the question is whether the analyses reported reflect recognized causes of and degrees of variation in mercury concentrations. For example, significant daily variations have been noted by researchers: <a href="http://toxics.usgs.gov/highlights/mercury_streams.html">http://toxics.usgs.gov/highlights/mercury_streams.html</a> and <a href="http://toxics.usgs.gov/highlights/metals_variation.html">http://toxics.usgs.gov/highlights/metals_variation.html</a> . Have models used to project methylmercury concentrations included estimates of expected variation in measures under varied conditions? Please clarify.	WR1E,WR4B,FM1,FM2
36	4.1.3.5 Mitigation and Monitoring Measures. On p 4.1-172, Mercury monitoring is noted the MPCA Mercury Strategy (2006) that recommends water monitoring for sulfate releases and effects on methylmercury production and establishment of five monitoring sites on streams draining wetlands...” The language in this paragraph and the next paragraph where it states: “PolyMet should develop a similar mercury monitoring plan for the Mine Site...” are ambiguous. What specifically is the responsibility of PolyMet for achieving the MPCA 2006 recommendations and what does the word “should” mean? Please clarify.	WR1E,WR4C
36	4.1.3 Environmental Consequences: Note is made of Uncertainty re key assumptions and the use of “Uncertainty Analysis” for selected contaminants. Since uncertainty analysis requires a variety of objective and subjective data inputs, such simulations may produce highly variable outputs. It is stated that the analyses were approved by the resource agencies? Could the methodology, data input and analyses be appended to this EIS?	WR1E
36	4.1.3 Environmental Consequences: It is stated: “The mining, ore processing, and tailings disposal operations associated with the Project may cause changes to the quantity and quality of ground and surface water in the Project area.” The word “may” should be changed to “will”. Has there ever been a circumstance reported in the peer-reviewed literature when such mining operations have not caused such changes? Hard-rock mining causes clear predictable and adverse acid and metal-rich drainage. This DEIS focuses primarily on mercury but as noted above numerous metals leach from mining sites with toxic consequences for the biota. (Kimball BA. Assessment of metal loads in watersheds affected by acid mine drainage..Applied Geochemistry; 17; 2002:1183-1207)	WR1E

Comment ID	Comment Text	Theme Codes
37	4.1.4.2 Water Quality: Northern MN, including the area of Northmet Project, has significant existing mercury impaired waters. (Fig4.5-4 and p 4.1-189 re Colby Lake) Almost 1,500 waterbodies in MN require Total Maximum Daily Load (TMDL) list. Remarkably a TMDL pollution reduction study has not been performed for Colby Lake to address this impairment. It would seem reasonable that this Draft EIS Northmet address when this will be accomplished and by whom. Is this planned prior to the projected operation of the Northmet Project?	WR4B
37	4.1.4 Cumulative Effects on Water Resources: It is most disconcerting that there is “.existing seepage from the LTVSMC Tailings Basin” and that the Draft EIS suggests that the duration of these impacts would be extended. Why have the seepage problems not been corrected? The law requires polluting offenders to comply with remediation plans. The current problems should be corrected before any new mining operations are approved. As noted earlier, shouldn’t the Cumulative Effects summaries in this and other Chapters include major projected mining activities of Franconia; Duluth Metals; Encampment; and Tech Caminco? If not, please provide rationale.	WR5A
38	Note: Please clarify: Throughout the DEIS statements are made that recommendations have been made after study (such as the above by MPCA.) I am unclear as to what the disposition is on such statements. Are these all included in the final EIS? Are these negotiated with Polymet? Who makes the decision and what is the process? The current DEIS does not provide information to answer this question.	WR4C,WR1E
38	On p 4.1-196 it is noted that MPCA (2006) “recommends avoiding “discharges” of sulfate to “high risk” situations, which include wetlands, low-sulfate water...where sulfate may be a limiting factor in the activity of sulfate-reducing bacteria...re the potential for methylmercury production.” Has Northmet Project accepted this recommendation? Who will be responsible for ensuring that the recommendation is followed?	WR1E
38	4.2 Wetlands: It would seem reasonable that “non-field” and field analyses be used to determine wetland locations unless there are scientific data that confirm that “non-field” analyses provide as much information as “non-field” plus “field” review. This DEIS states that only “non-field” analyses were used. Why?	WE1,WE2
39	4.2.1.3 ; 4.2.1.4; Wetland Classification System: The question is whether the Wetland Classification System Descriptors (see Table 4.2.1 and 4.2-2) may be ascertained by only “non-field” analyses or whether a more accurate description would result from both non-field and field assessments as noted above.	WE1
39	4.2.1.2 Wetland Delineation: Since wetlands in MN are protected by both federal and state laws, it would seem critical that precise definitions of wetlands, including their characteristics be included in the Draft EIS. This is especially true in light of the fact that 70% of the wetlands are “high quality.” (p4.2-25)	WE1
40	Potential Indirect Wetland Impacts: It is not clear in the DEIS that robust methodology exist to quantify the changes in surface or groundwater flow rates and patterns needed to project wetland impacts from the Project. What specific methodologies have been used and have they been validated?	WE2
41	4.2.4.3: Monitoring: A wetland monitoring plan is not included in the DEIS. But such a plan “should” be implemented. Such a plan has apparently been initiated by Barr 2005 and “may need to be expanded.” Several features of this plan are suggested (p4.2-37). Since wetland monitoring is arguably the most important element of the Project’s role in ensuring minimum harm to wetlands, it would seem critical that this plan be included in the EIS. This deficiency should be corrected.	WE3
41	Note: Dynamical systems analyses have apparently not been used in preparation of this and other Chapters and Sections of the DEIS. As complex systems, ecosystems lend themselves to such modeling and simulation. The ACE and DNR should incorporate such tools into the EA/EIS process and make the findings public.	G8,G14

Comment ID	Comment Text	Theme Codes
42	4.4 Wildlife; The fact that numerous species are deemed fragile in MN: federally and state listed endangered, threatened, and species of special concern (ETSC—7species); MN Species of Greatest Conservation Need (SGCN-58 species); the USFS Regional Foresters Sensitive Species (RFSS—23 species), indicates that, while conservation and environmental policies in northern MN have merit, there are major threats to this region from human activities, including mining, proposed sulfide mining and logging and industrial development. It is in this context that this DEIS must be viewed with the plausible likelihood that the Northmet Project will only add to these environmental burdens and threats to wildlife. I found no evidence in the DEIS that the proposed Northmet Site was monitored over time for evidence of the species noted above. This deficiency should be corrected.	WI2
43	Under NEPA and CEQ regulations, cumulative effects must be evaluated for project proposals, including alternative proposals, along with direct effects and indirect effects. It is therefore critical that a comprehensive assessment of the current and proposed mineral mining impacts on Lynx and snowshoe hare populations be conducted for the areas under consideration for mining and adjacent areas of Lynx habitat. Snow compacting from current and proposed activities and temporary roads and human activities are now and will continue to impact the lives of these creatures. The question is: How and to what extent will proposed Project activities affect these species and other species, in the context of all changes in human development in northeastern MN that may compound the adverse effects of mining?	WI5
43	Canada Lynx: on p4.4-3 it is stated that “.portions of the Mine site lie within the revised boundaries of federally designated lynx critical habitat. A recovery plan has not yet been issued for the Canada Lynx.” Will specific responsibilities for the Northmet Project regarding protecting Lynx habitat be included in the final EIS? Has PolyMet physically inspected the proposed Project site for lynx dens?	WI1
44	Road density has been found to directly affect predators high in the food chain: elk, wolves, wolverines, bears and lynx. (Switalski TA. How many is too many: A review of road density thresholds for wildlife. Wildlands CPR Newsletter, RoadRIReporter, 2006). Although the extent of proposed road development in this DEIS NorthMet may not suggest a deleterious effect on Lynx, it is the combination of multiple seemingly small changes across Lynx range and habitat that must be assessed, since seemingly minor effects in a complex system may in aggregate cause profound and deleterious, often unforeseen, adverse impacts. (Emmons & Olivier Resources. Cumulative effects analysis on wildlife habitat loss/fragmentation. ...Prepared for MN DNS, May 15, 2006; Fed Reg 2003 vol 68, No. 128. Part III. Dept of Interior: Fish and Wildlife Service. 50CFR Pt 17: Endangered and Threatened Wildlife and Plants; Notice..re Canada Lynx. Final rule. Pp 40076-40101; Hickenbottom JR et al USDA Forest Service Biological Assessment (Canada Lynx) Lynx biological Assessment, Dec. 1999). The current DEIS Northmet does not provide sufficient information to clarify this issue?	WI5
<b>Sender Last Name:</b> Arpi		<b>Submission ID:</b> 3719
20627	Resources are available to the DNR and ACE to assist them in determining financial assurance requirements for the NorthMet Project as part of the environmental review process.11 By failing to include a comprehensive description and analysis of closure and reclamation activities and the associated amount and viability of financial assurance required for the NorthMet Project, the NorthMet DEIS fails to provide the public with essential information to determine the environmental impacts associated with the NorthMet Project. Without this critical information, the NorthMet DEIS fails to follow established practice as part of the environmental review process for hard rock mines or meet the requirements of NEPA.	PD3
20628	In addition, the DEIS must also provide an analysis of the potential negative impacts from the Project on the tourist industry and sustainable economies in Northeastern Minnesota and include a discussion of mitigation measures which would be available to address the negative socioeconomic impacts from the Project.	SE4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
20628	As noted by Dr. Chambers, the type of dam construction used for both the existing taconite tailings and proposed flotation tailings impoundments is upstream-type construction, which is the most unstable of the dam construction types. <sup>94</sup> The instability of the tailings dam is of particular concern in light of the fact that the waste with the most potential to impact water quality is the hydrometallurgical waste, which will be stored in lined cells built on top of existing taconite tailings in cell 2W. However, it appears that the potential stability of the tailings in cell 2W is not known. <sup>95</sup> As noted by Dr. Chambers, the long-term integrity of both the flotation and hydrometallurgical tailings storage facilities is necessary to protect water quality.	GT1
20628	In addition, the NorthMet DEIS fails to recognize the socioeconomic benefit associated with tourism from maintaining wildlife habitat and wildlife corridors which ensure that populations of endangered species are maintained or increased. For a specific example, reintroduction programs indicate that the return of the wolf will benefit the local economy by bringing in more tourist dollars. For instance, in northern Minnesota, the town of Ely (population 5,000) has seen nearly \$3 million in new annual economic activity and as many as 66 new jobs result since the launching there, in 1993, of a wolf educational facility. <sup>92</sup> Wolf reintroduction has also improved the economy of Cooke City, the small town just outside Yellowstone Park's northeast gate. Id. Cooke City's traditionally slow season, the month of June, became a peak season because "it is a good month for sighting a wolf." These reports are consistent with other endangered species restoration efforts around the country. For example, in Nebraska, the annual migration of the sandhill crane and whooping crane brings 80,000 tourists and \$15 million to the State's Platte River region each year. <sup>93</sup> Likewise, at Tennessee's Reelfoot Lake, bald eagle tours alone generate more than \$2 million annually. Id. For the residents of these areas, the existence of endangered species provides more than just attractive scenery, it is a vital economic resource that must be protected. Id.	SE4
20630	The NorthMet DEIS discussion on this subject must include an analysis of "direct effects," which are "caused by the action and occur at the same time and place," as well as "indirect effects which . . . are later in time or farther removed in distance, but are still reasonably foreseeable." 40 C.F.R. § 1508.8.	G10
20630	The NorthMet DEIS indicates that "[f]urther design and analysis would occur during permitting to ensure that the proposed construction meets acceptable design standards." <sup>96</sup> In light of the potential significant environmental impacts associated with instability of the tailings facility and waste rock piles, the DNR and ACOE must provide an analysis of geotechnical stability of the tailings facility and waste rock piles as part of the environmental review. Delaying the stability analysis until permitting is not acceptable because it would prejudice one possible outcome, i.e., the possibility that safely depositing the hydrometallurgical waste on top of the existing tailings basin is not feasible. If, in fact, other tailings alternatives need to be considered because of stability problems, they must be disclosed and analyzed during environmental review. Moreover, the public needs to have an opportunity to understand the potential environmental implications of the proposed designs and weigh the environmental risks and any potential alternatives or mitigation measures to these designs which could minimize environmental impacts as part of the environmental review process. Geotechnical stability is an issue that must be addressed in the DEIS, and is a major flaw of the DEIS.	GT1
20630	However, significant questions still remain to be addressed regarding the long-term vulnerability of the waste storage facilities to seismic events. Dr. Chambers also notes that similar concern for the waste rock piles also exist.	GT1,GT2
20631	MCEA appreciates that the issues of greenhouse gas (GHG) emissions and climate change were incorporated into the DEIS after scoping, and notes that the DEIS may do a better job than many of its predecessors at identifying channels of GHG emissions resulting directly or indirectly from the Project and describing recent significant developments concerning climate change policy. Given the widely acknowledged scale of the threat posed by anthropogenic climate change and its direct link to GHG emissions, the preparing agencies have a duty under the National Environmental Policy Act (NEPA) to address the Project's GHG emissions more thoroughly than the DEIS currently does. <sup>97</sup>	AQ3

1306	Dear Mr. Arkley: As an environmental steward and public servant, I implore you to take steps necessary to protect watersheds adjoining and comprising the BWCAW. Please do what you can to prevent sulfide mining operations in areas even remotely adjacent to this inestimable natural resource.	G7A
<b>Sender Last Name:</b>	Ault	<b>Submission ID:</b> 1164
1279	We pride ourselves as Minnesotans that we maintain integrity of our peoples land and have it cared for! This is an honest test of our land stewardship!! We must have hearings!! And we must insist on protection for pristine areas. The people must be listened to!!	EOO
<b>Sender Last Name:</b>	Avaloz	<b>Submission ID:</b> 3087
3472	THERE IS NO PROJECT WORTH MORE THAN THE SUPERIOR NATIONAL FOREST. PRESERVATION HAS A MORE LASTING AND IMPORTANT IMPACT ON THE FUTURE THAN ANY SMALL, SHORT TERM PRODUCT FROM THE POLYMET PROJECT. THEY SHOULD BE DENIED PERMISSION TO MAKE MONEY AND DESTROY THE PEOPLE'S LAND. A citizen	EOO
<b>Sender Last Name:</b>	Bach	<b>Submission ID:</b> 319
335	Think of our childresn, children! I invested my life savings into this cabin we build in 06 for the future. Sulfide mining is BAD! It's just so WRONG! Poly Met will put and end to Gods Country - and please stop them!	EOO
<b>Sender Last Name:</b>	Backstrom	<b>Submission ID:</b> 210
210	I strongly support PolyMet's NorthMet project. The EIS has covered the factors which I consider necessary to preserve our water and air quality. That is why we live and work here in Northern Minnesota. PolyMet plans to reuse a brownfield site and reuse an existing plant, thus minimizing the impact on wetlands. It is not in the BWCA nor does it border that wilderness area. The PolyMet project will provide a domestic source for some critical metals. Rather than mining these metals in another country and transporting them to the US for use in products such as cell phones and computers and catalytic converters, we will be able to produce them here for use here. The business and job situation in our communities is not good at this time, and we need the new construction jobs and the permanent jobs which will come as the mine is developed. The mine will have the effect of many spin-off jobs in our region. As a small business person, our business will improve if the NorthMet mine is built. I cannot emphasize enough what the positive impact it will have on the suppliers and small businesses in this area. As a positive factor for the State of Minnesota, we will see PolyMet tax dollars contributing to the state and local governments' budgets. We need this mine to be developed in accordance with the EIS. It is a great project. Let's go forward!	EOO
310	I am very pleased to support and endorse PolyMet Mining's NorthMet Project. The mining of Copper and Nickel as well as the precious metals from this project is vital to the economic growth and stability in northeastern Minnesota. The safeguards for the environment, which the state has in place, will make our state mining industry safe and exemplary. This opening project will give Minnesota the chance to compete, on the world market, with other follow on industries utilizing the raw materials that will be generated from this project. It will also increase the tax base as well as increase the employment opportunities that northeast Minnesota so badly needs. As a manager for over 40 years in the mineral exploration industry I have seen many projects in many countries and this PolyMet project certainly stands at the top of the list for projects that have been correctly done. The time and energy spent in planning and engineering with all the state and federal agencies has been a model effort. Our company has been working with PolyMet and the Minnesota DNR in the exploration phase and it has been a pleasure to work with both groups where the focus is on how to do it right.	EOO

2038 I am concerned for the protection of the boundary waters, one of the few truly wild places left in the Midwest. What are the sustainable measures that protect ALL life? Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. EOO,G7B

**Sender Last Name:**    Bailey-Johnson **Submission ID:** 3379

3669 There is nothing sustainable about the PolyMet mining proposal except the pollution that will undoubtedly be created. I highly support and encourage the preservation of environmental quality for future generations, Short-term profits should not trump long-term degradation. G2

**Sender Last Name:**    Baland **Submission ID:** 6

6 I'm here to support PolyMet and am really upset with how long it's taking them to get their permits; and other companies, new companies are getting them in a short period of time. They've done their homework to really cover the environmental side of this project, and I truly believe that this should be pushed through. It would help our whole area and our state. EOO

7 I'm a retired miner. I worked in the mining industry for 30 years, and was very fortunate to have a quality job with quality schools and a church of our choice here, living in Aurora, Minnesota, where we're located right now. And I would like that this could continue for other generations, for younger people, our children of my generation and our grandchildren. And it seems that obstacles are being put consistently in the way of PolyMet to make progress and put people back to work, and this is disappointing for a lot of us, that the length of time to get these permits seems unreasonable. And instead of trying to put restrictions on them and delay this, you should encourage them and help them to get started, the sooner, the quicker, the better; and not only does that help jobs for people in this area, the State of Minnesota has a huge deficit; this will help pay taxes in Minnesota and benefit all Minnesotans with additional monies going into the tax coffers for the State of Minnesota. Let's get the ball rolling, let's get this thing behind us, let's put people to work. EOO,G10

149	I support this PolyMet thing that they are doing. I'm a Boilermaker on Local 647 in Ramsey. You know our economy is slowing down and with the way things are going right now, it opens 400 jobs in that area after the plant is built and while the plant is being built, you know. It's great for our local and it opens a lot of jobs up for guys in our Local and our career line of work. And that's about it. I think it's good for everybody all the way around. The economy is safe. And we do a lot of work with pollution control and stuff like that and we do the best we can to eliminate the pollution -- as much pollution as we can. With the technology that we have come up with now a days, it's very sufficient. So that's about it.	EOO
3562	Having grown up in Babbitt, I have been the beneficiary of generous mining operations who supported the town of Babbitt. That said, I have been following the PolyMet situation, and want to point out some facts: PolyMet has done it's homework and knows how to run a clean and environmental operation. There would be no run-off into Boundry waters as all operations would be on the south side of the divide, therefore, waters south would be affected-if at all since there are plans to put cleaner water back into the ground than what exists now. Copper and nickel are now currently being imported from foreign countries when we need to be looking at our own resources. Undeniably, jobs are needed to secure the northern Minnesota economy, and the timing is critical to our nation. The land in question has already been ravished by former mining, and PolyMet would only improve that situation as demonstrated in their environmental plans.	EOO,G2
3565	We vacation in the NE MN area and enjoy seeing industry grow in that area. It would be foolish to turn this project away because of any remaining environmental concerns when jobs are needed, as well as the copper and nickel minerals extracted for income for the US for helping the green industries. It seems that way too many environmental concerns have risen and voiced by outside groups that don't even know the area. Seems strange that they are so worried about a small operation starting up verse a large mining operations that already in place in Babbitt and Aurora. The impact statements address and answer all of the concerns, so just get with it and let operations begin. John Baldwin, retired college instructor	EOO
<b>Sender Last Name:</b> Baratto		<b>Submission ID:</b> 127
116	Basically,this -- the comment that I wanted to make is that I don't feel that there is a problem with any of the exploration. I mean, it's not going to hurt us any more than what we have already been hurt in the past. And I believe that they are probably going to have -- well, they have to comply to the EPA standards, which are stricter now than they have ever been, so I want to support them in any way I can.	EOO,G5
<b>Sender Last Name:</b> Barker		<b>Submission ID:</b> 165
155	I support the PolyMet NorthMet project and draft EIS. I am comfortable with the thorough evaluation that has taken place and with the proposed utilization of advanced technologies. PolyMet will produce much needed metals in an environmentally sound manner and generate additional economic activity in a depressed portion of our state benefiting our nation as a whole.	EOO
<b>Sender Last Name:</b> Barnacle		<b>Submission ID:</b> 1030
1130	This letter is to express my support of the proposed Polymet NorthMet Project. Polymet can operate under Minnesota's Strict environmental regulations. I would be proud to have this plant in my state knowing it would be held to the standards that Minnesota is known for. Furthermore, with the unemployment rate in Northern Minnesota so high, 10 - 18%, the Polymet NorthMet Project would help a huge number of families. Thank you for the work that you do, and I hope you are able to support the Polymet NorthMet Project by granting Polymet the permits required to move forward.	EOO

1751	After reviewing sections of the DEIS for this project, I am still heavily concerned with the river water quality in the surrounding area. The pristine quality of water in that area attracts hikers and campers from the entire Midwest and beyond. Increasing sulfate levels and potentially mercury/manganese/nickel in surface water will terribly affect wildlife and fishing in the area. The proposed action is simply too reckless and would be a major mistake to allow. Acidification of the St. Louis watershed or any of the BWCA is not an option and would terribly effect the local tourism economy.	EOO
1952	Focusing on long term, is there any way to require something similar to a damage deposit that will guarantee funding for future remediation as well as fund continuing 3rd party monitoring???	PD3,PD4
2530	With regard to the alternative actions, the max recycle option seems most beneficial but the retainment of this water must be made a principle priority to ensure groundwater quality. Yet I'm not convinced the 70% reduction in sulfate loading will be good enough.	G7
<b>Sender Last Name:</b> Barsel		<b>Submission ID:</b> 3238

743	I am concerned about the paucity of public meetings on the DEIS, the timing of the public meetings, the location of the public meetings and the format of the public meetings. My detailed concerns include: • the paucity of public meetings (2) to provide members of the community an opportunity to learn about this precedent-setting project and express their opinions; • the timing of the public meetings is too soon after the release of the massive and complicated draft EIS, making it difficult / impossible for most individuals to familiarize themselves with the details of the DEIS; • the difficulties some citizens have experienced in submitting their public comments (i.e. bounce back and institution of a new Survey Monkey-based form); • there is no information on where citizen participants can obtain written records of submitted comments and answers. Proposed solutions: • schedule more public meetings in early January, 2010, permitting individuals to read the DEIS, submit informed public comments, and participate in holiday events; • locate additional public meetings in accessible sites: Duluth, St. Paul, and Rochester; • extend the deadline for public comments a minimum of 30 days beyond the current Feb. 3, 2010 deadline o publicly acknowledge difficulty in submission of comments and repair by institution of the Survey Monkey site; o monitor the site(s) to insure that additional shut downs do not occur; o insure that multiple hard copies of the DEIS are available at all sites listed by MDNR; o extend the deadline in acknowledgement of all the issues listed above; • provide clear information detailing where citizens may obtain a written (or web-based) record of submitted comments and answers, preferably as a daily-updated link to the DNR site detailing this proposal. I appreciate your consideration of ways to make public participation in the PolyMet EIS process more effective. I look forward to seeing these suggestions implemented, and/or receiving a detailed response explaining why these are not possible.	PRO6
3579	Minnesota is politically poised to permit sulfide mining. This is despite the disastrous environmental track record of sulfide mining, including designation of some sulfide mining sites as Superfund sites in the U.S. I read large portions of the PolyMet DEIS and attended the hearing in Blaine, MN. I found both the hearing and the DEIS document deficient in numerous areas, several of these deficiencies are detailed below.	G2,G8

3918 Having attended the Polymet’s Northmet Projects Draft EIS meetings and reading other information, I have the following observations. Economic Impact: There is no question of the need for jobs on the Iron Range, in Minnesota or the nation. The direct and indirect employment will be beneficial to all. The products of the operation are used world wide in many of the items we use on a daily basis. The taxes to be generated are needed to support the governmental services. Environmental Impact: The reuse of an existing site and equipment for part of the production process benefits in a number of ways - energy and materials not needed for new , continued use of structures rather than deterioration etc. The reuse of the tailings basin is a plus. Not only is the water recycled, but the basin will be improved and monitored. This is a benefit compared to sitting idle. Mining proposals for backfill and locations are a positive factor. Placement and burial of low grade ore will control run off and leaching. Site restoration upon closure will insure acceptable reclamation of the affected site. In viewing the Iron Range now, it is evident that “Mother Nature” will be a great partner in returning the land to other uses - forest, wildlife and recreation. The Draft EIS is extensive and complete after four year’s of input. The meetings and comment procedure are adequate. The presentations to the public and approving agencies are not “Sales Jobs“, but a study of the facts and an educational process. I look forward with anticipation to the approval and permitting of this project.

267 The Hoyt Lakes Chamber of Commerce has always supported new enterprises in our area. In this case this adventure is critical to our survival . Our area has been devastated by the closure of LTV, not only did we lose jobs at the mine but our peripheral services also suffered enormous losses. The studies that have been done by the state have set aside all worries about environmental issues. For years this area has been responsible to the environment and has strived to preserve our pristine area. There comes a time in most lives where we realize that the world is changing, we need to expand our essential needs to meet the needs of the world and do our part in securing a future for our children and their families. We do not want to sacrifice our way of life just to have jobs. This company has shown through studies by everyone even remotely involved that they are a responsible and conscientious company who care about our environment and the needs of the world to do things right. It has taken an enormous amount oftime for this to happen, but as we can see and believe that they have taken all necessary and reasonable efforts to secure the proper permits to begin operation in a safe and responsible manner. Not only will Poly Met do this in a safe and responsible manner, they may be able to absorb enough of the foreign market who do not show responsibility to the worlds environment, to make a difference. They have stepped up to the plate and opened every facet of their operation to be scrutinized by the group responsible to protect our rights and country and have met the requirements in every aspect. Now it is time for our state to step up to the plate and take that swing that will mean a home run for our area and the state of Minnesota. So in speaking for the Hoyt Lakes Chamber of Commerce as it's President and more importantly, a member of this proud community, I and the Chamber support this permit for Poly Met 100%. Please consider the needs of this country and this community and the surrounding area's that depend on jobs of quality and safe use of our resources.

18 We must be absolutely certain that the mining will not endanger this one of a kind precious resource. The BWCA is truly one of our state's, as well as the world's, greatest resource. The money made of off tourism in this area will far exceed the profit made from mining in the long term. The University of Minnesota study bore this out back in the 70's when nickel minig was proposed.

1	Since one of the major wilderness areas in the U.S. and MN is near Ely (BWCA) it would be imperative to know what impact Northmet Project will have on air quality of the BWCA, which is already suffering from degradation of ambient air quality from power plant and other point sources.	AQ4,AQ4B
1	The DEIS predicts that the total direct and indirect annual GHG emissions from the Project will be more than 744,000 metric tons of CO <sub>2</sub> -equivalent (m.t.CO <sub>2</sub> e) emissions.101 That volume of annual GHG emissions represents a measurable and very significant fraction of total statewide emissions. Specifically, according to data in the DEIS, the proposed Project would cause statewide annual emissions to jump by 2/3 of 1% (+0.62%),102 which is an enormous impact for a single project to have.103	EOO,AQ5
1	Accordingly, the DEIS for the Project cannot rely upon the operation of the RES to accomplish state policy on GHG emissions. Rather, reductions in total new energy demand must occur, and the new energy demand that does arise must be met with new low- or no-carbon supplies.	EOO,AQ5
2	4.10 Socioeconomics: The major and growing contribution to the Arrowhead region in MN of tourism is not presented in this section and should be so that a more complete view of the economy of this region may be understood. Tourism contributes \$11 billion to MN economy, with >41 million visitors annually. These numbers have increased steadily in recent years. The Northeastern region has 16% of the >41 million visitors or about 6.56 million visitors with generation of >\$719 million in Gross Sales. This activity contributes 17,932 private sector jobs. (Explore Tourism 2008: <a href="http://www.tourismroi.com/Content_Attachments/26124/File_633480214451131154.pdf">http://www.tourismroi.com/Content_Attachments/26124/File_633480214451131154.pdf</a> . A critical question not addressed in the DEIS is the extent to which current and proposed major increase in mining in the region will increase, have no effect or decrease tourism to the Arrowhead of MN.	SE4
2	Moreover, this increase would come just as Minnesota is seeking to achieve substantial reductions in total statewide emissions. Indeed, three years have passed since the GHG emissions reduction law was passed, and with just five years remaining until 2015, the Project would push statewide emissions in the wrong direction, frustrate the State's important public policy and public health interests, and have a deleterious effect on the State's involvement and compliance with the Midwestern Greenhouse Gas Reduction Accord.104	EOO,AQ5
3	NEPA requires agencies to identify a preferred alternative or alternatives in the draft environmental impact statement. 40 CFR §1502.14(e). The NorthMet DEIS does not clearly identify the preferred alternative for the project. A brief indication is made that the mine site alternative is preferred, however, this is not explained in detail.12 MCEA supports the mine site alternative as the preferred alternative to the extent that subaqueous disposal of the more highly reactive waste rock will minimize the potential for acid mine drainage and other water quality issues associated with storage of the waste rock in stockpiles on the surface. In addition, the DEIS does not identify a preference between the proposed action or the tailings basin alternative. NEPA requires that preferred alternatives be identified in the DEIS. The failure of the NorthMet DEIS to indicate a clear preferred alternative for both the mine site and tailings facility is a fundamental inadequacy of the DEIS.	ALT7
3	I am a chemist in the composite industry, a frequent traveler to the MN northwoods area and a resident of Minnesota. I make several trips to the Boundary Waters Wilderness and the surrounding area each year and would like to ask that you accept the following comments regarding the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. As a citizen of Minnesota, a place where often low-skilled jobs are not sustainable, I am glad that a private mining company has decided to pursue the mineral deposits in the northern part of the state. The economic conditions in the northern MN region have deteriorated substantially since the days of the large mining operations and in the economic conditions at present we should not be quick to dismiss real development for the sake of outdated environmental concerns. I am also a professional in an industry which, like the mining industry, is often vilified by environmental-types such as the members of the Friends of the BWCAW. I am quite comfortable with the concept that with proper planning a profitable mining operation can be performed with minimal environmental impact (I am not intimately familiar with the geology and chemistry related specifically to sulfide mining, but it seems that acidic runoff should be able to be treated adequately using basic minerals including carbonates or bicarbonates that could possibly be retrieved from mines in other parts of the state).	G1,G7

4	Most (68.4%) <sup>105</sup> of the Project's GHG emissions predicted in the DEIS are attributed to off-site production of roughly 59.3 megawatts (MW) of electrical power. <sup>106</sup> It would come from one of Minnesota Power's coal-fired power plants. <sup>107</sup>	EOO
4	Despite the significance of climate change and the State's GHG reduction timeline, and despite the Minnesota Pollution Control Agency's urging, <sup>108</sup> the DEIS fails to analyze a green power alternative under which the Project would run on low- or no-carbon electricity, thereby minimizing the Project's biggest single source of emissions. The DEIS does discuss methods of increasing efficiency of vehicles and equipment on site, <sup>109</sup> but none that address switching from coal to green power. Coal-fired electricity is the only form of generation that is mentioned. Consequently, the DEIS ignores an opportunity to use widely available, existing technology to reduce or eliminate the biggest source of GHG emissions, simply by changing the way the power used by the Project is produced. The DEIS does not discuss alternative types of power; it only explains it will purchase coal-derived electricity from Minnesota Power. <sup>110</sup> The option of buying different types of electricity (green power) from Minnesota Power is never discussed. The option of building its own power source is summarily dismissed without justification. The option of purchasing from a different provider not fully explored.	AQ5
4	The state of Wisconsin has basically banned such mining. The other issue is that not only will our economy be harmed because of lost tourism revenues, it will also be harmed because we will have to pay for the clean up of the mess that the mines will create. And that clean up will be forever, perpetual, continual. The leaching will never stop. There's a risk that in this type of economy that no clean would even be done. But, again, I stress that any clean up would only potentially be effective if it continues to happen forever. So, that's an unending stream of lost revenue devoted to cleaning up the mess made by a mining company that will have long since skipped town with the precious metals that they took from our lands.	PD3,PD4
5	Have arrangements been made (not just talked about) to provide for perpetual monitoring of the mining facility, and surrounding area (whatever that is deemed to be) if approval is given?	G10
5	The State doesn't have such a great record monitoring where and when it should. I can think of a few examples off the top of my head: the taconite mines, 3M, the Arden Hills arsenal, and the 35W bridge. Doesn't make me sleep all that well at night, you?	G10
5	Who's in charge of pulling permits back if things go south? And WILL they be pulled if things go south?	G10
6	"There would be a low margin of safety with the tailings embankments." Read this: <a href="http://www.crismart.org/upload/Case%20bank/BOLIDEN_.PDF">http://www.crismart.org/upload/Case%20bank/BOLIDEN_.PDF</a>	G8
6	will it come from? Shipping in the needed fill isn't very green, is it? What are the sulfur %'s of low and high waste rock? Will it be exposed to air? For how long? Please read this!!! <a href="http://diss-epsilon.slu.se:8080/archive/00001874/01/Kappan_Avhandling_nr_08.88.pdf">http://diss-epsilon.slu.se:8080/archive/00001874/01/Kappan_Avhandling_nr_08.88.pdf</a>	EOO
7	(According to Wikipedia; In 2007 the United States produced 1.19 million metric tonnes of copper, worth \$8.8 billion, making it the world's third largest copper producer. The nation produces 63% of the copper it uses. Top copper producing states in 2007 were (in order) Arizona, Utah, New Mexico, Nevada, and Montana.) We import them from countries that don't follow our stringent environmental laws, that subject miners to unsafe working conditions, and that contribute to the global pool of pollution circulating in our atmosphere. Then, we contribute to greenhouse gas emissions by shipping them to another country for processing before we ship them to the U.S. See above comment. Explain the PolyMet/Glencore plan please? What about the energy consumption required to mine 99% waste?...nice try though...	G1,G2
8	And PolyMet wins by demonstrating environmental safety — not only because it is more environmentally sound than importing metals, but also because PolyMet has shown that it will operate in a way that protects our air, our water, and our land. Ahh, little FYI here - PolyMet has never demonstrated or shown anything. They've never mined anything before, correct? They paid people to put together numbers and such in their favor, so the investors (and State) can make a bunch of money.	G10

Comment ID	Comment Text	Theme Codes
9	As elected officials representing the Iron Range, we are confident that after more than four years of PolyMet working with scientists and biologists and spending upwards of \$20 million, that the DEIS is covering all the bases. The products that will be mined are extensively used in our society. The data shows a safe mining operation, one that has the controls to address the environmental concerns. Again, please read this research...	G6
10	While wind roses for Hibbing show a north north west through west-northwest direction 25% of the year and south-southeast through southeast 15% of the year, Ely shows a pattern of west westsouth for the months of April through September. (University of Minnesota: <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> . )Thus, the BWCA which is only 34km or 21 mi from the Project Site would receive winds from the Polymet Project Site for several months of the year. To what extent will this add to the worrisome burden currently being experienced by Class 1 areas BWCA and Voyageurs NP? At BWCA, visibility impairments have been documented for 200 days in a recent year. Has the potential impact of the Northmet Project on BWCA been quantified as part of this DEIS? Has the potential impacts of other mining activities between the Northmet Project Site and the Franconia; Duluth Metals; Encampment and Tech Cominco projected mining sites been quantified as part of this DEIS? These are critical data that must be included in the Final EIS.	AQ4,AQ4B
11	4.6.1.2 Local and Regional Air Quality: On p 4.6-2 it is noted that “ambient monitoring data from the closest monitoring stations to the Project are provided in Table 4.6.2.” It is not clear where the “nearest monitor” to the Northmet Project Site was; the data are from MPCA 2008 but the monitor source is not listed. If the data in Table 4.6-2 are from a remote monitoring site, the Northmet Project should request relevant data from MPCA for the Site environs. Also, note is made that the MPCA data was for 2004-06. These data are out of date and should be updated to ensure reliable baseline data are available from the Site.	AQ4,AQ5
12	4.6.3.1 Proposed Action (Criteria Pollutants): The assessments of human toxicity from exposure to chemicals used at the Mine Site (Table 4.6-17) need to consider the lung health of workers at the time of their employment. Preexisting respiratory diseases may be exacerbated by exposure to chemicals included in this table. Of great importance is the documentation of cigarette smoking status of workers since some chemicals on this list are mutagens or carcinogens. In general, combined exposure to inhaled chemicals and cigarette smoke may increase the likelihood of development of lung cancer. The Northmet Project should have ready access to state- of- the -art smoking cessation program, including a Quit Line to support workers’ smoking cessation. (these resources may be obtained from the MN Department of Health) In addition to the above threats to human health, the mining activities, miners but protect from inhaling fine particles of hard rock dust. Lung neoplasms have been associated with mining and are markedly increased in tobacco smokers. There are concerns about the risk of mesothelioma among hard rock miners: (Univ. MN: <a href="http://taconiteworkers.umn.edu/about/study_goals.html">http://taconiteworkers.umn.edu/about/study_goals.html</a> . Lemen RA, et al. Epidemiology of Asbestosis-Related diseases. <i>Envir Health Persp.</i> , 1980: <a href="http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1568524/pdf/envhper00470-0008.pdf">http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1568524/pdf/envhper00470-0008.pdf</a> )	AQ4C,AQ6
12	4.6.1.4 Minnesota Standards of Performance: on p 4.6-6 the first point, the statement “that facilities are required to take reasonable precautions to prevent the discharge of visible fugitive emissions beyond the property line” raises serious concern for the following reasons: Particulate Matter (PM) especially, PM 2.5 micrometers is invisible so one would not expect to see it. Yet these fine particles pose threats, not only to the environment, but to human health. Fine particles are a known cause of cardiovascular disease (heart attacks; strokes); respiratory disease (asthma, COPD) and cancer, particularly, lung cancer. (Department of Health and Human Services: <a href="http://www.atsdr.cdc.gov/general/theair.html">http://www.atsdr.cdc.gov/general/theair.html</a> . The language in this DEIS should be revised to reflect the above. Finally, vehicular traffic and exhaust adds fine particles and other air toxicants to ambient air. Have estimates been made of the contributions to fine particle pollution over the life of the proposed Project?	AQ1,AQ6
13	4.6.4.5 Cumulative Mercury Emissions. As noted above, the projected hard-rock mining operations of Franconia; Duluth Metals; Encampment and Tech Cominco must be included in this analysis and Table 4.6-22.	AQ4B

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
14	In addition, the DEIS Northmet and other mining activities in this region appear to conflict with the Forest Service Mission and Goals (USDA Forest Service Strategic Plan FY 2007-2012, USDA, FS-880, July 2007; USDA FS Land and Resource Management Plan, Superior National Forest, July 2004) which state: "Forest Service Mission (is to) sustain the health, diversity, and productivity of the Nation's forests and grasslands to meet the needs of present and future generations;" and a primary goal: "Promote ecosystem health and conservation using a collaborative approach to sustain the nation's forests and watersheds." Hard-rock mining is in direct conflict with the purpose for which the SNF was created. The aim must be to reconcile the strikingly differing legal mandates and missions of lead agencies with to stated aims, goals and objectives of PolyMet Northmet Project and related mining and human development activities in the area.	PD1
15	4.6.4.7 Summary of 2006 Visibility Class I Study Scope (Updated 2009): Regional Haze and Visibility Impairment. : On p 4.6-50 a table of projects and actions are presented. Again, this table needs to include all "foreseeable" projects that will adversely impact the air quality of northeastern MN, including Franconia; Duluth Metals; Encampment; and Tech Cominco projects.	AQ4B
16	4.7 Noise: It is stated that the effect of noise on wildlife is reviewed in section 4.4. However, a review of 4.4 reveals a dearth of references to the wealth of science regarding the compelling adverse impact of noise on wildlife and human health. A separate section devoted to this topic should be written and included in the DEIS. The cumulative effects of noise as animals move along corridors over ranges of a few meters to > 100 miles must be considered. (Radle AL. Effect of Noise on Wildlife: A Literature Review. <a href="http://interact.uoregon.edu/MediaLit/wfae/library/articles/radle_effect_noise_wildlife.pdf">http://interact.uoregon.edu/MediaLit/wfae/library/articles/radle_effect_noise_wildlife.pdf</a> .)	WI2,N4
17	The DEIS fails to provide evidence regarding the serious and growing human health effects of noise. Former U.S. Surgeon General William H. Stewart said in 1978: "Noise must be considered a hazard to the health of people everywhere." (Goins L, Hagler L. Noise Pollution: A Modern Plague. S Med J 2007: <a href="http://web.ebscohost.com/ehost/pdf?vid=2&amp;hid=102&amp;sid=72c7f778-d60d-4a16-9a7f-010ec30d90a7%40sessionmgr104">http://web.ebscohost.com/ehost/pdf?vid=2&amp;hid=102&amp;sid=72c7f778-d60d-4a16-9a7f-010ec30d90a7%40sessionmgr104</a> )	N5
18	Summary: p4.7-9. The use of the word "continuous" is confusing. Does not "discontinuous" noise matter, eg, blasting; 100 ton mine truck traffic; etc? For those people who frequent the environs of the proposed Project for recreation, fishing, hunting, and such activities, the data presented in 4.7 would likely adversely affect their experiences.	N6
19	4.8 Cultural Resources: Regulatory Framework: It is stated that Cultural Resources management within Federal and State agencies seeks identify cultural resources and balance the need for development with protection. Not included here is an analysis of public opinion in the Arrowhead as to whether the regulatory process is fairly achieving this balance. Development is driven by economic considerations that would likely overshadow the power of those whose goal is to protect Cultural Resources. This DEIS should provide evidence to support conclusions that suggest there are no cumulative effects associated with cultural resources.	G3,CR1,CR2,CR3,CR4
19	4.9.1.1 Federal Land Management: A discussion regarding the feasibility for a land exchange between USFS and PolyMet is discussed. This DEIS should not be approved or move forward until such time as the feasibility and legality of this idea be decided. The statement: "This analysis is based on a successful completion of the land exchange and elimination of National Forest lands from the Project" suggests the authors of this DEIS can predict the future. It is impossible for the public to fairly evaluate this DEIS with such speculation.	PD1

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
20	This DEIS needs to address this critical question with data. To focus on short-term financial gain from sulfide mining and not incorporate long-term consequences, including the predictable “boom” and “bust” mining cycles, in the DEIS analyses is a major deficiency of this DEIS. Potential depression of the tourism industry and land values in the Arrowhead, would have a devastating adverse effect on the entire region for decades to come. (Thomas M. Power (Economics Dept., University of Montana: “The Economic Role of Metal Mining in MN: Past, Present, and Future” prepared for MN Center for Environmental Advocacy and the Sierra Club, 2007.; <a href="http://www.sosbluewater.org/mn_mining_economics_power.pdf">http://www.sosbluewater.org/mn_mining_economics_power.pdf</a> .) Unfortunately, a study funded by industry (Labovitz School of Business, Duluth) failed to incorporate destabilizing boom and bust cycles and adverse impacts on the growing tourism industry in their narrowly focused analysis. ( <a href="http://www.ironrangeresources.org/_site_components/documents/user/aboutreports-publications230.pdf">http://www.ironrangeresources.org/_site_components/documents/user/aboutreports-publications230.pdf</a> .) 4.10.2: Impact Criteria: This sections fails to include explicit review of the “boom” and “bust” cycles of mining (as noted above) that are extensively documented in the literature and relevant to the DEIS Northmet. 4.10.3: Socioeconomic Consequences: Impact Analysis for Planning (IMPLAN) was based on old data that does not reflect the current fiscal crisis. What impact will this have on estimating the “boom” and “bust” predictable cycles of the proposed mining?	SE3
21	4.10.3.1: Proposed Action: Environmental Justice: What assumptions are being made to support the statement that: “Therefore the Proposed Action would not have disproportionately high or adverse effects on minority populations?” While it is suggested that the proposed “boom” resulting from the proposed mining would benefit low income persons, isn’t it logical to assume that the “bust” that could occur at any time during the proposed 20 year operation of the mine would have a deleterious impact on low income families—potentially a devastating impact on persons who lack safety nets of community support?	SE2
22	4.10.4: Cumulative Effects: Note is made that the data in Tables 4.10-15-16 do not appear to be based on the recent, unique fiscal situation in the U.S. and MN. Also note that neither this section nor the section “Socioeconomics” p S14 (Summary) reflect on compelling data regarding the “Boom” and “Bust Cycles”, an issue of critical importance to the integrity of the Draft EIS Northmet as reflected by Thomas M. Power (Economics Dept., University of Montana: “The Economic Role of Metal Mining in MN: Past, Present, and Future” prepared for MN Center for Environmental Advocacy and the Sierra Club, 2007.; <a href="http://www.sosbluewater.org/mn_mining_economics_power.pdf">http://www.sosbluewater.org/mn_mining_economics_power.pdf</a> )	SE3
23	The accomplishment of these aims requires a systems approach to research, planning, management and evaluation. There is consensus among researchers and scholars that natural environments are complex dynamic systems. (Aber JD, et al. Synthesis and Extrapolation. Yale Univ. Press, 2004: <a href="http://harvardforest.fas.harvard.edu/research/newengland.html">http://harvardforest.fas.harvard.edu/research/newengland.html</a> ; Foley J. Studying Complex Systems: 2002: <a href="http://www.jsmf.org/grants/cs/essays/2002/foley.htm">http://www.jsmf.org/grants/cs/essays/2002/foley.htm</a> ; Institute for the Study of Earth, Oceans, and Space. Complex Systems Research Center. University of New Hampshire. <a href="http://www.eos.sr.unh.edu/resproj/resproj.shtml">http://www.eos.sr.unh.edu/resproj/resproj.shtml</a> ; Ostrom E. A diagnostic approach for going beyond panaceas. PNAS. 2007; 104:15181-15187: <a href="http://www.pnas.org/cgi/doi/10.1073/pnas.0702288104">www.pnas.org/cgi/doi/10.1073/pnas.0702288104</a> ; Yale School of Forestry and Environmental Studies: <a href="http://environment.yale.edu/centers/">http://environment.yale.edu/centers/</a> ). To understand the potential impact of the proposed Project and related projects, systems analyses are required. The DEIS is narrow in scope and fails to address important questions regarding the impact of proposed hard-rock mining on the forest and related natural systems. The conclusions do not follow a principle of the USDA U.S. Forest Service: “We use the best scientific knowledge in making decisions and select the most appropriate technologies in the management of resources.” ( <a href="http://www.fs.fed.us/aboutus/mission.shtml">http://www.fs.fed.us/aboutus/mission.shtml</a> ) With science-based and unequivocal dynamic changes in global climate (WHO; UNEP Intergovernmental Government Panel on Climate Change: <a href="http://www.ipcc.ch/">http://www.ipcc.ch/</a> (reflected in Ely environs weather in recent years), coupled with multiple recent and pending major human developments in northern MN (mining; new roads; new building; new power sources; and the like) the failure to use the best science, including dynamic systems methodologies, will have grave implications on the future sustainability of these treasured forest and wilderness areas. The data and information provided in this DEIS is inadequate for formulating conclusions let alone formulating the critical questions regarding effects of sulfide mining in SNF, adjacent ecosystems and in the critically protected areas such as BWCA and Voyageurs National Park.	AQ6,AQ4B,PD1

Comment ID	Comment Text	Theme Codes
24	4.14 Cumulative Effects: The USFS must ensure that a full range of cumulative impacts, past, present and foreseeable future, from mining in this area and adjacent areas or regions are included in the analyses. The DEIS Northmet 2009 is narrowly focused and it appears to this reader not meet the CEQ definition and intent of the National Environmental Policy Act. The cumulative and related effects of mining exploration and hard rock mining in this area and the impacts of extending the 100 mile plus Iron Range corridor deep into northeastern Minnesota's SNF and BWCA wilderness areas, have not been addressed adequately as required by National Environmental Policy Act (NEPA) of 1969 (29) (CEQ Sec. 1508.7: Cumulative Impact). Cumulative Effects analyses on wildlife habitats in this region have demonstrated the need for such information. (Emmons & Olivier Resources, Inc. Cumulative effects analysis on wildlife habitat loss/fragmentation and wildlife travel corridor obstruction/landscape barriers in the Mesabi Iron Range and Arrowhead regions of MN. MN DNS, May 15, 2006).	CR1
25	It is noted (4.14-4) that there is major disagreement with the conclusions of DEIS authors regarding the significance of the above findings. In addition, the legitimacy of the analytical approach to the Cumulative Effects approach is problematic for several reasons: 1. Major data elements are missing e.g. baseline data for the Partridge and Embarrass Rivers. 2. In the watersheds, concentrations of aluminum, iron, copper and mercury exceed MN Water Quality Standards; 3. Analytic methods were not robust, e.g., no dynamical systems analysis of these complex environments. 4. No inclusion of data regarding Climate Change impacts on the ecosystems.	G8C,AQ3
26	Finally, one must ask the question: What are the trends in the Arrowhead of MN for the quality of air; water; loss of habitat; threatened species; forest fragmentation. For these data categories, the trends over the past 20 years are as follows: overall worsening air quality; worsening water quality; increase loss of habitat; increase threats to the biota; increased forest fragmentation. These trends suggest that the process for approving projects in MN (whether power plants; mining operations; industrial development; other human developments) is failing to protect the health of the biota. The trends are not sustainable or consistent with a goal of ensuring highly valued public natural and recreational environments for future generations. The trends, if sustained, will have adverse impacts on human health and the economies of health.	G9
26	Thus, the stated goal of 4.14 Cumulative Effects to "summarize the resource-specific cumulative effects analyses and provide an overall, synergistic analysis of the system-level cumulative effects resulting from the combined influence of the resource-specific effects to the regional airshed, watershed, and ecoregion surrounding the Project" has not been accomplished.	CR1
27	1.1: Background... The project is stated to consist of three components: Mine Site; Plant Site; Transportation Corridor. A fourth Project component should be considered: a Regional Site. Both NEPA and the MN Environmental Policy Act require that proposed projects include review of project impacts at the mine and plant sites, transportation corridors, and on regional environments. The scope of this DEIS is inappropriately narrow. Incorporation of the fourth component would provide focus for filling in the gaps in data and information regarding direct, indirect, cumulative effects as required by NEPA.	G9
28	1.5: Agency Roles and Responsibilities... This would be a convenient place to include all governmental and non-governmental organizations; corporations, consultants, etc. who worked under the direction of "Lead Agencies; Cooperating Agencies, Others". Transparency of the process is critical to serve the public's interest and such information would benefit that interest.	PD9
29	1.6.1: Tribal Cooperating Agency Positions Included in the DEIS: In paragraph 2 last sentence (P1-8) it states "...differences of opinion remain between the lead agencies and the tribal cooperating agencies." Question: Are the differences noted between the DEIS lead agencies and the tribal cooperating agencies differences of opinion or differences in agreement as to facts or both? See 4.1.1.2 below.	G14
30	Emphasis should be placed on the "proper planning" portion of my statement above. I would like to ask that the MN DNR please consider the impact of any visual and noise pollution that may impact the BWCAW itself or the surrounding eco-tourism industry. That is in addition to the very real potential for massive pollution in the runoff from the project sites about which I'm sure you are well aware. The MN DNR has a rather good reputation for regulating land use in a way that allows the land to be used but not destroyed. I only ask that this reputation be upheld during the discussions and decisions regarding the PolyMet Mining Corp. NorthMet mining project.	G11

31	St. Mary's Duluth Clinic Health System is very interested in supporting Polymet Mining Company's economic development in the Aurora/Hoyt Lakes area of Northern Minnesota. SMDC has operated a primary care clinic in Aurora since 1998 and has witnessed, first hand, the economic depression caused by the LTV mine closure earlier this decade. This summer, SMDC hopes to integrate with White Community Hospital in Aurora to improve the sustainability of healthcare in the region for citizens of the area and employees/vendors associated with Polymet. We plan on constructing a new primary clinic facility on the hospital campus, integrating care delivery across the clinic, hospital and nursing home settings and ensuring the continuation of local health care for future generations. SMDC, through it's affiliation with WCH and our proposed expansion of Occupational Medicine services will be ready to serve the 400 employees of Polymet along with the hundreds of construction workers and vendors who will be working in the area – we will be prepared to provide preventive services along with acute injury services in the nearby hospital/clinic facility. Personally, I'm concerned about sulfur leaching associated with copper mining as witnessed by other mining operations in nearby Midwest states and around the world over the past several decades. I attended Polymet's open house in Hoyt Lakes this past fall to better understand the impacts of heavy metal mining and what Polymet is doing to ensure our environment stays healthy for our children, grandchildren and future generations. As someone who lives and plays in NE MN, the environment is of utmost importance for me; a healthy environment is more important to me than economic development. Based on what I've read and learned about the precautions Polymet is and has taken, I believe our environment will remain intact and healthy during and after the development and operation of this mine. The reuse of the LTV facilities, use of the brown field site, sealing of extracted waste materials, capturing of run-off with separation from wetlands and groundwater are but a few of the multiple safeguards used by Polymet to protect the environment. Once operational, I expect the State of MN to carefully monitor runoff and leaching levels and work with Polymet to make any needed adjustments to maintain our healthy environment; my understanding is that Polymet is setting aside financial resources now and during operation to cover expenses associated with protecting the environment and returning it to the natural state after the mine has run its course. With these safeguards in place, I am confident my "playground of the North" will remain safe and beautiful for our future generations. I'm glad Polymet has been subject to the level of environmental scrutiny it's received over the past several years. This, along with the substantial economic stability Polymet will bring to the local area makes this a win/win scenario. Both personally and as a representative of SMDC am proud to support this project and am hopeful that the EIS will result in the release of permits so Polymet can proceed with their plans.	EOO,G2A
32	There seems to be enormous risk in releasing high sulfate concentrations from the tailings basin into wetlands north of the basin. Isn't it possible or even likely that mercury contamination will occur.	WR4B,WE8
32	I do not believe the technology being proposed is proven to work in a wetlands environment such as ours. We need to see specific examples that proves it works for many years. There is no margin for error. Once our water quality is gone, it's gone!	WE6
33	This EIS is unacceptable. We are dealing with a critical resource which must be protected! Future generations depend on us to do the right thing.	EOO
34	I want to express several concerns regarding the Polymet Mining draft EIS. It seems to me to be wholly inadequate. We need much stronger protection for the future. If the company leaves or goes bankrupt what financial recourse do we have to mitigate the potentially disastrous problems that could occur many years in the future?	PD3
35	The technology apparently is very new, very expensive, and unproven on the scale proposed here. How can we make Polymet responsible now and for many years in the future? Can they bond against the enormous potential cost? The bond would have to be mind-boggling large.	PD4
36	Over \$9 billion is spent by tourists and outdoor enthusiasts on lake-based tourism in MN annually. That is in jeopardy due to this project because heavy metals and other toxins as well as highly acidic water ALWAYS leach into the surrounding watershed for hundreds of miles on these types of mining projects, in this case all the way to Lake Superior. I said ALWAYS because every case of this type of mining in history has resulted in this kind of damage that kills fish and entire ecosystems, and thus kills eco-tourism which depends on fish and clean water, but also which depends on the perception of the public that the areas toured are "pristine" "untouched" and certainly unpolluted. This mining project puts billions of tourism dollars in jeopardy every year. So how can it be good economically?	SE4

37	I would like to comment on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. This type of mining will forever alter and harm Minnesota's crown jewel of natural beauty, a place unlike anywhere else in the world that attracts people from all over the world to visit. I am talking about the adverse affects that sulfide mining will have on the Boundary Waters Canoe Area Wilderness.	G11
38	All of this is not to mention that the environment being horribly ruined is in itself unacceptable because it cannot be fixed again. It will never be pristine again once the leaching starts and fish and other animals die. This will affect people's health too. Its not just a spoiled postcard, its people dying or getting sick due to bad water. Nothing is more Minnesotan that clean lakes and fishing. And this project jeopardizes both. Lets keep mining taconite, but lets not ever start mining using sulfide mining practices. Please stand up for Minnesotan values and the people and the economy and the environment and natural beauty of the state.	G2C
39	The idea that jobs that will be gained will make the project worth it is ludicrous, because again the lost money due to pollution clean up and lowered amounts of tourism will far exceed the value gained from any jobs?	SE4
40	This letter is in response to the North Met draft EIS. `I represent the Intemational Union of Operating Engineers Local 49 and the Iron Range Building Trades Counsel. Combined we represent 20,000 tradesman in the State of Minnesota. We have reviewed the EIS Draft as proposed and support it as is without any amendments. We believe it's in our best interest to build this facility in this area where we will have some control over environmental or other controls. If any issues become apparent after they are in operation we would have the ability to correct the situation. If this plant was build elsewhere in the Country or the World we would not have any control over these issues. I've attached several petitions that I've collected from workers on projects throughout Northem Minnesota. I have not encountered any opposition to this project or EIS in this process. We urge your department to approve the EIS and allow Polymet to start this project and help get the economy in Northern Minnesota headed in the right direction.	EOO
41	"An increase in regional air emissions." What will it contain? And how much?	RFI
42	PolyMet is required to replace any wetlands they destroy...What's their restoration process? Is that regulated by the State?	WE3
43	impact be? 1200 acres of wetlands would be impacted." Impacted how? And for how long?	WE2
44	How much energy will be consumed for all this – for nothing more than investor profits?	G1,G2
45	The politicians talk about how green we need to be. How many green technologies will be used in the operation (solar panels/wind/etc)? I'd be willing to bet, NONE.	G2
45	<a href="http://en.wikipedia.org/wiki/Mining_Certification_of_mines_with_good_practices">http://en.wikipedia.org/wiki/Mining_Certification_of_mines_with_good_practices</a> occurs through the International Organization for Standardization (ISO) such as ISO 9000 and ISO 14001, which certifies an 'auditable environmental management system'; this certification involves short inspections, although it has been accused of lacking rigor.	G2D

45	<p>Subaqueous tailings... Subaqueous deposition is particularly suited to tailings that contain sulphides that are likely to oxidise, mobilise metals and produce acid (Tremblay 1998). Restricting oxygen to the tailings by permanently placing them underwater will prevent oxidation and minimise the environmental problems associated with AMD (figure 2). With this in mind, the offshore disposal of tailings to natural water bodies is appealing but the actual overall environmental consequences of this technique are not fully understood. However, subaqueous deposition can be practiced in conventional impoundments. Discharging of tailings below water can create significantly steeper slopes than that of subaerial deposition (Robertson and Wels 1999). Dillon et al. (2004) report that for Lisheen the underwater tailings slope could be in excess of 10%. This means that if the distribution head or spigot is not regularly moved then differential settlement, slumping and squeezing can occur. This can damage synthetic liners particularly if the underlying material is likely to compress. It is essential for a lined impoundment using subaqueous deposition that the tailings are evenly distributed and that depth measurements are recorded at regular time intervals to establish dramatic elevation changes. From the Neves-Corvo mine in southern Portugal... <a href="http://www.imwa.info/bibliographie/09_14_209-221.pdf">http://www.imwa.info/bibliographie/09_14_209-221.pdf</a> Discharging of tailings below water can create significantly steeper slopes than that of subaerial deposition (Robertson and Wels 1999). Back home, though, the multinational mining companies of Australia, Canada and the United States are not permitted to dump waste into rivers and oceans as their respective governments have effectively outlawed the practice -- a point not lost on the coalition, which argues a good corporate citizen should use the most protective environmental practices at home as well as overseas. "The use of natural surround technology would avoid the use of engineered barriers, such as dams or liners, which might fail in the long term." <a href="http://www.ceaa-acee.gc.ca/default.asp?lang=En&amp;n=29CBBFF8-1&amp;offset=8&amp;toc=show">http://www.ceaa-acee.gc.ca/default.asp?lang=En&amp;n=29CBBFF8-1&amp;offset=8&amp;toc=show</a> On the other hand, an engineering firm reviewed published data and experimental results from existing tailings facilities which indicated that arsenic concentrations in the porewater, instead of decreasing with time, have actually increased at a rate of about 500 per cent per year. [R.C. Swider, The Cigar Lake and Midwest Projects Tailings Disposal, Richard C. Swider Consulting Engineers Limited, Toronto, Ontario, August 21, 1997, p. 23.] When the hearings closed on August 28, 1997, the issue of the value to be assigned to the arsenic source term remained unresolved. It is clear, however, that a license should not be given to use the JEB pit as a TMF until it has been demonstrated that</p>	G10
46	<p>Theoretical solutions should not be accepted in lieu of experimental data... The chemistry of tailings depositories is so complex that theories can be used only as a rough guide for the design of processes.</p>	G7A
47	<p>I spoke with a few people from the DNR and PolyMet at the Blaine discussion and have some real concerns that the tailings will not be handled correctly.</p>	G2D
48	<p>The politician's quote went something like this: "Minnesota has strict environmental regulations to protect our land." I would like to hear those at the State, who will be responsible for the monitoring, describe the monitoring process? I'd be willing to bet they couldn't. How in-depth will the monitoring process be? How often will it take place? Who actually does it? Does the State know their role? Will they not just take PolyMet's word on things? And will they do what's necessary to enforce? With all the proposed cuts at the State level, I have real concerns.</p>	G2D
49	<p>If the State is going to allow this, will there be a monitoring board – with citizens as members established? There should be – and it needs to be absolutely transparent.</p>	G10

50	Are levels of everything being measured in a huge surrounding area prior to anything happening – so the mining company can't say "it wasn't us" when something does happen?	G10
51	The regulators need to make a careful assessment of PolyMet's ability to manage the entire facility. PolyMet has never done this before, nor has the State of Mn.	G10
52	Are the DNR and PolyMet showing a genuine caring attitude towards the public's concerns? Are the public comments going to be taken with a grain of salt? Who is in charge of reading, understanding, and bringing forth pertinent public comments?	G10
52	Will the procedures for mitigating all potential unacceptable impacts be identified before permitting begins?	G2,G10
53	PolyMet should demonstrate that it is capable of, and intent upon, giving thoughtful, sincere and professional attention to the concerns of the regulators, and the public. I have yet to see it in earnest...	G10
53	PolyMet should be required to demonstrate that it possesses adequate managerial and scientific competence before approval is given to construct and operate this highly dangerous facility.	G10
54	Who is in charge of critiquing Barr Engineering?	G10
54	Concerning a copper mine in Quebec... <a href="http://www.minem.gob.pe/minem/archivos/file/dgaam/publicaciones/curso_cierreminas/02_T%C3%A9cnico/06_Coberturas/TecCover-L06_Water%20cover-Louvicourt.pdf">http://www.minem.gob.pe/minem/archivos/file/dgaam/publicaciones/curso_cierreminas/02_T%C3%A9cnico/06_Coberturas/TecCover-L06_Water%20cover-Louvicourt.pdf</a>	EOO
55	They (Sen. Bakk in particular) also mentioned how great it will be to have copper wire, tubing, and all the good stuff made right here. Does not Polymet's agreement with Glencore mean that metals will be sold on the world market? I believe it does...	G1
55	The politicians talk about all of the spin off jobs that will be created – 500 give or take. Have them tell the people what those jobs are. Not just 500 jobs – name the jobs and what they pay.	G1
56	It was especially nice to see that the mining company shipped their people in from around the country. And they did, I met some of them. I guess since the cameras were rolling, they needed to make a good pro-mining showing?	EOO
56	<a href="http://www.mbendi.com/indy/ming/cppr/am/cn/p0005.htm">http://www.mbendi.com/indy/ming/cppr/am/cn/p0005.htm</a> Canada is arguably the third largest copper producer in the world, after Chile and the USA. It is also the world's largest zinc and second largest nickel and lead producer. Then, there's this... <a href="http://www.nationsencyclopedia.com/Americas/Canada-MINING.html">http://www.nationsencyclopedia.com/Americas/Canada-MINING.html</a> Australia is the 4th largest producer... What about Sweden? Aitik Sweden Annual Production 240,000T copper concentrate This concentrate contains 66,100t of copper, 35,700kg of silver and 2,340kg of gold. Mining started on the basis of a 50Mt reserve, but by 1998 Aitik had yielded 300Mt of ore. As of November 2006, total proven reserves were 520Mt grading 0.31% copper, 0.2g/t gold and 2.0g/t silver, while 110Mt of probable reserves have similar precious metals grades and 0.28% copper. Measured resources at January 2006 were 635Mt grading 0.30% copper, 0.2g/t gold and 2g/t silver. Indicated plus inferred resources totaled 350Mt at similar grades. So, I have a very hard time buying into the politicians theory that we can no longer accept having to get our metals, etc from the dictatorships around the world – nice try though. I believe the actual quote went something like this: "We can't rely on unstable governments/dictators in other countries to supply our metals." Little advice for the prominers...lose the politicians, they're full of shi%...	G1

57	<p>Politician quotes from the hearings and newspaper articles... "When the LTV taconite plant shut down a decade ago, the people rolled up their sleeves." To figure why LTV went bankrupt? We all know why LTV went bankrupt...Or was it to determine how the land could be raped even more? "There have been 6 generations of mining wealth on the Range." Yep, 6 dead cancer riddled generations...awesome!!! "We've provided iron for 2 world wars, built the state capitol building, and the U of M. There are educational endowments of \$1 billion. \$600,000 a year that goes toward research and scholarships." What does this have to do with the copper mine? They gonna build a big copper something we haven't heard of yet? A huge reason this will go through is so the State can collect monies to pay for their overspending. Maybe, just maybe, our politicians could do their jobs correctly so we don't find ourselves in these types of predicaments? "Mining is our culture. That's why our families came here. We continue to produce wealth." Compare the mining dollars to the tourism/hunting/fishing/etc industry in northern Mn. How is this going to effect those consistent money makers? "Cell phones need 26 different metals." They USE 26 metals – do they NEED 26 metals? Are there alternatives to the 26 metals? Last time I looked – there was not a shortage of cell phones... "A green economy is what environmentalists want." And this sure ain't it... "We all want and need devices." We all want and need politicians to smarten up – what's your point? The "devices" you mention aren't made here, and won't be made here... "It's fundamentally wrong to export our pollution to other countries by our demands." What an outright crock of shi*...What's fundamentally wrong is our State's politicians to lying to us.</p>	G2D,G10
58	<p>"Sulfur in the ores have potential for acid mine drainage." Not just potential – it will happen.</p>	G2
59	<p>"The plan is to backfill the east pit with low sulfur waste rock, and to line and cap the high sulfur waste rock concurrently with the mining. Backfill with what? Where</p>	EOO
60	<p>From newspaper article: "State lawmakers write letter of support for PolyMet" Published: Saturday, December 5, 2009 10:30 PM CST Mesabi Daily News PolyMet is a strategic win. The copper, nickel, platinum, palladium, gold, and cobalt that PolyMet will produce are essential to our way of life. They are found in electrical wiring, hybrid cars, wind turbines, stainless steel, jet engines, cell phones, computers, blood sugar test strips, artificial joints, catalytic converters, and a myriad of other products, but the United States imports from 40 percent to 90 percent of these metals. As well as most of the products you mention above. So, how green is it to ship the raw materials around the globe (China) and then ship the finished goods back to the US? It isn't...</p>	G1,G2

3840	<p>The Minnesota DNR and the Army Corps. of Engineers are creating an Environmental Impact Statement on a new type of mine being proposed for Northern Minnesota near the Boundary Waters Canoe Area Wilderness, and 50 miles from Voyager National Park . This mine is different from long established iron ore mines that Minnesota has had over the years. These proposed mines, contain among the copper, nickel, platinum, and silver, significant deposits of sulfide . The sulfur in the resultant mine tailings could leach off into the surface and ground water, creating yellow and red streams and creeks with toxic heavy metals and sulfur. Water that contains heavy metals and sulfuric acid kills fish, birds and other aquatic life . The watershed for these proposed sulfide mines includes the Kawishiwi River which flows into the Boundary Waters Wilderness, and includes the St. Louis River which flows into Lake Superior. Contaminated water flowing from abandoned mines is one of the most significant contributors to water pollution in the United States . A toxic form of pollution caused by sulfide mines is called Acid Mine Drainage (AMD) . AMD can have severe impacts on aquatic resources, killing micro -organisms, insects, fish and other aquatic life . It stunts terrestrial plant growth, harms wetlands, contaminates groundwater, raises water treatment costs, and damages concrete and metal structures . There are several thousands miles of streams impacted by AMD within the United States. The economic losses on fisheries and recreational use mounts to hundreds of millions of dollars' annually. See appendices C and D. AMD causes elevated levels of dissolved metals and sulfates, which render the stream unsuitable as a source of drinking water for humans, livestock or for use as aquatic habitat for wildlife. Because of the potential for Acid Mine Drainage, sulfide mines require treatment systems to ensure that acidic water is not discharged . These systems must be in place for the life of the mine, and continue in perpetuity to treat acidic waters after the mine is closed . Due to the ongoing treatment process, the risk of discharging acidic water increases over time . Water treatment systems at reclaimed mining sites is complicated by changing levels of ground water and fluctuating rain fall levels over decades and centuries. If movement of the acidic water is not contained within an impermeable barrier (e .g. pipe, plastic, glass, etc .) the acidic water flows into the underlying groundwater system . Once the acidic water enters the groundwater system, the detrimental affects on flora and fauna becomes widespread. Containment and treatment of the affected groundwater system is difficult, if not impossible. Generation of acidic waters is a long-term situation that requires perpetual chemical treatment. Therefore, funding for long-term treatment of acidic waters and long-term responsibility and liability for environmental protection is on going . Mining companies and sulfide handling operators may not be perpetual and often go bankrupt . As a result, there are many examples of operators abandoning properties that discharge acidic water and requiring public money to clean up the site . See Appendix B. Unlike many dry Western states, Minnesota is rich in water resources that are especially vulnerable and are a great part of Minnesota's outdoor heritage for anglers, canoeists, duck hunters and of course wildlife . Our neighbors in Wisconsin have a moratorium on mining metallic sulfide ores written into law . In effect, the Wisconsin law says : "Industry can mine metallic sulfide ores in Wisconsin when it can show one mine in the United States or Canada that has operated and been closed for ten years without significant damage to its watershed." See Appendix A. The Izaak Walton League of America and the Minnesota Ike's in particular, have a long history of fighting for, protecting, and preserving Minnesota's North Woods and the wildlife it contains. It was</p>	G2C,G7A,G11,G12
<p><b>Sender Last Name:</b> Bartosh</p>		<p><b>Submission ID:</b> 186</p>
178	<p>Hello. I'm writing to express my opinion on the PolyMet copper mine. I seriously think Minnesota needs to add a mining moratorium like Wisconsin has. Wisconsin learned it's lesson! This type of mining does not belong in Minnesota. The few years of jobs and minerals it will produce will not outweigh the pollution and environmental wreckage. Our world is so full of cancer, so full of toxins, so full of 'industrial' growth, that we are killing ourselves and our world. Everyday I wonder why we continue on our destructive path. Destroying northern Minnesota's natural beauty so someone can make a buck is just wrong. I hope you consider my comments, and truly look inside your heart to see what's worth saving.</p>	E00,G2,G12

336	I'm writing to voice my opinion on the PolyMet project. I'm sure you are getting lots of emails and are a little overwhelmed, but I really wanted to write with my thoughts. I'm very afraid of this PolyMet project. I don't believe they have 'new' technology. I don't think they wish to do harm or intend to, but who does? Oil companies don't wish to have oil spills, but they still happen. It's human error. Even if PolyMet follows strict environmental regulations and does it all by the books, errors can happen. And such errors can be so deadly and disastrous. The Boundary Waters, the St. Louis, and even Lake Superior are all too precious to even risk. Even if I had a great baseball player. He's got the best throw of them all. I still wouldn't want to put him next to a glass house. But I also learned the other day that PolyMet had been taken to court back in 2007 regarding the mess they were making in Floodwood, MN. If they have no problem skirting the laws in Floodwood, they won't think twice about skirting other laws. In my opinion, if you break an environmental law once, you shouldn't be allowed to get a permit for anything! So, I'm very upset that this EIS is still continuing. Not only do we have a great baseball player next to a glass house, but this player is known for liking to break glass.	EOO,G5
2852	I believe that PolyMet's sulfide/copper mine is not an acceptable option due to the damages it will cause to northeastern Minnesota. The long term repercussions of such a project certainly warrant great concern and I, for one, say "NO" to the PolyMet project. I hope you will consider my objection earnestly and with diligence.	EOO,G2
3841	I'm writing in opposition to the proposed PolyMet project or any other sulfide/copper mining project. I feel anyone who believes they won't do damage is a fool. Their PR spin doesn't fool me. No mine of this type is safe in wet environments such as NE Minnesota. They don't care about MN, they only care about the profits they'll make exploiting Minnesota's greatest treasure the BWCA. We hold a vast amount of precious, clean water. Water is worth protecting! Plus, if PolyMet and society wants copper so bad, we've got 60 years of copper buildup in our landfills. Everything from computers, electronics, appliances, old vacuum cleaners, etc. Let them go into the recycling business.	EOO
<b>Sender Last Name:</b> Bartosh,Toupal		<b>Submission ID:</b> 3700
1	If PolyMet is going to be as beneficial to our economy as is being claimed by its proponents, it should lead to rate decreases and not rate increases. The project should be advanced transparently, and legally. An increase in rates for small businesses is not good for the diversification of the regional economy and makes it more dependent on the big business of mining. Realtors in regions where mining is being advanced notice depreciations in property values generally. Much can be said about this economic harm.	G1
<b>Sender Last Name:</b> Baumgartner		<b>Submission ID:</b> 2018
2486	Because of the problems detailed below, and because this type of toxic mining has never before been done in Minnesota, I would respectfully point to the decision of our neighbor state Wisconsin, to ban this type of mining unless and until it can be proven safe.	G14
<b>Sender Last Name:</b> Baurle		<b>Submission ID:</b> 3526
3790	I am a college student in the Twin Cities area. One of the features that attracted me to Minnesota was the environmental consciousness of this state's citizens and government officials-- a welcome change from my Chicago-area hometown, eager simply to make a buck. In fact, I am pretty confident Minnesota will be my new home. Friends, I urge this state to reconsider the permanent impact this decision will have on the environment and future generations. Minnesota is a beautiful, picturesque state-- please do not throw all that inherent charm away for a get-rich-quick-scheme. It will only leave the state morally and environmentally bankrupt in the end.	EOO,G2

3183	My husband and I are ardent supporters of the quality of all of Minnesota's natural resources, particularly the Boundary Waters Canoe Area. To hear that the health of this area is at great risk is of great concern not only to the land and water, but to the people and wildlife.	EOO
<b>Sender Last Name:</b>	Beaver	<b>Submission ID:</b> 1188
1303	Minnesota waters should not be polluted with heavy metals and sulfates, which contributes to mercury contamination of fish. Any short-term process, that leave behind a pollution problem that needs treatment in perpetuity, should be avoided.	G2C,G7B
<b>Sender Last Name:</b>	Bechtold	<b>Submission ID:</b> 3518
3785	I can't believe a project such as this is even being considered in such an environmentally important area. These environments need to be protected. We need to be making changes in our life styles and our use of recycling. If all the time money and energy that went into trying to pull this off was directed to the recycling effort we would be a world ahead. How can anyone working to push this mining effort forward sleep at night knowing the kind of risk they are putting on the environment and future generations health. Are their paychecks really more important than the health of their grandchildren. Why would we allow big business to use us for short term benefits and ruin our own long term benefits of keeping the environment pure. Northern minnesota is known as pure natural area, to explore and learn, to get back to nature. No one wants to fish next to a exploration rig. With the economy suffering people may not have the funds or spending cash to travel as much as before but this is not the answer. Selling our souls to the devil is not the answer to our state economic issues. We should be investing in sustainable methods. Thank you for this opportunity to express my opinion on this matter, I hope and pray that the devil doesn't beat mother nature out on this one.	EOO,G2
<b>Sender Last Name:</b>	Beck	<b>Submission ID:</b> 3480
1115	loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area	WI1
1321	basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project. Further, the PolyMet NorthMet project will result in total	GT2
3234	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an existing mine tailings	EOO,WR4B,FM1
3683	Water quality impacts remain a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone.	PD2,PD4
3754	Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	G2

3174 Gentlemen, I grew up in the Boundary Waters and learned about land and water conservation, to have fun as well and to "leave where ever you camped cleaner and better than you found it." Interestingly enough that last quote happened to stay with me for life for it has so many other applications! How can you in good conscience slowly contaminate, kill waterlife, and slowly kill the BWCA? The fire a few years ago wiped out an large part of the area but, that is Mother Nature and the BWCA thrived after it! It took years, but it thrived non the less. Gentlemen, as I'm pretty sure no woman in good conscience would be apart of this committee; You are Not Mother Nature, and you have no right to do what you are doing. I've taken nieces and nephew's, under-priveleged kids from the inner city, and I plan on taking my grand nieces and nephews and other mother's, father's, Kids. How dare you take that right away from me and anyone. Ther is no greater lesson in life then a trip to the Boundary Waters! Stop everything you are doing in the Boundary waters! EOO,G7

Comment ID	Comment Text	Theme Codes
300	Loss Of Wetlands - The project allows the loss of 1200 acres of wetlands in St. Louis County and the St. Louis River watershed, with an inadequate mitigation plan. The loss of these wetlands will result in a net loss in carbon sequestration provided by these wetlands (peatlands).	WE3
306	Harmful To Wildlife - The DEIS does not adequately address the mining project's impact on Canada Lynx and Grey Wolf Habitats. It also does not address the destruction of existing wildlife corridors. The project is located on land the USFWS designated less than one year ago as critical habitat for the Canada Lynx.	WI1,WI5
839	The mine's tailings basin will also produce discharges high in sulfate concentrations, which will turn mercury into methylmercury, making fish dangerous to consume.	WR4B,FM1
1168	Cumulative Impacts Not Analyzed - The DEIS should expand its analysis of the Cumulative Impacts of the PolyMet project to include a review of past, present and foreseeable future actions within the project vicinity.	PD8,G9
1169	Financial Assurance Information Missing - As recommended by the EPA, the DEIS must include an evaluation of the financial assurance that would be provided to ensure post-closure reclamation of the PolyMet NorthMet mine and plant. Sulfide mining places huge burdens on taxpayers. These mines often require long-term or perpetual pollution and treatment. PolyMet has few assets or financial history. The question of where the funding will come from for post-closure treatment, monitoring and maintenance has not not been adequately addressed, and Minnesota taxpayers may have to pay millions of dollars for clean up after PolyMet has gone.	PD4
1170	Land Exchange Analysis Missing - The PolyMet project proposes a land exchange of 6,700 of federal land within the Superior National Forest. This "connected action" is required to be part of the EIS under federal law. Knowing which what lands will be exchanged is important in evaluating the environmental and cultural impacts of the PolyMet NorthMet Project.	PRO4,PD1
1209	Water Quality At Risk - Water quality concerns have not been adequately addressed in the PolyMet project's DEIS. Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years.	EOO

**Submission ID:** 316

330	Please accept these comments in support of the Draft Environmental Impact Statement (DEIS) for PolyMet Mining Company and its proposed NorthMet project. I write this letter wearing many hats. First, I am an Iron Ranger who loves this area and wants to see it be sustainable - economically and environmentally. Second, I have had a long career in iron mining, having retired after a long career at U.S. Steel's Minntac operation; I know mining! Third, I am the mayor of a small town west of the proposed project, Gilbert, which stands to benefit from the economic development that PolyMet will create and also would stand to lose if the project isn't environmentally sound. In my career in mining, I have witnessed great improvements in the environmental stewardship practiced by iron mining companies on the Range. What's exciting to me is that PolyMet will take advantage of all of these stewardship practices - and introduce new ones based on the unique challenges of nonferrous mining. They have done their homework on this huge project. The DEIS demonstrates this environmental stewardship. From the mine, where PolyMet will develop and implement a comprehensive waste rock management program, to the processing plant, where sulfur from the ore will serve as fuel, PolyMet will be a shining example of sound environmental practices. Their reclamation will be like done other. PolyMet also will be a major economic driver for the entire Iron Range, creating construction jobs and providing good jobs for 400 people - jobs that can support families. We will see our young people coming back to the Iron Range to work and live. Mining is exciting, challenging and constantly improving. When producing metals that all Minnesotans demand and that are used in daily life - whether it's the iron ore currently mined to produce steel or nonferrous minerals that are used in everything for cell phones to jet engines to medicine - mining professionals have an obligation to minimize the impact on the environment and natural resources. PolyMet has accepted that obligation. The DEIS-a detailed, comprehensive review of the impacts-should be approved.	EOO

3545 My opinion is approval for this project EOO

**Sender Last Name:**    Bendas **Submission ID:** 266

279 The Area Partnership for Economic Expansion (APEX) is an entrepreneurial business development organization led by top executives and senior managers from Northeastern Minnesota and Northwestern Wisconsin's largest, most successful companies. Our goal is to strengthen the regional economy by creating sustainable economic development. The project being proposed by PolyMet Mining Company not only would create sustainable economic development, it also would produce metals used by my members every day and, moreover, do so in an environmentally sustainable manner. The 400 jobs that PolyMet will create will lead to the creation of hundreds of other jobs throughout the region; the tax base will benefit not only from the company's contributions but also from the taxes paid by these employees. Perhaps most importantly, these economic benefits will not accrue at the expense of environmental protection. As the comprehensive, detailed draft environmental impact statement demonstrates, PolyMet will generate this economic activity while it is protecting our air, water and land. The environmental impact statement outlines the many choices PolyMet has made to protect our environment, including but not limited to: • Using a brownfield site, minimizing further disruption to the environment and taking advantage of existing processing and transportation facilities. • Designing the mine and plant footprint to minimize the impact to wetlands. • Using the sulfur in the ore as a fuel for processing instead of greenhouse gascreating fossil fuels. • Emitting very few air pollutants. • Ensuring proper treatment and disposal of waste streams from processing. • Managing waste rock, including liners, collection drains and covers. • Assuring that closure costs will be covered by setting aside financial resources now to pay for these future costs. • Friends, Neighbors, and Relatives in this area have been hit by the economic downturn. This project will provide opportunities for families in Northern Minnesota and Wisconsin to have good paying jobs. The draft environmental impact statement has proven that PolyMet can mine these critical metals, create these jobs and contribute to our regional, state and national economy at the same time it is protecting our environment. In fact, the PolyMet project has been subjected to extraordinary scrutiny over more than four years of environmental review, and PolyMet has demonstrated the economic and environmental viability of its project. PolyMet has played by the rules. It has invested more than \$20 million to support this exhaustive environmental review. The draft environmental impact statement should be deemed adequate. Permits should be issued. PolyMet should be given the green light to start developing these green jobs.

EOO

Comment ID	Comment Text	Theme Codes
18273	(4.1-112) PolyMet’s proposal to construct a wetland for the purpose of treating contaminated water is – at this point – merely an idea. It would be prudent to require full-scale testing of this key component before relying on it to protect such high quality watersheds and important wilderness areas as the nearby BWCAW. From my understanding, a treatment wetland of this scale has never been tried. Previous tests of small-scale treatment wetlands have shown wide seasonal variations in effectiveness. Moreover, no-one knows if these wetlands can continue to uptake pollutants over the hundreds or even thousands of years that they will remain necessary. Failure of this system would require very long-term and costly treatment by alternate means – most likely paid for by Minnesota’s taxpayers.	WR3L
18274	(4.13-2) The stability of the existing LTVSMC tailings basin that PolyMet plans to use for their disposal is a well-recognized concern. The existing basin has been documented to contain fines and underlying soils that create a “low margin of safety” for its long-term stability. Rather than generating a plan that satisfactorily increases the safety margin of the basin, PolyMet concedes that “further design and analysis is needed.”	GT1
18275	To date, PolyMet has done nothing concrete to demonstrate their promise to mine safely with minimal environmental damage and risk. On the contrary, PolyMet’s rush to begin the EIS process before adequate plans and testing (as described above) is complete does not bode well for the future. As an indication of their commitment to protecting Minnesota’s environment and future citizens, PolyMet should – at a minimum – complete two tasks. 1) Develop and test a plan that generously increases the safety margin of its planned use of unstable, old tailings basins. 2) Develop a full-scale wetland treatment system and demonstrate its effectiveness over all seasons and for a projected term of years equal to the expected discharge of polluted water from the mine.	WE6,GT1
18277	My second concern with the NorthMet DEIS is in regards to the probable negative impacts the project will have on the area’s water quality. The DEIS states that water from waste rock piles will likely remain contaminated with heavy metals - including mercury - and sulfates for up to 2,000 years. After only 65 years, this contaminated water is expected to overflow from the west pit, contaminating nearby water bodies for up to the following 1,945 years. In addition, seepage from the tailings pit is expected to create “high risk situations” for mercury methylation in wetlands and lakes downstream on the Embarrass River. As climate change continues to threaten the water supplies of many western states, and Minnesota’s own population continues to grow, I have no doubt that high-quality water will be in short supply. According to the U.S. Government Accountability Office, at least 36 states will face catastrophic water shortages within five years due to a combination of drought, rising temperatures, pollution, urban sprawl, and population growth. In light of these circumstances, it is easy to see that Minnesota’s access to abundant, clean water is precious and unique. In fact, it is, or soon will be, much more precious - and essential – than the metals contained at the PolyMet mine site. Water also happens to be a renewable resource able to sustain Minnesotans for generations - if protected. In contrast, the metal contained at the NorthMet site is expected to be gone in one generation. Trading away generations of valuable, clean water for a quick profit is not a tradeoff that is in the best long or short-term interests of Minnesotans.	EOO,WR3I,WR5A

Comment ID	Comment Text	Theme Codes
1139	Thank you for your efforts to collect and review public comments on PolyMet Mining's proposed copper-nickel-precious metal mine. The Lake County Board of Commissioners is pleased to write in support of this project, which will provide critical metals that I and my constituents use every single day. The Lake County Board of Commissioners is well aware of the importance of mining to the economy of Northeastern Minnesota and equally well aware of the need for mining to be done in an environmentally sound manner. We are pleased to see that the environmental impact statement developed for the project clearly reflects the fact that PolyMet can do both. The proposed mine is in neighboring St. Louis County in an area that already is widely used for mining and has been logged extensively. It is surrounded by existing mine pits, high-transmission power lines and transportation infrastructure that includes roads and rail. This is an appropriate area for this type of industrial development. PolyMet proposes to take advantage of this impressive infrastructure, re-using the Brownfield site left by the bankruptcy of LTVSMC and much of the existing road and rail service. Not only will this minimize further disruption, it also will recycle these facilities. The environmental impact statement also shows that PolyMet processes will be environmentally superior to more traditional processing methods, using constituents in the ore to fuel processing, generating very low rates of air pollution and minimizing the use of greenhouse gas generating fuels. PolyMet won't discharge process water to the environment and will manage waste rock to avoid generation of acid rock drainage. I'd like to expand on the socio-economic impacts of PolyMet's proposed project. Construction of the facility will provide 1.5 million man hours of construction employment. PolyMet will create 400 full time jobs at wages that can support a family, and at least 500 spinoff jobs are expected. The company will also pay millions annually in local, state and federal taxes. This economic benefit will help much of Northeastern Minnesota. Lake County specifically is struggling with rising costs, increased demand for services and a shrinking tax bases. In Lake County we currently have an unemployment rate of eight percent because of the economic recession. Construction of the mine as well as its operations will provide much needed high paying and stable jobs to Lake County residents and will help improve the county's bottom line. We need sound, long-term, sustainable economic development to help ensure a steady stream of local revenues. PolyMet would contribute to that revenue stream. Please work quickly to answer public comments and to issue a determination that the environmental impact statement as adequately addressed the issues associated with the project so permitting can begin.	EOO
<b>Sender Last Name:</b> Bergstrom		<b>Submission ID:</b> 1829
115	Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. This is unacceptable to me. We have saddled our children and grandchildren with so many future problems, especially environmental, that the time has come to stop all projects with such far reaching consequences.	PD2
2434	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. Please follow Wisconsin's lead and encourage the legislature to ban this type of mining until it is proven safe. This area of Minnesota is my favorite vacation destination. I have observed increased degradation in years gone by. Many changes have occurred over the 35 years I have been visiting it. If much more occurs, I will spend my vacation dollars elsewhere.	EOO,G11
<b>Sender Last Name:</b> Berkopec		<b>Submission ID:</b> 1637
2060	If this open pit mine occurs, it will pollute the beautiful and natural wildlife of Minnesota for over 2000 years. This is completely unnecessary and should not occur. I grew up in Minnesota and going to the BWCA was one of my most fond memories. It will not be the same for myself and thousands of others if this sulfur is mined. Plus Minnesota will have less visitors for people will not want to visit a polluted area. Please consider the beautiful wildlife, waters, and rare beauty that is found in the BWCA. It is truly something I am passionate about and would be devastated to see destroyed.	EOO,G2C,G7B,G11

3681 so it can avoid this kind of expenditure, expecting that the people of this state will pay for the cleanup just as states elsewhere have. In doing so, PolyMet fails to act responsibly in its application, shows it is not acting in good faith with the people of Minnesota. We cannot accept this kind of irresponsibility. If this project is approved by the state, it must do so only if PolyMet agrees to post a significant bond to pay for the ongoing cleanup which will be required. If the state does not require this, then the state will be acting irresponsibly on behalf of the people of the state.  
Glenn Bertelson

PD4

3752 Dear Sirs: Thank you for this opportunity to comment. I would like to see this mining operation go forward for the jobs and revenue it would create for the state. But wherever this kind of mining has occurred in the country, there has been significant pollution of the environment. The environment of this area of Minnesota is its most profound contribution to the quality of life here. People visit and live in this area mostly for the quality of the environment. Resorts and outfitters benefit only because of the quality of the environment. The Boundary Waters Canoe Area Wilderness is unique in the world, and its appeal is due solely to its pristine environmental qualities. Should the quality of the environment be degraded in any way, this area will suffer enormously far into the future. There has not been one instance in the country where this kind of mining has not created significant environmental degradation. When the mining companies have left, the public has been left to pay for the ongoing cleanup into perpetuity. PolyMet knows this, but instead of making the pledge to pay for the cleanup which will be required, it has declined to post a bond for the purpose, claiming that the sulphur content is significantly less than elsewhere. It is relying on the demand of the people for jobs and revenue, and the complicity of the state, to support its application

EOO,G4A,G11

**Submission ID:** 3643

18278 As a citizen organization whose home-base is Michigan our first and foremost concerns are the destruction and potential trading of very unique federal lands that we all share, and the contamination that is likely to occur to our water resources, given that massive piles of toxic waste rock (with low levels of acid-neutralizing minerals) will be stored in a very water-rich environment.

G2A,G7A

18279 First of all, PolyMet proposes to clear, mine, develop, store tailings on, and frankly destroy approximately 1,200 acres of wetlands and 1,000 acres of forest on public land in the Superior National Forest and within the 1854 Treaty Ceded Territory where the Bois Forte Band of Chippewa, Fond du Lac Band of Lake Superior Chippewa, and Grand Portage Band of Chippewa retain hunting, fishing, and gathering rights. The land that would be destroyed by the proposed mine has been identified by Forest Service and DNR scientists, in several assessments, as having high quality and unique natural features and for providing habitat for threatened, endangered and/or sensitive species—also referred to as an “under-represented habitat”. The area’s special features include high watershed integrity, large areas of wetlands, the presence of riverine ecosystems, and a large amount of interior forest. This Northwoods area and its surrounding ecosystem are rare and getting rarer with increasing development.

EOO,G2A

18281 The DEIS is not adequate in addressing the loss of this special place. The DEIS only mentions that PolyMet is considering trading land but does not describe the supposedly “more useful” land that is to be traded. We are also concerned that this land trade would set a detrimental precedent for federal lands in our own State of Michigan and throughout the country. This proposed land trade is hardly a solution to destruction that would forever erase an already dwindling resource. Allowing PolyMet to operate its Northmet Mine would shift the balance away from sustainable use levels to an industrial level of development that would permanently alter the social, ecological and economic characteristics.

EOO

Comment ID	Comment Text	Theme Codes
18282	And, whatever we do to the land eventually finds its way to the water. In fact, according to the Forest Service’s Wildland Waters Newsletter (Issue 4, winter 2005), “Water has been called mining’s “most common casualty” (Environmental Mining Council of British Columbia [EMCBC])”. The DEIS mentions but does not fully address the potential to create mercury, methyl mercury and sulfate pollution in the nearby watersheds, especially from the tailings basin (where we can expect at least minimal leakage because it is a well known fact that all liners leak). For example, according to the DEIS, “there is some uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard” and it goes on to read that, “this impact could be mitigated if it would occur.” How does PolyMet propose to mitigate this potential impact? Operations will not always go as planned, modeling and predictions are not always accurate (garbage in garbage out). Can the responsible agencies and PolyMet show the concerned citizens that we will not be stuck with the bill to clean up another mine site?	WR1E,WR3I,WR5A,AQ4,A
18284	The DEIS also does not adequately address potential hydrologic impacts, including surface water drawdown, water flow impacts in the St. Louis River Basin (including the potential impacts to wild rice ), the leaching of metals to surface water, and the ability of the Project to meet long-term closure requirements relative to surface water quantity and quality.	WR1A,WR1C
18285	The DEIS mentions potential long term arsenic, cobalt, selenium, copper, nickel, aluminum, beryllium, iron, manganese, thallium, sulfate, antimony, manganese, and nickel exceedances at the mine site, but it does not address the cumulative or synergistic impacts upon fish, wildlife or humans.	WI5,G9,FM3
18288	Moreover, the DEIS does not adequately address cumulative impacts of a proposed new mining region. As you may know exploration for minerals has accelerated throughout the upper Midwest with active exploration and proposals in northern Minnesota, Ontario, Wisconsin and Michigan. What might this mean for our shared waters, especially Lake Superior?	G1
18289	A mining district is a likely foreseen outcome, as agencies continue to sell exploratory leases to companies throughout the Northwoods. The PolyMet DEIS is inadequate as it addresses the Northmet project as an isolated copper-nickel mining project in the Great Lakes region.	CR1
18290	Finally, the DEIS states that PolyMet would have no significant effect on regional air quality. Cumulative effects of other proposed mining must be included in order to make the DEIS adequate.	AQ4B
18291	Although there is rich body of research that describes the “Boom and Bust” nature of mining, the DEIS only addresses the socioeconomic benefits of the proposed Northmet Mine. It does not mention the economic effects mining could have on the local tourism industry. We would like to see this issue addressed and presented to concerned citizens before any decision is made on the proposed mine.	SE4
18292	We understand that the Bois Forte Band of Chippewa, Fond du Lac Band of Lake Superior Chippewa, and Grand Portage Band of Chippewa participated as cooperating agencies, we hope that their concerns will be addressed in the FEIS, including the implications of the potential loss of access to public lands for hunting, fishing, and gathering and other tribal uses due to the potential land exchange.	G3,CR2,CR4
18293	Despite a land exchange, the DEIS does not address loss of wild rice and berries as food crops, or the accumulation of toxic metals in plants, wildlife, and fish species used as game. Even if land is exchanged, the proposed mine would also effect wildlife movement patterns, including those of moose, wolf, Canada lynx, American marten and others. Both moose and wolf are having difficulties reproducing in many areas in the western Great Lakes ecoregion, adding to the cumulative adverse impact these and other species are faced with would constitute a significant effect with lasting and unpredictable outcomes, not only to the wildlife but to the hunting, fishing, and gathering rights of indigenous peoples.	WI3,G9,CR1,CR4

329	I'm writing to indicate my support of the PolyMet Mining NorthMet Project. Because of the number of jobs it will create, this project will contribute greatly to the economy of northern Minnesota and beyond. It's my belief that PolyMet can produce precious metals in an environmentally sound manner and follow Minnesota's strict requirements to protect our air, water, and land resources. It makes more economic and environmental sense to mine and process these metals in one location - keeping jobs and the metals here in the United States where they're needed.	EOO
<b>Sender Last Name:</b> Bethke		<b>Submission ID:</b> 321
339	Once again greed & ignorance seem to go hand in hand. Not that many years ago there were laws written to protect these sacred waters. Get off & away from the BWCA know.	EOO
<b>Sender Last Name:</b> Bevis		<b>Submission ID:</b> 1352
1579	I trust you are carefully considering the permitting process for this project. I urge you to keep our water quality at the top of your list. I am concerned with the high potential for acid drainage and the cost of cleaning. I value the ecology and natural history of the Boundary Waters and northern Minnesota. Please keep our distinctive natural resources and history in mind.	EOO,G4A,G7A
1580	I'm writing to encourage you to do everything you can to make sure sulfide mining does not occur in northern MN. The BWCA & Superior National Forest are full of plants and animals that would greatly suffer if open pit mines were to move into the area. The potential economic gains are greatly overshadowed by the long-term damages to the environment. I trust you and your colleagues will do the right thing for the future of our state.	EOO,G2C
1581	I am writing to express my concerns about proposed hard rock mining in the Superior National Forest in Northeastern Minnesota. The BWCA's proximity to these projects alarms me especially, as this region has been a treasured part of my summers for almost all of my life. An open pit sulfide mine's potential environmental impact for decades to come is not worth the short-term economic benefits. I am eager to hear your perspective on this critical issue.	EOO,G11

212	Please abide by the precautionary principle and require PolyMet to prove without doubt that the available technology will not lead to pollution. They claim it won't, but as noted in the DEIS, pollution will eventually happen. Please do not sacrifice the health of a federally protected wilderness.	G2
<b>Sender Last Name:</b>	Binnell	<b>Submission ID:</b> 3368
3658	As a born and raised Minnesotan I am lucky enough to say that I had the opportunity to visit the boundary waters many times in my short life. The thought of someone risking what we have for 20 years of mining makes me furious. It's irresponsible and down right stupid. I want to be able to take my grand children to the boundary waters and fish and drink out of the lake just like I got to do. If we allow the mining companies to mine the boundary waters I might not be able to do that.	G11
<b>Sender Last Name:</b>	Biondich	<b>Submission ID:</b> 203
201	I would like to express my support for the NorthMet Project being developed near Hoyt Lakes. This project will give a needed boost to the economy of not only northeastern Minnesota, but will also contribute to the economy of the whole state. Hundreds of jobs will be created for the mine itself and even more spinoff jobs. This will add to the tax base to support our schools and communities. PolyMet has met all of the environmental requirements of the state of Minnesota. Furthermore, many of the metals produced by this mine are needed in the manufacture of green technology products such as catalytic converters and hybrid cars. I have lived in this area for over fifty years and have enjoyed the lakes and forests my whole life. I can assure you if there were a real threat to the environment neither myself nor many of my neighbors would support this project. That has been proven in the EIS not to be the case, so I am in full support of the NorthMet Project. I also feel that using the old Erie/LTV Minesite is a smart move. Reusing existing facilities and being in the footprint of a former mining operation minimizes disturbance of any other wetlands or forests. I also feel that we have become too dependent on other countries to provide metals that we use every day. Foreign producers of these metals don't always have to follow the strict environmental guidelines we do in this country. This creates a larger global impact on the environment. I think PolyMet has shown it is a good corporate citizen and has been very open with the public on all their plans for this project.	EOO

1	I've read the draft impact statement summary, and they talk about not mining and say that if they don't mine, that doesn't create any pollution, except for reclaiming the mine holes and some other things like that. And that is not correct, and it should be changed. The reason is someone else will mine if we don't mine, and pollution will result from that mine; it just won't be here. You could say that that pollution is outside the scope of the study, but to say that it won't happen would be an error. The only way to keep that from happening, it's a supply and demand thing. If the demand for copper were reduced, then other people wouldn't mine. But as long as the demand for copper stays strong and we don't mine, then someone somewhere else in the world will mine, and the chances that they will mine in a more environmentally friendly way than we do are small. So the most likely thing is that if we don't have the mine here, it will increase the pollution in the world from copper mining because wherever else it gets mined probably won't be done as well as it would be done here. And I just think that should be corrected. That's it.	ALT1
259	This is my comment concerning the PolyMet Draft Environmental Impact Statement. My position is that not mining copper in Minnesota will raise the level of pollution in the world. Those who think that preventing mining in Minnesota will lower pollution are basing their analysis on too local a view. They assume that if one mine is not allowed to operate there will be a reduction in pollution. That would only be true if no other place in the world would increase their mining activities to make up for the lack of production taking place in Minnesota. That simply will not happen. Any economist who believes in the law of supply and demand will say that the supply of a product will rise to meet the demand for that product. That means that if the demand for copper is strong and we are not mining copper in Minnesota, someone else somewhere in the world will be mining copper to meet that demand. We have no control over who that will be, how their mine will be operated, or how they will process their ore. The US Geological Survey estimated that Chile mined 3,735,900 metric tons of copper in 2005. They were the top copper mining nation that year. They were followed by Indonesia, Australia, Peru, China, and the Russian Federation in that order. The United States was next on the list producing 586,000 metric tons that year. I suspect that if we do not mine copper in Minnesota, and the demand for copper remains, Chile could take up the slack. If not Chile, then perhaps it would be Indonesia or one of the other top producers. Look at those possibilities. What nation among them would insist on the water quality standards that the Minnesota Pollution Control Agency and the Minnesota Department of Natural Resources will hold PolyMet to? Which nation among them would insist on an autoclave process and not allow a smelter? I believe the world will take up the slack for any mining that we don't do in Minnesota. I believe that the level of pollution associated with the mining done elsewhere in the world will most likely be dramatically higher than the level of pollution from the mine at the PolyMet project. I believe that PolyMet and the agencies that regulate pollution in Minnesota have come up with a plan that will keep the pollution from this mine at a very low level. I believe the operating permit ought to be issued. Although the pollution that would result from not operating this mine will not originate in Minnesota, it will take place somewhere on this earth. The air and the water will be polluted. The people, the animals and the plants from somewhere else will be damaged because we are not mining copper in Minnesota. I believe that limiting pollution in other places is just as important as limiting pollution in Minnesota. Issuing this permit to mine copper in Minnesota will reduce the level of pollution from copper mining in the world.	EOO

2494 I wish to go on record as opposing the proposed sulfide mining project in the Arrowhead region. I believe that our waters are too important to pollute no matter how many jobs the project might create. Clean, healthy water is critical for both human consumption and for the existence of wildlife. The DEIS identifies the following: Water from waste rock piles will be polluted for up to 2,000 years. For 40 years after mine closure, the West Pit will overflow and begin discharging polluted water into the adjacent Partridge River which flows into the St. Louis River and then into Lake Superior. Groundwater at the mine site will be contaminated with heavy metals. Enormous sulfate releases will exceed the state standard for wild rice and will likely eliminate wild rice in the Partridge and Embarrass Rivers and the St. Louis River estuary near Duluth. There may well be additional damage not disclosed by the DEIS. The identified damage and pollution is totally unacceptable. The project should be abandoned. The project should not go forward even if the mining company pays for all the damage and water pollution prior to beginning the project.

3117	The DEIS identifies many significant, irreversible detrimental impacts to wetlands, groundwater, streams, and wildlife. The DEIS further admits substantial uncertainty with respect to the actual degree of pollution and damage that will result from the Project. The DEIS appears to propose that replacement wetlands would be at locations so far removed from the Project site that they cannot possibly offset the habitat fragmentation that the Project will cause in the 100 Mile Swamp. Further, the DEIS improperly proposes leaving to the permitting stage the vital issue of financial assurance for cleanup and restoration. Many of these problems, and others, are identified in the comments of the Bois Forte Band and Fond du Lac Band; because of the treaty rights of those tribal cooperating agencies, their comments deserve great weight. The Proposed Action as described in the DEIS contemplates a project massively-destructive in its scope; the relatively few short-term jobs that will allegedly be created are virtually insignificant in comparison to the damage that will be done to the landscape and to sustainable economic endeavors in Northeastern Minnesota.	EOO,G2C,G4,G7C,G15
18296	I am for clean water. I am against this proposed nonferrous mining in Minnesota because neither PolyMet, nor anyone quantifiably knows the extent to which these dangerous mining processes will pollute our waters, land, and fauna, only that they will. The draft EIS admits this. The risk is unacceptable, because at stake is something far greater than the minerals. Minnesota contains almost one tenth of the total inland water area of the nation. At risk is the last large remaining resource of clean water for the continent. Our clean water is invaluable to the people of Minnesota, the United States, and Canada.	G7
18297	It would be disastrous for Minnesota to gamble away its diverse ecosystem to nonferrous mining. Degradation of our clean water resource would have far and deep reaching consequences.	G7
18298	violation of the Federal Clean Water Act for over 15 years. PolyMet nonferrous mining should have no business establishing itself in Northeastern Minnesota with a risk magnitude of its proposed size, after even a small test-run for copper nickel mining, as demonstrated with Dunka, proved unsuccessful.	G7
18299	We may live in a world where so often money and business control and destroy the natural order of things, but all people share stock in the natural order. It is the responsibility of our MEPA and USEPA to hold as priority the full value of the environment around and under us, to safeguard it, and not to permit it to be sold and poisoned.	G10
18300	1. The dEIS does not address the financial assurances that would adequately protect taxpayers against clean-up costs. The latency of acid mine waste migrates and intensifies years or decades after closure, warranting serious attention. An example of concern is again, from the Dunka aquifers, which have buried down deep the Big Plume, which will eventually surface in the Dunka River.	G9
18301	2. If PolyMet is using new technology, what is it? I was unable to locate the description of the new technology in the dEIS, other than Platsol. Based on the evaluation by the dEIS, the technology may be new, but with old results that fail to safeguard 100%. Nothing less than 100% is acceptable when it comes to clean water. Monitors are unreliable, and/or reckless.	PD8
18302	3. The dEIS would serve itself well to address the issue of the contaminants that will be unearthed and dispersed with mining at the site and plant. a. What are all of the anticipated waste products? Is uranium or hot water an issue? According to the federal EPA, Northeastern Minnesota is a target area for uranium, as demonstrated by intent to mine uranium in the past. It would seem prudent that up-front data be in place prior to any activity (leasing, exploration, or mining) to prevent uranium exposure, that is not of natural occurrence. b. What do we do with these contaminants? There were zero documents in the dEIS regarding adequate, long-term treatment for waste rock, land, and water reclamation.	WR1E,PD2
18304	4. Groundwater seepage exceeding aquifer flux capacity resulting in significant seepage upwelling and wetland impacts is a horrifying situation which can never be mitigated.	EOO,WE2
18306	5. Degradation of aquatic habitat directly affects the natural chemistry of watersheds and beyond, as all life forms in the environment are related.	WR5A
18307	6. Contamination resulting in cumulative loss of wildlife habitat and migration routes throughout the Iron Range, is a troubling thought, radical in the breakdown of the balance and beauty of a natural community.	WI2

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
18308	7. No data as to how much leakage from the mine site and plant that will flow into the Partridge, Embarrass, St. Louis Rivers, and surrounding wetlands is frightening. The dEIS needs to speak directly and clearly to the contingency plan with specific criteria as to limits that would trigger shutdown. Once again, what about the monitoring of all operations? Will there be on site monitors, who will monitor (the MPCA?) and how frequent will the monitoring take place? Is there money for all this critical environmental protection?	WR1E,WR3I,WE2,WE3,PD
18311	8. The overall tribal loss of access to lands and natural resources within the 1854 Ceded Territory, despite the land exchange, speaks of cultural disrespect.	G3,CR4
18312	9. Two public hearings for PolyMet’s nonferrous mining proposal and it’s dEIS were held by the DNR in December 2009 in Aurora and Blaine. There, the DNR, mining representatives, government officials, and union leaders were allowed to voice their support of a \$600 million copper-nickel mining operation. The citizens representing their concerns, however, were not allowed to speak out. Instead, they were directed to give their comments to stenographers. Even though an attachment in the dEIS stated citizen commentary at the hearings may be in written or vocal format, the representation of opinions was muffled. The scene was disgraceful and unfair.	PRO6
18313	In conclusion, nonferrous mining is not in the best interest for our state. To no longer have Northern Minnesota with its forests, waterways, and wetlands as they are today, to no longer trust that water will be clean in our nations most valuable wilderness area, would be a fatal blow to the growing, sustainable tourism-economic base, which residents and business owners have worked hard in developing and maintaining. Furthermore, the BWCAW cannot exist with these mines. Nonferrous mining would be a huge waste producer. Nonferrous mining should be banned from Minnesota as it is in Montana and Wisconsin, until 100% safe methods are PROVEN. Our ecosystem is too fragile and valuable to be tampered with by the nonferrous mining industry. WE WANT TO SAVE THE BOUNDARY WATERS! I believe the risk of irreversible contamination to areas in and surrounding the BWCAW should not be foisted on the coming generations. I empathize with the pressures of your decisions on this issue, but with all my heart, hope you will not permit nonferrous mining to develop in Minnesota.	EOO,G2,G11
<b>Sender Last Name:</b> Bitker- <b>Submission ID:</b> 3380		
3670	Some of my fondest childhood memories occurred while on family trips to the BWCA. I would hate to see this peaceful sanctuary destroyed by the sounds of drilling and sulphuric acid pollution. Destruction of the area rivers and fish populations would have a devastating effect on the areas economy. My father, all my aunts and uncles, are forever going “up North” on exciting fishing trips. They’re not going to go where there’s no fish. Don’t let mining and supposed resource gain destroy our most precious of resources, the water and wilderness of Northern MN.	G2C,G7A,G11
<b>Sender Last Name:</b> Bjerke <b>Submission ID:</b> 132		
121	My biggest points are that if the standards aren't high enough, we are still going to pollute the area. The water is not clean enough. Eighty percent of our kids are sick by the time they are two or five; it's just horrible. And so it shouldn't be done without stricter guidelines, not just meeting them, but what is really good for us, what's good for seven years from now. The Indians had a better idea of how to take care of land and their people than what we do. At times I think we should be on the reservation and they should be making decisions. The company is not an American company. Make it a Minnesota company. We need the jobs. One, we need the jobs. Two, recycle it first. We are throwing stuff away that they are going to mine out of there. Recycle what we are throwing into the landfills. Then you can dig up and rape the land if you need it to survive. That's it.	EOO,G5
714	I AM ASKING; for an extension of the comment time for at least thirty (30) additional days to March 8. A project of this scope demands time for careful consideration. ABSOLUTELY! Here is why. I went to the Blaine Sports Center looking for information I have only now found on the Sierra web site.	PRO6

Comment ID	Comment Text	Theme Codes
2597	SHAR BJERKE: This is in addition to my other comments. After listening, it sounds like they are being very environmentally wise about this. The jobs are important, but I want them to step back ten more steps and look at the whole thing. I want the sulfate taken care of. It appears that there are existing and new ways to take care of the sulfate so that it doesn't end up in the organic matter and making mercury for our water and for our fish. And I think they are going to have to take care of that right away. There are possibilities of making product or neutralizing it, wrapping it up. It just doesn't go away. Once you create something, it's there. So the sulfate is there and you have to put it into something. If it's Sheetrock, then fine. That works. If it's something else -- it should be done right away so that it doesn't go into the environment. Best case scenario is making it into another product that we make right there, then all that property is worthwhile as long as everything is self-contained and environmentally3 taken care of, and jobs are created in the process of doing it. The other part of what we discussed is if we are going to be mining out something, metals and raw materials, we should be required, at least in our state, to recycle all of them and have plans in place so that it can't be such that your city doesn't do that. All of those things should be recycled before we dig up more, because anytime we separate out elemental things that nature didn't want or didn't have naturally separated out into those elements, there is a way of a problem for causing blood-brain barriers and making people ill and pollution that's really damaging. So cell phones, there was talk out there that cell phones are being recycled, melted down, and being recycled for their raw materials. We should be doing that instead of creating more. Computers and whatever else, and I'm not enlightened as to what other things should be, but we shouldn't be allowed to throw away or put in a landfill or have recycling centers that have you separate out everything and then they put it in a landfill and don't recycle it. Those things should not be happening if we are mining out new raw materials. All the existing and discarded items should be required to be recycled, and we should be making business out of it. If somebody else can make a profitable business out of it, we shouldn't be shipping it anywhere. We should be separating it out here. And they are more than welcome to set those operations up, up there.	G1,G2C,G9,G14

Comment ID	Comment Text	Theme Codes
2409	Require financial assurances in the EIS before the permitting process gets underway. Money needs to be set aside for perpetual(hundreds of years) treatment of water discharges and tailing basin maintenance. Financial assurance also need to be put in place to reimburse property owners in case of a drop in property values due to toxic pollution. The property value of my lake home on Birch Lake will be directly affected, if not by the Polymet mine, then by the Franconia mine. Financial assurances should also be in place to make the community whole again after the mine closes. Unemployment payments, worker retraining, food stamps, welfare, etc.. should come out of mine profits, not the rest of the state's citizens' pockets.	PD4
3559	Please direct me to where I can read all of the public comments.	RFI
<b>Sender Last Name:</b>	Blake	<b>Submission ID:</b> 3538
3801	I am very concerned about the proposed mining plans that seems to be moving ahead? If you take a look at the past practices that this minig firm has done I can't believe there would even be any thought of moving forward? I know folks up there really needs jobs but this would only be short term till the mining company has taken all the can get. Then they will leave us with a huge mess that may not even be possible to clean up. They can make all the assurances they want about how they can contain the pollution. Check out what happened in Michigan with similar techniques. I believe they now need the Super Fund to help them clean up the mess. I hope whoever is reading this will take a hard look at long term affects on our envionrment rather then shortr term jobs and money for the state. It just doesn't add up.	G2,G4A
<b>Sender Last Name:</b>	Blesi	<b>Submission ID:</b> 1835
2445	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. The proposed mining project is stupid and outrageous. If allowed to happen, it proves we don't deserve to be here and we won't be here.	EOO,G2
<b>Sender Last Name:</b>	Blomstrom	<b>Submission ID:</b> 2711
3175	Make sure you have enough rersources to clean up any problem you create. We do not want a similar situation as in The Exxon Valdez oil spill in Prince William Sound. The cost of this project should include making sure the environment stays the way it is now.	G4A,G6
<b>Sender Last Name:</b>	Bloomquist	<b>Submission ID:</b> 2330
2790	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. I do not want the most beautiful part of Minnesota to become another Sudbury, Ontario or Butte, MT. The chemicals released into the waters from the metals processing will eventually destroy the area for generations to come.	G7A

1157	I support the Nortmet development project. This will be great for the local economy with minimal impact on the environment. I have been following the progress of this project for aver ten years from my home in Connecticut. Thanks for doing a great job.	EOO
<b>Sender Last Name:</b> Boerst		<b>Submission ID:</b> 351
70	Some resentment has been expressed on the means by which the public comment sessions were held. I believe they were very well-planned. They were instructive and allowed people to voice their opinions to the agencies involved. The public comment period has already been extended over what is put forth in the guidelines. We need no longer. If people want a soapbox to speak from to publicly address the people themselves, they have had more than enough chances. Many public forums were held by those opposing the project, websites are available, organizations can be joined, newspapers have printed countless opinion articles, and news stations have broadcasted opinions both on TV and the radio. There has been no lack of public input and education. The time to finish this is now.	PRO6
388	I appreciate being given the opportunity to participate in the public comment process on the Draft Environmental Impact Statement (DEIS) for PolyMet Mining Company and to add my voice to the thousands of Minnesotans who want to create jobs and to produce metals in our local economy in an environmentally friendly way. I commend the involved agencies on the amount of effort that was put in to this project in a way to appease all concerned parties and yet protect our environment. In brief, I believe that the MN-DNR should deem the draft EIS for Polymet as more than adequate and issue a final EIS, leading to the mining permit. This proposed polymetallic mine is necessary for Minnesota, its citizens, and the entire nation. Firstly, as I live in the area near the proposed project, I see a growing tide of economic depression. Many people I personally know hold down multiple poor-paying jobs that do not provide necessary benefits such as health care just to make ends meet and to feed their families. The means of survival in this region and current economy are daunting. How can we put the opinions of a few over the physical, mental, and economic well-being of the many? The Northmet project would provide direct employment to over 400 Minnesotans eager to be put to work for many years. Besides the direct employment, this venture will produce countless spin-off jobs. What many laymen fail to include in their economic impacts is apart from the direct creation of new jobs. The real impact is the sound of copper ingots trickling into the pockets of every man, woman, and child in the region and spreading out across our hungry nation. As a few hundred people will be given well-paying jobs, they will now have disposable income to spend. This money will primarily be spent in the small businesses of local entrepreneurs, but will extend its reach. As these businesses conduct more business, the money is spread farther, helping us all. Secondly, our education system in Minnesota has and will be served leaner servings of a budget every year. With the Minnesota state budget now in gross deficit, the proposed mine will provide a necessary bolster to our schools. Years past, Minnesota's education system shined brightly among national standards due to the taconite mines now in operation for over a century. This base metal project is simply a new generation of benefactors for the next century. What is on the minds of many of this project's opponents is the potential environmental impact. I will be the first to admit that, yes, it will have an impact, but albeit negligible. Any action pursued by humankind, including brushing your teeth, checking your email, taking medications, or waving an antiananything flag has an environmental impact. The question is: What is acceptable, and what is not? Since the initial moratorium on sulfide mining in Minnesota decades ago, the state along with other agencies and entities have agreed upon what is acceptable as an environmental impact from such a project. The plans put forth by Polymet and the government agencies for the operation of this project meet or exceed these restrictions, thus the DEIS should be deemed adequate. Minnesota has some of the most stringent regulations in the world on sulfide mining. As we still need to consume these metals, where then should we mine? "Not in my back yard" mentality has taken a strong footing. Maybe we should let them open a copper mine in China. Let the pollution be made over there. The problem is that we not only live in a global economy, but more importantly a global environment. We in Minnesota get rained upon by clouds containing well above acceptable amounts of mercury. The source of most of this contaminant is not local, or even from our continent, but its documented source is mainly Asia where environmental regulations are weak. I can then see that there is no better place to mine these metals than right here in Minnesota where, besides keeping the environmental impact in che	EOO

389	In conclusion, I trust in the process and the system. By independent party review, I believe that an possibilities have been covered, alternatives have been presented where appropriate, and the proper mitigation procedures will be implemented to protect our precious environment. Many years and over twenty million dollars have been expended on this project. That said, I believe the DEIS is more than adequate, and the DNR needs to deem it so as well and finally finish this project. Permitting based upon the information put forth in the DEIS should begin immediately. Any further delay is a moot effort.	EOO,G10

2866	PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. There's something wrong with this sentence. It doesn't belong in Minnesota. It doesn't belong on public lands. Minnesotans - and actually most people - view this state as a gem of natural beauty. Why would we take the chance of spoiling the one thing we have going for us? I beg for some serious thinking about letting this "genie" out of the bottle. There are literally millions of other places around the globe that offer good access to this mineral with far less potential degradation to the environment. To patently allow someone else to make profits off of public land like this is a sad state of affairs for the DNR and ACE Thanks for thinking this through to doing the right thing.	EOO

213 I am in full support for this project to get started immediately. I find it very difficult to understand why it has taken 7 years for this project to NOT get off the ground! I can not imagine why anyone would want to impede world progress by opposing this project. The world needs these commodities! This mining process would use a hyro process not the the pyro process that our grandfathers used! Are we to purchase these commodities from foreign countries, many of them third world countries, with no care for the environment whatsoever? Polymet will be scrutinized every step of the way. They will use state-of-the-art technology. I can only imagine what the economic impact will be to our now economically depressed area. The Iron Range is, was and always will be MINING COUNTRY! Please, please help get this much needed project started!

275 Malton Electric Company's management and its employees would like to express their support for the PolyMet NorthMet Project. Malton has been a provider of electrical equipment and services to the mining, electric power and wood industries for more than sixty years. The PolyMet NorthMet Project would require electrical equipment and services of the type we typically offer to our other area industries, thereby providing growth and additional employment for our company. PolyMet would be a leading innovator of the production process that will protect the environment while providing domestic sources for critical materials required for new energy efficient vehicles and other technologies. Malton employees live in Northern Minnesota because they enjoy the many benefits of the recreational areas and lakes and the many opportunities they provide for outdoor activity. Our sportsmen and women are very aware of preserving the environment and feel that PolyMet has done their homework to ensure an environmentally protective process. Malton suffered employee layoffs with the closure of LTV Mining Company's facility in Hoyt Lakes which PolyMet intends to utilize for part of the production process and we look forward to participating in the revitalization of the facility.

170 It is difficult to imagine that after five years of review in one manner or another that every conceivable question about Polymet Mining's Northmet Project has not been asked and answered. I believe we are well past this point and are now asking nonrelevant questions or are just asking the same questions over and over again in different form. This has to end. So many resources on all sides are being wasted covering the same ground. Many other worthwhile concerns are being ignored with all the effort that is going into trying to find fault with Northmet. No state has the resources to continue such a pointless effort when there is so much need elsewhere. Northmet is a good project with good people at the helm. We are taking an already existing industrial site, recycling the infrastructure that is already there for a new and valuable use, and doing it in a way that could not be positively environmentally matched if done anywhere else in the world. There is so much on the plus side environmentally that it has to outweigh the lack of the existence of an unrealistic one hundred per cent guarantee of no even unappreciable harm on all issues. Northmet is a good project that deserves to move forward now.

1	Moreover, even the assertion that the Project must use Minnesota Power is not entirely correct. The DEIS and the Barr report to which it refers argue that the Project would have to be powered by Minnesota Power, pointing to a state law on exclusive service territories for energy companies, Minn. Stat. § 216B.37, and to an exception, Minn. Stat. § 216B.42, Subd. 1, that apparently would not apply to the Project. The DEIS and the Barr report gloss over other options, including the one presented in Minn. Stat. §§ 216B.40, which allows use of a different power company if the usual company agrees in writing; and the self-generation exception, Minn. Stat. § 216B.1621. As to the first option, the DEIS documents simply assert, without further explanation that it is “not likely applicable to PolyMet.” <sup>111</sup> As to the second, the company suggests that because it is a mining company, it lacks the technical and business savvy to operate a power plant – a proposition with which several mining companies in Minnesota, including Cleveland Cliffs (Silver Bay) and the old LTV Steel (Taconite Harbor) would certainly disagree. The DEIS asserts arbitrarily that self-generation, “is outside the scope of reasonable alternatives to reducing carbon emissions at this time.” <sup>112</sup> The treatment that the DEIS gives to the available alternatives for power production and power selection by the Project does not satisfy the requirements of 40 C.F.R. §1502.16.113	AQ5
2	The DEIS and supporting documents take pains to assume that the bulk of stable carbon currently stored in peatlands, but slated for excavation, will remain in solid form and not be released into the atmosphere through oxidation. Specifically, the DEIS estimates that the peat slated for excavation and stockpiling is equivalent to 1,780,000 tons of CO <sub>2</sub> . <sup>114</sup> The DEIS estimates that only 23,000 metric tons of CO <sub>2</sub> equivalent per year (m.t.CO <sub>2</sub> -e/yr) would be emitted from the oxidation of peat held in stockpiles over the 20-year life of the mine. This conclusion should be better explained, and work that went into the calculations should be shown.	AQ3
4	The DEIS’s estimate may be contradicted by comments of the MPCA, which suggests that land use emissions should be evaluated as a pulse emission in the initial year, rather than distributed over some longer time period. MCEA notes that land use emissions must include not just the conversion of above-ground carbon into gas, but also the conversion of all below-ground carbon in upland and wetland soils that will likely occur sooner and more rapidly than would be the case if the peatlands were left undisturbed (i.e., under the no-build alternative).	AQ3
4	Also, in addition to the carbon emissions from peat stockpiled over a 20-year period – which the DEIS and its supporting document (AQ05) discuss and attempt to quantify – will account for only a portion of the peat’s carbon emissions. An emissions spike will occur when peat used for mine site and tailings basin reclamation. <sup>115</sup> As peat is spread thinly over a large area during reclamation of the mine site and tailings basins, the ratio of surface area to volume will increase, and with it the peat’s exposure to the effects of heat, oxygenation, and dessication. These are the main factors that will drive the spike in reclamation-timed carbon emissions from once-stockpiled peat. This spike is a land use emission, and must be evaluated as the MPCA suggests: as a pulse emission in the initial year of the Project.	AQ3

1118	PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue	WI1
1323	to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	GT2
3237	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine’s closure, as well as tailing’s basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes	EOO,WR4B,FM1

1	Rather than make a proper accounting of peat-carbon volatilized during and following reclamation, the DEIS and its supporting documents suggest, speciously, that all peat used as mulch in reclamation should be considered a mitigation or carbon offset.116 The fallacy of this suggestion should be apparent, since if the Project were not constructed and excavated, there would be no need to use on-site peat reclamation; there would be no "site" to reclaim, and thus essentially all of the carbon now stored in the peat would remain locked up. The necessity of addressing these problems with the carbon emission calculations for the Project cannot be over-emphasized. To demonstrate the significance of peatland carbon's fate, consider the effects on Project total emissions if all the excavated peat were to be volatilized: the Project's estimated carbon footprint (as measured in m.t.CO2-e) would jump from 744,000 to more than three times that much, or 2,524,000. Instead of bumping statewide CO2 emissions by 0.62%, the bump would be more than 2%.	AQ3
2	The NorthMet DEIS should include mitigation options that can be imposed in the permit with regard to GHG emissions. These mitigation measures need to show that the project can be consistent with Minnesota's GHG reduction goals.	AQ5
3	Of principal concern in this review of the NorthMet project is the possible enhancement of methylmercury production and the potential for significant mercury releases to air and water. Regarding mercury methylation, the relevant factors are the amount and location of predicted sulfate discharges, whether there are methylating environments along the flow path, ambient levels of sulfate in the receiving waters, and seasonal hydrologic fluctuations that could alter the redox (oxic vs. anoxic) conditions where SRB occur. The DEIS provides a reasonably balanced overview of the potential for sulfate to increase mercury methylation and concludes that seepage from the tailings basin and pit overflows, " ... would introduce elevated sulfate concentrations to a high risk situation for mercury methylation." (4.1-127, 4.5-21). However, it also tends to downplay this concern by suggesting that sulfate levels may not be limiting mercury methylation where legacy sulfate releases (from former LTV operations) have already raised sulfate concentrations to high levels (4.5-21). While this may be true in a limited senses (those locations and sampling dates), it ignores the complexity of the landscape and hydrologic variability which could produce a different outcome (increased methylation) in other locations or at other times. My overall assessment is that the NorthMet DEIS is deficient in its evaluation of the risks of increased mercury methylation and the development of contingency plans for adaptive management should unforeseen problems arise. The principal deficiencies are as follows:	WR4B,FM1,FM4,AQ6A

Comment ID	Comment Text	Theme Codes
4	<p>Four lakes located along the Embarrass River downstream of the NorthMet project (Sabin, Wynne, Embarrass, and Esquagama) are potential high-risk sites for sulfate-enhanced mercury methylation. The four lakes are also 303d-listed for mercury in fish tissue impairment (4.1-40). There are no water quality data for these lakes in the DEIS or supporting documents, but monitoring results from an upstream site on the Embarrass River (PM13) show elevated sulfate levels (mean = 36 mg/L), a consequence of legacy mine drainage from LTV Pit 5NW (4.1-41, 4.1-122). The fish mercury levels in these lakes are in the high range for northeastern Minnesota, though a comparison with other regional (non mine-impacted) lakes in the Barr Technical Memo (HG02) was biased and not useful as an objective evaluation (see MPCA and DNR responses to HG02). Nonetheless, the question remains as to whether fish-mercury levels are currently elevated in the Embarrass lakes because of legacy sulfate discharge (sulfate-enhanced methylation) or because of other factors known to contribute to high fish-mercury - in particular the presence of extensive contributing wetlands and high DOC (dissolved organic carbon) levels in the upper Embarrass River (4.1-125). The important point I wish to make here, and as noted in the DNR response to HG02, is the potential for enhanced mercury methylation in the hypolimnia of these lakes during summer stratification, should bottom waters become anoxic. The zone of active mercury methylation can move from bottom sediments into the water column as oxygen becomes depleted, and hypolimnetic methylation can be a very important in-lake source of methylmercury (Eckley et al. 2005; Munthe et al. 2007). Moreover, sulfate reduction, especially during periods of stratification, could consume much of the current sulfate load to the first lakes in the chain, thereby rendering lower lakes susceptible to increased sulfate inputs. My understanding is that PolyMet (Barr Engineering) is currently conducting water-chemistry sampling in the Embarrass chain of lakes (under advisement from MPCA and DNR staff) in order to assess the potential for in-lake methylmercury production.</p>	WR1E,WR4B,FM1,FM2
5	<p>The DEIS points out that there are few wetlands or lakes on the middle St. Louis River where sulfate-enhanced mercury methylation would be a problem. However, the document only briefly considers the potential for mercury methylation in the St. Louis River estuary (4.1-196). Sulfate concentrations in the lower St. Louis River are relatively low, as compared to upper reaches principally because of dilution from major (non-mining) tributaries such as the Cloquet (4.1- 195). At lower concentrations, sulfate tends to be a limiting factor for mercury methylation by sulfate reducing bacteria, and increased sulfate inputs are more likely to stimulate SRB activity. We currently have little information regarding the methylating potential of the estuary, but its shallow and relatively productive waters suggest that it could be high (Munthe et al. 2007). This section of the river is state listed for fish-mercury levels as well as for mercury in water (4.1- 194). Equally important, the estuary supports a rich recreational fishery and abundant wildlife, and is a critical cultural resource for the Fond du Lac Band of Lake Superior Chippewa. The failure of the DEIS to address mercury-exposure risks in the estuary associated with the NorthMet project is a serious oversight. Based on this near-complete lack of information it is difficult to see how the DEIS can conclude (4.1-196) that, "Overall, the Project is not expected to contribute significantly to cumulative effects on mercury or methylmercury in the St. Louis River."</p>	WR4B, WR5A,WR5C,FM1
6	<p>PolyMet proposes a wastewater treatment facility (WWTF) at the mine site which would treat process water and runoff from other site operations (4.1-67,68). The proposed treatment system would utilize chemical precipitation of drainage with elevated trace metals and/or low pH followed by nanofiltration to concentrate the circumneutral drainage with lower levels of trace metals. The nanofiltration would remove an unspecified amount of sulfate, yielding process water with a residual concentration of 250 mg/L, which would then be pumped to the tailings basin for reuse or to expended mine pits for flooding. Under a proposed mitigation option, the WWTF could be fitted with nanofiltration units in series to improve the removal of sulfate and other solutes. (4.1-167). Other discharges, including leakage from the tailings basin, would not be treated for sulfate removal, and surface waters would be impacted accordingly. There is no discussion of the expected efficacy of the WWTF mitigation option nor is there any consideration of alternatives (e.g. sulfide precipitation in the mine pits) that might reduce sulfate concentrations in discharges closer to background (natural) levels. The DEIS appears to accept the inevitability of high sulfate loading from the NorthMet Project to area surface waters, even as it recognizes cumulative effects of high sulfate from legacy mining and other proposed operations (e.g. Mesabi Nugget) (4.1-189).</p>	WR1E,WR2G

**Theme Codes**

7 A constructed wetland in the filled East Pit of the NorthMet mine-site is proposed as a means of treating ("polishing") mine-site drainage following closure (4.1-112). Little information is provided regarding the nature of this wetland (water depth, vegetation, residence time, substrate), and it is very difficult to predict its efficacy in treating contaminated drainage waters (4.1-112, 4.1-123). However, another issue not addressed in the DEIS is the potential for mercury methylation in the constructed wetland. While natural wetlands are important methylation sites, the constructed wetland may function very differently, depending on whether there is an organic rich substrate supporting redox conditions suitable for sulfate reducing bacteria. If sulfate inputs to the wetland are very high (as expected), methylation could be inhibited by high sulfide levels which favor charged mercury-sulfide species that are not readily methylated (Benoit et al. 1999). Again, it is very difficult to predict this outcome based on first principles. However, constructed wetlands at the nearby Dunka mine, which currently treat rock-stockpile seepage, would make a good a case study for evaluating mercury cycling and methylation under conditions at least approximate to those proposed for NorthMet.

WR4B,WE6

7 It is difficult to fully evaluate the potential for mercury releases to air and water from the proposed NorthMet project, but if DEIS estimates are even remotely correct, the numbers will be low relative to other mercury sources. Based on the observed performance of other tailings basins used for taconite processing (Berndt 2003), I would expect high retention of dissolved and particulate mercury and low concentrations in outflow waters - as documented in the DEIS (4.1- 124). A large area of wetland and forest soils will be cleared at the mine site, with the resulting stockpiles of peat representing a large potential source of mercury and methylmercury that could be mobilized with subsequent drying and oxidation (4.1-123). Drainage from these stockpiles would be captured and routed to the WWTF and from there to the tailings basin or later, the constructed wetland and flooded mine pits. Neither the WWTF nor the constructed wetland is expected to be effective at sequestering mercury. Thus mercury discharge from the Project will depend largely on the removal efficiency of the tailings basin or the mine pits. The mine pits are expected to be a fairly effective sink for mercury (through sedimentation), given their depth and hydraulic residence time. The DEIS does not consider the efficacy of the mine pits in removing methylmercury. Both methylmercury loss through photo-demethylation in surface waters and methylmercury production by SRB in anoxic bottom waters are likely to occur and should be evaluated in the DEIS. Air emissions are m'ore problematic, as autoclave and scrubber performance is not assured. Projected annual air emissions of 9 pounds is probably overly optimistic, and in any case would have to be mitigated through emission trading in order to meet targets for the mining sector of the statewide mercury TMDL (4.6-35). A comprehensive monitoring program for mercury releases needs to be implemented for this project should it be approved (4.1-172). That said, it is my professional opinion that direct mercury releases from the NorthMet project represent a much smaller risk of biotic mercury exposure than that posed by sulfate discharges and a resulting increase in mercury methylation in receiving waters of the St. Louis River and tributaries.

Comment ID	Comment Text	Theme Codes
8	The discharge of sulfate-laden waters from the mine site and tailings basins, either during operations or following closure is among the most serious environmental risks posed by the proposed NorthMet project. Based on a large body of experimental and observational evidence, it is my view that these discharges are likely to increase the microbial methylation of mercury somewhere in the watershed of the St. Louis River, either in wetlands or lakes proximal to the mining/processing operations or possibly downstream in its estuary with Lake Superior. This increase in methylmercury production will be transferred up the food chain to increased levels of mercury in game fish, with the attendant increase in human and wildlife exposure. Lakes along the Embarrass River as well as the St. Louis River itself are currently state-listed as impaired (303d) for high mercury levels in fish, which raises important regulatory questions for proposed activities that might further increase methylmercury exposure. To some extent, the DEIS downplays these risks by emphasizing legacy conditions of high sulfate levels from past mining activities in certain river sections and tributaries. While it is unlikely that additional sulfate inputs will stimulate methylation in some specific stream reaches (because sulfate may not limit SRB activity at high concentrations), it is probable that sulfate concentrations will fall into a more sensitive (lower) range further downstream as a result of dilution or sulfate uptake. The basic assumption here is that increased sulfate loads are likely to generate additional methylmercury somewhere along the flow path of the receiving waters. This point is briefly acknowledged in the DEIS (4.1-125). It is also my view that the DEIS underrates our current scientific understanding of mercury biogeochemistry and the environmental factors controlling methylation rates (4.5-19). That is, there is less uncertainty that mercury methylation will be enhanced by sulfate discharge, than the document acknowledges. While it is still difficult to accurately predict the degree by which methylation will be increased or exactly where in the landscape it will occur, we now possess a solid conceptual framework from which to identify conditions that pose substantial risk. In the final analysis it would be prudent for the state regulatory agencies to require additional on-site sampling and analysis of those sectors of the watershed that represent high-risk conditions for sulfate-induced mercury methylation. The DEIS is equivocal in its depiction of the risks of increased mercury methylation posed by the NorthMet project (4.5-21). Some of this uncertainty arises from the biogeochemical complexity of mercury cycling and methylation. However, firmer conclusions could have been reached had there been a better assessment of existing conditions, including the effects of legacy sulfate contamination from past mining activities. Such an assessment if properly structured could provide a more reliable picture of the project's likely effects on methylmercury levels in the St. Louis River and its headwaters.	EOO,WR1E,WR4B,FM1,F
9	The DEIS should provide a more realistic assessment of the mercury methylation risks posed by sulfate discharges to key sensitive areas (Embarrass River wetlands, Embarrass chain of lakes, Partridge River beaver impoundments, and the St. Louis River estuary).	WR4B
10	Finally, the DEIS wrongly attributes GHG emissions mitigation to the wetlands restoration that it proposes.117 The MPCA stated clearly, in its comments on the DEIS and supporting documents, that, “[s]ince the recovery times of the [natural lands to be cleared and excavated by the Project] are long in relation to the project lifetime, no offset from wetlands mitigation during the lifetime of the project need be considered.”118	AQ3,AQ5
3733	I am very against this project due to obvious environmental concerns. My husband is out of work and may have a chance at a job if this does pass but the environmental concerns far outweigh my financial concerns. Please do not allow this to happen. Thank you.	EOO,G1,G2

<b>Sender Last Name:</b> Braun		<b>Submission ID:</b> 1838
2451	As a transplant from Tennessee to Minnesota, I have grave concerns about sulfide mining anywhere in the world, but most especially on the edge of the BWCA, which I visit at least once a year and have come to love. You see, in the southeast corner of Tennessee, right at the border with Georgia and North Carolina, there is a 50 square mile area that was completely denuded by copper mining that started in the 1840s and continued until the early 1900s. In the summer of 1979 I was in the Youth Conservation Corps in the neighboring Cherokee National Forest. We took a field trip to Copperhill Tennessee. I remember seeing bare orange earth as far as the eye can see. Some parts of the basin appear still to be like that, in spite of years of efforts to remediate the area through tree planting. I suggest you google "copper mining Tennessee" to learn more. I know that the copper mining proposed for Minnesota would use much more advanced technology. However, the environmental damage at Copperhill Tennessee occurred even though most of the mines were closed, and thus the rock was not as exposed to oxygen. There are some things that are extremely hard to control once you set up the conditions for them. Precaution suggests we shouldn't even try, especially not when they pose a threat to a jewel such as the BWCA. There is already concern that the forests of Northern Minnesota are going to be stressed due to climate change. To add another stress on top of that one would be devastating.	G8C,G14

18314	I am providing these comments to express my concerns with the proposals and conclusions that are stated in the October 2009 Draft EIS. I own property in Lake County, and as such am concerned as to the effects that the proposed mine will have on the environment, primarily the surface and ground water resources, not only during its active life, but also after closure. I am also a professional Geohydrologist and have personally written many sections of EISs for the U.S. Forest Service and the EPA. In that regard I would like to say that this DEIS is very well written and understandable. However, after reading the DEIS and all of the supporting information, many, if not most of my concerns have already been relayed to you by the Tribal Cooperating Agencies. Therefore, instead of restating and reiterating their previously-made comments, I would like to reinforce their opinion and comments as those of my own. So when you tally up the comments, please count the Tribal Cooperating Agencies comments as if they were my own. In addition, when you develop the formal "Response to Comments" I would like to receive the full packet of the Response to Comments as you provide to them.	G7A,G15
18315	1) The Financial Assurance that should be required for a project of this magnitude is not discussed and as such constitutes a major omission. As a consultant that has worked on mine cleanups at Superfund sites in the U.S. EPA Region 8 States, I can assure you that the closure and long term post closure costs of this site will be in the 10s of millions of dollars ( in current dollars ), if not more. Therefore, the EIS should include a very thorough discussion of the Financial Assurance of real post closure cost for the worst case scenario. In my opinion, the worst case	PD3,PD4
18316	2) The areas that have the greatest potential for causing ground water contamination (the costliest to cleanup) are the ore pads, the pits and the tailings basins. The EIS states that these areas will be unlined (with the exception some ore pads). I disagree that the tailings basin will not have an impact on the ground water. The preponderance of evidence from past sulfide ore mines is that the ground water always becomes contaminated with metals, although it may take many years or decades for it to occur. The fact is, that it does occur. Therefore, given that historical knowledge, the rationale provided in the DEIS for not requiring "state of science" containment systems for all ore pads, pits, and most importantly the tailings basin, is totally inadequate and can not be substantiated. Given that this mine will extract billions of dollars worth of minerals, there is no sound scientific or engineering reason for the MDNR not to require the installation of the best available liners for all of the pads, pits and tailings areas.	EOO

18317	3) In light of the comments that were provided to you by the Tribal Cooperating Agencies, and the two major comments above, I do not object to proposed mine if all of the comments are adequately addressed.	EOO
<b>Sender Last Name:</b> Breen		<b>Submission ID:</b> 3463
1110	Further, the PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf.	WI1
1316	Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	GT2
1944	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine’s closure, as well as tailing’s basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR4B,FM1
3671	Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone.	PD2,PD4
3742	Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Sincerely,	EOO,G2

2045	I live in Winton, MN which is 3 miles from Ely, MN. I grew up here, and recently moved back so that my children could grow up here. Don't ruin the beauty and peace of the area for other generations.	EOO,G11
<b>Sender Last Name:</b> Brekke		<b>Submission ID:</b> 1887
2467	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. I believe that Polymet is doing it's best to keep our lakes and water clean. I approve them to get permits to carry on as long as they take due diligence in the safety of our waters. Go for it. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	G6

3144	-Deis does not outline any specific plan for reclamation after the mine site is closed. -little or no field sampling done on the movement of ground water through the bedrock. - The mine site disrupts natural corridors for the movement of wildlife. -According to the U.S. Forest Service, the Polymet project alone will cause significant haze impairments in the Boundary Waters 36 days each year! -Where is the plan for constant monitoring of the mining operation by the DNR? -Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition sulfates react with elemental mercury in a process known as mercury methylation. Methylmercury is the form that bioaccumulates in fish and animals that eat fish, including humans. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for? Each one of these points is significant. Any one of these issues is enough to halt the conversation or idea of mining.	RF1,WR1E,WR3I,WR5A,W
<b>Sender Last Name:</b> Brinkman		<b>Submission ID:</b> 2676
3161	This type of sulfide mining has a PROVEN TRACK RECORD OF TOXIC POLLUTION TO GROUND WATER !!!!! wISCONSIN HAS BANNED THIS TYPE OF MINING!!!!	G8B
<b>Sender Last Name:</b> Brittain		<b>Submission ID:</b> 1564
1923	No company can guarantee that its pollution will not be harmful in the future. With the collapse of General Motors, we learned how tenuous a strong company is. No bond could be posted that would cover the potential damage that this project could entail. From a business standpoint, the only way this project makes sense is if the costs shared with the public are discounted to nothing. We have already made this mistake dozens of times. Do not do it again. In addition, this would occur in one of the most pristine areas of the state. I do not want to see the economic disruption this project would create. Added population and the attendant pollution of all types would ruin the character of this region.	EOO,G2B
<b>Sender Last Name:</b> Brockway		<b>Submission ID:</b> 3724
1	There needs to be an evaluation of the potential for mercury methylation in the constructed treatment wetland. The nearby Dunka mine-site, where constructed wetlands are used to treat rock-stockpile seepage, provides a good analog for the NorthMet project. It should be monitored for mercury methylation as part of this evaluation.	WR5A,WE6
2	There is a striking lack of useful data or supporting information on which to base predictions of methylation risk. As detailed below, mercury and methylmercury sampling of area streams, wetlands, and lakes are inadequate for assessment purposes. The samples are too few and data quality for total mercury is poor.	WR1E,WE8
<b>Sender Last Name:</b> Brown		<b>Submission ID:</b> 2251
21	Many of the supporters of this proposed mine remember and hope for the economic impact of the old iron mining industry, which employed thousands of workers and supported an Iron Range boom (off and on) for generations. They fail to notice that new mines will employ a far smaller workforce, and that the productive life of the PolyMet operation is projected to be only 20 years or so. Meanwhile, it has become clear to many local residents and businesses that the economic future of the Ely/North Shore Arrowhead Region is increasingly dependent on tourism. People come from distant states to canoe, camp, and fish (and spend money!) here precisely because clean water, fresh air, good fishing, and undeveloped wilderness is now so rare. It seems very shortsighted to put our richest natural assets (rivers, lakes, air, edible fish) at risk for the sake of short-term heavy industry.	SE3,SE4
37	Regarding the PolyMet Project This project has great potential to harm the natural environment in this region. This environment is not only valuable inherently, it also a key draw for the recreation and tourist industry that is so important to this part of Minnesota.	SE4

131	My name is Jeff Brown, I live in Lakeville, Minnesota, and I support the PolyMet NorthMet project. I believe there's minimal risk, I believe that they're taking necessary precautions with their processes and ensuring that there's going to be a proper closure to the mine in 20 years as well, and I believe the risk is minimal, given the economic situation we're in and the jobs it will create. Thank you.	EOO,G6
183	I am writing to comment on the Polymet Northmet EIS. First, I think Polymet has taken steps to ensure they do not release sulfuric acids, or air contaminants into the environment. I read the Hydromet process description. The Hydromet process using autoclave technology ensures the sulfur is added to lime which creates a gypsum by product. Furthermore, Polymet is investing in special lining and holding the Hydromet process water into a special basin. As well as ensuring containment drainage and pumping system for further redundancy. It would be a shame in this economic environment and with all the steps that Polymet has taken to not go forward with their permit. They will be investing \$600 million and creating over 400 jobs as well as generating \$15 million in state and local tax revenue. I don't see how this project is any worse than many of the industrial projects I see in Minneapolis or greater Minnesota.	EOO
311	I am writing to provide comment and provide feedback on the Polymet Northmet project that is in review. This project would provide investment of \$600 million into the state as well as create 400 jobs. I have reviewed the draft and believe Polymet is taking steps to contain the risk of containments such as the Hydromet process which converts sulfur into gypsum. As well as using a Hydromet tailings basin with special lining.	EOO
526	Such destructive enterprise should not be allowed. It would affect not only waters near the BWCA W but some waters within.	WR3B
735	I would hope that the DNR would: 1. Extend the EIS review period by 45 to 60 days, 2. Hold more public meetings in more places to gather community input, as the current schedule is too limited. 3. Include in the public meetings the opportunity for citizen statements and discussion in the open meeting.	PRO6
1218	While the majority of Minnesota residents strive through legislation and advocacy to clean up our lakes and rivers, and to preserve our remaining wetlands, guess what? Incongruously there are those who allow and even promote the construction of of sulfide mining in the great wild and scenic areas of Minnesota. Sulfide mining is known as one of the most destructive methods of mining to the ecology of streams, lakes, connected wetlands and wildlife.	G2C
1219	No amount of jobs are worth such devastating destructions as this kind of development.	EOO
1848	We are told that the sulfide waste product of this non-ferrous mining process will be safely capped so that water contamination will never be an issue. No copper/nickel mine has accomplished this goal, nor has this new process been tested on such a large scale. I understand that in a recent smaller scale test of the new techniques, they have proven fallible. It is the experience of many of us who live in NE Minnesota that water has a way of eventually getting any place that people try to keep it out!	EOO,WR1E
1849	I am an avid fisherman, hunter, and outdoor enthusiast. I also am a realist and I understand the need for resource extraction in the face of an ever-changing global marketplace. While it is important to keep Minnesota competitive with the rest of the nation I believe there are more sustainable and reasonable ways to achieve this. Mining is a dangerous practice. May it be known to all those associated with a project of such scope and potential interference with the BWCA, we will destroy one the last greatest places this nation has to offer should this initiative be allowed to proceed. I, as a Minnesotan and American citizen, beg of the people in power to do everything they can to stop resource extraction from entering into the BWCA arena. Please, make this choice based on principal, moral obligation, and the well-being of our future generations to enjoy this great vestige we call the Minnesota Wilderness. Thank you.	EOO,G7B,G11
2042	Just because precious metals lie beneath our surface does not mean that we have to allow a foreign company to make a lot of money at our long-term expense. Copper/nickel mines have a history of promising environmental protection, promises which invariably prove false in the long run, long after the company has moved on. If PolyMet is allowed to proceed, the company should at least be required to put in escrow enough money to mitigate any sulfuric acid leaks or mercury poisoning that may occur in perpetuity.	PD4

2659	I understand that a number of other mining companies are exploring opportunities and drilling test holes in the area between Babbitt and Ely (some just six miles SE of Ely). Approval of the PolyMet proposal will establish a precedent that will encourage a rapid expansion of non-ferrous mines with accompanying noise, emissions, waste products, industrial traffic, and the ever- increasing risk of human error. All of this is bound to have serious consequences for our pristine environment, which will then depress theeconomic benefits of tourism, fishing, camping, birding, paddling, backpacking, etc...	G8C,G11
3027	As recommended by the EPA, the DEIS must include an evaluation of the financial assurance that would be provided to ensure postclosure reclamation of the PolyMet NorthMet mine and plant. Sulfide mining places huge burdens on taxpayers. These mines often require long-term or perpetual pollution and treatment. PolyMet has few assets or financial history. The question of where the funding will come from for post-closure treatment, monitoring and maintenance has not not been adequately addressed, and Minnesota taxpayers may have to pay millions of dollars for clean up after PolyMet has gone.	PD4
3193	Minnesotans are concerned about water quality issues, having many of their lakes and other waters with serious pollution issues. This type of mining is know to add to those serious problems.	G7
3287	Environmental disasters can happen when huge mining projects take place. When I read that water from the waste rock piles will be polluted for up to 2,000 years, who will have the resources to monitor and maintain facilities to treat the water? Not the companies, they won't be around for 2,000 years. Should we pass this along to generations to come? Looking ahead, there is concern that after 65 years the West Pit will discharge polluted water with arsenic, cobalt, selenium, high sulfate concentrations and more. Minnesota has water. We are at the head of the water system and should not pollute. Fish will be affected.	EOO,WR3I,PD2,PD3,PD4
3353	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. In addition, Outward Bound has led leadership and character development programs in this spot since 1964, impacting thousands of people. Allowing this will destroy this legacy and this pristine place. Please do not allow this.	EOO,G11
<b>Sender Last Name:</b> Brummitt <b>Submission ID:</b> 1507		
1815	Keep the Boundary Waters clean and pristine! The profits of your corporation, PolyMet Mining Corp. are NOT worth the damage that would be done to the beloved Boundary Waters Canoe Area Wilderness.	EOO

1215 I wish to express my strong support for the PolyMet Mining project at Hoyt lakes, MN. As demonstrated in the draft EIS, I believe the company has taken the steps necessary to assure that the effects to the environment would be minimal to nil. The company has already spent millions of dollars in engineering and research studies to insure that the impact would be minimal. Also, the entire area in question has already been mined for decades and PolyMet would be using existing infrastructure from prior taconite mining operations. Northern Minnesota and the Iron Range in particular, are in desperate need of the 400 plus jobs that would be created along with countless jobs created in the satellite industries. With the current state of the economy, Minnesota badly needs the millions of dollars in tax revenues that would be generated by the new mining operation. The favorable economic impact for both the state and for those employed would be tremendous. I was born and raised on the Iron Range and have witnessed firsthand the economic impact to families that have been affected by the volatility of the mining industry. Although I no longer reside on the range, I have relatives and friends there who are in need of the jobs that would be created. Many folks that I know have been unemployed for quite some time and are about to lose their unemployment benefits. I strongly urge that for the sake of those living on the Iron Range and for the obvious economic reasons, all necessary permits required to allow operations to begin, be issued. The sooner the better. Thank you.

**Sender Last Name:**    bryson    **Submission ID:** 3543

3806 I believe that the state should NOT allow sulfide mining in Minnesota. I realize that the supporters are looking at this as jobs for Minnesotans. This is true, there will be jobs created if this goes through, but for how long? 20 or 30 years? Is the local environment really worth destroying for one generation of jobs? This area produces revenue for many from tourism generated specifically by our pristine wilderness. The draw to the National Forest, the BWCAW, and Lake Superior will drop off if we end up polluting this area both by water contaminants and from sound pollution. I know lots of promises are being made that steps will be taken to prevent any contamination of the surrounding wilderness. Unfortunately big companies like these have a track record of not following through with their promises. Many times its more cost effective for them to pollute and pay the fines instead of keeping things clean. Not to mention, even the best laid plan may fail 20 or 30 years from now. If we need examples, we don't need to look very far. Wisconsin, our neighbors to the east will not allow this type of mining to take place in their state period. Why can't we learn from them instead of destroying our land before we figure it out? I want my children and grandchildren to enjoy the Northwoods. I feel that by allowing this type of mining to happen it will cause detrimental damages to the area. This isn't the same type of mining people in Northern Minnesota are used to. Iron ore mining doesn't produce the levels of sulfuric acid that this type of mining is known to produce. Lets stop thinking about what may be a temporary benefit and start to think about what we'll be leaving for our future generations.

**Sender Last Name:**    Buckmaster    **Submission ID:** 3131

3500 As you consider the mining proposal for Northern Minnesota please take the time to investigate the insidious leachate that is seeping into Lake Michigan from the community of Bay Harbor in Michigan and what is "not" being done about it.

1154 As a resident of Hoyt lakes for over 40 years, I have closely followed the development of the PolyMet NorthMet Project. I have attended the EIS Scoping hearing, the DEIS meeting in Aurora and the DEIS meeting in Blaine. I have talked to people at the various tables (air, water, minewaste, wetlands, etc.) setup by the agencies and contractors at these sessions. I have talked to folks from PolyMet. I have read the DEIS summary and small parts of the full DEIS. (It is a awfully big document to digerst.) I worked for over 35 years in the iron mining industry as a mining engineer. Based on what I have been able to learn and based on my previous experience, it appears to me that the NorthMet Project will have no greater and probably less environmental effect on our area than the previously operated iron mines. The social and economic effects will definately be a positive for the city of Hoyt Lakes, the entire NE Minnesota area and ultimately the State of Minnesota.    EOO

3819 Perhaps the biggest positive that will come of the PolyMet NorthMet Project is the well paying, year around jobs that will be created. Jobs not only at the actual site of the operation but also in the various support industries that will be created to supply materials and maintenance to PolyMet. Having lived in Hoyt Lakes for almost 44 years I have seen and lived through the ups and downs of the iron mining industry. As a "mining" town we expect and are prepared for the cyclical nature of the iron mining industry. The PolyMet facility will probably see a similar history of ups and downs. Hopefully their cycles will be a slightly different timing than those of the steel industry. Some people have advocated looking for other industries to bring in jobs for the citizens of the area. This has been tried for many years with little if any success. The relatively few industrial companies that have come, not failed and continued to opereate have brought relatively few jobs (dozens) compared to the several hundred jobs that this project will provide. Call centers have produced more jobs but for the most part these can not compete with the salaries that will come with the PolyMet project and related suppliers. "Tourism" jobs are few, low paying and for the most part seasonal in nature and do not pay to support a family or even individual year around. Allowing this project ot proceed will allow this area of Northeastern Minnesota to survive and grow with successful and happy citizens.    EOO

**Submission ID:** 298

312 I am pleased to have the opportunity to provide comments regarding the draft EIS prepared for the NorthMet Project. Based on review of the DEIS the project has my support and I encourage the Minnesota DNR to support the recommendations provided in that document. As noted therein: • The project has the purpose of producing base and precious metal, precipitates and flotation concentrates needed by the domestic and global markets. • The project is subject to federal and state regulations to protect human health and the environment. • The DEIS/EIS process is a concerted, comprehensive effort to consider and evaluate potential environmental consequences of the proposed project, with input from local, state and federal agencies and private interests. Those activities are provided for the benefit ofthe public. • The proposed development and alternatives have been identified, and areas of major differences of opinion concerning significant impacts are outlined. The facility details and differences of opinion do not appear to pose irreparable, irreconcilable impacts that cannot be addressed via current technologies, and the ability to assess and mitigate accordingly. In the current and projected economic climate, development of the precious metals mining industry is vital to the economy of northern Minnesota. As a professional engineer and environmental scientist, I support the NorthMet Project, and I urge federal, state and local agencies to support the same, proceeding in accordance with appropriate policy and procedures in the public's best interest.    EOO

**Sender Last Name:**    Burnete

**Submission ID:** 3367

3657 The mining companies say that sulfide mining will boost the economy of Northern Minnesota. I can see how in this recession this makes mining look very attractive. I ask you to consider the externalities in terms of damage to the environment loss of ecotourism. Who will pay for those?    G2,G11

38	<p>To meet the standards of Enhanced, Sustainable, and Conserved, a permit must reflect exactly how the seeker will achieve these policy goals, and what clear assurances does the public have that there will be financial, and other needed resources to mitigate potential problems over the entire impact area throughout their operation? A lot of people have a stake in this project, not just a small spot on the map. This isn't holding industry to a different standard. It's holding it to the same policy standards as are all Minnesota citizens. Let me illustrate my point. There are policies and laws thankfully regulating lakeshore use in Minnesota. Yet there are those who see their property goals only in terms of their own benefits and costs, not the whole lake ecosystem. I'm thinking of a case where a property owner built a new cabin, and nearly defoliated the wooded area to make a lawn. It was clearly against the standard of conserve, enhance, sustain, and perhaps they were even fined for violating DNR regulations. The danger is, and I've heard it said, "To just pay the fine and have things the way you want." It's just a small cost of doing business the way "you want", rather than how "we want". Now, every boater, fisherman, or neighbor sees an urban lawn where ducks used to nest, and deer drank. The cost of that action is multiplied by countless consequences, and over time. In the case of Polymet the impact area is large, and we must be assured prior to permitting they have proven to us that the goals of the DNR will be met, using great caution instead of trust. The first line of action is to make sure clear, enforceable, rules are indeed established for sulfide mining practices: A model operation rather than just an operation. We must also have remedy for damages. Far too often the public as a whole is left paying the ultimate costs, because companies just close their doors, file bankruptcy, and walk away. Clearly, the best prevention is be sure at the start that this project is done so the DNR, and citizens of Minnesota can say this is being done right based on our state goals.</p>	PD4
380	<p>I am writing as a property owner in St. Louis County wanting to raise questions that I feel, based on the following Minnesota DNR policy statements, should be addressed before the Polymet sulfide mining project is legally entitled to move forward. We hear almost daily about situations where tragic consequences occur, or are only narrowly avoided because somebody didn't squarely look at the "red flags". This is too important to let that happen.</p>	EOO
381	<p>I shall make my statements working from three of the following policy goals of the Minnesota Department of Natural Resources effective in January of 2010, and taken from their website. I think it is an accurate assumption that state policy is, and should be, the foundation of law, regulation, and practices within our state. So I shall work from what they say, which I also feel sets an excellent standard for all of us to follow in this beautiful state. 1. Minnesota's natural lands and habitats will be conserved and enhanced ... 2. Minnesota's water resources and watersheds will be conserved and enhanced ... 3. Minnesota will provide for the sustainable economic use of its abundant natural resources ... Three words stand out in these policy statements. Conserved, Enhanced, and Sustainable In further elaborating on these policy goals the DNR goes on to suggest that conserved doesn't mean never used, but rather utilized in ways measured against the standard of stewardship, and enduring benefit. The word enhanced, as making life better under varied criterion, and once again where the benefits outweigh the costs. Nothing less than good stewardship is the standard. The word sustainable again refers to a range of things impacted by an action. I will include below the Minnesota DNR's policy statement regarding their legal and ethical meaning of sustainable. Access to mineral resources is preserved. Sufficient supplies of sand and gravel are available with minimal harm to natural lands and waters. Deposits are assessed early in areas facing development. Mining and reclamation are planned to meet community needs, minimize conflicts, and ensure environmental integrity while producing important mineral products. Conserved, Enhanced, Sustainable .... The burden of clearly addressing the "red flags" is legally required of anyone seeking a permit. This is the same standard set for a person seeking to build a garage near a lakeshore, or a business developing a mining operation.</p>	EOO
382	<p>The Geographic Problem Often permit seekers see their project as a "local area" issue. The builder of a lake lot garage often sees the immediate benefit of boat storage, while not thinking about the other impacts on others, and an entire water system impacted by accelerated runoff. In terms of the Polymet sulfide mine, the issue of "local area" needs redefinition when determining if it meets the state policy goals for the entire impact area. Although it is a term often used to make the scope of problems appear limited, it isn't a useful term in reality. Workers commute, water flows, winds blow, chemicals mingle, businesses bloom, and others are diminished, property values change, and many other things can change over areas far larger than we are led to believe.</p>	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
383	The Economic Problem I've taught economics, and know all too well its complexity. Like all statistical studies, various points of view often pick their own data to build their case. For the sake of brevity, I'm not going to address specific claims in the EIS, but rather again turn to the DNR goals and how they relate to one important economic element of this project. 1. Cost/benefit There are endless elements in trying to apply this to mining. Some things are clear. We use minerals. People need jobs. And, the classic circular flow in the economy must operate. One can debate endlessly how much benefit there is, how it is distributed in society, and the impact of "boom" production in the long term. I think of most concern under the DNR goals, however, is addressing the costs of production that often are borne by citizens after the fact ... the so called externalities. By definition the costs of production then become society's problem. These costs have historically been given a blind eye by business, and tolerated by government that is often more influenced by elections than long term goals. We often read about China's booming economy. Trying to see where the DNR goals are being applied there would be laughable. The externalities of production are being allowed to just run amuck. If we are to meet the standards set by the DNR in Minnesota, we have to account for these externalities (the quality of our air, water, aesthetics, ecosystem health, human health and safety, etc.) as a true cost of production that must be dealt with in the permit. It must be insured that those costs are clearly mitigated in the production plan itself.	EOO,G1
384	In conclusion, I would hope to see in a final permit that the DNR policy goals are used in establishing a model plan that we all can be proud of. There is clearly a lot of supporting evidence for the fact that anything short of that will leave us with a terrible legacy. The "cowboy economy" practiced in our early history, and now thriving in the under developed world has no place here any longer. Public financing no longer has the ability to pick up the tab for the unmitigated damage of citizens or business. As a society we must ensure that conserve, enhance, and sustain aren't just esoteric concepts, but rather the building blocks of best practices, and model operations for now and our future.	EOO

156	I am writing to declare my support for the PolyMet Mining Co. mining and processing plant near Hoyt Lakes, Mn. I believe they have demonstrated in their EIS that PolyMet will operate a safe and environmentally sound mineral processing operation. The US is in need of an adequate reserve of these critical metals and we need a viable and safe processing operation to produce these metals. Also, this area is in need of a large scale business that will provide good and stable employment and help support a healthy business climate.	EOO,G6

2710	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. As a avid and frequent user of the BWCA I am very concerned that we do everything in our power to preserve and protect the wilderness for our generation and generations to come. I raised my children with frequent trips to the BWCA for a experience not available anywhere else. Some day I hope to bring my grandchildren to the BWCA for similar trips. In the mean time we need to protected and cherish the wilderness so that will be possible.	G7A

3211	I have personally been to the Boundary Waters Canoe Area Wilderness about 2 dozen times. I have brought with me from Indiana an average of six people per trip. We drive fourteen hours each way. We have purchased gasoline, eaten food, paid outfitters, purchased Entry Permits, paid User Fees, and stayed in lodgings on each trip. Why would I want to return to canoe and fish in waters that are polluted by chemical runoff, unsightly tailings, polluted skies? Please DO NOT permit this mining operation to ruin your beautiful area.	G2,G7,G11
<b>Sender Last Name:</b> Cannata		<b>Submission ID:</b> 28
26	I'm from Hibbing, Minnesota, representing a company called Industrial Door Company, and I just want to put my statement in of this project of my approval of this project because the -- the potential for employment, the potential for the future of the different trades involved with this type of mining, and the ability to expand the region up here in Northern Minnesota; so voicing my opinion for approval of this project for the -- for those reasons. That's it.	EOO
<b>Sender Last Name:</b> Carey		<b>Submission ID:</b> 1104
1209	I am writing this letter in support of PolyMet Mining's NorthMet Project and here are my comments: 1. I think it is apparent that PolyMet will have 400 employees and hundreds of spinoff jobs that will provide significant economic benefits to Minnesota and the Arrowhead Region. This, in turn, will result in providing millions of dollars in local and state taxes to support our communities and educational system. 2. From an environmental standpoint, PolyMet can and will produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families, as already noted. It has been demonstrated that PolyMet will produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. Furthermore, these metals that will be mined by PolyMet are essential to green technology (e.g. wind turbines and hybrid cars) and are also necessary for pollution prevention devices such as catalytic converters. From a personal standpoint, my roots come from the Iron Range. By way of example, my mother was raised in Chisom and returned there after graduating from college to teach kindergarten. My father was raised in Virginia and his work history over many years involved dealing with "big businesses" in the Iron Range area, including everyone from Bethlehem Steel to U.S. Steel, etc. I also had a grandfather that was a Judge in Virginia for 46 years and an uncle who practiced law in Virginia and was also a Judge. My twin brother, Tom, practiced law in Virginia and has since retired as a District Court Judge and lives with his wife in the Biwabik area. I mention this personal history so that you understand that my support of PolyMet is not just due to the fact that I am an investor. As the saying goes, "once a ranger, always a ranger" and having said that, my personal ties with Northern Minnesota is the primary purpose for sending this letter in support of PolyMet. One final comment. I just had a chance to read the letter addressed to you by Congressman Oberstar and for what it is worth, ditto.	EOO

36	HUNTING, FISHING AND GATHERING RIGHTS UNDER THE TREATY OF 1854: Archaeological evidence shows that native people gathered copper on Isle Royale and on other Lake Superior area lands for many centuries prior to the Treaty of 1854. Some archaeological evidence even points to the possibility that Viking explorers obtained Lake Superior area copper from native people a thousand years ago. Before the Polymet project proposal is approved, Federal courts should determine whether this archaeological precedent should be the basis for including the gathering or mining of copper in the rights of native populations on lands involved in the Treaty of 1854. Such a Federal legal opinion could be the basis for a congressional amendment to the wording of the Treaty of 1854, if necessary.	G3,CR1,CR4
117	My thoughts are that, as I talk to people out there, that PolyMet has taken the precautions needed to have a -- to make a -- to not impact the environment in a negative way, I guess. And my hope is the DNA follows through and ensures that it is -- that it is good for the environment and, hopefully, the jobs will be created that we need.	EOO,G5

540	<p>SECTION 3.1.3 Proposed transport of ore. The first paragraph of this section states that "three trains, each consisting of up to twenty 100-ton side dumping ore cars and one 2,100 hp diesel-electric "Gen-set" locomotive, would transport the ore from the Mine Site to the Processing Plant." Genset diesel-electric locomotives are fairly new forms of switcher locomotive technology. Instead of using a single large diesel engine to generate electricity to power the locomotive, genset locomotives use two or three generator sets which are each powered by low horsepower diesel engines. Several locomotive manufacturers now build genset switcher locomotives which contain three diesel engines of approximately 700 hp each. Computer controls turn the diesel engines on and off to match the electrical power required for the load being moved by the locomotive. When genset switchers are used in railroad switch yards, exhaust emissions are reduced by up to 80%, compared to the emissions from older switcher designs. Genset locomotives are a logical modern source of power for these ore trains. Polymet may have even found examples of mining operations which use 2,100 hp genset locomotives to pull twenty 100 ton ore cars. However, it does not appear to be realistic to have up to twenty 100 ton ore cars powered by a single 2,100 hp locomotive at the Polymet site. At the time LTV Mining ceased operation, it was using a fleet of 1950s vintage Alco RSII 1,800 hp locomotives, with one locomotive powering each train of nine 85 ton side dump ore cars between the mine site and the primary crusher. Although a change in track grade could improve energy requirements, there is a substantial difference in mass between a train consisting of twenty 100 ton ore cars and a train consisting of nine 85 ton ore cars! Most mining operations rely on negative (down hill) track grades for gravity assistance in moving ore. Unfortunately, it takes a large amount of generated electrical energy to provide braking power as a heavy ore train is inched along during loading operations and when ore dump cars are being aligned with the rotary dumper at the primary crusher. The emphasis in this section needs to be on the use of locomotives which meet or exceed EPA Tier 2 locomotive emissions regulations during the mine transport operation and not on the horsepower or type of locomotive. Although mining trains appear to be sitting at rest during loading and unloading, the locomotive needs to burn a significant amount of fossil fuel to keep the train from running away on a grade. A high efficiency state-of-the-art locomotive may not meet EPA Tier 2 emissions regulations during its mine transport operation, if excessive demands for maximum power are constantly placed on it. It is also worth noting that the Burlington Northern Santa Fe railroad has rebuilt an experimental prototype genset locomotive, with the standard diesel electric generator sets replaced by hydrogen fuel cells. Perhaps hydrogen fuel cell locomotives should be considered in newly proposed mining operations.</p>	AQ3
772	<p>At several points in this environmental impact statement draft, the United States asserts that deeded mineral rights do not include the right to open pit mine the National Forest System lands. A federal court ruling on this U.S. government opinion has farther reaching impact than the Polymet proposal. The Polymet mining project would take place on a portion of lands once owned by LTV Mining. This author has learned from reliable government sources in Lake County, Minnesota that a significant portion of the land once owned by LTV Mining is now owned by a single individual with Saudi Arabian citizenship. It is further understood by this author that a significant portion of the U.S. Steel Corp. is now in Asian ownership. The question at hand is whether approval of the Polymet mining proposal would open a "Pandora's Box" and set a legal precedent for the pillage of American mineral resources by foreign investors and governments. Such an issue is especially significant if it weakens the economic and national security of the United States.</p>	PRO4
2599	<p>MR. CARLSON: My name is David Carlson, D-A-V-I-D, C-A-R-L-S-O-N. I just want to make a statement that I support the PolyMet project up in Northern Minnesota. We need to jump start this economy somehow, and this is a perfect way to get jobs in Northern Minnesota. PolyMet I was actually at a UMD conference and talking to the professors up there, they spelled out that is it is a very safe way of mining. I support it 100 percent.</p>	EOO
3142	<p>Virtually everyplace in the world that sulfide rock has been distributed to extract metallic minerals, it has produced acid mine drainage and polluted the water. Please keep the Boundary Waters clean and do not allow sulfide mining. The time has come to find new ways to produce metals, start reusing the existing materials that are out there.</p>	EOO

3721	SECTION 3.1.3 Proposed transport of ore. The first paragraph of this section states that "three trains, each consisting of up to twenty 100-ton side dumping ore cars and one 2,100 hp diesel-electric "Gen-set" locomotive, would transport the ore from the Mine Site to the Processing Plant." Genset diesel-electric locomotives are fairly new forms of switcher locomotive technology. Instead of using a single large diesel engine to generate electricity to power the locomotive, genset locomotives use two or three generator sets which are each powered by low horsepower diesel engines. Several locomotive manufacturers now build genset switcher locomotives which contain three diesel engines of approximately 700 hp each. Computer controls turn the diesel engines on and off to match the electrical power required for the load being moved by the locomotive. When genset switchers are used in railroad switch yards, exhaust emissions are reduced by up to 80%, compared to the emissions from older switcher designs. Genset locomotives are a logical modern source of power for these ore trains. Polymet may have even found examples of mining operations which use 2,100 hp genset locomotives to pull twenty 100 ton ore cars. However, it does not appear to be realistic to have up to twenty 100 ton ore cars powered by a single 2,100 hp locomotive at the Polymet site. At the time LTV Mining ceased operation, it was using a fleet of 1950s vintage Alco RSII 1,800 hp locomotives, with one locomotive powering each train of nine 85 ton side dump ore cars between the mine site and the primary crusher. Although a change in track grade could improve energy requirements, there is a substantial difference in mass between a train consisting of twenty 100 ton ore cars and a train consisting of nine 85 ton ore cars! Most mining operations rely on negative (down hill) track grades for gravity assistance in moving ore. Unfortunately, it takes a large amount of generated electrical energy to provide braking power as a heavy ore train is inched along during loading operations and when ore dump cars are being aligned with the rotary dumper at the primary crusher. The emphasis in this section needs to be on the use of locomotives which meet or exceed EPA Tier 2 locomotive emissions regulations during the mine transport operation and not on the horsepower or type of locomotive. Although mining trains appear to be sitting at rest during loading and unloading, the locomotive needs to burn a significant amount of fossil fuel to keep the train from running away on a grade. A high efficiency state-of-the-art locomotive may not meet EPA Tier 2 emissions regulations during its mine transport operation, if excessive demands for maximum power are constantly placed on it. It is also worth noting that the Burlington Northern Santa Fe railroad has rebuilt an experimental prototype genset locomotive, with the standard diesel electric generator sets replaced by hydrogen fuel cells. Perhaps hydrogen fuel cell locomotives should be considered in newly proposed mining operations.	PD7
3722	At several points in this environmental impact statement draft, the United States asserts that deeded mineral rights do not include the right to open pit mine the National Forest System lands. A federal court ruling on this U.S. government opinion has farther reaching impact than the Polymet proposal. The Polymet mining project would take place on a portion of lands once owned by LTV Mining. This author has learned from reliable government sources in Lake County, Minnesota that a significant portion of the land once owned by LTV Mining is now owned by a single individual with Saudi Arabian citizenship. It is further understood by this author that a significant portion of the U.S. Steel Corp. is now in Asian ownership. The question at hand is whether approval of the Polymet mining proposal would open a "Pandora's Box" and set a legal precedent for the pillage of American mineral resources by foreign investors and governments. Such an issue is especially significant if it weakens the economic and national security of the United States.	PD1
3723	During the Great Depression of the last century, the United States nationalized the ownership of gold. The ownership of mining rights to platinum in the United States needs to be addressed on the Federal level before any new copper/nickel mining operations are approved by the Minnesota Department of Natural Resources or the U.S. Army Corps of Engineers.	G1
3725	I think the risks far out way the reward. I think its ridiculous that we could even think about doing such a thing in of Minnesota's most beautiful places. The very chance that sulfuric acid could get to the boundry waters is reason enough to say no.	EOO,G7

3843	<p>Several unique factors make my comments relevant in assessing the NORTHMET PROJECT ENVIRONMENTAL STATEMENT DRAFT. Being a retired Earth science teacher is probably the least significant of those factors. In addition to having a masters degree in physical science education and holding Minnesota teaching license certifications in every area of science licensed in Minnesota, I have also completed an unlicensed undergraduate major in political science. Prior to becoming a teacher, I was employed for nine and a half years by the State of Minnesota. The highest position I held with the State of Minnesota was Senior Management Analyst/Project Manager for a major federally funded computer system development project. During my time with the State of Minnesota, I received four suggestion system awards, including an award for an innovation which ended up saving Minnesota taxpayers more money than I received in salary and fringe benefits for the duration of my State of Minnesota employment. In recent years, I have been teaching in a federally funded graduate level summer school program which provides Earth and environmental science education methods training to inner city teachers. I have written the curriculum for two of the three graduate level summer school courses, which are offered through Hamline University. One of the courses I developed is an Advanced North Shore Field Study course, which covers the geology and the water issues in the geographic area included in the NORTHMET PROJECT draft. For several summers, I have also been a volunteer for the Minnesota Minerals Educators' Workshop (MMEW), which has been presented for teachers through the Division of Lands and Minerals, Minnesota Department of Natural Resources. I believe I have a good understanding of political, economic and scientific issues at stake in the expansion of mining in the State of Minnesota. Through the MMEW, I have become acquainted with MN DNR employees and with employees of the mining industry involved in the NORTHMET PROJECT draft. I have toured the Polymet Project site with the MMEW, and I have made several tours of the Northshore Mining taconite facility in Silver Bay. I personally own 83 acres of forested recreational land at 710 Wales Road, less than a mile from the Highland ore car scales, where the Canadian National Railroad weighs the taconite loads being transported to the Two Harbors ore docks. My property is about twenty miles south of the source of the St. Louis River. I am very familiar with wetlands in the area. Beginning in 2010, I will be conducting lake and stream testing in parts of Lake County as a volunteer for the Minnesota Pollution Control Agency. As an additional side note, I am a model railroader who owns a video tape of the former LTV Mining operation (Pentrex PEN-LTV, copyright 1992). This video tape shows highlights of the full LTV mining operation, beginning as the large mine trucks are loaded with ore. The video shows the initial railroad transport system, ore dump car unloading at the crusher house, taconite production, and the final ore train transport and unloading into the ships at the ore docks. This video tape shows some mining operations which were never a part of public tours. When I toured the Polymet property with the MMEW, I was surprised at my level of familiarity with our tour sites, based on my prior review of the LTV Mining video. I have viewed this video tape several times as I have reviewed the NORTHMET PROJECT draft. Amazingly, this video tape has made it very easy to visualize Polymet property locations on the draft proposal diagrams.</p>	EOO
3844	<p>GENERAL CONCERNS REGARDING MINERAL RIGHTS: Mineral rights in much of the western United States originated as incentives in land grants to railroads. The purpose of these land grants from the 1800s was to provide a mechanism for transport of settlers to new states and territories and to provide the incentives for developing the natural resources on wilderness land. Mineral rights were included with those land grants to assure that the United States moved forward with other large nations in the development of industrialization. At the time, it was in the interest of the economic growth and national security of the United States to put mineral rights in the hands of those who could develop the mining industry as rapidly as possible. Historians have fully documented the fact that a substantial number of these land grants and mineral rights were handed out through illegal acts of cronyism and profiteering among elected officials, whose first and foremost interest was personal gain. There is good reason to believe that federal courts might rule against the legality of those ancient mineral rights, should it become evident that they no longer serve the better interest of national security and economic growth. At the time these mineral rights were established, the full extent of types of minerals in the land was unknown. Also unknown were the new uses which would develop for some minerals and the role of those mineral uses in national security. Also unknown was the potential for environmental destruction by then unknown new mining techniques. It is unreasonable to assume that the federal government ever intended mineral rights over a parcel of land to extend in perpetuity for all possible minerals and all possible mining methods.</p>	G13

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3845	<p>In a worse-case scenario, no new mining jobs would be provided for Minnesotans by foreign investors. Instead, they could bring in their own citizens on short-term work visas, strip American land of its resources, and leave an environmental mess which could plague the United States for centuries. Unless written into prior international economic trade agreements, the chances of recovering the costs of dealing with poorly managed mine wastes is zero to none. The most that the United States might recover would be the title to mineral-depleted land. It would not be unreasonable for federal courts to rule that currently existing mineral rights only extend to the single primary mineral that a mining operation has been designed to extract. In such a case, mineral rights owned by iron mining entities would not include the mineral rights to trace elements which might be extracted as a byproduct from iron mining wastes.</p>	G1
3846	<p>PLATINUM: According to page 3-2 of the DEIS, Polymet expects to produce 22,184 ounces of platinum per year. Compared to the Polymet projections of 38,821 tons of copper and 9,037 tons of nickel, the expected production of platinum appears to be of minimal significance. However, Polymet's projected platinum production is roughly equal to one half of one percent of the entire world's current annual usage of platinum for automobile and truck catalytic converters! It is an unfortunate fact of geology, that very little pure platinum metal is found in nature. The vast majority of today's platinum is produced as a small quantity byproduct from sulfide bearing rock, during the mining of copper and nickel ore. Most of the world's currently known platinum is mined in Russia, South Africa, and Canada. A relatively small percentage of current world-wide platinum production comes from the State of Montana. As greater and greater efforts are made to control greenhouse gas production, it is reasonable to expect the industrial need for platinum catalytic converters to rise significantly beyond what is currently mined or recycled. New platinum catalytic converter technologies can be expected to include new factory combustion processes and a wider range of fuel burning forms of transportation. In the past, the price per ounce of platinum has been driven by industrial demand to a far greater extent than the price of other trace metals. World-wide platinum production can be most easily increased by increasing the production of copper and nickel. Consequently, there is a real possibility for copper and nickel to flood the market as platinum production is stepped up. Increased platinum prices might not compensate for a decrease in the prices of copper and nickel! Decreased market values for copper and nickel may, in fact, result in a decrease in overall profits during the projected life-span of the Polymet project. To compensate for its decrease in profits, Polymet (and other future copper/nickel mining projects in Minnesota) may be forced to take one of the following two actions: 1) Increase copper and nickel mining beyond what their mining operation was designed to handle, in order to increase revenue from the sale of platinum. 2) Petition for a decrease in expenditures for the environmental treatment and containment of sulfide mine wastes. Both of these actions may be necessary in order to keep an established copper/nickel mining operation running in the black. If the production of platinum becomes the driving force in successful copper and nickel mining, serious issues arise in cases of foreign-owned mining lands. Platinum is a low volume product with a very high value. Does the mined platinum stay in the United States, or will the foreign investors export it for their own needs? Platinum does not need to be processed into pure metallic form to be shipped out of the United States. Platinum slurry is a difficult material to identify and could be transported unobtrusively, before it can be accounted for in taxes paid to the United States government. In the past, mining has been performed on large tracts of northern Minnesota land. The burden of inspecting the new copper/nickel mines for environmental compliance would require a substantial staff of government inspectors. Foreign mining operations could easily step up platinum production and leave excessive quantities of sulfide bearing waste rock behind in a manner which would foul our ground waters and delicate wetland soils for indeterminate periods of time. Environmental damage and substantial restorative costs caused by excessive rates of copper/nickel mining could also prevent more desirable alternative uses of northern Minnesota land. It is consequently very important that the Polymet project and its review and approval process set appropriate legal precedents for future copper/nickel mining proposals in the same geographical setting. NATIONALIZATION OF PLATINUM PRODUCTION IN THE UNITED STATES: It</p>	G1

1221	I attended the town-hall meeting in Hoyt Lakes last summer. At the meeting, the Poly-Met representatives there, had a very convincing proposal for constructing this project environmentally responsibly.	EOO
1222	I am personally convinced that they have done their research thoroughly. I also believe that all this research should be subject to audit, both privately and publically, as well.	EOO,G10
1223	I think a lot of issues are at stake in our state, both economically and environmentally. I believe that there should be an earnest effort to conclude this research, so that our state can begin to recover economically (like North Dakota already has) with the bag-houses, and sequestration projects underway for the coal fired power production units there. I know a lot of this technology is new, like the Nugget facility, (on a large-scale), but I don't think some national attention to a forward-mined project would hurt us right now. Best wishes on your on-going research, and I do hope for the best for the PolyMet precious meter mining project proposal.	EOO
3186	I cannot understand why anyone would so want to endanger our water or any natural resource as this project would do.	G7
<b>Sender Last Name:</b> Carron		<b>Submission ID:</b> 3580
50	Further, negative socioeconomic impacts of the boom-and-bust mining economy will extend across Northeastern Minnesota.	SE3
541	The addition of significant amounts of greenhouse gases from the destruction of wetlands literally will add to a global problem.	AQ3
1072	The addition of significant amounts of greenhouse gases from the destruction of wetlands literally will add to a global problem.	WE5
1073	Wetlands: The complete or partial destruction of over 1400 acres of wetlands is outrageous. The value of these lands for oxygen production, carbon storage, and habitat infinitely outweighs the value of the short-term employment opportunities offered by the Project.	WE2
1144	Part III.A.-Evaluating impacts within only a five-mile radius around the major components of the Project is misleading and inadequate. For example, the habitat destruction in the Project area will have significant impacts on wildlife now living outside the Project area because of, among other things, the displacement of members of species currently using the Project area and the concomitant increase in competition for space and food.	WI2
1145	Wildlife: The loss of critical habitat for Canada lynx and the gray wolf alone should be sufficient to compel implementation of the No Action Alternative. The DEIS's blithe reference to "increased risk of vehicle strikes to Canada lynx and gray wolf at the Mine Site" is frosting on the cake.	WI1
1332	Geotechnical Stability: The admission by the DEIS that Tailings Basin embankments "would have a low margin of safety" compels the adoption of the No-Action Alternative. If the Tailings Basin collapses, the resulting pollution and habitat destruction would vastly exceed any amount considered acceptable by even the most shameless mine booster. The intent to defer considering mitigation until the presumed permitting process is unacceptable.	GT1,GT2

Comment ID	Comment Text	Theme Codes
1977	Part III.B.2.-Water Resources: The chemical and physical alteration of surface waters and groundwater predicted to result from the proposed Project by the DEIS is unacceptable. The DEIS admits that the Proposed Action will contaminate groundwater with antimony, manganese, and nickel. This pollution will exceed Primary Maximum Contaminant Levels and/or Health Risk Limits "potentially for the long term." What is the long term? The tribal cooperating agencies believe that it is potentially thousands of years. The DEIS is silent as to the likely extent of the dispersion of this poisoned groundwater; this silence suggests that the likely extent of the dispersion is either unknown or obviously unacceptable. The DEIS admits that significant (9%) reductions in flows would occur in the Partridge River, and that the frequency of low flows would increase. It further admits that groundwater seepage downgradient of the Tailings Basin would result in significant seepage upwelling and impacts on wetlands. "High risk situations" for mercury methylation would likely result from high sulfate concentrations in seepage from the Tailings Basin. In sum, it is clear that the pollution by metals and the changes in streamflows and wetland levels would seriously disrupt the stability of both aquatic and terrestrial habitats; the actual extent of the damage is uncertain because the DEIS admits to "a high degree of uncertainty regarding key input assumptions" to the models.	FM1
1978	Fish and Macroinvertebrates: The DEIS admits that the Proposed Action would create the possibility of (a) degradation of aquatic habitat in the Partridge River because of the duration and frequency of low flows and (b) increased methylmercury in wetlands and the Embarrass River because of the discharge of sulfates from the Tailings Basin; the poisonous impact of mercury in the environment, particularly with respect to consumers high in the food chain, such as fish and homo sapiens, is well-known. Maintenance of healthy aquatic ecosystems is crucial to the health of the earth and all its inhabitants. The Proposed Action should not be allowed to proceed given the possibility of the impacts described in the DEIS.	EOO
3290	Both surface and groundwater pollution by acid mine drainage and leached metals will certainly flow well beyond the five-mile radius imposed by the DEIS.	WR1E
3291	Part III.B.2.-Water Resources: The chemical and physical alteration of surface waters and groundwater predicted to result from the proposed Project by the DEIS is unacceptable. 1282	I believe no mining should be done, no matter what the metal, if our wilderness is at risk. I support the project's effort to stop this and protect Earth's waters. Finally someone is taking action and opening people's eyes to the problems the environment is facing. Today, many animals are suffering because of human's mistakes and if one problem can be solved there will be hope for solutions else where.	EOO,G2C

2601	MR. CASON: Hi there. My name is Joe Cason with the Labors 563, Minneapolis Local. I live in Columbia Heights, Minnesota. I strongly agree with this project that is going forward, the PolyMet project that is going up north. I think that with 10,000 construction workers out of work that this would be a great economic plus for the area, and I think that that is what we need is more economic development. I think that they have plenty of -- they have plenty of regulations in place so you won't have the pollution concerns that they are talking about, and I think jobs is what it's all about. That is my story, and I'm sticking to it. Thank you.	EOO

3122	<p>I will never forget the pollution I witnessed on a recent business trip to Shanghai, the epicenter of China's newfound affluence. My lungs burned as I simply walked the streets. And when I looked out my window on the 54th floor in a city dominated by skyscrapers, all I could see was smog. When I returned home I made a point of taking a deep, cleansing breath as I walked out of the airport. While I knew that the economic boom and resulting pollution I witnessed in China impacted my life in Minnesota to some extent, the problem still seemed a world away. Little did I know how directly it could impact the environmental health of my own backyard. One of the by-products of China's economic growth has been an exponential increase in their demand for precious metals like copper and nickel, key ingredients in the production of a wide range of products including cell phones and laptops. To answer this demand, mining companies around the world have stepped up their efforts to mine these metals. Among them is PolyMet Mining Inc. and their proposal to operate an open-pit sulfide mine and processing facility at the edge of the Boundary Waters Canoe Area Wilderness. As you know, the sulfide mining that PolyMet proposes is fundamentally different than the traditional iron mining that has come to define much of Northern Minnesota's cultural and economic identity. Sulfide mining involves the extraction of metals from sulfide-bearing ores, while traditional iron mining deals with oxide ores. The difference between the two comes into stark relief once you introduce water. When precipitation comes in contact with the waste rock from traditional iron mining, it creates rust. When precipitation comes in contact with the waste rock from sulfide mining, it creates sulfuric acid. The findings contained in the DEIS are too many to fully address in this short note. For the sake of brevity, I will summarize four key findings with regards to water resources given the critical role that water plays in sulfide mining. According to the DEIS: 1) water from waste rock piles will be polluted for up to 2,000 years, 2) at year 65, the West pit will begin to discharge polluted water into the surrounding wetlands, rivers and lakes, 3) the polluted water will contain high sulfate concentrations that represent "high risk" situations for mercury methylation, which can cause mercury to accumulate in fish, and 4) PolyMet has proposed the construction of a wetland to treat contaminated waters. However, "the effectiveness of constructed wetlands to remove metals has strong seasonal variability... also a limited literature review revealed a wide range of variability in the pollutant removal effectiveness of constructed wetlands." Based on the impact to water resources alone, the science seems to make a clear case against sulfide mining in Minnesota. However, as we have seen so often around the world, socioeconomic factors can cause people to disregard the science in an effort to address more immediate and personal concerns. Minnesota's taconite industry has been gutted by the current recession so it is no surprise that PolyMet's promise of 400 new jobs over the 20-year lifespan of the mine has Iron Range families and politicians alike speaking out in favor of the proposed mine. On December 10th, I attended a public meeting in Blaine hosted by the MnDNR and the USACE meant to inform the public on the scientific findings of the DEIS. However, the influence of socioeconomic and political issues on this process was obvious to me. The day before the meeting, Governor Tim Pawlenty announced that the public would not be allowed to speak at the public meeting. Instead, two Iron Range politicians were allowed to address the crowd with stump speeches about job creation before a single scientific word was spoken. I urge the MnDNR, the USACE and anyone else involved in making a decision on this matter to not allow China's copper rush and a Canadian company's business plans risk the long-</p>	G1,G2,G7A,G9

1	<p>The PolyMet demands on the public for rate increase is being done without public notice in the form of a blank check. The illegally executed contract between PolyMet and Minnesota Dower done in violation of environmental laws which require connected actions be administered as a part of an Environmental Impact Statement was violated. This is similar to the Wetland Mitigation agreement between St. Louis County and PolyMet, that was sued on and held to be illegal in District Court. Clean energy is being blamed for rate increase because to mention PolyMet would be an admission of a violation of the law so the PUC and Minnesota Power will do it secretly.</p>	PRO7

1	The DNR has joined the PUC in hiding information from the public. In the EIS the tribal partners concerns have been placed in appendix 3 and many of the claims given little or no explanation. It is not the job of the PUC to aid corporations in hiding public information, it is not for Minnesota Power to do economic development, or expose the public to risky business ventures including losses on real estate in Florida. The power company is a regulated monopoly whose responsibility is solely to provide power to consumers. Minnesota Power will not spend money on improving our power system because they don't like the conservative lower rate of return this provides. The public has given and continues to give them our dammed rivers and a monopoly. They owe us more than the arrogant claim of trade secrets that they have made and we must put pressure on our politician's to force them to keep their side of the bargain. If PolyMet is going to provide Minnesota Power with an excuse to raise our power rates, we should oppose PolyMet.	PRO3
2	Note: At this years Consumer Electronics Show one of the main topics and displays was Wireless Television, no cables. They have had for some time wireless sound systems, but now the predictions are that in the next five years most of our electronics will be wireless. What will that do to the price of copper? If the world price of copper goes down will PolyMet abandon any mining begun here as has been done so many times in the past by other copper mining companies? My guess is they would, leaving us the cost of cleanup.	SE3,G1
3	The project's carbon footprint. What would be the true measure of greenhouse gas and particulate emissions? How will the destruction of extensive bog affect the area's value for carbon sequestration?	AQ3
4	(4.13-2) The stability of the existing LTVSMC tailings basin that PolyMet plans to use for their disposal is a well-recognized concern. The existing basin has been documented to contain fines and underlying soils that create a "low margin of safety" for its long-term stability. Rather than generating a plan that satisfactorily increases the safety margin of the basin, PolyMet concedes that "further design and analysis is needed."	GT2
5	The DEIS text has only five citations to the Regional Copper-Nickel Study. This is a glaring omission of important data that was prepared especially for this environmental impacts evaluation of copper-nickel mining. This environmental impact statement is for copper/nickel/metals mining in the very same area of the Study. The DEIS does have a few citations for the Study so its authors knew the Study existed, but the DEIS does not even discuss the fact that the Study exists, its purpose, and applicability. The DEIS cannot be adequate without acknowledging and utilizing the Study data and subsequent research.	WR1E,PD8
6	Require the PolyMet Company to show that their waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for hundreds or thousands of years.	GT2
6	Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	WR4B
7	4.6-32-However, while energy use is reduced by one-half, greenhouse gas emissions do not decline per unit of production from what would be expected ... principally because of the large load of non-energy process emissions associated with hydro processing." How could a cap and trade policy or carbon tax affect the economic viability of this plant?	PD4,AQ3
8	As the owner of both a resort facility and a Boundary Waters canoe outfitting business, I find it unbelievable that the DNR and the Corp of Engineers, have the sole power to determine if northeastern Minnesota will exchange its present sustainable tourism industry (a billion dollar industry- www.exploreminnesota.com) for a "non-sustainable" sulfide mine (and possible sulfide mining district) that will destroy our natural resources and forever more alter the incredible beauty of the lakes region of northeastern Minnesota for the sake of PolyMet's 400 short term jobs, and additional spin off jobs for a lifespan of just 20 years. The questions for you to evaluate are: Is this really what we want for this part of our state? Do we want to forever more change surrounding forests and wetlands as they are today? To no longer count on clean water? To deal a fatal blow to the sustainable tourism economic base of this area?	WR4C,G7B,G7C,G11

9	I think mining and processing sulfide ore bodies would be a mistake because of possible toxin and most certainly long term pollution problems. If the mine went into production and there were immediate problems, would it be possible to even stop production to resolve problems with pollution, I don't think so. I think the mine would stay in production and the EPA would have them resolve them but centive production. Assuming the mine life we reached, I think the long term pollution risks are very high. Apparently the project will use an existing waste basin that has problems of its own now. I don't think that should be used. Even using the latest technology to use the pits it wouldn't be long enough to hold the pollution indefinitely. This is not acceptable. Minnesota tax payers will have to pay for maintenance of the waste rock.	EOO,G4A
10	younger workers as well as retirees and other populations in its midst." I'm for retiree's. This is age discrimination being promoted by PolyMet's business partner and is indicative of an illegal civil rights violation Don't count on Minnesota Power. Margaret and PolyMet are with corporate health care and they want to profit from their pollution making you and your grandchildren sick and disabled.	EOO
11	It is a resilient aspect of Anglo Property Law that the use of land should be privately withheld from use. This is the Rule of Perpetuities in estates that provide for the public policy in favor of the marketability of land. The Brownfield that will be created by PolyMet is against public policy and violates the Rule of Perpetuities. The Brownfield will result in unusable land for the foreseeable future. It is a violation of principles of morality and good public policy to spoil a valuable commodity such as land. The Ladysmith Mine in Wisconsin was set up as an industrial park. No private businesses have chosen to locate at the Ladysmith industrial park and none are expected.	EOO
12	1) Analyze the land that is going to be exchanged for Superior National Forest land to make this project possible. Make sure that the land swap would protect wetlands, endangered species, hydrology, tribal rights and taxpayers' interests.	PD1
13	4) Get better information on existing pollution, the nature of wetlands, endangered species, wild rice stands and other resources that would be affected by the project.	WR1E,WI5,WE2
14	5) Require the PolyMet Company to show that their waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for hundreds or thousands of years.	GT2

15	<p>Mining in Minnesota has never been quite as magical as politicians and offspring of miners who have left the area and the mining work behind would make us believe. Although Amy Klobachur plays the "My Family were Miners Card" often in public, I would bet that her grandfather didn't sit her down and try to talk her into being a miner and not going to college. Do we think less of the unemployed in Northeastern Minnesota? Don't they deserve an education and training so they may be a part of the growing information, networking, knowledge communities that will continue to grow and expand for hundreds of years? Or do we need to consign them to another short cycle non-sustainable extractive industry. When iron mining started its economic decline here about 25 years ago, politicians made one of the biggest economic blunders in Minnesota history. They dictated that mining in Minnesota should increase and threw millions of taxpayer dollars into that very specific effort, which continues to the day. This is akin to dictating to state agencies, at the beginning of the oil crisis that we find ways to use up more oil. The DNR's Department of Minerals and the University of Minnesota have been "endowed" with the legislative edict to "increase mining in Minnesota" How much money has been spent in this endeavor will probably never be totally accounted for. But from the amount spent recently on the Polymet pep rally in Aurora, paid for by Minnesota taxpayers and meant to be a public meeting by the DNR for the exposure and discussion of the DEIS on the first project for Cu-Ni mining in Minnesota, it is more than apparent that mining is still a very narrowly defined expensive effort being severely and intently pushed on the Minnesota populace. (See Exhibit A , end of comment section) When iron mining started its decline would have been an opportune time for everyone in the state to re-evaluate the "all our eggs in one basket" economic approach of mining in Minnesota. Especially in light of the one of a kind boreal forest wetland resource beginning to be transformed into the Boundary Waters Canoe Area Wilderness. Someone realized the value of this land; unfortunately it was not the same group of people who controlled the funding for mining development in the state. To this day there are northern Minnesotans who are trying to "get over on the man" with their illegal excursions and activities in the BWCAW, with applause and support of a few others here. It is understandable that people would be upset with the loss of jobs, the decline of an industry and the replacement of a personal no-rules playground with a structured somewhat restricted public area with rules. So the initial reaction of let's find ways to bring mining back and the reaction to the forming of the BWCAW might be understood. But years later, some have not progressed beyond the knee jerk reactions formed over 25 years ago. Where might we be today if at least a part of the funding that has gone towards mining, a proven cyclical industry with a hard down side, had been put toward an effort for new sustainable truly long term jobs? We have a very specific state department for expanding mining, The Department of Minerals. We do not have a state department for the establishment of long term sustainable jobs that concentrate on the health of individuals and the planet. Nature has so many other uses besides extractive industries it is rather amazing to "an outsider," I've only lived here about 26 years. That Minnesota hasn't made a concerted effort to put at least some of their eggs into a healthier relationship with the value of Nature in this state is sad and amazing. The Trust for Public Lands has published an eye opening document entitled "Conservation: an Investment that Pays" that points out the economic value of Nature. The inspiring part of this document is that it is based on research. It is not an opinion piece; it offers many pages of references to the research upon which their con</p>	G1
16	<p>JOBS JOBS JOBS! Another of the mining companies Mantras. And, they are important, too important to leave to foreign extractive industries. How about repairing our bridges, roads, dams, pipes and the rest of our crumbling infrastructure? How about rebuilding the decimated American Forests, clean energy, information systems, computer and networking and telecommunications systems to make us again a leading nation rather than the laggard we've become. Building knowledge communities? Many other nations are doing just that. Many of our "leaders" haven't even heard of it. How about cleaning up our polluted planet? Why can't Minnesota be a leader in earth stewardship? We could be. Any of the above job ideas could be significantly more rewarding for workers than anything you can dream up with extractive industries, and better for the planet. It's past time for us to significantly alter our ways.</p>	G1
16	<p>Please pay close attention to the comments of the tribal communities and individuals, scientists, and ex-iron miners who have weighed in on this issue and disagree with proceeding with Copper Nickel Sulfide Rock Mining in Northeastern Minnesota. I agree with the There is currently no scientific justification for it. A moratorium is the only sensible approach, one comparable to Wisconsin's.</p>	EOO,G12

17	On a global scale how much fresh water do we have in Minnesota? What is its value? What is its value polluted with heavy metals and acid mine drainage? What is the value of an unpolluted 100 mile swamp for sequestering carbon?	AQ4
17	I searched and could not find any such Executive Order for the State of Minnesota relating to sustainable, healthy, environmental, eco-system improvement, re-forestation, protection of our states resources, or protection and expansion of our thriving nature based tourist industry. Unfortunately for all of us we have not progressed beyond the beliefs and directives of 1985. And, unfortunately no one, then or now has looked past these shackles to determine a better course of action. Fortunately there are MANY better courses of action for the state than Copper Nickel Sulfide Rock mining at this point in our nation's history.	EOO
18	"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it intends otherwise" Aldo Leopold I started my search for information on Copper Nickel mining believing that I would find someone who could show us that a safe way to do so had been developed; and, that No pollution would be permitted by such mining since it would take place in one of the last major fresh water reservoirs in the world. (Watch the video "The Flow" to understand just how rare and valuable the fresh water of our region is globally <a href="http://www.flowthefilm.com/trailer">http://www.flowthefilm.com/trailer</a> .) But, all that we have been given are mining company propaganda and bullet points and political and governmental agencies who are trying harder to justify pollution, yes they are trying to minimize, but everyone admits many pollutants will be placed in our water supply by this mining and the cleanup will go on for centuries. This is totally unacceptable to me in this point in the history of our polluted planet. We personally believe that the way to true long term rewarding jobs is with Nature not against it. A recent MPR article probably represents best what our customers feel, or would feel if they knew about the threat of Copper Nickel Sulfide Rock mining here. Copper Nickel Sulfide Rock mining is probably the greatest threat to tourism and will severely affect all of our businesses if permitted to pollute the watershed here. <a href="http://minnesota.publicradio.org/display/web/2010/01/12/loch/">http://minnesota.publicradio.org/display/web/2010/01/12/loch/</a> The first lumbermen to discover the vast stands of white pines in Minnesota probably didn't think they could ever cut them all. But, those hard working lumbermen left us only about 2% of the white pines and none of the yellow birch. Across this country 95% of the old growth trees are gone. The Texas oilmen at the turn of the century claimed they would be able to pump oil "forever" from the vast oil fields there. Today there is little oil left in Texas. No one ever imaged that we would be able to deplete the oceans seafood supply, but we are well on our way to doing so. 95% of all the big fish in the ocean are gone. And certainly no one would have thought we would have allowed over 300 water pollutants into our water supply, 80% of which are not removed by current municipal water treatment and go untested in over 98% of municipalities. We ignore the mistakes of our past at our own peril. We do not however have to participate in any further degradation of our water supply and water table here in northeastern Minnesota. We can stop and think and NOT act on permitting Copper Nickel mining here UNTIL we know for certain that NO DAMAGE to the environment will occur because of it. The copper here isn't going anyplace and will only increase in value over time, giving us time to require an absolutely safe non-polluting mining method that is fully real-life tested, elsewhere first. Copper Nickel mining has never been done without significant pollution and high costs of cleanup in the communities where it has been allowed. And, those mines have always been allowed with the grand expectation of jobs and wealth for those communities. But, the wealth goes to foreign corporations and the cleanup costs goes to the local community and the public. Study closely what has happened in Wisconsin and you can only come to the conclusion that since no mining companies have ever gone back to prove to Wisconsin that Copper Sulfide Rock mining can be done in an environmentally safe manner that it probably isn't possible. PolyMet has only "proven" their system on a very small scale pilot plant operation. I'm certain that in the laboratory or pilot scale this might be possible. But, we cannot afford any failure, the cost to our well and water system is just too great.	G7A
18	What could be the value of a re-constituted forest industry, not just Popular for pulp, but a sustainable, white pine, red pine, and hardwoods forest mixture designed for the long term health and wealth of Minnesota and Minnesotans.	EOO

18	The remedial efforts described in the DEIS are so puny and inappropriate for the protection of that ecosystem that the whole process needs to be scrubbed and reworked. We the people of Minnesota, the drinkers of its waters, do not want any addition to the pollution already occurring from existing tailings ponds. Demand that the mining companies stop trying to "whitewash" their process with terms such as "mining sand" when in fact it is the same consistency as "mining slime" from the taconite industry but worse do to its acid nature and content of heavy metals.	WR1E
19	By the way, I didn't see any mention of the manner in which amphibole asbestos fibers will be handled or "remediated." Isn't that a significant oversight? Some mining company representatives have been upset with the non-scientific presentation of information against their proposals.	AQ4C
19	And, the manner in which Polymet attempts to circumvent the 100 mile swamp and "dilute" pollutants in the Partridge River is not acceptable. The effluent "into and out of the well" shell game is preposterous. Have none of these engineers looked at the history of Dow Chemical Companies' disastrous results in putting waste back into wells they had pumped out? Are they unaware of recent data showing that pollutants thought to be contained in deep wells were leaking into a multitude of levels. Some pollutants, thought contained, reappeared even at ground level because NO ONE knows where the faults and underground water passages are.	WR1E
19	Our present life style and lax regulation of industrial polluters is permitting pesticides, herbicides, pharmaceuticals, plastics and a myriad of chemicals to end up in our water supply. These are believed to be one of if not the cause of rapid increases in asthma, Alzheimer's, youth behavioral problems, cancer, autism, and Parkinson's diseases, and others. What more do we need to know about that connection? We cannot afford any further degradation of our water supply and should be doing all that we can to improve it, but we are not. Instead, our politicians have decided that we can tolerate a little more pollution of our waters, within regulations (regulations that equal a permit to pollute), for the politically expedient and popular JOBS they promise. Take a look at the pollution on both coasts, The Chesapeake Bay and the Duwamish River in Seattle in "Poisoned Waters" <a href="http://www.pbs.org/wgbh/pages/frontline/poisonedwaters/view/">http://www.pbs.org/wgbh/pages/frontline/poisonedwaters/view/</a> A Boei ng environmental engineering stated that he didn't think we should expect to ever again subsistence fish, as the Native Americans attempt to do, in the Duwamish River currently a Federal Mega Super Fund Site. It seems once we create pollution we cannot clean it up. How about, we just don't muck it up in the first place? We all need to live in a healthy environment and to be healthy. How can you live without health or without life giving clean water? Where ever you live you tap into the water supply, municipal, personal well, or purchased from some supplier. How much mercury, heavy metals, pharmaceuticals, acid or other pollutants would you allow in your well or source of water, none, just a little, or a lot? Few of us would allow any if we thought about it. But, it seems if the well is big enough and a few miles from our personal well, we somehow think that will not affect us if we allow or permit that pollution. It all adds up and ends up in OUR well. Let's not! Another very good video pointing out how serious pollution of the planet is can be seen in "11th hour" <a href="http://www.youtube.com/watch?v=71BG2V98IBY">http://www.youtube.com/watch?v=71BG2V98IBY</a> The water, the wetlands, the plants and myriad creatures from the microbes to the mega fauna, many of which we have yet to identify according to the Biologist E. O. Wilson, depend on uS not to destroy a balance we have little or no knowledge of.	G7B
20	I have been associated with mining all my life. My father worked for a mining –dependent industry—the railroad in Two Harbors. My father-in law was a miner in Bessemer, WI. My late husband was a metallurgical engineer, was Ass. Superintendent of the milling dept. at Tennessee Copper and Supt. of Pilotac, the experimental plant that preceded U.S.X's Minntac. The smelter emissions at Copper Hill, Tennessee killed vegetation within the 100 sqa re mile Copper Basin. Fertilization brought some vegetation back.The ores have given out so the area is probably now green. A proposed autoclaving process that Polymet will use has not been tested in a full-scale operation, will emit 12 1/2 T/yr. of sulfuric acid mist, 68 T./yr of NOX + other pollutants. A Dr. Thomas Powers from Montana has testified that mining is not as big a part of our economy as most people think, maybe as low as 35%. Once mining is over, tourism will be the mainstay of our economy. Tourists will not come here is there are fish adviseries.	G11

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
21	The metal content of Polymet's ores is low so 350' high piles of waste rock will be built. These piles will be lined, but the leakage from liners can be predicted. Sulfates will leak into the groundwater and tributaries of the St. Louis River, interact with mercury and bacteria in the sediments to produce methyl mercury, the substance responsible for fish advisories. Brain damage is the result if pregnant women and infants drink water contaminated with methyl mercury. The health of adults who eat a lot of fish will be adversely affected. Nickel is known carcinogen. If cobalt and nickel are together, the mix is toxic to fish. The platinum group of metals are toxic. The DNR and the PCA should check Nickel's operation at Sudbury, the Tennessee Dept of Health for similar affects due to Tennessee Copper's operations and the Montana dept of Health for numerous health and environmental effects caused by mining operations there. Dr. Samuel Blowes of the University of Waterloo has examined about 10,000 mine sites, found varying amounts of damage in all.	EOO,WR4B
22	In telecommunication, fiber optics are taking the place of the copper wire. Wetlands will be destroyed by mercury affected waters; migration patterns of wildlife will be disturbed. If Polymet is permitted five other companies will follow audit. Drainage from some of these will reach waters of the Boundary Waters Canoe Area Wilderness, eventually running into Canada. This could cause an international incident. We could end up with one or more Superfund sites. A South Dakota company went bankrupt, forfeiting a sizable bond that taxpayers had to pay for.	G2C,G7C,G9
23	A cost benefit analysis which weights the impact of jobs and tax revenue versus the cost of serious environmental and health effects plus the cost of rehabilitating Superfund sites should be done before a permit is granted. Short term benefits should not out weigh long term costs.	SE3
24	The Minnesota DNR and the Army Corps. of Engineers are creating an Environmental Impact Statement on a new type of mine being proposed for Northern Minnesota near the Boundary Waters Canoe Area Wilderness, and 50 miles from Voyager National Park. This mine is different from long established iron ore mines that Minnesota has had over the years. These proposed mines~ contain among the copper, nickel, platinum, and silver, significant deposits of sulfide. The sulfur in the resultant mine tailings could leach off into the surface and ground water, creating yellow and red streams and creeks with toxic heavy metals and sulfur. Water that contains heavy metals and sulfuric acid kills fish, birds and other aquatic life. The watershed for these proposed sulfide mines includes the Kawishiwi River which flows into the Boundary Waters Wilderness, and includes the St. Louis River which flows into Lake Superior. Contaminated water flowing from abandoned mines is one of the most significant contributors to water pollution in the United States. A toxic form of pollution caused by sulfide mines is called Acid Mine Drainage (AMD). AMD can have severe impacts on aquatic resources, killing microorganisms, insects, fish and other aquatic life. It stunts terrestrial plant growth, harms wetlands, contaminates groundwater, raises water treatment costs, and damages concrete and metal structures. There are several thousands miles of streams impacted by AMD within the United States. The economic losses on fisheries and recreational use mounts to hundreds of millions of dollars' annually. See appendices C and D. AMD causes elevated levels of dissolved metals and sulfates, which render the stream unsuitable as a source of drinking water for humans, livestock or for use as aquatic habitat for wildlife. Because of the potential for Acid Mine Drainage, sulfide mines require treatment systems to ensure that acidic water is not discharged. These systems must be in place for the life of the mine, and continue in perpetuity to treat acidic waters after the mine is closed. Due to the ongoing treatment process, the risk of discharging acidic water increases over time. Water treatment systems at reclaimed mining sites is complicated by changing levels of ground water and fluctuating rain fall levels over decades and centuries. If movement of the acidic water is not contained within an impermeable barrier (e.g. pipe, plastic, glass, etc.) the acidic water flows into the underlying groundwater system. Once the acidic water enters the groundwater system, the detrimental affects on flora and fauna becomes widespread. Containment and treatment of the affected groundwater system is difficult, if not impossible.	WR1E,WR3I
25	Unlike many dry Western states, Minnesota is rich in water resources that are especially vulnerable and are a great part of Minnesota's outdoor heritage for anglers, canoeists, duck hunters and of course wildlife. Our neighbors in Wisconsin have a moratorium on mining metallic sulfide ores written into law. In effect, the Wisconsin law says: "Industry can mine metallic sulfide ores in Wisconsin when it can show one mine in the United States or Canada that has operated and been closed for ten years without significant damage to its watershed." See Appendix A.	EOO

Comment ID	Comment Text	Theme Codes
25	Therefore, funding for long-term treatment of acidic waters and long-term responsibility and liability for environmental protection is on going. Mining companies and sulfide handling operators may not be perpetual and often go bankrupt. As a result, there are many examples of operators abandoning properties that discharge acidic water and requiring public money to clean up the site. See Appendix B.	PD4
26	Honestly how do you think this kind of mining can be safe as far as pollution is concerned when it's NEVER been non-polluting before?? NEVER! And NEVER has a mining company taken responsibility for the clean up. NEVER! I live in the Superior National Forest. THis will affect me and I'm outraged that this project may proceed before you're sure its safe for the environment.	EOO
26	To ensure the protection of Minnesota's water resources which are critically important for anglers, canoeists, hunters, and the wildlife which depends upon these water resources, which include the Rainy River drainage which flows into the Boundary Waters Canoe Area Wilderness and Voyageurs National Park, and the st. Louis drainage which flows into Lake Superior, the Walter J. Breckenridge Chapter of the Izaak Walton League of America supports legislation which bans the use of perpetual treatment systems for mine tailings and the discharged water that is produced by mines. The Walter J. Breckenridge Chapter of The Izaak Walton League of America further urges Minnesota to not permit any new mines that require ongoing water treatment after the mine was reclaimed.	G7A,G11
27	I live in Embarrass, Minnesota and I am concerned about the effects that copper nickel mining might have on my water supply. The DEIS seems to think that it's ok to have a lot of metals and chemicals in our water. I am concerned about the cumulative effects of these metals and chemicals on our health.	EOO
28	How will this mining affect the wildlife in my area? The people here enjoy living where we can see a lot of wildlife. How will water pollution affect the fish?	WI5
29	The PolyMet DEIS shows me that this mine will be very damaging to the environment, that there will be a lot of waste rock, and that our water will be filled with chemicals that we don't want to drink. What laws allow this to happen in one of the least contaminated parts of the state?	G2,G7B
30	We understand the struggle to find jobs and support families and local economies. However, the boom and bust cycle that mining brings is not the sort of sustainable economy we need. The new jobs projected for the project are speculative and short term. Many of them may well be contracted out to companies with no ties to the northland; locals may see few benefits. PolyMet's profits belong to a Canadian company and the minerals that would be mined will be sold on a world market; our state, even our nation, will see few if any benefits. Weigh this against our healthy tourism industry along with the invaluable ecosystem functions provided by healthy lands and waters, and the proposed action makes no	G1
31	Impacts of acid mine drainage. There has never been a mine of the type proposed that has failed to pollute adjacent land and watersheds. The DEIS claim that PolyMet can avoid this seem to be based on new untested technologies. There must be detailed plans in place in case these new technologies fail. Similar operations in dryer environments have been disastrous; here, in an area rich in surface and ground waters, all interconnected, the result could be catastrophic.	WR1E
31	The exchange of public land for a project that will destroy the natural values that current management (by the Forest Service) protects. The site of the proposed mine was singled out as being unique and significant by Forest Service and DNR scientists in the late 1990s. The proposed action would permanently erase a good part of an already dwindling resource.	PRO4
32	Disposal of waste. PolyMet plans to use tailings basins that are currently leaking and in violation of state law. State and federal regulatory agencies have failed to take action. How can we be assured that our health and natural resources will be protected from the more toxic waste that will be generated by the proposed action? The DEIS does not answer this question.	PD2
33	Very long term effects. Impacts to the environment that may occur after Poly Met is gone (which may be sooner than the projected 2 - 3 decades, due to market fluctuations, the company's solvency or adjusted priorities, etc) need to be scrutinized in detail. Exactly how will adequate water treatment be accomplished as the decades and centuries roll by?	RFI

Comment ID	Comment Text	Theme Codes
34	Risk to aquatic resources. There is a high potential for mercury methylation as a result of increased sulfate concentrations in seepage from the tailings basin to surrounding wetlands. Impacts to wild rice stands are just one of the many aquatic resources that the DEIS fails to address, or addresses inadequately.	WR4B,WR4F
34	Financial assurances. In light of the history of similar mining projects around the world, assurances that taxpayers won't be left with a colossal clean up bill must be iron-clad, and currently, they are not.	PD4
35	Loss of habitat for the Canadian Lynx. Can this loss, to an endangered species, of hundreds of acres of critical habitat be adequately rationalized or mitigated?	WI1
36	Damage to the wild character of the area. The impacts of the proposed project on the character of an area that millions from around the world visit for its beauty, peace, good fishing, spiritual renewal and all sorts of intangible values should be considered. Will people continue to flock here with this sort of mining going on?	EOO
37	Please postpone final approval of this mine until the company commits to additional environmental and economic protections. I believe it is important that waste pits should be leak-proof for hundreds of years, rather than the 65 years the company proposes. Additionally, we must have ironclad guarantees that the money for cleanup is in a fund that is secure against any changes in ownership. Otherwise, a future bankruptcy could dump massive cleanup costs on taxpayers.	G4A
37	In my role as CEO of a Minnesota-based company, I keep a close watch on significant potential developments that may affect the economy and, in turn, the market for my company's product. Although the recession has slowed momentum on some of the major industrial developments on the horizon for Minnesota's Iron Range, the growth prospects there remain critical to the future of our company and the job security of our employees. I believe that Polymet can run its operation in an environmentally sound manner and create hundreds of good jobs to help turn around a weak economy in our region. Perhaps, more importantly, if Minnesota can show the world we know how to strike a balance between jobs and legitimate environmental concerns, the NorthMet project can be just the beginning of an exciting new industry in our state. As an avid outdoorsman, I wholeheartedly support the diligence that's gone into making sure that Polymet's processes will be conducted in such a way that Minnesota's environment is protected and sustained for generations to come. As I understand it, this project has been designed to minimize environmental impacts; reusing a brown-field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. I appreciate the thoroughness of the review process to date and I believe it's time to move forward. That's why I'm writing to urge approval of the EIS. Thank you for your consideration.	EOO,G6
38	WHEREAS, PolyMet Mining Co. proposes developing a copper, nickel, platinum, palladium, gold and cobalt mine and an ore processing plant at the former LTV Steel Mining Company plant near Hoyt Lakes; and, WHEREAS, It is projected that PolyMet will create 400 fulltime jobs with a payroll of \$40 million and more than 500 spin-off jobs with a \$242 million payroll in St. Louis County alone; and, WHEREAS, Construction of the \$600 million NorthMet Project will require about 1.5 million construction hours over two years; and, WHEREAS, PolyMet worked with federal and state regulatory agencies in drafting an Environmental Impact Statement (EIS) exploring potential impacts and ways to address them; the draft EIS demonstrates PolyMet can mine these metals AND protect air, water and natural resources; and, WHEREAS, PolyMet will provide millions of dollars in local and state taxes to provide much needed support to our communities and educational system; and, WHEREAS, PolyMet will have a positive economic impact on the City of Hibbing just as LTV Steel Mining Company had when it was operating. NOW, THEREFORE, BE IT RESOLVED, That the City Council of the City of Hibbing hereby go on record in full support of the Poly Met Mining NorthMet Project. The motion to adopt the foregoing Resolution was duly supported by Councilor Jack Lund and upon being put to a vote, carried as follows:	EOO
38	I also ask that you continue the public comment period on this issue beyond February 3. Many of us only became aware in the past several weeks of the plan to mine copper in Northern Minnesota. We need time to research this issue and offer informed comments.	PRO6

39	<p>We the members of the East Range Sportsmen &amp; Conservation Club appreciate the opportunity to express our support for the PolyMet Mining Co. project. We are all concerned about our environment. We want to protect it, so that our children will be able to use it Anne enjoy it as we have. From what we can see from the 700 plus review, PolyMet Mining Co. will do the utmost to preserve and protect the surrounding environment. PolyMet Mining Co. will go forward with the state of the art design to manage waste rock and protect the surrounding waters. We would like to thank you for your effort with this environment statement. We the members of the East Range Sportsmen &amp; Conservation Club strongly urge you to approve the statement so that PolyMet Mining Co. can start forward with their operation and bring the long needed jobs to our communities.</p>	EOO
39	<p>(4.1-112) PolyMet's proposal to construct a wetland for the purpose of treating contaminated water is - at this point - merely an idea. It would be prudent to require full-scale testing of this key component before relying on it to protect such high quality watersheds and important wilderness areas as the nearby BWCAW. From my understanding, a treatment wetland of this scale has never been tried. Previous tests of small-scale treatment wetlands have shown wide seasonal variations in effectiveness. Moreover, no-one knows if these wetlands can continue to uptake pollutants over the hundreds or even thousands of years that they will remain necessary. Failure of this system would require very long-term and costly treatment by alternate means - most likely paid for by Minnesota's taxpayers.</p>	WR3B,WR3L
40	<p>As climate change continues to threaten the water supplies of many western states, and Minnesota's own population continues to grow, I have no doubt that high-quality water will be in short supply. According to the U.S. Government Accountability Office, at least 36 states will face catastrophic water shortages within five years due to a combination of drought, rising temperatures, pollution, urban sprawl, and population growth. In light of these circumstances, it is easy to see that Minnesota's access to abundant, clean water is precious and unique. In fact, it is, or soon will be, much more precious - and essential- than the metals contained at the PolyMet mine site. Water also happens to be a renewable resource able to sustain Minnesotans for generations - if protected. In contrast, the metal contained at the NorthMet site is expected to be gone in one generation. Trading away generations of valuable, clean water for a quick profit is not a tradeoff that is in the best long or short-term interests of Minnesotans.</p>	G7B
40	<p>My second concern with the NorthMet DEIS is in regards to the probable negative impacts the project will have on the area's water quality. The DEIS states that water from waste rock piles will likely remain contaminated with heavy metals - including mercury - and sulfates for up to 2,000 years. After only 65 years, this contaminated water is expected to overflow from the west pit, contaminating nearby water bodies for up to the following 1,945 years. In addition, seepage from the tailings pit is expected to create "high risk situations" for mercury methylation in wetlands and lakes downstream on the Embarrass River.</p>	WR4B
41	<p>We are writing to you to express our deep concern over the proposed PolyMet Mining Project near Hoyt Lakes, Minnesota. This non-ferrous mining project is fraught with serious environmental issues concerning water and air quality in the BWCAW and surrounding areas. We know you have reviewed the environmental Impact Study that was recently released for the project. Therefore, you are aware of the significant threat this type of mining operation poses to our environment, including acid mine drainage, mercury methylization, and the use of the same LTV tailings basin that is already leaking. This new operation poses new threats for sulfuric acid runoff and higher levels of mercury contamination to our already polluted waters. The technology that PolyMet proposes to use to control these and many other pollution issues is untested and unproved. The State of Wisconsin has banned non-ferrous mining as a result of the environmental concerns with this type of mining and as a result of the past environmental disasters associated with it. The economic benefits of the proposed project and others like it are relatively short term and are not sustainable. The environmental costs, however, are long term and will impact our grandchildren and future generations for many, many years to come. The jewel we know as the BWCA Wand its surrounding areas are too delicate and too important for our culture and to our environment to trade for short term gain. We respectfully urge you to deny your support for non-ferrous mining in Minnesota, until the mining industry, and especially PolyMet in the short term, can demonstrate the "proven" technology needed to prevent serious environmental impact. Future generations are depending on you to do the right thing. So are we.</p>	G2C,G7A,G12

41	<p>The voting members of the Community Economic Development Joint Powers (CEDJP) support the Polymet Mining Company NorthMet Project. The CEDJP was created under Minnesota Statute and our purpose is to create and support a sustainable economy for our area and to enhance the quality of life for our residents. The Community Economic Development Joint Powers recommends the decision of adequacy for the Environmental Impact Statement. We firmly desire that the project protects the environment. We live here and our community members care as much or more about protection of the environment. We believe the Draft Environmental Impact Statement supports an informed decision by the multiple agencies with responsibility to approve the project that meets the intent of the National Environmental Policy Act (NEPA) to fully and thoroughly disclose the potential environmental, social and economic impacts of the project. The draft EIS also includes numerous measures and proposed actions with recommended alterations and mitigations to assure that it meets the needs of the project proponent, the economic needs of the local communities and protects the environment. The economic benefits of the NorthMet Project are substantial and that is critical to the long term sustainability of our local area's economic well being. Clearly, local communities will be harmed if the project is not approved for anything but clearly legitimate reasons. The project will significantly contribute to the state and local economy with over 400 employees and hundreds of spinoff jobs. If the agencies do not approve the project, all local people and communities will be substantially harmed. The economic benefits of wages, services and taxes to support our communities and educational system are huge. The jobs created by the project are needed by our region and state. We believe in environmental responsibility. The draft EIS thoroughly discloses the impacts and how they can be minimized to acceptable levels to achieve the purpose and need of the NorthMet Project. Polymet Mining Corporation has demonstrated its commitment to environmental protection of this area that we as locals expect to be protected, with the years of exhaustive study that have been performed to fulfill the purpose of the NEPA and support an informed decision to approve the project. The EIS has been prepared with the full participation and oversight of several federal and state agencies with jurisdiction over the project and permits, including the Minnesota Department of Natural Resources, the Army Corps of Engineers, Minnesota Pollution Control Agency and other cooperating agencies. We as local communities must depend upon these agencies with the technical expertise to perform this analysis. Based upon our participation in the process and review of the EIS, we believe these agencies have fulfilled their obligations to the communities and citizens of the State of Minnesota to supervise and direct the preparation of the EIS. The environmental impact statement has been performed in consultation with the local communities. In addition to formal scoping directed under the direction of the agencies, Polymet has taken numerous and extraordinary measures to inform the public, including several open houses to inform the public of the proposed project. We note that in addition to supporting economic development and assuring environmental protection, the project can produce metals essential to our national security and to green technology such as wind turbines and hybrid cars and metals necessary for pollution prevention devices such as catalytic converters. The positive outcome of the project, in addition to the jobs created, will be a domestic supply of critical metals needed in medical applications and multiple technological products essential to the livelihood and security of our state, country and world. It has been a longstanding policy of the state to encourage the development of minerals. Northern Minnesota has a</p>	EOO,G10
42	<p>I grew up in Duluth, and I understand the desperate need for jobs in northern Minnesota. However, it is completely unsustainable to allow sulfide mining in Minnesota for a short-term gain in jobs at a very long-term loss in water quality. The clean-up costs associated with the sulfide mining contamination over the 2,000 years expected by PolyMet (DEIS, Table 4.1-45), will drain the Minnesota economy far greater than sulfide mining will contribute to the economy. New Mexico has required that some mining companies pay \$400 million upfront in financial assurance for clean-up costs. Minnesota - at a minimum - should require the same from PolyMet.</p>	PD2
43	<p>(4.1-112) PolyMet's proposal to construct a wetland for the purpose of treating contaminated water is - at this point - merely an idea. It would be prudent to -require full-scale testing of this key component before relying on it to protect such high quality watersheds and itnpoliant wilderness areas as the nearby BWCAW. From my understanding, a treatment wetland of this scale has never been tried. Previous tests of small-scale treatment wetlands have shown wide seasonal variations in effectiveness. Moreover, no-one knows if these wetlands can continue to uptake pollutants over the hundreds or even thousands of years that they will remain necessary. Failure of this system would require very long-term and costly treatment by alternate means - Most likely paid for by Minnesota's taxpayers.</p>	WR3B,WR3L

44	(4.13-2) The stability of the existing LTVSMC tailings basin that PolyMet plans to use for their disposal is a well-recognized concern. The existing basin has been documented to contain fines and underlying soils that create a "low margin of safety" for its long-term stability. Rather than generating a plan that satisfactorily increases the safety margin of the basin, PolyMet concedes that "further design and analysis is needed."	GT2
45	What concerns me is the 1200 acres to be filled or drained at the headwaters and watershed at the Partridge River, by Polymet. The Partridge River feeds Colby Lake, where the city of Hoyt Lakes gets its drinking water! It appears to be the only source of water, as the city has drilled wells in earlier times without success. The feeder creeks are extremely low in the summer and some dry up, that feed the Partridge. Even that river gets very low at different times! Colby Lake needs a certain depth of water, as Minnesota Power has its generator plant located on the lake and uses the water for cooling. Further, a diversion plant was put in to feed Whitewater Lake (man made) next to Colby to divert water back to Colby during low water times of the year. Minnesota Power owns all the land around Whitewater Lake and is developing lots for sale and private holdings. If Polymet screws up the water levels or quality of the water from the Partridge it will cause major problems for Hoyt Lakes, Minnesota Power, Whitewater Lake and the St. Louis River!!!.	WR3F
46	This letter will serve as official notification that I support PolyMet Mining. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air, water or land will be minimal, if any. I believe that PolyMet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed area. I have lived in this area most of my life and I am obviously concerned about our environment, not only for myself but for my family as well. My husband and I also own a couple of businesses in this community and therefore certainly invite an economic boost to the area. We also are outdoors people and are very interested in maintaining a healthy natural environment, not only for my own enjoyment but for the enjoyment of future generations. I also serve as the Mayor of the City of Aurora. As a local elected official, I have a responsibility to ensure the long-term health, sustainability and vitality of my community. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project.	EOO
47	The short-term economic gains of the PolyMet proposal NEED to be balanced against long-term risk and cost of clean-up. Additionally, Minnesota's natural water resources are priceless, and the key to its long-term image and sustainable economy. I know that many decision along with many of my friends, family, and colleagues choose to remain in or move to Minnesota because of the BWCA and other natural areas in Northern Minnesota. I was married on the shores of Lake Superior and thousands of others are each year. There are reasons to reject the PolyMet proposal beyond economics. The identity of Minnesota and Minnesotans is at stake. Even if the possibility of environmental disaster is minimal, the destruction would be infinitely catastrophic and a fraction of infinity is still infinity. Do not approve the PolyMet mining proposal.	EOO,G7
48	I believe that the PolyMet DEIS process is not following NEPA regulations. PolyMet is being treated as an isolated mining project, when in truth it is part of copper-nickel-precious mineralization that includes two separate watersheds.	WR31,PRO4,G9

- 48 I would like to write in support of the Polymet Mining project that is being considered for implementation. To understand why I support the project, it is necessary to know some information about me. I have lived on the iron Range since the age of eight. From the age of twelve, I knew that I wanted to be an attorney. Seventeen years later, I have my own solo practice in Virginia, MN, but while in law school at the University of St. Thomas, I received my MBA as well. Prior to opening my practice, I looked at a number of factors in consideration of opening a firm. One primary reason that weighed in favor of making an affirmation decision to start my practice here was Polymet. People on the Iron Range have become accustomed to the boom and bust cycle of the mining industry and that will not change. Polymet raises the economic floor of the entire region so that the economic busts are not quite as bad. In addition, more people, like myself, will be more inclined to begin opening businesses and venture into the entrepreneurship waters. Mining is the way of life here and that will not change. Outdoor activities are also a way of life here, but that pales in comparison to the need for clean drinking water, fresh air, and uncontaminated soil. No one wants pollution; however we live in an area where some pollution is required in order to sustain the rest of the world. If people want pristine areas, such as the Boundary Water Canoe Area, then they must alternatively have places like the Iron Range. The goal, then, is to have the safest and cleanest form of mining possible. Polymet has achieved that standard by pursuing the policy of having the cleanest copper mine in the world. I know this because of the various statements made by its president and legal counsel, but also because of the EIS itself. The EIS is like a contract and Polymet is the bound party. That policy will be continued as the DNR, MPCA and other various governmental and private agencies monitor Polymet's continued activities, assuming the plan is adopted. Therefore, not only is Polymet starting at an extraordinary high standard but it is seeking to sustain that standard into the future. Therefore, the Iron Range achieves the best of both worlds: continued economic growth And development and doing so in a responsible and clean manner.
- 49 The premature PolyMet DEIS process denies the public scoping and analysis of the full extent of this mining district.
- 50 My name is Maureen Johnson. Not far from Ely near the BWCA W, my family, my spouse and I have a place that my grandfather realized was very special and kept for his family to visit. I visit this place whenever I can in any season, to find peace, solitude, and quiet, but also health, hunting, hiking, and friends. I studied biology for my B.A. Several of my jobs were water research in the Ely area by USEPA and the USFS, including field sampling, lab work, and quality checking data. I have 21 years of Superfund work and project management at the Minnesota Pollution Control Agency. I have worked with and learned from scientists in all the fields that relate to environmental studies but especially those that deal with hazardous waste, acutely toxic chemicals, and waste with long-term effects on land, ground water, surface water, and air, and on people and biota. During my work in Ely in the 1970's, the Regional Copper-Nickel Study was gathering baseline environmental data and identifying potential problems, which would be researched subsequently, all for the time in the future when copper-nickel mining would be proposed. My spouse worked on the Study. The State of Minnesota and many government agencies spent a lot of taxpayer money for years of research on flora and fauna, climatology, ground and surface water quality, habitat, geology, minerals composition and developing an understanding of what might be affected and how. Why? The researchers and the funding legislators at the time understood that mining for metals across North America resulted in dead land and dead water. They knew the risks of toxic metals releases were not well understood, and wanted to create a record of the environmental background so that anyone looking at a mining proposal would have the necessary information to evaluate its impacts. A mining company would be able to point to it and say what mining would change and what the company would protect or affect. I understand that the resulting literature occupies four to five feet of a wall at the Legislative Library.
- 51 I also note that the DEIS generously uses terms to evaluate data including, but not limited to, slow, fast, low, little, high, elevated, significant, insignificant. These are editorial terms that do not belong in a scientific document such as the DEIS without actual data and a discussion about how it relates to other similar data and other numbers arising from the Copper-Nickel Study, toxicity studies, health concerns and risk, and regulatory standards. If other authors disagree about editorial terms, this should be included in, the text discussion. Footnoting disagreement is an insult and makes it appear that the DEIS authors think they know best. Good scientists know that they do not know everything and avoidance of the appearance of arrogance will be better evidence of non-bias.

52	As a former Superfund project manager, I spent years cleaning up industrial and agricultural contamination that was toxic and almost deadly to children and adults. These multi-thousands and multi-million dollar cleanups at taxpayer expense should serve as examples of what not to do. A new venture seldom understands its impacts until it is too late. It appears the preparers of the DEIS have not even read much of the Study or the subsequent research. It would be easy then for them to say, "I didn't know" when uncontrolled pollution begins to occur. The DEIS basically says that they think bad contamination will not happen, in spite of metals releases in several places nearby which have not yet been controlled and continue to pollute. PolyMet must show that they have a reliable, appropriate capture/ treatment/ extraction/ disposal systems for any and all contamination that might be released, in addition to the financial assurance for performance. No matter who pays the bill, it is always cheaper to prevent contamination than to clean it up later.	G4A
53	I strongly support the proposed PolyMet operation at Hoyt Lakes. As a native of Silver Bay, former resident of the Gunflint Trail, current Babbitt-area wetland and timberland owner, and hardcore conservationist, I am, like all of my neighbors, enthusiastic about the prospect for this new generation of mining operation coming to the area. PolyMet will provide a domestic supply of metals that Americans use every day-nickel, copper, gold, platinum, and palladium-in cell phones, computers, catalytic converters, electric cars, wind turbines, and medical devices. The global environmental and domestic economic impact of producing these critical metals here, and having to import less from elsewhere, will be very positive. After all, avoiding mining in Minnesota won't reduce American demand. By mining in the U.S., and specifically here in Minnesota, we can ensure that we have control of the operations and can ensure the most responsible stewardship possible. We should take a holistic view of the global environment. PolyMet's operation in Minnesota will be so environmentally and technologically cutting-edge that it will be a model for the world. The state and federal government's environmental requirements for this mine will be unprecedented. In fact, this mine might even have a positive effect on the global environment. Indeed, the entire human race would benefit from PolyMet's operation being established instead of a mine in some other, less environmentally conscientious country. It would be the epitome of good stewardship envisioned by our nation's great progressive conservationist forebears, like Teddy Roosevelt, who fought for the establishment of the national forest system for just such wise-use applications as this.	EOO
53	This mine is in the Lake Superior watershed, an international water, and the mine is a short enough distance from the international boundary to consider international air quality issues. The DEIS should discuss what obligations the mining company has to the International Joint Commission serving both the United States and Canada ...the Commission rules upon applications for approval of projects affecting boundary or transboundary waters and may regulate the operation of these projects; it assists the two countries in the protection of the trans boundary environment, including the implementation of the Great Lakes Water Quality Agreement and the improvement of trans boundary air quality; and it alerts the governments to emerging issues along the boundary that may give rise to bilateral disputes. (www.ijc.org) Was public notice of this DEIS specifically served to the IJC, the Minister of Environment Canada, and affected provinces?	G2B
54	Native American land and the tribal nations will be affected. They have great concern regarding this project. The final EIS must have the support and fully consider these sovereign nations.	G3,CR2,CR4
55	I feel the Draft Environment Impact Statement (DEIS) is inadequate. It does not go far enough to protect the vital watershed that will be affected - nor does it address the other two major watersheds that could potentially be affected. These watersheds could easily be negatively impacted, or ruined, for thousands of years.	WR2E
56	More research into the potential immediate and long term risks to human health resulting from mercury and acid contamination of the Lake Superior watershed, the Embarrass River, its tributaries and lakes-as well as the long-term affects on the wetlands and wild rice needs to be done. The DEIS is not going far enough to assess the immediate and long-term affects these toxins will have on all of us who depend on the quality of water, which encompasses ALL living things in this region.	WR1E,WR5A,PRO4

Comment ID	Comment Text	Theme Codes
57	PolyMet needs to fully provide financial assurance to protect the taxpayers of Minnesota from the very real chance of long-term pollution. In other such arrangements, the assurance secured by the mining companies responsible for damage to the environment have been woefully inadequate. We need to protect the residents/taxpayers of Minnesota and the long-term viability of this region. It would be negligent not give this issue intensive scrutiny.	WR1E,PD4
58	Claims of "new technologies" by PolyMet have not been properly investigated or proven. Sulfide mining has been done in areas of the western USA and all over the planet Investigation of what the overall environmental effects have been from a random selection of current and completed projects is essential before proceeding .	PD8
59	Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	WI5,WE2,FM1,AQ6A
60	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, interfere with tribal rights guaranteed by Treaty and with tribal resources, like wild rice, increase air pollution that results in regional haze and create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs. The Indian tribes working on the EIS and the United States Environmental Protection Agency have provided helpful information on the inadequacy of the PolyMet draft EIS. Before this sulfide mining project is even considered for permits, please fill these gaps:	WR1E,PD1,G2B,G2C,G4A,
61	As the U.S. EPA suggested, make sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.	PD4
62	The project could also increase air pollution that results in regional haze and create a risk of perpetual pollution. The PolyMet DEIS states that PolyMet would have no significant effect on regional air quality. This conclusion is taken in isolation. Cumulative effects of other proposed mining must be included in order to make the DEIS adequate.	AQ4,AQ4B
63	Furthermore, the most important fact is that PolyMet does not even own the 6700 acres yet. Explain to me how the state can even consider permitting this mining company without even following the proper protocol for a land exchange? Sounds like you are putting the cart before the horse:	PRO4
64	The PolyMet "NorthMet" copper-nickel strip mine project is proposed to be sited on approximately 6,700 acres of United States Forest Service lands in the Superior National Forest. Pursuant to law, the project depends on the completion of a successful land exchange of Superior National Forest lands for non-federal lands. (POE IS), p. 1-3. The proposed land exchange tracts and the characteristics of such land are not described in the DEIS and have not yet been publicly disclosed. Across Minnesota, there are dozens of applications for permits to prospect for nonferrous metals. Understanding land exchange and mineral rights is critical for the PolyMet Project and for future proposed strip mine development. The need for a land exchange prior to permitting of the PolyMet strip mine project must be transparent to the public and the DEIS, for the PolyMet project must include an analysis of the environmental impacts of the land transfer, including potential impacts on tribal rights. This precludes any possible permitting of the PolyMet DEIS as it stands now. Thus, before PolyMet can be permitted for the land that is to be exchanged for Superior National Forest land to make this project possible must be analyzed. Include impacts of the land swap on wetlands, endangered species, hydrology, tribal rights, and taxpayers' interests.	PRO4

Comment ID	Comment Text	Theme Codes
64	I believe that we as a state have to follow the environmental review law. No way are 400 short term mining jobs worth the risk to our environment, especially our precious water and air. We have to start to think about our future generations and not be so easily persuaded to exchange our natural resources for very few jobs now just because of the poor economic conditions. In better times I doubt we would even consider this drastic proposal. Why are we in Minnesota so gullible to let this happen? Our neighbors to the east have a moratorium on this type of mining ... why don't we have this until PolyMet and other hard rock mining companies can prove that is a 100 percent clean project which would result in zero damage to the environment?	WR5A,G10,G12
65	Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, and interfere with tribal treaty rights and tribal resources, like wild rice. The state must analyze ALL of the CUMULATIVE impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in accumulates in fish and causes brain damage to children and to fetuses.	WR3I, PRO4,G7B,G7C,G8
66	I find it unbelievable that the DNR and the Corp of Engineers, have the sole power to determine if northeastern Minnesota will exchange its present sustainable tourism industry (a billion dollar industry-www.exploreminnesota.com) for a "non-sustainable" sulfide mine (and possible sulfide mining district) that will destroy our natural resources and forever more alter the incredible beauty of the lakes region of northeastern Minnesota for the sake of PolyMet's 400 short term jobs, and additional spin off jobs for a lifespan of just 20 years. The tourism industry of Minnesota contributes substantially to the tax base-... "Unlike US Steel which paid precious little in property taxes on its 3,000 acres ... " Timberjay Newspaper, January, 21, 2010. The questions for you to evaluate are: Is this really what we want for this part of our state? Do we want to forever more change surrounding forests and wetlands as they are today? To no longer count on clean water? To deal a fatal blow to the sustainable economic base of this area?	G11
66	Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers	G10

67	<p>How can PolyMet be permitted without the land? How can PolyMet be permitting without completing a land exchange for the 6,700 acres needed? As an Industrial Engineer, every project I have ever developed begins with a solid foundation and from there the project proceeds. There are serious flaws in the PolyMet DEIS because the most important aspect of this project is the need for 6,700 acres of land--the foundation for the project, and the land has yet to be exchanged with the USFS. Both the Indian tribes and the United States Environmental Protection Agency have pointed out this very serious inadequacy in the PolyMet/NorthMet Draft environmental impact statement. Before PolyMet can even be considered for permits, the following gaps NEED to be filled: The PolyMet "NorthMet" copper-nickel strip mine project is proposed to be sited on approximately 6,700 acres of United States Forest Service lands in the Superior National Forest. Pursuant to law, the project depends on the completion of a successful land exchange of Superior National Forest lands for non-federal lands. (PDEIS), p. 1-3. The proposed land exchange tracts and the characteristics of such land are not described in the DEIS and have not yet been publicly disclosed. Across Minnesota, there are dozens of applications for permits to prospect for nonferrous metals. Understanding land exchange and mineral rights is critical for the PolyMet Project and for future proposed strip mine development. The need for a land exchange prior to permitting of the PolyMet strip mine project must be transparent to the public and the DEIS, for the PolyMet project must include an analysis of the environmental impacts of the land transfer, including potential impacts on tribal rights. This precludes any possible permitting of the PolyMet DEIS as it stands now. A. PolyMet reserved mineral rights do not support strip mining on Superior Forest Land. PolyMet proposes to develop a copper-sulfide strip mining operation located primarily on Superior National Forest Lands. Although PolyMet has claimed that the mineral rights "reserved" in its 1935 deed authorize mining in any form, the U.S. Forest Service has maintained that the deed does not permit strip mining, so PolyMet must buy land to exchange before obtaining permits for the NorthMet mining project. The analysis conducted by the U.S. Forest Service is consistent with prevailing law. Strip mining necessarily entails massive removal of soil and plant life to access underground minerals. This results in irretrievable loss to the environment as well as a fundamental change in forest land use. Prepared by Bride Seifert, William Mitchell Law School, Intern for WaterLegacy; Paula Maccabee, Counsel for WaterLegacy. Furthermore, why does PolyMet's DEIS not contain an alternative underground mine option? B. Land exchange process requires equal value and environmental review. In order for PolyMet to purchase Superior National Forest land, a land exchange needs to occur. PDEIS, p. 3-1. Under The Federal Land Policy and Management Act of 1976 § 206,43 U.S.C. § 1716, lands exchanged must be of equal value, in the public interest and in line with the forest land and resource management plans. Public interest assessment examines the needs of State and local community, looking at the economy, recreation, fish and wildlife as well as food, fiber and minerals. 43 U.S.C. § 1716(a). Environmental concerns are clearly included. A critical first step in a public lands exchange is the public interest determination. No land exchange can take place unless it is in the public interest. The public interest determination considers the needs of State and local residents, fish and wildlife habitats, wilderness and recreation values, economic interests and cultural resources, and watershed issues. 36 C.F.R. § 254.3(1). C. Environmental Review - National Environmental Policy Act. The National Environmental Policy Act (NEPA) calls for the preparation of an Environmental Impact</p>	SE3,N1,CPLU4
67	<p>The advancement and possibility of PolyMet being permitted has destabilized the real estate market in areas of northeastern Minnesota where the MDNR has leased and offered for lease state mineral leases. People do not want to live near a sulfide mine and property values are already being affected by the possibility of PolyMet's approval.</p>	RFI,WE3,WE4,SE4,N1
68	<p>The economic analysis of the DEIS must be rewritten to address the above concerns</p>	EOO,RFI,WI5,WE2,N3,AQ
69	<p>Cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district.</p>	RFI,SE4,N1,AQ3
70	<p>What is the economic liability of transporting crushed rock rather than semi-processed metals?</p>	RFI

71	<p>PolyMet's DEIS is based upon PolyMet using 1/3 of its plant capacity, as purchased from LTVSMC/Cleveland Cliffs. Excess capacity is planned to be utilized by neighboring Teck Cominco, Franconia, Kennecott and Duluth Metals. The Excess Capacity of PolyMet's processing plant is not addressed in the DEIS. The PolyMet DEIS is inadequate in not allowing for public knowledge or participation in the discussion of the creation of a sulfide mining district in the Arrowhead Region of Minnesota.</p>	SE4,PRO3,PRO4
72	<p>Contaminated discharge from waste rock piles. Water from waste rock pile swill be polluted for up to 2,000 years (DEIS, Table 4.1-45) The St. Louis River watershed is already contaminated with sulfates, which become part of a biochemical process converting mercury into methylmercury. This methylated form of mercury accumulates in fish, resulting in fish consumption adversaries. Allowing PolyMet to store tailings on top of already leaching L TVSMC tailings would increase the amount of sulfates in the watershed. DEIS: "Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent 'high risk situations' for mercury methylation" (S-9) When mercury is "methylated" it can bioaccumulate in fish, making them unsafe to eat. The DEIS is inadequate in not addressing state standards regarding sulfates and methylmercury.</p>	WR3I,WR4B,PRO3,PD2,P

72	The DNR's exploratory leasing is opening up the entire Arrowhead to become a sulfide mining district. An EIS needs to be completed on the mineralization of the entire Duluth Complex prior to the permitting of any one project.	PRO4
73	Plant closure plans extend to year 50 (30 years after closure) but do not account for acid mine drainage that can last for hundreds to thousands of years, requiring perpetual or near perpetual treatment. The DEIS does not provide adequate plans for monitoring or mitigation. There is no adequate means of enforcement for clean-up or for any financial assurances that the mining company will be responsible. Instead, the MN taxpayers will bear the burden of clean-up cost of toxic wastes for decades-and into perpetuity.	WR3I,PRO3,PD4,PD5
74	Please accept these comments that I am writing to you as a second generation resort owner and Boundary Waters Canoe Area outfitter on the South Kawishiwi River and Birch Lake in Ely, Minnesota. I am also a retired high school teacher with decades of experience and a Masters Degree in Industrial Engineering. Living on Birch Lake since 1946, I have seen the impact to the water quality and fisheries due to the rather benign pollution associated with taconite mining and ever present air and noise pollution due to the blasting from the mine. I know, first-hand, the effects of water and air pollution on the environment. Presently, a lawsuit is pending on Cliffs Erie, a subsidiary of Cliffs Natural Resources, for ongoing water pollution from previous taconite iron mining:	WR2E,PD4,G2
75	Explain the sense of moving forward with the approval of a permit for a much more dangerous mining operation-PolyMet sulfide mining- when other mining companies have yet to clean up previous pollutions from much more benign mining operations than sulfide mining? I have extreme concerns about the PolyMet NorthMet mining project Draft Environmental Impact Statement (DEIS) proposed on 6,700 acres of public land in the Superior National Forest, not only for the safety of the proposed project, but for its potential impact on Minnesota's natural resources, and the future of its present sustainable economy.	WR5A,PD3,PD4,G10
76	According to Tom Powers, economic rationality requires that mineral deposits be left in the ground undeveloped. Especially, since according to the Polymet data only 1 to 5 percent of the ore contains the non-ferrous metals, relegating the 95 to 99 percent not used to the tailings area. From my perspective, the environmental risk is one no rational person would take. Please review Comparison of Predicted and Actual Water Quality at Hardrock Mines: The reliability of predictions in Environmental Impact Statements and Predicting Water Quality at Hardrock Mines: Methods and Models, Uncertainties, and State-of-the-Art, Ann Maest and Jim Kuipers. The results of this study are: 100 percent of sulfide mines predicted compliance with water quality standards before operations began; 76 percent of mines, studied in detail, exceeded water quality standards due to mining activity; Mitigation measures predicted to prevent water quality exceedances failed at 64 percent of the mines studied in detail. Other environmentally conscious companies embarked upon "safe" sulfide mining projects with every intention of being environmentally friendly. However, the facts are that three out four ended up be polluters. Statistically, that means that the PolyMet project has a 75% chance of polluting! That risk is untenable and one that should not be taken.	ALT8,WR2D,G7B
77	We did not get any latitude to circumvent the law for our land exchange. Our economic contribution makes dollars that stay in the area, not like those of a Canadian mining company that extracts the natural resources, makes their money, layoff the workers, closes the plant, and leaves the polluted and toxic mess for the public to try to reclaim and clean up into perpetuity. This is the basis of the "Resource Curse" and the Iron Range is a perfect example of this "curse." If mining of any kind is so good, why then are present Iron Range communities struggling with loss of jobs, shrinking school enrollment, and blighted main streets---and the area is dotted with taconite and iron ore mines? Should not they be prospering? I think not, because an industry based on extraction can not survive.	RFI,WR2D,G1

78	However, I believe that a total moratorium on mining must occur in Minnesota, the same which presently exists in Wisconsin after their Flambeau sulfide mining disaster. This would allow for time to further evaluate sulfide mining in Minnesota and its expressed dangers with full and transparent disclosure to the public, since current MN laws have plenty of "gaps" in safeguards that expose the state and its citizens to significant risks. Some of these gaps are 1) Only the DNR can make decisions in calculating the amount of financial assurances and in determining the appropriate form of financial assurance. Presently, the Pollution Control Agency and the Dept. of Management and Budget are not involved in this process. 2) Mining could also be allowed up to the very borders of the Boundary Waters Canoe Area Wilderness and adjacent to (or under) water bodies that flow into the wilderness. 3) Mining companies are not required to discuss financial assurance or damage deposit, in the DEIS for their mine proposals, which is a key opportunity for public involvement in the process. These present "gaps" must be addressed and changed for the protection and safety of the state of Minnesota and its citizens. Representative Rukavina has referenced "tough US environmental laws" in Minnesota that would hold PolyMet accountable in recent newspaper articles. However, the reality is that the leaking tailings ponds in his district are polluting public waters right now from past "benign" mining procedures. These same waters will be more dangerously polluted from the acid mine drainage from the stripping piles and the leaking tailings pond of the proposed PolyMet project. How then can you even consider permitting such a project?	RFI,WR3C,WR5C,G10,G12
79	Cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district.	EOO,RFI,WR5A,G7A
79	Third, will we be trading a lakes district for a mining district in northern Minnesota?	RFI,WR5A,PD7
80	S-11- "If water quality monitoring demonstrated the need, treatment of the pumped seepage could be provided prior to discharge to the Partridge River." What would the treatment consist of and what impacts might the treatment have upon the water quality? Who does the monitoring, how often would the monitoring be done, and how would treatment be monitored?	WR1A,WR1B,G7A
81	4.1-135-"PolyMet proposes to mitigate the increased solute load expected in the East Pit from the disposal of the higher sulfide waste rock by pumping East Pit water to the WWTF for additional treatment for approximately 30 years (years 21-50)." What happens after 30 years? Does the pollution disappear?	WR3I
82	What role does the DNR have in monitoring the pollution and the treatment? Does the DNR have enough of a budget to maintain this?	WR1A
83	4.4-136-"Reservations existed about relying on just the low and average liner leakage rates for groundwater quality predictions, as it may not fully account for the essentially permanent use of the liner (e.g., liner degradation over time, differential settlement, and accidental tears during waste rock placement)." Exactly which liners would be able to be replaced in five years time, or as needed, according to statements made by Joe Scipioni and Frank Ongaro?	WR2D
84	4.1-137-"It should be noted that aluminum, beryllium, iron, , manganese, and thallium exceeded the groundwater evaluation criteria in the model; however, this was due to high baseline concentrations that were not attributable to the Project and these solutes were not carried forward for detailed transient flow modeling." If the modeling was not attributable to the Project, what is the significance of the modeling?	WR2E
85	4.1-143-"The deterministic modeling results suggest that three parameters (i.e., arsenic, cobalt, and selenium) could exceed surface water standards, in addition to relatively high sulfate concentrations. The Uncertainty Analysis for the Proposed Action suggests that copper and nickel could be underestimated by the deterministic modeling." What are the cumulative effects of these water quality exceedances?	RFI
86	How would the resulting acid mine drainage trail, especially that of the rail line, be addressed?	WR1D

87	Please extend the comment period for public input about the EIS. Forums held to discuss this mine have been one-sided and tightly controlled. In at least one instance, only elected officials were able to speak to the audience, and all of them were advocates of rapid approval of mine permits. Media discussion of the proposed mine has been scarce and was all but absent prior to this winter. More time is needed for the public to study this issue and offer their views.	PRO1,PRO6
88	I also ask that the EIS not be approved until certain conditions are met. One, the current EIS anticipates leaks from waste storage areas within 65 years. That is not an acceptable protection for the surrounding ecosystem. Waste storage should be designed to be leak-proof for centuries, not decades. Two, the EIS plans for the necessity of treating waste water for 2,000 years. If that time frame cannot be reduced to several hundred years, I believe it is irresponsible to approve a mine permit.	WR2D,WR3I
89	I believe it is irresponsible to approve a mine permit. Third, it is essential that the fund for remediation of environmental damage be designed so that it will be truly "bankruptcy proof," and not subject to reduction or loss due to mergers, acquisitions, Chapter 11 actions, or other changes in corporate structure.	PD4
90	The liability of the mining company should be consequential. I feel there should be many hundreds of millions of dollars that's available to solve the pollution problems. The money should be in place long before the mine company starts production, they must maintain the site forever. If PolyMet claims bankruptcy then the money is available to resolve problems	PD4
91	In Section I.A., it is stated that this DEIS is being prepared by the Minnesota Department of Natural Resources (MnDNR) and the Army Corps of Engineer (USACE). I did not see the Forest Service was involved other than very superficially. Since they are the surface land holders it seems peculiar that they are not fully involved. I further noted that there is disagreement between PolyMet and the Forest Service. "The Mine Site is located on National Forest System lands; however, the mineral rights are privately held and under lease to PolyMet. It is the position of the United States that the mineral rights leased by PolyMet do not include the right to open pit mine the National Forest System land. PolyMet disagrees with the U.S. Forest (USFS) interpretation of the deed language and argues that the mineral rights it seeks to utilize provide for access to the minerals by any mining method including open pit or surface mining." Obviously, this issue has not been settled and for this reason, I would assume that it would be prudent to hold all actions until this issue has been settled. I further noted that the USFS will be preparing their own EIS and action should be tabled until the Forest Service has their environmental impact statement prepared. I realize that there is the possibility of a land exchange but at present the land is still held by the Superior Forest Service. I find it strange that the USFS was not asked to join the preparation of this DEIS.	PRO1,PRO4
92	In the Mine Site portion of the document it is unclear who will oversee the reclamation of the grounds for this project. The second bullet point speaks of a wetlands creation. I cannot imagine a wetlands that is able to handle the amount of sulfuric acid that would have to be filtered. If this has been done previously it would be nice to see the research cited. Also the idea of sending the pit outflows to the Partridge River is not a good idea considering the watershed that could be contaminated. I understand from my investigation that despite monitoring by state entities, many of these mines have created so much contamination that they have ended up a superfund clean up sites.	WE3,WE6,PD3,PD4
93	In III.B.2 Impacts of the Proposed Action Water Resources In the first bullet point, there is talk of the year 65. This is very long term and will commit either the State or Federal Government to very long term monitoring for this site. If it has to be overseen for 65 years, it is a good probability that all of us will be long gone and we are obligating the Federal or State Government to a very long term proposition. All the variables talk mostly about the rate of flow of water. The Partridge River could be more heavily impacted by lower rainfall totals as the whole of the Northeast Minnesota has been in a long term drought. The Whitewater Reservoir is mentioned and it is unknown if any towns use this for water in their community water supply. If the reservoir is used by towns, will the water be tested for contaminants on a regular basis and who would stand the cost of this monitoring?	WR1A,WR3C

Comment ID	Comment Text	Theme Codes
94	The Groundwater Levels Downgradient of the Tailings Basin sounds as if it will contaminate an aquifer. If so where does this aquifer flow and what water does it supply? In the 10th bullet point there are high levels of aluminum expected to be found. At one time, aluminum was implicated as a cause of brain damage. On the 14th bullet point, it is unclear who would perform the water tests. If it was the mining company, that would be like the fox guarding the henhouse. In the wetlands section they speak of the transportation corridors as passing through coniferous and open bogs.	RFI,WR1B
95	All the Alternatives have greater or lesser degrees of change to the surface and ground waters. Some have high mercury, aluminum or antimony levels. We all ready have many waters that have high levels of lead or other heavy metals that have limited the numbers and size of fish that can be eaten. Acid rain all ready comes from the states to our west. We have Asbestosis that was part of iron mining. It was not recognized until recently so why are the Minnesota EPA and Public Health findings not in the summary?	EOO
95	Again with all the dust generated, will the dust mix with the water and form sulfuric acid. On page S-14 in the Air Quality Section acid rain may be carried over the lakes and rivers to the east including Lake Superior. On the same page in socioeconomics the positive effects are listed; however, does the short term good they provide justify the leaving behind of rock wastes that will continue to pollute the area for many thousands of years? Under the Cumulative Effects what does the increase in "sulfates loading" mean? Does this refer to sulfuric acid? The only River that had been mentioned previously was the Partridge River. I take this to mean that one whole branch of the St. Louis River would suffer contamination and potentially Lake Superior as well. The water waste situation from Duluth has recently been remedied and the Lake is enjoying better water quality than it has in a number of years.	RFI
96	Northern Minnesota only has a couple of things going for it. One is the wilderness or near wilderness that generates a large number of tourists from many states. Tourism is all that the majority of businesses live off of in the Arrowhead of Minnesota. Second, we have our water and have tried to keep them as pure as possible because tourists do not want to come to where there are polluted waters and lands. The last thing that we have is our people. If the land is made unfit for habitation, then there are no people who can live on the land. The Range has had the benefit of the mining jobs through the years but they have paid heavily with their health as we are now finding out. The jobs last for 10-20 years and then disappear. They become highly automated so that in the last years of the mining, there are very few jobs providing salaries and the towns dry up once again. The waste from this type of mining uses a lot of water, leaves a lot of waste and is not easily cleaned up. We can see from looking at mining in the Western States that the land is permanently scarred and the waters will never be clean again. The mining companies take the metals from the land and then go out of business. They tell us that it is now clean and safe. They are drilling in the middle of Birch Lake. How will they keep from polluting the lake? What about the people that live on Birch Lake? What if their sources of water are polluted?	WR2E,WR3B
97	With the Iron Ore, the companies were longer term and they contributed to the fund to help the local communities continue after the mines were closed. I see nothing in the summary that indicates that the mining interests are taking a stake in the future of the people of the Range area. I see nothing indicating what they will spend or do with the inevitable pollution that will linger beyond year 65.	G1

Comment ID	Comment Text	Theme Codes
98	I know that the Mining Companies are buying up leases for other exploratory drilling sites and that those sites have a good potential for polluting aquifers, leaving mineral wastes on the ground, and being unsightly for tourists and locals to look and live with. This would have the potential to damage the land so that it is not fit for anything beyond mining. What we have to balance is the short term interest's of the mining companies to take the minerals from the land and then run or declare bankruptcy to get out of the cleanup. The cleanup will never be truly done and which will probably be handled as a Super Fund site. What we have is one of the least disturbed areas in the lower 48 states. I suppose it was inevitable that the mining companies would once again raise their heads but this time the waste is more dangerous than the waste from the Iron Ore. The mines in the West that harvest this type of resource have done heavy damage to the environment. They assure us that they will keep the pollution from happening. Wisconsin has declared a moratorium on mining permits until they can be better studied. I see no reason to rush to put in this mine. The copper will still be in the rock in a few years and if the rush passes us by, we will still have the environment that draws others to see the Boundary Waters. People have needs other than material. They need to be able to get away and have their mental batteries recharged. It will not happen if the land is destroyed.	G9,G12
99	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. With the poor economy, more people are exploring close to home and discovering northern Minnesota for vacations. If mining were to take place, the long term economic impact on Northeast MN. tourism would be devastating. Minnesota values are embedded in its natural resources. We can't afford to loose what we stand for. I lived in MN for 20 years and our family values were rooted in the BWCA. I now live in Montana and am constantly drawn back to Minnesota because of its natural resources and the peoples values toward life. Many Montanans are intrigued with the BWCA and plan to visit Mn due to its pristine waters. The proposed mine would destroy not only the natural resources, but MN values, family values and tourism.	G11
100	The erosion of peat into the mine, and slumping will increase the sediment in the mine which will require another reactive soil pile not planned for and will increase sulfide run off.	PD2
100	The PolyMet mine site is located on an inside bend of the Partridge River. It is common for rivulets to form on the inside bends in rivers generally as the river seeks a shorter and more direct route. Inadequate testing has been done to evaluate for this contingency and a inflow to the mine that greatly surpasses the estimates made in the EIS. The EIS also vastly underestimate swamp inflow.	WR3J
101	With this inundation of water into the PolyMet mine pit will come a corresponding drawdown in the area water level. The drying out of the area swamp will result in the death of stands of forest in the 100 mile swamp by sulfide pollution and lack of a water rich environment that these trees depend on. Along with the death of large stands of trees will come a strain on wildlife that depends on them. The EIS inadequately has surveyed for the loss of wildlife.	WR1E,WI2
101	Furthermore, the peat soil base will not support the ditch and dike system planned to keep water out of the mine from the Partridge River. Estimates for the mine filling after closure are exaggerated and will overflow and result in pollution to the environment in a far shorter period of time. These will greatly add to and overwhelm the mining operation and/or the treatment system. Spring flooding along the St. Louis will be exacerbated.	WR3K
102	Furthermore, the weakening of the rock wall from water saturation will be unstable and catastrophically collapse. The berm to keep out water from the Partridge River and the weight of the water in the river and ditch will contribute to this collapse. Wet rock shears more easily as indicated by a mining engineer reporting on the eagle mine in Michigan. I agree with the comments made by the Tribes in the EIS with the exception of the shaft mine alternative. The rock in the area is to unstable because of water saturation to support a shaft mine and its crown pillar(s). Any diagonally shafted mine in this area would be unstable.	EOO

103	Finally, it was related to me by an employee of the MPCA who was in one of the test shaft mines in the area that the test shaft mine was being pumped continuously, was filled with hip boot level water, and the walls glittered from iron pyrite. Iron pyrite contains large amounts of sulfides, mercury and fragile. The fragility encourages the spreading and lack of control of these substances. The condition of this mine shaft belies the EIS prediction on the water likely to inundate the PolyMet Mine.	WR2C
104	The announcement made by the News Release violates my and the public's civil constitutional due process rights in many respects. The authors of the News Release under color of law have created an atmosphere of fear to discourage attendance and the exercise of the civil rights of the public to be heard. The hearings were held despite advised travel restrictions affecting many interested persons. The management of the hearing is an indication of the administering agencies lack of concern for public safety and constitutional rights generally.	PRO6
105	The revelation to me by the forgoing PCA employee that the walls of the test shaft glittered from iron pyrite is an indication of high levels of sulfates and mercury. Iron pyrite is known to be composed of high levels of mercury and iron pyrite and is an indication of the release of illegal and unacceptable levels of pollution. These will be added to already high levels in the Rivers in the upper St. Louis and will increase over time. As taconite ore is depleted the amount of sulfides released from mining will only increase. It was related to our class at the College of St. Scholastica in the early '80's by adjunct professor Jack McGrath, Senior-Vice President at Minnesota Power, that the only taconite mine with an enduring supply of taconite reserves was Minntac. However, he indicated that at some point in the early 21st century this would encounter an overlay of sulfide bearing rock in the formation and that this would present pollution that would be intolerable to the public.	WR3E
106	As a resident of Duluth Minnesota for most of the 50 years of my life I have had opportunity to swim, fish, boat, and sail on the St. Louis River. I haven't engaged in recreation on the St. Louis River on more occasions because of my perception that it is a dirty river. I discourage out of town friends from doing the same. Even the threat of pollution from PolyMet will diminish recreation on the river. Less boating, canoeing, kayaking, fishing, hunting, swimming, sailing, bird watching, and other recreational activity will take place on this large river with fewer tourist tax dollars coming into the communities along its length.	EOO
107	Fish will not only be weakened and poisoned by pollution from sulfites, sulfates, sulfides, the process which turns these into sulfuric acid, sulfuric acid, arsenic, methyl mercury, lead, other heavy metals, and other toxic substances, the weakening of the fish when combined with water born viruses such as Viral Hemorrhagic Septicemia will result in large fish die-offs in the St. Louis River and Lake Superior.	FM1
108	Asbestiform particulates are worst in the east range and these will create a risk of a health hazard to the surrounding area as indicated by the litigation with Reserve Mining in the 1970's. The taconite mines through their stack emissions and dust from the exposed soil were rated 4 of the top 7 polluters in 2000. It is unlikely that PolyMet will be any better. This will create more of a health hazard and further diminish the air quality and the incidents of toxic regional hazing in the Superior National Forest and Voyageurs National Park.	AQ4C
109	Monarchs have a migration that takes them 900 miles into Mexico. The indigenous population of Mexico celebrate this migration as the Day of the Dead and regard the butterflies as manifestations of their ancestors. Northern Minnesota, Wisconsin, and Michigan where mining projects are predominant compose the majority of the northern habitat. Little study has been done on the northern habitat. In Mexico, forests where the butterflies congregate are protected by law. Their migration provide for a modest income for an indigenous population through tourism. Further study needs to be done in consultation with the U.S. Secretary of State to avoid a violation of treaty, international law, and a failure of diplomacy.	WI2
109	The hazing of the Superior National and surrounding forest is treated as simply a matter of aesthetics, but this form of air pollution caused by mining and power production in support of mining has been inadequately studied. As a child I observed large clusters of Monarch Butterflies during summer months. These numbers have diminished to the extent that I have observed a dramatic decline in their numbers. More study needs to be done on the effect of air pollution on these and other primary pollinators, including honey bees.	WI2,AQ4A

110	PolyMet does not currently have a right to open pit mine at the deSignated location. It is attempting to make an exception under the Weeks Act through the action of its political allies in carving out an exception through special legislation or a land exchange. The Weeks Act in protecting watersheds and forest land for various purposes, has been public policy since its passage nearly one hundred years ago. Carving out exceptions to the Weeks Act without an outright repeal is illegal. Law is not law if it is not enforced equally. The environmental laws are failing when it comes to protecting local communities from the effects of sulfide mining as in dictated by the EPA.	PRO7
111	Time after time local officials turn their back on the community interest. We should have disclosed the real interest of these officials made available including their stock holdings in mining companies and campaign contributions. The corruption of neglect of community interest is itself a reason for not allowing this type of mining. Sulfide mining attracts public officials of weak character and weakens the community through a concentration and centralization of the wealth in one industry that is then allowed to control public policy, including pollution. Mining not only pollutes physically, it pollutes socially. 14	G1
111	The PolyMet project is a violation of water law, common law property rights, the Clean Water Act, the National Environmental Policy Act, the Migratory Bird Act, the Clean Air Act, the Great Lakes Compact and other laws. The PolyMet project will hurt the area and state economy for centuries to come. The MDNR must pick the "No Action Alternative" and deny a permit to PolyMet Mining Company. It is clear that this project was conceived of, promoted, and designed by politicians and not mining engineers, hydrologists, biologists, economists, or experts of any kind. If the MDNR is concerned about public opinion it will follow the lead of the State of Wisconsin where citizens successfully pressured their legislature into enacting a moratorium on any sulfide mining and Aitkin County which refused to consent to allow even any exploration in the county. PolyMet is not a garden variety sulfide mine, it is the worst of possible sulfide mines along with a processing center which invites more ill conceived mines.' The main reason proposed by advocates in favor of the proposed PolyMet project is jobs. The loss of jobs was the main reason used to oppose the abolition of the production of DDT. The claimed need for jobs is not of sufficient importance to disregard environmental harm.	G5A,G12
112	The process aside from the unnecessary risk of public harm presented is unfair in many respects. The open house planned is ill timed and should have been conducted outside of the present time that is the public comment and not the agency comment period. The open house will cast a shadow of intimidation over the process by the authors of the EIS heavy handed participation in the comment process, is unfair, and cast a chilling effect on the public oral comment process and the exercise of mine and the public's civil rights under color of law. Furthermore, any information given out ancillary to and outside of the EIS is a violation of principles of constitutional due process and illegal in that public notice is not provided and subject to comment.	PRO6
112	The failure of the agencies to schedule hearings in Duluth in a location central to the harm that is reasonably foreseeable to occur from the PolyMet project is unfair to the people likely to be effect, the public, and myself and is a violation of our civil rights under color of law. The harm likely to occur being the contamination of the drinking water for a community in excess of 150,000 people in further disregard for the public safety. Furthermore, Duluth is the place best suited to provide facilities in North East Minnesota to accommodate the large number of people interested in attending a hearing.	PRO6
113	Furthermore, expediency is not a legal basis for not conducting a public hearing and instead diverting speakers to private rooms where their testimony cannot be objectively witnessed and documented by the public. Everyone has a constitutional due process right to equal time in being heard. Again, expediency should not shortcut the public's constitutional rights. The hearing should take as long as necessary to provide a fair process. Contrary to the claim that the agencies are going to allow more people to speak as opposed to "selecting a small number of people to speak", they have in effect chosen one voice to speak.	PRO6

114	By allowing PolyMet participation in the agency sponsored open house, under color of law, they are given an unfair voice in the hearing at the expense of other interested party resulting in a fundamentally unfair process and a violation of the public's and my right to constitutional due process. Furthermore, providing a seat at the open house for PolyMet clearly indicates a bias in the decision making process in conflict with the principle that the public is constitutional entitled to agency action that indicates a fair and impartial decision maker and that by a show of bias to this extent has tainted the process and should recuse themselves from and the process should be started de novo with decision makers capable of showing impartiality in the process as is guaranteed by the constitution in the 4th and 14th amendments.	PRO6
115	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Supelior National Forest. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, interfere with tlibal lights guaranteed by Treaty and with tribal resources, like wild rice, increase air pollution that results in regional haze, and create a lisk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs. The Indian tribes working on the EIS and the United States Environmental Protection Agency have provided helpful information on the inadequacy of the PolyMet draft EIS. Before this sulfide mining project is even considered for permits, please fill these gaps:	G2A,G2C,G3,G7C
115	1) Analyze the land that is going to be exchanged for Superior National Forest land to make this project possible. Make sure that the land swap would protect wetlands, endangered species, hydrology, tlibal rights and taxpayers' interests.	PD1
115	The agencies surprise at the interest in the hearing is simply an issue of there lack of competence in dealing with the process and their disregard for the political process that took place in Wisconsin leading to a mining moratorium. Poor planning and judgment cannot release the agencies from their constitutional obligation to provide constitutionally fair due process. The forgoing along with the denial of more than a 90 day comment period on a lengthy and complex document, the denial of fair hearing in Duluth, the relegation of the tribal partners comments to an appendix, and other irregularities indicate a violation of due process, are unfair, biased, and arbitrary and capricious.	PRO6
116	2) As the U.S. EPA suggested, make sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.	PD4
117	3) Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	WR4B,FM1,AQ6A
118	4) Get better information on existing pollution, the nature of wetlands, endangered species, wild lice stands and other resources that would be affected by the project.	WR1E,WI5,WE2
118	5) Require the PolyMet Company to show that their waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for hundreds or thousands of years.	GT2
118	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. . . , Sulfide mining would be new to Minnesota. 1287	I am voicing my opposition to any kind of mining especially Polymet on public land! I am literally horrified at the track record of Polymet from this type of mining in other states. I don't believe there can be any guarantee of \$ monies to clean up the side effects of this mining. Why take this risk at any cost of destroying our natural resources and profitable ecotourism dollars. As a taxpayer and steward of the Earth I implore you to stop this mining with Polymet Franconia & Duluth Metals. No!	EOO,G4A
<b>Sender Last Name:</b> Chandler		<b>Submission ID:</b> 1641
2067	We own property near Ely with the intention of moving there, starting a business, and contributing to the tax base. Short-sighted and damaging mining operations will result in terrible and irreversible water contamination. You know that already the fish are too contaminated to eat every day. Additional contamination from mining operations will result in a significant reduction in tourists, long term jobs, and ultimately a severe reduction in population. No one, including me, wants to live where the water is too contaminated to swim, fish, or ingest. Please choose a healthy future, not a polluted one.	EOO,G2B,G7B,G11
<b>Sender Last Name:</b> Charwood		<b>Submission ID:</b> 3376
3666	Sulfide mining is not the answer to economic growth. The land of 10,000 lakes is a very precious environment that is necessary for freshwater invertebrates as well as domestic use in which we all depend on.	G2C,G7
<b>Sender Last Name:</b> Chezik		<b>Submission ID:</b> 1372
6	No Action Alternative – The DEIS states that no social or economic benefits would result from the no action alternative and that local employment and economic revenue would not increase. No data or background information is provided to make this conclusion. The USFS is required to manage its lands, which does provide social and economic benefits to the local community. Timber production, hunting, fishing, camping, and other activities are all income producing benefits resulting from a healthy, undisturbed ecosystem. The proposed mine site is owned by the USFS and lies within 21 miles of the Boundary Waters Canoe Area Wilderness. Therefore, there are social and economic benefits from the no action alternative.	ALT1
7	Mine Site Alternative – Only minor alternatives were presented in the alternatives provided in this section related to the surface and ground water. No alternatives were presented in the DEIS that looked outside the proposed Mine Site. Additionally, the DEIS states that underground mining would not be economically viable. No economic analysis is provided to support this statement. We disagree that the DEIS explains why the use of underground mining would not meet the project's purpose and need.	ALT2,ALT3

16	No Action Alternative – The DEIS states that no social or economic benefits would result from the no action alternative and that local employment and economic revenue would not increase. No data or background information is provided to make this conclusion. The USFS is required to manage its lands, which does provide social and economic benefits to the local community. Timber production, hunting, fishing, camping, and other activities are all income producing benefits resulting from a healthy, undisturbed ecosystem. The proposed mine site is owned by the USFS and lies within 21 miles of the Boundary Waters Canoe Area Wilderness. Therefore, there are social and economic benefits from the no action alternative.	SE1
240	Wetland Delineation – The wetlands of the proposed Mine Site were delineated for PolyMet by Barr Engineering using the Corps’ 1987 Wetland Delineation Manual. However, we found wetland delineation errors in Figure 4.2-1. For example, Wetland #20, which was delineated as a sedge meadow, can clearly be identified, using 2008 color infrared FSA photography, as an impounded marsh surrounded by forested wetland. Another unfortunate delineation error is the upland forest between Wetland #103 and Wetland #18 that omitted a long, linear hardwood swamp. The Corps should re-check and verify the wetland delineation mapping for the entire proposed Mine Site.	WE1
241	Wetland Mitigation, Off-Site Mitigation – The DEIS states that total direct and indirect wetland impacts from the proposed project total 1,522 acres. PolyMet has proposed wetland mitigation among three sites – on-site mitigation, the Aitkin site mitigation, and the Hinckley site mitigation. The total for these mitigation sites only add up to 1,287, mostly at a 1:1 wetland mitigation ratio. Using the Corps’ usual requirement of a 1.5:1 ratio, a total of 2,283 wetlands would need to be restored or created to meet the Corps mitigation rule. A significant amount of wetland mitigation is not specified in the DEIS, which states that compensatory mitigation for any remaining acres would need to be addressed through permit conditions following the Record of Decision in this EIS. We maintain that all wetland mitigation requirements should be completely identified in the DEIS.	WE3
246	The Corps of Engineers, as the lead federal action agency, needs to prepare a Biological Assessment to assess impacts to the Canada lynx and the gray wolf, both of which are federally listed under the Endangered Species Act (ESA) in Minnesota. Critical habitat has been designated under the ESA for both the Canada lynx and the gray wolf. The federally-threatened Canada lynx ( <i>Lynx canadensis</i> ) and federally-threatened gray wolf ( <i>Canis lupus</i> ) are found within the proposed project area. In accordance with Section 7(c) of the Endangered Species Act of 1973, as amended, it is the responsibility of the Corps to determine if its actions "may affect" listed species or critical habitat. The Corps is required to prepare a Biological Assessment (BA) for Federal actions that are "major construction activities" [50CFR 402.12 (b)]. The BA should evaluate the potential effects of the proposed action on the Canada lynx and gray wolf and designated critical habitat and determine whether any such species or critical habitat is likely to be adversely affected by the action [50CFR 402.12 (a)]. If the proposed action is likely to adversely affect Canada lynx or gray wolves, or adversely modify their critical habitat, the FWS will prepare a Biological Opinion, which will use the Corps’ BA and other scientific data to determine if the proposed project jeopardizes lynx or wolves or adversely modifies lynx critical habitat or jeopardizes gray wolf. Additionally, the BO will determine the amount of any incidental take for the proposed action and will then develop measures to reduce incidental take of Canada lynx and gray wolf.	WI1
247	Applicable Regulations – Under Table 1.1-1, the DEIS states that only an ESA consultation is needed from the FWS. On September 11, 2009, the FWS issued its Final Rule regarding permits for taking bald eagles. ( <a href="http://www.fws.gov/migratorybirds/CurrentBirdIssues/BaldEagle/Final%20Disturbance%20Rule%209%20Sept%202009.pdf">http://www.fws.gov/migratorybirds/CurrentBirdIssues/BaldEagle/Final%20Disturbance%20Rule%209%20Sept%202009.pdf</a> ) Before any bald eagles or nests may be disturbed, project proponents must acquire a permit from the FWS. A permit may be needed if there are bald eagles nesting or using areas close to or within the project site. The last eagle nest survey within the project area was completed in 2005. The Partridge River, which flows around the east edge of the proposed Mine Site does provide nesting habitat for bald eagles based on the availability of nest trees and nearby water features including stream and lake habitats. Therefore, we recommend that an updated bald eagle survey be completed in advance of construction activities during the estimated 9 to 12 months of pre-production mine development. Results from this survey should be provided to the Minnesota Department of Natural Resources and to the Twin Cities Field Office of the FWS.	WI1

248	Endangered, Threatened, and Special Concern Wildlife Species - The following sentence needs to be corrected, “Since 2000, the USFWS and USFS documented five road-killed lynx in Minnesota.” There have been six lynx mortalities due to road kills since 2000, and an additional two lynx have been hit and killed by trains (USFWS, Twin Cities Field Office data).	WI1
666	The DEIS states that it was the position of the United States that the mineral rights leased by PolyMet do not include the right to open pit mine the National Forest System land. PolyMet disagrees with this interpretation. However, the DEIS also states that the U.S. Forest Service (USFS) and PolyMet are exploring the feasibility of a land exchange, which would consolidate surface ownership and mineral rights and that the USFS will be initiating its own environmental impact statement to evaluate this land exchange. The DEIS states unequivocally throughout the document that it assumes a land exchange would occur. A land exchange is a connected action under the National Environmental Policy Act (see CEQ’s regulations for implementing NEPA, Section 1508.25) and, therefore, should be discussed in the same impact statement. Other than continuing to assume a land exchange, the DEIS offers no analysis of a land exchange between the USFS and PolyMet of a proposed 6,700 acres in the DEIS. Because of the interconnectedness, it appears that the scope of the DEIS should be expanded to include a discussion of the anticipated environmental impacts resulting from the land exchange.	PD1
667	Project Closure – The DEIS states that a closure plan would be finalized to provide details for the final closure of the actual as-built facilities during project operations. No additional details are provided about how to ensure that continuing runoff from the mine spoil is mitigated. The DEIS does not state who would be the responsible party should there be significant acid mine runoff event into surrounding wetlands and uplands, which drain into the Partridge River.	PD2
668	Reclamation of Plant Site – Closure Cost Estimate - The DEIS estimates that it would cost \$44.6 million (in 2007 dollars) to complete a variety of closure tasks including reclamation, revegetation, remediation, removal of structures, monitoring and maintenance. It was stated these are very rough estimates. These figures need to be updated and refined based on actual surface mining reclamation data prior to the Final EIS in order for agencies to better understand the cost of reclaiming such a large area to a mix of forest land and wetland habitat.	PD3
669	Mine Site Alternative – Only minor alternatives were presented in the alternatives provided in this section related to the surface and ground water. No alternatives were presented in the DEIS that looked outside the proposed Mine Site. Additionally, the DEIS states that underground mining would not be economically viable. No economic analysis is provided to support this statement. We disagree that the DEIS explains why the use of underground mining would not meet the project’s purpose and need.	ALT8
1604	The anticipated environmental impacts of the proposed action are not fully and fairly addressed in the DEIS. In particular, the DEIS does not fully address anticipated project effects from or to: an interconnected action, federally listed species, the bald eagle, wetlands and mine run-off. In addition, the DEIS does not appear to fully satisfy U.S. Fish and Wildlife Service (FWS) or Corps wetland mitigation requirements, leaving part of necessary compensation to be determined subsequent to the NEPA analysis. Since each issue falls with the Department’s jurisdiction or special expertise, we urge the Corps to adequately describe anticipated environmental impacts, as further identified below, in the final environmental statement.	G8

1181	This letter is to note that all of us at Northern Mining Services Inc. support Polymet's mining project. The impact that Molymet will have on our local and state economy will be tremendous, in a time of economic down turn we need this jobs more than ever. This will turn the economy of Northern MN from one that is reliant on the ferrous mines to a much more diversified one, making our area a much more stable one to live in. On the environmental impact on our area, we are confident that the job Polymet has done is over and beyond what they had to do to protect the environment. If we didn't believe this we would not be for the project, this is our back yard and we are very protective of it. The best way I can describe the lengths that Polymet has gone to is to quote some of our friends from non-ferrous mines in Canada, who also go to great lengths to protect their back yard. They all ask us why Polymet has gone to such great lengths over and above what the have done to protect the environment, when what they have done is more than would ever have to be done to make sure that no ground and water is polluted. When we asked the gentlemen at Polymet this question their reply is that we want to make sure we're right and nothing is polluted. Our area is more important than the money we spend to protect it. And I'm sure we all know how important it is to have a domestic supplier of these metals. Some are not currently produced in the USA. Any time we don't have to rely on foreign suppliers helps out everyone.	EOO

3591	Isn't Minnesota Cold Enough . ? There was little information on the oxygen plant within the DEIS , as far as I could gather the chore was to be outsourced to another company. If a private company can raise funds to initiate such a project , why is it that the community leaders such as the DNR do not run a similar project to keep the precious metals here, rather than trade away our natural resources elsewhere for money ?	G1
<b>Sender Last Name:</b>	Church	<b>Submission ID:</b> 1754
2292	I live in a county whose most valuable resource is its lakes, including our greatest lake, Lake Superior. As a Cook County citizen and as a steward of resources we need to preserve for future generations, I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	G2
3447	I am deeply concerned about the longterm environmental impact of the PolyMet Mining Corp. NorthMet mining project It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for 2,000 years and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. I grew up in northern Minnesota, and continue to return in order to enjoy the wilderness lakes, clean air, and undisturbed environment. I can't begin to express how upsetting it is to contemplate the loss of that pristine place.	G2,G4A

2625	Well, my comment would be in association with the socio-economic benefits of the project. We've indicated that there's going to be 400 jobs directly at the plant, another 500 jobs. We're going to need support industries that are around the project that support the project, service industries. But what we're not saying is how much of the value of the metals that we're extracting churns within the economy within the region, and an economist will tell you that that's about four to five times the value of the metals that are taken from the ground. So to sell a dollar's worth of copper to the end user, you get about \$4 or \$5 worth of the capital circulating: Employee gets paid a salary, goes to a restaurant; the restaurant employs a wash -- somebody in the kitchen and somebody to cook; they, in turn, have incremental employment, and they go out and get somebody to do their washing. So it really does cycle in the economy. I'm not sure if anybody's done that exercise for this project as part of the valuation of the socio-economic benefits to the region. Just declaring the number of jobs doesn't really tell the story. That's what I'd like to see. I'd like to see some comment or some evaluation of what the true socio-economic value of this project is in the region. Another interesting comparison would be in terms of job creation, in terms of the job stimulus that we're spending money on right now, how much does it cost with the stimulus money to create a single job? Multiply that by 1,000 directly for 20 years, and you've got a measure of what we're saving in the economy of this country. So I'd like to see something like that coming out of the evaluation of the project and we haven't seen it. That's my comment.	EOO,G14
<b>Sender Last Name:</b> Clegg		<b>Submission ID:</b> 2776
3188	The risks to our state, its citizens, its wildlife and its waters in this proposal are enormous. Any benefit to be derived from the jobs it might create are transitory at best and vastly outweighed by the catastrophic possibilities inherent in the project.	G1,G2C,G7
<b>Sender Last Name:</b> Clements		<b>Submission ID:</b> 326
2	Speaking of expensive, how can we possibly get a detailed financial assurance bond up front large enough to really lock in decades of future water treatment as these pits begin to overflow and seep and leak? And the water treatment may not even be the only cleanup task. I'm not sure I could find statements that talk about other pollution abatement possibilities in the EIS, if something goes terribly wrong.	EOO,WE3
27	Specifically, it makes me very nervous to read in the EIS that there are concerns about the potential for structural failure in the existing Northmet tailings basin, which I understand is one area where residue from this mining is planned to be deposited. Until there is a complete and thorough understanding of how this basin could be used without any possible failure, I don't see how we could just go on hope.	GT2
33	Speaking of expensive, how can we possibly get a detailed financial assurance bond up front large enough to really lock in decades of future water treatment as these pits begin to overflow and seep and leak? And the water treatment may not even be the only cleanup task. I'm not sure I could find statements that talk about other pollution abatement possibilities in the EIS, if something goes terribly wrong.	PD4
38	I'm also troubled with what I can discern about the proposed technology to deal with overflow water from the pit in which the tailing will be deposited. I take that to be a different pit, to be filled after the ore is removed. But that pit will be mined for 20 years, according to what I read, and where will the sulfide residue be stored until then, that it won't be open to air and water? I talked with representatives of the MPCA at the public hearing in Blaine, and I was told that the technology being looked at for treating water that escapes the pit is quite new, and very expensive, and that there aren't examples of it elsewhere in a large multi-acre mining application that we can look at. This seems very weak to me, and I'm wondering how we can ever gamble on unproven technology used by an unproven company. Are we the guinea pigs here? If something goes awry, the consequences would be enormous.	WR3C
345	I am writing in regard to the NorthMet Draft Environmental Impact Statement, which speaks to the permit application by Polymet to mine sulfide ores near Aurora, Minnesota. I have been reading the Draft EIS, and I have several deep concerns about the scope of this project, both in physical size and in length of time, in regards to the protection of clean, life sustaining water, from near the mine site all the way to Lake Superior.	G7A

1812	My comment refers to Chapter 4.6.5.5 I think; it's the monitoring part of the report, and in that brief statement, it gives no -- it tells nothing about how this project will be monitored. It talks about some mitigation, but there is nothing laid out about monitoring the project, and I'm very concerned about the monitoring of the project. How will we know if there is any polluting things happening? That's my question, so please address that	WR1A
2614	I am concerned about how the process will be monitored of the mining. I believe in the purposes of the Army Corp of Engineers and the Department of Natural Resources, but I have seen budget cuts happen, so that things that have been promised to be overseen have not. So from that point of view and from my understanding that the Partridge River flowage has really not been monitored for a lot of years because there isn't money. The budget cuts have been such that there hasn't been money. I am really concerned about how they will keep on top of the pollution issues and that is not addressed to my satisfaction in the report.	G2
3177	Please stop this mining project or at least proceed very cautiously and slowly. We can't afford to make a mistake.	EOO
<b>Sender Last Name:</b> Clock <b>Submission ID:</b> 359		
397	I am in support of the PolyMet project. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. Based on the documentation outlined in the DEIS, I am confident that impacts to the air and water will be minimal. As a person who lives, works and plays in Northern Minnesota, I understand the need to ensure a safe environment project. Let's get on with a project that will do nothing but enhance the Iron Range.	EOO
441	I would like to add my voice to those who have raised concern over the draft of the Polymet EIS. I encourage further study into the impact on air quality, the long-term potential for mine drainage leaching through bedrock, and the potential impact on wildlife habitat and movement. No doubt there will be other requests for mining in or near the BWCA. Therefore, it is critical that this first process be conducted carefully, with long-term impacts considered.	WR2A,WI2,AQ4A
<b>Sender Last Name:</b> Clothier <b>Submission ID:</b> 1489		
1778	This important issue will define how Minnesota views the future of the earth we all share. It will also determine how history views Minnesota and its decision makers. Are we for money and destruction, or are we for preservation? As a Minnesota native who has experienced the beauty of this land, I must raise my voice with others in grave concern about the PolyMet mining project.	G10
1779	These pollutants will not only affect fish and wildlife, but humans as well. Is Minnesota willing to say that it finds this risk to today's and future generations acceptable? An entire ecosystem is threatened when one part of it is threatened. This proposed project promises to have devastating long-term impact Minnesota's water quality, affecting ecosystems in irrevocable ways. Let Minnesota stand up and say that it will not accept the devastation.	EOO,G2A,G7B
<b>Sender Last Name:</b> Clower <b>Submission ID:</b> 3481		
47	and gray wolf -- I do not support this. Furthermore, I am concerned about long-term impacts to the Superior National Forest and the Boundary Waters Canoe Area Wilderness. These places are precious to me, both because they represent wilderness in our state and because they are an incredible cultural resource. In addition to environmental effects, I am concerned about impacts to tourism and	SE4
1116	habitat for native species. I understand that the mining project will cause the loss of over 1000 acres of critical habitat for Canada lynx	WI1

3235	strong concerns about the project's potential impacts on the environment and human health. My main concern is with water quality - particularly the increase in sulfates and methylmercury. This is an unacceptable environmental risk. I believe that Minnesota should follow Wisconsin's lead in banning sulfide mining because of its threat to wildlife and human health. I am also concerned about protecting	WR4B,FM1
3755	recreation in these areas. Finally, I disapprove of the fact that the project will reduce native people's access to public land in the area. Overall, I do not support a project that risks long-term negative impacts to the environment and human health for short-term profits to one company. While I understand the need to weigh the economic importance of mining in our state, I feel that the protection of health and natural resources is even more important. These issues need to be satisfactorily addressed before a permit is issued for mining. Thank you for your consideration, - Katie Clower	EOO,G3A,G3B
<b>Sender Last Name:</b> Cochrane		<b>Submission ID:</b> 3024
3444	Along with all the vary serious environmental impacts, the fact that tribal governments are opposed to the mining is something that dominant culture needs to hear and adhere to. It's not just environmentalists, recreationalists but the people who have belonged to this land long before mining was a viable economic option for people that stand opposed to sulfide mining. While in the short term hard rock mining might provide some jobs for a few people, although how many of those jobs will actually go to local people is questionable, the destruction it will cause in the long term doesn't make it a sustainable or desirable option for the people living in the Iron Range as well as throughout the midwest.	EOO,G1,G2,G3

3160	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. We should not even think of allowing any industry to conduct business that risks doing harm to the environment. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources	G2
<b>Sender Last Name:</b> Colarich		<b>Submission ID:</b> 3221
3551	There must be a balance between the economy and the ecology. The work that Poly Met has done strives to and has achieved the balance. This project will be operating under strict environmental standards. It must be viewed on a world wide environmental carbon footprint basis. If the minerals are mined somewhere else in the world the world environment will be damaged because of the lack of environmental standards and accountability. Common sense needs to prevail when the Mn. DNR makes a final decision on the EIS. I wholly support the project and I congratulate Poly Met on the work they've done to insure that the environment is protected. Thank you	EOO,G10

2475	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. Absolutely not! Not in my beautiful state - keep this filthy mining away from the Land of 10,000 Lakes. Our modern society has no need for this devastating activity. It's a no-brainer. just follow Wisconsin's lead. I don't need to highlight the problems with this abusive mining - the official agencies involved already know what horrible impact this would have. Every summer I go up to Sha Sha Resort on Rainy Lake and don't want to hear how the nearby land has been defiled by yet another greedy, self-centered industry. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	EOO,G6
<b>Sender Last Name:</b> Collins		<b>Submission ID:</b> 275
289	As President of the Northeast Higher Education District, I highly value sustainability, sustainability of higher education design and delivery, of our regional economy and of employment opportunities that drive that economy. I work with five college Provosts in the District to ensure sustainability of educational services we provide to thousands of students. I also work with businesses in the region to ensure that we offer educational programs and customized training that help keep their employees on the cutting edge of technology and service, ensuring their long-term sustainability. And, I contribute countless hours to initiatives designed to ensure our region is sustainable - that our region will be able to provide jobs for the families that want to live in Northeastern Minnesota today and generations into the future. My commitment to sustainability is the foundation of my support for PolyMet Mining's NorthMet project, and I urge you to conclude that the draft Environmental Impact Statement for the project adequately identified and addressed potential environmental issues associated with the project and move forward with issuing permits for the project as soon as possible. PolyMet has invested more than four years and more than \$20 million in the technical information and research that are represented in the draft; the draft clearly demonstrates the value of that research. PolyMet will be an environmental model for mining and processing copper, nickel, gold, cobalt, palladium and platinum. The designs for the mine and the plant maximize the use of existing infrastructure and minimize the disruption of wetlands. By using sulfur in the ore to help fuel the process, PolyMet maximizes the use of the material it mines and minimizes the use of fossil fuels that generate greenhouse gases. Despite mining tens of thousands of ore per day, PolyMet Mining will be a minor source of air emissions and also will not discharge any process water. Waste rock stockpiles will be managed by first laying down engineered liners with drains and collection systems to collect water for treatment and finally through special covers that will minimize any water seepage into the piles. The jobs PolyMet will create - both in direct employment and in spin-off jobs - will help provide viable, high-tech careers for graduates from the five colleges of the Northeast Higher Education District, and the resulting economic benefit will help ensure the sustainability of the entire region. Like you, I use these metals every day. As an educated consumer, I believe it's better that the metals are mined and produced under the strict laws that exist in Minnesota - laws that protect our environment and that I know PolyMet Mining will follow. Minerals produced in foreign countries that lack environmental controls and protections for workers are not an acceptable substitute; they are not produced in a sustainable fashion. PolyMet Mining will help our region, state and country become more sustainable on many fronts. Please move quickly to find that the EIS is adequate and begin developing permits so PolyMet Mining can fulfill its promise of sustainability as quickly as possible.	EOO
1111	Further, the PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf.	WI1
1318	Understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to	GT2

3230	up after PolyMet has gone. In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my	EOO,FM1
3677	Minnesota's natural resources and public health. Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean	PD2,PD4
3748	cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine.	EOO,G8C,G11
<b>Sender Last Name:</b> Condit <b>Submission ID:</b> 3727		
1	The DEIS needs to spell out a more comprehensive monitoring program to evaluate the effects of sulfate discharge from the NorthMet project. The program should include sampling of food-web organisms as well as surface waters and should be spatially and temporally intensive. High risk areas, as outlined in this review (and especially the Embarrass River wetlands), should be a priority for sampling. The program should be designed by mercury scientists with the MPCA and DNR and peer-reviewed by independent mercury experts to insure that results are meaningful.	WR4C,FM1,FM2
<b>Sender Last Name:</b> Conklin <b>Submission ID:</b> 2874		
2749	The DEIS does not address adequately the danger of acid mine drainage leaching into the water and wetlands. Nor does it address adequately the impact upon Class 1 air quality of the BWCAW and Voyageurs National Park due to proximity. PolyMet would have an impact on increased mercury contamination of our lakes and wetlands. So many of our lakes are already at high levels of mercury contamination. Also, the DEIS does not adequately address the impact upon fish, wildlife, or humans. The risk of permitting PolyMet mining is too great.	EOO,WR1E,WR5A,WE2,W
<b>Sender Last Name:</b> Connor <b>Submission ID:</b> 139		
130	Hello, my name is Gordon Connor, I'm from Chicago, Illinois, and I'd like to go on public record in support of this development in northern Minnesota. That's it.	EOO
<b>Sender Last Name:</b> Conrad <b>Submission ID:</b> 2300		
24	Currently most of the economy of the Ely MN area is driven by outdoor recreation and tourism surrounding the BWCAW. The proposed mine has the potential to drastically alter the health and purity of the kawishiwi river watershed which flows directly into a significant portion of the BWCAW including Basswood lake which is the premier sport fishing location in Northeast Minnesota. The potential to damage water quality in a wilderness area that is the source of livelihood for most of the area residents is irresponsible. The gain of a few for a relatively short time (20 years) is not worth ruining an economy that has and will sustain many generations in Northeast MN.	SE4

480	We value and respect our National Forests, especially Superior National, as our land borders it. We also appreciate the overall preservation efforts of our Federal Government for this valuable treasure we all get to enjoy. We strongly believe the U.S. Forest Service should not sell or trade public lands to any private company who will mine for a profit and not preserve all of its natural surroundings as it currently exists.	PD1
501	We have been property owners in Lake County on North McDougal Lake near Isabella since 1999. We plan to retire and live in this pristine wilderness area in the future. We are very concerned about the environmental effects of an open pit copper mine in this northern MN region with our valuable water resources from Rainy Lake and River, to the Mississippi River and Lake Superior. Our concerns are based on what has happened to other copper mine sites in SO and Sudbury, Canada, where land has been totally transformed from its natural state.	WR3B,WR3D
1137	We are wondering why the DNR would ever risk its valuable natural resources that have been utilized by people all over the country. Will you be notifying all users of the BWCA to get their input on this project?	RFI
1138	We appreciate the fact that our neighboring state of WI has been a leader by passing legislation asking mining companies to show real proof over time how the environment would be impacted by copper/nickel/platinum mining. We would hope that the same principals are applied when reviewing this project.	G14
1457	I am totally frustrated and confused by our legislators, and those in control, willing to allow any public lands to be sold for an environmentally damaging long term outcome. In particular the sale of land for certain forms of mining that have proven to be detrimental in the past. In one breath we have the Government wanting us to pay attention to global warming and the impact of negative emission into the atmosphere. Because of this concern massive public funding subsidies have been provided to change how we produce electricity. Currently we have legislation in place to help reduce our carbon footprint, so we can protect this land from further destruction for future generations to come. Much effort and public money has been provided for seeking alternative electrical generation sources, such as wind and solar. Congratulations to our efforts, and good luck in our ability to actually succeed. Now the confusion I have is how are WE STILL willing to endorse certain mining efforts, which over time have proven to be detrimental to all users of this environment. Why are we so naïve to think we can control the outcome because we have laws and regulations in place. So we don't want to damage the atmosphere and the air we breathe, but we are ok with damaging our lakes, and rivers, and surrounding habitat, for which we also need to live on. Where is the consistency in our leadership and decision making? Do we really have so called ambassadors who are genuinely interested in protecting our land for future generations to come? Should we really believe that our controlling environmental agencies, through their enforcement actions, are sufficient in protecting our environment? Do we really believe those in control of the mine can control the negative side effects of mining, even though they have not been successful in the past? Look around, visit those places that have been mined or visit with those who remain to tell their stories and observations,. You will find a significantly different story. ASK yourself, if this mining could be done close to your home, would you allow this type of mining in your neighborhoods, near your schools, near your fresh water resources, near where your family and future generations intend to live? If you SAY NO, than it's not good in our forest, or rural areas either! PLEASE PLEASE, BE RESPONSIBLE and be good stewards of this land for all of us now and hereafter, and don't allow a short term economic decision for the benefit of a few take precedence over the benefit of mankind.	EOO,G2B,G2C,G7B,G10

2637	I support PolyMet's instinction on this joint -- or mining venture. I've been a ranger all my life. I breathe the air; I drink the water, and I use the lands up there for basic entertainment, hunting, fishing, everything. I'm a miner currently and have been for 10 years, and the development they're doing in this and the time and effort they've put in this along with the money, it way, by far, outdoes any other place that's -- any of these other mining ventures right now, so -- the way they're categorizing the waste rock and everything like that and the mining process and, you know, try to eliminate as much of the flow-off into the rivers or anything like that as possible, and the manufacturing process too with the autoclave and everything like that, it's very minimal pollution, so I am in 100 percent support of this.	EOO,G6,G7
<b>Sender Last Name:</b>	Corliss	<b>Submission ID:</b> 3273
3581	This land is too beautiful to ruin. It is one of Minnesota's natural treasures and I do not believe the long term picture will be good if mining of this kind is allowed. I for one will stay clear of the natural beauty if this is allowed. How many places have been polluted and destroyed by this kind of activity? Below lists the reasons for concern.	G11
<b>Sender Last Name:</b>	Corradi	<b>Submission ID:</b> 2173
2579	This letter is in support of the PolyMet Draft EIS. I had an oppportunity to hear from a representative from PolyMet speak at our Range Bar Meeting. I was not aware of the difficulties this mining project was facing in getting permitted. As being a native Iron Ranger, I fully support the PolyMet Mining project. PolyMet and its vendors will provide the Iron Range with multiple opportunities for challenging and exciting careers providing critical metals needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential products. PloyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. The Iron Range relies on itsmining industries to generate economic activity and provide job security. The future of the Iron Range depends on companies like PloyMet to find new and innovative means of mining the resources in northern Minnesota.	EOO
<b>Sender Last Name:</b>	Cosgrove	<b>Submission ID:</b> 3156
35	Do we want the Boundary Waters, an international treasure, to be the guinea pig for attempting to demonstrate safe sulfide mining? I don't think so. Has anyone done a study quantifying the importance of the tourist trade in the area versus the importance of mining? Mining is a short term proposition, perhaps twenty years of recoverable ore. Tourism is a perpetual benefit to the economy of the area. To jeopardize this pristine area with sulfide mining runoff for short term gain and ruin the annuity of tourism is absurd. I am against sulfide mining until it can be proven somewhere else that current mining technology is safe for the environment.	SE4
<b>Sender Last Name:</b>	Coudron	<b>Submission ID:</b> 1319
1539	I would like to speak out in support of Polymet Mining's NorthMet project. Kraus-Anderson Construction Company has been based in Minnesota for 113 years and our continued success is dependent on the State continuing to expand and change. I believe it is far better to mine and process these minerals right here in Minnesota with sound environmental practices than rely on often-unregulated foreign sources. Minnesota can strike a balance of extracting these valuable resources while protecting the Northern Minnesota environment. This project will foster other economic development activity in the region and help strengthen Minnesota's long-term economy. The project will create good paying jobs and generate significant tax revenue to the state and local governments. I support moving forward with the permitting process for the NorthMet project.	EOO,G2B

2404	I am extremely invested in the preservation of the BWCAW. Since I was 13, the Boundary Waters has provided the experiences that have been most formative in my life. I am now a camp counselor up north, and each summer I see the BWCA continue to provide those experiences for hundreds of kids. The changes made in all of us by this unique wilderness area are truly invaluable. In a world that is increasingly in need of environmental awareness for the mere continuation of our species, I cannot stress enough how important wilderness experience is for young people. Please, please do not compromise this ethic for short-term, unsustainable economic gain. Furthermore, please accept these comments on potential environmental impacts of the PolyMet Mining Corp. NorthMet mining project. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO,G2,G3
<b>Sender Last Name:</b> Cummins		<b>Submission ID:</b> 11
10	Douglas Cummins from Hill City, Minnesota. I just -- I'm in favor of seeing this all going for the simple fact that I'm a boilermaker by trade. I'd like to see the new ones coming up in our trade as having a place to work for the future. We do a lot of repair work in the mine industry and stuff, a lot of local contractors in this area. I would like to see everything carry on and get a lot of people back to work in this area. I'm getting ready to retire. Being affiliated with a union, you think about your health and welfare and your retirement fund and everything and that keeps it going. It's a good plan to have in the making right now I think. I've been around these mines and I don't object to too much as long as it's kept up and they go along with the EPA rules and regulations. That's about all I've got to say.	EOO

691	From my understanding of the EIS statement I find gaps on key issues: The specific impacts of our native Wild Rice.	WR1E
1560	I am writing to you as a concerned property owner from Brimson, MN. My husband and I own a cabin in close proximity to the PolyMet sulfide mining site and we are opposed to the project as it is currently being proposed. I am a proud member of the Fond du Lac band of Lake Superior Chippewa. I am an active user of the Ceded territory land for Hunting, Fishing and Gathering. My concerns for the project are as follows:	EOO
1561	Our family has resided in the area of the proposed contamination for more then 40 years. We have a son who we have hoped to pass on the beauty and fulfillment of our Native Land. A place where our grandchildren will love as we do.	G11
1562	In closing, I am NOT in support of the Polymet Mining project and will not be until studies show a clean, safe, reliable mining process can be obtained.	EOO
1585	There has been no proven evidence that the containment of sulfuric acid runoff can be accomplished. Why gamble in an environmentally sensitive area such as northern Minnesota. THE beginning as orgin of several watersheds like the Lake Superior-Mississippi [illegible]	EOO,G7A
1587	We can not believe that this pending damage will be done to any beautiful land- sulphuric mining is not safe. What does a [illegible] counting have to lose? mine, do damage, file bankruptcy and pull out and leave the taxpayers to "clean up"	EOO,G4A
<b>Sender Last Name:</b> Curran		<b>Submission ID:</b> 3460
3739	Fellow Citizens, While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. The bottom line is that this mining project cannot be approved. Sincerely, Merv Curran	EOO,G2
<b>Sender Last Name:</b> Cyrus		<b>Submission ID:</b> 2358
2843	I have concerns about the PolyMet Mining Corp. NorthMet mining project, primarily in relation to tourism in the surrounding regions. I am not a native of Minnesota, however, I have considerable family in the area and was planning to take a camping/canoe trip this coming summer to the boundary waters. The impact of this mining operation draws into my head serious doubts on if I want to travel to northeastern Minnesota to hear and see the sounds of drilling or mining activities, when I go now or the in future. I feel that it is in the best interests of the peoples of the United States to not conduct this mining in this area. Considering it is planned to occur in superior national forest, I feel I have the right and the duty to let these concerns be know. I have a special place for Minnesota in my heart and have heard such outcry from my family that I feel moved to protest. Thank you for your time, I hope that further review will be given to the EIS on the project and that the watersheds affected remain healthy and clean.	G2A,G7

3253	As a tourist to MN and a natural resource professional I am unsure that the provisions to protect watersheds impacted by the proposed sulfate mining will be as affective as is promised. I believe that the clean and wild characteristics that define this valuable resource are what people pursue when they visit northern MN as it is what I look for. Though I understand that there is already impact as there is in most places, the publicity received by these mining operations degrades the perceived wildness and cleanness just as much as if there was serious impacts. I urge more consideration to be placed on these plans before a weighty decision like this is made. Thank you for your time.	EOO
<b>Sender Last Name:</b> Dahlberg		<b>Submission ID:</b> 325
21	I want to add one final comment which I aplogize if I end on somewhat negative note. I find myself feeling somewhat uneasy with the fact that an additional hearing outside the project area was set in the Metro. I am unfamiliar with the precedence here and whether similar projects situated in the Metro require a second Out-State hearing.	PRO6
344	Thank you for the opportunity to comment on the draft Environmental Impact Statement (DEIS) for the PolyMet Mining project. As a St. Louis County Commissioner, an individual with deep family roots in the region affected, and perhaps most importantly the father of a 5-year old, I have the foremost oblicagation to assure that a sound, objective, technically-based analysis process of the project is followed to guard against degradation of the environment and health injury to the surrounding population. Once this first obligation is met, I then turn my efforts to aggressively work for projects that promote long-term economic viability to our region. After spending considerable time educating myself on this project, I am convinced that the PolyMet project has met the requirements to assess its potential impacts and has offered significant evidence that is will meet or exceed Minnesota's strict environmental regulations. I have had meetings with PolyMet officials to discuss the mining and processing operation as well as toured the actual site. I am impressed with the multiple safeguards the company has developed to protect the environment now and ewll into the future. This has been an over 5-year process to date. The company will manage waste rock from the beginning, separating it based on its acid generating (reactive rock) potential and storing it on engineered foundations with drains that will be able to collect any water that flows through the stockpiles and treat it at a wastewater treatment plant. Once operations are complete, stockpiles will be covered and vegetated to minimize the amount of water that can come into contact with the rock. Seepage will continue to be collected and treated. A financial assurance mechanism will be set up that is bankruptcy and judgement proof to assure funds are reserved to continue with treatment remediation well after the project production ceases. Further, I have looked to the objective, technically-based analysis of the lead agencies: Minnesota Department of Natural Resources and U.S. Army Corps of Engineer (ACE). I have the fullest confidence inyour jointly prepared DEIS findings. This confidence comes from my past dealings with these agencies both in my role now as a county commissioner and formerly as a Duluth City Councilor. On a more personal note, my confidence may be also attributed to the fact that as an Army Engineer I am deeply aware of the importance ACE places on jealously guarding its reputation to assure all such studies are meticulously conducted and scrutinized internally. I urge that regulatory agencies may soon begin using the data in the EIS to develop operating permits for PolyMet.	G1,G4

3101	I am anxious to submit a comment regarding the PolyMet Corp. NorthMet mining project Draft Environmental Impact Statement. I am concerned about the consequences this project will have on Minnesota's economy and precious natural resources. I am certain you have received a number of responses outlining concerns about 1) safety, 2) impacts on water quality, including water leaching from waste rock piles, 3) long-term responsibility for clean-up, 4) subsequent tax burdens, 5) high sulfate (and therefore mercury) levels, 6) stability of tailings basins, 7) long-lasting contamination. I share these concerns, and I urge the DNR and the U.S. Army Corps of Engineers to more carefully examine the DEIS, working with PolyMet to complete stability analyses and create a realistic long-term plan for containing pollutants and striving for minimal impact. I am encouraged by the relationships which have been set up between the Wisconsin DNR and potential mining companies, because I value the care and thought put into permit grants. I would appreciate a similar prudence and critical eye from the Minnesota DNR. I understand the value of increased economic opportunity in northern Minnesota. I live in Wyoming now, and work for a science and conservation organization, but I am a Minnesota resident and have spent significant time in the ecosystems under consideration for these PolyMet mines. I know the economy could use a boost. However, I know that the pristine nature of these ecosystems is a huge part of their appeal, both for tourism and for agriculture and for industry. For these reason, I strongly urge the DNR to not only reconsider the PolyMet proposal but to implement a creative problem solving team to move towards innovation in northern Minnesota. The solution is not simply to abandon all mining prospects. I see the solution laying somewhere within a compromise, one that protects Minnesota's natural resources so they can continue to build an economy with vibrant tourism, fish and wildlife opportunities, and safe communities. I have grave concerns about the PolyMet proposal as it stands, and I fervently hope the DNR will reconsider before approval.	G4,G6,G7A,G11,G14
<b>Sender Last Name:</b> DAngel		<b>Submission ID:</b> 2215
2622	Hi. I'm Dianne D'Angel from Hibbing, and I'm just very excited about the possibility of these jobs coming to the Iron Range. We really need them up there. And as far as the environmental impact, I believe that PolyMet has been meeting all their criteria that is required of them, and I believe that they're doing it in a responsible way, much more responsible than the rest of the world, as far as mining is concerned, and I have faith in the DNR and the Environmental Protection Agency to keep them on their toes as they need to, but I believe that this is a very positive impact for Minnesota, not only the Iron Range, but for Minnesota as a whole. That's pretty much all I have to say.	EOO,G5
<b>Sender Last Name:</b> Danicic		<b>Submission ID:</b> 3494
48	our state's best interest - not the corporation's. Economic and Social Impact As the DEIS considered this, I must point out that the effects to other industries in the area were not adequately studied. There are serious outdoor tourism and lodging and recreation businesses that will likely see negative impact. These are environmentally sustainable. The effects an extractive industry truly has on an area have not been given due thought and Resource Curse theories not taken in. Mining has become so automated that few real sustainable jobs will be created and the real earnings will go to a very few. A cursory glance at Northeastern Minnesota's three big counties	SE4

3241	Waters Wilderness, of which I am a member, has submitted. Here are my concerns. Water Pollution It seems to me the best case scenarios have been studied in this draft EIS and few of the highly likely problems have been sufficiently analyzed. I have no faith that the tailings basin liners will last the amount of time it takes for the waste rock to become inert. This design will not work without expensive maintenance and no maintenance is described in the DEIS. Who will pay to get those fixed properly? And how long will the pollution from this likely scenario go on while Minnesota figures it out? High sulfate concentrations in the Tailings Basin will be released, resulting in high-risk situations for mercury methylation. Lakes and rivers in the area are already under mercury advisories, including the waters of the watershed into which the PolyMet mine would discharge. The ground water issues are not adequately studied or modeled. The analysis overlooks the fact that most fens in the area are porous and basically, the engineers do not know how waste water will move through it. I cannot support the risk to this area's wetlands when they are such a large part of our state's carbon sequestration, which will become increasingly important. Northeastern Minnesota has some interesting value beyond the minerals beneath its surface. The area has headwaters of three of the four major watersheds of North America, the Arctic, the Atlantic and the Mississippi. Surely, if this and other mines are permitted, and pollution begins trickling out of them, many of our neighboring states and Canada will be lining up for legal action. The BWCAW and neighboring public lands in Canada are also the world's first transboundary protection area. I believe the permitting of this and other mines like it at this time threaten that protection and our valuable position at the top of the water flow food chain. Precedent This is the first non-ferrous mine proposal here in Minnesota. Duluth Metals and Franconia stand right behind PolyMet and are watching this process intently. Their mines would operate well within the Boundary Waters watershed and thousands of feet deep. It will be highly unlikely their engineers will be able to predict the environmental damage to the groundwater and surface water. And again, the DNR would place itself squarely into controversy around conservation of the nation's most visited wilderness area vs the number one toxic polluting industry in the US today. If you are to permit any operation in this area, it had best be PROVEN not to create	WR1E,WE2,GT1
3691	water pollution, not depend upon unproven technology. Financial Assurance The EPA has recommended financial assurance be taken into consideration in any EIS for non-ferrous mine operations. It is not considered in this draft EIS. In this day an age, when surely, we have learned from many corporations who have used bankruptcy as a business model, we cannot take a chance that will cost Minnesota's children millions of dollars. Any financial assurance regulations need to involve the Pollution Control Agency and MN Office of Management and Budget who have people who understand the latest financial products and securities and who will work for the people of	PD3,PD4
<b>Sender Last Name:</b> Daniels <b>Submission ID:</b> 2054		
2490	Mining has a history of leaving behind environmental disasters. If the PolyMet Mining Corp is allowed to mine in Minnesota, It must leave the area as pristine as they found it.	G14
<b>Sender Last Name:</b> Danz <b>Submission ID:</b> 2892		
3231	I am concerned about mercury pollution from the PolyMet sulfide mine proposal on public land in the Superior National Forest. I oppose any further mercury pollution. I believe allowing the PolyMet mine to open is both dangerous and illegal, damaging as it will the environment, human and animal lives, and tribal sovereignty. The project must not proceed.	G2
<b>Sender Last Name:</b> Danzl <b>Submission ID:</b> 1719		
2226	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. The statistics show that even if PolyMet says they will not pollute the water or cause damage to the environment, it will happen (as it did in most other cases). I do not believe that this project is worth the damage that it is going to cause.	G10

- 22 What I would like to share with you is my concern about the decision to allow policy-makers to speak and provide their endorsement of the project. The event was turned from a public informational meeting into a political rally. This was highly disturbing to see. Rather than an even-handed, unbiased and accurate portrayal of the project, members of the public were provided, from the politicians, with personal endorsements and at times inaccurate representations of the project. There was no equal time provided to speakers who might have expressed different points of view about the project. Conducting the event in such a fashion risks losing the public's trust in the state and federal agencies overseeing this project. Minnesotans need to know that decisions affecting this proposed mine will be made solely based on applicable laws, regulations and technical information. When the agencies hold a public meeting that instead becomes a rally for only one point of view, it shakes that confidence. PRO1,PRO6
- 346 I wanted to give you some feedback about last night's public meeting on the PolyMet DEIS in Blaine. I was impressed with how well it was organized. It appeared that the lines to provide verbal or written comments flowed well. And I thought it was a good idea to have the tables with DNR staff to answer questions. I'm sure it was a large task to organize the event - and all seemed to go well. Some have provided their objections to a format that did not include a more public sharing of audience questions and comments. I will not add to that debate here. EOO
- 347 I will add, I thought the presentations by Steven Colvin of the DNR and Al Trippel of ERM were well done and without any indication of bias. Had the agenda been limited to their presentations, it would have been a more fair and unbiased presentation of information. Please share these reflections with those appropriate individuals within your agencies. EOO

- 3560 Have you been to Sudbury, Ontario? I went through in the late 50's. From driving through thick forests, suddenly there was only deadness. No trees, no shrubbery. This continued on through town and beyond, describing perhaps a 10-15 mile circle. I drove through again in 2003. Now, there are a few tiny, sickly trees. Conditions have been "improved". This is the effect of copper/nickle mining and processing. I have a cabin and 94 acres of land about 20 miles of Hoyt Lakes. My heart aches for the destruction projected in this territory. You can always make things sound good on paper. But copper/nickle mining and processing is toxic. Maybe fancy "environmental devices" can slow down the rate of destruction, like the barrels of nuclear waste that were to last 10,000 years, but what Polymet is projecting is going to destroy the nature, your habitat and mine. G2

254	To Whom it may concern. I feel that the PolyMet Project is a very important project for the Northern part of Minnesota as it will employ a number of people with good earnings that will allow there employees to prosper, currently the work situation is dismal on the Range and this would be a great boost for the area. I have personally sat with some of the researchers from UMD that have looked into some of the concerns that have been risen, they assured me that the plant can be built and ran so that it would not be detrimental for the ecology of the area. The processes that would be used are not the evasive and contaminating processes that are of concern. I also would like to point out that the minerals that they would be mining are very important to our society, if we are to ever become self sufficient and free of having to depend on other countries for our resources this is a huge step in the right direction. The time to build is now when the economy is slow, the owner will reap the rewards of very competitive bidding and materials are at a low due to the slow economy, the contractors that are hungry for work will reap the rewards of procuring work when there is little else to bid on, the people that would get employed would reap the rewards of a pay check and in turn spend money in the area and thus the area itself would reap the benefits of financial boost from the plant being built in their area. I ask that we stop trying to cease construction in Northern Minnesota as many people who do not live in the area, look at it as their play ground and vacation areas, we that live here and try to survive need real jobs that pays decent wages and will give us a secure future. I ask that you please push this project forward and stop stalemating industry growing in Minnesota.	EOO

411	Destruction of the St. Louis River Watershed by Acid Mine Drainage would have a significant negative economic impact on the area and the State of Minnesota. A U.S. Fish and Wildlife Service survey found that in 2006 nearly half (48 percent) of Minnesotans said they were wildlife watchers while 13 percent said they were hunters. Wildlife watchers spent \$654.5 million pursuing their sport last year, while hunters spent \$475.8 million. While fishing is enjoyed by 28 percent of Minnesotans (tying Alaska as the highest participation rate in the nation), the 1.4 million anglers spend an amazing \$2.5 billion on their sport. Minnesotans are more active in outdoor wildlife activities than residents in any other state in the nation. By estimating that the loss from destruction of the St. Louis River watershed is 1/100th of this spending means a loss of approximately \$36,000,000/year to the area economy. 400 mining jobs at a \$75,000 per year would represent only \$30,000,000.	SE4

261	I support the PolyMet NothMet Project. Enough is enough; let's get on with permitting this mine. I will not go into the discussion as to the impact on the local economy because of mining, or the number of jobs that are dependent on such. Or the effect on the local tax base and how those taxes "give back" to the area and those perhaps less fortunate. And the services that have flourished due to the mine's jobs and benefits. Those jobs that assure other essential services like hospitals and schools that have a base from which to operate. Or the fact that Minnesota has lost a great number of jobs due to its excessive tax structure and state policies as they pertain to business. But I will caution our legislature to view this issue in a world context rather than looking at it from a micro perspective. As economies flourish in developing nations it puts a burden on the entire world metals sector. We, as consumers pay more for those imports, and are held hostage, much like the OPEC Cartel has us held hostage today. This country does not even have a nickel, cobalt, or platinum mine producing today. This is a sad commentary for the most powerful nation in the world. PolyMet will mine and produce several metals not currently mined anywhere in the United States. And mining these metals in a foreign country will more then likely create a greater global environmental impact as they have no safe guards in place. One has only to review Mesabi Range Mining and its contribution to the industrialization of America, or the world for that matter. And let's not forget the role Iron Range mining played in the production of goods during our World War I and World War II effort. Mining is important to our county and its industrial base, as well as our national security. While no one wants to talk of war, our lack of self sustaining minerals will put our country in a precarious position. These "strategic" minerals are of paramount importance should a conflict erupt today. And PolyMet will also be a domestic supply of critical metals needed in medical applications, catalytic converters (necessary for pollution prevention), cell phones, computers and other essential products. These metals that will be mined are also important in our move to green technology such as wind turbines and hybrid cars. We have this "window of opportunity" that needs to be addressed. I firmly believe that our country will experience less "ups and downs" in the future should we become more self sufficient. Self sufficiency is the measure of a strong country and a healthy society. Special interest groups must not stop this project. And make no mistake they want to delay it as well. That is there intent. To analyze this project "to death" and hope it goes away. What is our county to become, one Giant Park or playground? That is not the measure of a great people or society. PolyMet's NorthMet Project has been designed to minimize environmental impacts using the best technology available. The DEIS has laid the groundwork for developing an environmentally and economically sustainable project and I support it. As for protecting our environment there are no better "watch dogs" then the employees of our mining companies. Unsound environmental policies put our employees in harms way. Its employees and our residents recognize this. Much of labors laws that have developed since the turn of the century are due to its own employees, as have the environmental safeguards. We live here 24/7 and no one wants to protect our resources more that those of us who make our living here. We do so now- within the existing laws. And what better place to develop a new mine then at an old one. I urge you to support this initiative in our region for the good of our residents, our state, and our country.	EOO

241 Gentlemen: Having had the opportunity to listening to a presentation by Mr. Joseph Scipioni, President of Polymet Mining, I feel comfortable in addressing the question of whether Polymet ought to receive permitting for their proposed mining facility. Mr. Scipioni presented out our Quad Cities Rotary\* meeting the spring of 2009. His presentation covered the proposed mining of precious metals and then focused on the process involved in bringing the metal to final form. He was asked several in-depth questions regarding the potential of water contamination etc. When everything was said and done, the membership was support of continuing the permitting process by Polymet. It appears to me (and others) that Polymet has DONE their due diligence in meeting current and even future rules/regulations in place by Minnesota PCA, etc., etc. Government agencies have also done "their" job in scrutinizing Polymets' proposed mining process to make certain that pollution of water/land etc. is not in the offering. Further, is appears that governmental agencies know more about potential pollution issues than the general public and that ought to weight more in granting of the final permits necessary to begin mining. IN ADDITION, polymet has followed the processes necessary to secure permitting and should be granted the permits. The old adage "we can go on and on letting people make rules on the fly" only further delays and creates unforeseen expenses. One can surely say that there may be pollution from this project, BUT that can also be said about every business adventure in Minnesota today. We don't know what types of pollutes maybe out there and if we want to keep Minnesota TOTALLY green forever, we will have to shut down all types of businesses..which will cause total unemployment and no one will be living in the state in 20 years.even those who want the state green. I urge you to grant Polymet the permits necessary to move ahead with their project.

EOO,G6

3603 It is our turn to fight to preserve the BWCA as others have before us. As a college student at Bemidji State University and member of students for the Environment on our Campus, I believe that it is quite clearly not in the best interest of Minnesota to allow these mines to be dug. I am not a native Minnesotan. I grew up in Colorado, and was directly effected by sulfide mining. Many times I went fishing with my father and uncle an caught nothing because the lakes were dead from the acidic run-off form old gold mining operations in the 1900's (Central City/Black Hawk). I do not want to see the yellow piles of waste rock, and dirty streams without fish in Minnesota. Enough is enough. We have already tainted the Rockies, let us stop there and keep our Boundary Waters precious, and our North woods free of this proposed monstrosity.

EOO,G2

3796	Dear Mr. Arkley, I appreciate the opportunity to provide my personal perspective on the proposed NorthMet Project as described in the Draft Environmental Impact Statement (EIS) dated October 2009. I believe that the DEIS is a comprehensive document that adequately addresses State and Federal requirements and I fully support this project. Protection of the environment is a high priority for me. I live in Northeastern Minnesota, am an outdoor enthusiast and have spent a significant portion of my life enjoying fishing, hiking, skiing, snowshoeing, swimming and canoeing in northern Minnesota, on the Iron Range and in the Boundary Water Canoe Area Wilderness (BWCAW). As an environmental professional, I have seen that risk assessment and risk management are required as development occurs in order to protect human health and the environment. I have had the opportunity to observe my colleagues as the NorthMet Project has proceeded through the joint State/Federal environmental review process. The environmental assessments for this project have been conducted by professionals with high moral standards and respect for the environment. In addition, independent technical reviews have occurred by a team of environmental professionals that included State and Federal agencies. This lengthy and thorough process has identified effective solutions that will protect human health and the environment, as described in the Draft EIS. I am confident that the project design will continue to be optimized during the Final EIS and permitting process. The NorthMet Project will allow people in this State and Nation to produce more of the metals that we utilize and will limit our dependence on other countries for these metals. I also feel that we as consumers must share the responsibility for the environmental impacts that are associated with the goods that we purchase. The NorthMet Project meets rigorous environmental regulations. Lastly, I support the NorthMet Project because of the direct and indirect long-term jobs that it will bring to the region and the State. In summary, I recommend proceeding with the Final EIS and I support a declaration of adequacy for the NorthMet Project.	EOO,G10

1922	The mine's tailings basin will also produce discharges high in sulfate concentrations, which will turn mercury into methylmercury, making fish dangerous to consume.	WR4B,FM1
3174	Water Quality At Risk - Water quality concerns have not been adequately addressed in the PolyMet project's DEIS. Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years.	EOO
3580	So, I guess it just seems unbelievable that this is even an issue. I could scream, cry, and yell at those who want to harm our environment. But that has never proved to have a positive effect. So I am asking everyone involved in this decision to act on what YOU KNOW is the right thing to do. What price can we put on losing our fresh water? Please consider what this means for the future of our state and country. You can be a voice that will be respected and admired throughout not only our state, but also the country. Thank you for voting AGAINST the mining project. Put the value again on what is truly important for our children and country.	EOO,G2
<b>Sender Last Name:</b> Dirks <span style="float: right;"><b>Submission ID:</b> 1828</span>		
2432	We don't need the proposed mining on the BWCA border badly enough to risk the environmental damage.	EOO
<b>Sender Last Name:</b> Doane <span style="float: right;"><b>Submission ID:</b> 3124</span>		
3496	Please add me to list of people opposed to this proposal. I'm already disgusted enough with my government and this is another insane idea. Sulfide Mining has left a disaster everywhere it has been tried. Why would you ever consider doing it?	EOO
<b>Sender Last Name:</b> Dodson <span style="float: right;"><b>Submission ID:</b> 3562</span>		
1067	Effectiveness of constructed wetland treatment systems has not been proven. The suggested method should not be relied upon as a water treatment method. Reliance on this method will likely result in pollution in rivers and lakes downstream. A complete stability analysis and acceptable basin design should be a part of the DEIS. Before any of PolyMet's tailings are deposited on top of existing tailings, existing structural deficiencies must be addressed. The tailings basin will contain extremely hazardous waste materials. An appropriate design is critical, and should be identified in the DEIS. The company should design another method for cleaning cleaning polluted waters.	WE6
1068	The PolyMet proposal's impact on wetlands and global warming is unacceptable: A major problem: Significant Loss of Wetlands – Increasing CO2 Emissions. Peatlands at mine sites have been identified as high quality wetlands in federal and state inventories. The peatlands represent habitats that are increasingly rare on the landscape, and should be protected from destruction. Reports commissioned by the MN State Legislature and by Governor Pawlenty call for the protection of peatlands for their ability to capture and secure carbon. Minnesota needs to heed these recommendations and halt any further destruction of these valuable habitats.	WE2,AQ3
1137	The PolyMet proposal's impact on wildlife is unacceptable: A major problem: Loss of Critical Habitat for Wolves and Lynx Critical habitat identifies geographic areas that contain features essential for the conservation of a threatened or endangered species. Habitat was designated for the lynx and wolf to prevent further population declines. Minnesota should not permit the diminishment of habitats for these species.	WI1
3275	The PolyMet proposal's risks to water quality are unacceptable: Major Problems: Contaminated Discharge from Waste Rock Pile; Contaminated Overflow from the West Pit; Tailing's Basin Water Discharges Will Be High in Sulfate; Unreliable Wetland Water-Treatment Plan; Unstable Tailings Basin Could Discharge Toxic Materials	EOO

26 Please just evaluate the health costs of people affected by toxins or add up the loss of income and taxes to resorts closing due to problems (plus dead fish clean up) and it will for certain add up to what it would cost the company in terms of implementing proper environmental safety controls. Even if you only took a small number of people getting sick or just a few resorts closing it would still add up to a huge expense, then compound that by it becoming an extensive problem, wow! Cost figures speak loudly when evaluating business decisions.

SE5

3466 I am writing my own personal comments, but I concur with the statements below that outline the incredible damage related to the PolyMet Mining Corp. NorthMet mining project. The Boundary Waters Canoe Area (BWCA) as well as the adjacent joining Canadian Quetico Provincial Park are treasures in terms of wilderness areas. People from all over the world come to experience the beauty and clean environmental state of these protected parks. Water contamination run off problems could have monumental, irreversible long term impact. In my youth I spent my summers in the BWCA and Quetico and as a camp counselor for many years I led youth into those wilderness areas. Plus I have traveled there as an adult many times. My two nephews now take yearly canoe trips in the BWCA. Since PolyMet Mining Corp. is a Canadian company I believe the Canadian government should also be concerned it terms of how it would impact the Quetico Provincial Park as well since the waters are interconnected. Canoeists pull drinking water directly from the lakes only using a water purifier for removing bacteria. To have to carry water in on trips in the future would be very difficult for canoe travel and portaging purposes and would likely limit use of the parks. Also the resort industry in northern Minnesota is vital to our economy and toxins/poisons in Minnesota waters would diminish that industry greatly, damaging fish and recreation potential. Also, we have a large native American population that relies on clean waters both for lifestyle and income. Health problems and related costs could be astronomical if pollutants go unchecked. Once it is in our waterways it cannot be contained. As a concerned long term Minnesotan I truly believe that companies can indeed create and implement proper pollution control methods due to the incredible technology and research that is available today. It is primarily a matter of cost and enforcement. If a company want to do business in a state that values environmental safety for it's citizens then strict controls need to be part of the package and they bear that cost or else they cannot do business here.

1150 I am really interest in the PolyMet Draft EIS process and was unable to attend either of the two information sessions. Is there a video/audio recording Or transcript available from the meetings?

RFI

2469 This mining SHOULD NEVER HAPPEN due to the deleterious effects it would have on life, human and other species. If this mining is allowed to take place, I imagine suing the company as well as both the United States and Canadian governments for lack of forethought and bad policy would be an easy thing to do. It could be a veritable field day for unemployed lawyers.

1271	It is our obligation and your responsibility to do the right thing. I do not want the land torn up and the waters polluted only for monetary gain. Can you put a price on clean water and a healthy landscape???	EOO
3063	To date there has been no proven adequate solution to prevent acid mine drainage from waste rock piles. This drainage has the potential to pollute and kill aquatic life in rivers, lakes, and wetlands for up to 2,000 years. This includes the unproven wetland water-treatment plan in the Polymet EIS. For the Polymet project this includes the loss of over 1,500 acres of wetlands/peat lands to do this type of treatment. Mines that require treatment of waters for thousands of years is not sustainable.	WR1A,WR1E,WE6
3064	It would also be difficult to quantify the cost of water treatment for that length of time. High sulfate concentrations in the Tailings Basin would be released, resulting in high-risk situations for mercury methylation. When mercury is methylated it can bioaccumulate in fish, making them unsafe to eat. Many of our lakes and rivers are already under mercury advisories, including the waters of the watershed into which the Polymet mine would discharge. Consuming these fish would be an even greater hazard to those catching and eating fish.	WR4B,PD3,PD4,FM1
3065	There are other sulfide ore mining companies presently exploring in Minnesota. The precedent that would be set by permitting Polymet would potentially be devastating to the water resources in Northern Minnesota including the Boundary Water Canoe Wilderness Area and Voyageurs National Park. It may encourage mining by other companies who are no more prepared to protect affected water resources than Polymet. With the uncertainty of adequate proven water treatment, the Austin Chapter 10 recommends a moratorium on all proposed sulfide mining requests. Austin Chapter 10 would recommend that the moratorium would be similar to or replicate the Wisconsin Act 171 on sulfide mining.	EOO,PD4
3526	Upon review of the Environmental Impact Statement for the Polymet proposal, Austin Chapter 10 is very concerned with the potential environmental damage that would occur with this project and other projects like it if they would be allowed to proceed. This type of mining has not previously been done in Minnesota. Where it has been done in other states, the sulfide mining industry has a poor track record in environmental clean up. The taxpayer in numerous instances has picked up the bill for clean up.	PD4,G9
<b>Sender Last Name:</b> Dornfeld		<b>Submission ID:</b> 2513
3066	I would like to comment on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. The watershed contamination, damage to the area's wilderness aesthetic and image, and the precedent which will be established by the approval of this project are untenable. Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. Mining operations such as these have an accurate notoriety for disappearing as soon as they have exhausted the resources they are after. It is not to be expected that PolyMet will take responsibility for mitigating even the short-term after-effects of this operation, much less such long lasting impacts. As concerning as is this project in itself, the precedent it will set for the approval of similar future ventures with even greater negative consequences is even more worrisome to me. Last year, applications were submitted for 32 permits for mineral exploration on the doorstep of the Boundary Waters Canoe Area Wilderness. The exploration by Franconia Minerals on Birch Lake is already disrupting recreation activities in the area and impacting the wilderness experience of BWCA users. As a longtime user of the BWCA and a seasonal employee in the tourist industry there myself, I am deeply apprehensive about the damage on many levels which will result from mining in the Arrowhead. These activities are fundamentally at odds with the wilderness ethic and philosophy of the Boundary Waters. They also present very practical concerns for local businesses who depend on the image of the wilderness. The Boundary Waters is one of the most unique and best known wilderness areas in the entire nation; it would be a great detriment to the state's reputation to allow anything to infringe the integrity of this unparalleled resource.	G2,G7A,G8C,G9,G11
<b>Sender Last Name:</b> Dosch		<b>Submission ID:</b> 367
39	4.1-85—Humidity cell testing is not complete and not totally accurate. Explain to what extent humidity cell testing has been used in the DEIS.	WR2E

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
39	4.1-68—“...monitoring of the WWTF effluent is recommended as a leading indicator of potential groundwater issues at the Tailings Basins.” The EIS process needs to explain the value of monitoring if there is no mitigation plan in place.	WR4C
39	4.1-69—“The analyses identified the following 16 constituents as being present in the NorthMet waste rock/ore and leaching in sufficient quantities to warrant additional analysis: aluminum, antimony, arsenic, beryllium, cadmium, cobalt, copper, fluoride, iron, lead, manganese, nickel, sulfate, thallium, vanadium, and zinc.” Some of these metals, such as arsenic and nickel, are considered carcinogenic. Nickel and cobalt together have a synergistic carcinogenic effect. Nickel and arsenic are known to leach out in greater amounts in the neutral range, so if limestone is being added to water treatment to neutralize acid mine drainage, the result is an increased leaching of contaminants such as nickel and arsenic. According to “Toxic Water,” MPR Midmorning January 27, 2010, all chemicals are lethal—we are simply giving them allowable levels. Arsenic is one of the top contaminants of concern nationally. Our drinking water standards have not been updated in the last ten years, and the EPA is starting to take a closer look at some of these pollutants. According to Wikipedia, “The Precautionary Principle states that if an action or policy has suspected risk of causing harm to the public or to the environment, in the absence of a scientific consensus that harm would not ensue, the burden of proof would fall on those who would advocate taking the action.” The chemicals and metals listed above must be considered in the PolyMet EIS process as part of current contamination within the Embarrass River, the Partridge River, Colby Lake, and area wells, as part of cumulative contamination with Mesabi Nugget, and as part of a sulfide mining district. The burden of proof rests with the regulatory agencies.	WR1C
39	4.1-65—PolyMet proposes to construct five waste rock/lean ore stockpiles at the Mine Site segregated based on their potential to generate acid rock drainage and to leach metals.” This is the one and only time that acid rock drainage (aka acid mine drainage) is mentioned in the DEIS. The lack of transparency within the DEIS regarding acid mine drainage and long term treatment deems this DEIS inadequate. The fact that PolyMet is proposing lean ore stockpiles needs to be addressed in two regards. First, lean ore stockpiles obviously have the greatest potential for generating acid mine drainage and leaching heavy metals. This is not being adequately addressed. Second, lean ore stockpiling suggests that further mine processing could be done, generating more tailings. The DEIS does not adequately address the potential of extracting metals from these stockpiles.	WR1E,WR2C,WR2D
39	4.1-65—There is no conclusion as to how ground water seepage would be treated.	WR4C
39	4.1—59—“However the scant data that does exist characterizing mine site hydrology suggests that there may be substantial connection between the bedrock and surficial aquifers.” There is a disconnect between this statement and the data provided by Barr Engineering. It appears that modeling was done to fit pollutants into existing standards irrespective of the actual physical hydrology. Explain the software program that produced this modeling. Explain how the independent consulting firm put this together. Neither the DNR nor the hired consulting firm is doing an adequate job of independently checking out statistical information provided by Barr Engineering for PolyMet. Explain in the introduction what standards the agencies are using when they accept data provided by Barr Engineering when Barr has been hired by PolyMet. Explain in the introduction how the agencies chose Environmental Resources Management, a London based firm, as an independent agency to assist with the environmental review process. Al Trippel’s double dipping, being paid by ERM as well as being paid by Aquila, should be included under socioeconomic impacts, along with PolyMet officials who are retired from mining or other jobs but now receiving salaries from PolyMet. Explain how double dipping such as this contributes to the local economy.	WR1E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
40	I am introducing my comments with the following remarks. The Minnesota Department of Natural Resources and the Army Corps of Engineers have twice denied Minnesota citizens free access to public comment and discourse. During both the PolyMet scoping hearing and the DEIS hearing process, citizens were denied the right to ask questions of the agencies in a public format. At the same time, the agencies allowed spokesmen to speak in favor of PolyMet. At the scoping hearing, PolyMet was allowed to present a power point introduction to its mine project with no mention of acid mine drainage. At the DEIS hearing, local politicians were allowed to speak in favor of the mining project, using verbatim quotes from company propaganda. Again, no mention was made of acid mine drainage and heavy metal leaching requiring long-term treatment. This process is further tarnished by the fact that PolyMet is considered in this DEIS as an isolated mine project, not as the lead mine within a metallic sulfide mining district. The sad fact is that agency heads are getting paid with public money to mislead and misinform the public. I don't understand how 5 years and \$20,000,000 could result in a document so poorly put together and based upon such poor science. That amount of money in itself could have been a start toward cleanup of the area and a new vision of how the future might look. Instead, we have \$20,000,000 of paperwork that tries to justify the mining of less than 1% ores. To top it all off, the public was given 90 days to make their way through 3 binders full of documents.	EOO,PRO6,RFI,WR3I
161	I respectfully urge you to extend the public comment period to May 3, 3010. This issue- the impacts if granted- will have major and lasting and irreversible consequences for our region. The official comment period fell during the major holidays and the worst weather. Please Extend!	PRO6
407	4.1-135—"PolyMet proposes to mitigate the increased solute load expected in the East Pit from the disposal of the higher sulfide waste rock by pumping East Pit water to the WWTF for additional treatment for approximately 30 years (years 21-50)." What happens after 30 years? Does the pollution disappear? What motivation is there for the company to spend money on treatment after the mine is closed and no longer making money? When Polymet gets bought out by another company, how will the transfer of this responsibility occur? What role does the DNR have in monitoring the pollution and the treatment? Does the DNR have enough of a budget to maintain this? How can we project such costs up to 50 years in the future? Please address the above within the EIS process. The Dunka mine site, at which LTV excavated sulfide ores in order to mine taconite underneath beginning in the 1960's and continuing through the 1980's, has been leaching toxic heavy metals into Birch Lake, and now into the Dunka River. This is concrete evidence that the sulfide ores will leach out toxic metals and that the agencies and the mining companies have not been able to control this leaching. The Dunka mine site continues to receive a variance. Information on the leaching of these heavy toxic metals has been known since the 1980's. The Dunka pit legacy shows several things. First, it may take a period of 20 years or more for acid mine drainage and/or heavy metal leaching to appear after ore and rock has been stockpiled. Second, there is no known way to control the leaching, at least no way that is financially acceptable. The Dunka mine site records must be made part of the EIS process. All records from the MPCA regarding this matter must be brought forward, as the MPCA is the agency that has been granting variances in regard to the leaching of metals into Minnesota waters.	RFI,WR3I

301 I am not an expert on environmental matters, nor am I an expert in the area of non-ferrous mining. However, I am an educated person who understands both sides of the issues that surround the Polymet Mining project in the Hoyt Lakes, Minnesota area. I would like to state my support for this much needed project. I grew up in Hibbing, Minnesota and currently live and work in the twin cities area. My grand-father, father, and uncle are all current/former employees of the mining industry. During college I was able to work two summers for National Steel Pellet Company in Keewatin as a truck driver in the iron ore pit and was able to see first-hand how much of the operation worked. Thanks to this opportunity, I was able to save enough money to pay for my entire college tuition and graduate debt-free. I have also experienced how much the state of Minnesota needs mining, especially in these grim economic times. Despite my family and geographic background, one would assume that my opinion is biased. However, I have spent my fair share of time hunting, fishing, canoeing in the BWCA, and I have even lived in Grand Marais for 4 years which is one of the most beautiful areas in Minnesota. I have also traveled to three other continents and have seen firsthand what real environmental devastation looks like in places that have no regulations. If there were any reasonable facts that one would lead a reasonable person to believe that irreparable harm would befall our state due to this mining process, I would be against it 100 percent because I love this state and enjoy its vast natural resources. No one wants an environmental disaster in their back yard. Many groups have voiced their opinions on the matter and despite Polymets and the State of Minnesota's best efforts, their response is blatantly predictable. Their idea of economic prosperity is to open another canoeing outfitter in Ely or another dog-sledding outfitter in Grand Marais. Their idea of good paying jobs is to have a bread-winner of a family working as a waiter/waitress in a restaurant or cleaning a hotel room for visitors from the twin cities area. They simply cannot come to terms with the fact that northern Minnesota's economy is sustained by the mining industry and not the tourism industry. If the state of Minnesota were to have these special interest groups impose their will upon it, we would soon be in a state of complete economic collapse. Growing up on the range, I saw piles of red rocks my entire life. Growing up on the range, I saw huge pits of water surrounded by red rocks. Now when I return, I see Birch trees reclaiming these red mountains and trout now swim in the pits of water. Thanks to the DNR and Mother Nature, these large man-made scars on the landscape are returning to their original state. However, the smoke stacks and conveyor belts stand idle and workers are waiting for a real opportunity to provide into the local and state economy. This project needs to be approved.

EOO

Comment ID	Comment Text	Theme Codes
348	I am writing in support of the EIS for the proposed Polymet project. It seems to me that after over 4 years, \$20 million dollars, and countless hours on everyone's part that the company's compliance with some of the most stringent environmental laws in the world can be assured. I believe the effort on the part of all interest involved in the process assures a win-win situation for all interested parties. In projects of this magnitude, someone can always fault something but the focus on the main issue of whether the requirements need to be of primary importance. With today's technological capabilities, monitoring of compliance should be readily available. I also believe approval will send a very positive message to the investment markets that while the state laws are very stringent, projects can get done in an environmentally friendly and economic manner. I believe Polymet has been very fortunate to have patient investors who have contributed over \$60 million to the Company. If the markets perceive that the state is a roadblock going forward, investment capital for Polymet and other like companies on the Range will not be available from capital markets for developmental monies and the potential for economic redevelopment will be lost. I spent my career in the investment business and I urge you to not lose sight of how important this factor is. If Glencore, which is providing Polymet over \$50 million were not in the picture, the project would not be moving forward due to lack of funds. This project in my opinion will prove to be a catalyst for the rebirth of the mining industry on the Range in a number of different ways. First, it will create over 400 permanent jobs, numerous related jobs for other services, increase state and local taxes, and reinvigorate several communities. Secondly, it will help preserve the cultural aspects of the Range which is important to many people and to the diversity of the state. I grew up in a steel mill town (East Chicago, Indiana) which once was thriving but now when I return it is boarded up with no tax base and declining population due to lack of jobs. I believe this project will contribute to a reversal of the trend on the Range so what happened to my home town will not happen there. Lastly, I really believe this project will prove to be a catalyst for further growth of metals mining throughout the entire area, bringing with it job growth, more tax dollars, reinvigoration of communities, as well as increased domestic security from foreign-sourced metals risk. Economic growth when balanced with environmental compliance is a real positive for everyone involved.	EOO
<b>Sender Last Name:</b> Dunn		<b>Submission ID:</b> 1222
1352	I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I have researched the environmental effects on mining in this area and am convinced that it would be detrimental to this nature conservatory. Please do not allow mining to occur near the MN Boundary waters. Let's protect this land that has already been set aside for conservation amidst growing habitat loss.	G2A
<b>Sender Last Name:</b> Dunnington		<b>Submission ID:</b> 2545
701	The mine site disrupts natural corridors for the movement of wildlife. Specifically the Canada lynx, which is a federally-listed threatened species that requires large territories and benefits from undisturbed forest corridors. No provision is made for mitigating this loss of habitat in the DEIS.	WI5
1402	Sulfates are a problem that are not dealt with rigorously in the DEIS. Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition, sulfates react with elemental mercury in a process known as mercury methylation. Methylmercury is the form that bio-accumulates in fish and animals that eat fish, including humans. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for?	WR4B,WR4C,WR4F,FM1,F
2182	There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide, it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting.	WR2A

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2373	The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held in escrow as a damage deposit and that amount should be specific and included in the final EIS.	PD3,PD4
2374	The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet can not be looked at as a single, one-time event in N.E. Minnesota. With permitting of Polymet will come at least 2, perhaps 4 or more new applications for permitting from other mining companies. What will be the total impact on the environment by all these potential mines and how will the EIS deal with mitigation of all these in concert? Specifically the Boundary Waters, which is down wind of all these projects, will be negatively impacted in terms of atmospheric haze from dust particles and other emissions blown into the air. According to the U.S. Forest Service, the Polymet project alone will cause significant haze impairments in the Boundary Waters 36 days each year! Tell us how this cumulative effect on air quality must be dealt with for Polymet and all future applications. In addition how is global warming affected by this mining operation and the combinations of all potential mines in the future?	G9
2375	Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. Do we just depend on the mining company to do its own monitoring? There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR.	PD8
<b>Sender Last Name:</b> Durbin		<b>Submission ID:</b> 2573
3131	I would like to urge you to recommend and immediate halt of the Polymet sulfide mine project. The possibility of mercury and acid contamination of the rivers and ground water is too great. The EIS was totally inadequate. As a resident of Lake Vermilion, I believe our watershed is too important a resource to risk possible, short-term economic gain. Every sulfide mine in the history of North America has had major contamination problems. Let's join our neighbors in Wisconsin and place a moratorium on nonferrous mining.	EOO,G7,G8,G12
<b>Sender Last Name:</b> Durtsche		<b>Submission ID:</b> 2320
2773	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Finally, as a long-time user of the Boundary Water Canoe Area Wilderness, I have major concerns over mining operations encroaching on this treasured and pristine "island" of wildlife, nature, and beauty. The BWCAW is a significant recreation and tourism resource for MN today and will only increase in value as more and more of our earth is destroyed from industries such as mining. It would be foolish to use short-term, non-generational thinking when deciding on whether to allow this mining operation to move forward.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
216	The wetland mitigation proposals make absolutely no sense. The wetlands impacted are in a sensitive watershed that depends on them to store, release, and filter water into the watershed. Why create wetlands in a different watershed to mitigate this destruction? That will not solve the problem of damage to the impacted watershed. Perhaps the saddest part of the DEIS is its coversheet.	WE3
771	The draft environmental impact statement for this project is a massive document that cannot be adequately reviewed in the time period allocated for public comment. In addition, this project impacts the Superior National Forest, Lake Superior, an international body of water, and the atmosphere which is obviously international. Therefore public comment should at least receive national attention. The document is based on many assumptions,	PRO6
1069	which it admits, are uncertain. Many of these are based on the experience of iron mining which is wholly illegitimate. The type of mining proposed here, because of its highly acidic production process, will produce toxic runoff that will continuously seep into the watershed. The pursuit of this project based on such uncertain and erroneous assumptions is nothing but an act of technological hubris. A fancy statistical technique—uncertainty analysis—was employed to get around uncertain assumptions. But how free is this method of bias since it was based on “data, professional judgment, and literature values that were approved by the resource agencies”? The wetland mitigation proposals make absolutely no sense. The wetlands impacted are in a sensitive watershed that depends on them to store, release, and filter water into the watershed. Why create wetlands in a different watershed to mitigate this destruction? That will not solve the problem of damage to the impacted watershed. Perhaps the saddest part of the DEIS is its coversheet. Three of its pictures depict the area that this massive blueprint for a toxic waste dump seeks to bequeath to posterity as a monument of our ignorance. The only responsible and reasonable alternative is the no action alternative. It is sad that the citizens of Minnesota did not have the wisdom and foresight to enact an Environmental Protection Amendment to the state constitution that could have prevented folly such as this. But, a political culture that is accelerating into degeneration cannot be expected to produce wisdom and foresight.	EOO,WE2,WE3,G7A,G7C

1323	<p>Bad public policy initiatives have a nasty habit of gaining traction and becoming impossible to stop. The proposed Polymet Mine at the edge of the Boundary Waters is an obvious example. The process through which this idea is being implemented is an ideal representation of internal parasitism—the corruption of the political process by narrows economic interests. ( Mancur Olson called these distributional associations—highly organized, well financed, and relatively small associations that are able to drive public policy toward their own economic interest against the public interest—Mancur Olson, <i>The Rise and Fall of Nations</i>, Yale University, 1982) Polymet and its lobbying arm, Mining Minnesota, have successfully co-opted the local politicians in Northeastern Minnesota with their mantra of “jobs, jobs, jobs” to bring this destructive project to fruition. It is worth pointing out that the jobs mantra is often used to justify special interest rent seeking at the state and local level. At the federal level national defense is an additional excuse for special interest corruption. The environmental arguments against this project are so overwhelming that its rejection ought to be a no brainer. Since these arguments have been presented elsewhere (e.g. <a href="http://nmw.org/issues/sulfide%20index%20page.htm">http://nmw.org/issues/sulfide%20index%20page.htm</a> and <a href="http://www.preciouswaters.org/#&lt;http://www.preciouswaters.org/&gt;">http://www.preciouswaters.org/# &lt;http://www.preciouswaters.org/&gt;</a> ), I will not other to repeat them here. Rather I shall focus on some issues that may have received less attention. This whole problem began with the ill-advised leasing of state lands in Minnesota for mining exploration. This raises the question about the property rights attached to these lands. Supposedly these lands are held in the interest of all the citizens of Minnesota, and their acquisition and maintenance are supported by the tax payments of those citizens. The state justifies mineral exploration on the grounds that it will create jobs and drive economic growth. (It ought to be obvious that unlimited economic growth, by treating the earth as both a source and a sink, will consume and pollute the biosphere to our own detriment. The fact that this is not obvious is too complex to address here.) This possibility captures the interest of the people living near the areas where minerals are found. But living in the local area does not confer a property right to the resources in the area that are on public lands. Leasing these lands, however, initiates an illegitimate transfer of property. (Legality is not the issue here. Unfortunately much corruption is legal which has resulted in a general complacency regarding it.) The end result is that the local residents behave as if they have some sort of use right to the property to the detriment of the more diffuse interests of the rest of the citizens of the state. When all the negative externalities are added in, the issue of property rights becomes far more complex. What about the pollution of the Boundary Waters, a resource that belongs to all citizens of the United States, and is used by national and international visitors? What about the pollution of adjacent private lands? What about pollution of waterways that may affect Canada and air pollution that has worldwide effects? The fact that the approval of this proposal will inevitably lead to the approval of several more such “projects” magnifies the complexity and cumulative impact of these issues. This cumulative impact only received passing mention in the DEIS. In addition to negative externalities, there are transcendental values that are ignored by the economic calculations. These include natural beauty, the experience of being in the relatively unspoiled natural world, outdoor recreation, and the satisfaction of knowing that our natural heritage is preserved even though we may never visit it. Evidence is now beginning to accumulate that modern man is starting to suffer from a natural deficit disorder. The fact that we are becoming so divorced from the natural world may</p>	G1,G2,G4,G13
1324	<p>The document is based on many assumptions, which it admits, are uncertain. Many of these are based on the experience of iron mining which is wholly illegitimate. The type of mining proposed here, because of its highly acidic production process, will produce toxic runoff that will continuously seep into the watershed. The pursuit of this project based on such uncertain and erroneous assumptions is nothing but an act of technological hubris. A fancy statistical technique—uncertainty analysis—was employed to get around uncertain assumptions. But how free is this method of bias since it was based on “data, professional judgment, and literature values that were approved by the resource agencies”?</p>	G7A,G8B

3826	In addition to negative externalities, there are transcendental values that are ignored by the economic calculations. These include natural beauty, the experience of being in the relatively unspoiled natural world, outdoor recreation, and the satisfaction of knowing that our natural heritage is preserved even though we may never visit it. Evidence is now beginning to accumulate that modern man is starting to suffer from a natural deficit disorder. The fact that we are becoming so divorced from the natural world may have deleterious consequences for human evolution. The wanton destruction of our natural areas will only hasten the development of this condition. Since transcendental values are not amenable to valuation by the price mechanism, they are not adequately accounted for in the economic calculations used to justify this ill-advised project. In addition, the failure to account for these values violates inter-generational equity since we will be leaving a despoiled environment to our descendents. The alleged benefits upon which this project is justified are local, short term and short sighted. The non-local benefits will accrue to an alien corporation. Once the resource is depleted (and sold to China which raises othe issues); a massive pile of waste will remain. History is very clear when it comes to clean-up after projects like this are completed—it does not get done. The corporate organization of the mining industry is designed to avoid these costs. Polymet is a subsidiary of a parent organization conveniently located in Canada. Once the resource is depleted, the	EOO

3827	subsidiary will declare bankruptcy after transferring its assets to its parent. The taxpayers of Minnesota will be left with the mess to clean up. In addition, unfortunately, those who are responsible for this bad decision will not be in place to be held accountable once the environmental consequences become evident. The all purpose justifier of this project is that it will create jobs. But some jobs simply should not be done. A prime example is the creation and marketing of tobacco products. This creates jobs and provides wealth to the corporations in the business, and tax revenues to government. But it has no other purpose than to cause addiction, illness, and death, which, unfortunately, creates other jobs in the health care and funeral industries, all of which increases that sacrosanct indicator of economic growth--GDP. It has now become evident that some high paying, "good jobs" in the finance industry should not be done. The fact that this project will defoliate, consume, and pollute a resource that would generate far more lasting value if left alone puts it in the same category.	G1,G2,G4A

3189	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. I am vastly opposed to this LARGE open pit sulfide mine next to the Boundary Waters Canoe Area Wilderness. The mine proposal is in an area that drains into the St. Louis River watershed. These mines are never clean during operation or after they supposedly close (Minnesotans are going to get stuck with the long term cleanup for many, many years.) Just visit the gigantic open pit copper mine in Bisbee Arizona - these are NOT clean or environmentally friendly operations! PolyMet is not even a United States Company, it is a Canadian firm based out of Vancouver, British Columbia so why would we have them rob us?	EOO,G2,G7A
3756	How can you justify mining near the BWCA. Not only will it have long term effects on our health, environment, and public safety; it will be endangering wildlife, fish, and people. Doesn't concern over the long-term effects outweigh the short term profits. I guess money talks! Think about it.	G2C,G3B
<b>Sender Last Name:</b> Earth Protector, Inc		<b>Submission ID:</b> 3438
3210	Earth Protector is certain that it is not news to the Minnesota Department of Natural Resources (DNR)and the Pollution Control Agency (PCA) that when PolyMet mines and processes the sulfide containing rock, the wastewater from the process will be exposed to air and water and produce sulfuric acid, which will drain into the Partridge River. This discharge will affect the quality of the water and the wild rice contained therein that is an integral part of Minnesota's heritage and people's livelihood. While the rules for sulfide discharge to surface water are questionable, the rules protecting the wild rice are not. Please advise how PolyMet, DNR and PCA, will prevent damage to our valuable water and wild rice resources from the discharge of sulfide laden wastewater by the PolyMet company.	WR4F

1	<p>Moreover, the Draft EIS fails to demonstrate compliance of the proposed mining project with Minnesota’s antidegradation policy and requirements. In fact, the Draft EIS discloses “uncertainty” as to whether the proposal would or would not comply with the antidegradation requirements. DEIS, 4.1-128 (stating that “there is some uncertainty whether mercury concentrations in the West Pit, or the ultimate discharge to the Partridge River when the West Pit begins to overflow around Year 65, would meet Great Lakes Initiative water quality standards”). Instead of stating that the project cannot go forward until compliance with water quality standards and the antidegradation policy are demonstrated, however, the agencies simply state in the Draft EIS that mercury monitoring is recommended to determine if there are elevated mercury concentrations. Id. There is no support within the CWA or Minnesota’s regulations for the approval of a project that may in fact violate water quality standards and the antidegradation policy by simply recommending monitoring by the project applicant. To the contrary, the proposed project cannot be approved until full compliance with water quality standards, including the antidegradation policy - is demonstrated through a detailed and objective environmental analysis.</p>	WR3I
2	<p>Moreover, the Draft EIS admits that the proposed project “would degrade surface water quality by raising ambient concentrations of several parameters, primarily metals (e.g., antimony, arsenic, copper, nickel, and zinc).” DEIS, 4.1-191. The Draft EIS, fails to explain how this admitted degradation will somehow not violate the state’s antidegradation policy.</p>	WR3I
2	<p>I. The Agencies Have Improperly Limited the Scope of the Environmental Analysis within the Draft EIS The Council on Environmental Quality (“CEQ”) has promulgated regulations to implement the National Environmental Policy Act (“NEPA”), found at 40 C.F.R. Part 1500. The CEQ NEPA regulations are binding on all federal agencies. 40 C.F.R. § 1507.1. NEPA requires agencies to use the criteria for “scope” that is set forth in the CEQ regulations in order to determine “which proposal(s) shall be the subject of a particular statement.” 40 C.F.R. § 1502.4(a). Proposals which are related to each other closely enough to be, in effect, a single course of action, must be evaluated together in a single EIS. Id. The CEQ NEPA regulations further define the proper scope of EISs, and mandate that connected, cumulative, and similar actions be assessed together in a single EIS. 40 C.F.R. § 1508.25. Actions are connected if they automatically trigger other actions which may require EISs, they cannot or will not proceed unless other actions are taken previously or simultaneously, or they are interdependent parts of a larger action and depend on the larger action for their justification. 40 C.F.R. § 1508.25(a)(1). Actions are cumulative if they will have cumulatively significant impacts. 40 C.F.R. § 1508.25(a)(2). And actions are similar if they have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography. 40 C.F.R. § 1508.25(a)(3). According to the Draft EIS: The Mine Site would be located at a previously unmined area in the Superior National Forest . . . The Mine Site is located on National Forest System lands; however, the mineral rights are privately held and under lease to PolyMet. It is the position of the United States that the mineral rights leased by PolyMet do not include the right to open pit mine the National Forest System land. . . The USFS and PolyMet are exploring the feasibility of a land exchange to consolidate the surface ownership and mineral rights to PolyMet and thereby remove all National Forest System lands from the proposed Project. The USFS will be initiating its own EIS to evaluate the proposed land exchange, while this NorthMet Project DEIS assumes the successful completion of a land exchange. Draft EIS at S-1; see also id. at 1-3. From this description, there is no question that the proposed NorthMet mining project and the proposed land exchange are connected, cumulative, and similar actions that must be assessed together in a single EIS. 40 C.F.R. § 1508.25(a). Because the mineral rights leased by PolyMet do not include the right to open pit mine the Superior National Forest lands, the proposed mine cannot proceed unless the</p>	PRO1
3	<p>Last, the Draft EIS is wholly deficient in its failure to analyze and predict impacts to Lake Superior. The simple statement that little information is available on the extent of methylmercury formation in the Lake Superior estuary is no substitute for the required environmental analysis, especially where it is acknowledged both that the project area waterbodies and the St. Louis River are already impaired for mercury, and that the NorthMet and other proposed projects would increase sulfate levels which would likely increase methylmercury. A comprehensive, cumulative effects assessment on the potential impacts to Lake Superior is required.</p>	WR5A

3 Applicants for federal licenses and permits must obtain Section 401 Certification from the state “before a federal license or permit can be issued for activities that may result in any discharge into intrastate navigable waters.” PUD No. 1 of Jefferson County v. Wash. Dep’t of Ecology, 511 U.S. 700, 707 (1994). The triggers for the Section 401 certification requirement are 1) a request for a federal license or permit authorizing 2) any activity that may result in the discharge of pollutants into navigable waters. No federal licenses or permits, including a Section 404 permit, can be issued for the proposed NorthMet mine without the proper Section 401 Certification. And the required 401 Certification must demonstrate that the proposed project will comply with all water quality standards at all times. See Hells Canyon Preservation Council v. Haines, 2006 WL 2252554 (D. Or. 2006). In another mining case, the State of Washington Pollution Control Hearings Board (PCHB) vacated a previously-issued 401 certification largely because the water in the mine pit is predicted to violate water quality standards. See Okanogan Highlands Alliance v. State of Washington, Case No. 97-146, Final Findings of Fact, Conclusions of Law and Order of the Washington Pollution Control Hearings Board (1/19/2000), <http://www.eho.wa.gov/searchdocuments/2000%20Archive/pchb%2097-146%20final.htm>, on reconsideration: <http://www.eho.wa.gov/searchdocuments/2000%20Archive/pchb%2097-146%20reconsideration.htm>. (final agency action denying Mine’s water rights and finding that there is no reasonable assurance that the Mine will comply with state water quality standards). Here, because the Draft EIS acknowledges that numerous water quality standards will be violated at some point, the State cannot issue the 401 Certification and thus the Corps cannot issue the 404 permit.

4 V. The Draft EIS Fails to Disclose and Discuss Past Failures of Similar Mines, in Violation of NEPA NEPA requires that environmental information of high quality be provided to public officials and citizens before decisions are made. 40 C.F.R. § 1500.1(b). The purpose of NEPA is to help public officials make decisions that are based on an understanding of the potential environmental consequences, and to take actions that protect, restore, and enhance the environment. Id. § 1500.1(c). Moreover, an EIS must disclose and respond to “any responsible opposing view.” Id. § 1502.9(b); see also *Seattle Audubon Society v. Moseley*, 798 F. Supp. 1473, 1479 (W.D. Wa. 1992), *aff’d* *Seattle Audubon Society v. Espy*, 998 F.2d 699 (9th Cir. 1993) (“[a]n EIS that fails to disclose and respond to ‘the opinions held by well respected scientists concerning the hazards of the proposed action ... is fatally deficient.’”); *Earth Island Institute v. U.S. Forest Service*, 442 F.3d 1147, 1172-73 (9th Cir. 2006) (FEIS failed to respond “explicitly and directly” to conflicting views, and agency violated NEPA requirement to take a hard look and provide a full and fair discussion allowing informed public participation and informed decision-making). The proposed NorthMet mine would be the first ever copper nickel mine in the state. To comply with NEPA’s disclosure requirements and the underlying purpose of NEPA, the agencies must fully disclose to the public the long-history of past failures and severe environmental harm caused by hard rock and copper mines across the country and world wide. Few if any activities have had more persistent, permanent and significant environmental impacts to water quality and other resources, and the Draft EIS violates NEPA by failing to objectively and openly disclose this legacy of environmental pollution from the hard rock mining industry. Before permitting this type of mining in the state, the agencies must plainly and openly disclose that, according to EPA, 40% of the headwaters of all western waterways have sections that are polluted by mining, and that EPA ranks the mining industry as the nation’s top toxic polluter, reporting more toxic releases annually than any other industry sector. Moreover, in the scientific reports “Comparison of Predicted and Actual Water Quality at Hardrock Mines,” and “Predicting Water Quality Problems at Hardrock Mines: Methods and Models, Uncertainties, and State-of-the-Art,” prepared by Jim Kuipers, P.E., and geochemist Ann Maest, Ph.D., the authors analyzed water quality predictions and outcomes at 25 representative metal mines permitted in the United States during the last 25 years. See Attachment 2. The reports found that faulty water quality predictions, mitigation measures and regulatory failures result in the approval of mines that create significant water pollution problems. Id. Despite assurances from government regulators and mine proponents that mines would not pollute clean water, the researchers found that 76 percent of studied mines exceeded water quality standards, polluting rivers, and groundwater with toxic contaminants, such as lead, mercury, arsenic and cyanide, and exposing taxpayers to huge cleanup liabilities. Among the researchers' findings for the 25 mines examined in depth: • 76 percent of mines exceed groundwater or surface water quality standards • 93 percent of mines that are near groundwater and have elevated potential for acid drainage or contaminant leaching exceeded water quality standards[1] • 85 percent of mines that are near surface water and have elevated potential for acid drainage or contaminant leaching exceeded water quality standards • Water quality standards for toxic heavy metals, such as lead, mercury, cadmium, copper, and zinc, were exceeded at 63 percent of mines. • Mitigation measures predicted to protect clean water failed at 64 percent of the mines. Id. The researchers also found that mines located near surface or groundwater that tapped ore bodie

PD8

4 VI. The Draft EIS Analysis of Impacts to Air Quality and Greenhouse Gas Emissions is Inadequate As indicated by EPA in its July 31, 2009, comments, the Draft EIS must accurately describe and plainly disclose the toxic and harmful air pollutants that would be emitted from the proposed mine. This analysis must include the predicted local deposition of pollutants and their impact on local waterbodies, including potential contributions to water quality standard violations. Any conclusions that no significant deposition of pollutants is likely to occur must be supported by actual, objective analysis, and must include comparisons to other similar mines and their impacts. See *Idaho Sporting Congress v. Thomas*, 137 F.3d 1146, 1150 (9th Cir. 1998) (holding that NEPA does not allow an agency to rely on expert opinion unsupported by hard data and objective analysis); 40 C.F.R. 1502.24.

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
5	The Clean Air Act analysis, including the cumulative impacts analysis, must include PM2.5 emissions, which is recognized as a harmful Criteria Air Pollutant under the Clean Air Act. See EPA PM2.5 Rule, 72 Fed. Reg. 20586 (April 25, 2007). By failing to fully analyze PM2.5 baseline levels and emissions (including the emissions of other toxic or harmful air pollutants), any conclusion that the Project complies with air quality standards and requirements is contrary to NEPA and the Clean Air Act. PM2.5 emissions, also known as “fine particle” emissions, can cause serious health impacts. According to the U.S. EPA: Fine particles and precursor pollutants are emitted by ... burning or combustion-related activities. Health effects that have been associated with exposure to PM2.5 include premature death, aggravation of heart and lung disease, and asthma attacks. Those particularly sensitive to PM2.5 exposure include older adults, people with heart and lung disease, and children. 72 Fed. Reg. 20586 (April 25, 2007). See also EPA PM2.5 NAAQS Implementation Webpage, <a href="http://www.epa.gov/ttn/naaqs/pm/pm25_index.html">http://www.epa.gov/ttn/naaqs/pm/pm25_index.html</a> ; Attachment 8 (Vermont Dept. of Environmental Conservation, “Fine Particles, the Microscopic Menace”). Additionally, as stated by the Tribal cooperating agencies, the Draft EIS cumulative effects analysis is incomplete because the 24-hour PM2.5 modeling needs to account for emissions from the Keetac Expansion Project. DEIS, 4.6- 42, n. 9. “Furthermore the Tribal cooperating agencies feel that the full cumulative effects may lead to violations of the PM2.5 NAAQS standard. Id.	AQ4,AQ4B
5	Moreover, the agencies must prepare a comprehensive, cumulative impacts analysis concerning air pollution in the region. As explained by EPA: In order to accurately assess cumulative impacts of the proposed project, including those impacts to Class I and Class II areas, the DEIS air quality analyses (increment and visibility modeling) should consider all current and reasonably foreseeable projects occurring in the area. The air quality modeling analyses do not include a comprehensive inventory of existing and planned sources impacting regional air quality. In particular, the analysis does not appear to include the proposed Mesaba Energy power plant, the Mesabi Nugget Phase II projects, or the Keetac Expansion project. There may be additional projects that have emerged since the modeling was completed. We recommend revising the air quality analysis to include all reasonably foreseeable projects in the area. July 31, 2009, EPA Comments, p. 1; see also DEIS, 4.6-42, n. 8 & 9 (Tribal cooperating agencies commenting that Draft EIS analysis did not factor in any emissions from the Keetac Expansion Project or the Essar Steel Expansion project, and that “the full cumulative effects may lead to violations of the PM2.5 NAAQS standard”). This analysis must include a discussion of how this proposal and other reasonably foreseeable projects in the region would affect the ability to satisfy state, national, and international standards and goals regarding the reduction of mercury and other emissions.	AQ4B
6	The Draft EIS acknowledges that the emissions resulting from the proposed project would be approximately 776,650 metric tons per year of carbon dioxide. DEIS, 4.6-31. What is missing, however, is any meaningful discussion as to how this and other reasonably foreseeable projects under consideration in northeastern Minnesota will affect the state’s ability to meet its goals and obligations under the Midwestern Greenhouse Gas Reduction Accord and related legislation. See DEIS, 4.6-32, n. 4 (“The Tribal cooperating agencies’ position is that these emissions will have an effect on the Midwestern Greenhouse Gas Reduction Accord and their impact needs to be analyzed as to that effect”). Even the inadequate cumulative effects that was prepared and disclosed in the Draft EIS for air pollutants inexplicably neglects to include any assessment of the overall cumulative effects from greenhouse gas emissions. With such a high number of major proposals under evaluation in northeastern Minnesota (see e.g., Table 4.6-22; DEIS, 4.6-50,51; Table 4.6-24), this lack of a cumulative effects analysis for this critically important issue violates NEPA. See <i>Muckleshoot Indian Tribe v. U.S. Forest Service</i> , 177 F.3d 800, 809-10 (9th Cir. 1999) (NEPA requires EIS to consider cumulative impacts of a project, requiring detailed information “describing the cumulative effects of a proposed action with other proposed actions”); 40 C.F.R. §§ 1508.7, 1508.25(a)(2).	AQ3,AQ4B

6 The Draft EIS is also deficient in its analysis of greenhouse gas emissions and climate change impacts, including a complete lack of a cumulative impacts analysis for greenhouse gas emissions. As stated in the Draft EIS, the state of Minnesota has committed to long-term greenhouse gas reduction targets of 60- 80% below 2005 emission levels as part of the Midwestern Greenhouse Gas Reduction Accord in 2007. DEIS, 4.6-30. Moreover, in May, 2008, the Governor signed legislation requiring the tracking of greenhouse gas emissions and directing that interim reduction recommendations be developing, including a 15% reduction target for 2015 and a 30% reduction target for 2025. Id. The interim goals are designed as milestones towards meeting the state’s goal of reducing greenhouse gas emissions to a level at least 80% below 2005 levels by 2050. Id.

2505 Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. Please do no harm to the water of Lake Superior or its watershed and to the lakes and rivers of the BWCA. WR1A,WR1E

2621 And basically I support any jobs. I support union wages and jobs, of course, according to Minnesota. And I could use the work, obviously, just as a, you know, in whole, as a whole. Alright. That's it. That's all I got. EOO

2829 As recommended by the EPA, the DEIS must include an evaluation of the financial assurance that would be provided to ensure postclosure reclamation of the PolyMet NorthMet mine and plant. Sulfide mining places huge burdens on taxpayers. These mines often require long-term or perpetual pollution and treatment. PolyMet has few assets or financial history. The question of where the funding will come from for post-closure treatment, monitoring and maintenance has not been adequately addressed, and Minnesota taxpayers may have to pay millions of dollars for clean up after PolyMet has gone. I don't want to pay to clean up this operation like I already have to pay to clean up many other former industrial operations on the shores of Lake Superior. PD4

**Sender Last Name:**    Effle **Submission ID:** 3209

3544 surrounding countryside. That was OLD technology and a cut and burn mentality! I have read large parts of the EIS for the Polymet mine. This mine will employ NEW, STATE OF THE ART processes for the recovery of these metals. What with recycling an existing brownfield site(the LTV plant), NO water that will be discharged off site plus extensive monitoring of the ground and surface water, the autoclave process for recovering the metals, etc. I feel that the State of Minnesota, their consultants, and Polymet have done a very through job of identifying the risks and trying to mitigate any possible problems with nonferrious mining on this site. It is high time that this country stops depending on the rest of the world for the base metals we need to operate our industries and produce these metals right here in the USA. I feel that the Range should be able to develop these minerals for the well being of the residents, communities, and also for the taxes for the state. Polymet will provide good paying, long term employment on the Range. The " best science " has been brought to bear and the Polymet project should be allowed to be permitted and move forward towards production!! EOO,G2

220 I wholeheartedly support the Polymet Northmet project. As an elected official in Itasca County (county board) I understand the overwhelming positive economic impact the project will have to the entire arrowhead region. I believe Polymets' environmental impacts will be minimal. Please move forward with the permitting process, and allow this project to become a reality. Thank you. Rusty Eichorn 31708 lalpant rd. grand rapids, mn 55744 218-244-1049 EOO

2396	I cannot pretend to be an expert on the environmental impacts of sulfide mining or on the particular situation regarding the proposed PolyMet mine. I have only lived in the state of Minnesota for half a year, and became aware of the environmental threat posed by sulfide mining to the Boundary Waters less than an hour ago. But as a citizen who believes that the state government has a responsibility to protect our natural resources, I must speak up and urge the Department of Natural Resources and the US Army Corp of Engineers to more carefully consider the long-term effects of the proposed mine. Large-scale sulfide mining is not a zero-impact process, no matter what a mining company's intentions may be. It seems ludicrous to locate such a mine in the middle of a protected wilderness area, especially when the pollutants will make their way downstream to Lake Superior. If sulfide mining is unavoidable, it seems like it would make a lot of sense to find a less fragile location for it. Furthermore, if sulfide mining is pursued, I would urge the DNR to invest seriously in technology that could make the process less harmful. Please hold the mining companies accountable-- citizens like me who love clean water and the natural silence of wilderness will be depending on you.	G6,G7

3241	I strongly oppose the Iron Range PolyMet project, because of potential damage to our environment. The DEIS is inadequate and ignores loss of habitat, damage to wetlands, and the cumulative effects of sulfide mining. Please reject this project.	G2C,G7C,G9
<b>Sender Last Name:</b>	Ellies	<b>Submission ID:</b> 195
192	11-16-2009 I have reviewed the EIS and found the mining project to be acceptable, although I think the sulfur levels must be monitored. I support the project.	EOO
<b>Sender Last Name:</b>	Elliott	<b>Submission ID:</b> 1341
1566	Birch Lake and S. Kawishiwi River are much too large and beautiful to ruin! Their waters are especially soft and clean. I love to visit and swim there.	G7A,G11
<b>Sender Last Name:</b>	Emmons	<b>Submission ID:</b> 2179
19	The low grade character of this ore body is not adequately addressed under socioeconomic impacts. Because of the less than 1% metals in this ore body, mining will become progressively more expensive as gas, oil, and electricity prices rise. A rise in those prices will also increase the costs of limestone and chemicals needed in the process. Equipment replacement will become more costly. No one can accurately predict whether rises in the market prices of the metals will outpace rises in the cost of mining. These factors will determine output, shutdowns, and bankruptcy. The risk factor is downplayed, based upon biased economic analysis by the Labovitz School of Business. The DEIS is inadequate in not addressing this issue from varying perspectives.	EOO,SE6
337	PolyMet would have an impact upon Class I air quality of the BWCAW and Voyageurs' National Park, due to proximity. PolyMet would have a cumulative impact upon this air quality. This issue is not defined or addressed adequately within the DEIS. The impact of acid rain from the autoclave/hydromet needs to be studied for cumulative effects in combination with acid mine drainage leaching into the water. Asbestiform fibers are not addressed in any thorough way.	AQ9
582	The DEIS allows for loss of open and coniferous bogs. The DEIS does not adequately address wetlands, sequestration, and global warming. The wetlands (peatlands) at PolyMet's mine site have been identified as worthy of protection by the USFS and DNR.	WE3,WE5

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
595	The DEIS does not adequately address loss of habitat for species considered threatened or with diminishing populations. The DEIS does not adequately address cumulative effects of its proposed operations in context with other projects in the environmental process stages.	WI5
1803	Arsenic, cobalt, selenium, copper, nickel, aluminum, beryllium, iron, manganese, and thallium may exceed water quality standards. The DEIS does not address cumulative or synergistic impacts for these parameters and others upon fish, wildlife, or humans. Water would need to be treated for anywhere from 30 years after closure through indefinitely. No financial assurance is listed or calculated. The St. Louis River watershed is already contaminated for mercury and sulfates and the former LTV tailings basin already leaches into the Embarrass River.	WR1A,WR5A
1997	The greatest inaccuracy within the DEIS is the treatment of PolyMet as a single mining project, even though all evidence points to the opening of a sulfide mining district. Addressing this issue as a single project is misleading to the public. The agencies are following political rather than scientific or legal guidelines in setting forth this DEIS from such a narrow perspective. This DEIS is inadequate by disregarding the environmental ramifications of a sulfide mining district within the Arrowhead Region of the state, and the impact upon our waters, wetlands, wildlife, air, and human health. The DEIS is inadequate due to its bias that favors the exploitation of mineral resources as the sole use of resources within the Arrowhead region.	G9

3872	I realize that the country needs copper, nickle etc. and Northern Minnesota wants and needs jobs. However, the open pit mining project proposal by PolyMet Mining will populate our precious water resources in the BWCA. How much is difficult to predict - but polute they will. We are not only talking about the beauty an serenity of the area. We are talking about the future of our children & grandchildren. Will they have clean water to drink?	EOO
<b>Sender Last Name:</b> Engel		<b>Submission ID:</b> 3205
3541	To Whom it may concern, I have personally been following Poly Met for a couple years. and find this to be a very favorable proposal for both the company and the citizens of Minnesota as well, I have read the EIS and found that the it is comprehensive and complete and should be accepted as proposed to complete the permitting process. This project is imperative to the survival of the Iron Range of Minnesota, especially so in these very difficult economic times. I encourage MN DNR to act now to grant the permit necessary for the Poly Met Hoyt Lakes project to begin. Thank you, Chris Engel	EOO
<b>Sender Last Name:</b> Engelsma		<b>Submission ID:</b> 353
391	I am writing today in support of Polymet Mining's NorthMet project. Our firm, Kraus-Anderson Construction Company, is over one hundred years old and is one of the most respected general contracting/construction management organizations in Minnesota. As a business person and someone who is concerned about the environment, I took a serious look at the draft EIS. My evaluation indicates that it is far better to mine and process these minerals, that are so strategically essential to the American economy, right here in Minnesota with sound environmental practices, than rely on foreign sources that often operate free of oversight and regulation. We at Kraus-Anderson are extremely proud of our safety record in an inherently dangerous industry. I feel that worker safety at the NorthMet project can also be assured operating in Minnesota, a state with strong worker safety regulations and an exemplary worker safety record. Finally, the NorthMet project is exactly the kind of natural resource based manufacturing that is the foundation for a host of other industries that utilize these etals in their own products. This is the kind of economic stimulus that Minnesota and the United States needs right now. This project will provide many good paying jobs, with benefits, and tax revenue that will keep our State and local governments providing the basic services and education for our children. I see no reason to further delay the permitting necessary to proceed with the NorthMet project.	EOO

13 My name is Dale Erickson from Aurora, Minnesota. I'm in strong support of this PolyMet project. It's too bad it drug out for that many years, for seven years to get permits and everything. I am in strong support of it. EOO

19 My name is Debbie Erickson, from Aurora, Minnesota, and I support the PolyMet project. EOO

215 My name is Joel Erickson and I represent Cummins NPower, the exclusive Distributor for Cummins Engines & Power Systems in the upper midwest. I, along with my company, fully support the approval of Polymet to operate an open pit mine. During the course of their extensive EIS review we've had the opportunity to be involved in many aspects of their operational and mining plans. Polymet has completed a comprehensive review of all potential environmental risks and have illustrated to us a commitment, second to none, to operate this mine in an environmentally sensitive manner. I can attest directly to their environmental efforts on mobile and stationary mining equipment that would be used to power their production equipment. Cummins is a world leader in clean emission technology, and PolyMet has pursued information from us on utilization of our very best technology, in an effort reduce exhaust and carbon emissions - even at a significant cost premium. Examples of this are rail cars that will shut off engines when not needed, full Tier II emission reduction technology for their high horsepower power units, and best available emission reduction technology options. Once operational they will be become a positive environmental example for all mining operations world wide to emulate. At a time in which this country is facing 10% unemployment levels and huge deficit spending the Polymet NorthMet project is exactly what we should be encouraging: responsible development that has been extensively researched, providing well paying jobs for our residents, an increased tax base for our state, and providing our country the natural materials needed to remain competitive in a global economy. Materials such as copper are necessary for a number of environmental products, including our copper zeolite SCR catalyst that will be utilized in 2010 on highway diesel engines. Using this technology 2010 on highway engines will emit virtually zero emissions by using the copper in the catalyst to reduce NOx levels while, at the same time, improving fuel efficiency significantly. We need a viable copper supply for this technology and what better way to produce it than in a mine committed to responsible environmental compliance, employing Minnesota residents, and paying Minnesota and federal taxes? I applaud their efforts and strongly recommend their request be approved as soon as possible so that operations and new jobs may begin. EOO

2741 The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Please consider impact to not only a pristine wilderness area, but to other economic engines that exist in northern Minnesota. Namely, tourism. Environmental destruction is a sure outcome of such a mining project. As persons in a position to make decisions that can have huge impacts to this precious land and water resource, PLEASE do not allow this type of mining here. Any environmental analysis must consider the possibility of a spill due to a natural disaster or failure of mechanical equipment. This is too serious to just consider some current economic gain. EOO,G2,G11

3829 PolyMet Mining Corp. wants to dig an open-pit mine in more than 6,700 acres of the Superior National Forest. This is a deep deep hole roughly 1 1/3 miles in size. A permanent hole in the SNF! An terrible ecological eyesore accumulating all sorts of chemical pollutants virtually forever. Because the ores are in sulfide-bearing rock, the result will be staggering amounts of permanent chemical pollution in the immediate location, throughout the region, and any waterways associated with and around the mine -- the BWCAW would be one areas. Remember mines are 'treasure chests' with long term negatives. All for a few years of mining jobs and increasing wealth of the owners. G2A

2	As a resident of Hoyt Lakes, Minnesota and the father of three children, I am very concerned about the environment that my children grow up in, and I believe that the PolyMet Mining Company has done their due diligence in seeing that our environment will be protected. So as a citizen, I fully support the PolyMet Mining project. I would like to see it move forward. That's it.	EOO
<b>Sender Last Name:</b>	Esau	<b>Submission ID:</b> 2310
426	I have only recently become aware of the proposals regarding sulfide mining in northern Minnesota. The public comment period on the DEIS comes to a close on February 3, 2010. This is far too soon for a proposal of this nature I respectfully request a sixty day extension for the public comment period to enable citizens such as myself to properly examine the DEIS and make appropriate comment. As you are aware, the document is some eighteen hundred pages and deserves careful and thoughtful consideration before we move forward on decisions that will have impacts far beyond our lifetimes. Please be sensitive to the needs of the public for better educating themselves before bringing comments forward that will impact the decisions being made.	PRO6
<b>Sender Last Name:</b>	Essian	<b>Submission ID:</b> 3215
3546	once again toil for the country's needs by providing essential metals, base metals, to transform this country once again. So I urgently recommend the permitting of this project, the Polymet Mining Company specifically, so that the urgent work can begin now, towards rebuilding what America will surely lose if this project doesn't move forward. Our collective lives, and standard of living is in balance, for the better off amongst us, as well as the not so well off.	EOO,G1
<b>Sender Last Name:</b>	Esslinger	<b>Submission ID:</b> 1547
1892	Read on...I think you will enjoy this request regarding the PolyMet Mining decision: Before you make a decision on the PolyMet Mining Corporation, I would like to make a request of all those making the decision. It is a simple request that you WILL MOST ENJOY, I promise. Purchase and read "The Big Burn" by Timothy Egan which is about one of the largest fires this country has ever experienced (1910). BUT MOST INTERESTING is the discussion about the abuse of the land due mostly to politics, persons and corporations with large amounts of money and the lack of those managing our forest lands to keep things under control, especially under political pressure. I have serious concerns and you have some serious decisions to make. Reading this book might help you with your decision. I give you this challenge: read the book first. My email is www.geeessjr@wi.rr.com . Let me know how you appreciated reading the book and if it help with your decision on this and perhaps future issues.	EOO,G14
<b>Sender Last Name:</b>	Ethan K.	<b>Submission ID:</b> 3370
3660	It looks as if the cost isn't worth the reward. The environmental damage that could take place isn't worth the economic gain. My father works at MinTac and I've heard both sides. I've also been to the BWCA numerous times and hope to go there my whole life without it being harmed.	EOO
<b>Sender Last Name:</b>	Evans	<b>Submission ID:</b> 3469
44	Listed in the DEIS is the number of jobs this will provide to the area. Who has taken a look at this number? Are we relying solely on the statements of Polymet? Are there similar operations the state and independent observers should look at to see if the risks with the project are balanced by the promise of jobs?	RFI

766	I am troubled by the short time period the public had to review and comment on the project and the fact that environmental groups had to hire experts to do what should've been done by the agencies involved. If the state of Minnesota were truly interested in making this a process to protect the public interest they would've hired independent experts to review the plan and made those comments available to the public in a timely fashion.	EOO,PRO6
1059	The project is planning to use a wetland to scrub the water of pollutants. Yet this has never been proven to be effective.	WE6
3229	Mercury contamination through leaching of metals, drying of wetlands and change in water flows promises to be a huge problem. Has the Polymet project done enough actual measuring of water flows or are they relying on unproven untested models?	WR1E
3672	Financial assurance laws provide little if any protection for the public. The DNR commissioner can grant variances for a variety of reasons. I find it troubling that there are no financial estimates of the costs involved in closing the mine and the treatments in perpetuity. Certainly if I were Polymet I would want to know those costs if I were serious about cleaning up the mess after mining is finished. This should not wait until the mine permitting process.	PD4
3673	I am troubled by the proposed land exchange. The proposed open pit mine is on a unique wetland ecosystem. How is the loss of this wetland to be mitigated?	PD1
3674	Nowhere in the DEIS is a list of the many assumptions involved with this project. For example: if the sulfur content is as predicted, and if the waste rock reacts as predicted in a lab study, and if the liners hold, and if the company doesn't walk away in twenty years by declaring bankruptcy, and if the ground water flows as modeled, and if the price of the metals justifies the high cost of extraction, then the question can be asked "Is it worth it?"	PD9
3712	jobs. PolyMet purchased the former LTV taconite crushing plant and tailings basin for its plant site, but the open pit strip mine would be located within 6,700 acres of public Superior National Forest land which is designated to be sold to PolyMet without environmental review.	PD1
3744	Polymet is a Junior Mine Development Company. The executives and officers have received millions of stock options which allows them to sell their stock at a certain price. They have never operated a copper nickel mine. Their intent is clearly to get the permit to mine and then sell to the highest bidder. Their intent is not necessarily to design a mine that will safely operate and upon closure have minimal costs and minimal environmental effects. Yet this fact is not acknowledged anywhere in the DEIS and yet should be taken into account as a huge risk factor.	EOO
3745	This project is a template for mines to follow. It is very important that the state get this right.	G10
3800	I am in support of the Polymet NorthMet Project. The Polymet mine will create many long term jobs and bring much needed economic activity locally and statewide. The metals mined and the byproducts created will provide for further career opportunities. It will lessen the global environmental impact because Polymet will ensure environmentally sound mining procedures that cannot/will not be the case of mining practices overseas. It will cut down on environmental gas emissions by eliminating the need for overseas transportation of the metals. It will reuse existing equipment and facilities saving on environmental impacts, minimizing the disturbance of wetlands. Do not delay project any further. Issue the permits so job creation and economic activity can begin now while it is so desperately needed. Improve the state of MN and the nation.	EOO
3803	I love Minnesota and at 62 am thinking of retiring there but want to be someplace that air, water, ground quality are protected as well as open spaces and other species. Polymet Northmet Draft Environmental Impact Statement Polymet is a Canadian company, so this mining project will not provide a domestic source of copper, nickel, cobalt, platinum, palladium, and gold. The metals will be further processed in Canada and sold on the global market. The mineralization of northeast Minnesota is very low grade, containing approximately 8 pounds of copper and .01 ounces of precious metals per ton of waste rock. This will require energy and electricity to create enormous amounts of waste, making this a marginal mining venture on the global market, rather than providing a steady supply of	G1

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3804	470 acres of imperiled or rare/uncommon black spruce (bog) and jack pine forest would be impacted. Excess capacity at the PolyMet processing facility would open the door for a sulfide mining district between the PolyMet site and the Boundary Waters Canoe Area Wilderness (BWCAW). Acid mine drainage and toxic heavy metal leaching are byproducts of mining sulfide ores, requiring water treatment for centuries. PolyMet admits the mine would pollute ground water, but claims that any pollution would meet water quality drinking standards. Mining pollution also adds sulfates to watersheds, triggering the chemical reaction by which mercury becomes methylated, and bio-accumulates in fish tissues. Since PolyMet's open pit would be within 20 miles of the BWCAW, haze and noise pollution would impact the wilderness. Disruption of the landscape would impact wildlife, bird, and plant habitat, while vegetation used in reclamation would introduce non-native species. Polymet's project is within federally designated lynx critical habitat. In addition, Polymet's project will impact moose habitat. Moose are experiencing rapid populations declines in Minnesota. Global warming threatens many wildlife species. According to conservation biologists working in the field, some key steps to helping wildlife survive are: 1) Protecting wildlife corridors and buffer zones, and 2) Limiting climate stresses, including habitat fragmentation and pollution.	WI2,WI5,G2B,G2C,G7A,G7
<b>Sender Last Name:</b> Evenson		<b>Submission ID:</b> 1534
1868	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. It is objectively impossible to believe that PolyMet will keep it's promises and fulfill their environmental responsibilities into even the near-term future. The mining industries record in Minnesota and nationwide is simply dismal. Unless a new level of serious is established on their side, giving them access to our sensitive public lands and waterways is unacceptable.	EOO
<b>Sender Last Name:</b> Favet		<b>Submission ID:</b> 1370
665	Long-term financial guarantees - Mining projects of this type have left enormous economic burdens on the surrounding communities resulting from environmental degradation and social impacts, especially after closure of active mining. Polymet talks of long-term jobs lasting for 20-years. In the life of a community that is very short-term. Our communities are suffering enormous financial burdens that are peaking now due in part to the closing of iron mines over 20 years ago and the resulting loss of families raising children in our area. The mining companies involved must be required to put sufficient funds into escrow for both environmental and social impacts. These companies who have no local ties must be held accountable for their impact as they reap what must surely be enormous financial gains to warrant the level of investment shown in just the exploratory phase of the project.	SE3,PD4
707	Water and air quality monitoring - The MPCA and USEPA have been understaffed and underfunded in recent years. A project of this scope with untested and unproven processes would require substantial, consistent monitoring to ensure the watersheds are not being polluted. The DEIS enumerates several anticipated water quality concerns for surface water, groundwater, wetlands and the greater St. Louis River Watershed (which empties in to Lake Superior) both during the mine operation and after closure. In addition to substantial monitoring there must be public access to monitoring data.	WR1A,WE3,AQ5
1601	We would like to express our concern about the proposed Polymet mining project in northern Minnesota. There are many reasons we feel it would be beneficial to have the mine project in our backyard, but there are several critical concerns not addressed by the Draft Environmental Impact Statement. If this project is allowed to go forward, our primary concerns are as follows:	EOO

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
1602	History of environmental degradation resulting from similar mining - Several states have a moratorium in place on this type of mining because it has resulted in such horrendous environmental degradation everywhere it has been tried. Wet environments are even more susceptible to the exposure of sulfur than dry environments. Polymet claims they have a new procedure that will limit the environmental impact. Is a watershed that drains into the world's largest freshwater lake the best place to test this new science? We must ensure they do this right the first time, with no shortcuts and no variances. The stakes for our region's environment, human and financial health are too great. The reality is we use the products made from these ores and we should ensure that mining is done safely. The DEIS indicates more needs to be required of Polymet to ensure that the mining will be done safely. The DEIS indicates more needs to be required of Polymet to ensure that the mining will be done safely for the people, plants, animals and environment both during the active mining period and well in to the future.	G8A,G12
<b>Sender Last Name:</b> Fedo		<b>Submission ID:</b> 138
129	My name is Lory Fedo and I am the president of the Hibbing Area Chamber of Commerce and I actually live in Side Lake, Minnesota, which is 30 miles north of Hibbing. I'm supportive of the PolyMet project, it's an important project for the people of our region. We've had double-digit unemployment for the last few years in Hibbing and many of those people are people who work for mining vendor companies so when mining -- when iron mining has been down, our people have been out of work, so for us it's just so important to have this project go forward. Already we have people from Hibbing that are working at the PolyMet project who are working for vendors who are working with the PolyMet people and we're excited about the project. We've had many -- or witnessed many presentations on the environmental aspect of the project and what they've done to minimize the environmental impact and people in our community and in our businesses are very supportive of it and really happy to see what they've done to make this a safe project for our region. I grew up around mining, I lived in northern Michigan and I lived in northern Minnesota after that, so I've been in mining communities my entire life. We know in our region how to do mining and this project, as I've reviewed it, has been one of the best put-together projects I've ever seen and we're just so excited and thrilled, I am, to see it and to be a part of something new that's going to be happening on the Iron Range. So thank you for allowing me to comment and for allowing other people to come from the Iron Range to this area. Thanks.	EOO
2634	John A. Fedo, Side Lake, Minnesota. I'm here to support the process that PolyMet has been involved with and the issuance of permits for the extraction of minerals that they're seeking. I've lived in northeastern Minnesota all my life. The last 20 years, I've lived in Side Lake. I've drawn my water from a well; we live on a lake; we've raised eight children on that site, and I think I've paid very close attention to the environment that I'm living in as well as the economy, hopefully, that both I work in and my wife works in as the director of the Chamber of Commerce in Hibbing and, frankly, the hopefulness that my children have at some time to find jobs within the area that they grew up in. I'm very comfortable with the process that PolyMet has been involved with in seeking the permit to extract the minerals. I have attended public hearings; I have read extensively about the processes that they intend to use to dispose of various elements that will be needed to refine the minerals and am comfortable that they have a process in place that frankly will do both, employ people, extract the minerals in an environmentally-safe way and ensure that I can continue to draw water from my well, which, frankly, is in the same watershed that this mine is	EOO,G6,G7
<b>Sender Last Name:</b> Feldhamer		<b>Submission ID:</b> 1344
1570	We appreciate the importance of mining to the economy of Minnesota. However, sulfide mining has always, and will always, result in acid runoff- despite the claims of new technology by the mining industry. Pollution in the BWCA - and its adverse impact on the natural resources and tourism of the area- is clearly unacceptable. We own a home on White Iron Lake and strongly oppose any mining.	EOO,G7A,G11

Comment ID	Comment Text	Theme Codes
18322	The Minnesota NPDES General Stormwater Permit for Industrial Activity requires permit coverage for all types of mining for metal and nonmetallic minerals. The DEIS does not address this fact. The DEIS should be revised to include permitting of the Project site under the Minnesota NPDES General Stormwater Permit for Industrial Activity. This permitting would extend beyond the period of mining operations and into the Post-Closure time period.	EOO
18323	COMMENT #2: NONDEGRADATION - APPLICATION OF MN RULE 7050. On page 4.1-33, the DEIS includes the following text: "Because the Project is in the Lake Superior Basin, the Great Lakes Initiative (Lake Superior) water quality standards also apply (Minnesota Rules, chapter 7052). These Lake Superior standards can differ from the water quality standards for the same parameters in the Minnesota Rules, chapter 7050. Where different, the 7052 standards supersede the 7050 standards, even if the 7052 rules are less stringent. For parameters not listed in Minnesota Rules, chapter 7052, the standards from Minnesota Rules, chapter 7050 apply." This is not accurate and should be corrected. All the elements of DEIS that are affected by this correction should be revised. MN Rule 7052.0300, subp. 1 includes the following language: "This part and parts 7050.0180 and 7050.0185 establish the nondegradation standards and implementation procedures for surface waters of the state in the Lake Superior Basin. For the purposes of this part and parts 7052.0310 to 7052.0330, lowering of water quality means a new or expanded point source discharge of a BSIC to an outstanding international resource water, or a new or expanded point or nonpoint source discharge, for which there is a control document, of a BCC to a high quality water. The nondegradation standards established in this part and parts 7050.0180 and 7050.0185 for surface waters of the state in the Lake Superior Basin apply as follows:" (bold and underline added) As indicated by this language and other text from MN Rule 7052, the relationship between Rules 7052 and 7050 and the applicability of both of these Rules to this Project are not nearly as simple as stated in the text from the DEIS.	WR3I
18324	There are minimum requirements and protocols included under MN Rule 7050.0185. These should be followed. The DEIS should provide the information needed to make the "Determination of Significance". In particular, the data and analysis should be included to see if the discharge qualifies as a "significant discharge" under MN Rule 7050.0185, subp.2.G.3, as per MN Rule 7050.0185, subp.5. This provision must be applied to both the process discharge water and the stormwater discharge from the site (construction and site). This will require establishing the "baseline quality" consistently attained in the waters by January 1, 1988.	WR3I
18325	Additionally, MN Rules 7050.0185, subp.0 and 7050.0186 should be applied to any and all wetland impacts from the Project/	WE2,WE4
18326	Rule 7050.0185 applies to all pollutants. At a minimum, the analytic work in the revised DEIS should address all the chemicals on the GLI list of chemicals.	WR3I
18327	There are numerous instances in the DEIS where PolyMet proposes that long-term measures be implemented to address a problem identified in the DEIS. For every one of these measures, there must be financial provisions proposed to assure that the measures will be funded for as long as they may be needed, even if PolyMet, or some other future owner of the Project, should go out of business. There are a variety of widely-accepted business methods to structure and implement such arrangements. The costs for such arrangements can be accurately determined in order to allow for almost every possible event or development over time. Such financial provision are the only method of assuring that there will be the monetary support to implement the necessary and appropriate measures. Wherever a long-term measure is proposed to address a problem identified in the EIS and requires review and approval by any regulatory body, that regulatory body should require a suitable financial arrangement to assure funding support for the measure for as long as may be necessary. If such an arrangement is not provided, the proposed measure should be ignored in the context of the regulatory review and approval.	PD3,PD4

18328	Many of the proposed mitigation measures included in the DEIS would require long-term funding to implement. For each of these measures, the DEIS should include proposals from PolyMet to provide funding mechanisms to support these mitigation measures. These funding mechanisms should be sufficiently robust and durable to assure long-term funding even in the event of PolyMet going out of business. Where monitoring is proposed as part of a mitigation strategy, there should be a discussion of the possible alternatives that may be required in response to the monitoring results. The estimated costs of these possible alternatives should be provided along with durable long-term funding mechanisms. Where funding mechanisms do not accompany mitigation measures, those mitigation measures should not be considered or accepted by the agencies reviewing and approving the DEIS.	PD3,PD4
18329	The DEIS states that discharge from the Project reaches all these water bodies. There have been multiple State and Federal court rulings regarding discharges to waters that have been listed as impaired and for which a TMDL is required, but not yet completed. See, e.g, Friends of Pinto Creek v. United States Env'tl Prot. Agc'y. 504 F.3d 1007 (9th Cir., 2007) cert. denied sub nom Carlotta Copper Company v. Friends of Pinto Creek, et al. 129 S. Ct. 896 (2009). During the period of time that a water body is in this status, "40 C.F.R. 122.4(i) provides that "[n]o permit may be issued" [t]o a new source or a new discharger, if the discharge from its construction or operation will cause or contribute to the violation of water quality standards. The owner or operator of a new source or new discharger proposing to discharge into a water segment which does not meet applicable water quality standards or is not expected to meet those standards even after the application of the effluent limitations required by sections 301(b)(1)(A) and 201(b)(1)(B) of CWA, and for which the State or interstate agency has performed a pollutants load allocation to be discharged, must demonstrate, before the close of the public comment period, that: (1) There are sufficient remaining pollutant load allocations to allow for the discharge; and (2) The existing dischargers into that segment are subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards." (MN Supreme Court ruling A04-2003, Cities of Annadale and Maple Lake NPDES/SDS Permit Issuance	WR3I
18330	This principle applies to project discharges of mercury and sulfates that would contribute to mercury methylation. The impairments are for mercury and mercury in fish tissue. This principle also applies to permitting for the project process operations and the site stormwater discharges (construction and industrial site NPDES permits).	WR4B,FM1,FM5
18332	The discharge requirements (no contribution at all) for mercury and sulfates that would contribute to mercury methylation under this principle are significantly more stringent than the impact criteria used in the DEIS.	WR4D
18333	Many of the statements in these sections are irresponsibly inaccurate, incomplete, and/or misleading.	WR1E
18334	"The statewide nondegradation procedures are in place to protect all waters from significant degradation from point and nonpoint sources" This statement is accurate, but the DEIS section provides no information or provisions in response to its applicability to this project. At a minimum, the DEIS should provide enough information to determine whether the degradation caused by the new or expanded discharges from the project are "significant" under Minnesota Rule 7050.	WR1E
18335	"The Lake Superior Basin nondegradation procedures apply to new or expanded point source discharges of bioaccumulative substances of immediate concern (BSIC) (Minnesota Rules, part 7052.0350)." This statement in the DEIS is incorrect. In MN Rule 7050.0300, subp. 1, there is the following text (highlighting added): "For the purposes of this part and parts 7052.0310 to 7052.0330, lowering of water quality means a new or expanded point source discharge of a BSIC to an outstanding international resource water, or a new expanded point or nonpoint source discharge, for which there is a control document, of a BCC to a high quality water." Mercury is a BCC. All the receiving and downstream waters are not currently on the 303(d) Impaired Waters List are High Quality Waters. Thus, the Lake Superior nondegradation procedures apply to both point and nonpoint source discharges of BSICs and BCCs from this project..	WR1E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
18336	"The NorthMet Project would be a new facility, but PolyMet has proposed a water balance that avoids the need for any point source discharges during mine operations." This project is required to have NPDES stormwater permits for Construction Activity and Industrial Activity. These permits will cover site discharges, above and beyond the process discharges covered by another NPDES permit. By definition, discharges covered by NPDES permits are point source discharges. Thus, the project will have point source discharges during mine operations. In this section and others, the DEIS states that there will be discharge from the West Pit during Post-Closure. The Lake Superior Basin Nondegradation Standards would apply to this discharge, but the DEIS provides no information or provisions in response to their applicability to this Project discharge. Finally, this statement leads the reader to believe, in broad terms, that there is no new or expanded discharge from the site that is governed by MN Rule 7052. In addition to the discharges listed above, there are other Proposed Actions that will contribute to increased mercury discharge and/or mercury methylation listed in other sections of the DEIS, such as wetland disruption, forest loss, or disruption of peat deposits. These Actions are covered by the provisions and procedures of the Lake Superior Basin Nondegradation Standards.	WR1E,WR3I
18337	Based on the provisions of MN Rule 7052.0310 and the items listed above and elsewhere in these comments, a Nondegradation Demonstration is required. The EIS is the appropriate document for this Demonstration. Based MN Rule 7052.0310, subp. 3, the Nondegradation Demonstration must meet the requirements of MN Rules 7052.0323, subp. 2 and 7050.0320. subp. 3. At a minimum, the Nondegradation Demonstration must address mercury. The MPCA should provide guidance about whether the Nondegradation Demonstration should address other chemicals to be discharged from the Project process and/or site.	WR3I
18338	This text lists multiple new or expanded sources of mercury to downstream waters. In all these cases, PolyMet is relying on mercury reductions due to sequestration in the Duluth complex mine waste rock or the LTVSMC taconite tailings to eliminate this new or expanded discharges. In the case of the Duluth Complex rock, this assertion is based on batch simulation tests conducted by PolyMet. In the case of the taconite tailings, this assertion is based on one MnDNR study at two tailings basins. In both cases, the support for these assertions is insufficient. The support is based on only one study in each case. A study conducted by PolyMet, a party with a very strong self-interest, could be many other possible significant differences between the characteristics and sequestration capacity of the tailings in these basins and the LTVSMC tailings. Furthermore, no quantitative information from the MnDNR study is provided. There is no reason to believe that the sequestration capacity of the LTVSMC tailings will be sufficient to remove the loading of mercury generated at this project. Sequestration of chemicals by soil and/or minerals typically varies over time. For example, the soil under stormwater infiltration trenches I known to sequester heavy metals as the water leaches through the soil. At some point, though, the adsorption capacity of this soil is exceeded. From that time forward, the soil ceases to remove the heavy metals. Additionally, the heavy metals previously adsorbed by the soil may become mobile and start moving again through the soil column. This aspect of sequestration is not discussed in the DEIS.	WR4E,AQ6A
18340	This section also refers to meeting the Great Lakes Initiative water quality standard as an appropriate Impact Criteria. This is incorrect. This section should be revised to meet the more rigorous Impact Criteria imposed by the downstream impaired waters and TMDL status and nondegradation under MN Rules 7050 and 7052.	WR4D

1135	I am writing to you in regard to Poly Met Mining, Inc. North Met Project. This will significantly contribute to the State and local economy at a time when we really need the jobs and economic benefits. Many of the young families have to leave the area and the state in many cases to find employment, Poly Met has demonstrated it can produce these critical metals while following strict environmental requirements. Poly Met will be a domestic supplier of critical metals needed in so many applications. We need to start supplying our own goods rather than foreign suppliers for so many things including steel. It is my opinion that their project should secure approval which will benefit us locally as well as our country.	EOO

3290	When deciding whether to take action, consider the following alarming predictions about water pollution from the PolyMet mine, taken from the DEIS itself: • Water from waste rock piles will be polluted for up to 2,000 years. • About 40 years after mine closure, the West Pit will overflow and begin discharging polluted water into the adjacent Partridge River which flows into the St. Louis River and then to Lake Superior. • Groundwater at the mine site will be contaminated with heavy metals. • Enormous sulfate releases will exceed the state standard for wild rice and will likely eliminate wild rice in the Partridge and Embarrass Rivers and the St. Louis River estuary near Duluth. • The iron range community had mining as an economic industry in the past and it wasn't sustainable nor good for the environment. It's time to support clean green energy. Let's look elsewhere for economic gains.	G1,G7A,G7B
<b>Sender Last Name:</b> Fink		<b>Submission ID:</b> 3755
1	We are writing in support of the PolyMet Mining Inc./NorthMet Project. We are long-time residents of the Iron Range and we believe that environmental concerns will be carefully met and that the project will breathe much-needed life back into this wonderful area.	EOO
2	I support the draft PolyMet EIS for the NorthMet project. PolyMet has developed a thorough EIS. The State of Minnesota is capable of conducting the necessary analysis + public review. The State's stringent standards for environmental protection will ensure the EIS requirements are met in developing + operating this project. The PolyMet NorthMet project will be developed and operated with modern technology. It will be properly supervised by the State. It will bring much needed employment to our region in a balanced, responsible way. The NorthMet EIS should be approved + accepted.	EOO
3	I am in favor of the project if air and water quality will not be adversely affected.	EOO,G2
4	In my opinion, the proposed PolyMet North Met project would benefit not only the community, but the entire state of Minnesota greatly. Locally, it would provide great opportunities for a lot of hardworking people. I also believe that the economy of the area would be greatly benefitted. I am aware of the said environmental factors, and I strongly believe that PolyMet and people in the area could join together, and work around the "roadblocks". I am pleased to see the project is moving forward, in hope to get NorthMet off the ground. I am hoping to see many great things start up in this area.	EOO,G1
5	I hope this project is decided by scientific evidence. That being said, it is very difficult for the average person to interpret the data. I wish more of the data could be put in a form that would compare Polymet with LTV. My main environmental concern is whether this will affect the BWCA. Nobody in Ely ever noticed the affect LTV had on the BWCA nor did we notice a difference when LTV closed. If Polymet will be less damaging than LTV was, I don't believe it will affect the BWCA. If that's the case, proximity to the BWCA should not be a consideration.	EOO
5	I support the Poly-Met project. I believe they will be responsible in the operation of the facility. The jobs and economic benefit it will bring to northeastern MN is very much needed. I also believe the mining of the resources in this country is a matter of national security. Also if there materials were to be mined somewhere else in the world to meet demand it would not be done as safely as Poly-Met is proposing to do. Poly-Met has made a huge investment in this project to date, it is time to move forward.	EOO
6	The Iron ranges economy was founded on mining natural resources. I have a child a house payment and intend to stay here on the range. I really hope this project goes thru so I can stay here.	EOO,G1
6	Please, I understand what economic crisis means and wish to show my support for no action proposal. I do not wish to see the exploitation of the natural resources of my home for more filthy pieces of woven cotton with writing on it to enter the area (disputable). The precious natural resources beneath our feet are not by any means worth the destruction and loss of what we have as a people in exchange to the extortion driving society and the potentially corrupt government. It's greedy, foolish, and wasteful. Think about it!	EOO,G2
7	I am a cabin owner on Birch Lake. I am in favor of Polymet 7 Fraconia Minerals. I believe in the expertise of the MN DNR. Technology can overcome the problems Northern MN needs these jobs.	EOO

8	Snapshot Comments: -Environmental arguments should be relevant. NOT WHAT WAS DONE YEARS AGO. Present rules & science should prevail. -There are no 100% guarantees on anything. Don't do that to mining any more than reasonable to anything else. -New technology requires a place to be showcased and monitored. The present Polymet site is not a virgin site. Areas and facilities are already in place. Therefore minimal impact. -Studies have been extensive, much longer and greater than typically required. What are the results? Good or bad. If OK, get on with it. -Resources, economies are at stake. Evaluate, be reasonable and decide!	EOO
9	Craig Olson, C-R-A-I-G, O-L-S-O-N, I'm president of the Duluth Building and Trades Council representing approximately 6,000 men and women in the construction trades and 15 construction trade unions. I've been very active in the PolyMet process to-date. I think it is a very safe way to extract the copper and nickel, etcetera. It -- we have high unemployment in the northeast region of the state right now, some trades nearing 50 percent. This will provide much needed jobs for our local workforce. We will be able to create a better tax base if our people are working. Yesterday St. Louis County had a bond referendum for the school districts, which is the rural St. Louis County schools, and it did pass by a slim margin. And this is very important because we need to keep our kids locally in the communities and keep our parents working. So I just want to again say that we're here to -- I'm here to support the PolyMet mine and that it will provide much needed jobs for our community and our members of our unions. Thank you.	EOO
9	Dear Sirs: I am writing in favor of the Polymet Project. I feel that they have exceeded my expectations for environmental concerns and feel that the benefit of the jobs, precious minerals and general overall economic benefit to our area is far greater than the potential for environmental concerns. No facility is faultless nor can every contingency be covered but as the mining is developed, further safeguards can be implemented. These are not the same mines from 50 years ago. Many more safeguards have been implemented. We need a national supply of precious minerals to further develop fuel cells and emission controlling devices. We must not be held hostage by foreign mineral imports if we can obtain them here. The Copenhagen gathering will force us into stricter control and we need our natural resources to help with this.	EOO
9	We need the jobs on the Iron Range with all the spin-off jobs it would help tremendously, we need to keep the younger generations here. If Polymet do it safe let them do it.	EOO
9	From the information I have seen & heard, I believe that Polymet has either met or exceeded the requirements necessary to operate in No MN. I have lived in this area my entire life & plan to stay here. I have witnessed boom times and recessions and much prefer the up side. I support Polymets plan to mine in my back yard.	EOO
9	The Polymet project is a strategic project for the state of Minnesota and for the USA. It has been comprehensively evaluated and carefully designed to have minimal environmental impact. and will provide a huge economic boost to the local, state and national economies. The project must be supported by any and all right-minded citizens.	EOO
10	Having a cabin on the Kawishimi, I am very concerned that air, water, and noise pollution be guaranteed. What worries me most is the future and the impact of this mining on the N.E. portion of Minnesota wilderness.	G2C
11	My name is Elanne Palcich. I am from Chisholm, Minnesota. I have been following the PolyMet project since the scoping, and that was in like June of 2005. And, first of all, that hearing was very similar to this hearing in which people were not allowed to give -- there was no public discourse. Everybody just gave their private comment, so nobody got to hear anybody else's concerns, nobody got to hear questions. Acid mine drainage was not even mentioned at the scoping hearing. Now, I am not prepared to make real substantive comments at this time. I have the DEIS, which consists of three binders; I have followed the scoping documents, I have followed the preliminary draft EIS, and now I've got this laid out in front of me, and I don't see how anybody here tonight could possibly make substantive comments. It just takes too long to make your way through this. There is parts here, there is parts over here, you have to go back on the computer, you have to, you know, put it all together.	PRO6
12	We have a summer home in Ely, MN. I watch loons and bald eagles catch fish. I want them to live.	G2C

13	<p>The Construction Industry throughout the state of Minnesota is struggling. The economic recession has taken a toll on the construction industry as unemployment reaches devastating levels. Hundreds of Signatory Union Contractors in Minnesota and the region have equipment and resources sitting idle, while many Skilled Construction Craft Union Laborers remain unemployed. It is truly a rough time to be in the building and construction industry. The PolyMet Mining Company proposal to build a copper-nickel-precious metal mine and processing facility near Hoyt Lakes, MN offers Union Contractors and Union Laborers some hope to get through this recession. Construction will require approximately 1.5 million man hours of construction over a two-year period, which will greatly help our struggling economy during this recessionary period. The impact that construction work brings to the economy is numerous and includes: state taxes, income taxes, goods, services, food, lodging and other expenditures. The PolyMet Mining draft Environmental Impact Statement (EIS) for the project has reviewed all of the potential impacts and offers options for mitigation, where appropriate. We hope that you find the draft EIS to be adequate so that construction may begin quickly. PolyMet has demonstrated it can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. With an abundant supply of natural resources to process, the PolyMet Mining project appears to be one that offers resources and supplies that will be utilized on a worldwide market, making it an even more worthy construction project. On behalf of the Minnesota LECET Board of Trustees, we support the PolyMet Mining Project and would like to see it move forward quickly without delay to help move our economy forward again.</p>	EOO
14	<p>The economy of Minnesota is an ecosystem just like the ecosystems found throughout the state. When one part of the ecosystem is struggling, it has a negative impact on the related parts. The Building Trades in the Twin Cities Metropolitan Area are struggling; the economic recession has devastated the industries that have kept our members employed. As many as 50% of our members are sitting on the bench on any given day. The PolyMet Mining Company proposal to build a copper-nickel-precious metal mine and processing facility near Hoyt Lakes offers our members some hope to wait out this recession. Construction will require about 1.5 million man hours of construction over a two year period; some of my members are bound to part of that construction work force. But we don't have time for delays. PolyMet has made our job relatively easy by proposing a very environmentally friendly project. Much of the infrastructure for transportation and processing will be recycled from the old LTV plant. Stockpiles will be managed so water infiltration is minimized and so any water that does percolate through the piles is collected and treated. Sulfur in the ore will be used as fuel in the process, and waste streams will be managed. Air emissions will be much less than other facilities in the region – so much less they're considered a minor source. The draft environmental impact statement for the project has done a very thorough job of looking at all the potential impacts and offering options for mitigation, where appropriate. The draft EIS should be deemed adequate so that permitting can begin quickly – and so our members can start working to build the facility.</p>	EOO

14	<p>As Chair of the Minnesota Section of the Society for Mining, Metallurgy, and Exploration, I am pleased and honored to convey our Section’s officers support to an adequacy determination of the draft Environmental Impact Statement (DEIS) for PolyMet Mining Company’s NorthMet project proposed near Hoyt Lakes. The Society for Mining, Metallurgy, and Exploration (SME) is the world’s largest society of mineral professionals. The Minnesota Section is made up of over 350 mining professionals from around Minnesota. The SME advances the worldwide mining and minerals community through information exchange and professional development. As mining professionals we understand the complexities of our industry and emphasize the role of environmental stewardship and regulation in mineral development and processing. The DEIS demonstrates that, time and time again, PolyMet has made well researched engineering and other choices so that it can operate the mine and processing facility without harming our environment. PolyMet carefully laid out the entire project so that the disruption of wetlands would be minimized and developed a comprehensive, multi-step waste rock management regimen to minimize the potential creation of acid mine drainage. PolyMet proposes to maximize the value of the ore by using the sulfur it contains to fuel the processing. Not only does this make the best use of the material mined, it also eliminates the need for greenhouse gas-producing fuels for the process. PolyMet will manage waste streams appropriately. To ensure no financial burdens falls on the people of the state, the State of Minnesota will regularly review the closure plans, estimated costs and the financial instruments proposed by the company. Before the first shovel of ore is removed the State will need to be satisfied that all costs of closure will be set aside in bankruptcy-proof financial instruments to cover estimates closure costs. As mining professionals, and engineers of all disciplines, we not only have a keen interest in seeing this project move forward but also a strong desire to ensure that any mining be done right, with a minimal impact on our natural environment. As Minnesotan’s, we support the proper development of its mineral resources for the positive impact it has had on its people, the local area and the state. We believe the Draft Environmental Impact Statement adequately identifies the environmental issues associated with the PolyMet project and that measures have been determined to adequately address those issues. We support an adequacy determination for the draft Environmental Impact Statement (DEIS) for PolyMet Mining Company’s NorthMet project. Any other determination would be a detriment to the State’s otherwise valuable mineral resource. The PolyMet project should move from environmental review to the permitting stage.</p>	EOO
15	<p>I think that the project has been studied in full and [illegible] no change for the final EIS. Let Polymet get on with it.</p>	EOO
15	<p>The economy of Minnesota is an ecosystem just like the ecosystems found throughout the state. When one part of the ecosystem is struggling, it has a negative impact on the related parts. The Building Trades in the Twin Cities Metropolitan Area are struggling; the economic recession has devastated the industries that have kept our members employed. 16	<p>I live in the Town of White, just outside of Aurora. I am in support of the Polymet Project. The technology that will be used in this project is the most up to date process that will have the least amount of impact on the environment that is available today. We have the natural resources here and we need the jobs. Having the plant in Minnesota with one of the strictest environmental regulations in the country is better than elsewhere with less regulation.</p>	EOO

16	I attempted to review the E.I.S. on line, but was unable to access the process flow sheet. This item would be most valuable to ascertain: 1. Reagents used in the process 2. Containment provisions for: a. Waste dock b. Loan ore c. Gaseous containment. 3. Discharge points. 4. Dewatering plans. 5. In plant spill containment. I hope this session and/or future information will bring clear light to these issues.	RFI
16	Someone should do the math on the following How much money would Obama have to spend of our tax dollars on money we have to borrow from China to create 1000 jobs for 20 years? Go PolyMet	EOO
17	My name is Brock Kangas, and I'm for the project of PolyMet Mining. I think we need the mining up here. Things have slowed down. We need a new industry. Times are changing. They say it is for the hybrid cars and all the greenhouse -- the energy saving stuff. Let's do it, let's get it done, and let's put some people back to work.	EOO
18	We are very much for the polymet project. I have been following this project for 4 yrs. This is a company that is willing, and has already spent millions \$ on the range w/o any TAX or government help. I am for this and the other precious metal projects. This project is key to our future in Northern Minnesota. I believe any environmental hazards have been overstated by outside special interest groups.	EOO,G1
18	Please don't do this! Our water, wildlife and land is what makes Minnesota special. Money will come and go but we must keep our responsibilities to our life our water. The threat is too high not everything goes as planned. We need clean water to sustain life.	EOO,G2
18	I think Polymet mining would be a great asset to the East end of the Range after listening to the comments on the Draft. We need jobs. The study took a long time (to long) I think it will open the door for more industry. We lived in Northern MN for 80 years + seen up + downs tax, etc. I hope Polymet will be successful + I think it will because a lot of study went into this project.	EOO
19	This city of Hoyt Lakes has attempted to obtain water from sources other than the Partridge River, with no results. It's the only water we have!!! I'm concerned that the quality and flow will be screwed up by the reduction of the watershed. Also the MP+h plant needs a set volume of water from Colby Lake which the Partridge River feeds. During August – the river is very low! Hopefully this won't end up with poor water quality + reduced flow so we experience water shortages, contamination + having to buy all our water.	WR3F
20	I believe with all the new Laws + equipment that the process is safe for all + our convience store personnel for tourists. I know you will use your education to see that it is right to proceed at this time.	EOO
21	I am writing in support of PolyMet. They have always been available to answer any questions we have. They have invested enormous amounts of money and time making sure they have the process right. We need jobs in this area. Need I say more. Issue the permits already.	EOO
21	I support Polymet Project for the future of Aurora and for the jobs it will create!	EOO
22	Let's get this off the ground + in production, our economy/ lives depend on it!	EOO,G1
23	Yes –	EOO
24	My name is Larry Brunfelt, and I'm in favor of this project, and I believe that it has went on -- the process has taken too long already, and I think it is time to move this forward. And we can use the jobs in the area, so -- that's all.	EOO
25	I have reviewed the summary EIS. I find, in it many concerns have been addressed. I also feel confident (very) that the project sponsors will be good stewards of our Natural Resources. Those of us who have grown up in this area and made it our home should look at this project closely. Not only does it address OUR concerns it also gives us hope for a future.	EOO
26	I am in full support of the PolyMet project and the economic benifit that it will bring. I believe that Mining can occur in an environmentally sound manner and benefits our country.	EOO,G1
26	I agree with Mayer Mary Hess in the support of opening the mine. Let's get it done!	EOO,G15
27	I believe PolyMet will be good for our area. We need jobs for the willing to work people of our area.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
28	I think this would be good for the area economy. The jobs this will bring good for the tax base. They have relieved my concerns about what this will do to the environment	EOO
28	I am in favor of approving the permit requests for PolyMet. We need jobs or our towns will die. PolyMet has shown that they will not pollute the environment.	EOO
28	This project is not only important for the economy of NE MN but is also important for the security of the US. We can not depend on third world nations for our stratigis in metal supplies.	EOO,G1
29	We need jobs! Good union jobs.	EOO
30	I am writing in support of the Polymet Project. It will be a benefit to the area in form of jobs, will support small businesses, and the communities as a whole. The project is well planned and very well studied as evident by the very thorough EIS process. I am looking for this operation to see a successful precedence for other operations of this type. The US needs more primary industry, especially well run primary industry.	EOO
31	My name is Dave Lislegard. I live in the city of Aurora. I serve on the city council. I am also the Chairman of the City of Aurora HRA, and I understand the inner workings of small government and also big government, and I realize that not only in this city, but in this state and in this nation, we are facing crisis for financial, health care, a wide variety, and many people are on fixed incomes. I think it is extremely important that we look at this project. I believe that many things are looked at that needs to be perfect, and perfection in all reality is subjective. We strive for excellence. I believe this plan covers that, and I think that -- I think it is time that we move forward, and I would appreciate a speedy process. Thank you.	EOO,G1
32	I support Polymets mine development proposal and look forward to the prompt issue of permits for this important project. Polymet has demonstrated through planning consultants and mitigation that such a project can be brought into production in a careful and sensitive way. The products produced by Polymet are key to the nation's manufacturing and are strategic to our nation. We should support projects such as this which balance carefully development and environmental values.	EOO,G1
32	At this time we need copper and we need jobs. We must go ahead with this project.	EOO
32	I am a union boilermaker & have been for the last 2 ½ years. I feel that mining has been the back bone of northern Minnesota for many many years, I don't feel we should stop that now! I also feel that the development of the polymet mining project would have a great impact on not only many families in the area but it would greatly support our surrounding communities and educational systems.	EOO,G1
33	Copper is a needed resource. It will be provided to the market. Please help Polymet do it with respect for the environment rather than in a third world economy that does not follow needed safe guards. Move ahead with this project!	EOO,G1
33	We need this project to proceed. Our children need jobs we need the tax base.	EOO,G1
34	Polymet is a must! To boost the economy and stimulate jobs! Very important!	EOO
35	I firmly believe that the Polymet project should move ahead to construction and that all necessary permits are granted. We need the jobs and the new industry on the Iron Range. The completion of this project will surely open the doors to additional development. Let's get this done quickly!	EOO
35	Given the high number of outstanding environmental concerns raised by this proposal, I believe it is incumbent on regulatory authorities to hold an event of this type in Duluth.	G10
36	I support this project because jobs are needed in our area. Times are tough the economy is down. This is an opportunity to not only provide long term jobs for several area people but also many short term jobs via the reconstruction process.	EOO
37	I support this project I'm a Union Iron worker and would like to see this go ahead. We could use the work.	EOO

Comment ID	Comment Text	Theme Codes
38	My name is Virgil Sohm. I'm a Bois Forte Nett Lake tribal member. I'm here to represent the future generations, and I oppose the mining of the copper and the other precious metals. This area is used for our gathering, our hunting, our wild rice, and it is part of a treaty area, so I concern myself with the contamination possibility of our hunting, fishing and gathering areas. Thank you.	G3A
39	I think is a great thing in tough times like were in now to have this project go ahead. Because it will put a lot of people back to work that are laid off. And it might bring a lot of other jobs to there area which would be a good thing. And it can't be that bad for the environment.	EOO
40	I am a student at Mesabi Ease High School. I feel that this project would be a great success. Learning about Iron Range History has made me proud of this area and proud to be a part of it. The Polymet Project is history in the making. This is the future not only for Minnesota, but for the United States. I greatly support!	EOO
41	I feel that PolyMet has completed an extensive environmental impact study and is able to demonstrate that they are fully competent to operate the proposed facility in an environmentally friendly and safe manner. The EIS should be clearer. PolyMet is not in a Boundary Waters watershed. Enough said.	EOO,G2
42	We import 80% of ore copper from overseas, keep the job here. They have addressed all the requirements, let them build.	EOO
43	As a member of the building trades, my primary reason for supporting this project is the creation of jobs. I've reviewed the EIS online, and am comfortable that this project is possible without damage to the environment. As a proud citizen of the Iron range (10 min from Polymet site) I am concerned with the lack of economic possibilities for my children, and this project is a step in the right direction. Though it won't solve the entire economic recession for the Range, we must move ahead wherever we can.	EOO
44	I think the Polymet plant will be good to the area for jobs to all kinds of trades and small businesses. I believe in protecting the land and water but also bringing in jobs for families like mine. It's not like there ruining the land there because the old LTV plant is here somebody should use the old mine. I believe we should mine are natural resources instead of letting them go to waste.	EOO
45	Bring long awaited jobs, will be an economic boost to the economy. The development will take place on land already developed. These won't be any soil disturbed. Low environmental impact.	EOO
46	I'm curious -- I don't think I've seen enough analysis of what would happen in terms of catastrophic failure surrounding the tailings ponds. I'm a farmer.	GT2
46	I support the Polymet Project. This area needs the jobs that this project will bring for construction and permanent jobs. The EIS is well thought out and in a good plan.	EOO
47	So I think we need further assurances about the durability in the long-term, you know, 50, 100, 200 years, for some of these technologies they are going to be using in those storage pits.	GT2
47	I fully support the Polymet project. We need secure minerals for our national defense. It will be done in a manner, good for the area and environment.	EOO
48	And then a third consideration would be discharge of any contaminated water affecting wild rice. They mentioned wild rice on the Embarrass River, and one of the alternatives I believe then instead would channel some of that discharge into the Partridge River, but my understanding is that further south of the area there are wild -- significant wildlife areas that that water would be flowing into. And I know for a fact that sulfates can affect the health of wild rice and maybe the viability. So I would need further analysis and assurance that any discharge flowing into any of those rivers, you know, we need some study that it is not going to affect rice areas even outside of the mining site.	WR1E,WR4F

48	I support the NorthMet project. The economic impact of this industry in our backyard is immense. Not only will Polymet create over 400 permanent jobs for the next 20 years, but the construction and spin off jobs created will stimulate our economy. At a time when employment is almost impossible to find also the millions of tax dollars that state and local communities will gain. Environmentally it has been proven that Polymet can mine for these metals without destructive waste and damage to the water, land and air. The metals that will be mined will be used for green technology such as wind turbines, hybrid cars also electronics that we use in everyday life and controlled here locally instead of somewhere overseas where environmental restrictions are not in place. I live and use all of Minnesota's natural resources I and my family camp, fish, hike, bike and have friends who live here in this area and some who have recreation property as well. I understand the balance between mining and living in this area and I strongly support this project.	EOO
49	Unemployed member painter and allied trades Local 106 Duluth. Project would be great for area and state with the technology available the impact to the environment should be very minimal with proper oversight.	EOO
49	I feel this phase is similar to the taconite industry was 60 years ago. No one wanted that at the time either. Polymet will have more gov't scrutiny than any company could possibly put up with. Please let them continue!	EOO
49	I have lived here on the Iron Range for 25 years. It is a great place to live and a great place to raise a family. This project would do this area and this end of the Range a great deal of good. I also believe that this is no better place to mine for these precious metals than right here in the US. I would rather see more jobs produced here on home soil than jobs overseas. I would also like to see this go through for the local economy and the surrounding local businesses to help everyone here out. This would help keep many families right here on the Range which if you are from here, you would understand the reasons why you would want to stay here. Keep up the good work.	EOO
49	I want nothing more than to see this project go 100%. With the number of jobs we will get in a time of large unemployment will wonderful. With minimal effect on the areas habitat and water is a great bonus and shows what today's technology allows us to accomplish. To think of all the families that this project will help and benefit from is great as well. My family has been part of the mining industry for more than 40 years and I hope that it will continue to stay that way for years to come.	EOO
49	This whole part of Northern Mn needs this project. I am a member of Local 49 Heat and Frost Insulator and we need jobs to put our member of other people to work. We need to put food on the table and put our kid through school. It's a no brainer, move forward, times have changed.	EOO
49	Another concern would be further financial assurances. It has been an unfortunate tradition for mining companies to sort of hit the road when the heat gets on, so financial assurances to the State in case of an event in which PolyMet would go bankrupt or, you know, further safety, water quality monitoring or clean-up procedures, you know, if they were necessary, financial assurances that PolyMet would -- bonds or whatever is needed, that that money would be available and the State wouldn't get footed with those bills. We all know that Superfund is a vastly underfunded program at the moment.	PD4
50	A great opportunity for the Range, NE MN, MN, USA and World!	EOO
50	We need jobs!!!	EOO

50	They also say there's "a high degree of uncertainty regarding key input assumptions for water quality at the mine site". So again, we simply don't know how much pollution is going to result from this. We have a loss of over 1500 acres of wetland, a loss of 1700 acres of vegetative cover, direct impact to seven endangered species of plants. The tailings basin and residue facility embankment have "a low margin of safety due to previous mines and the underlying soils". So in other words, whatever gets put in the tailings bin doesn't stay in the tailings bin. And that's going to be sulfates. Finally, their alternative plan for the tailings basin entails testing of a permeable reactive barrier, ostensibly a chemical barrier, to prevent seepage. I find it very disturbing that PolyMet is relying on untested, unproven technology as a mitigation tool, and it should tell us -- it should give us severe pause, give the DNR serious pause in considering approving this Impact Statement. So in conclusion, I urge the rejection of the Environmental Impact Statement, the rejection of the sale of National Forest Service land and the rejection of pollution of our precious waters, which both provide habitat for wildlife, environment for recreation, huge tourist industry and drinking water for tens of thousands of Minnesotans who haven't been adequately served by this public input process. Thanks.	EOO,G2,G7A,G8
50	My name is Jeremy Fleming. I am a teacher at Mesabi East High School. I live in Chisholm and commute to work 45 minutes. I am in support of the Polymet project due to the fact that this area needs jobs like we used to have. Mines in this area ave produced iron ore that has produced metal to build this country. I believe this company will do everything to ensure that our quality of life will not be affected. The proposed LTV site which Polymet will be using was used for an excess of 45 years. With technology that we have today, and the resources that will be mined, I see great benefits in not only the amount of jobs created, but the potential students we would gain at Mesabi East. We have a brand new K-12 building and we are looking forward to an increased enrollment for the first time in ten years. In closing I would like to stress that this area deserves good news something positive since the closing of LTV. The iron range can prosper with another mine for the next twenty years.	EOO
50	The tailings pit that's proposed for use, the old LTV tailings pit, we already know is leaky, we already know has significant sulfate infiltration and runoff into the Embarrass River and that will only get worse. It should be cleaned up, not allowed to get worse by a new type of mining that would inherently severely increase the amount of sulfate that is drained into the river systems there. The groundwater is expected to be drawn down until Year 65, and levels of antimony, manganese and nickel are expected to exceed the maximum contaminant limits "potentially for the long term at the mine site". That's extremely troubling that the groundwater could be polluted forever.	G7B
51	As a resident of Northern Minnesota I would like to show my support of the Polymet NorthMet Project. First, it would contribute significantly to our local and state economies and provide many much needed jobs for this area. With the financial stat of the state (and local) economy, this project could not come at a better time. Second as a person who cares about the environment, I feel the project has been designed with the environment in mind by reusing a brown field, re-using existing infrastructure and utilizing multiple safeguards to protect the environment. I would much rather have this mine located in Minnesota where there are regulations that ensure the environment will be a top consideration versus being located in a place where it wouldn't be considered at all. Thirdly I support the project because it will be supporting a buy local theme by producing several metals that are not currently mined anywhere in the US but that we need to produce necessary items for technology and green production such as photovoltaic cells and hybrid cars. In summary I believe that PolyMet is dedicated to protecting our environment, that our economy would benefit tremendously and we would reduce our need to import metals for certain industries. I support this project.	EOO
51	In addition, tonight we've had -- we've been under a snowstorm warning, we are continuing to be under a snowstorm warning until six o'clock tomorrow morning. So while I've come up with a small delegation of people from Duluth, others who wanted to come tonight to be here to comment couldn't, and they won't have the opportunity to do so unless the DNR revises its public input schedule to include a session in Duluth, which it should do to fulfill, you know, legally the requirement for public input.	PRO6,PD1
51	We as in Northern Minnesota need to have some work on the Iron Range.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
51	I don't believe the DNR has made adequate plans for public input on this project, and the public input that they're getting does not reflect the majority sentiment of the people of northern Minnesota who are going to be directly impacted by this project because no public input sessions have been scheduled in the major metropolitan areas that are impacted directly by the potential pollution from this site. You know, Duluth is the county seat of St. Louis County. It is the largest population area in the region, and it is directly downstream from the potential pollution that could be generated by the site, so all 150,000 people in the Duluth/Superior metropolitan area have a stake in this and their voices are being excluded by not having a public input session there.	RFI,PRO6
52	We need jobs in this area. This site will be good for the area as long as it is modified for contaminants.	EOO
53	My husband and I support the Polymet Project 100%. I think they have done their work to prove their product.	EOO,G1
53	I am in favor of this project for the fact that it will create jobs and potentially put me back to work so I can better afford to take care of my wife and kids.	EOO
54	My husband and I are retired, our children have jobs We are worried about our Grand Children. We trust in the E.P.A. We need work in the USA!!	EOO
54	I am here to support PolyMet. I believe most people who live in Northern Minnesota will tell you the same. We need this project! Not only will this project feed my family, but it will provide income for countless families in Northern Minnesota and many more in surrounding areas. With the economy at such a low point, this project will stimulate Minnesota's economy and the nation's economy by providing metals essential in producing many products such as wind turbines, catalytic converters, and computers. It will also stimulate local and national economy by providing income to other businesses local, state wide, and nationally who provide products and services to this mine. This in turn provides more jobs that the people of this country need! Many construction companies and workers will also benefit from its production and maintenance over the years. Polymet can do this in an environmentally sound maner by recycling an existing mine sit eliminating the need to cut down forests and minimizing the disturbance of wetlands. Using multiple safeguards they can protect the air, water, and land and follow Minnesota's strict guidelines. Bottom line, we need this project to pass! Thank you for reading this and hearing what I have to say.	EOO,G1
54	I was very impressed with information available at meeting + personel from all the government agencies available to answer my questions. I am confident polymet will get there permits.	EOO,G10
54	Local 106 painters, looking for more work, and to keep future going	EOO
54	I support the Polymet project for the economic benefit it will bring the Hoyt Lakes area and the Iron Range.	EOO,G1
55	I guess all I really want to say is that I'm for the project and everything looks environmentally safe. And I work out there right now for Our Gang Staffing and everything looks good. I hope to see some jobs on this side of the Range. That's all.	EOO
56	I support Polymet because they've takin the stepps in the direction of how to make sure that the process of mining these metals will be safe to the environment and cause no inamate threat to our Children's future and no threat to our wildlife. We've got thousands of people out of work and without health care this is our chance to better our Community and ourselves.	EOO
56	I would like to see Polymet go ahead with this project. We are probably one of the more enviromentaly consciencous countrys in the world, witch is good. To maintain a modern lifestyle we have to mine some place. And last, but not lease we really need the jobs in Northern Minnesota!	EOO
57	With 12 trillion dollars owed to the nations that make things it is time to get back to basics in the USA. The evidence of a profigate lifestyle is all around us in unemployment and debt. Job creation has to be the number 1 priority for this nation so that we can claim back the reputation of hard working productive people. This can be done with due regard to protecting the environment – and we need the close scrutiny that has been given to the project. The work on that front has been done. It is time to get on with the work of putting people to work on a good project.	EOO

*Alphabetical by sender's first name*

57	Polymet says the [illegible] will last 50 years – etc. That is nothing – Wish you could be a cleared answer to damage to our environment. But, I know there [illegible] yes or no.	EOO
58	With 12 trillion dollars owed to the nations that make things it is time to get back to basics in the USA. The evidence of a profligate lifestyle is all around us in unemployment and debt. Job creation has to be the number 1 priority for this nation so that we can claim back the reputation of hard working productive people. This can be done with due regard to protecting the environment – and we need the close scrutiny that has been given to the project. The work on that front has been done. It is time to get on with the work of putting people to work on a good project.	EOO
59	I consider my self to be very aware and consciouse of the enviornment. I enjoy canoeing, hiking, biking and the outdoors. I lived in this area all of my life. I also support responsible development and job creation. I think its entirely possible to have both. I support this project and the process the State of Minnesota has to make sure it’s done right. Thank you for allowing me this opportunity to express my support.	EOO
60	The people of this area have logged and minned for well over 100 years. We can still drink the water we can grow garden in the soil eat the fish we catch. We have managed our resources and continue to do so. Poly Met certainly meets the standards for environmental responsibility and preservation of the land – Air + water.	G5
60	I am involved with mining projects throughout North America and internationally and the companies that comply with + invest in technology that keep our environment clean are the ones that should be allowed to mine our resources. We need these minerals + jobs. The planet will be better off buying our needed minerals from “Compliant” environmentally aware companies. Art Ostman Minnesotan’s including miners like clean water + aim to keep it clean.	EOO
61	My name is Karl Hansen. I just want to say that I feel good about PolyMet. I feel strong that it's environmentally strong. They're doing everything they can to do it the right way. And I feel that it's good for the people, good for the -- for the area, and I -- I strongly believe it's a really good, strong project for this community. And I hope it -- I hope it goes. And that's it.	EOO,G6
62	I beleive that this project would be a great asset to the iron range and it’s economy. I live here on the range and work here through the Ironworkers Local 512 out of Hermantown, MN. This project would really help a lot of people that live here provide for their families and get off unemployment. I really like the fact that it would create short-term and long term employment for the area. All mines create environmental issues but even if it was built somewhere else it still would.	EOO
63	I’m a union Boilermaker, and a local resident of Aurora. As a avid sportsmen me and my family hunt, fish, take nature walks + work here. So a main concern was what was the impact going to be on the environment? So looked online at the States and all I see is good. as a union Boilermaker working at all the taconite plants + power houses across the Range and else where the one thing that comes to mind is that technology has improved 110% since the 50’s, 60’s, 70’s. Alot is bieng done to clean up the mistakes of the past such as the SCR added to the power house in cohassette [illegible] to clean the NOC’S out of the emissions so with that said the next thing on my mind is jobs there is a lot of people on the Range without them, the proposal of 400 permanent jobs + 500 spin off jobs which is [illegible] my occupation [illegible]. this project will help the Range cities prosper once again. So in short I am all for Polymett mining project.	EOO,G2
64	I want polymet to come here to boost the jobs.	EOO
64	I want polymet to come here for more jobs.	EOO
64	PolyMet would be bomb on the range so come here. thank you	EOO
64	I feel poly met is good for this Region. We need job and things to keep people in this area it also will be good to have something beside minning ore this will be something to keep this area going when demand for steel is down people in our area what something to help keep there kids in the area our kids grow up and have to move to support there familys this will help in keeping job in the Region and keep familys intact.	EOO

64	Why does Minnesota DNR, Politicians, decision makers think they can accomplish what no other state in the union could not, environmentally safe CuNi mining. Why has no mining co. stepped up to prove to Wisconsin that they could. They have had since 1989. On the way into the meeting I asked 6 Aurora residents for directions to the DNR meeting. I was asked "Do you mean the Polymet meeting?"	EOO
64	I support the Polymet Project and they should be given a permit to mine with these stipulations 1. They should buttress the tailing pond dikes beyond adequate requirements. 2. They should drill collection wells and treat any discharged water that can be regulated. 3. Polymet should be held to high standards not just lip service, the real thing!!! 4. Done properly it can be such a win-win for the economy and environment. 5. Hold Polymet to high standards and let them be a model on how it should be done. 6. Reuse of LTV facilities is a big plus!!!	EOO
65	Polymet has proven in my opinion, that they have a process for copper mining that is financially beneficial to them as well as the Iron Range. They have proven this process to be safe to the environment. These benefits have been backed up with the determination and financial backing that should be applauded. The representatives of this state have taken enough time to decide on this. If they have any pride in the state, and the legislative process they have an obligation to decide either way. I hope for the sake of the Iron Range and it's people they will allow this to go forward and police it from that day forward. We have been sitting on our hands long enough.	EOO
66	Let do it! We need jobs - - Best Welfare Program in the World!	EOO
67	I just wanted to give my support for this PolyMet project. I think they've really done a lot of research on this project. I've come to some of the other meetings and I've listened to all the background information and all the technology that they're using in this process, and I really think that they have jumped through a lot of hoops to make this project go. And I'm a hundred percent for it, and I think the State of Minnesota will protect our resources. And I think northeastern Minnesota is ready for a new -- new industry to take hold and give people hope in this area.	EOO,G6
67	I'm commenting in favor of the Polymet project. I believe that Polymet and the State of Minnesota have done their due diligence as to the environmental impact of this project. While there are risks in any project of this type Polymet + the State of Minnesota have done as much as is reasonable to identify any potential problems. When the potential problems are identified the state and the community gain awareness of the effects of these potential problems and are in much better position to deal with them. The economic benefits to the area would be to count.	EOO
67	I support the Polymet Project because of the positive economic impact it will have in our area and state. I feel they have adequately addressed the environmental issues that are associated with this project. As a resident of Hoyt Lakes, I feel the mining and processing process will not adversely affect the quality of the environment in our area and will result in the remediation of an existing field (i.e. Erie Mining to LTV Steel).	EOO
68	I support the Polymet Project. They have done their work to do this environmentally correct. We need jobs in our area	EOO
68	I support mining in N.E. Minn Polymets processes in [illegible] mining and processing not smelting. good for the economy	EOO
68	As a resident of Duluth, I live downstream of the proposed NorthMet project via the St. Louis river. I will drink the consequences of sulfide ore mining south of the Laurentian divide. As a business owner in Duluth, my livelihood rises and falls with the state of the economy as a whole. Thus, for better and for ill, I would be impacted by the project. This project should not go forward. The PolyMet corporation lack the technology and the will to deal with the environmental consequences of sulfide ore mining. Sulfide tailing represent a novel challenge in waste containment. The technology to contain those tailing is unproven – and NE MN is too large and too dear a place to serve as a test bed. Sulfide tailings are also a permanent hazard. The repeated history of mining companies winning out of existence when the remediation bill comes due prevents me from having any faith in PolyMet's ability to follow through on its commitments. In short, I fail to understand why this project is worth the risk.	EOO,G7
68	I support the Polymet project. Jobs- jobs – jobs We need this to help this area	EOO
68	The next time Blaine has an EIS, I hope they hold a hearing on the Iron Range.	G10

69	I am in full support of the Polymet Mining Project. I am a kindergarten teacher here at Mesabi East & would love to see an influx of families for the jobs that Polymet could offer. My husband has also been a Polymet employee for 5 ½ years. It is a great place to work – very family oriented. Polymet Mining has a lot to offer for many communities.	EOO
69	The environment was delt with threw out the ages. From a 20 yr life to who knows, we have advanced to better know how to deal with it. We have scholars that can advance our environment.	G2
70	I strongly support the Polymet project for the following reasons 1. Socio-economic - reserves will improve the economic stability of northern MN providing sound education facilities through school taxation 2. Mining the sulfide ore deposits will remove these potential sources of contaminants and improve ground water /stream water quality. 3. These are strategic metals for the future of the USA. This baseindustry will allow the USA to continue to be a world leader. 4. PolyMet can do this right. If we can plan a future mission to Mars 2020 we can certainly mine these reserves responsibly	EOO
70	I see no hidden facts, no pulling the wool over our eyes in trying to get the plan through. I think of all the people that are running this company, they're probably the most educated people they could get for this project. So -- and I'm all for the project. I can understand the environmentalist point of view, but they're comparing apples to oranges because they're basing it on companies and plants that were out West and in other parts of the country that have different mineral contents compared to what we are dealing with as far as contamination. And if they're going to fight this PolyMet plant, I think they should have the facts straight instead of a generic answer and look what happened out West. It's -- I had a brother that was involved in all the environmental testing for this plant, and even though he said it out of -- off record, he said this is probably going to be one of the cleanest copper nickel plants ever produced, so I don't think there is really any negatives to this. This part of this country is off the beaten path of traffic, so minerals is about the only product that can keep this area going. Tourism is a small part of it, but we're noncentrally located and the climate chases most people away anyway. So I'm all for the PolyMet. I think they're a very well-organized, well-led, honest company. And I think if they were given the chance, even the hardest protester of this company would see that they're going to do a clean mining operation with exceptional safeguards to prevent our most -- our most important natural resource from getting damaged, and that is our water. And I do see the point, but the facts are the facts and they have that all covered. That is it.	EOO
71	I am in 100% in favor of this project and strongly recommend approval of all permit applications. This project will provide needed jobs, benefits, and spin off benefits for many years. This project will set a new standard for environmental operation in an environment that will stand for nothing less. This project is widely supported by the immediate area, the region and broader interests. It is economically viable for the long term, providing many integrated benefits to our area. This project has been researched, vetted, and investigated and found to be well designed, environmentally safe & responsible, and well integrated into our region. The leaders of this effort are among the finest people I know. In my career of 21 years in mining and power, they have dedicated their lives to their family, their friends, and their work to provide a good future for all of the stakeholders affected by their actions. Build this plant. It's the right thing to do.	EOO
71	This company has put up millions to make the mining process safe. They want to employ people. They are mandated by the state agencies. They are mandated by the Feds. A mining process in any other country would not have to go through this process. Anyone can tell that the safe guards in effect will protect the environment. Wall Street can crush the country, however people want to stop Polymet from making jobs.	G1
71	Concerned about political influences on the final discussion as to permit the new copper nickel mining in NE Minn What is the degree (%) of political sway from both parties & the governor offices on the permitting process given that the Governor appoints the head of many state agencies that are involved putting together the final draft of the EIS & the final permits for the mining companies to pursue the mining process.	PRO1
71	We don't want jobs! We want welfare! OBAMA loves us!	EOO
72	We need to make this project happen! It will be done in a responsible manner with safeguards in place and plenty of watchful eyes. Let's make it happen.	EOO

*Alphabetical by sender's first name*

73	Build it. We need the work – the state of Minnesota would not let a company do work in MN without being held accountable. I believe that PolyMet with the draft EIS has shown they will do the mining correct.	EOO
74	I have reviewed the Polymet EIS and I strongly believe that Polymet has addressed all environmental concerns, I am the vice-chair of the Mesabi East School District and we need to promote business/employment in this area.	EOO,G1
75	My name is Gregg Benz, I'm from Hibbing. I'm here for the public meeting for the PolyMet Manufacturing, which I believe is a good idea to have to mine the precious -- precious minerals that are available here. The Iron Range has been hurting for work for a long time, can't just rely on taconite plants forever. We gotta think of our kids also coming up, they need places to work. Besides, I remember when I went to high school, there was 400 kids in my class in '81. Now there's only 150 graduating. And it shows how much of -- of the economic value of people around here are losing. I mean can't go down the street without seeing five houses for sale in one block, which is sad. I know I'm not much of a talker. That's about all I have to say. I really don't have much else to say except that I hope this goes through. It's going to be good for the Range. Also it's not going to be a -- a huge factor in the environment because of the way they're mining, for one. That's all I have to say. Thank you.	EOO
75	I have read the EIS and support the proposed mine! I live in Hoyt Lakes and own a large tract of land on the partridge river near the proposed mine. If I didn't think the safeguards in place were adequate I would not be in support of this project. My friends and neighbors will run and work at the mine and I trust them to protect our lands. It is our Home.	EOO
75	I am requesting an extension of the comment period through the end of March. Those of us who have followed this entire process since the scoping hearing in 2005 do not feel we have ample time to study the DEIS. Likewise more hearings are needed. This project has ramifications that need to be addressed.	PRO6
76	I support the polymet project. Because I feel it would bring more jobs to area. And, we really need growth in this area. I think it would benefit everyone in many ways.	EOO
77	I would like to see this project go it's a safe process and we need jobs up here, I would like to see the range and its kids have a future here. So thanks for letting me comment and lets get this project going.	EOO
77	I am currently an equipment operator at Mintec. And I know first hand what good paying jobs mean to this area. We need jobs that pay a "living wage" not the 7.25 an hour, few and far between jobs that are currently available. And nowhere will you find more hardworking honest people to do the job! We are all proud of our area and support the environment. We all want responsible employers like Polymet & other mines. These mines are not the mines of the 60's! Where the environment was second to profit. Lets get this project going as the EIS shows all necessary safeguards are already in place! Let's put the people of the great Iron Range to work!	EOO
78	I am in support of the Polymet Project. It will bring needed jobs to our area – I think that from what I am told that they are very conscious of the environment and will abide in all rules that are in place.	EOO
78	I support Polymet 110%, I've been in new construction at Mesobi Nugget. As we near operation I am in the process of learning our environmental requirements. Knowing Polymet will be held to equally exacting standards for air/water emissions is good enough for me, The monitoring standards are incredible. Feel free to call me @ 218 750 3955	EOO,G5

2683	With this letter the Northern Counties Land Use Coordinating Board - a joint powers board of eight counties covering over 10 million acres and representing over 282,900 citizens - voices its support of the PolyMet Mining Corp. Draft Environmental Impact Statement on its proposed NorthMet non-ferrous mine on the Mesabi Iron Range. The board qualifies its support by including the following points: 1) The board recognizes the economic benefits to the region such a development represents, especially at a time when challenges to full employment are causing hardships to area families. 2) The board underscores the fact that while the region's economy has historically been dependent on its natural resources, throughout recent years best practices that support social and environmental concerns have developed alongside economic benefits. 3) The board puts confidence in the strong, well-defined environmental protections in place in the United States and Minnesota and in the agency personnel trained to ensure these protections. NCLUCB relies on these agencies and the permitting processes they have established.	EOO,G5
2684	4) The board insists that enforcement of permit requirements remain essential to the project. The board adds that third-party verification would add a measure of confidence regarding the EIS.	G5

2507	We are presented with a Golden Opportunity that we can't let slip away. With unemployment nearing record highs, many jobs going over seas and an economy steadily declining we need to do something about this. With Polymet Mining we have an opportunity to create hundreds of jobs right here at home. These new jobs will not only be direct jobs with Polymet, but many spinoff jobs will also be created. And with these new jobs comes money that will be spent in the community thus stimulating the economy. An existing infrastructure can be utilized and an existing brown field site can be reused. A thorough study, as detailed in the EIS, has been conducted to show that there will be minimal impact, if any, on the environment. I say 'Don't Delay', issue the permits, it is what America needs right now.	EOO
<b>Sender Last Name:</b> Flaten		<b>Submission ID:</b> 164
154	I would like to comment on the EIS I recently reviewed for the Polymet project in the Aurora & Hoyt Lakes area. I would just like to say that I am fully behind this project and would like to see it proceed. This project is vital for the residents of the Iron Range and will also benefit the entire state of Minnesota as well. Please proceed with this project and bring much needed jobs to the Iron Range.	EOO
<b>Sender Last Name:</b> Fleming		<b>Submission ID:</b> 1683
689	will effect the Superior Forest ecosystem 3)Tailings basin construction which allows excessive seepage and is susceptible to earthquake damage causing major damage to local waterways.	GT2
1017	1)Lack of financial assurance calculations which are essential to understand public financial burden to clean up the probable "mess".	PD3
1018	2)Lack of a detailed reclamation plan. This mine will exist for 100's/1000's of years and I need to know what it is going to look like and how it	PD3
1057	These comments relate to the Polymet Draft EIS. I have read the DEIS and understand most of what is written. It seems to me that there are significant technical weaknesses(list below) that need to be addressed before the project moves forward toward permitting. The key technical issue is the high potential to generate acid mine drainage and associated acidified lakes and streams in and around the project area. Acidified waters lead to direct damage to aquatic and ultimately land animals and plants including humans and associated indirect damage through the high concentrations of dissolved metals in the acid waters. There is too much risk to take a chance on the above water pollution.	WR3D,FM1
1058	5)Mercury and other metal pollution above accepted standards.	WR3I,AQ6,AQ6A

2154	6)Cumulative impacts of all effects generated by the mine and processing facility. These must be taken in conjunction with expected effects from other copper/nickel mining proposals,e.g., Franconia & Duluth Metals,which are in real formative stages now.	G9
2155	There are other detail items in the DEIS that reflect inadequate or incomplete science which need to be examined prior to moving ahead. I believe the project should be placed in the NO ACTION category pending data and science based clarification of the many problem areas.	G8
<b>Sender Last Name:</b> Flesvig		<b>Submission ID:</b> 3730
20681	2.1 Acid Mine Drainage The Draft EIS (4.1-53) recognizes that waste rock from the Polymet mine could be a source for acid mine drainage (AMD). The plan to eliminate this source for AMD involves: 1) depositing the waste rock in the mine pits, 2) submerging the rock to create anoxic pore waters, and 3) applying limestone as a neutralizing agent. Although these treatments are commonly used to limit acid mine drainage elsewhere they are not always effective since exceptions have been reported in the scientific literature. First, it is now recognized that Acidithiobacillus ferrooxidans (formerly known as Thiobacillus ferrooxidans) , the common bacterium responsible for pyrite oxidation and acid mine drainage, is a facultative anaerobe since it is capable of surviving and solubilizing metals under anaerobic conditions (Pronk et al. 1992). A. ferrooxidans, for example was the dominant bacterium in anaerobic and highly acidic (pH of 2.4) mine waters that were pumped from 2 flooded copper mines in Wales (Coupland and Johnson 2004). Second, A. ferrooxidans has been shown to grow and etch pyrite crystals under circumneutral conditions in: laboratory cultures apparently by forming biofilms that maintain an internal environment favorable for its growth (Mielke et al. 2003). In view of these findings a degree of caution should be exercised in the Draft EIS with regard to predicting the generation of acid mine drainage by the waste rock. Specifically statements such as those listed below should be either altered or qualified to recognize that the prescribed treatments have not always been effective in preventing AMD at other locations. Specific Examples from the DEIS that need modification include at EIS, 4.1-56, 3rd paragraph: After inundation, wall-rock oxidation essentially stops due to the low solubility (~10 mg/L) and the slow diffusion rate (i.e., ~1/10,000th as fast as in air) of oxygen in water, so submerged wallrock may be considered essentially inert. (emphasis added); and DEIS, 4.1-56, last paragraph: Waste rock backfilled to the pit lake has a chemical effect similar to wall rock, with waste rock above the lake surface oxidizing and leaching solutes to the pit lake. When inundated by the pit lake, however, leaching stops and the submerged rock is essentially inert fill. (emphasis added). Recommendation: Although the measures taken with regard to waste rock disposal may limit acid mine drainage an element of uncertainty still exists with regard to the effectiveness of these measures because of the heterogeneities of the waste rock itself and the ability of the bacteria responsible for pyrite oxidation to cope with apparently unfavorable environmental conditions (e.g. anoxia and circumneutral waters). As a result a continuing monitoring plan should be designed to check for the generation of acid mine drainage within the mine pits and its seepage into surrounding areas.	WR1E,WR4A,WR4B

- |       |   |                     |
|-------|---|---------------------|
| 20681 | <p>A portion of the groundwater leakage from the tailings basin is predicted to occur toward the Partridge River during operations (4.1-63). If the tailings-basin alternative is implemented, some portion of the recovered groundwater seepage that would have gone to the Embarrass River could also be redirected in discharge to the Partridge River (4.1-155,156). Following closure additional sulfate loading to the upper reaches of this river will occur via overflow from the West mine pit and to the lower reaches (below Colby Lake) as discharge from the tailings basin through Second Creek (4.1-88). While the DEIS recognizes that these hydrologic inputs will increase sulfate loading to the Partridge River, the risk of sulfate-enhanced mercury methylation is downplayed because (1) sulfate levels are already high in the lower river (below the confluence with Second Creek, which drains former LTV Pits 1 and 6 on the proposed Mesabi Nugget site) (4.1-39), and (2) there are reportedly few wetlands along the Partridge River where mercury methylation might be enhanced. In-stream production of methylmercury is generally considered to be of minor importance relative to other watershed sources. However, elsewhere in the DEIS (4.1-23) the Partridge River is described as having "a very well-developed floodplain along most of its reaches with" ... many beaver dams along the entire length ... which create wide pools." Recent studies have shown that beaver impoundments provide conditions suitable for active mercury methylation and represent net sources for methylmercury in riverine systems (Roy et al. 2009). It thus seems likely that the risk of enhanced methylation from sulfate discharge to the Partridge River may be greater than is concluded in the DEIS. Two lakes located in the Partridge River watershed, Colby and the Whitewater Reservoir, could also see increases in mercury methylation as a consequence of the proposed action. Colby Lake is predicted to see a modest increase in sulfate loading from the Partridge River (increasing lake concentrations from 10 mg/L to 15 mg/L) (4.1-116), and the Whitewater Reservoir is expected to see a larger range of water level fluctuations (to maintain water levels in Colby Lake) than currently occurs (4.1-105). Fluctuating water levels are known to increase mercury methylation - principally through redox cycling of sulfate in littoral sediments during drying and rewetting (Munthe et al. 2007; Sorensen et al. 2005). The DEIS incorrectly concludes that this will not be a problem in the Whitewater Reservoir because it does not receive inflows from the Partridge River under normal flow conditions (4.1-127). This conclusion presupposes that additional sulfate inputs from the Partridge River would be necessary for water-level fluctuations to induce mercury methylation. However, it should be expected that current sulfate inputs to the Whitewater Reservoir (e.g. from other inflows including the City of Hoyt Lakes WWTP) would be sufficient to stimulate microbial sulfate reduction (and mercury methylation) during water level fluctuations.</p> | WR1E,WR4A,WR4B,WE2, |
| 20681 | <p>The Draft EIS (e.g. 4.1-89) proposes that wetlands could be used to treat acid mine drainage that leaks from the tailings basin and/or other sources. Although wetlands are often used to consume the acidity and immobilize metals arising from AMD they have not always been effective in other locations. Acid mine waters, for example were pumped from 2 Welsh mines and discharged into a wetland, which had little or no effect on either the acidity or metal content of these waters (Coupland and Johnson 2004). Unfortunately the term wetland covers a very wide range of ecosystems that are characterized by very different sets of physical, chemical, and biotic properties. It should therefore not be surprising that their capacity to neutralize the acidity and remove contaminants from different types of pollution sources varies depending on the type of wetland considered and its hydrogeologic setting. The natural neutralizing capacity of wetlands, within the project site, moreover, maybe limited by the low carbonate content of the glacial deposits in this area that are derived from the Rainy Lobe of the Wisconsin Ice Sheet. Recommendation: A long-term monitoring plan is needed to test the effectiveness of the wetlands for remediation of acid mine drainage from the tailings basins and/or waste rock stockpiles. A contingency plan should also be in place in case these wetlands prove to be ineffective in treating drainage from the tailings basins since many types of wetlands have a low acid neutralizing capacity.</p>   | WR4B,FM2,WR1E       |

20681 The DEIS predicts substantially increased groundwater leakage from the proposed NorthMet tailings basin largely in the direction of the Embarrass River to the north ( 4.1-65). This leakage would occur as a result of increased head gradients and is expected to discharge through an area of extensive wetlands located between the basin and the Embarrass River. Because leakage rates are expected to greatly exceed the flux capacity of the surficial aquifer, upwelling and surface ponding and drainage is expected to increase. According to the DEIS classification (4.2-3), most of these wetlands (72%) are ombrotrophic bogs (though a review by P. Glaser indicates that most are poor fens). Indeed, the DEIS concludes that legacy leakage from the existing LTV tailings basins is currently impacting portions of this wetland complex - though the actual extent of impact appears to be poorly known because of a lack of on-the-ground observation and sampling. Groundwater discharge through these wetlands and toward the Embarrass River is expected to increase from a current estimated rate of 1800 gpm to 3800 gpm by year-20 of operation (4.1-65). A tailings basin alternative in which ground-water seepage would be intercepted by a series of wells and returned to the plant operations as make-up water (or partially discharged to the Partridge River) is included in the DEIS (4.1-147). These operations, if implemented, would cease upon closure, and the tailings-basin leakage would revert to the Embarrass River wetlands (4.1-65). In my view this tailings-basin leakage poses the project's greatest risk of increasing mercury methylation and methylmercury export to downstream aquatic environments. As pointed out in the DEIS, wetlands are important sites for mercury methylation, and the aerial extent of hydrologically connected wetlands is one of the strongest predictors of fish-mercury levels in area lakes and streams (St. Louis et al. 1996; Wiener et al. 2006). Mercury methylation rates are strongly sulfate-limited in bogs (and poor fens), so that addition of sulfate from atmospheric deposition or groundwater discharge would be expected to stimulate methylmercury production (Branfireun et al. 2001; Branfireun et al. 1999; Jeremiason et al. 2006). The configuration of the Embarrass River wetland complex makes it especially susceptible to sulfate-enhanced mercury methylation. Not only would these bogs/poor fens be sulfate limited (and hence sensitive to additional sulfate), but the anticipated discharge would upwell through a mercury and carbonrich, anoxic environment ideal for SRB. Such groundwater discharge at the upland-wetland margin has been identified as creating sites of intense mercury methylation - "methylation hot spots" where methylmercury concentrations (or %MeHg) are exceptionally high relative to other wetland areas (Mitchell et al. 2008a). The increased ground-water and surface discharge toward the Embarrass River would also increase mercury transport from, sites of methylation to the river itself where the methylmercury load could then impact downstream aquatic systems. It is one of the unfortunate outcomes of Barr's stream sampling scheme that no water samples were apparently collected within the wetland complex north of the tailings basin (except locally at its toe). Such sampling would have provided a picture of current (legacy) groundwater discharge and associated sulfate and mercury levels by which a better understanding of the effects of increased groundwater discharge might be derived. Perhaps the best analogue for what might be expected from discharge of sulfate-rich groundwater through the Embarrass River wetlands is provided by the Everglades ecosystem of south Florida where agricultural drainage of sulfate-rich surface waters has greatly increased mercury methylation and mercury levels at all levels of the food chain (Gilmour et al. 1998). More recent reductions in sulfate discharge to the Everglades are closely associated with mark

2466 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. As a Minnesota citizen I value the natural resources we have in this state. I enjoy spending time up north and have serious concerns about the implications of allowing this kind of mining here. I am not opposed to tapping our resources for economic benefit, unless it comes at the expense of the very reason so many Minnesota citizens love this state. Please apply the appropriate level of scrutiny to this proposal. I look forward to enjoying the beauty of norther Minnesota, and sharing it with my friends and family, for years to come. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.

**Submission ID:** 2260

2670 Dear Mr. Arkley When I first read that this project, Polymet Mining Proposal, was getting positive attention by the DNR, I could not believe my eyes. I thought they were failing me. Being an ardent trout fisherman and having done so in the West and Midwest including the BWCA and surrounding areas, I have grown to value fresh water resources immensely. It is impossible for me to believe that an open pit mine using sulfuric acid to dissolve the metal and then leave that toxic waste out in the open behind earthen dams can be stable for the hundreds of years it takes for the compounds to detoxify. Breaches in dams are common place. I have seen myself what mining has done to streams and rivers in Montana, with the taxpayers picking up the cleanup tab. With full cleanup very questionable, so fish are edible, I think this a huge mistake. So please put me on record as very opposed to the permitting of the Polymet mine. I will be watching your actions with great interest.

1515 NOTE: the paragraphs below this are a form letter, but I'm leaving them in since I agree with them. My personal comment is that I was born and raised in MN. I've been to Lake Superior and BWCA nearly every summer growing up and I have some knowledge of the tourist and other industries around there from my adult work experience. You are destroying jobs, lives, and livelihoods by allowing sulfide copper mining, it is not like taconite mining, and it is not going to profit MN (although it may profit some few in MN who are already quite well off). Please look to the long term and preserve our state's natural resources, health, and beauty.

G2A,G11

**Sender Last Name:**    Forberg

**Submission ID:** 2213

2620 MR. FORBERG: Well, I think it is probably a really good idea for PolyMet to do their mining up there. First of all, it seems they have little to no environmental impact from what I have read. It is going to be really good, you know, during the economic downturn and recovery to have more jobs not only in Minnesota but in the Iron Range. That seems like it has had a little more trouble since the closings and layoffs up there. It would be nice to not have to travel really far to have to work. They are using pre-built facilities. They just have to refurbish them. What is it? 1.5 million man-hours of jobs. 400 permanent jobs. Spin-off jobs for not only the local economy, but it will be nice to actually keep it in state. You know, I was born and raised in the state and I would like to see Minnesota have more opportunities for people. And I know it won't just benefit the range, but it will also benefit Duluth and the surrounding cities; Cloquet. It will give the working men more opportunities to further themselves, especially with the trades. You know, I'm in the Ironworkers and I would like to see a lot of the other people in the trades, even people that aren't in the trades, be able to make enough to have a better life, both at home and within the drivable area, you know, so. And I would have to think more. It is nice to know that the money, you know, as long as it goes through, that the money is going to stay in state. If they don't open it up here, where else are they going to open it? It is either going A lot of the stuff they are going to be mining there, proposed mining, is stuff that we have to import from overseas, you know, for everyday things that we use. And the environmental standards here in the United States are a lot higher than they are overseas, so it would be an environmental impact worldwide as well, so. I think that's about as much as I have to say. Thank you very much.

2294 I have serious concerns about the proposed sulfide mining in northeastern MN. This is an unacceptable risk to the area. Despite the best intentions and reassurances, there is no guarantee that the mine and its waste rock piles will be kept safe. It has not been shown anywhere yet that it is possible not to pollute the ground and water. The continued maintenance of this very real potential hazard is an unfair burden to pass along to the many generations who will follow. The proposed mine(s) could touch two major watersheds, including the precious Boundary Waters Canoe Area Wilderness. Two decades or more of mining jobs is very important and needed. But if we're trading two decades of mining jobs for ruining our natural areas (quite possibly including the BWCAW) and losing tourist dollars for many hundreds or thousands of years, that is not a trade-off worth making. This is an unacceptable choice, and we who love this place, who live here and who visit here, want to preserve our natural places from sulfide mining and its contaminants.

3020 I am anxious to submit a comment regarding the PolyMet Corp. NorthMet mining project Draft Environmental Impact Statement. I am concerned about the consequences this project will have on Minnesota's economy and precious natural resources. I am certain you have received a number of responses outlining concerns about 1) safety, 2) impacts on water quality, including water leaching from waste rock piles, 3) long-term responsibility for clean-up, 4) subsequent tax burdens, 5) high sulfate (and therefore mercury) levels, 6) stability of tailings basins, 7) long-lasting contamination. I share these concerns, and I urge the DNR and the U.S. Army Corps of Engineers to more carefully examine the DEIS, working with PolyMet to complete stability analyses and create realistic long-term plan for containing pollutants and striving for minimal impact. I am encouraged by the relationships which have been set up in Wisconsin between the DNR and potential mining companies, because I value the care and thought put into permit grants. I would appreciate a similar prudence and critical eye from the Minnesota DNR. I understand the value of increased economic opportunity in northern Minnesota. I am a Minnesota resident and have spent significant time in the ecosystems under consideration for these PolyMet mines. I know the economy could use a boost. However, I know that the pristine nature of these ecosystems is a huge part of their appeal, both for tourism and for agriculture and for industry. For these reasons, I strongly urge the DNR to not only reconsider the PolyMet proposal but to implement a creative problem solving team to move towards sustainable innovation in northern Minnesota. The solution is not simply to abandon all mining prospects. I see the solution situated somewhere within a compromise, one that protects Minnesota's natural resources so they can continue to build an economy with vibrant tourism, fish and wildlife opportunities, and safe communities. I have grave concerns about the PolyMet proposal as it stands, and I fervently hope the DNR will reconsider before approval.

1 I'm a member of Painters and Allied Trades, Local 106, unemployed. I think the job opportunities will be great up here. Hopefully the technology has moved forward in the mining industry, and I think with the correct oversight we can do it safe; and the jobs is something that's really important, not only to the local economy, but to the whole State of Minnesota. I think it's a great opportunity for our area. I just give the project my full support. Thank you.

EOO

2608 I'm an unemployed member of the Local 106 Painters and Allied Trade in Keewatin near Hibbing, and I think it would be a great project for the jobs it would bring, not only to the area but for the state, to contribute. There's technology moving forward more and more every day, and we can, you know, take care of any problems that we have with anything coming, you know, any of the problems with the runoff and everything, we should be able to manage and take care of, the company should be up on it. And with as great as the state of Minnesota monitors stuff, we should be able to do good, and I'm just for the project.

1448	I worked in the boundry waters for 4 summers. I have traveled around the united states. I have explored Yosemite National Park, Joshua Tree, Florida Keys, the kenai peninsula, baja, canyonlands, and the tetons. There is no place that I have been that has such pure water as the boundry waters. In a world where civilization continually destroys pristine environments we have to ask ourselves is it fair to the earth and future generations. I know the answer for me is NO. Unfornately, I do not make the decisions that make such impacts. I am a voice, I am a person who has explored the boundry waters and I hope to someday re-visit them with my family. I hope that my child has a chance to see the purity that I have seen. I also hope that who ever reads this has the strength to stand up and say NO!	EOO,G7A,G11

| 4    | My concern about noise pollution is relevant to my work as a Spiritual Director, and Pastoral Care Provider to Clergy. I often advise people who are suffering from stress to care for their emotional, and spiritual needs by spending quality time in a place of beauty and peace. My family and friends frequently canoe in the Boundary Waters and we find that it is a restorative and therapeutic place to listen to the sound of silence and nature. Sound travels great distances across those precious waters and those in the Boundary Waters and neighboring resorts would experience mining noise from the blasting, drilling, and huge trucks hauling the minerals. How will this affect tourism? | N1   |
| 244  | Failure of the basin would result in serious and long-lasting contamination. I am also wondering how this will affect our bird, wolf and lynx habitat.   | WI5  |
| 400  | Some sites remain toxic for years after aggressive efforts to clean up the sulfuric acid waste. High sulfate concentrations turns mercury into forms that make fish dangerous to consume. Too many of our lakes and streams already are under mercury advisories. We live near the Mississippi River and there are advisories on both the kind and number of fish per week that can be eaten from it. I also believe that leaching chemicals from these mines can enter wetlands, peatlands, and tributary streams that have potential to be a hazard to our beautiful rivers and lakes.   | FM1  |
| 660  | I have viewed videos of the enormous pollution problems from this type of mining in places like Montana where clean-up efforts continue, and because the mining companies declare bankruptcy after their monies for clean-up are depleted the taxpayers are left with very long term clean-up efforts. Some sites remain toxic for years after aggressive efforts to clean up the sulfuric acid waste.   | PD4  |
| 703  | Some sites remain toxic for years after aggressive efforts to clean up the sulfuric acid waste. High sulfate concentrations turns mercury into forms that make fish dangerous to consume. Too many of our lakes and streams already are under mercury advisories. 18341 Just so you are absolutely clear from the get-go, the Climate Crisis Coalition of the Twin Cities (3CTC) is vehemently opposed to hard-rock, metallic sulfide mining in Minnesota or for that matter anywhere. Therefore, we call for not a moratorium or weak regulation thereof but a complete and thorough ban on all leasing, drilling, exploration, and extraction of metals by way of open-pit, strip and underground mining. The Arrowhead Region already looks like a wedge of Swiss cheese from all the drilling & exploration that has gone on thus far. We oppose this form of extraction not only the grounds of climate change but the long-term environmental and health impacts that will result if it is allowed to go forward. THE RELEASE OF GREENHOUSE GAS EMISSIONS Non-ferrous mining is just as energy-intensive as iron mining. The extraction, transport and smelting processes will release vast amounts of greenhouse gases that will add to global warming. With carbon dioxide levels already at 389 ppm, the planet cannot afford anymore such foolish and reckless behavior. The globe is rapidly heating up as seen in the alarming disappearance of Earth's cryosphere in the polar and alpine regions. Climate zones are shifting, bringing more droughts, heat waves and wildfires. Species are struggling to adapt with some succeeding and others failing and passing into the eternal void of extinction. More extreme weather events are causing natural disasters and unspeakable suffering and death for millions of people. The metals being smelted in Canada instead of here does not leave Minnesota off the hook. The state will be contributing hugely to the greenhouse gas equation and undermining Earth's heat balance. There is nothing climate-friendly about metallic sulfide mining especially since our climate is reaching its tipping point, which will eventually catapult the planet into complete ecological collapse. THE DESTRUCTION OF A VITAL CARBON SINK PolyMet's proposed strip mining operation will destroy 3,200 acres of forest and bog, which are needed not only for their water filtering capacity and precious wildlife habitat, but also for their carbon storage. Once the peat is removed and dried, it will oxidize and release tons of carbon. The deadly release of that carbon will add two percent to the state's CO2 emissions. It is quite astounding that the DNR could even consider it let alone grant a permit for such a heinous act as the destruction of an ecologically and climatologically essential peatland. PolyMet's promise to replace the lost wetland with another is only a ruse. A fake does not a wetland make. ACID-MINE DRAINAGE IN PERPETUITY Northern Minnesota being a water-rich region, it is extremely vulnerable to the pollution caused by the extraction of sulfur ores. The Duluth Tribune claims that the ore is low-sulfur, containing one percent or lower. The editors of the paper consider it negligible. However, an EPA senior research chemist, Gary Glass, has pointed out that "the folks who talk about low-sulfide ore content are using the 'game of units' to try to minimize the potential for impacts by the reactive component—sulfide—expressed in percentages.... By expressing the concentration of sulfide as a percentage, by weight, in the ore or ore tailings, the values computed are made to be small, but in reality, they are not insignificant." The sulfur contained in the huge volumes of ore that need to be mined in order to get at the sought-after copper, nickel, cobalt, palladium, platinum, gold and other precious metals will add up in no time as the rock waste accumulates. Once the rocks are blasted and piled up in slag heaps and tailings ponds, they will come into contact with surface and groundwater and the sulfur will acidify, making lakes and streams uninhabitable for aquatic life and causing massive fish and bird kills. That has been the experience elsewhere in the country. There will also be similar releases from tailings basins, whose linings are notorious for

332	I am writing to express my support for the proposed PolyMet Mining Co. project in the Mesabi Iron Range. Minnesota needs jobs, and nowhere is that more true than on the Iron Range. PolyMet will help diversify the economy of the iron ore-dependent Range, and will help meet our nation's domestic demand for copper, nickel, platinum, cobalt, gold, and palladium. Most importantly, this project offers a real opportunity to put Northeastern Minnesota citizens back to work. At full operation, PolyMet will employ 400 people earning an annual payroll of about \$40 million. In St. Louis County alone, it will create more than 500 spin-off jobs and create an economic impact of \$242 million. Minnesota has strict environmental standards, and I have the utmost confidence in the environmental review process. This process includes public hearings, such as the one taking place here tonight. Throughout this multi-year process, PolyMet has done their due diligence and has faithfully followed the law. This includes providing all the necessary information for the draft environmental impact statement (EIS). The resulting draft describes the many steps PolyMet will take to minimize environmental impacts. I am excited to see this process move ahead, and I look forward to creating more jobs on the Iron Range.	EOO,G6
<b>Sender Last Name:</b> Fredrickson		<b>Submission ID:</b> 1111
1216	I respectfully urge that all necessary permits allowing PolyMet Mining to begin construction of its proposed precious metals mining operations be issued as soon as possible. I am very much in support of the project and feel there is great need for the jobs that will be created both in the construction phase and the operations phase. It is my opinion that the company has demonstrated that it has taken the necessary steps to assure little or no adverse affects to the environment. I believe the company has thoroughly evaluated the potential threats to the environment and has addressed those in detail in its draft Environmental Impact Statement. It will use existing infrastructure and land from the former LTV mining operation thereby reducing the need for completely new facilities. With the dismal state is our state's economy, the state is in great need of the tax revenues that will be generated from both taxes on the mining operation and the millions of dollars in salaries and wages that will be paid annually. The favorable economic impact to the Iron Range and to Minnesota as a whole would be phenomenal. I was raised on the Iron Range and have family and friends in Hoyt Lakes who have always been dependent on the mining industry and have suffered through its volatility. There is no better time to allow these new jobs to be created than now. Please consider carefully, the benefits to the people living in northern Minnesota.	EOO
<b>Sender Last Name:</b> Freeberg		<b>Submission ID:</b> 3533
3795	I believe the Poly Met project should be allowed to proceed. The project would be good for the local economy. Minnesota and US regulations are the best in the world. If Mining can be competitive I feel it should be done in the US rather than a country where there are no regulations to protect the environment or labor forces. Although mining can change the landscape existing mineral reclamation regulations can be enforced to protect the area. Richard Freeberg	EOO
<b>Sender Last Name:</b> Freundschuh		<b>Submission ID:</b> 204
202	I recently visited and toured the new PolyMet facility where they described their operation and processes. I was very impressed with the detail and effort already committed. As a Minnesotan, born and bred, I appreciate all our state has to offer. The lakes and woods are something I enjoy on a regular basis. I believe that PolyMet has addressed the issues of contamination as well as those of what to do with the bi-products developed. In good economic as well as current times, companies willing to invest in Minnesota should be embraced and thanked. This facility will provide jobs and support for the local communities as well as provide needed financial support for our state. The sooner this plant is up and running, the better. Thank you for the opportunity of presenting my two cents,	EOO

729 Come on, guys....This is too much, too fast. There needs to be more time spent studying the effects of this, and more public hearings. Why do I care, living in Colorado? Because I love the Boundary Waters and everything it stands for. PRO6

**Sender Last Name:**    Froehlingsdorf **Submission ID:** 1050

1153 My name is Tom Froehlingsdorf, and I am -a skilled construction laborer, with a educational background in Wildlife Biology. I support the PolyMet mine project! It would have a great impact on the economy, both local and nation wide. We need more domestically produced metals with less means of transporting. We all know how much the environment is hurt by the ongoing chain of transportation. Environmentally I believe Minnesota is ready for this mine. The methods to mine the metals here in an existing, "infrastructure are a great idea. Please listen to all the positives this job has and what it could do both economically providing jobs, and environmentally controlling them. EOO

**Sender Last Name:**    Fryberger **Submission ID:** 1101

1206 As a life-long resident of northern Minnesota and affiliated with its Iron Ore industry the past fifty years, I have been witness to the many changes across our Mesabi Iron Range - from the numerous small underground mines to the "red ore" open mines and now to the large taconite operations with state-of-the-art technology to process the low grade ores. During the last 100+ years these changes have brought considerable progress in the areas of----environmental safe guards; safer work places for the employees; more and comprehensive benefits; a more stable tax base for the communities from Grand Rapids to Babbitt and finally the industry has been and continues to be the economic engine of northeastern Minnesota. This economic engine---- Contribute \$3.1 billion to the states economy in 2007 and supported more than 10,000 jobs - Paid \$148 million in state and local taxes in 2008 of which \$46 million supported local schools and \$11 million supported the University of Minnesota - As the foregoing makes very clear our minerals industry has certainly provided the foundation which has supported a high standard of living for many across our iron range. So it is not a question of whether or not our mining industry is important to our area and our state, that was determined years ago, but rather how do we manage an extractive industry without harming our precious natural resources of air, water, and land as we provide the necessary metals for our increasingly complex and technologically based way of life? I feel that Poly Met Mining, in their draft EIS for their Northeast Project, has thoroughly and painstakingly addressed the potential environmental hazards. The \$30 million that Poly Met spent in researching and documenting the process to be used to protect our natural resources in the development of the DEIS, along with the expertise input from the folks at the Minnesota Department of Natural Resources, Minnesota Pollution Control Agency, US Corps of Engineers, and other stakeholders certainly convinces me that the North Met Project is an environmentally and economically sustainable project, which I can wholeheartedly support. In addition, we are all citizens of the world, not only of Minnesota, and consequently it would be irresponsible of me to speak out against this thoroughly researched and responsibility documented project hoping to force Poly Met to relocate from Minnesota to focus their efforts on minerals reserves in other areas of the world - areas in which the environmental regulations are more lenient and by their nature, more damaging to the world's natural resources. So let's get behind the project and make it a state-of-the-art operation that protects our precious natural Resources and becomes the benchmark for all other similar mines throughout the world. In other words, let's be part of the solution rather than an obstacle to the protection of our natural resources, not only in Minnesota, but also around the world. We in northeastern Minnesota can, in an environmentally responsible way, produce these metals so dearly needed to build our green technology of wind turbines, solar energy, and hybrid automobiles. Thank you for your consideration and ongoing commitment to protect our natural resources while providing the cooperative leadership with other stakeholders which is so necessary if our extractive industry is to be economically viable. EOO

3208 I live in Minnesota and love to take advantage of the many opportunities to be outside, especially on the North Shore. Some of my favorite places are the BWCA, Superior Hiking trail, State Parks and Forrest Service campgrounds, and all the trails and back roads of northeastern Minnesota. The drive up Highway 61 to Grand Marais and stopping to look out at Lake Superior is amazing. I will never forget the first time I saw the Partridge River at the falls with the water spray falling on me. I would certainly hate for the Polymet project to impact our precious resources on the North Shore. I'm concerned about the impact on the wildlife in the area; especially the Canada lynx and the wolves. I am also concerned the impact on the Partridge River and the aquatic life and habitat and nearby lakes due to the discharge of sulfates from the Tailings Basin. I am also concerned for the health of the BWCA. According to the U.S. Forest Service, the Polymet project alone will cause significant haze impairments in the Boundary Waters 36 days each year! I don't think it has been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. Please take the time to consider my concerns as well as those of others before approving the Polymet project.

1 The wetland classification was based on a generalized, largely physiognomic scheme that was not effective for characterizing wetlands within either the project area or potential mitigation sites. With respect to peatlands, this scheme failed to distinguish between bogs and fens, which have contrasting sets of physical, chemical, and biotic properties. It was therefore difficult to adequately evaluate Polymet mining impacts on peatlands within the project area or the quality of the mitigation plan.

2	<p>According to the Draft EIS (4.2-3): The coniferous bog and open bog communities make up the majority of the wetlands at the Mine Site. Black spruce, tamarack, and balsam fir are the dominant canopy tree conifers. White cedar and deciduous swamp birch are also occasionally found in this community ..... Shrubs are usually ericaceous (belonging to the heath family) and/or speckled alder and raspberry. Sphagnum moss comprises an almost continuous mat with interspersed, non-dominant forbs such as bunchberry and blue bead lily along with sedges and grasses. However, balsam fir, white cedar, swamp birch, speckled alder, raspberry, blue bead lily, and all the grasses in Minnesota are reliable fen indicator species that are never found on true raised bogs (see papers in the Glaser C.V. and also Field Guide to the Native Plant Communities of Minnesota. The Laurentian Mixed Forest Province). The scientific literature defines raised bogs on the basis of a discrete set of physical, chemical, biotic, and hydraulic factors such as: 1) the interior of these peat landforms is higher than its margins (so the peatlands are called "raised bogs), 2) the surface waters have a pH less than 4.2 and Ca concentrations less than 2 mg/l, 3) the peatland has no fen indicator species, and 4) the peatland receives all its waters and salts solely from atmospheric deposition (so raised bogs are considered to be "ombrotrophic") (see Glaser CV for citations). Since the species composition provided for the bog vegetation types within the Draft EIS includes species that are clearly fen indicators, it is impossible to say that these wetlands are disconnected from groundwater or surface water flow systems as stated in this report. It is also illogical to conclude that these wetlands are "perched" since many of the wetlands in the Polymet site are probably forested or non-forested fens (or poor fens) that are supplied at least partly by surface or ground waters that have percolated through mineral soil. If these surface or groundwaters have elevated concentrations of sulfate, the wetlands could be significant sources of methyl mercury. The Draft EIS also fails to note that fens can be either forested or non-forested or that marshes are distinguished from non-forested peatlands by the absence of peat accumulation so that the vascular plants root directly into the mineral soil. Recommendations: The Draft EIS should be improved by using more generally accepted definitions for bogs, fens, marshes, peatlands, and other types of wetlands so that they conform to international scientific literature and also the scheme adopted by the Minnesota DNR's County Biological Survey's treatise on the native plant communities of Minnesota. It would be highly advantageous to collect samples of the surface water in the wetlands of the project areas for analysis of pH, alkalinity, and dissolved solutes particularly Ca for help in separating bogs from fens but also for assessing the acid neutralizing capacity of these wetlands.</p>	WE1

**Theme Codes**

2 The Draft EIS needs more documentation with regard to all the sites evaluated for the mitigation plan. I realize that the report is very long and broad in scope but it was not possible to evaluate the reasons why so many nearby sites for wetland mitigation were rejected within the Saint Louis River watershed and adjacent areas. This decision weakened the mitigation plan because the closer sites have the highest probability of containing wetlands that are similar to those that will be directly impacted by the Polymet mine. At the minimum a table should be included that contains the geographic coordinates and some rationale for rejecting each of these sites. As it stands the case for selecting 2 distant sites near Aitken or Hinckley for the mitigation plans seems weak, and unsupported given their distance from the Polymet site and their differences with respect to vegetation and environmental setting. My reservations with regard to the mitigation plan are fourfold: First, the 2 sites identified for mitigation efforts have different environmental settings with respect to climate, depth to bedrock, and glacial deposits than those at the Polymet project site. Second, the wetlands selected within these sites are also probably significantly different from those of the Polymet project areas because the Aitken and Hinckley sites are located at the extreme southern fringe of the boreal and mixed-conifer hardwood peatlands of the northern portions of Minnesota. Third, geographic coordinates were not provided for all the sites evaluated for mitigation efforts so they could not be independently located with certainty and examined on Google Earth or topographic maps. Fourth, it is impossible to replace a peatland ecosystem within the lifetime of human beings since it takes centennial to millennial time scales for peatlands to form and develop into raised bogs. Fifth, I still feel that Polymet and the state of Minnesota are missing an important opportunity for restoring and protecting an exceptional complex of wetlands north of the town of Alborn in the Saint Louis River watershed that contains peatlands and wetlands very similar to those found in the Polymet site. This site was described in depth in my past report to Janette Brimmer of the MCEA and I am here enclosing digital files of its satellite image and a map of the site. Recommendation: In my opinion the DEIS misses an outstanding opportunity to restore and preserve an exceptional wetland complex in the Saint Louis River watershed that contains a complex of bogs, fens, and other types of wetlands similar to those at the project site and adjacent areas. In addition, this complex just north of the town of Alborn also has the most outstanding patterned fen in northeastern MN, robust populations of several rare and endangered plant species (*Carex exilis*, *Rhynchospora jitsca*, *Xyris montana*, and *Jungius stygius*). The site has been previously impacted by drainage ditches and a now abandoned road, but occupies largely tax forfeit land and is relatively wild. It has a wolf pack in the vicinity and is apparently a prime wildlife habitat based on its lack of development. The land could be purchased, restored (by filling in drainage ditches) and provided to the state or county to be managed as a scientific and natural area.

WE3

3 1. The Polymet DEIS and supporting documents I reviewed addressed issues pertinent to potential hydrologic and geochemical effects of the proposed low-grade ore heavy-metal mine (e.g. copper, nickel and associated metals except for mercury) to suggest that there will be little regional long-term water quantity and water quality effects caused by the mining activity, and probably not many effects locally and proximate to the mine other than in the mine footprint itself. However, there still remains enough uncertainty to merit the Minnesota DNR (herein termed, "DNR") to take additional steps to minimize possible environmental degradation in the vicinity of the proposed mine.

268 As a resident and business owner in Hibbing, MN, I am writing to express my support for the Polymet Mining Corporation project. As a financial advisor in an area that has been hit hard in the past 18 months by the decline in the steel industry, I would be remiss if I did not reach out at this time to make known the importance of this project to our local region. As a business owner in the financial sector, I continually strive to run my business in a manner that supports the local economy. Without any solicitation whatsoever, my clients have continually requested that portions of their dollars be invested in Polymet Mining Corporation (PLM). It is nothing less than inspirational to see the hope and support that has been generated by this project so far. It is my understanding that Polymet will produce the copper, nickel, platinum, gold and cobalt in an environmentally sound manner and generate significant economic activity in this depressed part of Minnesota. In addition, it will provide millions of dollars in local and state Taxes that will, in turn, give a boost to our communities and educational systems. It is my request that you make every effort to see the Polymet Mining Corporation project through to completion.

1594 I am writing to you in support of the PolyMet Mining Company's NorthMet project. This project would be located in an established mining district on the Mesabi Iron Range. It would develop a new mine and reuse many processing facilities of a shuttered taconite plant and recycle a brownfield site. The company would use environmentally superior processing technologies including using sulfur in the ore to fuel processing reducing the need for additional fuel. PolyMet Mining is proposing a mine and processing facility near Hoyt Lakes to produce copper, nickel, platinum, palladium, gold and cobalt-many of which are used in medical applications. The annual production would be 35,000 tons of copper (to be used in electrical wiring, hybrid cars, wind turbines, plumbing, roofing and water heaters-the US imports 40% of the copper used annually) and 7,700 tons of nickel (used in alloys, batteries, aerospace and stainless steel for many medical instruments-there are no nickel mines in the USA). They will also produce 360 tons of cobalt used in super alloys, aircraft engines, cell phone batteries, steel belted radial tires, hand tools, and medical applications like joint replacements and cardiac stents. There are no cobalt mines in the US. In addition to these uses, they will also produce 106,000 troy ounces of platinum, palladium, and gold. Platinum is in catalytic converters, fuel cells computer disk drives, fiber optic cables, spark plugs, and anti-cancer drugs, surgical implants, neurosurgical applications and dental implants. The US imports more than 90% of the platinum it uses each year. Palladium is in catalytic converters, fuel cells, watches, carbon monoxide detectors, mobile phones, dental crowns and filings and blood sugar test strips. We import 85% of the palladium we use each year. Gold is used in telephones, cell phones, air bag systems, home appliances, electronics, computers, arthritis treatments, stents, pacemakers, and insulin pumps. We import more than 50% of the gold required each year. PolyMet will protect air and water resources while promoting efficient use of natural resources through an open and transparent process. The ultimate result of this environmental philosophy is that PolyMet will conserve and protect the air, water, and other natural resources upon which we all depend. PolyMet is dedicated to the conservation and protection of environmental resources and will conduct itself in an open and transparent manner regarding environmental monitoring, performance, and reporting. The PolyMet project will recycle and reuse water, be a minor source of air emissions, minimize impacts, reuse resources, and assure proper closure and reclamation. The project will have a huge economic benefit to the area. It will create 1.5 million hours of construction, employing about 300 workers over three years along with about 400 stable jobs with an estimated \$40 million annual payroll. There will also be an additional 500 spin-off jobs. This will create a \$242 million economic impact in St. Louis County and \$15 million annually in state and local taxes and \$45 million in federal taxes, based on 2008 metal prices. PolyMet has worked with federal and state regulatory agencies in drafting an environmental impact statement exploring potential impacts and ways to address them. In closing, I urge the DNR and the MPCA to issue the necessary permits to move the PolyMet project to a reality.

171	I am writing to you regarding the PolyMet Mining Co Proposal. It is my hope that you will be encouraged to continue this project. My family has worked for the different mines on the Iron Range for as long as I can remember. My father retired from the mines, all 3 of my brothers worked for the mines and I have one brother who is still working for the mines. As you can see, my family relied on this work to be able to remain living on the Iron Range. I know that many of our young people have moved out of the area because there is little work here on the Iron Range. According to what I have read regarding PolyMet, it looks like this is a good opportunity for our people to “come home” and live in this beautiful Northland - if not to be employees of PolyMet than to run businesses of their own which will spin off from the increase in people coming to the Iron Range. It looks like the environmental review process has been very thorough and does address all the impacts and how to mitigate them. I believe that PolyMet will meet the environmental requirements and be able to generate a boom in the economy in the Northland that only adds to the betterment of all of our lives in this area.	EOO,G5
<b>Sender Last Name:</b> Gagnon		<b>Submission ID:</b> 3224
3553	Please do not compromise our wilderness for a temporary gain! We need our wilderness areas to sustain tourism and to uphold our charge to be good stewards of the land. I am not a die hard environmentalist, but selling our wilderness rights to a foreign strip mining company just smacks of nearsighted greediness. We are better than that. Some day our clean water and wilderness might be the greatest resource of all. Please honor that fact. Do not do business with Poly met. My tax dollar is speaking. Thankyou!	EOO,G2,G11
<b>Sender Last Name:</b> Gaillot		<b>Submission ID:</b> 3198
739	To do so I am rquesting a time extension of 30 to 45 days to conduct a review of the EIS. In addition I am requesting more public meetings in more places be conducted to gather public input. The current EIS review schedule is too limited. Public meetings should include the option for citizen statements and discussion in the open meeting.	PRO6
3223	The DEIS does not outline any specific plan for reclamation after the mine site is closed. There is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held in escrow, in perpetuum, as a damage deposit and that amount should be specific and included in the final EIS. What assurances are there that the mine site will be reclaimed if Polymet is closed in the future due to a down turn in the mineral market and abandons/orphans the mine site and leaves their environmental devastation to the taxpayers to mitigate? There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting. The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet can not be looked at as a single, one-time event in N.E. Minnesota. With permitting of Polymet will come at least 2, perhaps 4 or more new applications for permitting from other mining companies. What will be the total impact on the environment by all these potential mines and how will the EIS deal with mitigation of all these in concert? Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. You cannot just depend on the mining company to do its own monitoring. There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR	EOO,WR1A,WR1E,WR2D,

3835	This letter is coming to you to inform you of my strong concern for the serious and dangerous water and wildlife impact your intended mining procedures would create. Keeping the waters of Minnesota and their contents not only safe, but as clean as possible has been the major concern of so many of us, especially in the Superior area and north. We are located on Burntside Lake in St.Louis County and actively participate in testing and protecting the purity of our lake.....and surrounding lakes. Sometime very soon we, as a country, need to become aware of the sustenance value of our water and environment. We have enjoyed the luxury of using all that our lands will give us with no recognition of what we are losing. We don't now nor will we want to pay for the added protection of our natural resources which are needed to provide us with safe drinking water and safe environs. We won't even have useable natural resources if we keep using all we have. I am sure you are already aware of all that I have said. My reason for writing you is to inform you of my great concern about the gradual destruction your mining procedures will cause to the priceless environment so many of us enjoy and intend to protect. Please take the time to develop safe methods. Those metals will remain there until you are ready with safe mining procedures. Until then, we all will firmly oppose the PolyMet proposal.	G2C
<b>Sender Last Name:</b> Garber		<b>Submission ID:</b> 2302
425	1. Extend the comment period beyond February 1 so more citizens as they learn more about this project can convey their opinions	PRO6
2743	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. 3. Just because a foreign mining company can make money here for awhile, does not mean we should allow them to. Risking perpetual problems with our water makes no sense. 4. Why is our governor not standing up for the citizens of Minnesota on this issue?	G7
<b>Sender Last Name:</b> Garbisch		<b>Submission ID:</b> 1178
1293	I am writing to oppose the permitting of the PolyMet project or any other sulfide mine in Minnesota. While I am a more conservative, business-oriented person than many PolyMet opponents, a business like sulfide mining places huge risks upon people (us, the public) who have nothing to gain from the mine. These who seek to earn the profits should also shoulder the risks. Once Lake Superior or the Boundary Waters lose their pure water, it will be gone forever.	EOO,G7B
<b>Sender Last Name:</b> Garrity		<b>Submission ID:</b> 187
179	I'm writing to ask you to support PolyMet Mining. PolyMet's 400 employees and the hundreds of spin-off jobs will provide a huge economic benefit across all of the Iron Range. It will also provide millions of dollars in local and state taxes of much needed support our communities and educational system. I am the General Manager of Midwest Communications here in Hibbing; we have six local radio stations serving Northern MN. PolyMet would be a huge help to not only my business, but so many other existing businesses. Without more jobs in this area, more people will be forced to leave the area and more local businesses will close. This beautiful area has so much to offer, but we need jobs to be able to keep growing and prospering. I've lived on the Range my entire life and I would love my daughters to be able to live and work in this area. I'm so proud to have not only grown up here, but have been so lucky to have been able to stay and raise my daughters. Our youth have been forced to move in previous years due to the lack of work after college and it would be ashamed for this to continue. I think PolyMet would be a huge step in the right direction to be able to keep our area people employed, existing businesses healthy and our youth would have a chance to stay in this area after college and work and raise their children. I'm asking you to please support PolyMet Mining for these reasons I stated along with so many other reasons.	EOO
3820	I strongly support the Polyment project. I think they are doing everything they can to maintain the safety to the environment. This area needs jobs. Last year was the worst year ever in this area. I was layed off for the first time in my carrer.	EOO

3784 I'm originally from North Dakota, and first came to Minnesota a few years ago for college. The North Shore is the most beautiful place I've ever seen, and I don't believe PolyMet has the capacity or the intention to conduct their mining in a safe and clean manner. The acid and toxic metals that will be released into our Minnesota waters will continue to pollute our rivers and streams for decades, long after PolyMet has cut and run from the disastrous site that sulfide mining has left in other states. Allowing this project to go through will be a mistake that will affect Minnesota for years.

G7A

**Sender Last Name:**    Gavitt

**Submission ID:** 15

14 Samuel Gavitt. I'm for the project because I'm a union ironworker and it will hopefully bring us a bunch of good jobs and also bring good jobs to all the people in the community and hopefully spinoff jobs like other businesses coming up here and all that good stuff. I'm totally for the project and hopefully this whole environmental impact statement shows people that it's a good thing and it won't really affect the environment that much. That's everything I have to say.

**Submission ID:** 2233

1146 Increased levels of sulfates leached from the PolyMet Mine will increase mercury accumulated in fish tissues, causing harm not only to the fish but to animals and people who eat the fish. The DEIS did not adequately analyze the potential impact of the mine on mercury levels in surrounding waters and fish. This may have a disproportionate impact upon the Fond du Lac Chippewa Tribe who depend upon fish in their diet to a greater extent than their non-Indian neighbors.

WR4B,WR5C,FM1

1817 The PolyMet Mine will result in sulfate releases that will exceed state standards for wild rice, which is sensitive to sulfates. These sulfates will likely eliminate wild rice in the Partridge and Embarrass Rivers, and diminish the famous wild rice beds in the St. Louis River estuary near Duluth, which is 100 miles away from the mine. Any contamination or elimination of wild rice resources will likely have a disproportionate impact upon Chippewa Indians, who depend upon wild rice to a greater extent than their non-Indian neighbors.

WR4F,WR5C

2011 PolyMet does not propose a liner for the Tailings Basin. This would result in increased seepage from the tailings basin relative to existing LTVSMC seepage, including both surface seepage through the tailings basin embankment and groundwater seepage through the base of the LTVSMC tailings. It is the Tribal cooperating agencies' position that the existing LTVSMC tailings are contributing substantially to the level of constituents observed in the groundwater. More mine waste will simply make this problem worse.

PD2,G9

**Submission ID:** 1848

304 I am most concerned about the loss of wetlands.. The project allows the loss of 1200 acres of wetlands in St. Louis County and the St. Louis River watershed, with an inadequate mitigation plan. The loss of these wetlands will result in a net loss in carbon sequestration provided by these wetlands (peatlands).

WE3

310 Harmful To Wildlife - The DEIS does not adequately address the mining project's impact on Canada Lynx and Grey Wolf Habitats. It also does not address the destruction of existing wildlife corridors. The project is located on land the USFWS designated less than one year ago as critical habitat for the Canada Lynx.

1280	I do not value short-term economic gains over long-term water quality. As an inner-city kid, going to the Boundary Waters changed the course of my life. The experience of being able to drink the water and have silence- made me more aware of the environment & how valuable it is. PLEASE take the time to judge this decision carefully. I don't want sulfide mining to ruin the BWCAW.	EOO,G11
<b>Sender Last Name:</b>	Geist	<b>Submission ID:</b> 1244
1395	As an environmental science instructor and resident of Minnesota, I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources, including waters and native habitat, especially lands designated as critical habitat for the endangered Canada lynx.	G2C,G7B
<b>Sender Last Name:</b>	Geiwitz	<b>Submission ID:</b> 299
313	I am pleased to support PolyMet Mining's NorthMet Project. The mining of these valuable metals is vital to the economic growth of Minnesota. At the same time, I know that the State of Minnesota has sufficient regulations to successfully guide the production of these metals using responsible, environmentally appropriate mining practices. The PolyMet Project offers Minnesota an opportunity to be the sole source of critical metals that are used in products across many competitive industries. Growth in employment in the Arrowhead region, growth in the tax base and the associated benefits to area communities/educational systems, all make the PolyMet Project a vital next step for the state economy. As an investor in private businesses, the prospect of increased production using environmentally responsible guidelines is the perfect formula for successful returns in today's economy. I urge the DNR to support the PolyMet Mining Project and therefore support the continued success of our MN economy.	EOO
<b>Sender Last Name:</b>	Gemuenden	<b>Submission ID:</b> 371
412	The Draft EIS must assess the cumulative impacts of past actions, including past mining activities, on affected aquatic species in considerable more detail than what is presented, including ongoing adverse impacts resulting from the pollution occurring at the LTV site. See e.g., DEIS, 4.5-9, n. 4 (Tribal cooperating agencies comments, stating "there is no evidence to support a conclusion that low species richness in either the macroinvertebrate or fish communities is solely a manifestation of poor habitat, and not also potentially a result of previous mining impacts in the watershed").	FM3
3573	I support PolyMet Mining's NorthMet Project. PolyMet will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefit. PolyMet's 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region/and my local business GPM,inc. PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system. The metals that Polymet will mine are essential to green technology such as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters. The PolyMet project has been designed to minimize environmental impacts; reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. Polymet is not using Yesterdays Technology that cause people to be fearsome and water in the BWCA is on the otherside of the watershed.	EOO

3115	<p>I believe that the PolyMet sulfide open-pit mining project proposed on public land in Minnesota’s Superior National Forest would harm the environment and has not been properly studied in the DEIS. I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care. In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine’s closure, as well as tailing’s basin discharges, high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume and affects the growth of wild rice. Changes in water levels caused by the mine would affect a large surrounding area, impacting recreation as well as mercury levels and water quality. It is also my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials, but that the basin already has stability issues making it unsafe. All liners will eventually leak. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project. Require PolyMet to show that their waste rock and tailings piles won’t collapse and dump uncontrolled pollution into nearby surface and ground water, and that they will not create water pollution from mine pits, seepage or discharge that lasts for decades or even thousands of years. Multiple discharges from the PolyMet project to surface water and ground water would violate Clean Water Act and State water quality standards, putting human health and animal species at risk. Safe, clean drinking water is a critical global issue and a matter of national security, as well as a state and local concern. Permitting a mine that projects these kinds of pollution outcomes and these uncertainties is unacceptable to me as a responsible citizen and steward. The DEIS has not addressed the effects of climate change, especially on water levels. What are the effects of regional predictions for warmer, wetter winters and hotter drier summers? How do these predictions affect the ability of the proposed technology, to control water levels to contain sulfuric acid and other contaminants?</p>	<p>EOO,WR1E,WR2D,WR3I,P</p>
3116	<p>Specifically, the tribes commented that the studies of water pollution, wetlands, mercury in fish, wild rice, endangered species, financial risks and perpetual pollution from the sulfide mine are inadequate. I am convinced that there is no objective evidence that sulfide mining for copper, nickel, and other nonferrous metals can be done in Minnesota at this time without impairing wetlands, habitats and water quality of lakes, streams, rivers, and the aquatic species, ecological systems and communities that depend on them. The PolyMet DEIS describes significant environmental issues associated with this proposed mine.</p>	<p>EOO,WR1E,WI2,WE2,PD3,</p>
3117	<p>Furthermore, PolyMet has not yet done the research needed on existing LTVSMC contamination and drinking water wells near the tailings basin.</p>	<p>WR1E</p>

1	Outstanding EIS work. Great for MN jobs. Product for MN Mtg in copper, etc. Will help us economically. More jobs in support areas. Great tax income. Go for it!	EOO,G1
1	I suggest we move from 1.5 to 2 times wetland replacement + recovery. Wetland are critical to the eco system and our [illegible] should reflect that. Therefore – more taxes on mining revenue - greater percent of wetland replacement rejoined – from 1.5 to 2 times	WE3
2	I support the project. It seems that Polymet is trying very hard to assure Minnesotans that they have their hazards identified enviromentally. I am slightly concerned with Polymets' attitude towards it's own workforce. Mesabi Nugget which is its neighbor at the old LTV site is only paying some of it's employees \$9.00 hr. This is not a living wage. I would hate to see Polymet get a permit if they are going to pay their employees only \$9.00 hr. If polymet can make assurances they will pay their employees well, Grant them a permit, but Minnesota's economic environment needs to be protected as well.	EOO,G1
3	My name is Carey Kowalski, I am the Apprenticeship Coordinator for Boilermakers Local 647. I have unemployed Apprentices in this area who need work as well as fellow Journeymen. I support PolyMet! The only way out of these hard economic times is to create jobs not to stop them.	EOO
3	I support the project. I think we should use of are resoruces to keep are economic growth strong. These jobs, it would bring should be good wages with health and pension for stuably	EOO

4	The project just makes good sense. Jobs, Revenue, product for the world market. JUST GET IT GOING!	EOO,G1
4	Well, my name is Bob Croteau, and I'm all for this PolyMet Mining. I've got a lot of people up here that need jobs, and after the mine closed down, this would be a very good thing to replace our work force. So that's about it.	EOO
4	Safe, environmentally sound mining that produces the products we all need and provides jobs & taxes to run our community. I am definitely in favor!	EOO,G1
4	Considering the following: - The strict rules governing possible environmental impact of mine development - The strategic nature of the mineral resources to the country - That this is one of the worlds largest resources of nickel & copper - The need of these metals for developing & manufacturing green technology - The positive impact it will have on the economy of the region & the state - The positive economic impact to the education system of Minnesota It would be a disservice to the local population & the state as a whole to prohibit this development.	EOO,G1
5	I think this project shoul be allowed to move forward. I believe the project is safe and will help economy. I live in city but own property near mine & Birch lk. I have nothing to gain from this mine personally but know it's the right thing to do. Polymet is not asking for Bail out money to start business is creating work with/out government job creation at not cost to tax payers. THIS IS WHAT OUR COUNTRY NEEDS. I also was told how tailing ponds are forever contaminated in the area. I was told that even a fathead minnow could not live in these ponds. I was told this from members of Sierra Club. Guess What? I still trap minnows in these ponds and have for years. So in ending I hope Sierra Club can find more factual information.	EOO,G2
7	I am writing this letter to support the MolyMet project. This project is not only very important to Northeast Minnesota, the the many people, families and businesses this project will benefit. The additional jobs from construction to the long term employment opportunities the PolyMet project will bring to the State of Minnesota through additional individual income taxes, corporate taxes, lower unemployment costs, additional savings from people having health insurance coverage to people in northeast Minnesota having a positive attitude towards the economy will in its self be Northeastern Minnesota's "STIMULAS PLAN". As a person who decided to move to this area several years ago, I understand the need to balance the available resources such as monerals and water with the development of a project like PolyMet. I feel the EIS lays the groundwork for developing an environmentally, economically project that will benefit not only northeast Minnesota residents, but people throughout the country and world by showing this type of mining can be achieved through good governmental entities and local people. In the end, this entire process should set the bar for future projects. I fully support this project. Thank you for your time and commitment to make this process open to everyone.	EOO,G1
7	My name is John Dahmen from Aurora, Minnesota. I'm a student here at Mesabi East, and I guess my interest in this project is more so for our area, too, because we were pretty devastated with the whole LTV closing, and we need something to, I guess, get our area boosting again. But I guess for my future in a way, because the way I look at it, once I leave from the area to go to college and stuff, what is here for me to come back? You know, how am I supposed to get a job back here if there is no options for me? And, you know, along with the economic boost for our area, us being northern Minnesota, Iron Rangers, we are pretty -- we care about our environment and stuff, so to see this many people in such favor for a project like this, that means that they must care for the environment, too, the company; otherwise, obviously we wouldn't be for it, too, because, I mean, we live in the outdoors, so we care about it, and we care about what happens with it. So I guess that's my statement I want to make. You know, the support that we have, not only is it for looking out for us and the money and the jobs and stuff, but it is for our future, I guess, for our kids and stuff, and the environmental future also for our area.	EOO

7 As a life-long citizen of Grand Rapids, Minnesota and Itasca County, I am very pleased to share my thoughts on the draft environmental impact statement (EIS) for PolyMet Mining Company's proposed non-ferrous mine near Hoyt Lakes. We are interdependent upon the industries of northern Minnesota with many citizens working and living in and about the communities of the Iron Range. A project such as this has rippling effects throughout all of northeastern Minnesota, and I am strongly in support of the approval of the EIS. I have been well informed at various presentations throughout the last couple of years about the great care and concern the management has taken to address the many environmental issues involved with a project like this. I am confident that all state of Minnesota environmental processes will be followed, and the appropriate authorities will monitor all progress in the project. Economically, this project is a positive sign for the future of northeastern Minnesota. With rampant unemployment and young people leaving the area at a rapid pace, the types of jobs created by this project as well as the spinoff jobs will come at a very critical time. I am confident the state and federal agencies will do their jobs to determine the adequacy of the EIS and I recommend permitting when all processes are complete.

EOO

7 Birch Lake is a treasure and we can't allow it to be contaminated.

G7

7 As a construction worker who lives in Northern Minnesota, I have a first hand view as to what construction jobs will do for our area. I support PolyMet Mining's North Met project. As a parent, I would like to see our area continue to grow so my children can continue to love and play in Northern Minnesota. This project will have a huge benefit to the area. As an American, I would like to stop our dependence on foreign suppliers. From what I have read, they will mine and produce some metals not currently mined anywhere in the United States. This is crucial to our part in the global economy. I am hoping the DNR will consider all the positive impacts this project will have.

EOO

7 I am in favor of the PolyMet project. As a person who grew up in the area, educated in the area, and had to move away from the area to find work after my education I know the full value of this area. This project would bring many good paying jobs to an area that has been forced to outsource it's youth to places with more opportunity. This is one of the many projects that would bring young people back to an area that knows family values and community.

EOO

1538 I am writing to voice my support of Polymet Mining/s NorthMet project. Kraus-Anderson Construction Company has been based in Minnesota for 113 years and is the largest provider of construction services in the State of Minnesota. I have reviewed the draft EIS for the NorthMet project and believe that mining and processing these minerals in Minnesota can be done in an environmentally sound manner. Minnesota places a great value on protecting our natural resources and I'm confident that we can implement mining practices that balance the ability to extract these valuable resources while protecting the surrounding environment. The people that live and work in Northern Minnesota would stand for nothing less. This project will provide many long term good paying jobs, with benefits] and tax revenue. It will also generate other jobs and business opportunities that will help keep our State and local communities stay strong and vibrant. I support moving forward with the permitting necessary to proceed with the NorthMet project.

EOO

1574	People need jobs! Educating and engaging citizens that do not have good paying jobs is difficult no matter how important the cause maybe. Big mining companies may lie, pollute and leave a mess for many years but they hold the upper hand when offering citizens jobs. Friends of the BWCA need to be able to say "there are green jobs let's explore these coming to our area."	EOO
<b>Sender Last Name:</b> Germolus		<b>Submission ID:</b> 256
269	I appreciate the opportunity to submit this letter in support of an adequacy determination for the draft Environmental Impact Statement for PolyMet Mining Company mine near Hoyt Lakes. The Chisholm-Hibbing Airport plays a key role in the economic development of Northeastern Minnesota - ensuring regional businesses have access to convenient, efficient air transportation. In turn, having a strong economic base helps ensure the success of the airport by ensuring a consistent stream of customers for flights. PolyMet Mining Company will be a significant player in the regional economy creating 400 direct jobs with an annual payroll of about \$40 million and at least 500 indirect jobs with an economic impact in the county of about \$242 million. In addition, PolyMet will pay millions each year in royalties and local, state and federal taxes. While the economic impacts of this project will be huge, the environmental impacts will be negligible, as demonstrated in the very thorough and comprehensive draft Environmental Impact Statement. PolyMet has worked hard to propose a project that doesn't require northern Minnesota to sacrifice its environmental riches for economic development. The project is in the midst of a well established mining area that also has been logged off. PolyMet proposes to reuse significant existing mine, processing and transportation infrastructure-recycling this valuable equipment instead of scrapping it. The footprint has been designed to minimize the impact to wetlands. Waste rock, which could create acid mine drainage if not properly handled, will be managed according to acid-generating potential. All stockpiles will have engineered foundations and liners with drainage systems that will collect water and treat it before reusing it for processing. At the end of mining, stockpiles will have special covers installed to make it difficult for water to contact the rock. Greenhouse gases will be kept at a minimum, as well, because PolyMet will use the sulfur found in the ore to supply the fuel to start recovering the metals. Waste streams will be managed appropriately. And, as required by state law, PolyMet will set aside financial resources to cover all closure costs before operations even begin-ensuring that the taxpayer won't have to do so. PolyMet will be mining critical metals used by each of us every single day, even though the United States must import 40% to 95% of these strategically important metals. Do the countries importing these critical metals have similarly strict environmental standards and can we guarantee the long-term stability of these imports? It makes more sense to rely on U.S. materials mined under U.S. environmental standards providing employment for U.S. citizens! As someone involved in the aviation industry, I am particularly concerned that we have clean, reliable, domestic sources of cobalt and nickel, alloys of which are used in jet engines, a high-performance application where components must retain strength and physical properties to ensure the safety and security of passengers. From my perspective, PolyMet offers tremendous benefits - to the region and to our nation's economy. The draft Environmental Impact Statement has adequately addressed the environmental and other issues associated with the proposed project and should be deemed adequate so that permitting can begin quickly.	EOO,G2,G4

1569	My father told me about a mining operation in his part of Ohio near a little stream where he had played as a child. After the mining (for coal) he said that there was "not a living thing in the stream, not a living thing." with deep sadness in his voice. While I know things have progressed since that unregulated day, still risk remains and beautiful and precious things may be ruined for a short-term benefit. I know we need beauty and wilderness. How badly do we really need these ores and jobs?	G2C
<b>Sender Last Name:</b> Gibson		<b>Submission ID:</b> 3189
730	I would like to request an extension to the comment and study period. This project and future expansion could possibly have a devastating effect on our watershed. It is clear to me that extreme caution should be exercised before moving forward. More public comment and understanding is required. Thank you.	PRO6
2496	Please allow more time to comment and study this issue. It is far too important and potentially devastating to rush into! Bob Gibson, 12855 64th ave SE Blooming Prairie , MN 55917	G10
3534	I want to voice a "NO" to the proposed PolyMet project in northern Minnesota. I believe that Minnesota should adopt a similar ban to this injurious sulfide mining as Wisconsin. It states that there will be no sulfide mining in Wisconsin until a mine has proven to be safe from water pollution for 10 during the mining and for 10 years post the mining. To date, this has not been proven. Why would our state, the state that just self-imposed a tax to protect our waters, allow such a travesty. PolyMet is a Canadian company with a short business record mining copper and cobalt that has a very volatile market. Jobs are a great incentive but it may be that the clean-up jobs at taxpayer expense are more predictable. You are the department of natural resources and minerals are a small part of your operations. Our healthy aquatic life and those who enjoy our vast water resources should have first priority. No to PolyMet!	EOO,G7,G12
3736	Jobs should not come at the expense of our environment. There is simply too much risk with this project. Please do not approve.	EOO
<b>Sender Last Name:</b> Gilk		<b>Submission ID:</b> 1085
1189	I work for Eaton Corporation, which is a major employer in the state of MN. Through these difficult economic times, Eaton has made some tough decisions that have unfortunately cost the state of MN jobs. As a resident of Chanhassen, MN, I don't want to see any further increases in the state unemployment rate. I would like to voice my support for PolyMet Mining's NorthMet project. The number of jobs that will be created by this business is substantial at over 400. I would estimate that suppliers and other beneficiaries of a project (and ongoing business) of this magnitude would add significant jobs as well. It appears to me that any environmental concerns are far outweighed by the positive economic impact of a successful ongoing business who is a good steward of the environment. Environmental issues are much better addressed by many businesses participating in a healthy economy. I look forward to seeing PolyMet Mining move forward with its NorthMet project. Your support is appreciated.	EOO

163 I am Senior Mine Manager for Cliffs Natural Resources. I have been working in mining for 15 years on the Iron Range and in Australia. I am writing you to endorse the Northmet project by Polymet Mining Co. The project would bring more than \$1 Billion of revenue to St. Louis county. When the Northmet operation is running successfully it will foster the development of at least 5 other companies and the development of the second largest Cu-Ni PPG deposit on the planet. Final revenue to the county and state could be more than \$13 billion. I feel that there is a more important reason for allowing Northmet. Mining companies represent the most active and well funded environmental stewards today. We do more to protect the environment than anyone. I have read the Northmet EIS Statement. It is thorough, professional and large. Polymet has covered all the environmental bases and the project will clean and controlled. Northmet represents an opportunity for the mining industry to prove that we will be environmental champions and we will usher in an era of mining and environmental protection. The Northmet project is exactly what the county and state need in this economy. It will be a safe, clean and profitable project that will lead to massive growth in the region.

322 I represented the Mining Industry in 1960 at the 1st National Air Pollution Conference. Until I retired in 1986, I represented Pickands Mather regarding dust and water problems throughout the U.S. & Canada dealing with underground mines, coal mines, and all the Taconite Plants. I was basically concerned about the pollution to protect our employee health so I am well trained in what is going on with PolyMet. I am all for getting this Copper/Precious metals mining going as soon as possible & approve their permit as soon as it can.

EOO

1134 I think that you people are doing a real good comprehensive study on this project. I handled all of the pollution problems for Erie Mining Company starting in 1960. When a new endeavor is started, there are bound to be problems that turn up that were not considered in the original design. We studied these problems and one by one we were able to correct them. These included air, water, power plant emissions, asbestos, PCB transformers, etc. When I retired in 1986, I felt we had made Erie a show place. I also assisted in working on the Wilwaukee Salvey Coke Plant in downtown Milwaukee, the Carbad Limertare + Coal operation in Ohio-Penn border + the Zolran Mines in Canada operated by Pickandes Mather. Before I came to Minn, I worked as a ventilation engineer for 6 underground mines in Northern Michigan. My only reason for going into the above is to remind you that as good a job as you are doing, there are going to be somethings that will be over looked. With all of the talented people out there, I have no doubt that they can be solved or corrected. Therefore, all I'm saying is that be prepared for things that you overlooked in the study but please give the company's a chance.

18342 1) The draft EIS document fails to mention the wealth of information in the US and Canada on the observed negative impacts to aquatic resources from mining activities where sulfidecontaining minerals were mined and the disturbance of the soil and aquifers resulted in 2,500 miles of permanently acid-polluted streams draining sulfide-containing coal mines in Pennsylvania, and 10,000 acid-contaminated sulfide-mineral mine sites in Canada. In Minnesota, where acid-forming sulfide minerals were encountered and buried at the Dunka Mine area in the 1970s, acidified runoff is still being observed to this day from the reactive sulfide-containing rock, and the treatment plant that once was operated to mitigate the problem is no longer running, resulting in continuously contaminated surface water runoff from that source of acid-forming sulfide-containing rocks. The Dunka Mine pit case of omitted information and data should be added to the final EIS, along with an assessment of past and present resultant impacts, and the necessary requirements for permanent mitigation.

WR3D

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
18343	2) The magnitude of the current problem in Pennsylvania is exactly what will happen in Minnesota unless totally protective measures are implemented. Sulfide mineral mining without regard to sulfide-air reactivity and resultant acid-drainage has resulted in continuous on-going environmental problems dating from the early 1900s, and before. Federally funded research (overseen by the Duluth EPA lab) from 1970 focused on identifying the origin of the problem: sulfide-containing mineral-air oxidation to sulfuric acid, and the resultant mobilization of soil/rock components, (primarily iron, manganese, and aluminum) which caused the acute and chronic toxicity to aquatic life in streams receiving acidified groundwater and acidified-surface water containing toxic levels of mobilized metals. Pennsylvania's acid-drainage mitigation program is on-going and information may be found on the web address: <a href="http://www.depweb.state.pa.us/abandonedminerec/cwp/">http://www.depweb.state.pa.us/abandonedminerec/cwp/</a> or by contacting: Bureau of Abandoned Mine Reclamation Director: Roderick A. Fletcher, P. E. Rachel Carson State Office Building P.O. Box 8476 Harrisburg, PA 17105-8476 Phone: 717-783-2267 FAX: 717-783-7442. See reference listed below. Relevant information from this state's extensive experience has been omitted from the DEIS, and the relevant information and data should be added to the final EIS, along with assessments of resultant impacts, requirements for permanent mitigation, and the methodology presently being tested and implemented.	WR1E
18344	3) The DEIS omits the information and data from Canada relevant to describing and assessing the proposed mining project. The magnitude of the current problem in Canada originating from sulfide-minerals that have been mined in more than 10,000 sites were described in a Geology Dept. seminar at UMD on Nov. 8, 2007, A Canadian professor from the University of Waterloo, Dr. David Blowes, summarized over 20 years of research on more than 10,000 mines in Canada. All Canadian mine operations Dr. Blowes studied and summarized have exhibited contaminated the groundwater at each of the sites, to greater or lesser extents, from the oxidation of sulfide-containing minerals, rock-wastes, and mine tailings, and the subsequent leaching of metals and sulfuric acids into groundwater. If any sulfide minerals are present, they are oxidized and leach toxic acid and metals in toxic concentrations. Prof. Blowes presented detailed data and information, and his conclusions were: 1) Immediate oxidation of sulfides by gaseous air is the major mechanism causing toxic components to be leachable. The first five-to-ten years or mineral exposure to air are the most important to control and prevent oxidation and leaching; 2) Groundwater is the major recipient and conduit for toxic leachate from waste sulfide-containing piles to surface waters down stream. Water travel-times of 2-200 meters per day are typical for contaminated groundwater streams containing toxic acids and metals; 3) Permanent maintenance funds should be required for all sulfide mineral mine, rock pile, and tailings deposits before mining is allowed to begin. Funds must be permanent and by "bankrupt proof" to assure they will be available in future time when groundwater pollution becomes evident and mitigation is required, and: 4) Permanent methods for the collection and treatment of all runoff, run-through, and leachate are required if downstream water quality is to be protected. Different types of prevention and remediation mechanisms are being studied, but no "best methods" are available at this time. Further study and research are underway. The DEIS omitted relevant information from the University of Waterloo Department's efforts that should be summarized and included in the final EIS for use in evaluation, assessment, and mitigation of the known negative impacts from mining sulfidecontaining, acid-forming, toxic-metal mobilizing minerals.	WR1A,WR2E

18345	lean ore over the life time of the mine, 20 yrs. On a daily rate basis, the tonnages are 32,000 and 91,200 tons per day, respectively. The finished product annual yield from the proposed effort are stated on page 3-2, in tons, as 38,821 copper, 9037 nickel, 400 cobalt, and, in ounces, 22,184 platinum, 87,129, palladium, and 13,824 gold. Comparing the annual ore tonnage to the copper yield gives a beginning ore percentage of copper, 0.33%, and nickel, 0.077%. Assuming CuS and NiS as the predominant chemical forms for each, the mass of sulfide in the ore calculates to about 24,000 tons annually, with a potential to form about 72,000 tons of sulfuric acid. It is not at all clear where and to what fate the sulfide annually processed mass will become or whether of not it will be neutralized. Assuming the extraction process to be 99% effective this would leave residual copper and nickel concentrations of 33 and 7.7 ppm, respectively, in the extracted sludge. If the waste rock and lean ore were one-tenth the concentrations of the metal sulfide ore being processed, then the potential for sulfuric acid formation by air oxidation in the piles 1-4 would be potentially 24,000 tons x 0.1 x 1.7 = 4,080 tons sulfide, and the potential for 12,000 tons sulfuric acid, added annually, (but not necessarily formed or released annually, since reaction times can take several years). Since there would be no metal extraction, the copper and nickel concentrations if 10 % of the processed ore would be, 330 and 77 ppm, respectively, in the waste rock and lean ore. Clearly these concentrations of metals in conjunction with oxygen reactive sulfide-containing lean ore would be of great concern from the potential for environmental damage to the aquatic environment from the piles containing 394 million tons of waste rock and lean ore. The calculations illustrated above for total mass quantities, using actual known values for metal and sulfide content of the ore, waste rock and lean ore, should be added to the final EIS, with the assessment and interpretations necessary to evaluate and mitigate probable environmental impacts.	PD2
18346	5) All sulfide-containing mined rock, ore, and sulfide-containing material is capable of reacting (Piles 1 - 4) with atmospheric oxygen and results in generating toxic sulfuric acid which then absorbs water from the air, mobilizes and transport toxic metal concentrations, and causes groundwater and surface water pollution. Data are absent for measured reactivity and predicted acid formation as functions of times of extraction, particle size, and exposure to various concentrations of oxygen in air vs. depth of cover and precipitation. The entire mining site can become a toxic acid-toxic metal solution generator where ever sulfidecontaining materials are deposited when mined, transported, handled, crushed, stored, processed, shipped, and their resulting wastes are finally disposed of. Long times of reaction will result in toxic acid and toxic metal solutions being generated over decades of time from when these reactive sulfide-containing minerals, ores, and wastes are exposed to atmospheric oxygen, extracted by precipitation, resultant runoff and groundwater displacement. Mine disposed of mineral extraction wastes in semi-pervious cells, build upon and within leaky iron-ore tailings basins are unacceptable and do not meet the specific requirements described in Minn. Rule 6132.2200 for REACTIVE MINE WASTES. Contaminated water collection systems must be put in place and all runoff water collected and treated at the WWTF for completion of mine waste reaction times to consume all reactive sulfide present, probably several decades into the future, post-closure. This information needs to be generated and added to the final EIS.	WR1E,WR3I,AQ4,AQ5
18348	6) All mine waste piles exceeding nickel concentrations of 1 part per million and other components exceeding specified concentrations in M.R. 7045.0214 EVALUATION OF WASTES should be handled and treated as hazardous wastes under Minnesota Rules. Any waste solid or liquid samples with concentrations exceeding the ppm values given in MR 7045.0214 are classified as hazardous wastes and must be properly treated and disposed of as such. The following components and concentrations in ppm (mg/kg) exceeding these values are defined as hazardous waste: antimony, 0.10 ppm; arsenic, 0.50 ppm; barium, 7.6 ppm; beryllium, 0.010; cadmium, 0.050 ppm; chromium (total), 0.33 ppm; cyanide (total), 1.8 ppm; lead, 0.15 ppm; mercury, 0.009 ppm; nickel, 1.0 ppm; selenium, 0.16 ppm; and silver, 0.30 ppm; thallium, 0.020 ppm; and zinc, 70 ppm, respectively. Any and all expected wastes predicted to exceed these concentrations must be properly disposed of in a properly designed, licensed, hazardous waste facility, according to Minnesota laws and regulations, with permanent monitoring to assure compliance, and the protection of present and future health and welfare. Specific components predicted to be present in the various mine wastes need to be added to the final EIS.	PD2,HM2

Comment ID	Comment Text	Theme Codes
18349	7) The remaining ore and waste rock (from section "Rail Transfer Hoppe Demolition and Reclamation," page 3-37), including Category 1, 2, 3, & 4 piles of sulfide-containing rock, and including ore spillages along all rail tracks and haul roads that are expected to contain acid-forming sulfide rock and dust accumulations must be collected and placed in approved, lined disposal areas where all surface and ground water runoff is collected and treated in the WWTF for elevated concentrations of acid and metals including H <sub>2</sub> SO <sub>4</sub> , Cu, Ni, Co, Mn, Fe, Al, and others toxic components. Any of these reactive sulfide-containing materials remaining after the mining operations are completed must be located in protective enclosures where all water leachate is collected and treated at the WWTF, on a permanent basis, for the foreseeable future, otherwise toxic acid and toxic metal pollution will result and downstream river reaches and Lake Superior will be adversely affected. These considerations need to be used to strengthen the technical design approach, and added to the final EIS	PD5,PD7
18350	8) As stated in section (pg 3-37): covering acid-forming sulfide-containing ore and waste rock with two feet of soil and vegetated according to Minnesota Rules, parts 6132.2700 and 6132.3200 is not an acceptable treatment for reactive, acid-forming sulfide-containing ore and waste rock and will lead to acid and metal contaminated surface and ground water runoff, and eventually led to acid and metal polluted streams and lakes. These reactive mine wastes must be properly contained and treated to mitigate any remaining reactivity as indicated by the presence of sulfide-containing materials and comply with the specific provisions of M.R. 6132.2200 for reactive mine waste. Measurements of total sulfide, and correlations with measurements of chemical oxygen demand (COD) are absent and would be useful in determining the total quantities of oxygen capable of reacting with atmospheric oxygen for the different categories of ore, waste rock, and mine tailings as a function of particle size and condition. This information should be generated, evaluated and added to the final EIS.	PD2
18351	9) "Proper disposal" as stated on page 3-38 for "Nuclear sources" and "Partially used paint, chemical, and petroleum products" must include complete inventories, safe packaging, and be shipped off-site to an approved, licensed hazardous waste disposal site. Disposal on-site is unacceptable and will lead to surface and ground water contamination and pollution. The	PD2
18352	10) The Waste Water Treatment Facility (WWTF) if operated properly will generate solid wastes containing the extracted components from water contaminated with toxic metals and other dissolved and suspended particulates. This solid sludge must be properly disposed in an approved, licensed solid waste landfill suitable for handling this waste. The cost for operation and disposal of contaminated sludge is absent from page 201 showing Closure Costs Estimate Summary Tab. 3.1-14 and omits the post-closure costs of continuing operation of WWTF and disposal costs for contaminated sludge. Both costs during the time of mine and plant operation (20 yr) and continuing after mine site closure for the several decades need to be specified and planned for, because of the remaining reactivity of the sulfide-containing rock present in the 294 million tons of waste rock and mine tailings generated by the proposed project. The costs for these operations need to be described and added to the final EIS.	PD3
18353	11) The reaction times for the reactivity of atmospheric oxygen and sulfide-containing mineral and other substances to form sulfuric acid, and the subsequent reactions caused by newly formed sulfuric acid, itself, acting as a reagent, reacting to cause toxic metals to be mobilized and leached from mineral and soil particles must be determined. This information is presently missing from the DEIS, and is absolutely necessary to evaluate the time frames for observing environmental impacts and devising methods for their possible mitigation. It is a requirement of M.R. 6132.2200, Subp 2, B. (1) to determine when the reactive mine waste "is no longer reactive." The time frames for the various types of solid and liquid wastes to become non-reactive for both sulfuric acid formation and sulfuric acid reactivity in mobilizing metals must be measured and known, and added to the final EIS and used to determine the total scope and magnitude of the treatment and potential mitigation necessary for the proposed project. The time frames for surface and groundwater movements must also be known, and in combination with the inputs due to the reactivity of the mine and mine wastes, and added to the final EIS.	WR1E,PD2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
18355	12) The use of impermeable liners to collect and control all infiltration into and through the piles, layers, and storage of reactive solids containing reactive sulfide mined ore and waste rock is absolutely critical that these liners do not leak. And if for any reason that water should contact the acid laden sulfide-containing particles resulting in leaching toxic concentrations of metals, the supporting structure under the storage piles must be constructed to collect all contaminated water and conduct it to the WWTF without any contact with the natural soil surface or be allowed to contaminate the ground water aquifer directly underlying the foundations of the storage piles. Liner leakage is referred to on page 209, and ditches to convey contaminated leachate water is not acceptable under any circumstances. Safeguards must be build into the plan to make sure it is impossible for any leakage what-soever to escape the second or third barrier to catch any highly concentrated toxic aqueous	WR2D,PD2,PD5
18357	13) The same is true for liners (described about in 10) used in mine waste storage cells constructed on the iron-ore tailings basin which was not constructed to retain all water and a significant quantity leaks out of the basin into the ground water and subsequently contaminates the surrounding surface waters. This condition of leakage must not be allowed for any water present in the mine-waste storage cells. These cells must be sealed for all time upon closure, and no precipitation or water through-put may be allow to occur, otherwise severe contamination of the ground water aquifer will occur and down-flow surface waters will be polluted, requiring very high cost mitigation and cleanup. These additions are needed in the final EIS.	WR2D,PD2
18359	14) The mine itself will leave exposed surfaces of reactive, acid-forming, sulfide-containing copper and nickel minerals which, like described above, will continuously form sulfuric acid and toxic concentrations of copper, nickel, aluminum, iron, and manganese, and mimic the acid-mine drainage problems observed in Pennsylvania for over 100 years. The final size and condition of the porosity of the mine wall surfaces will control to some extent the surface and groundwater flows into and out of the final mine pit. There is little question that the water contacting the solid surfaces of the sulfide-containing minerals making up the mine walls will change composition by leaching sulfuric acid and toxic metal concentrations into the otherwise potable water observed in iron-ore mines, absent exposed sulfide-baring minerals. Contaminated polluting acid mine drainage will have to be collected and treated through the WWTP requiring the probable permanent post-closure operation of such a mitigation process. These post-closure operations and costs need to be added to the final EIS.	WR1E,WR3I
18360	15) Human, animal health risk from airborne mineral fibers and mineral dust. A continuous program of air monitoring for mineral fibers (especially during times of high dust exposures during blasting, crushing, and conveying powdered minerals) is warranted to protect workers and the general population (City of Hoyt Lakes and the Boys Scout Camp, within 4 miles) given the positive identification of cancer-causing mineral fibers in test samples (Sec 4.6.5.1., pg. 4.6-60). ) A program to continuously monitor the health risk from intermittent air exposure to mineral fibers is an absolute requirement given the positive identification in test samples and the un-sampled exposure conditions which will occur over the life-time of the mine, and ore processing, from non-homogeneous pockets of fibrous minerals which will be encountered in the ore body over the lifetime of the mine. These concerns and precautions need to be added to the final EIS.	AQ4C
18361	16) Accumulative Economic and Social Cumulative Effects (Tab. 4.10-14) omits at least three potential probable negative impacts from the potential health and safety hazards associated with the proposed project. Probable human exposures and negative impacts known (4.6-57) to be caused from exposure to mineral fibers in air may led to increases in lung cancer, asbestosis, and mesothelioma over the present baseline numbers, as well as increases in asbestosis over current known numbers of cases. This increased exposure most likely will lead to increased mortality and higher incurred health-care costs in the working population, and may well produce a number negative and cumulative impacts which are	SE5

Comment ID	Comment Text	Theme Codes
18362	17) Hazardous wastes and Hazardous Materials (4.12). The section 4.12.2 Impact Criteria gives four bullets stating conditions where "a significant environmental impact" would occur. The impression given is that small quantities of substances necessary for the project would be used and are classified as hazardous, and if for some reason or accident, some escaped would cause a (small) amount of environmental damage "if not recovered in a timely manner." (4.12.2). Omitted, and not found else where, is the fact that the object of the project - the Cu/Ni ore itself, is classifiable by its own chemical properties, as a reactive, hazardous mine waste, by the content of at least several components (see # 5 above). This information should be generated and added to the final EIS.	HM2
18363	18) The section 4.12.4 Cumulative Effects states these effects "...could not be predicted." This is because of the narrow definition used for "hazardous materials" and focusing of the relatively small quantities of these substances while ignoring the real threat from the 294 million tons of reactive, oxygen-consuming, acid-generating, toxic-metal mobilization and transport from within the natural environment's atmospheric oxygen and forces of the hydrologic cycle of water (pg. 4.12-15). The larger view and scope of the impacts should be added to the final EIS, and in comparison with negative wide-spread impacts observed in other states and provinces.	HM2
18364	19) Comparison of Anticipated Impacts for Each Alternative, Tab. 5.1-1. Fish and Macroinvertebrates (pg 5-11) entry in the table states "no significant effect." is incorrect and a significant omission do to the admission that increased mercury emissions and concentrations would be created further contributing to contaminated waters (4.1-24, -29, - 30, -31) (pg. 5-8) and mercury mobilization and methylation rates would be increased by further sulfate increases (5-12), the causative reactant in methyl-mercury formation and mobilization (Tab. 5.1-1 Mercury and Bioaccumulation (pg 5-12). Mercury in precipitation exceeds state water quality standards and reflects unacceptable, polluting sources of emissions from upwind sources including mining operations and constitutes the major source of contamination for Minnesota surface waters and fishery resources. All mercury additions from the proposed project will contribute to increasing the contamination already at	ALT6
18365	20) Financial assurance, 3-48. Add to the final EIS: given the proposed project would leave behind a massive quantity of reactive mine wastes, it is reasonable and good public policy that a portion of the finished product from the proposed project be left behind to guarantee financial assurance that any future needs and all remaining and developing problems are properly mitigated and attended to. The problems experienced by other states (Pennsylvania acid mine drainage lasts greater than 100 years/mine) and provinces indicate that 15% of the gross annual profit would not be out of line for guaranteeing financial assurance. An annual deposit for financial assurance should be paid from the annual metals production, in native Minnesota gold, silver and platinum, and be deposited and held in the North Shore State Bank of Duluth for as long as is necessary to assure permanent protection of Minnesota's aquatic resources of the Lake Superior watershed from the impacts of the proposed project.	PD4

1402	Finally, and not only as an avid outdoors man and wildlife enthusiast, but also as a concerned Minnesotan, I would like to add to this letter a word from The Lorax; "Unless".	EOO
<b>Sender Last Name:</b>	Goldsmith	<b>Submission ID:</b> 3361
3652	We need to protect our environment. If this mine goes through, we can kiss the boundary waters good-bye. God Bless the almighty dollar.	G7
<b>Sender Last Name:</b>	Good	<b>Submission ID:</b> 1560
1916	Like every one of your neighbors human, animal, and vegetable in Northeastern Minnesota who are not motivated by greed for minerals and disregard for the true value of our resources, I must register my adamant opposition to the further consideration of the Polymet and Franconia Sulfide Mining operations being pushed by "The New generation of Mining in Minnesota." The assertion that removal of sulfide ore here at the very top of the watershed for the North American Continent can somehow magically be done in an "environmentally responsible" manner is simply absurd. If there is a proven way to isolate, contain and remove sulfuric and hydrochloric acid from the water and land from which it is extracted, it has never been demonstrated anywhere these mines have operated in the world. There are plenty of examples of the opposite: Vast yellow-orange acid-killed wastelands where nothing green will grow, rotten-egg stinking streams of acid devoid of fish, fowl, and fauna forever. We refuse to let our yearround and vacation homes and international wilderness be laid waste like Sudbury, Ontario which was for the sake of employment in Copper/Nickel mining and smelting turned into a moonscape devoid of any living thing except the humans in that "industry." The jobs we have in tourism and forestry are too valuable to discard for this short term gain and eternal damage. Besides that, it is just not right. The past, present and future defenders of our Boundary Waters will never allow this vicious assault to proceed. Any truthful assessment of these operations' environmental impact without including the words "horrific", "devastating" and "irreversible" have to be drafted by the mining corporations themselves. Oh, wait, "truthful assessment" and "mining corporations" don't really fit in the same sentence, now do they? Those who have worked in the mines ought to know that by now. Remember the pensions they promised?	EOO,G2B,G2C,G7A,G7B,G
<b>Sender Last Name:</b>	Graff	<b>Submission ID:</b> 1128
1236	I am not in favor of the sulfide mining. It will destroy our natural resources of water, aquatic life, animals, the aire, etc. These resources are irreplaceable. The contamination can not be cleaned up. It will ruin the Bwca, pollute our waters, etc. A little ore today is not worth the 200 years of pillution + troubles + expense.	G2C
<b>Sender Last Name:</b>	Graham	<b>Submission ID:</b> 3138
7	I've been coming to this area since 1968. I come here for the same reasons that your famous son, Sigurd Olson, came here - to enjoy the peacefulness of the place, to respect the natural surroundings, and to bask in the splendor that only northeastern Minnesota can offer. I am sure that I am not alone in objecting to the grating, blasphemous noise pollution that mining operations bring to the region.	N1
31	It is not news that tourism and wilderness recreation do not abide the mining industry. Mining companies are notorious for promoting job estimates that are over-inflated and promising jobs that don't materialize. In addition, mining jobs are often filled by non-local workers. Are you willing to sacrifice the growth in tourism for unsubstantiated job estimates? As tourism falls, will the economy suffer or will mining families infuse more money into the system? I believe the history of mining in northeastern Minnesota answers that question. Certainly, there will be an increase in the number of bars, but I question if the quality of life will improve.	SE4

504	When workers get sick, and they will from air-borne asbestos (amphibole) fibers, will the State pick up the tab? Will you get the mining company to pay? Do you have enough attorneys on board to address this issue with the mining company and affected parties?	AQ4C
1291	The integrity of liners and cover systems are notoriously suspect, especially in humid environments like Minnesota. The MPCA should be able to verify the questionable long-term sustainability of liners and cover systems.	GT1
3077	The MPCA can't establish specific sulfate discharge limits. This should be a particularly big red flag. What levels are you willing to accept on a non-scientific basis?	EOO
3078	Analysis of downgradient water quality using Uncertainty Analysis and deterministic modeling is guess work. Because someone can develop a model does not make it right. Areas like northeastern Minnesota that are humid, covered with vegetation, and have a complex subsurface of bedrock and glacial sediments do not lend themselves to precise (or accurate) groundwater models.	EOO
3079	If I'm reading the DEIS correctly, groundwater quality at the mine site will exceed MCLs or MDH limits for antimony, manganese, and nickel. Sulfate will exceed the groundwater evaluation criteria of 250 mg/L. Knowing that contaminate levels will be exceeded and that humans live downstream, are you willing to approve this mining operation?	WR2C
3508	This mining project proposes using unproven technologies in a relatively pristine area that has developed into one of the nation's premier tourist destinations and ecological wonders.	EOO
3509	When workers get sick, and they will from air-borne asbestos (amphibole) fibers, will the State pick up the tab? Will you get the mining company to pay? Do you have enough attorneys on board to address this issue with the mining company and affected parties?	G4
3510	I am not opposed to progress. Certainly, northeastern Minnesota has experienced a significant growth spurt in the past 25 years that has brought prosperity to Ely and revived this community. Because this area is so unique, and it is unique in every sense of the word for no where else on Earth can you find such an environment, I do not believe that the DEIS contains adequate safeguards to protect this marvelous ecosystem and I suggest that if you do not reject this mining operation altogether, which is what I would propose, then you seriously consider an expanded critical review of the project.	G8
3545	What happens when the mine packs up and leaves? Does the state of Minnesota have enough money to monitor surface and groundwater and if needed, address contaminants (especially mercury) into the resource?	PD4

302	The Iron Range Building Trades and Construction Trades Council appreciates the opportunity to lend its full support to an adequacy determination for the draft Environmental Impact Statement (dEIS) for PolyMet Mining Co. PolyMet's plans to develop a copper-nickel-precious metals mine near Hoyt Lakes and process the ore at the facility formerly owned by now-bankrupt LTV Steel Mining Co. offers several benefits to the Iron Range, the State of Minnesota and the country. Constructing the \$600 million project will require 1.5 million man hours of construction labor over two years and result in full-time employment for 400 people in the mine and plant with an annual payroll of \$40 million. These employment figures do not include the hundreds of spin-off jobs, with their related economic benefits. Clearly, this would be beneficial for the economy of the Iron Range and all of Northeast em Minnesota. The project also will provide minerals that are used in everyday living - from pigments to blood sugar test strips, jet engines to wind turbines, catalytic converters to cell phones. The members of the Iron Range Building Trades and Construction Trades Council can be confident that PolyMet will produce these minerals in a way that protects our natural resources and treats workers fairly; we do not have the same degree of confidence in the environmental or human rights records of foreign producers, from which the U.S. gets up to 95% of these critical metals. The State of Minnesota will benefit from the increased sales and income tax revenue, in addition to the millions in taxes and royalties that PolyMet will pay. The U.S. economy also will derive many benefits, including the ability to have a domestic source for metals critical to American consumers. The dEIS demonstrates that PolyMet has the ability to produce these metals while protecting the air, land and water. It will generate negligible air pollution and won't discharge process water. Stockpiles will be managed to minimize water that comes in contact with the rock and to collect and treat any water that does contact the rock. The Iron Range Building Trades and Construction Trades Council believes in fair play. PolyMet has invested more than four years and more than \$20 million providing detailed information and research results to inform the development of this dEIS. PolyMet has followed the very tough rules of environmental review. Now it's time for regulatory agencies to acknowledge that the draft EIS has done what it's supposed to do - adequately identify and address potential environmental impacts - and to get about the business of issuing permits so our members can get about the business of building a mine and processing plant that will contribute to our regional, state and national economies.	EOO

172	As a small business owner in Hoyt Lakes, I would like to show my support of the Polymet project. I run a daycare out of my home and rely on new families to come into the area and also to retain the families that are currently living here. In these hard economic times, we need the jobs that this endeavor will supply to our area now more than ever. Over the last few years, I am impressed with the patience and precautions that PolyMet has shown during their wait to start production. I know and live in the same community with the workers at PolyMet and they are committed to the safety and welfare of our future. I am excited to have them as my neighbor and to start production as soon as possible. They will be an asset to our area.	EOO

3176	What is the plan and estimated cost to reclaim the mining area when the mine to shut down. Does NorthMet Mining Operations have enough (\$) money to put things back in order? & do they list Potential Problems and test to prove everything is covered in their request including money to cover disasters.	PD3,PD4
3212	DNR needs to review the impact of other Companies that may follow with request ( I have heard of four (4) other that may turn in a request. OR is the DNR going to just grant only one company for mining this area or other close by?	G8
<b>Sender Last Name:</b> Green		<b>Submission ID:</b> 2454
25	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have just written a lengthy comment on my concerns about the PolyMet DEIS. Unfortunately, my computer deleted these comments when I attempted to send them. Therefore I would like to briefly state that I feel that the environmental and economic risks of this project are extremely high. The DEIS itself indicates many potential problems - probable leakage from pits and tailings basins, release of toxic chemicals such as heavy metals and sulfuric acid into waterways, the loss of peat and other wetlands, which would release greenhouse gases, and the loss and severe disturbance of critical habitat for wildlife. Much of the economy of northern Minnesota depends upon the maintenance of a relatively pristine environment, and the loss of income should waters become polluted, large areas cleared and degraded, noise and air pollution increased, would be devastating for it. We will be left with a huge bill and everlasting toxic waste long after the mining company has paid its last paycheck and vacated the state. This DEIS shows us how remarkably hurtful this project would be to northern Minnesota. We cannot sacrifice the long-term health of our region for short term interests.	SE4
1298	Short term gains in precious metals are not worth the potential impact on the environment. Find better jobs for the criticized on Northern MN! Can they recover 100% of the sulphur?? DO NOT PERMIT!	EOO
18367	The plan calls for placing all of the saturated overburden material (with potential for exceeding standards for S content), compacted, in the Category 1 and 2 stockpile, “although the effectiveness of compaction to limit oxidation [therefore AMD] is uncertain.” (p. 3-15). This should be known before permitting.	PD2
18368	The liner systems for Category 3 and 4 waste rock and Lean Ore include 80 mil LLDPE geomembrane. What is the industry experience with this material? For how many years has it been used? For how long has its performance been monitored under similar industrial and climatic conditions to this? On what quantitative basis is PolyMet’s confidence based, that this element will maintain its integrity over the hundreds of years that society will depend on it to do so? If a leak develops in such a liner, it it even feasible to locate and correct it?	PD2
18369	On p. 3-33 and 3-34, under Hydrometallurgical Residue Cell Design and Operation, end of par. 2, the liner system is said to include a “geosynthetic clay liner”. What is this? Clay is a natural geological material; what is “geosynthetic”?	PD2
18370	Also on p. 3-41, para. 2, under Stockpiles – Design and Cover, the statement is made, “The vegetated soil cover would be designed to promote runoff with minimal erosion and retain water until it is either transpired through vegetation or evaporated from the soil surface.” How can this cover be designed both to promote runoff (thus favoring runoff over infiltration) and retain water to be lost slowly through evapotranspiration? Can we have it both ways?	PD2

18371	and/or physical remediation on into the unspecified future (“in perpetuity”?). This plan assures the ongoing involvement of some authority (MNDNR?) to carry out these activities. Who is to pay for this? Clearly this should not be an obligation of the citizen taxpayer. A fully legally-binding arrangement of financial assurance must be a basic element of any mining permit to make sure that the entity that profits from the project assumes all of these risks and obligations that are the consequence of the project. Some examples: p. 3-34, para. 3: “Turf and final cover would be inspected and maintained by mowing once per year or as needed, fertilizing when visual inspection indicates poor vegetation growth, and repair within four weeks after visual inspection . . .” p. 3-39, piping for dewatering “would remain until water quality discharge limits at compliance locations would be met.” p. 3-42, para. 2: “Water draining from stockpile liners . . . after closure would be monitored, returned to the WWTF for treatment if necessary . . .” p. 3-43, end: “PolyMet would develop a final Mine Closure and Reclamation Plan, which would include . . . ongoing maintenance /water treatment.” p. 3-44, Reclamation – Tailings Basin, “Periodic evaluation of dam stability by a qualified geotechnical engineer.” p. 3-53, para. 2, Vertical wells, “The pumping wells would be operated long term and until no longer needed when . . . conditions allow.” p. 3-54, para. 3, Increased rock buttress material, “The PRB, if built, may require periodic recharging.”	PD2,PD4
18372	3. Insufficient data presented in DEIS before permitting. Thus the full disclosure of the Project’s environmental impact is incomplete, preventing adequate public review. Several examples of this problem are: p. 3-43 end: PolyMet would not develop a final closure and Reclamation plan, with projected costs, until the post-EIS permitting stage. p. 4-13, Mine Site, Plant Site: “. . . however, a slope stability assessment has not been completed. Further design and analysis would occur during permitting . . .”; “. . . have a low margin of safety for saturated or static liquefaction conditions.” p. 4.13-3, Plant Site: “. . . there is a risk that static liquefaction . . . could occur and may cause a flow failure . . .”; Mine Site Alternative: “Further design and analysis would occur during permitting . . .” [Same comment for Tailings Basin Alternative.] p. 4.13-4, Mine Site, Tailings Basin: only during permitting; if risks or stability concerns are identified, would analysis be undertaken.	G8
18373	An egregious omission from the brief discussion in this section is all of the nonrenewable fossil fuel resources that will be consumed in the processes of development, operation, and closure/reclamation of this mine. These would include coalpowered electricity, diesel fuel, gasoline, lubricants, natural gas, etc. The combustion of these fuels would also generate large amounts of greenhouse gases, especially CO2, with their known deleterious environmental effects. These should also be recognized as an	IR1

1057	This is a project with a high likelihood of water and land contamination of disastrous proportions, both near the proposed site and well beyond. Any possible economic advantage to the local and state economy is very likely to be erased by the overwhelming cost of clean-up. And clean-up is never completely possible, so there would be a net loss in both money and ecological services. Proposed technology to reduce contamination includes the use of liners, which are notoriously leaky. If the proposed storage of mine tailings in "a subaqueous environment to reduce oxidation", and then to create wetlands from these sites is an indication of the "new technology" to be employed, we're in big trouble all around. Do they really think that water has no oxygen to oxidize sulfides? Do they really mean to create wetlands over tailings with heavy metals and sulfides and call that minimal environmental impact? It is shocking and disappointing that the state of Minnesota is seriously considering issuing a permit for such a project.	EOO

1	from Dr. David M. Chambers, Re: Draft NorthMetEIS. Further, NMW joins in and adopts the contemporaneous comments of the Minnesota Center for Environmental Advocacy, Water Legacy, Friends of the Boundary Water Wilderness Foundation, and Save Lake Superior to the extent not inconsistent herein.	G14
2	The DNR has released an incomplete DEIS for public comment. The DNR should prepare and circulate a revised draft of the DEIS that addresses the missing and inadequately presented issues. The current DEIS is inadequate and does not comply with federal regulations. Because this is a joint federal-state EIS, the environmental review process must comply with federal law, despite the fact that a state agency has taken the lead. Under U.S. federal regulations, The draft statement must fulfill and satisfy to the fullest extent possible the requirements established for final statements in section 102(2)(C) of the Act. If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion. 40 C.F.R. 1502.9(a). For a number of reasons, the DEIS does not come close to meeting "the requirements established for final statements." Conclusion: To satisfy the requirements of the applicable federal regulations, the DNR should release another iteration of the DEIS for comment that addresses the missing and inadequately presented issues discussed below.	PRO3

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3	Conclusion: The final EIS for the PolyMet NorthMet project must be deferred until a comprehensive supplement to the DEIS has been prepared, with appropriate scoping, notice and public comment. Such supplement should include a detailed analysis of the specific lands proposed to be exchanged for the NorthMet mine site and the impact of this exchange on the public interest, the environment and cultural resources of affected tribes with usufructuary rights in the 1854 ceded territory.	PRO1
4	Conclusion: Since reclamation planning poses a significant environmental and economic impact of the mine development, a complete preliminary reclamation plan and cost estimate analysis should be included in the DEIS. The plan should be developed to show the reclamation liability on a year-by-year basis. Further, the DEIS must specifically analyze how the closure and post closure activities required by the PolyMet project comply with Minnesota statutes and rules requiring stable and maintenance free closure and reclamation. The DEIS should also provide more detailed and candid assessments of environmental impacts during closure and post-closure, including but not limited to the following: Waste Rock Stockpiles. DEIS data demonstrates that many pollutants in drainage from stockpiles would exceed groundwater criteria for up to 2000 years after the mine is opened under the Proposed (DEIS, p. 4.1-84). Note that numerous references to extended periods of pollution were deleted in the few weeks between the June 2009 PDEIS and the public release of the DEIS. (Compare DEIS, p. 4.1-80, Table 4.1-45 with Appendix D, p. 4.1-72, Table 4.1-41). West Pit Lake. The west pit lake will overflow post-closure, discharging water predicted to exceed water quality standards for arsenic, cobalt, copper and nickel and containing significant sulfate levels. (DEIS, p. 4.1-111, p. 4.1-114, Table 4.1-64). West pit lake overflow is also likely to exceed mercury water quality standards. (DEIS, 4.1-115). Tribal agencies have noted the likelihood that the west pit lake will remain at the site “in perpetuity and will exceed water quality standards.” (DEIS, Tribal Positions p. 3-19). East Pit Wetland. Although east pit overflow is noted as a modeling assumption, (DEIS, p. 4.1-72) no information could be found in the DEIS to characterize east pit outflow or overflow. Tailings Basin. The explanation of the plant site reclamation and seepage collection neither evaluates the potential for ongoing seepage, nor cites historical exceedances of groundwater and surface water quality standards from tailings basin seepage. (DEIS, pp. 3-45; compare with Table 4.1-6, p. 4.1-12; Table 4.1-8, p. 4.1-15; Table 4.1-19, p. 4.1-30; Table 4.1-31, p. 4.1-49). Hydrometallurgical Residue Cell Closure. A geomembrane barrier and geosynthetic clay barrier are proposed to cover this cell of highly contaminated material. (DEIS, p. 3-34). The EIS should describe expected leakage rates during operations as well as the longterm effectiveness of the cover system. (DEIS, Appendix D, Tribal Positions on July 2009 PDEIS, “Tribal Positions,” p. 3-34).	PRO3
5	Conclusion: The DEIS must discuss not only reclamation costs, but the contingency reclamation costs that will be covered by financial assurance, and the financial assurance mechanism that will be used to meet this requirement. Until it is known that a sufficient amount of money will be available to cover closure costs when mining ceases, it cannot be concluded that planned closure activities will prevent environmental impacts.	PD3,PD4
6	Problems concerning the proposed tailings basin form the basis for numerous and substantial NMW section specific comments. Some of the most significant of these are summarized below and one new conclusion (identified as “ADDITIONAL conclusion”) is presented as a result. Tailings basin problems stem from four basic sources: 1) geotechnical instability in the area, 2) proposed construction of the NorthMet tailings basin on top of the existing LTVSMC tailings, 3) inherent problems in tailings basin waste treatment leading to long-term treatment, perhaps “in perpetuity,” and 4) the ‘experimental’ nature of the proposed processing technology and the resulting need for additional financial assurance. The response by the applicant to this situation has been inadequate and irresponsible.	EOO,WR1E,WR2D,WR3I,P
7	Conclusion: Geotechnical stability is too important an issue to leave for analysis after the mine has been permitted. These stability issues should be thoroughly investigated and the issues resolved as a part of the DEIS process. Perhaps the most important component of the proposed basin is the tailings dam. NMW contends that, (3.1.5.3) “Upstream-type tailings dam construction, which was used for the existing taconite tailings, poses a long-term stability risk to the proposed hydrometallurgical residue cells. Upstream-type construction will also be utilized to contain the project’s flotation tailings, and again poses a long-term risk, although less than that to the hydrometallurgical residue cells because the hydrometallurgical residues contain much higher levels of contamination. A thorough analysis of the risk associated with tailings dam construction has not been done, and needs to be conducted as a part of the DEIS.	GT1

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
8	Conclusion: Centerline construction of the expanded tailings facility should be considered even though it would be more costly, and would likely require the destruction of more wetlands. The problems of geotechnical stability extend to the Hydrometallurgical Residue Cell Design and Operations Cell Seismic Stability (3.1.5.3). NMW reports that “The hydrometallurgical residue cells will be constructed at the edge of the existing tailings Cell 2W. Construction of the hydrometallurgical tailings cells on existing tailings, which are susceptible to seismic liquefaction, and are contained by upstream-type dams, also poses long term seismic stability risks.” Further, “[f]or an upstream-type tailings dam, which uses the tailings themselves as a structural foundation for the dam, the tailings must be dewatered in order to safely support the dam under seismic loading.” “Hydrometallurgical residue cells would be lined to minimize release of water that has contacted the residue. The liner would consist of a composite liner system utilizing a geomembrane liner above a geosynthetic clay liner.” In NMW comments (4.13), “If the material on which the hydrometallurgical cells are built is unstable, then the hydrometallurgical cells will also be vulnerable to rupture during a seismic event.” From DEIS reports, “It is known that unstable areas exist in tailings cell 2E: it appears that the potential stability of the tailings in cell 2W is not known.”	EOO
9	Conclusion: The additional cost associated with a double liner with leak detection for the hydrometallurgical residue cells is not cost prohibitive. A double liner with leak detection would provide maximum protection for the residue material, and should be required. Further, since reclamation planning poses a significant environmental and economic impact of the mine development, a complete preliminary reclamation plan and cost estimate analysis should be included in the DEIS. The problem of geotechnical stability also complicates the evaluation of the Tailings Basin Alternative (3.2.3). The goal of this alternative is to increase the geotechnical stability of the Tailings Basin and to minimize impacts to the wetlands north of the Tailings Basin and in the Embarrass River that may arise from seepage water. The alternative reduces the Project’s potential impacts to surface and ground water quality by capturing approximately 95 percent of the seepage generated from the PolyMet operation including from the proposed NorthMet tailings As reported by NMW, “The explanation of the plant site reclamation and seepage collection neither evaluates the potential for ongoing seepage, nor cites historical exceedances of groundwater and surface water quality standards from tailings basin seepage.” NMW concludes (its evaluation of geostability impacts), (4.13.3.5): Due to the failure of the applicant to address any of the potential geostability impacts, it is the position of NMW that in the DEIS the applicant must address measures to assure the structural integrity of the tailings basin, provide a dam break analysis, and must conduct a risk assessment prior to permitting.	GT1
10	Conclusion: A complete geotechnical stability analysis must be conducted prior to permitting and must be included in the DEIS.	GT1

Comment ID	Comment Text	Theme Codes
11	<p>The DEIS states that, “Current modeling assumes no interaction between NorthMet seepage with the underlying LTVSMC tailings.” (DEIS, 4.1-94). NMW concurs with the position of the tribal cooperating agencies that groundwater contamination from the previous mining activities is still an issue near the LTVSMC tailings basin more than twenty years after operations ceased. Because of the limited distribution of monitoring wells, the extent of the contaminant plume is not known. However, recent well data show that the plume extends in some areas at least as far as private wells along the Embarrass River. In the wells that do exist near the tailings basin, pollutants including iron, sulfate, manganese, aluminum, and fluoride exceeded drinking water standards. Recent wells near the northern property line show substantial contamination of the groundwater aquifer (Barr 2009, Memorandum: Results of Tailings Basin Hydrogeological Investigation. June 2, 2009). The baseline data on which to base estimates of the impact of the proposed project on water quality at the mine site and the tailings basins is insufficient. The existing analysis for the PolyMet project calculates the additional constituents that the project will add to groundwater, but is unable to realistically estimate what the resulting water quality will be because background water quality has not been incorporated into the estimates. Private domestic wells lie between the tailings basin and the Embarrass River where tailings basin discharge water is expected to ultimately discharge. Some of the sampled private wells have contaminants at levels several times the drinking water standard (Barr 2009, Memorandum: Results of residential well sampling north of LTVSMC tailings basin. January 27, 2009) Samples from these wells show exceedances of manganese and close to exceedances of the arsenic standard. Once a groundwater flow model is developed that would show the direction and rate of groundwater flow, that pattern of flow should be used to plan a groundwater sampling scheme that would map the extent of the existing contaminant plume. This data and analysis should then feed into estimates of how the proposed project would interact with existing contamination. The combination of existing conditions with impacts due to the proposed project would show what groundwater quality can be expected during and post project.</p>	WR1E
12	<p>Conclusion: At a minimum, contingencies should be put in place to fund long term water treatment well beyond the 65-year limit assumed in the DEIS.</p>	WR3I
13	<p>ADDITIONAL Conclusion: Financial assurance requirements must be readjusted (upwards) to reflect the additional risk associated with an ‘experimental processing technology.’</p>	PD2
14	<p>Many of the potential impacts of this project are still unknown because of a lack of data. Some of these gaps in critical information are pointed out in the DEIS, and some are not. However, the DEIS does not address the cost of obtaining the information for any of these gaps. Under the</p>	G8
15	<p>Stream flow, sedimentation, and water quality data (see Table 4.1-6). First, it is troubling that there is no stream flow data beyond 1964 for the Embarrass River, and beyond 1988 for the Partridge River. The lack of recent flow data calls into question the assessment of the severity of impacts to the Partridge River from mine dewatering, and the water quality modeling for the Embarrass River (which is based in part on dilution of pollutants from stream flow). Second, neither stream flow nor water quality data are available for the points of greatest impact to the streams, including Trimble Creek and Spring Mine Creek, area lakes, and the stretches of the Embarrass and Partridge Rivers closest to the mine site and tailings basin. Finally, there is no sedimentation data for the rivers in the mine area. In many forested locations, sedimentation from haul roads and stream crossings are the largest source of impact to streams, with the volume of traffic being the greatest single factor determining the degree of impact.</p>	WR3J
16	<p>Hydrogeological data under and downgradient from the tailings basin. Very little appears to be known about the hydrogeology of the area under and down gradient from the tailings basin. It is unclear at this point what additional data might be collected in response to the DNR’s recent request to PolyMet. However, more data on groundwater elevation, depth to bedrock, and groundwater flow is needed before an accurate model of ground and surface water impacts can be undertaken. As the EIS notes, it is impossible to estimate impacts on groundwater elevation based on available data, and thus the EIS provides no assessment of the subsequent impacts on vegetation, wetlands, and other surface water resources downgradient from the tailings basin. Sufficient data to make this assessment must be gathered and included in the draft EIS before permitting can proceed</p>	WR1E

Comment ID	Comment Text	Theme Codes
17	Hydrological data at the mine site. The model of impacts to the Partridge River and adjacent wetlands is based on inadequate data. According to the EIS, ten single-well tests were done in the surficial aquifer at the mine site, which covers several square miles. The scarcity and quality of data are such that the assessment of impacts to the Partridge River and adjacent wetlands is virtually meaningless. Without this data, a determination of the potential acreage of impacted wetlands is impossible, as is a determination of the potential drawdown of the Partridge River. As the CPEIS concludes, “the potential for widespread drawdown of the water table within the surficial and wetlands deposits cannot be evaluated from the available study.” Monitoring wetlands and stream flow after the mine is built is not an alternative to collecting the data for the draft EIS. The whole point of the environmental review process is to reveal these impacts before decisions are made to permit the project.	WR3J
18	Mercury transport modeling. In several situations, mercury seems to have been deliberately left out of modeling and analysis presented in the CPDEIS. Since all of the water bodies in the mining area are either known to be or can be assumed to be above the water quality standard for mercury, this is a curious omission. As an example, the discussion of water quality impacts on the Partridge River omits mercury because “predicted concentrations for mercury were not available for the liner leakage of the stockpiles (RS53/RS42, SRK, 2007a) and groundwater recharge from the East Pit and West Pit (RS31, SRK, 2007b).” These predictions “were not available” because PolyMet has not done them, despite doing equivalent work for a number of other constituents that are far less likely to result in violations of water quality standards. It is incumbent upon the DNR to demand that this work be done so that it can be included in the EIS. The failure of the DEIS to address mercury release and transport is discussed further below.	WR4A,WR4B,AQ4,AQ6A
19	Wetland delineation and field data. The impacts of mine dewatering are likely to extend to wetlands far beyond those that have been delineated and described in the CPDEIS and the wetlands permit application. The lack of information on the hydrology of the mine site cannot become an excuse for failing to identify the full extent of potential impacts on wetlands. All of the wetlands that may be impacted must be delineated and field surveyed.	WE1
20	Conclusion: To comply with 40 C.F.R. 1502.22, relevant information, including, but not limited to the examples provided above, must be included in the DEIS.	G8
21	Conclusion: The EIS must provide a thorough analysis of the underground mine alternative. (See 3.2.4.1 for additional section specific comments.).	G9

Comment ID	Comment Text	Theme Codes
22	<p>The DEIS is unclear about discharges to surface water. For example, “Reuse of the Mine Site process water at the Plant Site would eliminate the need to discharge any process water to surface waters.” (3.1.2.9.) This statement is misleading because the seepage to groundwater from the tailings basin will surface in wetlands and the Embarrass River. While it may be technically true that there will be no “surface discharge . . . to surface water” this does not mean that there will be no discharge to surface water. Based on this faulty reasoning, the DEIS concludes that a NPDES permit would be needed only for storm water run off during construction activities. (Table 1.1-1) The question of whether a NPDES permit is needed for the wastewater discharge through seeps is a question for the discharge permit proceeding. However, it is worth noting here that EPA and most federal courts require a NPDES permit where it is clear that a discharge to dry land or to groundwater is contributing pollutants to nearby surface water. The EPA has stated that “the Agency interprets the Clean Water Act to apply to discharges of pollutants from a point source via ground water that has a direct hydrologic connection to surface water.” 66 FR 2960, 3015. Most federal courts that have addressed the issue have agreed with this interpretation. Following an extensive review of the case law, one court concluded, “The logic of these cases is compelling: since the goal of the CWA is to protect the quality of surface waters, any pollutant which enters such waters, whether directly or through groundwater, is subject to regulation by NPDES permit.” <i>Washington Wilderness Coalition v. Hecla Min. Co.</i>, 870 F.Supp. 983, 990 (E.D. Wash. 1994). This conclusion is particularly compelling here where discharges to the Embarrass River and its tributary streams and wetlands through groundwater seeps have been treated as surface water discharges for decades. There is no rational reason to treat seeps that reach ground level at a point that is covered by water differently than seeps that reach ground level in a dry area. PolyMet appears to be seeking to take advantage of what it sees as a loophole in permitting requirements, and this attempt must not be accepted by the permitting agencies. The situation is further complicated in that PolyMet plans to discharge mine pit overflow to surface water (the Partridge River) after the mine closes. It is incredible that because this discharge will not be happening within the current NPDES permitting cycle, the discussion of necessary permits treats it as if it does not exist. Once again, the public is led to believe that the</p>	WR3A,WR3I
23	<p>As noted above, the DEIS “must fulfill and satisfy to the fullest extent possible the requirements established for final statements.” Thus the DEIS must include the comments and opinions of the Fish and Wildlife Service regarding impacts on lynx and lynx habitat. NMW can find no evidence in the DEIS of USFWS comments and opinions concerning the Canada Lynx (4.4.1.1 – Canada Lynx, and elsewhere). Conclusion: The EIS must include USFWS comments concerning the Canada Lynx that will satisfy the relevant federal regulations.</p>	WI1,PRO3
24	<p>Conclusion: At the very least, the EIS should identify the longest time frame that the activity might need to continue. This information is critical to evaluating environmental risks. Any activity that may be needed for years after mine closure presents significant risks that failures of the financial or regulatory systems will lead to a failure of the closure or mitigation activity. The longer the activity might need to continue, the greater the risk. In addition to a discussion of the potential length of time treatment and closure activities might need to continue, the EIS should include a description of the potential impacts if the operation or activity ends prematurely. Some of these activities (not a complete list) include monitoring and upkeep of wetland treatment systems; monitoring and upkeep of fencing around the pit lake; restricting tree growth on the top of bench areas in the waste rock stockpiles; pumping and piping drainage from stockpiles and the tailings basin; operation of the wastewater treatment facility; monitoring (and potentially treating) discharge to the Partridge River; pumping of water from Colby Lake to the tailings basin pond; monitoring and pumping drainage from the hydrometallurgical residue cells; and maintenance of the pit wall cover.</p>	WR3I,PD4
25	<p>The DEIS discusses the beneficial social and economic impacts of the PolyMet NorthMet project resulting from employment opportunities and increased tax revenue, but contains little analysis of potential adverse social and economic impacts from the project.</p>	SE3
26	<p>Without citing any reference, the DEIS suggests only negative social and economic outcomes from the No Action Alternative, including declining employment, population decline, underutilized housing and aging population. (DEIS, p. 4.10-21) The DEIS does not address as an adverse social or economic consequence the risk that project could create an unfunded Superfund liability for taxpayers, as other mining projects across the nation historically have done.</p>	SE1,SE3

Comment ID	Comment Text	Theme Codes
27	Missing from the DEIS analysis is any acknowledgement of the boom and bust cycle of extraction industries in Minnesota and the adverse social and economic impacts associated with the cycle once ores that can be economically extracted and processed are used up. Research pertaining to Northern Minnesota documents repeated booms and busts in the mining industry, leading to community instability and long-term decline. From 1979 to 2005, 83 percent of the iron jobs in Minnesota were eliminated, while 80 percent of the nation's copper mining jobs disappeared between 1972 and 2002. (See Thomas M. Power, <i>The Economic Role of Metal Mining in Minnesota: Past Present and Future</i> , October 2007, pp. ii, 6, 7, 29, "Power Report" and references cited therein).	SE3
28	Price volatility affects the decline cycle. When metal prices are high, lower grade deposits are brought on line, adding to supply and moderating price increases. In a global market, poorer nations also attempt to secure mining jobs, displacing American sources. In addition, technical change steadily displaces labor with more powerful equipment and new electro-chemical processes, resulting in a smaller workforce even for the same amount of ore extraction. Although mining inevitably depletes economically viable ores in a relatively short period of time, the process of extraction and processing creates relatively permanent environmental damage. (Power Report, pp. ii, 6, 7). The EIS must assess the adverse impacts to local communities of the bust cycle, when population and payroll drop due to temporary shut-downs or inevitable closure. (DEIS, Appendix D, Tribal Positions on July 2009 PDEIS, "Tribal Positions," p. 4.10-14).	SE3
29	In correlating a "no action" alternative with adverse consequences, the DEIS also fails to analyze the actual economy of Northern Minnesota and its reliance on sectors of the economy that depend on residential preference and, thus, indirectly on environmental amenities, as well as tourism and recreation, that depend directly on environmental quality. Mining related income is only a small percentage of earnings in Northern Minnesota and the growth of other sectors of the economy has provided sources of income many times larger than the loss of the iron industry payroll. (See Power Report, pp. iii, 10,11, 22-23, 25) Tribal agencies emphasize that the EIS must acknowledge negative economic and social impacts to local communities if natural resources are lost or damaged due to the project. (DEIS, Tribal Positions, pp. 3-50, 4.10-14).	SE4
30	Finally, the DEIS fails to analyze the price assumptions on which both the opening and continued operation of the project depend. This is not an academic inquiry. Interest in the project was, no doubt, spurred by the quintupling of copper prices from 2001 to 2006, rising from about \$0.75 per pound to about \$3.80 per pound. In the 1970's, a similar sharp increase in copper prices spurred interest in development of Minnesota's copper ore deposits, but copper prices fell in the early 1980's and copper mines shut down nationwide rather than opening in lower grade Minnesota deposits. (Power Report, pp.1, 5). Recent economic recession and predicted economic factors that might lead to the intermittent operation, early shut down or failure to fund adequate reclamation and post-closure activities if the project were to move forward should be analyzed in the EIS.	SE3
31	The final EIS should include adverse economic and social impacts of the project and benefits of the no action alternative, considering the following: <input type="checkbox"/> Information on Minnesota's mining industry, including historical and reasonably predicted cyclical "boom and bust cycles; <input type="checkbox"/> Analysis of the regional economy's reliance on perceived environmental amenities, including tourism, recreation and industries such as health and finance which may be located based on residential choices; and <input type="checkbox"/> Analysis of the adverse economic and social impacts of population and payroll loss when mining activities stall or cease, or resulting from mechanization, including impacts on unemployment, demand for social services, and tax revenues to fund social services. Analysis of the price structure needed to support opening of the PolyMet mine and processing facility, sustaining operations and supporting closure and post-closure treatment and reclamation, including the potential economic risk that unfunded pollution costs would become a burden on communities or taxpayers.	SE3,SE4
32	Further, the discussion of socio-economics must include detrimental aspects of mining economies. Socio-economics cannot be reduced to the amount of money and jobs the project will ostensibly bring to the area.	SE3

Comment ID	Comment Text	Theme Codes
33	The CPDEIS does provide numbers that reflect the fact that historically, mining has had more of a negative than a positive impact on communities. According to the CPDEIS, East Range communities, most of which are mining-based, have lower education levels, lower median income, and higher poverty rate than St. Louis County and the State of Minnesota as a whole. Table 4.9-10 indicates that of the selected East Range cities, Tower is the only one with less than 10% of its workforce employed by the mining industry; Table 4.10-6 indicates that while Tower has a lower median income than some of the cities that are heavily affiliated with mining, it also has a much lower poverty rate and a higher percentage of employed adults. This makes intuitive sense. Virtually anyone in Northeastern Minnesota who pays attention understands that mining jobs pay comparatively well, but are not stable over the long term. These statistics are also in line with studies of economic conditions in mining communities. <sup>1</sup> Rather than simply list statistics, the DEIS should provide some interpretation to make the numbers meaningful.	SE3
34	The CPDEIS ignores the volatility of the mining industry, assuming that jobs will continue uninterrupted for the predicted life of the project. It has no more to say about mine closure than “Unless new industry is developed in the East Range area prior to completion of these activities, it is assumed that 95 percent of working-age people formerly employed by the NorthMet Project would need to secure alternative local employment or would leave the area after this time.” This complete lack of concern for the impacts of mine closure is particularly galling given the fact that the taconite industry is currently suffering yet another downturn, and miners are being laid off as the DEIS is written. The DEIS discussion of socio-economics needs to include a discussion of the impacts of relying on a cyclical industry as the major economic driver of a community.	SE3
35	Since the mine site would be removed from the Ceded Territory in order for the PolyMet project to proceed, none of the wetland replacements proposed in the DEIS, including those on the mine site, would be within the 1854 Ceded Territory. At most, the 175 acres proposed to be restored on the mine site or the 175 acres to be restored post-closure (DEIS, p. 4.2-38) might have some relation to waters within the remaining Ceded Territory. The planned wetland replacement, thus, would lead to a loss of wetland function within the Ceded Territory. (DEIS, p. 4.14-5). Minnesota Rules state that a replacement plan for activities that involve modification of known archaeological, historical, or cultural resource sites must be denied if the proposed activities will have a significant adverse effect on the archaeological or historical value of the site. (Minn. R. 8420.0515, Subp. 5). Although the strict letter of this rule is restricted to sites eligible for inclusion in the National Register of Historic Places, its rationale may apply to the 1854 Ceded Territory. Tribal representatives have recently suggested that the 1854 Ceded Territory may meet the criteria for listing in the National Register, while the U. S. Army Corps of Engineers has concluded that it would not. As acknowledged in the DEIS, even if the Ceded Territory is not listed, “This does not diminish the significance of the Project impacts to the cultural geography of the Ceded Territory.” (DEIS, p. 4.8-15). The 1854 Ceded Territory represents an important cultural resource that may be impacted by loss and impairment of wetlands. DEIS does not include this issue in its description of impacts on wetlands (DEIS, Section 4.2). The final EIS must analyze the cumulative impacts of the PolyMet project on the 1854 Ceded Territory, including, but not limited to the loss of wetlands and changes in wetland functional values during operation, closure and post-closure, the additive effects of air and water emissions on wetlands, and the loss of tribal access to wetlands due to the above changes and the mitigation of wetland impacts by replacements occurring outside the ceded territory. (PolyMet DEIS, Appendix D, Tribal Positions on July 2009 PDEIS “Tribal Positions,” p. 4.2-44) Any loss of wetlands or loss of wetland functionality within the 1854 Ceded Territory that is not replaced within the 1854 Ceded Territory must be considered an irreversible and irretrievable loss of cultural resources resulting from the PolyMet project.	WE3,WE5,G3,CR1,CR2,CR
36	Conclusion: NMW repeats its request that the DEIS comment period be extended to at least 120 days.	PRO6
37	So few paper copies of the DEIS were made available that virtually all citizen groups such as NMW, as well as individuals were forced to work with electronic copies. With a complex 700+ page document, this is an unrealistic approach. Conclusion: The next version of the DEIS and certainly the EIS should be reproduced in sufficient quantities that citizens may reasonably make known their views.	PRO6

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
38	Comments are intended to be public. Citizens should have the opportunity to hear and to learn from the comments made by others in a public forum, and to have their own views challenged by others. The process adopted by DNR/USACE precludes these opportunities. Conclusion: Additional hearings should be scheduled and should include the opportunity to present views in a public forum and to challenge the views of others as part of the process.	PRO6
39	The PolyMet project is likely to have impacts on several receptors and from several sources that are not included in the DEIS. These include water quality in local wells at residences downgradient from the tailings basin; the impact of pit water quality on wildlife; mercury and sulfate impacts downstream from the tailings basin and mine site; and impacts from the generation of electricity used by the project. Conclusion: All of the above issues should be added to the DEIS.	ALT8,WR1E,WI2,CR1
40	NMW supports the tribal representatives view of themselves as uniquely and disproportionately impacted by mining activities in the 1854 Ceded Territory and it has not been possible to reach agreement on a number of conclusions within the DEIS. See e.g. Tribal Position on Chapter 4.10, Section 4.10.3.1 (Proposed Action; Environmental Justice). Extended NMW comments on the potential consequences of NorthMet on the tribes are presented under Major Issues and Multi-Section Issues.	G8
41	NMW urges USACE to reissue public notice of the section 404 permit because of significant changes in the Project design that have occurred since the initial public notice in 2005. As the DEIS states, “The majority of supporting documentation for the PD and potential impacts of the Project were submitted by PolyMet between July 2006 and July 2009, including documents and technical memoranda and reports as listed in Section 7.0.”	G10
42	Financial assurance can and should be addressed in the DEIS. NMW rejects the contention that financial assurance considerations can be postponed to the permitting phase. This position is developed in detail in the Major Issues section of NMW comments. Support for this position is also developed in comments in Sec. 3.1.8 of this document.	PD8
43	NMW supports the tribal cooperating agencies position that the Tribes were not involved as Cooperating Agencies during Scoping, or when the Final SDD was issued and that additional consultation and evaluation is needed to determine the degree of impact on the ceded territory as a result of this project.	PRO1
44	NMW supports the tribal cooperating agencies position that although groundwater hydrology and impacts to groundwater, Cultural Resources, and impacts to wild rice were “incorporated” after scoping, impacts resulting from groundwater drawdown and inundation cannot be determined without additional data. NMW notes further that consultation is ongoing between tribal cooperating agencies and USACE regarding Cultural resources and impacts to wild rice.	WR2A
45	NMW contends that, as proposed, Mine Site wastewater, both non-contact storm water and process water, will require treatment for centuries to avoid contamination to the Partridge River. Likewise, the proposed CPS will require operation potentially for centuries. Conclusion: Treatment in perpetuity is unacceptable and not allowed under Minnesota law. The Mine Site wastewater treatment proposal should be rejected.	PD8

Comment ID	Comment Text	Theme Codes
46	<p>All waste rock piles are to have engineered liners. The waste rock with the least predicted ability to generate acid mine drainage and/or metals leaching is the Category 1 and 2 waste rock. Category 1 waste rock piles will have an engineered barrier layer and overlying drain layer to minimize the amount of waste rock seepage that will enter groundwater. Categories 3 and 4 waste rock liners have additional liner protection in the form of a synthetic liner placed on top of the engineered subgrade barrier. In describing the subgrade barrier layer to limit vertical infiltration from the waste rock piles, it is stated that the barrier layer will have permeabilities ranging from <math>5 \times 10^{-7}</math> to <math>1 \times 10^{-5}</math> cm/sec. (DEIS, Table 3.1-9) Clarification: The DEIS should describe how this specification will be tested during construction, and should disclose the methods that will be employed if testing indicates that the target permeability is not being attained? This subgrade will be the only barrier between leachate from the waste rock and groundwater for Category 1 and 2 wastes. Although this waste is not projected to generate AMD, it could contribute to Metals Leaching. Quality control in the placement of the subgrade barrier will be particularly important. Achieving these permeabilities, especially the lower ones, could be difficult unless the subgrade material has significant clay content. Amending this material, once in place, would be time consuming and expensive. Conclusion: A thorough testing program for verifying the target permeabilities of the various subgrade barriers should be required. If testing indicates that the specified permeabilities are not being reached, then corrective measures should be required.</p>	PD4
47	<p>According to the DEIS, trains consisting of up to twenty 100-ton side dumping ore cars would transport the ore from the Mine Site to the Processing Plant. Under the plan, the cars would have hinged sides that drop down when the cars are tipped at the Coarse Crusher for unloading. Ore would inevitably escape the confines of the rail cars during transport. The plan for limiting the escape of ore (with metal contaminants) from the rail cars is to load the cars at the centerline to keep fines from reaching the edge of the car where they would be subject to spillage through the hinge gaps. The likelihood that this procedure will prevent spillage from rail cars is, quite frankly, not good. Unless the rail cars are designed to be completely enclosed, there will inevitably be spillage and resulting environmental contamination along the rail line. Given time, the spillage from the rail cars would likely spread from the rail line across a wide area. Conclusion: Ore-transport rail cars should be completely enclosed, for example a tipple-dump type car that would not have hinges that could leak, and which could be sealed with a hardtop cover to prevent windblown dust loss. Soil monitoring along the rail line should also be required to document the absence or presence of soil contamination. Provisions should be made to remove contaminated soil as a part of mine closure. Failure to remove contaminated soil has led to contaminated storm water runoff at other mine sites.</p>	PD5
48	<p>The shipment of concentrate poses a significant risk for contamination because of its high metal content and the small particle size of the concentrate material. The shipment of concentrate from the plant is projected to be by rail and with pneumatically sealed rail cars, or in rail cars with a rigid cover. A risk of leakage, however, remains, and there is no plan to monitor for soil contamination. Conclusion: As with the rail transport of the ore, soil monitoring at the concentrate loading facility and along the rail line from the plant should be required to document the absence or presence of soil contamination.</p>	PD2
49	<p>Conclusion: Centerline construction of the expanded tailings facility should be considered even though it would be more costly, and would likely require the destruction of more wetlands.</p>	PD7
50	<p>Conclusion: Given the nature of the material to be stored in the hydrometallurgical residue cells, these cells should be designed to withstand the maximum credible earthquake.</p>	PD7
51	<p>Conclusion: A better description of the composite liner for the hydrometallurgical residue cells should be included in the DEIS. The additional cost associated with a double liner with leak detection for the hydrometallurgical residue cells is not cost prohibitive. A double liner with leak detection would provide maximum protection for the residue material, and should be required.</p>	PD10
52	<p>While the volume of water requiring treatment post closure may decline substantially, pumping and water treatment activities at the plant sites would have to be conducted in perpetuity. The proposed cover and liner would also require perpetual maintenance. These perpetual activities need to be addressed.</p>	PD2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
53	Financial assurance associated with reclamation actions must be addressed in the DEIS, and not deferred until the permitting process as proposed. Analysis of the DEIS discloses the likelihood of extremely long-term/perpetual treatment, maintenance, and monitoring (centuries – perhaps thousands of years in some instances). NMW joins with the tribal cooperating agencies in requesting that DNR/USACE incorporate the views of EPA regarding inclusion of financial assurance in the DEIS. Namely that, because of its experience in expensive cleanups of contamination from many defunct or bankrupt sulfide mines, EPA Region 9 has strongly urged other Regions over the past two years to require financial assurance disclosure in the NEPA process. New national rules for financial assurance are under development by EPA, because “Given the history of adverse environmental effects resulting from some hard rock mines, and the expenditure of public funds used in some cases to address environmental problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS.” (from InsideEPA.com, Tuesday, August 25, 2009). The DEIS is misleading in the claim that, “Post-Closure and reclamation activities would be expected to be ongoing until such time as the various facility features are deemed environmentally acceptable, in a self-sustaining and stable condition. This is misleading because post closure activities may well continue for hundreds or thousands of years.	PD2,PD5
54	Likewise misleading is the DEIS statement that, “When PolyMet has completed all reclamation required by the Permit to Mine, they may submit a Request for Release per Minnesota Rules, part 6132.1400. This request would provide the Commissioner of the MnDNR with detailed information on the final reclamation status of the Mine Site.” This is misleading because if, as expected, the project would require perpetual maintenance it cannot be deemed to be “reclaimed” and would violate the stated goal of Minnesota’s reclamation statute.	PD4
55	NMW concurs with tribal cooperators who note that the scoping period for a federal EIS continues until the release of the DEIS. Therefore, new issues that have been identified during the review of the three PDEIS documents must be considered for the DEIS.	PD3
56	Conclusion: The cost-benefit analysis of the No Action Alternative should be redone to reflect the full range of anticipated outcomes	PD2
57	Conclusion: All Category 2, 3 and 4 waste rock should be backfilled into the mined-out East Pit, and Category 1 waste rock should be used to fill (i.e. top off) all of the remaining room in the East Pit.	PD8
58	Conclusion: It should be clearly stated in the DEIS what levels of contaminants would trigger the use of capture wells for treatment, and what standards the treatment of the water must meet in order to be discharged into the Partridge River. Another aspect of the Tailings Basin Alternative is the buttressing of the toe of a portion of the northern embankment of Cell 2E. Any effort to increase the stability of the present upstreamtype tailings dams would lower long term financial risk to the public, and lessen long term environmental risk.	ALT8,PD5,PD11
59	The DEIS statement asserts that, “The Tailings Basin Alternative resulted from the comprehensive mitigation planning effort by the co-lead agencies, and included input from all Cooperating Agencies and consulting tribes.” NMW concurs with the tribal cooperating agencies statement that “although they (tribal cooperating agencies) participated in the identification of potential mitigation measures for the tailings basin, they did not participate in the development of the tailings basin mitigation design.” In addition, NMW endorses the position of the tribal cooperators that, “an untreated discharge of contaminated tailings basin water to the Partridge River in order to dilute and dispose of tailings basin water would have environmental impacts that must be avoided in order to adequately protect the environment.”	PD5
60	The scope and depth of the analysis presented in ALT11 is not enough to state conclusively that underground mining is not economical at this site. Indeed, here, a significant portion of the mill processing facilities are already in place from previous mining. Underground mining might be economical at this site as metal prices increase, and when the processing technology proposed for the NorthMet operation has been proven enough to clearly quantify the costs.	PD11

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
61	The comments by the tribal cooperating agencies also yield some additional information on the topic of potential underground mining. As noted there, "A study of this particular deposit was performed by U.S. Steel that recommended underground mining. By examining cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative." (DEIS, p. 3-64)	PD5
62	Table 3.2.4 E7 Underground Mining (p. 3-64) NMW endorses the position of the tribal cooperating agencies that this alternative was eliminated prematurely and without sufficient consideration. Tribal cooperating agencies note that, "analysis of unquantified environmental impacts, values, and amenities have not been evaluated as required by CEQ regulations." A study of this particular deposit was performed by U.S. Steel that recommended underground mining. By examining cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative."	ALT8
63	Conclusion: The discussion of impacts to water quality should not be limited to constituents for which water quality standards may be violated. The increased level of all pollutants over background levels must be assessed and disclosed.	WR1E
64	Conclusion: A more pristine, upgradient site should be identified for baseline water quality data.	WR1E
65	Conclusion: The historic and cultural significance of wild rice to the Ojibwe tribes is recognized in the DEIS, which reflects the beginning of the consultation with tribes required under law. (DEIS, pp. 4.3-1, 4.8-5) This consultation must be completed, including an objective and thorough wild rice survey. (DEIS, Tribal Positions, p. 4.1-33). The EIS must include detailed information correlating wild rice conditions with sulfate levels throughout the entire St. Louis River system. It must also include the impacts of the Polymet Project on wild rice conditions. Information presented in the DEIS implies that waters of the Partridge, Embarrass and St. Louis Rivers would need to be treated in perpetuity to remove sulfates in order to comply with Minnesota statutes. The final EIS must then evaluate impacts on cultural resources and environmental justice, as well as defining the extent of violations of the 10 mg/L water quality standards pertaining to sulfates in waters designated for or producing wild rice.	WR1E,WR4F,WR5C
66	Baseline data for both the Mine Site and the Tailings Basin are inadequate. A comparison of hydrologic data that was collected for two other projects in the region (GLIFWC letter to Jon Ahlness and Stuart Arkley, February 6, 2009) demonstrates that the PolyMet project is data-poor in the area of basic hydrology. The use of flow data on the Partridge River from a site twenty years and seventeen miles distant from the proposed project does not provide sufficient information to allow a full assessment of the hydrologic and environmental impacts of the project on the Partridge River. The data presented in the DEIS is also not representative of the Partridge River near the mine site. The gauging station is seventeen miles from the mine site and the data from that station is twenty years old and, therefore, unlikely to be representative of current conditions at the mine site. Conclusion: Additional data must be collected before the DEIS may be considered adequate.	EOO
67	The extent of existing wild rice beds has not been fully characterized and may be in violation in MN statutes.	WR1E
68	NMW supports the tribal cooperating agencies' position that the standard for wild rice waters, as currently in place, must be enforced. Tribal cooperating agencies report that extensive research in Minnesota has demonstrated that healthy and viable wild rice beds occur only in waters with less than 10 mg/l of sulfate.	WR3I,WR4F

Comment ID	Comment Text	Theme Codes
69	Listed parameters calculated for the Partridge River have little data to support them. The MODFLOW model was developed to assess the rates of mine pit inflow and as such, the results it gives for areas outside the mine pit footprint are unsupported by data. As noted earlier, the XP-SWMM is based on stream gage data that is 17 miles and 20 years distant from the proposed project. Field data collection is spotty or non-existent and the numbers used in this DEIS are derived from the MODFLOW groundwater model and XP-SWMM model.	WR1E
70	Conclusion: Closure water treatment, as well as the other closure costs, will probably require a financial surety of approximately \$100 million. This is too important an issue to be ignored in the DEIS process. The financial surety amount should be analyzed and disclosed to the public in the DEIS.	WR3I
71	In discussing the geochemistry of the tailings, as it applies to the ability of the tailings to generate contaminants, it is noted in the DEIS: "Current modeling assumes an average tailings sulfur content of 0.13%. Predictions made from kinetic testing suggest that water reacting with NorthMet tailings could become acidic when sulfur content is between 0.14% to 0.17% (Day 2008)." (DEIS, p. 4.1-95) It is well known that mine waste can produce contamination by way of Metals Leaching (ML) under neutral or basic pH conditions. It should also be noted that the flotation process produces tailings with a sulfide sulfur content that is just under the range that could produce Acid Mine Drainage (AMD). Conclusion: More discussion and verification should be given to the finding that the sulfide sulfur content of the tailings is and will remain under 0.13% and non-acid producing.	WR1E
72	Conclusion: The mitigation of storm water management controls should be required, not merely recommended. This is good pollution prevention practice	EOO
73	Conclusion: At a minimum, contingencies should be put in place to fund long term water treatment well beyond the 65-year limit assumed in the DEIS. This is for the protection of the budget and citizens of Minnesota and the environment.	WR3I
74	Conclusion: The DEIS must provide a quantitative analysis of the discharge of mercury to the Partridge and Embarrass River from these pathways during and after mining, and from direct surface discharge from the West Pit after mining.	WR4E
75	Water quality analyses of aluminum cannot be explained away by the fact that aluminum concentrations already exceed standards. Analyses of aluminum must include appropriate variables. The DEIS reports: Predicted aluminum concentrations appear to exceed the surface water standard of 125 µg/L for low and average flow conditions in all mine years (i.e., Year 1 through Post-Closure) with a predicted high concentration of 346 µg/L. The exceedances are in part explained by the fact that average aluminum concentrations in the Embarrass River already exceed surface water standards under existing conditions, with an average concentration of 192 µg/L and a peak concentration of 433 µg/L based on available monitoring data, and a modeled existing low flow concentration of 671 µg/L. (DEIS, 4-118) The fact that background water quality already exceeds standards does not mean that an increase is not a significant impact. Just the opposite; once standards are exceeded, any additional amount is problematic. Conclusion: The DEIS analysis must include existing violations of standards.	WR3H
76	The DEIS then goes on to state, the surface water standard is for dissolved aluminum, whereas the modeled values predict total aluminum. Therefore, "the predicted aluminum concentration is not expected to exceed the surface water standard." This conclusion is undercut by the choice of an inappropriate outcome variable. Conclusion: The appropriate variable must be chosen, or results using a different measure preceded by an explanation of the measure and of the way its results will be modified to reflect those using an appropriate variable.	WR3H
77	Conclusion: The no-action alternative should assume compliance with state and federal law in the clean-up of existing contamination.	WR1E
78	In this section it is stated that: It is assumed under the Tailings Basin Alternative that the vertical wells would continue to operate at least through Year 50, which is the same year that operation of the WWTF would cease under the Mine Site Alternative. (DEIS, p. 4.1-148) It is not apparent why the WWTF would no longer be required after year 50. This time frame for the WWTF does not appear to be substantiated by the discussion in the DEIS, or in the supporting documents. Note: This reference to the cessation of WWTF operation may be an inadvertent error, but if not the documentation that supports the statement that the WWTF will not be required after year 50 should be cited and the statement should be justified.	WR3I

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
79	Conclusion: The agencies should clearly state which of the mitigation measures would be required in the permits, and which they consider to be voluntary for the mine operator. That way the public has the ability to weigh the importance of the 'voluntary' mitigation measures, and can then comment on the relevance and importance of the voluntary mitigation measures.	WR1E
80	In the analysis of cumulative effects, it is stated in the DEIS: "In order to be reasonably foreseeable, an activity cannot be simply speculative, but should be included in government plans and budgets or, for private projects, have filed for required permits." (DEIS, p. 4.1-173) To require that a project must "... have filed for permits" in order for it to be considered for cumulative impacts is imposing an unreasonably strict definition of what is a reasonably foreseeable impact. For example, there are several mining projects in the advanced stages of exploration that should be considered as reasonably foreseeable. These projects include the Duluth Metals Ltd - Nokomis deposit and the Franconia Minerals Corp - Birch Lake deposit. Ignoring the potential for these developments understates the cumulative impacts to the region. Conclusion: Mining projects in the advanced stages of exploration should be included as reasonably foreseeable impacts for analysis of the NorthMet project's cumulative impacts.	WR5A
81	We join the tribal cooperating agencies in disagreement with the DEIS conclusion that the NorthMet Project is expected to meet all surface water quality standards under all flow conditions for all mine years in the Partridge River. Wild rice grows on the lower Partridge River and it is our position that the wild rice sulfate standard applies. The PolyMet discharge under the tailings basin alternative would not meet this standard.	WR3I,WR4F
82	We join the tribal cooperating agencies' position that the wild rice standard for sulfate applies on the Lower Partridge River.	WR3I
83	Conclusion: The Section 401 certification process should be reopened and the MPCA should have the opportunity to examine the Projects' adverse water quality impacts.	WE4
84	Wetland resources affected include approximately 3,016 acres at the Mine Site and 1,000 acres at the Plant Site and along the railroad and treated water pipeline corridors. But this is less than 50% of the area that will be impacted by disruption of the existing hydrology. This is especially true around the Tailings Basin which will likely be inundated. USACE is working to assess these impact, but they are not in the current DEIS. This is a significant omission. Conclusion: An analysis of impacts on all wetlands areas potentially affected by the Project must be conducted.	WE2
85	The evaluation of hydrologic impacts to the Mine Site is flawed due to reliance on "best professional judgment" and aerial photographs. Conclusion: Data-based scientific analytical methods exist and should be used for estimating the impacts to drawdown and inundation on wetland hydrology. The current analysis is flawed.	WE2
86	The Agencies incorrectly identified wetlands at the Mine Site as "perched bogs," which are dependent on precipitation rather than groundwater flows. These wetlands are actually cedar, northern ash or alder swamps, rich forested peatlands, and poor fens: all of these require significant groundwater inputs. The groundwater impacts to them have not been determined. Conclusion: The analysis is incomplete and should be redone to include the issues identified above.	WE1,WE2
87	The Tailings Basin is "an actively permitted waste storage facility" and approximately 5,700 gpm of tailings waste is released due to past LTVSMC activity. Conclusion: This has had a significant influence on the hydrology of the area which should be accounted for in the DEIS to avoid any further cumulative adverse impact.	WE2,WE5
88	A mitigation plan that covers all wetland impacts must be included in the DEIS.	WE3
89	Conclusion: The 100 mile awamp must be included in a recalculated wetlands impacts analysis.	WE2
90	Second, given the lack of information on hydrology, the projected number of acres potentially affected is a very rough estimate. Conclusion: Information on uncertainty needs to be included in the wetlands impacts analysis, along with some disclosure of what the largest impacted acreage might turn out to be.	WE2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
91	Third, mitigation plans are not included in the DEIS. Conclusion: Mitigation plans must be identified included in the DEIS because replacement of wetlands is regarded as reducing the significance of wetland destruction, it is impossible to assess the significance of wetland impacts without knowing what the mitigation will be.	WE3
92	NMW supports the tribal cooperating agencies position that the proposed action would violate section 404(b)(1) guidelines of the CWA which prevents permitting when a feasible cost effective alternative (underground mine) would have less adverse effects, or when water quality standards are violated or significant water degradation would occur.	WE4
93	NMW supports the tribal cooperating agencies position that a larger mitigation ratio is warranted given the larger quantity and high quality of impacted wetlands.	WE3
94	Cumulative impacts on the St. Louis River watershed must be addressed. These include air and water emissions into the Partridge and Embarrass River watershed wetlands, the loss of wetlands, and the changes in wetland functional values. The same concerns also apply to the 1854 Ceded Territory. The cumulative impacts analysis does not include a quantitative analysis of the long-term effects of mine effluent, especially in the Embarrass River. If mine related effluent is to be perpetual, then the effects of perpetual mine discharge on wetlands must be assessed. Conclusion: The long-term maintenance requirements of the Polymet mine must be addressed and the potential cumulative impacts on the St Louis River Watershed and the 1854 Ceded Territory evaluated.	WE3,WE5
95	The Northmet Project would be the largest wetland impact that has occurred or is proposed to occur in the Partridge River watershed (814 direct impact acres and 318 indirect impact acres). It would impact high quality wetlands with significant functional values. However, the proposed mitigation would occur outside the Partridge River watershed and outside the 1854 Ceded Territory. As discussed in 4.2.4.2, 475 acres of additional required mitigation have not been addressed and must be included in the mitigation analysis and plans. The Northmet Project would be the largest wetland impact that has occurred or is proposed to occur in the Embarrass River watershed. One result would be an indirect loss of 352 acres which are considered to be of low quality. Conclusion: NMW supports the tribal cooperating agencies position that the impacts of this loss would be significant and should be ameliorated	WE2,WE3
100	Conclusion: Among many other negative impacts to wildlife, the Project will, by destroying wetlands, cause potential serious harm to moose populations in the Project Site area.	WI2
101	Conclusion: The DEIS impact criteria is incomplete. The effects of the Project on species harvested on public land must be analyzed.	WI1,WI3
102	Polymet plans to undertake some restoration of disturbed areas after mine closure. This would entail the re-creation of forest, wetlands and open water but “the successional process would likely take decades,” according to the DEIS. Thus, the area would be unavailable as lynx habitat for forty years, or longer -- twenty years of mine operation plus at least another twenty years before the area would provide even minimally suitable lynx habitat. Indeed, there is no guarantee that excellent Canada Lynx habitat would ever be restored, especially as more flexible competitor species, such as the bobcat, can be expected to more quickly re-colonize the regenerating forest and occupy the Canada Lynx’s ecological niche. Conclusion: The DEIS should note that the proposed restoration plan for the Mine Site would provide excellent bobcat habitat and that the presence of the Bobcat, which is a superior competitor, might prevent repopulation of this site by Canada Lynx.	WI1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
103	Among other important species which would potentially be affected by the Project is the bald eagle. Bald eagles are known to use a large range for both foraging and nesting. (Nests optimally do not occur within a ten-mile radius of each other, except where large areas of suitable habitat are unavailable.) According to the DEIS, “human activity within one-quarter mile to two miles can be seen by eagles and, depending on the level of screening and habituation of individual eagles, may cause them to abandon a nest.” Since there are nests approximately two miles from the Project Site, disturbances from the Project may have an adverse impact on both eagle nesting and foraging. Despite these manifest concerns, however, the DEIS ignores its own findings and proposes that “the Project is not likely to adversely affect bald eagles.” Conclusion: The DEIS fails to fully account for the potential negative impacts to bald eagles could result from the loss of feeding and nesting sites within or adjacent to the Project area. The DEIS should include, but is currently silent about, the potential that contaminants from the mine site, specifically mercury and other heavy metals, could bioaccumulate in prey species and have a secondary impact on bald eagle reproduction. The direct effects of heavy metals upon the survival of bald eagles, while unknown, are also potentially harmful	WI1
104	Although the Mine Site is adjacent to areas where there are known populations of wood turtles and the Project would produce water turbidity and flow modifications (specifically, a lowering of water levels in the Upper Partridge River), the DEIS asserts that “the Project is not likely to adversely affect wood turtles because there would be no direct loss of individuals, populations, or suitable habitat and the Project would have no indirect effects on downstream habitat.” The decrease in river flow would, however, “expose additional nesting areas” in the area which might be attractive to wood turtles. These additional nesting areas might induce the turtles to begin nesting in unsuitable habitat, such as sites where mining and vehicular traffic occurs. If so, these turtles would be subjected to nesting disturbances as well as increased mortality of both adults and younglings. Conclusion: Improved analysis is needed to support the claim that the Project is not likely to affect wood turtles.	WI2
105	Restoration efforts at the Mine Site would include afforestation over 792 acres of degraded land with red pine seedlings. As the DEIS states, “a red pine monoculture would not mimic the natural plant community [now present] at the Mine Site.” This red pine plantation would not cover the entire area of disturbed land at the Mine Site, and it would take twenty years for early succession to begin with aspen and willows, another two decades for larger aspens to grow, and 50-100 years to convert the more disturbed areas to a more diverse forest, as some native species such as jack pine, paper birch, spruce and fir invade. The disturbance would reduce the quality of habitat for decades because of soil compaction, removal of seedling stock, and the planting of a red pine monoculture. Conclusion: As recognized in the DEIS, and established in the scientific literature, singlespecies tree plantations (like the red pine monoculture proposed) do not in any way replace or replicate a diverse and resilient natural ecosystem (like the one that will be removed). Tree monocultures are impoverished in plant species, do not provide a rich variety of habitats for wildlife, and may actually retard the regeneration of a multi-tree-species forest due to removal of diverse seed stocks and the nutrients they need to take root, and by discouraging the presence of transient, seed-dispersing wildlife. The number of species of wildlife which can live or forage in these monocultures is greatly reduced from the natural condition. This opinion is supported by the statement in the DEIS that, “the quality of habitat for SGCN species is likely to remain degraded for some decades after Closure relative to pre-mining operations due to conversion of high-quality habitat to lower-quality habitat.”	WI4
106	With regard to wetlands in areas which would be impacted by the Project, the DEIS is unacceptably vague. It mentions a number of wildlife Species of Special Concern which might use the wetlands within the Project area, but, except for the marbled godwit and olive-sided flycatcher, Polymet did not survey or assess wildlife populations, asserting only that these species are unlikely to be present -- even though the DEIS itself states that 1,522 acres of wetlands would be impacted and that “these wetlands are generally considered to be of high quality and provide valuable habitat to a wide range of wildlife species.” It is unlikely that high quality wetland habitat would not be populated by a number of aquatic and riparian species. Conclusion: The responsible agencies should reevaluate the inadequate methodology used to predict the acreage of wetlands that will be indirectly impacted by the Project pit dewatering. Based on a revised methodology, reevaluate the indirect impact of the Project pit dewatering on area wetlands should then be reevaluated.	WI2,WE1,WE2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
107	Conclusion: NMW considers the loss of mature forest a significant impact and notes that activities on the mine site will prevent more forest acreage from reaching this mature community state, representing a nearly permanent loss of habitat	WI2
108	Two wildlife corridors, identified as #11 and #12, are located close to the proposed Mine Site. Corridor 11 is identified by the DEIS as a poor-quality, partially obstructed corridor with limited wildlife movement and that the “moderate impact” mining activities would not be “complete barriers” to the movement of wildlife. Mining activities and construction would result in a more severe impact on Corridor 12 by increasing noise, limiting access to the corridor, and disturb wildlife with rail and vehicular traffic. As stated in the DEIS, “...mining operations could generate sufficient activity and noise to discourage wildlife use of this corridor...” Although Corridor 11 is of relatively poor quality, it has been proposed to restore it by revegetation, which would be precluded by mining activities. Corridor 12 will obviously be significantly impaired as a wildlife corridor by mining activities. Conclusion: It is the position of NMW that negative wildlife-corridor impacts disclosed in the DEIS should be considered significant.	WI5
109	Conclusion: These basically represent mine closure, not mitigation, efforts. NMW thus finds these efforts to be inadequate. A mere plan to remove the agents that will have degraded the area does not constitute rehabilitation, nor does it ensure restoration of the area to its former state. Any new impacts to existing wildlife migration corridors, (e.g., by mining) is by definition significant, and should require mitigation. Until the Section 106 consultation process between the USACOE and the tribes is complete, it is not possible to determine the potential impacts to treaty-protected wildlife.	WI3,WI5
110	Although the DEIS states that “There are no known occurrences of lake sturgeon and no likely habitat for lake sturgeon in the Project area,” the tribal cooperating agencies note that lake sturgeon were once prevalent in the area prior to dam construction, and that lake sturgeon have been caught in the area recently. The Fond du Lac Resource Management Division has a restocking program based on early accounts of this fish’s abundance. Thus, the current absence of this fish species in the area of the Project is not representative of the appropriateness of the aquatic resources to support lake sturgeon but is due to blockage of their migration routes by dams. Conclusion: Lake sturgeon fish could be restored in waters involved with the activities of the Project.	FM2
111	According to the DEIS, the northern brook lamprey is not present in the Project area, although there is probably suitable habitat in the Project area. No survey has been made, however, to ascertain the presence or absence of the fish or of suitable habitat in the Project area. Conclusion: Given the lack of data, no conclusions about the presence or absence of northern brook lamprey in the Project area can be made. It is suggestive, however, that this species has been found in the Dark River, only a few miles from the target area.	FM2
112	The DEIS asserts that “Unionid mussels ...constitute one of the most imperiled major taxa in the United States.” There are populations of the creek heelsplitter, one of the species identified by the State of Minnesota as a Species of Special Concern, in the St. Louis River basin. Further, according to the DEIS, suitable habitat for the creek heelsplitter does exist within the Project area itself (though the DEIS notes that the species has not been collected in the Project area). Conclusion: This conclusion was based on a superficial survey, as many other (more common) species of mussels known to live in the St. Louis River basin were not collected in the survey relied upon by the DEIS. As the creek heelsplitter is a rare species, a more intensive collection effort might locate this species. Populations of this species have been located not far from the Mining Site	FM2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
113	NMW objects to the statement in the DEIS that the species-poor fish fauna in the Partridge River is due to a natural impoverished habitat present in these bodies of water -- rather than due at least partially to anthropogenic causes (e.g., pollution from LTVSMC tailings). (The DEIS does allow that the poverty of macroinvertebrate species in the river might be, at least partially, anthropogenic in origin.) This river has been sampled and has a relatively low fish and species richness as compared to other rivers with presumably ecologically-similar habitats. NMW does not agree, however, that previous mining activity has not affected the productivity of these waters. NWM asserts that the data presented to support the claim of poor habitat is based on an unsound methodology incapable of determining habitat quality reliably. Additionally, the sampling sites represent three to four different habitat conditions, and therefore one cannot extrapolate from one to another. Conclusion: This DEIS finding is inconsistent with the DEIS position that the physical environment is the cause of fish species impoverishment.	FM2
114	Colby Lake and Whitewater Reservoir are the two bodies of water which would be most directly affected by the proposed Polymet mine. Alterations in the water table and water levels by discharges and withdrawals by the mine could affect water quality and the population sizes of aquatic species in both. Although the fish assemblage has not been established for Colby Lake or Whitewater Reservoir by the Minnesota Department of Natural Resources, the DEIS states that the assemblage in Colby Lake “appears to be similar to what might be expected based on other lakes in the region with similar physical and water quality conditions.” Conclusion: This is not a valid evaluation of the fish populations present in Colby Lake because it is based on an assumption not verified by any data. If supporting data does exist, it should be cited in the DEIS. But no conclusions can be drawn from possibly fallacious comparisons. The same is true about the lack of data for the fish assemblage in Whitewater Reservoir: the DEIS finding is not valid because it is based on an assumption not supported by data. If supporting data does exist, it should be cited in the DEIS.	FM1,FM2
115	Given that there is so little data on either fish or invertebrate species in both Colby Lake and Whitewater Reservoir, it is curious that the DEIS suggests that these are species-poor waters, and that poverty of species (if it does, in fact, exist) is due to the inadequacy of the physical habitat. (The DEIS claims that “[t]his departure from richness expectations for the Mississippi and St. Croix River Basins is probably a manifestation of the species-poor nature of habitats encompassed by the Partridge River.”) The DEIS further claims that the presence of certain midge species indicate good water quality in these bodies of water -- supporting the position that the alleged species-poor status of the waters is not due to earlier episodes of water pollution. But NMW disputes the DEIS’s reliance on a proxy indicator, because midges are not on the sensitive end of the pollution-tolerance index. Conclusion: No current or recent water-quality data is cited to support the DEIS’s proposed finding. Reliance on the presence of midges in these waters as an indicator of good water quality is unjustified for the reasons given above.	FM2
116	Conclusion: The significant hydrologic alterations predicted will likely have significant adverse affects on the aquatic biota.	FM1
117	Conclusion: There is insufficient flow data and hydrologic modeling to support the conclusion that reductions in high-end flows would not have a significant effect on physical habitat for aquatic biota. Any alteration of flow at the magnitude predicted will definitely result in a decrease of stream power, leading in turn to a decrease in the size of particle able to be transported. Thus, increased sedimentation is likely to result.	FM1
118	The DEIS states that “aluminum appears to exceed the chronic water quality standard in the Embarrass River.” It seems that much of this contamination is due to the previous occupant of this property, LTVSMC. The DEIS goes on to state that “[t]here are several mitigation measures discussed [above] that could be used to treat the pit water before it is discharged and enable it to meet surface water standards.” Conclusion: NMW regards this statement as weak and non-binding, in that it does not adequately analyze or disclose what could be done to prevent further contamination of surface water in the area of the proposed mine. NMW’s position is that PolyMet must assume remedial liabilities of pollution from LTVSMC, and that mitigation measures relevant to this particular issue should be included and discussed in the DEIS to ensure that no new pollution exceeding aluminum standards for aquatic life will be released.	FM1,FM4

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
119	Conclusion: NMW holds that any increase of methylmercury bioavailability in the Partridge River watershed endangers a critical trust resource and should not be permitted. The fish resources from this area would potentially be impaired by waters highly contaminated with methylmercury. Further, any new discharges that would result in further degradation to waters already overloaded with mercury levels which would not be permissible under the Clean Water Act.	FM1,FM5
120	Conclusion: Additional analysis must be done concerning the reactivity of the waste rock dust. The environmental impact from the reactivity of the waste rock dust was overlooked in the current DEIS and needs to be included. This waste rock dust is reactive enough that the possibility exists that sulfates could form in wetlands and lead to an increase of methylation of mercury. Further, it has not been shown that the waste rock dust would not in and of itself create sulfuric acid.	AQ1
121	Conclusion: In addition to addressing the above concerns, a monitoring scheme should be required that will provide statistically reliable data on the autoclave mercury emissions, to ensure that the mercury capture systems on the autoclaves are functioning as designed.	AQ6A
122	Conclusion: Mitigation options should be aggressively pursued by the MPCA and the FLMs, as stated above. The Tribal cooperating agencies should be included in these discussions to every extent possible.	AQ5
123	Conclusion: Class II modeling did not adequately consider cumulative impacts. That analysis did not (1) take into account the effect of the full particulate emissions from the tailings basin, (2) factor in any emissions from the Keetac Expansion Project that plans to increase production by 61% by reopening another furnace line, or (3) include the planned Essar Steel Expansion project. The analysis is thus incomplete. The 24-hour PM2.5 modeling must account for emissions from the Keetac Expansion Project. Full cumulative effects may lead to violations of the PM2.5 NAAQS standard.	AQ4
124	Conclusion: The assessment that there is no significant impact cannot be considered correct, because that analysis did not take into effect the full particulate emissions from the tailings basin. That analysis did not factor in any emissions from the Keetac Expansion Project (that plans to increase production by 61% by reopening another furnace line), or the planned Essar Steel Expansion project.	AQ2,AQ4
125	Conclusion: The table is incomplete. There is no mention that the Keetac Expansion Project will be producing 64 lbs HG/yr controlled or 90 lbs uncontrolled. (Cumulative Impacts Analysis Local Mercury Deposition and Bioaccumulation in Fish, Keetac Expansion Project April.)	AQ6A
126	Conclusion: Noise-contour maps should be developed for inclusion in this DEIS. Noise-contour mapping would allow reviewers to assess the impacts of noise to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the Mine Site (see Figure 4.9-1). An assessment of noise impacts to all public access lands is important information for assessing cultural impacts to tribes with hunting, fishing and gathering rights in the 1854 ceded territory. NMW concurs with the tribal cooperating agencies position that the Army Corps has not yet completed consultation with potentially affected tribes. Therefore, this document does not estimate the potential degree of disturbance to tribal members who may not be involved in traditional natural resource harvests on national forest lands.	N1
127	Conclusion: The DEIS does not present sufficient information to support the claim that “the continuous generation of noise at the Plant and Mine Sites would not have a significant effect on the noise environment during mine operations, Closure, and Post Closure.”	N1
128	Conclusion: An adequate cumulative impact of noise impacts analysis has not been done. Meeting ambient-noise standards is a different question than assessing impacts. Impacts should be fully characterized in this document. Contour maps that show overlapping noise pollution from different projects should be provided -- it is impossible for the public to review the cumulative impacts of noise without this information. Also, the cumulative impacts of mine related vibration have not been assessed	N3
129	Conclusion: The DEIS remains incomplete and compliance with federal law Section 106 cannot be determined at this time. The EIS must address the issues described above.	CR1,CR2

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
130	Comments concerning the Loss of Cultural Resources as a Result of Direct and Indirect Loss and Functional Impairment of Wetlands in the 1854 Ceded Territory were addressed in the earlier section, "Other Major Issues..." NMW hereby incorporates and repeats the conclusion offered in that section. Conclusion: The final EIS must include an evaluation of the Project's impacts on cultural resources and environmental justice, as well as defining the extent of violations of the 10 mg/L water quality standards pertaining to sulfates in waters designated for or producing wild rice.	G3,CR1,CR4
131	Continued current uses and activities at the Mine and Plant Sites under the No Action Alternative would be compatible and consistent with existing land management plans, regulations, and practices. Conclusion: This section of the DEIS should include a discussion of the remediation that would occur at the site under the no-action alternative, and its compatibility with the MFRC Landscape Management Plan.	CPLU1
132	Implementation of the above-referenced mitigation measure (e.g., a native seed mix) would allow the Project to comply with the long-term goals of the MFRC Landscape Management Plan. Therefore, there would be no long-term or cumulative effects during the life of the Project and Post-Closure relative to Compatibility with Plans and Land Use Regulations. Conclusion: Post-closure impacts have been insufficiently addressed. This section should discuss long-term and cumulative impacts from the Proposed Action, including a detailed native seed mitigation plan.	CPLU1
133	What impacts will the Polymet Project have on the socioeconomic conditions of these East Range Cities? In order to best weigh the positive and negative impacts of a project, economists usually perform a cost/benefit analysis. Only then can an informed decision be made about proceeding with a project. However, this was not produced for the Polymet DEIS, leaving a large information gap in the analysis. "This analysis did not identify any potentially significant adverse socioeconomic effects from the Project, therefore, no mitigation measures are proposed."	SE3
134	What has been provided is an accounting of the benefits: the direct effect of 448 new jobs and the indirect and induced multiplier effects on employment. Only 25% or 112 jobs would be filled by local residents. In 20 years these jobs are gone and 95% of working-age adults would be unemployed and either leave the area or seek alternative employment. The boom-bust cycle is repeated. An accounting is given of likely tax revenues to accrue from the Project. But no accounting is provide for the increased cost of building new infrastructure, renovating schools, hiring additional city staff, police, fire, ambulance, and medical providers-all at public expense. Adverse economic impacts to communities during temporary shutdowns and at closure are conspicuously absent from the study But these costs are real, and there is reason to believe that they will be high:	SE3
135	The negative impacts associated with the loss of natural resources and environmental degradation have also not been addressed. There is reason to think that these costs will be high, too:	SE4
136	The DEIS details the likely need to treat the waste streams from the Polymet Project for hundreds or thousands of years. But what is the present value of this cost to perpetually treat acid mine drainage? This cost has not been quantified or included in a cost/benefit analysis.	SE3
137	Impacts to natural resources will disproportionately affect the Tribes, due to their subsistence consumption of rice, fish and other wildlife within the 1854 Ceded Territory. This is an environmental-justice issue covered under Executive Order 12898, which specifically identifies issued to be addressed regarding Native American Populations. It is inappropriate to conduct anything less than complete analysis of this issue, given the history of the environmental-justice issues raised by mining projects:	SE2
138	The DEIS is thus deficient because it has not presented a full cost/benefit analysis of the Polymet Project.	SE3

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
139	<p>NMW hereby incorporates and repeats the conclusion offered earlier (“Other Major Issues ... Economic Aspects). Conclusion: The final EIS should include adverse economic and social impacts of the project and benefits of the no action alternative, considering the following: □ Information on Minnesota’s mining industry, including historical and reasonably predicted cyclical “boom and bust” cycles; □ Analysis of the regional economy’s reliance on perceived environmental amenities, including property values, tourism, recreation, and industries such as health and finance which may be located based on residential choices; □ Analysis of the adverse economic and social impacts of population and payroll loss when mining activities stall or cease, or resulting from mechanization, including impacts on unemployment, demand for social services, and tax revenues to fund social services; and □ Analysis of the price structure needed to support opening of the PolyMet mine and processing facility, sustaining operations, and supporting closure and post-closure treatment and reclamation, including the potential economic risk that unfunded pollution costs would become a burden on communities or taxpayers.</p>	SE3,SE4
140	<p>Because the nature and magnitude of construction and operation activities are different, the effects of these activities on the communities would differ. For instance, it is assumed that a greater percentage of local labor would be used during the operations phase than during construction. These differences are reflected in the IMPLAN calculated multiplier for the two phases of the Project. The impacts have been insufficiently addressed. PolyMet has failed to acknowledge or to account for the negative impacts associated with the loss of natural features that will occur as a result of the Project. In keeping with current ecological economic models, the indirect use values, option values, and nonuse values have not been addressed. NMW notes that the recent report by Dr. Thomas Powers entitled “The Economic Role of Metal Mining in Minnesota: Past, Present, and Future,” addresses some of the impacts that are inadequately covered in the present draft. Conclusion: Dr. Powers' discussion of impacts should be used in developing this section for the DEIS.</p>	EOO
141	<p>As discussed in Section 4.8.3, the Project area overlaps the 1854 Ceded Territory, where certain tribal communities retain rights to hunt, fish, and gather on public lands. Although 2.1% of the population in St. Louis County is Native American, few members of these tribal communities live in the immediate vicinity of the Project. Conclusion: NMW recognizes the issue of Environmental Justice between the Project and Tribal communities. Further discussion of tribal use of Project area resources is provided in Section 4.8. Executive Order 12898 specifically identifies issues to be addressed regarding Native American Populations. Tribal representatives view themselves as uniquely and disproportionately impacted by mining activities in the 1854 Ceded Territory and disagree on a number of conclusions within the DEIS</p>	SE2
142	<p>According to the DEIS, the nearest potential visual receptors to the Mine Site are located approximately six miles to the east along Lake County Road 2 within the incorporated limits of the City of Babbitt, with the City of Hoyt Lakes is approximately nine miles to the southwest of the Mine Site. Conclusion: The DEIS’s use of a few limited visual receptors to assess PolyMet-related visual impacts is not adequate. The DEIS fails to address visual impacts to any other publicly accessible area in the vicinity of the proposed project. A complete VIA has not been included in this iteration of the PDEIS. A complete VIA would allow the public to review the impacts of project features to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the mine site. Further, a VIA of all public access lands is important information for assessing cultural impacts to tribes who have retained the right to hunt, fish and gather on national forest lands.</p>	VII
143	<p>The primary issues related to visual resources, and therefore the potential for impacts, would include: The ultimate appearance of the Project at full reclamation versus current and interim stages of active mining. In the absence of a full VIS, this document does not estimate the degree of disturbance to tribal members who may be involved in traditional natural resource harvests on national forest lands. The Project would increase the scale of disturbance in the region; however, mining activity is a long-established aspect of the Iron Range landscape and the addition of the proposed mining facilities would not introduce visual elements to surrounding viewpoints that are in stark contrast to the regional visual character. Conclusion: In the absence of a full VIA, this document does not present enough information to make the claims it does regarding visual impact criteria.</p>	VII

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
144	<p>According to the DEIS, the Project, as proposed, would be visually secluded from the surrounding area by the Giants Range formation and surrounding vegetation such that it would not influence the surrounding landscape. In addition, implementation of the above referenced mitigation measure (i.e., shielded lighting) would minimize impacts to the night sky. Therefore, there would be no long-term impacts during the Project life and Post-Closure relative to Visual Resources and no cumulative effects analysis would be warranted. Conclusion: The VIA is insufficient and does not fully address cumulative impacts. A cumulative impact of visual impacts analysis is needed. Moreover, a thorough VIA following past Army Corps practices has not been conducted for this project and tribal consultation regarding cultural impacts has not been completed.</p>	VII
145	<p>However, it appears that the potential stability of the tailings in cell 2W is not known: “Review of proposed Hydrometallurgical Residue Facility preliminary designs indicate it would have reasonable liner integrity and stability of embankments, however it is unknown if the slimes layer exists under the facility.” (DEIS, p. 4.13-2 (internal citations omitted)) If the slime layers are present under cell 2W, as would be expected, then this poses a risk to the integrity of the hydrometallurgical cells during an earthquake event. The long-term integrity of both the flotation and hydrometallurgical tailings storage facilities is necessary to protect water quality. But significant questions still need to be addressed regarding the long-term vulnerability of the waste storage facilities to seismic events. Further, in addition to the significant outstanding issues with the tailings storage facilities, there is similar concern for the waste rock piles. Analysis of a number of critical questions are not being conducted as a part of the DEIS. For example, while “[p]roposed heights and slope angles in the preliminary waste rock stockpile designs are within typical mine engineering practice, however a slope stability assessment has not been completed. Further design and analysis would occur during permitting to ensure that the proposed construction meets acceptable design standards.” (DEIS, p. 4.13-2) The DEIS makes this point explicitly, explaining that “[g]eotechnical stability will be further analyzed during permitting when final facility designs will be available.” (DEIS, p. 4.13-1) But geotechnical stability is too important an issue to leave for analysis until after the mine has been permitted. This is an issue that must be addressed in the DEIS, and is a major flaw of the DEIS. This concern has been echoed by the tribal cooperating agencies: “given the lack of confidence in the structural integrity of ... (liquefaction at the plan site, stockpile liner systems stability, stockpile heights and slope angles, tailings basin stability, dam break analysis) ... a risk assessment must be conducted prior to permitting and the results included in the DEIS so that the public can be fully informed about the risks associated with this project.” (DEIS, p. 4.13-2) NMW strongly concurs with the above conclusion of the tribal cooperating agencies. As discussed, these stability issues should be thoroughly investigated and the issues resolved as a part of the DEIS process. Conclusion: Geotechnical stability is too important an issue to leave for analysis after the mine has been permitted. These stability issues should be thoroughly investigated and the issues resolved as a part of the DEIS process.</p>	E00,GT1
146	<p>Conclusion: NMW contends that this approach is not consistent with the federal EIS process. The EIS must identify alternatives and mitigation methods that address potential problems with the project. Sufficient data must be collected so that a complete structural integrity analysis can be performed and included in the DEIS.</p>	GT1
147	<p>According to the DEIS, increased rock buttressing designs prepared for the northern outer embankment side slope of the existing LTVSMC Cell 2E tailings embankment would increase the geotechnical stability of the NorthMet Tailings Basin to within an acceptable margin of safety. Further investigations, design, and analysis would occur during permitting to ensure that construction meets acceptable design standards, including: criteria regarding material characteristics and properties, disposal systems and methods, investigation techniques, facility analysis and design, hydrologic/hydraulic procedures, construction objectives and inspection, performance evaluation and redesign considerations to insure geotechnical stability and satisfy the geochemical and other water quality objectives for the project. Conclusion: A complete geotechnical stability analysis must be conducted prior to permitting and must be included in the DEIS.</p>	GT1

Comment ID	Comment Text	Theme Codes
148	According to the DEIS, if stockpile slope stability concerns are identified during permitting, then mitigation measures (e.g., reduced heights, bench widths to reduce side slope angles) would be analyzed and any increased impact on wetlands would be assessed. Conclusion: This recommendation is unacceptable and violates the intent of the EIS. The purpose of an EIS is to identify mitigation measures that address potential problems in the project. The analysis described in the previous paragraph must be conducted prior to permitting and included in the DEIS.	GT1
149	Should the Tailings Basin Alternative be the design evaluated in permitting, and the predicted stability is determined to be insufficient through further analysis, additional mitigation measures such as further increasing the rock buttress and dewatering of LTVSMC tailings slimes layer (e.g. using sand drains), would be evaluated. Conclusion: Due to the failure of the applicant to address any of the potential geostability impacts, it is the position of NMW that the applicant must address measures to assure the structural integrity of the tailings basin, provide a dam break analysis, and conduct a risk assessment prior to permitting. These results must be included in the DEIS so that the public can be fully informed about the risks associated with this project.	GT1
150	The methodologies recommended in the CEQ guidance document were used by the USEPA in their Protocol to Assess Expanded Cumulative Effects on Native Americans (2007). Therefore, the 1997 CEQ guidance document was used in this DEIS to assess the potential cumulative impacts of the proposed NorthMet Project in combination with other past, present, and reasonably foreseeable future actions. The geographic scope of analysis varies dependent upon the resource under discussion (e.g., water resources, air quality, and uniquely-affected communities). The specific geographic scope for each resource is further discussed within the appropriate subsection of this analysis. Conclusion: While the protocol is mentioned in this section, none of the expanded data collection or analysis that the protocol recommends was done. Therefore the cumulative impact section is incomplete and does not properly assess cumulative effects of the proposed project on natural and cultural resources.	G8C
151	Climate Change implications of the proposed project. The project would disturb extensive areas of peat. (Section 4.2) Peat is known to be an important carbon sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife will seek refuge as the climate warms.	AQ3
152	Cumulative impacts to wild rice. Wild rice is a valuable tribal resource that has been declining throughout the 1854 ceded territory. Mine effluent is often associated with levels of sulfate that has impacted wild rice and hydrologic changes from pit dewatering and seepage from tailings basins can also impact wild rice, which is dependent upon a relatively stable hydrologic regime. The cumulative impacts to wild rice have not been assessed.	WR5A,G3,CR1,CR4
153	Cumulative impacts to plant and animal species that are not listed as threatened or endangered. The focus of the EIS on listed species is understandable but other species that are important to tribal and non-tribal members would likely be impacted by mining projects. Moose, for example, are likely to be impacted through disturbance along the few wildlife corridors remaining along the Mesabi range and through wetland impacts of this project. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should be done as part of this EIS.	WI5
154	The Cumulative effects of noise and vibration. These issues have not been analyzed although they were raised by the public during scoping.	N3
155	The Cumulative risk analysis of transportation of hazardous materials. This issue has not been analyzed.	HM3
156	The cumulative effects on fish and macroinvertebrates. This discussion is limited to sulfate and mercury. Cumulative effects of habitat degradation on the fisheries of the region have not been discussed.	FM3
157	For those resource areas not identified in this section, no cumulative effects were identified. Conclusion: A number of significant cumulative effects were identified after the scoping period and must be made a part of the cumulative impacts analysis and incorporated into the DEIS. These impacts include cumulative effects to groundwater, vegetation (other than threatened and endangered species), visual and noise effects, hazardous materials, and cultural resources.	G8C

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
158	Conclusion: Some mine features (e.g., pit lakes) would become permanent features of the landscape. Therefore post-closure impacts should also be included in the analysis	VI1
159	The DEIS fails to adequately analyze cumulative impacts to either the Partridge or Embarrass Rivers. Further, in Colby Lake, the community water supply for the city of Hoyt Lakes, aluminum, iron, copper, and mercury concentrations already exceed Minnesota Water Quality Standards (“WQS”). The existing large number of water-quality exceedances and the suite of constituents, particularly trace metals that exceed WQS, indicate that the site has not been remediated from previous mining activities. Additionally, amphibole or asbestos-like mineral fibers, known to cause digestive tract cancers in high concentrations, have been identified as existing pollutants in the Hoyt Lakes community water supply and their presence should be identified in the DEIS. Conclusion: Related cumulative-impacts issues such as groundwater drawdown or mounding due to multiple mine projects, water quality in aquifers impacted by previous and existing other mine projects, and surface waters such as the Partridge and Embarrass Rivers and Second Creek that are impacted by multiple mines need further analysis.	WR5A
160	Conclusion: A complete, rewritten wetlands section is required. Cumulative impacts also need to be addressed once the wetlands section is complete.	EOO
161	Conclusion: NMW notes that the applicant has incorrectly estimated cumulative impacts on wildlife. NMW is concerned that the analysis in the resource section has not been carried forward to the cumulative impacts section.	WI5
162	According to the DEIS, the Project, when combined with past, present, and reasonably foreseeable future actions, would reduce flows in the Upper Partridge River and contribute to an increase in the frequency and duration of low flows in the Lower Partridge River, depending on the timing of other mine dewatering activities, but these effects are not expected to be significant. (Section 4.1) Conclusion: As detailed in section 4.1, the available data and analysis is insufficient to make this claim. This cumulative impact analysis is thus incomplete.	WR5A
163	According to the DEIS, the Project, when combined with present and reasonably foreseeable future actions, would degrade water quality in the Partridge River, but would still comply with all surface water standards. These activities are predicted to increase average sulfate concentrations in the Embarrass River, which would attenuate as it flows downstream through the Embarrass chain of lakes. The increased sulfate levels could increase mercury methylation in the wetlands north of the Tailings Basin and downstream in the Embarrass River, (if sulfate is still a limiting factor), and therefore have a cumulative effect on downstream lakes already on the 303(d) list. The Tailings Basin Alternative options would redirect the seepage away from the Embarrass River and not contribute to a cumulative effect on downstream lakes already on the 303(d) list. (Section 4.1) Cumulative effects on the Embarrass River could be perpetual. Conclusion: The applicant is also obligated to assure that wild rice harvesting remains viable in this area.	WR5A
164	All of these impacts would combine to impair wildlife accessibility, although it should be noted that some impairments would still allow wildlife passage, albeit through degraded habitat conditions until completion of habitat reclamation activities. Conclusion: The applicant has failed to provide a complete, empirical cumulative impact assessment in this section.	WI5
165	Conclusion: The applicant's assessment of uniquely affected communities is incorrect. Consultation with Tribal cooperating agencies indicates that the project lands do support wild rice and moose populations. Wild rice grows in the Partridge River and a substantial moose population has been identified in the mine site area by aerial and ground surveys. Therefore, cumulative effects to both wild rice and moose populations must be considered.	WR5C,WI5,G3,CR1,CR2,C
166	IN CONCLUSION, NMW urges that the PolyMet DEIS be withdrawn until the serious omissions and flaws identified above can be corrected. A revised DEIS can then be submitted for an appropriate period of public comment.	G14

3168 I am continuously amazed that our state, a state which used to to pride itself on being near or on the top of the lists for healthy places to live has allowed itself to drop and drop and drop down those lists. I like to think that we are a state that is concerned about the environment but when these kind of things are even being considered, I'm worried. Will money and greed win??? I hope not. Once the damage is done it will be too late. Here are some of my concerns.

3257 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. The profits and job creation resulting from the proposed mining could never match the expense of monitoring and remediation of water contamination for centuries to come. Nor could they ever justify the inevitable loss of the habitat, food, and recreational resources that your organization seeks to protect. In addition, this issue is as much about Polymet as it is about the mining projects that will likely follow. Please don't encourage such projects by setting a short-sighted precedent. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.

G1,G2C,G11

3285 For 15 years, I've worked as an environmental scientist specializing in trace metals pollution in numerous matrices - primarily surface water. Most of my work has been on behalf the State of California. For decades, that State has spent an alarming amount of resources studying and remediating the effects of ongoing mining. Of particular importance is the fact that the majority of this mining occurred in the mid- to late-1800s. The profits resulting from the proposed mining could never match the expense of monitoring and remediation for centuries to come. Nor could they ever justify the inevitable loss of the habitat, food, and recreational resources that your organization seeks to protect. Finally, this issue is as much about Polymet as it is about the mining projects that will likely follow. Please don't encourage such projects by setting a short-sighted precedent.

1275	We cannot become another West Virginia! Mining interests have no concern when it comes to the environment. A mine on the steps of our most treasured parks in the state should not be allowed. The record of mining industries is riddled with broken promises and years of clean up and public dollars used to mend those broken promises. People come from across the world to visit our state & its natural resources and environmental treasures. This mine is a bad idea and should not be allowed.	EOO
<b>Sender Last Name:</b> Halas		<b>Submission ID:</b> 3439
40	Further, the PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district.	WI1,SE4
1314	PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	WR2D,GT2
1942	Water quality impacts are a top concern. I cannot understand how it could be considered acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company. Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone. It is grossly irresponsible to, in all likelihood, leave future generations with a massive cleanup debt in exchange for immediate benefit to a private company. In addition, the DEIS predicts that contaminated waters will be discharged from the mine site into the Partridge River after the mine's closure, as well as tailings basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR3I,PD2,FM1,FM4
<b>Sender Last Name:</b> Halbach		<b>Submission ID:</b> 3306
1054	The NorthMet project will have contaminated discharge from waste rock piles, there will be contamination from the west pit, water discharge will be high in sulfate, there isn't a reliable wetland water treatment plan, there will be a loss of critical wildlife, and will have a negative affect on ecotourism. Please reconsider the project.	EOO,WI2,WE6,SE4

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
1	<p>I strongly support Polymet's proposed NorthMet project in St. Louis County. Given the extensive evaluation in the DEIS, it is clear the project can proceed in an environmentally safe and sound manner. Any environmental concerns have been, or will be addressed in the EIS, including public input. It is clear that the regulations governing non ferrous mining in Minnesota are some of the most stringent in the world, and will ensure the project proceeds in an environmentally sound fashion. Misleading concerns have been raised. One example is the proximity of the project to the BWCA even though it is miles away and in a separate water shed. Such concerns should be treated as not applicable. The country is in the midst of the most serious economic downturn since the Great Depression. Northern Minnesota has been hit hard. It seems out of state interests have little consideration for the economic well being of Minnesotans. An economic development such as NorthMet would have a strong positive impact on the region and the state. Development of the non ferrous resources in the Duluth Complex would provide an economic base in addition to iron mining, for perhaps more than the next 100 years. This would diversify and could help the regional economy during fluctuations in the ferrous industries. Other examples of the positive economic impact from development of the NorthMet Project are: . It would improve our trade deficit, with many countries. . The country would no longer be dependent on importing elements such as nickel for stainless steel, copper for transmitting power from wind turbines, platinum for catalytic converters etc. . It would provide greater employment, add to income tax revenues, and relieve some of Minnesota's burden from social programs such as un-employment benefits. . The project is expected to generate 400 jobs, including high paying technical jobs rather than minimum wage employment. . Increased tax revenues would help address the state's current budget deficit, and possibly present the opportunity to decrease income tax. . Royalty revenues to the Minnesota school system, would provide for better education without increasing the tax burden on Minnesotans. . The money generated would be new money, not just the recycling of existing dollars. . The spin off economic benefits would impact the entire region, including suppliers and services, not just the mining industry. Positive environmental impacts would be: . Fewer greenhouse gases would be created by not having to transport (import) materials from other parts of globe. . Mineral development done domestically would be done in a safe and environmentally responsible manner. Alternatively, the copper, nickel etc. that we consume, would be mined in other jurisdictions, without the same environmental checks and balances, then transported here. The result may well be the un-checked release of pollutants into the atmosphere only to be deposited back here in the USA. . The project as proposed would ensure the rehabilitation of the site to an environmentally suitable condition. . The location is largely within an already disturbed mine site, minimizing the impact on existing forests. The EIS exercise demonstrates the NorthMet project can be done in an environmentally sound manner. The country needs the metals and materials this development would produce. The country would be better off if we did not need to import these materials. In addition, Minnesota needs the highly skilled, well paying jobs the project would provide, and the tax and royalty revenues. That being the case, the project should proceed without unnecessary delay.</p>	EOO
<b>Sender Last Name:</b>	Halvorson	<b>Submission ID:</b> 1556
1909	<p>My name is Charles Halvorson and I am a long-time visitor to the BWCA. I am concerned about the PolyMet project because I do not believe that this corporation is principally concerned with protecting and maintaining the wonderful natural resource that we have in the Boundary Waters. PolyMet has made statements to the effect of protecting against environmental degradation but they are a profitdriven corporation and inevitably there will come a conflict between the bottom line and environmental preservation. The Friends of the Boundary Waters assessment indicates the risks of the PolyMet mine will be present for 2,000 years. There will be degradation in that time period - surely sooner rather than later. If you vote to approve this process, you are permitting this degradation. There is no other way to construct your culpability. Hiding behind the rhetoric of the PolyMet corporation, placing blind faith in that corporation's claims, is an act of willful ignorance, you are underestimating your own intelligence and you are doing it to serve the interests of the few.</p>	EOO,G8B,G11

1	I grew up in Minnesota (although I now live in Montana) and am a property owner in Lake County. I am also an environmental scientist. I do not oppose the mine and I recognize the desire for jobs in this economy. However, I urge you to review my comments and also to pay special attention to the very pertinent comments submitted by the Cooperating Tribes. I would like to highlight two of these concerns: 1) Liners; and 2) Financial assurances.	G15
2	1) Lack of Required Liners The proposed action is located near the Partridge River and in a wetland area. These are sensitive ecosystems. I am concerned about the potential impacts of this mine on the river and wetland ecology. I am particularly concerned that the Minnesota Department of Natural Resources and the US Army Corps of Engineers would consider allowing a project of this magnitude to proceed without requiring that the tailings basin, ore pads, or pits be lined. This is a reasonable and prudent best management practice.	WE3
3	2) Need to require financial assurances from the Company The proposed project is large and potentially very profitable. It is standard practice to require financial assurances before an undertaking like this is permitted. Minnesota should protect its resources --- and its taxpayers -- by requiring financial assurances from the Company. Otherwise, if something does go wrong, Minnesota, and possibly US taxpayers will be left footing the bill as has happened at so many other abandoned mine land cleanups across the	PD4

**Submission ID:** 1268

1445 I am writing you to request your help in a matter urgent to our environmental safety as Minnesotans. The Boundary Waters, the largest wilderness area east of the Rocky Mountains (over 2 million acres), is under threat from a foreign mining company. PolyMet, a Canadian mining company, intends to commence exploratory sulfide mining for precious minerals in the bedrock underneath a crucial section of the Boundary Waters where the contaminated waste water would actually cycle back into the Boundary Waters miles from the source of contamination. The Kawishiwi River forms Birch Lake near the site of the proposed sulfide mine, then flows back into the wilderness area affecting large portions of the rest of the wilderness area. In a sense, the contamination at this single point could contaminate vast stretches of the Boundary Waters Wilderness Area. The process of sulfide mining produces acids and heavy metal runoff that are unlikely to be contained in any sufficient manner. These toxins threaten to affect all forms of life that seek refuge in the pristine wilderness, including sport fish, birds of prey, loons, aquatic plants and invertebrates, and even higher mammals, including humans. Sulfide mining is NOT just another form of mining. Unlike iron, which can be extracted from the earth with very little toxic by product, the mining of ores like copper require some nasty compounds that will continue to leech into the watershed long after the copper is no longer "profitably extractable." The Boundary Waters are our State's pride and we cannot afford the catastrophe that is unfolding. There will be no going back, we cannot dismantle the damage that will be done. We will be left to explain to future generations why we allowed a single company to destroy the land that has remained pure for thousands of years. The Boundary Waters are the homeland of the Ojibwe, they are the biggest canoe destination in the world, and the Boundary Waters are the pristine home to an entire, unique ecosystem. We would be destroying the most pure and beautiful thing in our state for the shortsighted profit on a non-renewable resource. I have a personal tie to the Boundary Waters as well. I work for Outward Bound, teaching students life skills like leadership, selfsufficiency, and communication. The Boundary Waters are my classroom. If fear we will no longer be able to drink from many of the lakes within the Boundary Waters and therefore I will no longer be able to teach in the BWCA giving these students life changing experiences. Please use your voice to speak out against this proposed PolyMet mine. This is a decision whose affects (either way) will be felt for generations to come. I just hope that 150 years from now people will be remarking on the foresight we had to protect such a gem, not heartbrokenly observing a toxic wasteland.

1288 I am writing this comment to express my disapproval for the sulfite mining propositions in Northeastern Minnesota. The boundary waters preservation area presents an incredible opportunity for education, relaxation, personal growth & sustainability in the local economy. There is overwhelming evidence that the introduction of a sulfite mine would cause disastrous consequences on the pristine environment that past generations have worked so hard to maintain; dismissing their efforts to allow for temporary gain from sulfite mining would be a disgrace not only to our past but to our future as well.

EOO,G11

1808 Water and air quality monitoring—The MPCA and USEPA have been understaffed and underfunded in recent years. A project of this scope with untested and unproven processes would require substantial, consistent monitoring to ensure the watersheds are not being polluted. The DEIS enumerates several anticipated water quality concerns for the immediate area surface water, groundwater, wetlands and the greater St. Louis River Watershed (which empties in to Lake Superior) both during the mine operation and after closure. In addition to monitoring there needs to be public access to monitoring data.

WR1A,AQ5

2002 Long-term financial guarantees—Mining projects similar in scope to this project have left enormous economic burdens on the surrounding communities resulting from environmental degradation and social impacts, especially after closure of active mining. Polymet talks of long-term jobs being for 20-years. In the life of a community that is very short-term. Our communities are suffering enormous financial burdens that are peaking now due in part to the closing of iron mines over 20 years ago and the resulting loss of families raising children in our area. The mining companies involved must be required to put sufficient funds into escrow for both environmental and social impacts. These companies who have no local ties must be held accountable for their impact as they reap what must surely be enormous financial gains to warrant the level of investment shown in just the exploratory phase of the project.

PD4,G1

2587 I have lived in Ely, Minnesota for over 20 years and would like to express my concern about the proposed Polymet mining project in northern Minnesota. As a parent of two school aged children, I understand the need for jobs in the area and thus more children in our schools. However, I also understand the costs to our environment and lifestyle if the permitting process goes through quickly without high environmental standards. I will take small schools and fewer jobs over long term environmental concerns. I ask you to take your time with your decision and consider looking more closely at how to effectively Minnesota can maintain high environmental standards for the Polymet project and future mining proposals. There are several critical concerns not addressed by the Draft Environmental Impact Statement. If this project is allowed to go forward, my primary concerns are as follows:

G1,G8

2588 History of environmental degradation resulting from similar mining—several states have a moratorium in place on this type of mining because it has resulted in such horrendous environmental degradation everywhere it has been tried. Wet environments are far more impacted by the release of sulfur and mercury than dry environments. Polymet claims they have a new procedure that will limit the environmental impact. Is one of the last great freshwater systems in the world the best place to test this new science? The reality is we use the products made from these ores and we should ensure the mining is done safely. The DEIS indicates more needs to be required of Polymet to ensure that the mining will be done safely for the people, plants, animals and environment both during the active mining period and well in to the future.

G2,G12

3169 Please do everything you can to keep our beautiful boundary waters area free of anything that will pollute the soil, air or water. Take no action that will damage that area in ANY way!

G2,G7

3916	As a sportsman in NE Minnesota, I am naturally concerned about the environment and how its air, land and waters are being affected by the industry in this area. As a resident of NE Minnesota, I am also concerned about our economic conditions and the creation of new jobs. I welcome Polymet Mining's NorthMet Project to our area. The jobs it will create and the economic benefit created by these new jobs will have a positive effect on Minnesota's and the Arrowhead region's economy. I have faith that the environmental guidelines put into effect by the US and state governments will be met by Polymet. I believe that the impact to the air and waters will be minimal if any at all. And I believe that Polymet has shown that it will follow Minnesota's environmental guidelines. Polymet will provide us with a local supply of raw materials used by 'green' manufacturing for electric cars, catalytic converters, the medical industry and more. Some foreign suppliers do not necessarily follow the environmental practices followed in the United States. I support Polymet Mining's NorthMet Project and welcome their presence in NE Minnesota. Sincerely, Eric	EOO
<b>Sender Last Name:</b> Hanson		<b>Submission ID:</b> 152
143	And I support the PolyMet Project. And I'm glad to see that they have spent a lot of time and money to do their environmental review. We definitely need good paying jobs up north. And I like to see that we are doing these jobs locally, you know. We're not going overseas where they don't have the environmental controls that we have here. That's about it. Thank you.	EOO,G6
2616	Pension Benefits. And I have seen the effects of no jobs in northern Minnesota for these guys and for people struggling to keep healthcare for their kids because there is no work out there and I would just love to see some jobs in that area, absolutely love to see it. Actually, my husband has been following PolyMet since I think day one. I wasn't really interested in the first part but now he has got me going on it, too. It just sounds like they are doing everything right. I just can't imagine why we shouldn't have it there. It sounds like a great company. It sounds like they have done their research and we need the jobs and I think it is time we go with it.	EOO
3242	I am concerned about the impact on fish and wildlife of the proposed PolyMet Mine in Superior National Forest and urge you to better analyze the proposed mine. I own a 40 acre historic Finnish immigrant homestead in the Superior National Forest on Little Creek Road in Brimson, Minnesota. My property is included in PolyNet's mine site. I do own the mineral rights to my 40 acres which puts me in a very precarious position.	G2C
3258	River. This is a positive benefit. However, we cannot forget that the root worry is the relatively high sulfate concentrations in the seepage. We MUST avoid the end result of a "Cumulative increase in sulfate loadings to the Partridge, Embarrass and St. Louis River." It is well known that the sulfate in mine seepage is essentially the cause of the Acid Mine Drainage (AMD) that we must avoid at all costs. So, discharging this sulfate laden seepage water into the Partridge River raises a critical concern: this discharge could cause AMD in that watershed. Water with relatively high sulfate concentrations should NOT be discharged into any of our natural rivers due to the real risk of AMD. The Partridge River (if it is healthy) contains oxygen, which would react with the sulfate seepage to produce acidic conditions in the river. It would be disastrous to avoid one problem (the creation of methyl-mercury) by creating another (sulfuric acid in the Partridge River). The suggested demonstration testing of a PRB or a constructed wetland at a location north of the Tailings Basin is good, but not good enough. A commitment should be made to treat nearly all of the seepage flow with a passive PRB, bioreactor with SBR and/or constructed wetland. The testing could determine which is the best alternative and location for treatment. But these relatively high sulfate concentrations in the seepage water must be treated to avoid AMD. The same treatment could also be used for the West Mine Pit outflow thereby eliminating the uncertainty of AMD resulting from this outflow. Polymet must be required to avoid both methyl mercury and AMD contamination from their operation in all of the related watersheds. Otherwise, the mining should not be done.	WR4F,WR5A,WE8

3588	precious natural landscape and water resources--and potentially expensive for the state. The type of pollution created from this type of mining (acid mine drainage) has disastrous consequences. Other states have learned the consequences the hard way. Let's learn from their mistakes. Upon review of the Draft Environmental Impact Statement for this project, I find Polymet's pollution prevention and reclamation plans dismal. This project needs to be looked at with great concern and diligence. More separation is needed between the stockpiles and overburden areas and the surrounding water resources. This area is also vulnerable to invasion by non-native plant species, which occur within miles of the project. This area of the state is one of the few that is not completely overrun with invasives. More provisions for the use of native plants and the prevention of colonization by invasives is needed in the EIS. More project alternatives need to be explored. Polymet, which by the way, is a foreign company who will likely bring in many of their own labor instead of creating jobs in the state, will not be able to stop all of the pollution as a result of this project. I urge you to help put financial assurances in place to ensure that Polymet will pay (UP FRONT) for any negative environmental consequences of this project and for increased monitoring many years after the project is proposed to end. The cost of monitoring and cleaning up after a project like this ranges in the tens of millions and is not something that the state can --or should-- pay for. I urge you, please to not let this project compromise our state's unique natural treasures and deprive the state's citizens of the healthy natural	EOO,WR1E,WR3A,PD3,PD

1	I did not find within the summary any indication of what process and standards are being used by the MnDNR and the ACE to prepare this DEIS. They do discuss the areas considered but it is difficult to know who they consulted on what area. Further, use of technical terms such as beneficiation plant, hydrometallurgical plant. Class 1 areas PM 10 increment are technical terms which make specific responses from the population difficult. The use of such terms makes the document appear so technical that it discourages people from making comments on the document and decision. This is in conflict with the purpose of solicitation of comments from the public.	EOO,PRO1,PRO6,G10
1	I also find that to be poor utilization of tax dollars and staff time to have 2 DEIS prepared. On other actions I have been involved with, I am aware of the MnDNR has not been forthcoming with what standards they are using for the preparation of Environmental Impact Statements. They have appeared to rush through the process in order to effect the result they wish to occur. In those other actions, one branch of the MnDNR, has not consulted with other branches of the MnDNR that have knowledge that would be important to consider. I see no evidence that other branches of the MDNR have been consulted on such issues as water quality, contamination of aquifers, amount of water use, reuse of water, air pollution, etc.	G10
2	The importance of evaluating the impact of additional sulfate on these down stream aquatic systems is underscored by the acceptance for peer review by the Minnesota Legislative Commission Minnesota Resources (LCMR), of a research proposal to study sulfates and mercury methylation in the estuary in the summer of 2010. This proposal, 028- A3, Mineland Sulfate Release in Saint Louis River basin has been accepted for peer review. The expected Result: "A series of recommendations and supporting documents that state agencies, decision makers and other stake holders can rely on to help manage sulfate releases to the St. Louis river". The DEIS and any permits relating to sulfates will be completely inadequate until that study is complete. (10)Will permits be issued before that study is completed?	RFI

3	<p>When we leave the area of influence of the Iron Range mines, from river mile 100 on down, the sulfate concentration gradually diminishes, due to bacterial reduction and dilution and probably other factors. At the mouth of the river in the St Louis River Estuary, it has been diminished enough so that a few remnant stands of wild rice appear after a 150 mile absence. According to Jerome Blazevec, a life long trapper in the estuary, the wild rice stands have gone from being the best in the whole area to just surviving in some bays and completely gone in others. The estuary wild rice crop is failing and the Fond du Lac Band, along with the Wisconsin and Minnesota DNR, have been trying for the last decade to restore it to its original vigor. So far they have had limited success. The sulfate standard for Class 4A water bodies of 10mg/L is sometimes exceeded in the estuary in modern times but is not exceeded in Pokegama Bay which is isolated from St Louis River water. Pokegama Bay has the only highly productive wild rice bed left in the estuary. The Schedule of Compliance, dated November 2007, between United States Steel Corporation and the Minnesota Pollution Control Agency, suggests appropriate boundaries for a detailed investigation and analysis in the PolyMet environmental review process. That Schedule stipulates that U.S. Steel shall model sulfate concentrations in the St Louis River and that "Modeling shall be done to the St Louis Bay." (21) Since the St Louis Bay is the site of well-documented decline in wild rice production, it only makes sense that PolyMet, the biggest sulfate generator proposed for this watershed, must be required to model cumulative sulfate impacts all the way to the Bay. Will that be done in the EIS?</p>	WR5A,WR5C
4	<p>The remnant stands of wild rice in the Partridge, Embarrass and St Louis Rivers must be protected with enforcement of the Minnesota Wild Rice Standard. Detailed investigation correlating wild rice conditions with sulfate concentrations and modeling impacts of the PolyMet project on wild rice throughout the entire chain to Lake Superior must be included in the draft EIS. Anything less would be a betrayal of the rights of Minnesota citizens and tribes who harvest and eat this valued wild grain and the waterfowl that depend on it. Minnesota Rules, part 7050.0224 subpart 2, addresses water quality as it relates to wild rice as follows: Sulfates 10 mg/L, applicable to water used for production of wild rice during periods when the rice may be susceptible to damage by high sulfates. The Lands and Minerals Division of the MnDNR, along with PolyMet, appear to have used a "boogey man" known as perpetual treatment to dissuade themselves from meeting the State Wild Rice Sulfate Standard. Instead of living up to State Standards, as you and I always have to do, they have developed a convenient but illegal strategy to try to bypass the standard. One of several examples will illustrate this strategy. On page 3-61 of the DEIS we read in table 32-3 Screening of NorthMet Individual Mitigation Measure Combinations, that combination C-1, which includes Water Treatment(long term), meets the purpose, is technologically feasible, and economically feasible but is judged regulatorily not feasible. No other rationale was given to reject the only viable option for reducing sulfate sufficiently to meet the Wild Rice Standard, except that it "would require long-term treatment." This is basically perpetual treatment. There is no defining of the statutory basis for the supposed lack of regulatory feasibility. What we have instead is a vague Minnesota goal of maintenance free closure, which is, of course, a recipe for disaster in a project this large, this dirty and this wet. This vague goal trumps good science and the State Wild Rice Water Quality Standard. (22) The EIS must address this dichotomy straight up with clear definition of "Regulatorily feasible" and the goal of maintenance free closure, and how they intend to get around the problem of meeting the Wild Rice Standard of 10 mg/L without long term Waste Water Treatment.</p>	WR4C,WR4F

5	<p>The Wild Rice Standard has gone through the proper public Rule Making process and is a Minnesota Water Quality Standard that would require a Use Attainability Analysis or a Rule Change process to avoid compliance. No mention of either process has been mentioned to date. Therefore, the EIS must outline mitigation strategies wherever there is the likelihood of violating the 10 mg/L Standard in the Partridge, Embarrass or St Louis Rivers. The MPCA has used the sulfate standard in past permitting activities (MINNTAC Schedule of Compliance, 2008) and therefore, anew, untested startup company should be held to the same standard. This EIS has a huge sulfate problem. The contaminated leachate at closure from the PolyMet tailings basin alone is 7,000,000 g/d. If you do the math, you get 3,756,000 pounds of sulfate per year pouring out into our aquatic systems. Whether it is directed to the Embarrass or to the Partridge River, the conclusion is the same. To protect wild rice and avoid unnecessary methylation of mercury, that leachate must be and can be collected and treated.(refer to table 3.2-3 C-1) There are several options for treating leachate from basins and mines sites that must be addressed in more detail. First, is the use of a Permeable Reactive Barrier. Because this is an unproven technology, it needs to be tested immediately on the present leachate. That hasn't been done and the EIS must give some guidance on a timeframe for this testing. Second, is the use of ultrafiltration, as is being done at Minntac. Third, let me quote from page 8 of Environment and Natural Resources Trust Fund, Research Addendum for Peer Review, Michael E. Berndt, Project number 028-A3: "one relatively new method that is receiving recent attention elsewhere (e.g., Park, 2008), but which has not been used on the Iron Range, involves in situ treatment of sulfate in mine pits. This method involves addition of organic carbon and iron to promote biological reduction of sulfate to sulfide and subsequent precipitation as iron-sulfide." This deserves a discussion in the EIS. Finally, as mentioned in the first paragraph of page 4-1-148 of the DEIS, "If determined to be necessary based on actual seepage water quality, the treatment plant would be required." It also mentioned that this provision was not "included in the water quality modeling that was conducted." (23)Why not? That admission alone should be grounds to reject the adequacy of the DEIS. How can the permiters evaluate what would trigger this option without the necessary water quality modeling?</p>	WR4C,WR4F
5	<p>The following question may not please the foreign corporation or the DNR Lands and Minerals Division that are pushing this project. With regards to toxic leachate that exceeds state water quality standards for manganese, aluminum, mercury, arsenic, sulfates and others, it appears we have two choices: 1. Long term treatment, (it could be hundreds or thousands of years, therefore, perpetual treatment) or 2. perpetual pollution. (24)Which will it be?</p>	G7B
6	<p>State, county, township and tribal governments spend millions of dollars each year to control beaver problems. They are not very successful because they will have to do it again next year. This relates to the PolyMet proposal in that they also will have to maintain a complex system of water management. Even though every rural citizen of Northern Minnesota understands the complexities of living with beaver colonies, the writers of the DEIS didn't get it. In this wet environment, the DNR, Army Corp and PolyMet have to explicitly outline what practices will be implemented to kill beavers that dam up flowages and build bank lodges in dikes and ditch banks. Also, the EIS should mention that control of beaver colonies will have to be done in perpetuity. Another beaver problem that was not discussed is the impact the beaver ponds have on mercury methylation and how we can legally control these beaver colonies. On page 424 of the DEIS it says, "There are many beaver dams along the entire length of the Partridge River". I am only familiar with the large dams on the lower Partridge River but I don't doubt they extend all the way to the headwaters and on any small sub-watersheds along the way. If the dams are left intact, the ponds will be methylation hotspots with organic carbon, low oxygen, mercury in sediments, sulfate reducing bacteria and in this river, a surplus of sulfate from mines and tailings basins. In other words, everything that is needed for methylation is present. However, if you decide to blow those dams you will get a rinsing of methylmercury as appeared to have happen on Second Creek. (24) Again, this problem will be around for the next hundred years and needs to be addressed in the EIS.</p>	WR1E,WI2,FM1

- 7 Finally, the beaver impact on wetland treatment operations needs to be addressed. Beaver can find and obstruct even very subtle flows and could turn wetland treatment facilities into a methylation hotspot. At this point, I would like to address the adequacy of the models used in the DEIS, from the perspective of the data that is used as input. I will just address a few inputs in which I have expertise as a biologist. Others will have to judge the validity of the mathematical processes involved. With regard to input there seems to be a consistent weakness that reflects lack of rigor in actual field generated data. It appears that the consultants ran into some sort of shortage of hip boots or maybe mosquito dope. Generating numbers on a map with a computer is easy, field work is hard. My first example will be the black sandshell, *Ligumia recta*. It's preferred substrate is gravel or firm sand in riffles or raceways. Mussel sampling was done by Heath(2004) and showed only one species, *Pyganodon giardis*, found in the Partridge River. However, in October of 2009, four of us put on our boots and went out to sample on the Partridge River and found *Ligumina recta* at 47 degrees 29.611' North Latitude and 92 degrees 13.736' West Longitude. That is about 100 meters upstream from the mouth of the Partridge River and on the right side. Why were able to find *Ligumia recta* in the Partridge River and PolyMet couldn't? We looked in this species natural habitat and they didn't. They should have because *Ligumia recta* is found in the St Louis River Basin (table 4.5-1 of the DEIS) is a Species of Special Concern in Minnesota. In section 4.5.1.1 of the DEIS we read that the Minnesota Comprehensive Wildlife Conservation Strategy identified *Ligumia recta* as a Species of Greatest Conservation Need. It is also listed as Nearly Threatened on the IUCN (International Union for Conservation of Natural Resources) Red List. The two Partridge River sampling sites identified in Table 4.5-2 of the DEIS show the only places mussels were sampled. The substrate is primarily silt and boulders. It would be a good place to go if you didn't want to find *Ligumia recta*. I am not saying that they deliberately sampled the two areas that were most unlikely to produce threatened species, but obviously, the sampling design was inadequate and any conclusions drawn were inadequate. The fault may be twofold. First, is just the simple lack of enough samples. Second, in the context of setting up the design of sampling we read in the RS26 document under 2.1 Method, that Partridge River Rosgen "Level 1 classification was performed based primarily on 2003 aerial photography. That is not adequate to set up the sampling regime for mussels. Two poorly chosen sampling sites missed an important indicator species that could be threatened by this proposal and the alternative proposal. Mussels are sensitive to sulfate levels. Copper sulfate is widely used to kill mussels. When that doesn't work, calcium arsenate does. (25)With all the calcium and arsenic and copper and sulfate leaching out to this mine site, the EIS must address the impacts on *Ligumina recta* in the Partridge River, or it will be inadequate.

8	<p>I have been a science teacher in Cloquet, Minnesota for 40 years. I was able to take my students on hundreds of field trips. We visited, on a regular basis, the plant and animal communities of three North American Biomes, as defined by the National Hierarchical Framework of Ecological Units. (ECOMAP 1993) They are the Eastern Broadleaf Forest, Northern Conifer Forest and only 60 miles to the west, an Oak Savannah Prairie Grassland. The transition zone, which includes all of the Iron Range, is called the Laurentian Mixed Forest. To the south and east stretches the Eastern Broadleaf Forest all the way to the Atlantic Ocean. To the north lies the Boreal or Northern Conifer Forest and to the west lies the Prairie Parkland. Biomes are climate dependant. As climatic zones move, biomes move. The climatic underpinnings of our present biomes are shifting to the north. How does climate change relate to the PolyMet proposal? According to a Nancy Schuldt email of 5-8-2008 to tribal, state, federal staff with attachments, the "Federal Court Requires Wildlife Service to Analyze Climate Change Effects during ESA consultations" and "Ninth Circuit Court Requires Climate Change Analysis during NEPA". I fail to find any reference in the DEIS of the interaction of global climate change and movements of biomes, and especially how this proposal impacts wildlife corridors that are necessary for that movement. Let me show you what that analysis should include. Last year Frelich and Reich, from the University of Minnesota, published a paper in Natural Areas Journal. They listed tree species that are likely to disappear from Northern Minnesota because of climate change. These trees were: balsam fir, black spruce, white spruce, jack pine and red pine. The southern edge of the black spruce range could shift 300 miles to the north. What will replace it? In prehistoric times, the Eastern Broadleaf Forest moved north as the Boreal Forest withdrew. We should expect that to happen again. That brings us to the analysis of corridors through which all the thousands of species associated with the Eastern Broadleaf Forest must move if it is going to replace the receding Boreal Forest. Like the popular press, the DEIS addresses corridor impacts for large mammalian species. I don't worry so much about corridors for them. Moose, wolves, cougars and even animals like the opossum have shown that they can move quickly into new habitats and, in fact, can be found in several different biomes. Most of the emphasis in the DEIS corridor impact analysis is on these mobile species. The Emmons and Oliver report commissioned by the Minnesota DNR in 2006 concludes that there may be significant cumulative effects to the mammals they studied. I will show that the DEIS must address the cumulative effects on corridors for organisms that are much less mobile and there many of them. To understand the importance of corridors we need a continental perspective. The bulk of the land in North America east of the Mississippi is the Eastern Broadleaf Forest. To the north of most of that forest lies the Great Lakes. If you measure the width of the Eastern Broadleaf Forest at its northern boundary, you find that about 75% of that boundary is the Great Lakes, which effectively blocks movement of most plants and animals. There only two significant corridors through which most of the plants and animals must migrate if they are to move north. The widest corridor to the north is from Watertown, New York, at the east end of Lake Ontario, to the Atlantic Ocean. That corridor is tremendously impacted and restricted by human activities. The corridor around the west end of the Great Lakes is much smaller but, fortunately, the forest ecosystems are more intact. It extends to the west from Lake Superior for about 200 miles and we call it the Laurentian Mixed Forest. For over 100 miles this important corridor is almost completely obstructed by the Mesabi Range and associated human activities. Therefore, any re</p>	WI2,WI5,AQ3,AQ4B
9	<p>I just happen to know the ecology of the wood turtle from a life time of watching them when I am on those waterways. Also, as a member of the St Louis River Board's Citizen Advisory Committee, I worked with many others, including DNR non-game wildlife personnel, to devise a Management Plan that would protect the wood turtle. It is instructive to look at what the St. Louis River Management Plan has to say. On page 46 under Threatened and endangered species and critical habitat, it says, "Where these species are known to occur, management activities should be evaluated and if necessary, the area placed into a Unique Protection Area. There are some habitat components which provide critical food and cover for wildlife in the watershed. These habitats should be maintained or increased, if possible. They include: 7) Wood turtle habitat." Under Wood turtle Management we read, "Specific management guidelines for the wood turtle include: 2. route roads at least 330 feet (100 meters) from stream channels. Road beds should be vegetated and paved at stream crossings to reduce their attractiveness to nesting females. Protect cutbanks, which are prime nesting areas for wood turtles, by making sure that all stream bank restoration programs and erosion control projects with reaches along the river likely to contain wood turtle nesting habitat are reviewed by DNR Non-game Wildlife Program". (27) These reasonable management strategies must be addressed in the EIS.</p>	WI2

Comment ID	Comment Text	Theme Codes
10	In Section of I.A., the transportation of ore was cited but there was no indication of how and the rock waste would be transported from the mine to the processing facilities until later in the summary. Since mining is a dusty business at best, it is foreseen that there could be a lot of dust that could be distributed on the trip from the mine to the processing plant regardless of transportation method. It is assumed that the dust would settle on vegetation which would be killed by the sulfuric acid formed when the air and water hit the dust. This spreads the area of contamination over more of the site than spoken of in the DEIS.	PD7
11	In section I.C., it is stated that the MnDNR is the Responsible Governmental Unit (RGU). This is hard to follow since the Forest Service is the holder of surface land. Apparently the State of Minnesota auctioned off the mineral leases at some point. None of this is explained so it is not an easy leap to see how the MnDNR is the RGU. It would have been helpful if (Minnesota Rules, part 4410.4400, subpart 8) had been quoted here. Most citizens do not have ready access to such state rules nor they do they have easy access to the portion of the full document to sort through for the rule. It is unknown if it is cited in the full DEIS. Again this makes the document very difficult to make comments on.	PD1
12	In Section I.D. the Minnesota Pollution Control Agency and the Minnesota Department of Health are not formal players other than reviewing documents apparently. Since the potential for contamination is so great to both surface and groundwater, it is puzzling to me that they are not more involved in both the DEIS and in monitoring the contamination that will result.	G10
13	In II.C. There is some discussion of air quality. For years, the lakes and rivers have received heavy concentrations of acid rain that have been changing the quality of these resources. We need good monitoring of the effects by some one. It does not really address this oversight and who will be responsible for this monitoring of environmental effects.	AQ4D,AQ5
14	In Section III.A. some of the questions that I had noted previously are partially answered but we are left with new questions. On the 5th bullet point Construction and Operate a Tailings Basin. Perhaps some will remember the failure of the Tailings Basin at Lax Lake which allowed many hundreds of tons of tailings to wash out of the Basin and covered thousands of acres of property in addition to covering Highway 61 many feet deep in tailings. The tailings went all the way to Lake Superior. Those tailings, while full of asbestos, were not as destructive as these mine wastes will be to the environment. These mine wastes will need special recovery techniques and the question remains, who will be responsible? This section does not state who will be in charge of seeing that the closure and its monitoring is done. Again in bullet point 7 a lot of technical jargon is used so that it is difficult to tell what is being talked about.	PD3,PD4
15	In Section III.B.1 Proposed Action Description-Mine Site Discussion is held about holding Category 1 and 2 Waste Rock subaqueously. I did not see where the possible contamination of ground water was addressed. The dikes and ditches would capture some of the runoff which would be taken to the WWTF by the CPS. Once again there is a lot of mining jargon so that one cannot make reasoned comments on this action. In the Plant Site section in the last paragraph on page S-8 this area was not noted on Figure S-2. Also in the continuation of the Plant Site section, the second paragraph on page S-9 is full of mining jargon that is difficult to interpret.	PD2,PD5
16	Aside from direct impacts on native plants and plant communities, impacts on water resources need to be addressed further. Hydrologic conditions form the basis of entire ecosystems, and hydrologic forces and characteristics shape entire landscapes. As such, impacts to water resources have a much broader and longer-lasting environmental impact. NorthMet Project Draft EIS does not recommend commensurate actions and/or alternatives to mitigate such serious impacts. The type of mining proposed would leave behind sulfide-containing waste rock and may result in acid mine drainage. Stockpiled material also poses a significant threat to surface water and groundwater, beginning with the Partridge River and the entire St. Louis River Basin. The project would involve direct and indirect impacts to ,...,1,522 acres of wetlands, most of them ranked as high quality. This would be one of the largest wetland impacts in Minnesota history.	WR1E

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
16	While peatlands cover only 3 percent of the Earth's surface, they store 550 gross tons of carbon, which is equivalent to 30 percent of all global soil carbon. The amount of wetlands projected to be impacted by PolyMet does not currently accurately represent the total amount of wetland impacts that would occur. This is due to the fact that no initial area of influence (AOI) on the wetlands was made. This means that wetland impacts to communities such as cedar swamps, northern wet ash swamps, forested rich peatlands, northern alder swamps, and poor fens have not been accurately accounted for. These communities rely on a steady influx of groundwater flow for nutrients and soil moisture. If the hydrology around them is changed, they too will be affected. The Army Corps is developing a work plan to assess impacts to these additional wetlands, but this work plan has not been finalized or implemented. As the PolyMet project currently stands, there would be both direct and indirect impacts to over 1,500 acres of wetland. The destruction of just 1,000 acres of peatland correlates into a 2 percent increase in the total output of carbon dioxide emissions in Minnesota.	WE1,WE2
17	Please do not compromise Minnesota's natural heritage by allowing PolyMet to circumvent their responsibility by minimizing the negative environmental impacts of this project.	G2
17	This project is focused on short-term economic gains and does not adequately address the long-term negative impacts, for which the state and the USFS will ultimately be responsible. Furthermore, the job benefits of this project are unsustainable and short sighted. The natural communities in the project area also providing habitat for native plants and animals and promote long-term economic tourism benefits, including tourism-related jobs. Minnesotans, as well as people from all over the country, have long been attracted to and enjoyed the relatively unspoiled beauty of northeastern Minnesota, and they will continue to value the integrity of their natural landscapes.	SE3,SE4
18	Polymet's proposal to mine copper, nickel, and platinum group metals in northern Minnesota has global benefits. The 'not in my back yard' mentality does not promote worldwide environmental protection; instead it encourages archaic mining methods in third world countries that don't have the resources to update their methods and government regulations to the high standards the United States demands. Refusing to let mining of essential materials in the United States does not resolve the problem because these materials are needed and used everyday and therefore will be mined regardless of environmental concerns. Mining in the United States ensures that the processes are done in accordance with stringent environmental regulations. A domestic supply offers American companies the opportunity to buy locally, reducing costs and greenhouse gas emissions associated with extensive transport of these materials. These environmental benefits not only affect the United States, but help further worldwide environmental protection. This will also provide jobs in Minnesota. It would be in Minnesota's and the Worlds best interests to suppli the Polynlet project.	EOO,G1

19	<p>The DEIS uses muddled modeling. The consultants have used reaches of the Partridge and Embarrass Rivers that are already badly polluted by excess sulfate, to evaluate the potential for methylation to occur. If a water body is above about 8 mg/L that is sometimes called the sulfide Max (Technical Memo concerning NorthMet project by Barr Engineering, Dated April 25, 2008) and additional sulfate will have little impact on the rate of methylation. The average concentration of sulfates in the Partridge River at SW-114 has been 10 mg/L for the last 4 years. After closure of PolyMet, it is predicted to go as high as 31.7 mg/L. The average concentration in the Embarrass over the last 4 years at location PM-13 is 36.1 mg/L and could climb to 63.4 mg/L at closure. All of those numbers are above the sulfur Max of 8 mg/L so we would not expect proportional increases in methylation. What they should have modeled would have been impacts of all that sulfate on downstream wetland methylation where the sulfate concentration is below 8 mg/L. Such a place would be the Scanlon Dam in Cloquet at river mile 35, according to the DNR research by Lindgren and Shuldt, published in 2007. The reservoirs and estuary are immediately below the Scanlon Dam and would be water bodies where sulfate is a limiting factor on methylation. (Gilmour et al. 1992; Krabbenhoft et al. 1998). It would not matter whether the excess sulfates came from the Embarrass or the Partridge River; it could stimulate methylation from the Scanlon Dam on down to Lake Superior. These are waters that are listed by the Minnesota Department of Health for fish consumption advisories for fish tissue mercury. These waterbodies were excluded from the statewide mercury TMDL because the fish tissue mercury was above the level considered achievable by the TMDL. These waterbodies must be subject to a separate mercury TMDL which according to EPA guidelines should be completed in the next few years. Further degradation of these waters would not be legal under the Clean Water Act. (see Friends of Pinto Creek v. EPA (9 Cir.) (9)Will there be any modeling of mercury methylation in these waters in the final EIS?</p>	WR1E,WR4B
20	<p>Most of our watersheds have a riparian flood plain that typically is inundated each spring and then the water slowly recedes. These lowland swamps and forests are naturally sulfate poor as is typical of surface and ground water in Northeastern Minnesota. All of the other prerequisites are present for mercury methylation. With the usual spring expansion of water into these floodplains, an increase in sulfate loading is added to the mix of organic matter, sulfate-reducing bacteria, deposited mercury and low oxygen concentrations. In other words any sulfate added to this system has the potential to enhance mercury methylation in the floodplain of over 100 miles of river. This issue must be addressed as indicated by the MPCA in "MPCA Strategy to Address Indirect Effects of Elevated Sulfate on Methylmercury Production and Phosphorus Availability" adopted 10-19-06. That MPCA Strategy document defines "high risk" for mercury methylation as: 1. Discharge of elevated sulfate concentrations into low-sulfate waters &lt;40 ppm or so) where sulfate may be a limiting factor in the activity of sulfate-reducing bacteria (SRB); 2. Discharge of elevated sulfate into streams with fluctuating water levels and bordering wetlands. Rising water levels would introduce sulfate into the high-organic wetland matrix, followed by falling water levels that hydraulically deliver elevated MeHg and/or phosphate into the stream. The important sentence "Rising water levels would introduce sulfate into the high-organic wetland matrix, followed by falling water levels that hydraulically deliver elevated MeHg and/or phosphate to the stream," is the perfect statement of modeling that must be done for the floodplains and multiple backwaters and bays of the entire watershed. It has not been done in this DEIS. (11)Will that modeling be included in the final EIS?</p>	WR4A

21	<p>When we leave the area of influence for the Iron Range mines, from river mile 100 on down, the sulfate concentration gradually diminishes due to bacterial reduction and dilution and probably other factors. At the mouth of the river in the St Louis River Estuary, it has diminished enough so a few remnant stands of wild rice appear after a 150 mile absence. According to Jerome Blazevic, a life long trapper in the estuary, the wild rice stands have gone from being the best in the whole area to being barely alive in some of the best bays and completely gone in others. We have limited hard data to show the sulfate levels in the estuary, but if we look at the good data we have from the Scanlon dam on upstream and extrapolate down to the lower reservoirs and the estuary we would expect numbers in the 8 to 10 mg/L range. That is a critical range for both mercury methylation and wild rice. The St. Louis River estuary is such a significant resource that it has been chosen as the 28th National Estuarine Research Reserve. It is only the second such reserve in the Great Lakes. This is an important nursery for Lake Superior walleye. Research on mercury in fisheries (Trevor M. Selch, 2008) showed that for walleye "fertilization success declined with increased waterborne MeHg". Also Howard McCormick, doing research for the EPA in Wisconsin, showed that mercury negatively impacted the over- wintering survival of young of the year for several species of game fish. Obviously, the St Louis River and estuary are such an exceptional sustainable resource that we have to make a better effort to protect it from this new even more dangerous form of mining. The DEIS needs data and modeling to show the risks to this resource. The question then arises, would it ever be possible to complete a mercury TMDL that would get the St Louis River delisted for fish tissue mercury if a "no action" decision were made and the PolyMet project was rejected? The answer is yes, because the science is showing us that what is unique about the St Louis is the significance of anthropomorphic impacts. They are controllable. The taconite industry has agreed, in the last year, to support the state wide mercury TMDL implementation plan with big cuts in emitted mercury. Secondly, we now know that this watershed can manage draw downs in a fashion that will reduce methylation. But most importantly, we have to do what Minntac is doing to reduce its' release of sulfates to the West Two River. In a presentation to the 70th Annual University of Minnesota Mining Symposium, titled "Membrane Treatment of Taconite Process Water for Sulfate Removal and Commercial Implementation Potential" Tom Moe of U.S. Steel reported that it can be done. Ultra filtration through special membranes can reduce their high volume, high concentration sulfate water to acceptable levels at an economically feasible cost. (12)The IES also should discuss the possibility of "in pit" sulfate treatment. If they can do it, a new permittee must be required to do it also.</p>	WR4B,WR4C,FM2
22	<p>I want to point out how sulfate impacts on mercury methylation relates to the National Environmental Policy Act and the Council on Environmental Quality Regulations for Implementing NEPA. Section 1502.16 of those regulations requires a discussion of the environmental consequences of a project: 1. Section 1508.8 requires a discussion of indirect effects and their significance. I find no discussion in their documents of indirect impacts from the project on mercury methylation below river mile 139, even though impacts will occur well below river mile 139. 2. Section 1506.2(d) requires a discussion of possible conflicts between the proposed action and objectives of State, Federal and local plans. With regards to State and Federal plans, an EIS must discuss the cumulative synergistic impacts of this and other project releases of mercury and sulfates on the required future mercury TMDL for each listed watershed. (Section 303(d) of the Clean Water Act) Cumulative impacts are the impacts on the environment that result from the incremental impact of the action when added to other past, present and future impacts. (Section 1508.7 of CEQ Regulations) In other words, the mercury and sulfates produced by the PolyMet proposal and possible future mining proposals, must be considered in light of the cumulative impacts of mercury and sulfates of all the Iron Range tributaries to a watershed. That has not yet been done. (14)When will that be completed?</p>	WR4B,PRO3

23 Fortunately, we have good data on the sulfate concentration of this river. Moyle found in DNR Fisheries Report no 69, April 2, 1944, sulfate concentrations of only .3 mg/L in the Partridge River. That has changed. In 2008, Berndt and Bavin, working for Minnesota DNR, reported sulfate as high as 90 mg/L. So what has clearly happened here is: the recent impact of mining has raised the sulfate levels to the point that natural wild rice beds are no longer productive, but are still alive. Actual in field observations clearly show the validity of the State Wild Rice Standard, with tall productive rice teeming with waterfowl where sulfates were normal, and stunted unproductive rice in water contaminated with sulfates. Wild rice can survive above 10 mg/L, but not thrive. The legacy of sulfate contamination of these water bodies should warn us about the will of the agencies to enforce the Wild Rice Standard after a proposal is permitted. One rice stand on the lower Partridge River, which was completely missed by the recent company sampling, was about 70 meters long by 10 meters wide. This is not some recent stand. It has been struggling to survive there for years while our government agencies continue to allow industry to try to kill it. What happens in wild rice stands that are inundated with high sulfate waters like this is: during cell growth and differentiation, suberisation and cell wall thickening can reduce the ability to take up oxygen, water and iron (Armstrong and Armstrong, 2005), which can stunt growth and reduce yields. (Gao et al., 2004). Not all stands respond the same. It depends upon the amount of oxygen in the water that flows through a stand. Therefore, in the same river we expect to find some stunted stands and some that are surviving the sulfate overload much better. The only safe conclusion is that exceeding the Wild Rice Sulfate Standard will negatively impact the quality of some of the rice beds along any given river. After noting the abundance of productive rice above river mile 161 and the stunted condition of wild rice in the lower Partridge River, we paddled down the St Louis River to the take out at the Highway 100 bridge. This is down stream from the Partridge River. The wild rice at this location in the St Louis River, had the same stunted and reddish and thin appearance of the rice in the lower Partridge River. The DEIS does not even acknowledge the presence of these stands. (18)Will that be corrected in the EIS final draft?

WR1E,WR4F,WR5A

23 To address deficiencies in the CPDEIS and supporting documents that claimed there was no wild rice in the lower Partridge River, and in the St Louis River below their confluence, four of us paddled those reaches on 9-16-09. Above the junction with the Partridge River at river mile 161, the St Louis River was full of high quality rice with several hundred waterfowl feeding and resting in the rice. The rice immediately above the junction is tall and healthy with viable rice kernels all the way to the top of the heads. This is to be expected in this sulfate poor region of the world. According to the DNR Study of the St Louis River (John Lindgren and Nancy Schuldt) released on August 29,2006, at river mile 171, which is above the junction with the Partridge, the St Louis River has a sulfate concentration of only 2 mg/L and "Wild rice dominates this reach". Next, we entered the lower Partridge River and searched for wild rice. There were stands there, but they were in such poor health that even though we were there to harvest wild rice, the plants were so stunted that you could not bend the stalks over the side of a canoe to harvest the grain. The plants averaged about 10 inches in height and the color was more reddish than green. Most plants had no viable seed, and not surprising, we saw no waterfowl there. This was in complete agreement with the report "Effects of Sulfate on the Biomass and Seed Production of Wild Rice" by Bradley Dewey and John Pastor, University of Duluth, December 20, 2009 where the authors state under Results: "The mean weights of roots, shoot and viable seeds and the total number of seeds produced all consistently decreased with sulfate concentrations (table 2)." (17)I know that this study supporting the state wild rice criteria, was released after the DEIS was released, but will it be incorporated into the final EIS?

23	<p>If the sulfate and mercury released by this proposal are managed as described in this DEIS, we will have fish tissue consumption advisories in perpetuity. The adequacy of this DEIS with regards to mercury and sulfate should be decided by the EPA and MPCA working with the already established St Louis River Mercury TMDL Partnership not the Lands and Minerals Division of the Minnesota DNR. Those of us that have served on that Partnership have known for several years that for this river it is all about sulfate. Adequate modeling of sulfate impacts on the lower St Louis River will be impossible until we have the data from LCMR proposal #028-A3. At the present it appears that we have a choice, either perpetual water treatment for sulfate at the Partridge River or perpetual fish tissue consumption advisories for the St Louis River. Thank you for your honest consideration of those two choices. I have harvested wild rice alongside tribal enrollees from the Fond du Lac Band of Lake Superior Chippewa since 1954. I have hunted waterfowl in wild rice waters just as long. I have trapped muskrats in wild rice stands going back to 1948. The incredible productivity of healthy wild rice stands is very important to all cultures of Northern Minnesota. The superior quality of hand picked, locally parched wild rice, is a signature product of this part of the world. Good stands provide food, cover and nesting materials for dozens of vertebrate and invertebrate animals including waterfowl, muskrats, loons, grebes, blackbirds, rails and, of course, billions of rice worms. John B. Moyle established the relationship between wild rice and sulfates back in the 1940' s. In 1944 he wrote in the Journal of Wildlife Management, Volume 8, page 177-184, "No large stands of rice occur in waters having a sulfate content greater than 10 p.p.m., and rice generally is absent from water with more than 50 p.p.m." Based on this research, Minnesota has established by Rule, a Wild Rice Standard limiting sulfates to 10 mg/L to permit wild rice to thrive. (Minn.R. 7050.0224 sets a standard for sulfates of 10 mg/L, applicable to water used for production of wild rice during periods when the rice may be susceptible to damage by high sulfate levels. (16)Will the state apply the 10 mg/L sulfate criterion to any new discharges to the Partridge River?</p>	WR4A,WR4B,WR4F
23	<p>The 1997 CEQ document, "Considering Cumulative Effects Under the National Environmental Policy Act" delineates the process to determine geographic areas that will be appropriate boundaries for a cumulative effects analysis. This is referred to as "area of interest." It states "One way to evaluate geographic boundaries is to consider the distance an effect can travel." The current documents consider the area of interest to be limited to the Partridge and Embarrass River sub-watersheds. The area of interest for direct, indirect and cumulative impacts of sulfates on the aquatic resources in this watershed should be the St Louis River from river mile 179, and downstream to its mouth. That has not yet been done. Finally, in considering the only project that has released documents on water quality, (about 100 pounds of paper printed on both sides) PolyMet has done an inadequate analysis of the impacts of the PolyMet project on mercury releases, mercury methylation, delisting of water bodies, wild rice and aquatic species. It has artificially limited its analysis of sulfate impacts to portions of the watershed that are already at excessive sulfate levels. (15) Given the requirements of the Clean Water Act for mercury delisting and the cumulative impacts of sulfates on wild rice and game fish, is it not likely that permitting the PolyMet project would violate water quality laws as well as irreversibly harm watersheds?</p>	WR5A
24	<p>Now I will correlate the quality of the stands we observed with sulfate concentrations of those same reaches of the rivers. In personal communications with Mike Berndt and Travis Bavin (MnDNR), they reported sulfate concentrations of 2.2 mg/L on 7-7-08 for the St Louis River above the Partridge River, and we found luxurious growth of wild rice there. They found 90.0 mg/L in the Partridge River on 10-1-8 and we found thin and stunted rice there. They found 66.9 mg/L in the St Louis River below the Partridge River and we found thin stunted rice. In my judgment, as a professional biologist, the water velocity, sunlight and substrate were similar at all three sites. The big difference was sulfate and that made all the difference. How valid is the Wild Rice Standard of 10 mg/L? Put your hip boots on and walk and observe those three miles and you will know. According to all the supporting documents from PolyMet and Mesabi Nugget, this was never done. (19)Will this deficiency in the DEIS be corrected in the EIS?</p>	WR4F

Comment ID	Comment Text	Theme Codes
25	First, I would like to discuss the effect of the PolyMet project on mercury sequestration in peat bogs. The hundreds of acres of peat bogs that will be destroyed in this watershed by the proposed mine, means that hundreds of acres of Hg(mercury) sequestering surface will be permanently lost to the Lake Superior watershed. Research done by the MPCA and others has shown that any disruption of peat bogs is known to release mercury. A watershed cannot be managed for Hg this way and expect it to ever be delisted for Hg contamination. Therefore bog mitigation must be brought back to this watershed. The PolyMet proposal to replace this loss of wetlands with artificially constructed wetlands in Aitkin and Pine counties having disproportionately less peat bog surface and located in other watersheds, will result in substantial mercury impacts to the Lake Superior watershed. (1)Therefore their wetland mitigation proposal should be rejected or modified through the Section 404 permit process with USACE.	WR1E,WR4E
25	I have used the St Louis River from top to bottom and have been troubled by the big void of wild rice from river mile 161 all the way down to the St Louis River Estuary. We now know that the entire river from the Embarrass River down to the Fond du Lac dam is devoid of wild rice and is also consistently above 10 mg/L for sulfates. I can take you to many places on the river where the physical conditions are prime for productive wild rice stands but are devoid of any wild rice. From LTV to Minntac, we have been pouring sulfate into this section of the river for half a century. In contrast, compare the flourishing rice stands on comparable reaches of the Mississippi, Rum, Vermillion and Big Fork Rivers, where they do not have mining generated sulfates. In Sources and Fate of Sulfate in NE Minnesota Watersheds, May 16, 2008, Travis Bavin and Mike Berndt say on page 13, "however, increased sulfate loading from mining could potentially have a negative impact on many wild rice beds in the area." According to NEPA, the area of concern for this project should extend down the estuary, where important stands still survive but could be even more threatened by the PolyMet releases. Adequate data, collecting and modeling have to be completed before this DEIS can be called complete. The lead agencies working on the PolyMet EIS have been asked to do a cumulative analysis of the impact of sulfates on wild rice. That has not been done. Instead, the DEIS has done individual sulfate analysis on the Partridge River by itself and the Embarrass River by itself. That is hardly cumulative. Based on the observations I have made, as well as guidance from the National CEQ, cumulative analysis must involve the St Louis River as well. The CEQ document, "Considering Cumulative Effects under the National Environmental Act" delineates the process to determine geographic areas that will be appropriate boundaries for a cumulative effects analysis. This is referred to as "area of interest." CEQ states, "One way to evaluate geographic boundaries is to consider the distance an effect can travel." With concentrations of sulfate projected to be as high as 31.7 mg/L in the Partridge and 63.4 mg/L in the Embarrass River at closure of the PolyMet operation, the area of influence will definitely extend a considerable distance down the St Louis River. In fact, because of the many other sources of anthropogenic sulfates along the St. Louis River, the "area of interest" for sulfates must go all the way down to Lake Superior. (20)Will this cumulative impact analysis be done before permits are issued?	WR5A
<b>Sender Last Name:</b> Harig		<b>Submission ID:</b> 2527
1127	It is my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in longlasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	GT2
3093	I am not a Minnesota resident but this issue greatly affects me. Living on the shores of Lake Superior and having this same situation occurring in my area. I would strongly oppose this type of mine. The water quality from leaching is a major issue.	EOO

3807	I strongly oppose the development of sulfide mining in Minnesota (or anywhere for that matter). This is a short term opportunity for economic gain that will not effect northern minnesotans in a positive way. This is a Canadian company that will exploit our natural resources and effect the environment in a way that cannot be reversed. I work in the tourism industry in northern minnesota, and I feel that the tourism industry, which is a pretty low impact-sustainable-way of enjoying our environment, will be adversely effected. Our national forests allow people to recreate, and even profit from the natural resources they hold. The difference between logging our renewable resources and mining minerals that will never be replaced (and many of us would argue that we don't even need) is astronomical. Please protect our waters from the influx of supheric acid that will leach into our water sources, please stop the pillage of our national forests. Do not put us at risk, do not allow this project to proceede.	EOO,G2A,G7A,G11
<b>Sender Last Name:</b> Harkins		<b>Submission ID:</b> 2580
449	need for better information on existing pollution, the nature of wetlands, endangered species, and other resources that would be affected by the project.	WR1E,FM1,AQ4
689	Analysis of all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources.	WI5,WE8
1146	The existing inadequate showing by PolyMet Company that their waste rock and tailings piles will not collapse and dump uncontrolled pollution into nearby waters, causing potentially catostrophic water pollution.	GT2
2217	The unacceptable prediction in the existing DEIS that water pollution from the proposed mine could possibly last 2,000 years.	WR1A
2218	inadequate information in the DEIS regarding the scope and extent of potential pollution, including detailed information regarding water flow from the affected areas.	WR2E
2413	As the U.S. EPA suggested, making sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.	PD4
2414	The absence of a detailed reclamation plan which is tied to the required financial assurances	PD4
2415	The failure to analyze the land that is going to be exchanged for Superior National Forest land to make this project possible.	PD1
3138	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, increase air pollution that results in regional haze and create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs.	G2C,G4A,G7A

3741 February 1, 2010 Stuart Arkley, EIS Project Manager Minnesota Department of Natural Resources Division of Ecological Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Polymet Draft EIS Dear Mr. Arkley: Among the many positive effects the Polymet project would bring to Minnesota and the United States, the most impressive benefits are those pertaining to economic impacts. With the potential to create 400 full time positions, hundreds of spinoff jobs and millions of dollars in local and state taxes, Minnesota can hardly afford to pass up this opportunity to rejuvenate the iron range. These significant impacts would greatly benefit all local parties, including school children, members of the work force, land owners, small business owners and large manufacturers. Environmental concerns weigh heavily on everyone’s mind; as they should. However, Polymet has taken great care to ensure their methods are environmentally friendly; Waste rock storage will be lined, with drains leading directly to water treatment facilities. Polymet’s ore processing methods not only use sulfur as a fuel source, but also use limestone to neutralize acids and create a practical byproduct of gypsum, which can then be used to make sheetrock, concrete, and fertilizer. In addition, Polymet will use high tech air emissions controls to further ensure minimal sulfur dioxide emissions. Polymet also plans to utilize a brown field site and existing infrastructure, which will minimize disturbance of wetlands and surrounding greenfields. The combination of Polymet’s extremely conservative approach to environmental concerns and the State of Minnesota’s stringent environmental guidelines and regulations leaves little opportunity for environmental impacts. With all these positive benefits available, it would be in Minnesota’s best interests to support the Polymet project. Sincerely, Marcella Hartman

EOO

- 15 The EIS should be clearer; PolyMet is not in the Boundary Waters watershed. WR3B
- 184 I support PolyMet Mining’s NorthMet Project. PolyMet will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefit. PolyMet’s 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region/my local business. PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system. We should move forward with permitting this mine. We need and want jobs. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. PolyMet has demonstrated it can produce these critical metals while following Minnesota’s strict environmental requirements to protect air, water and land. The metals that Polymet will mine are essential to green technology such as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air and water will be minimal, if any. EOO,G5
- 185 I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project and I wholeheartedly support it. PolyMet project has been designed to minimize environmental impacts; reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. PolyMet will be a domestic supply of critical metals needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential products. I understand the importance of buying locally. PolyMet will mine and produce several metals not currently mined anywhere in the United States. I use these metals every day. PolyMet will be a domestic source of the metals we all use every day. Mining these metals in one country, processing them in another and then transporting them to the U.S. creates unnecessary greenhouse gas emissions. Foreign suppliers of these metals don’t necessarily follow sound environmental practices, creating a greater global environmental impact. EOO,G5

2774	Good grief! Do not jeopardize the wonderful waters of our precious Lake Superior or of the Boundary Waters! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO
<b>Sender Last Name:</b> Hauser and Magliulo		<b>Submission ID:</b> 3667
1	1. The unfinished land exchange between the U.S. Forest Service and PolyMet is a major issue which has not been addressed in the DEIS. This land exchange may have significant environmental impacts which could therefore effect other aspects of the Project. The DEIS should not have been released until this land exchange was finalized. Without this completed land exchange the DEIS is incomplete and unacceptable.	PRO4
2	2. The St. Louis River drainage and possibly the Birch Lake system will risk major contamination. This is obviously an untenable situation, environmentally and financially. Mercury and sulfates do not enhance water quality! The DEIS (4.1 - 113) predict high sulfate concentration which will transform mercury causing fish to be inedible. Additionally, the DEIS (4.1 -113) predicts that arsenic, cobalt, and selenium will exceed water standards. Our public waters must be protected from heavy metals. The current DEIS design allocated for the prevention of contaminated overflow into adjacent water bodies is unacceptable. Until another design has been proven to prevent such pollution this DEIS is	WR3I,WR5A
3	3. Wildlife will suffer from the Project as PolyMet would be located in critical habitat for both the protected species Canada lynx and Gray wolf. The effects of noise, vehicle strikes and habitat destruction are totally unacceptable in that they diminish the habit of these species. The DEIS (4.4.3.1.) notes "...the effect on statewide lynx populations would be insignificant since no individual lynx or pair of lynx would be significantly affected by the habitat loss." The demolition of food resources, denning sites, and forest shielding coverings for these protected species may ultimately cause breeding problems thus impeding population growth. The DEIS is unacceptable until further analysis of the loss of critical habit regarding the Canada Lynx and the Gray Wolf is further examined.	WI1
4	4. There are serious issues related to the destruction of over 1500 acres of wetlands (read "peatlands") and as such would hardly represent Minnesota's commitment to reduce greenhouse gases and enhance carbon sequestration. Peatlands sequester carbon and the destruction of approximately 1,000 acres of peatlands by the Project would result in a two percent increase in Minnesota's carbon emissions. The DEIS (S-10) acknowledges that "project facilities and operations would result in additional greenhouse gas (GHG) emissions in the Arrowhead region." The DEIS is unacceptable since these high quality peatlands in Minnesota need to be protected rather than their loss contributing to additional greenhouse gases in our region and ultimately contributing to global warming.	AQ3

5	<p>5. Native American gathering and hunting rights have long been guaranteed by law (their status under the 1854 Treaty) in the Project area, and they would be abridged by the Project's activities. According to the DEIS (4.3), "Several plant species have been identified as being of significant tribal concern including wild rice, cedar, and sage. These species are relatively common to northeastern Minnesota; therefore, loss of access to these areas is not anticipated to have a significant impact on tribal use of these plant species. There is no documented tribal use of the Plant and Mine Sites for harvesting these resources." It is not Tribal custom to record the harvesting of wild rice, cedar and sage. Therefore no data can be examined. The quantity of these types of harvested resources can vary from year to year due to any number of variables leading to their destruction and, or, decline. This DEIS is inaccurate and unacceptable since it fails to show the data needed to evaluate the tribal utilization of these resources in the Plant and Mine Sites. ( 4.14.1.3) Uniquely Affected Communities DEIS(4.14-11) states...this area compared to other portions of the 1854 Ceded Territory and ongoing and future mining activities would be unlikely to encourage an increase in moose densities relative to the rest of northern Minnesota. It is imperative that northern Minnesota preserve its wetlands to protect the decline of our moose population. The MN Wildlife Advisory Committee notes these wetlands are required to prevent heat stress to moose. PolyMet is proposing the largest direct wetland fill in northeastern MN. Adjacent to the Project's wetland fill are two major wildlife corridors that moose have historically used. These wildlife corridors will be negatively impacted by the Project thus resulting in the decline of Tribal hunting. The DEIS' current evaluation of Tribal harvesting and hunting is inadequate and needs to be fully reconsidered since the availability of current tribal resources would be in danger of decline which by law should be protected. Until such time we find this DEIS unacceptable.</p>	G3,CR1,CR4

It is imperative that northern Minnesota preserve its wetlands to protect the decline of our moose population. The MN Wildlife Advisory Committee notes these wetlands are required to prevent heat stress to moose. PolyMet is proposing the largest direct wetland fill in northeastern MN. Adjacent to the Project's wetland fill are two major wildlife corridors that moose have historically used. These wildlife corridors will be negatively impacted by the Project thus resulting in the decline of Tribal hunting. The DEIS' current evaluation of Tribal harvesting and hunting is inadequate and needs to be fully reconsidered since the availability of current tribal resources would be in danger of decline which by law should be protected. Until such time we find this DEIS unacceptable.</p>	WI2,WI3,WI5,WE2
6	<p>6. Waste rock sequestration in perpetuity is impossible – just plain impossible, no matter what kind of ponds or liners are employed. When they start leaking their toxic slew (and they will – sooner or later) the local economy will suffer a terrible blow as fewer visitors mean declining lifestyle levels for our community. Four hundred "high-paying jobs" which might last a decade or two are not worth the loss of this unique landscape. The DEIS (Table 4.1 -45) notes water from waste rock piles will be polluted for up to 2,000 years. Future generations should not be responsible for our poor decisions now. The DEIS (S-10) recognizes the potential for basin structural failure: "The NorthMet Tailings Basin and hydrometallurgical facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin". Any potential for basin failure, causing environment contamination in perpetuity, is unacceptable.</p>	WR1E,PD2,GT2

7	7. The DEIS is incomplete without addressing the requirements for financial assurance. It is necessary for the public to be protected against "footing the bill" in perpetuity or adverse environmental impacts which PolyMet will surely incur. The EPA is establishing new rules supporting the necessity of financial assurance with hard rock mining by requiring it in future EIS evaluations, see (InsideEPA.com, Tuesday, August 25, 2009). The following is a list of Project parts requiring financial assurance and must be addressed in the DEIS. a. Post closure treatments such as waste water at the mine. b. Underground mine alternative which has not been examined sufficiently. c. Structural failures at the tailings facility with the needed information for the proposed stockpiles. d. The need for perpetual water treatment. e. Existing environmental problems at the LTVSMC Tailings Basin	PD4

726	The availability of this EIS has newly come to my attention and, given the risks of sulfide contamination to waters of Lake Superior and, if mining is extended into the BWCA watershed, to the waters and wilderness amenities of that region, I believe an extended comment period and opportunities for further public input are needed. At minimum, an additional 30-45 days are needed for review of the EIS and more public meetings at locations around Minnesota are necessary to inform and get the input of the many Minnesotans who use and have personal and commercial interests in the waters and wilderness amenities at risk. Moreover, in order to more fully educate and engage the public regarding their interests in this matter, making opportunity for public comment at those meetings is necessary.	PRO6
<b>Sender Last Name:</b> Haycock		<b>Submission ID:</b> 2253
2661	I very much oppose allowing sulfide mining (PolyMet) in Minnesota. Superior National Forest must be preserved in its natural state as much as possible. The minerals will be gone in a rather short time; pollution of water, peace & quiet of the area will last almost forever.	EOO,G2A
<b>Sender Last Name:</b> Hazen		<b>Submission ID:</b> 2682
3164	The PolyMet proposal is basically a private sector "taking": A foreign company seeks to procure sub-surface minerals from public lands at great environmental and economic cost to the American people, put them on the international market, and retain the financial profit from it outside of our borders. The American people will suffer the health, environmental and financial costs of this result, in cases into perpetuity. Here are some of the details:	G1,G2,G4A,G9
<b>Sender Last Name:</b> Heath		<b>Submission ID:</b> 3732
20685	b. At the scale (small size) of the modeled area being considered, the DEIS presented an inappropriate assumption, that the rock properties of the modeled hydrostratigraphic bedrock aquifers in the mine site area are uniform in all directions. I saw little effort to characterize the probable distributions of fractures in the bedrock by analogy in the Iron Range, or by direct measurement. I recommend that DNR explore the orientation and occurrence of fractures in the Iron Range to get a better sense of where groundwater in the bedrock at the mine site and proximate moves. Without this characterization, no conclusion can be clearly made as to where potentially contaminated water might move in bedrock after the mine closes, or even if this movement of potentially contaminated water might be an environmental problem.	WR2A

46	proposing to do so in should not be approved. Economic Impacts This project is focused on short-term economic gains and does not adequately address the long-term negative impacts. Minnesotans, as well as people from all over the country, have long been attracted to and supported the beauty of northeastern Minnesota. This project will negatively affect the local economy that is based on the tourism industry. Tourism is a sustainable source of income whereas mining, as has been proven in this area, is not a long-term, sustainable way of	SE3,SE4
3680	Many other jobs could be created which would be less polluting and support the community over the long run. Additionally, this project could leave taxpayers responsible for the costs of reclamation and cleanup after mine closure. The responsible agencies should require financial assurance from PolyMet should the project move forward. Pollution and financial assurance issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	ALT8,PD4
3751	directly or indirectly impact roughly 1,500 acres of high quality wetlands. The DEIS indicates that these polluting discharges and necessary water treatment would continue on for many years. This type and amount of pollution to Minnesota waters is unacceptable and any mine	G7C
<b>Sender Last Name:</b> Hedlund		<b>Submission ID:</b> 3464
3743	Please consider our impact on our fragile environment. I know in these economic times, there is a temptation to take short cuts. Jobs today or environmental problems for generations. Hmm what should we choose?	EOO,G2
<b>Sender Last Name:</b> Hedren		<b>Submission ID:</b> 1613
953	PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	G9
954	Future generations of Minnesotans will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care.	PD4
994	The DEIS predicts contaminated waters will be discharged from the mine site into the Partridge River after the mine’s closure, as well as tailing’s basin discharges high in sulfate concentrations. I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for hundred of years. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time. It is unacceptable to me to allow PolyMet to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR3I
2017	Please accept my comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential harmful impacts on not only Minnesota, but on the entire great lakes region of the USA and Canada	G10
2018	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. It is my feeling these issues must be totally resolved before the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers approve this mine.	G10
<b>Sender Last Name:</b> Heep		<b>Submission ID:</b> 2239
604	The mine site disrupts natural corridors for the movement of wildlife. Specifically the Canadian Lynx which is an endangered species that requires large territories and moves through undisturbed forest corridors. No provision is made for mitigating this loss of habitat in the DEIS.	WI5
1150	Sulfates are a problem that are not being dealt with rigorously in the DEIS. Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition there is the likely potential for mercury methylation in surface waters as a result of mining. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for?	WR4B,WR4C,WR4F,FM1,F

Comment ID	Comment Text	Theme Codes
1824	There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and it's waste storage site sits nearly on the continental divide it should have been determined if there is any chance that acid polluted mine drainage could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting.	WR2A
2017	The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is a necessary, there needs to be a large sum of cash held in escrow as a damage deposit and that amount should be specific and included in the final EIS.	PD3
2018	The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet cannot be looked at as a single, onetime event in N.E. Minnesota. With permitting of Polymet will come at least 2, perhaps 4 or more new applications for permitting from other mining companies. What will be the total impact on the environment by all these potential mines and how will the EIS deal with mitigation of all these in concert? Specifically the Boundary Waters which is downwind of allthese projects will be negatively impacted in terms of atmospheric haze from dust particles blown into the air. Tell us how this cumulative effect on air quality must be dealt with for Polymet and all future applications. In addition how is global warming affected by this mining operation and the combinations of all potential mines in the future?	G9
2019	Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. Do we just depend on the mining company to do its own monitoring? There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR.	PD8
2645	As a residents of Ely and people whose livelihood is directly connected to the Tourism industry of our area we are very concerned about the long term effects and implications of the any prospective mining in our area. We are very concerned about the ultimate potential impact it may have on our water, our air, and the Boundary Waters Canoe Area Wilderness. We are concerned about the impact it has on our global environment. These concerns outweigh any short term benefit to be derived in jobs.	G8C,G11
<b>Sender Last Name:</b> Heeter		<b>Submission ID:</b> 2332
2793	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I have been canoeing and camping in the bwcaw since my daughter was 10. She is now 46, and a resident of Minnesota. WE go back to the BWCA every summer. There is no place in the world like this set aside wilderness area. Once the waters become contaminated it will be lost forever. The value of this land and water is beyond any price tag.	G7,G11
<b>Sender Last Name:</b> Heino		<b>Submission ID:</b> 372
413	There needs to be an evaluation of the potential for mercury demethylation and/or methylation in flooded mine pits.	WR4B
413	The DEIS should incorporate new results from ongoing monitoring of area rivers and lakes, especially those receiving sulfate leakage from legacy mining operations.	WR1A

<b>Sender Last Name:</b> Heltunen		<b>Submission ID:</b> 249
262	RGGS Land & Minerals, LTD., L.P. submits this letter in support of the PolyMet Draft EIS and the PolyMet-NorthMet Project. As the owner of the majority of the mineral resource to be utilized in this project, RGGS has complete confidence that the project will be developed in a sustainable, environmentally sound manner and provide a much-needed economic boost to this region and its' residents. RGGS has worked with PolyMet staff and has consistently observed their professionalism and their insistence upon producing a superior grade product while maximizing environmental protections. Efforts to minimize environmental disturbance by utilizing the former-LTV Steel Mining Company facility and transportation infrastructure while employing state-of-the-art technology represent PolyMet's commitment to produce a domestic supply of critical metals in an environmentally conscious manner. While confident in the environmentally-sound technology to be employed by PolyMet, the effect that this project will have on this area's economy, tax base, and employment cannot be overestimated. This region has been severely impacted by the recent downturn in the taconite mining industry and the development of the NorthMet project will be a major step in this region's effort in diversifying its' economic base. There are a high number of people trained, qualified and available to be employed by this project. RGGS provides its' total support to the PolyMet-NorthMet project and requests that the Minnesota Department of Natural Resources and U.S. Army Corps of Engineers find this Draft EIS to be complete and thorough in order to issue the required permits in a timely manner after this review	EOO
<b>Sender Last Name:</b> Henderson		<b>Submission ID:</b> 3581
3849	Clean water is probably our most valuable thing on Earth. Please help protect our lands and water in northern Minnesota from the results of sulfide mining. Water and land pollution will effect those living now and those coming in the future, including humans, trees, fish, animals, birds, our/your great grandchildren... If we cannot stop the mining, please do your part to enforce all laws, written and moral, which keep the mining companies within the guidelines. There is only one Superior National Forest, let's keep it as natural as possible. Do we really have to trade ANY of it??	G2A,G2C
<b>Sender Last Name:</b> Hendrickson		<b>Submission ID:</b> 236
245	I am writing this email to show my support for the Polymet Project. Polymet is a much needed project not only for the jobs it will produce, but for more independence from foreign countries in buying their precious metals and the tactics they use to extract these minerals. The draft EIS is more than adequate to reassure people that this project will be safe to the environment not only in water run-off, but in green house gas emissions also. I firmly believe Polymet, along with yourselves have done all the necessary research to make this a safe and viable project. Hopefully after the public comment period the Final Permits can be issued quickly to start construction before all hope is lost, along with the quality paying construction jobs and much needed permanent jobs tied in with this project.	EOO
1178	This Job would help my area 10 fold I live in iron mn and I know lots off people In union trades that are laid off from the slow movement of work when if this job would start it could help my entire family and friends I am a union boilermakers local 647 my mother works for union trades as a book keeper my close friend is in.the local laborers union with 2 kids one born a year ago and one born a week ago we need to keep are jobs and this is a close job for us we need this	EOO

3726	Once this happens, the damage is virtually irreversible. Also, evaluate the land to be exchanged for Superior National Forest land to insure that the land swap would protect wetlands, hydrology and taxpayers' interests.	PD1
3727	Make sure, as the U.S. EPA has suggested, that financial assurances for the public are included in the EIS before permitting gets underway. Additionally, please require Polymet to show that their waste rock piles won't create water pollution problems after they have taken what they want and leave the rest of us with the waste.	PD4
3851	We are writing to you regarding the PolyMet sulfide mining project as concerned residents of Northeastern Minnesota. Our concern centers on the sulfide mining process and the great potential for acid mine drainage. We have heard about the "new" mining technologies that will prevent this from occurring, but other than stating that all necessary precautions will be taken, we have no idea what the "new" technology is and whether it has been proven. We are aware of past failures of sulfide mining operations to carry through on their promises to protect the environment. That is why Wisconsin now has a moratorium on sulfide mining operations. In this economy we know how powerful the promise of a few jobs can be, even if it means only short-term employment, and the mining companies are proficient at selling their projects based on the promise of these jobs. As long-term residents of Northeastern Minnesota, we see the results everyday of what the extraction of natural resources has done for the region and what happens once the resource is gone. The scars left from the wholesale harvesting of the white pine are still visible in the form of slowly rotting stumps. These will disappear in another generation, but the huge mine dumps and holes will be ruining our view until the next ice age. Now we understand that PolyMet and other companies wish to exploit this area once again for some minerals that, due to their current high value, are now considered worth mining even though they are present in low concentrations. Like the lumber companies and the iron mines before them, what assurances are there that they will not take what they want and leave us with the bill for clean up. A scarred landscape and, the very high probability of acid mine drainage, with the associated heavy metals, into the watersheds for generations to come could be what the State is left with. This will have a detrimental effect on one of the few sustainable industries in this region, tourism. Before sulfide mining is permitted, please insure that the mining process will not lead to the leaching of acid mine runoff into the watersheds.	G2C,G11
<b>Sender Last Name:</b> Henjum		<b>Submission ID:</b> 3165
710	I am requesting an extension of the comment period. A minimum of 180 days are needed to comment on what would be Minnesota's first ever metallic sulfide mine. Permitting agencies need to hear from those opposed to the PolyMet project. If permitted, PolyMet would pave the way for a new sulfide mining district in Minnesota's beloved Lakes region.	PRO6
711	The Polymet proposed mine raises many concerns. The BWCA and the Superior National Forest lands are precious State resources. Any proposal that might impact them deserves very careful consideration. The DEIS is about 1800 pages, please allow for a 60 day extension for comments.	PRO6

Comment ID	Comment Text	Theme Codes
3122	If a comment extension is not allowed then absolutely I would argue for a rejection of permits for Polymet. Some concerns listed below. Thank you. * Acid mine drainage and toxic heavy metal leaching are byproducts of mining sulfide ores, requiring water treatment for centuries. PolyMet admits the mine would pollute ground water, but claims that any pollution would meet water quality drinking standards. Mining pollution also adds sulfates to watersheds, triggering the chemical reaction by which mercury becomes methylated, and bio-accumulates in fish tissues. * Since PolyMet's open pit would be within 20 miles of the BWCAW, haze and noise pollution would impact the wilderness. * Disruption of the landscape would impact wildlife, bird, and plant habitat, while vegetation used in reclamation would introduce non-native species. * PolyMet is a Canadian company, so this mining project will not provide a domestic source of copper, nickel, cobalt, platinum, palladium, and gold. The metals will be further processed in Canada and sold on the global market. * The mineralization of northeast Minnesota is very low grade, containing approximately 8 pounds of copper and .01 ounces of precious metals per ton of waste rock. This will require energy and electricity to create enormous amounts of waste, making this a marginal mining venture on the global market, rather than providing a steady supply of jobs. * PolyMet purchased the former LTV taconite crushing plant and tailings basin for its plant site, but the open pit strip mine would be located within 6,700 acres of public Superior National Forest land which is designated to be sold to PolyMet without environmental review. 470 acres of imperiled or rare/uncommon black spruce (bog) and jack pine forest would be impacted. * Excess capacity at the PolyMet processing facility would open the door for a sulfide mining district between the PolyMet site and the Boundary Waters Canoe Area Wilderness (BWCAW).	WR1A,WI2,WI4,WI5,VI4,P
<b>Sender Last Name:</b> Hess		<b>Submission ID:</b> 145
136	Well, I think this project is important to northern Minnesota in a lot of ways besides just diversify industry. I think it's important for the greater Minnesota to understand that. Hibbing and the surrounding area, the Iron Range, is not just a playground or an area for recreation; there are people that live and have their lives there and it's important for those people to have jobs so their lives can be sustained for the long term and last for posterity. I think that bringing copper mining and precious metal mining to the range will help us to off-set some of the economical swings that iron mining has. I think that these jobs will help backfill a lot of the cutbacks in the existing iron mining industry, which will complement the existing economy. That's it.	EOO
1603	This letter will serve as official notification of our support of PolyMet Mining. Our organization consists of veterans, most of who reside with their families within the surrounding area. Obviously, these people are all very interested in maintaining a healthy environment, not only for their own enjoyment, but for the enjoyment of future generations. PolyMet has invested tens of millions of dollars in studies to inform the EIS and permitting process, and we believe that the PolyMet EIS has evaluated, in detail, all the elements of potential environmental concerns for a new mine. PolyMet has demonstrated it can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. PolyMet and its vendors will provide our young people with multiple opportunities for challenging and exciting careers, thus keeping our young people in the area. PolyMet will contribute to the local and state economy at a time when we really need the jobs and generate significant economic activity in our area.	EOO,G10
2001	c. The DEIS did not adequately characterize the potentiometric surfaces of bedrock aquifers by measuring water levels, the potential for surface-water and groundwater interaction with respect to the Partridge and Embarrass Rivers, and the degree to which ground water naturally moves vertically and under the influence of drainage through the bedrock to the mine pit. I recommend that DNR install several piezometer nests south of the proposed mine and adjacent to the Embarrass and Partridge Rivers to better characterize this aspect of the subsurface flow system.	WR2A
<b>Sender Last Name:</b> Hesterberg		<b>Submission ID:</b> 1193
158	Also, please extend the comment period on this project to 180 days to allow for thorough and accurate evaluation of this issue.	PRO6

1308	The DEIS says that water from waste rock piles will be polluted for up to 2000 years (Table 4.1-45). This is a bad idea – we can't expect mining companies to be responsible of the operations for that long. The DEIS says that the destruction of 1,000 acres of peatlands would result in a two percent increase in Minnesota's overall carbon dioxide emissions. Minnesota needs to halt the destruction of these valuable habitats.	EOO,G2B,G7A
<b>Sender Last Name:</b>	Hietalati	<b>Submission ID:</b> 1055
1159	I am Yiriting you in support of the PolyMet Mining's. NorthMet Project. I feel there has been plenty of studing and testing done to ensure the safetyof this project. I feeinorhem Minnesota needs the jobs this project would create; both in the construction and in,the running of the plant. I also feel it will make good use of and old mining area.	EOO
<b>Sender Last Name:</b>	Hildenbrand	<b>Submission ID:</b> 3583
3852	The PolyMet Mining Company proposal to develop precious metals mining at the old LTV Mining Company site near Hoyt Lakes needs the full support of our state and state agencies. From the sidelines, it appears that the PolyMet Mining Company has been run through the hoops with very little support from Minnesota. This mining will provide much needed jobs and much needed diversification to our region and will have financial impact for our region and state. This mining for our region is a new future. The environment should be protected within reason and it appears that the EIS answered all the elements of potential environmental concern. Stuart, let's support PolyMet and help them move forward with mining in an environmentally responsible way.	EOO
<b>Sender Last Name:</b>	Hill	<b>Submission ID:</b> 156
2	Now I didn't read the whole Environmental Impact Statement. I read the 27-page summary. I have just a couple comments about the scope of the Draft Environmental Impact Statement. There are some species listed in there that are endangered; but -- and this may be more a political boundary issue more than an endangered specie issue. The species of the bladderwort, the buttercup, or marsh marigold, the Canadian Lynx and the wolf -- there's only a narrow, small portion of that ecotype in the state of Minnesota. There's another 300 miles of that ecotype across the Rainy River in Canada. So while there may seem to be acarcity of these species in and around the mine site, there's several hundred more -- there's thousands of square miles more of this ecotype in Canada that didn't get counted which these species exist in. And I realize that the mandate of the Environmental Protection Agency is just to do stuff in the United States; but because of the political boundary, these species seem more scarce because of the scoping of the Impact Statement than they really are, because they do exist north of our border. So I think that's it. Thank you very much	WI2
147	Okay I support the adequacy of the Draft Environmental Statement and I would like to encourage the agencies to support the permit for PolyMet -- or the required permits for PolyMet. I think we need the jobs in Minnesota. And from what I've read of the Environmental Impact Statement, it looks like they've adequately gone over what the hazards are.	EOO,G6

1118	I am an engineer and have been in the mining industry for over 35 years. I have worked in four of the iron mines in Minnesota and two copper mines in other states. I have experienced good mining and environmental practices in both iron and copper, and know what it takes: a good and diligent attitude and acceptance of responsibility. I know the PolyMet management team and hold them in very high regard. They have always had the focus and direction to create a value for Northern Minnesota and their shareholders and of being a good environmental steward. Having spent in excess of \$24 million for the Draft Environmental Impact Statement, PolyMet will neither squander the investment nor the opportunity to become good neighbors and good corporate citizens. I believe that they will follow through, with full responsibility and diligence, with all of the requirements that the state of Minnesota will have in the permits. Their integrity and honesty is above reproach. The state and the economy need this project, not only for the employment and revenues it will bring to the local and state economy, but also for the overall business stimulation that it will drive throughout the northern region. As important to the region as iron mining is and has been to the region, the environmentally responsible development of the Duluth Complex by PolyMet will bring social and economic benefits to us for several generations. I ask that this draft EIS be completed, and the final EIS issued for the issuance of permits. This is a great opportunity.	EOO
<b>Sender Last Name:</b>	Hilty	<b>Submission ID:</b> 2575
3133	Allow me to be one more voice in opposition to the current proposal. I would briefly like to state just a couple points. There are many scientists and geologists who believe that we have already extracted, by far, most of the rare earth elements and strategic minerals available worldwide, which is evidenced in part by the prices for them going up exponentially. It is also increasingly becoming recognized that there are more of these minerals already out of the ground, that are available for recycling and re-use, than there are left in the ground. And there are untold amounts available for extraction from landfills and waste sites at far less cost and with far fewer potential adverse consequences. (For example, imagine how much copper can be retrieved when we finally determined that it's become unconscionable to waste electricity lighting billboards everywhere.) There is NO way to ensure that damage won't occur to our -- soon to be recognized worldwide as one of earth's most valuable resources -- safe and clean water. And there is no way to ensure that damage once done to the watersheds of northeastern Minnesota can ever be repaired, or even satisfactorily mitigated. Stewardship demands that we respect sound reasons for restraint. The potential long term costs don't justify what can already be seen as questionable short term gains. We must find better ways to conduct our human enterprises on our earth if it is going to continue to be life-sustaining. The time for us to be good ancestors is now.	EOO,G2
<b>Sender Last Name:</b>	Hines	<b>Submission ID:</b> 144
135	Ready for my statement? No, I've been following this project for a couple years and I'm all for it. I think it's pretty good for the State: Create jobs, taxes, be good for the area, lot of spin-off jobs. As long as they do it in an environmentally safe way, and I believe they've got that covered, I say, go ahead, they should do it. And that's all I got to say.	EOO
3148	Based on what I have heard about PolyMet's proposal and the history of this industry, it does not appear wise to make Minnesota's natural resources the guinea pig for unproven processes when the cost of failure will be so high and so long-term in nature. The resources will not disappear if you say no to this proposal at this time. If the processes prove viable elsewhere, this proposal will undoubtedly be made again in the future with the benefit of actual data instead of hypothetical projections. If the processes fail to prove viable elsewhere, the resources of Minnesota will not have suffered the long term negative consequences of gambling on the new processes. I have heard ongoing concerns that PolyMet's analyses have not adequately assured that the environmental history of the industry will not be repeated, and my understanding is that PolyMet does not have the financial resources to mitigate problems if the projected superior environmental results of their experimental processes fail to materialize. Please do not make me, as a taxpayer, responsible for the fallout if their gamble fails. Please don't let this company experiment on my state's resources.	G4A

323 This letter is to advise of my support for the PolyMet-NorthMet Project near Hoyt Lakes, Minnesota. During my career I have provided and managed the engineering design of numerous mineral processing facilities throughout the United States and in eight (8) foreign countries. In 2006 I had the privilege of participating in the preliminary engineering study of the PolyMet -North Met project and I am of the sincere opinion that this project has addressed its impact on our environment with more detail than any other project I have personally witnessed. The economy of Northeastern Minnesota is founded on mining of minerals and Minnesota needs diversification within its mineral industry. Minnesotans managing and working at the PolyMet facility will responsibly produce value added base metals while generating significant economic assistance to our state and local communities, and regional educational districts. Again, I strongly recommend issuance of permits for PolyMet Mining Company-NorthMet Project.

EOO

3590 proposal. Tax payers would continue to foot the bill for needed clean up from the mine and the EIS does not account for mitigation action items that would need to be employed if there were an issue. Further, there is a lack of detail regarding content in dealing with toxic tailing which would be produced by the mine. Minnesota needs to get up to speed on current mining issues or be taken advantage of by mining interests. I am not against mines and understand

3257 While the Polymet project is not directly in the BWCA, the proposed mine site and the affected area are very close to the BWCA. We know where the surface water flows, but we do not know where the groundwater flows, so this could have a serious impact within the BWCA.  
3805 I have been reading the Draft EIS. I share the concerns of the Native Americans as stated in footnotes. I believe their concerns have not been adequately addressed, and they are sufficient to block the project. They are too important to be relegated to footnotes. The proposed new mitigation techniques are not, and cannot be, adequately tested. The unleashing of harm is an irreversible process.

373	<p>As a resident of Hoyt Lakes I have watched Polymet employees work very hard to meet regularity requirements so the project can go forward. I have attended meetings and asked questions. As a 55 year resident of Hoyt Lakes I am very aware of our clean environment and tourist potential but the need for real work in this part of Minnesota requires development of our natural resoures. I trust that our state will classily observe the project's process and its effect on our resources. Our local residents and their children as they mature, deserve the opportunity for jobs that can support families and communities. Comparison of this project's process to old methods is not fair and the material to be mined is totally different. Let give this privately funded project the opportunity to enrich the lives of our communities.</p>	EOO

---------------------------------	--	--------------------------

23	<p>Thank you. My name is Alan Hodnik. I'm here to speak as president of Allete on behalf of Minnesota Power, its electrical utility division serving Northeastern Minnesota. I'm also here to speak as someone with lifelong and deeply personal ties to this immediate area and region as this city's former mayor. Minnesota Power supports the PolyMet NorthMet project and this very public process for reviewing the NorthMet EIS. This process is designed to be an open, thorough, and factual examination of the environmental protection framework proposed for NorthMet. There are three major public benefits that can stem from NorthMet in this EIS process. One benefit lies in the metals NorthMet could produce, many of which are currently sourced outside this country, and all of which are needed for many things that support our daily lives, from medical applications to computers to wind turbines. Secondly, another public benefit connected to NorthMet are the estimated 400 direct jobs it would create. These jobs are solid, bread-and-butter employment opportunities for residents of this region and state. No one can argue that these jobs are not desperately needed now or that they aren't needed longer term. This employment would occur through sensibly utilizing natural economic advantages of local mineral resources and existing mining industry infrastructure. There is a logical, thoughtful plan behind the NorthMet project and a foundation for lasting success. It isn't a pipe dream with no realistic prospects or a venture easily whisked away to another location on a whim by its owner. The NorthMet project requires substantial investment and commitment by PolyMet. I can tell you from personal experience this is not the kind of investment made lightly without due economic and environmental diligence. The third major public benefit connected to the NorthMet project and its EIS is the conscious experience this is not the kind of investment made lightly without due economic and environmental diligence. The third major public benefit connected to the NorthMet project and its EIS is the conscious and documented protection of the natural environment surrounding the project. The standards the state will use to protect the land, air, and water involved with NorthMet will be established through the EIS process. Some people say that Minnesota is incapable of properly developing or regulating the NorthMet project in a way that protects the environment. They argue that we must choose between having NorthMet's benefits and having a healthy environment. Often these arguments are based on experiences in eras and locations far removed from today's technology, today's permitting standards, and Minnesota's very stringent regulatory supervision. As an officer of Minnesota Power and president of Allete with responsibility for environmental integrity of our operations, I know firsthand how very stringently state regulations and regulatory affairs govern our industrial facilities. There is no reason to believe Minnesota is unable to properly permit and regulate the NorthMet project. The EIS for NorthMet contains extensive documentation of PolyMet's plans, thorough plans to protect the environment. There is no need to drive the mining of these metals to other parts of the world with lower environmental standards. There is no need to forego good jobs for residents and our communities and, instead, create subsistence jobs in other parts of the world. There is especially no need to do this on the basis of a false choice between environmental and jobs. There is absolutely a need, however, to allow a rigorous, open EIS process to proceed to its conclusion, setting the regulatory framework for PolyMet and its needs to develop and operate NorthMet. I represent a company with extensive firsthand knowledge of the state's strong environmental regulation, and I am here to attest to Minnesota's ability to properly permit this project. Minnesota Power supports the NorthMet project, the</p>	EOO,G6

193	I have been following the proposed Poly Met project near Hoyt Lakes since the beginning. I feel this project would be a true asset to the area and that this company is sincere about it's environmental impact on the property. I am in favor of this project.	EOO
<b>Sender Last Name:</b>	Hoelt	<b>Submission ID:</b> 1399
1632	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Please support this bill as we are in need of any new job openings no matter what the lunatic tree hugger fringe groups say. Thanks	EOO
<b>Sender Last Name:</b>	Hoffman	<b>Submission ID:</b> 2681
3163	We must not let these companies pollute and destroy our valuable resources. We must protect the Boundary Waters Canoe Area and the wonderful lakes and rivers in this area. This pollution may last for 2,000 years or more. The real treasures are above ground. People come to Minnesota to vacation, hunt, and fish. They will not come and spend their tourist dollars if we have allowed these companies to destroy these waterways.	EOO,G7,G11
<b>Sender Last Name:</b>	Holets	<b>Submission ID:</b> 1102
1207	As a resident of Minnesota for the past 67 years, I wish to support the Poly Met development in the Hoyt Lakes area. I have been following this proposed development for the past 2 or so years and feel that it will bring about positive economic development in a way that is compatible with what already exists in the area. I have read the E.I.S. and believe that environmental concerns and damage will be minimal. It appears that this is a well-conceived project that will benefit our state and all of our communities in the area. I urge your favorable support of the Poly Met project so that it may move forward soon. Thank you for your consideration of this request.	EOO
<b>Sender Last Name:</b>	Holland	<b>Submission ID:</b> 2045
2488	We cannot let our waters to get any more poluted. Wisconsin banned until safe. i believe we should do the same.	G14
3665	I think it'll be a shame to see such pristine areas as the Boundary Waters be so negatively impacted if this project goes through. There is no way to mine in a "clean" way, even if the technology has supposedly improved. Also, once damage has been done to the environment monetary solutions could never fully put the environment in to the same place as it was before. I think the benefits of both sides need to be evaluated. The outcome that results from mining would be such a short-term one if there was one at all.	G2
<b>Sender Last Name:</b>	Hollander	<b>Submission ID:</b> 2634
3150	I also own property in St. Louis County, on Pequaywan Lake. Please do not approve the mine. We have precious little clean water left in our county. Jobs can be created in many ways, but clean water is a limited resource. Once polluted by mercury and other contaminants, there is precious little that can be done to restore the water. Pollution lasts alot longer than the jobs that will be created. Once the minerals in the mine have been depleted, the pollution remains for all our grandchildren and their children.	EOO,G7B

3273 The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Furthermore, the PolyMet mine would change the symbolism of the area that the tourist industry relies on. Consequently, tourist businesses along the North Shore and Ely area would all bear the external costs of possible future mining, while all economic benefits would be contained to the community of the mine's location.

G1,G11

**Sender Last Name:**    Holzman **Submission ID:** 2978

3356 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I have three young children, and while I sympathize with Minnesotans desperate for jobs, I can't support trading away clean water for short-term economic gain. Nor can I support creating what amounts to an enormous clean-up debt for the next generation.

G1,G4,G7B

**Sender Last Name:**    Honkanen **Submission ID:** 3459

3738 Dear Commissioner, I would like to write in support of the Polymet Mining project that is being considered for implementation. To understand why I support the project, it is necessary to know some information about me. I have lived on the Iron Range since the age of eight. From the age of twelve, I knew that I wanted to be an attorney. Seventeen years later, I have my own solo practice in Virginia, MN, but while in law school at the University of St. Thomas, I received my MBA as well. Prior to opening my practice, I looked at a number of factors in consideration of opening a firm. One primary reason that weighed in favor of making an affirmative decision to start my practice here was Polymet. People on the Iron Range have become accustomed to the boom and bust cycle of the mining industry and that will not change. Polymet raises the economic floor of the entire region so that the economic busts are not quite as bad. In addition, more young people, like myself, will be more inclined to begin opening businesses and venture into the entrepreneurship waters. Mining is the way of life here and that cannot and will not change. Outdoor activities are also a way of life here, but that pales in comparison to the need for clean drinking water, fresh air, and uncontaminated soil. No one wants pollution; however, we live an area where some pollution is required in order to sustain the rest of the world. If people want pristine areas, such as the Boundary Water Canoe Area, then they must alternatively have places like the Iron Range. The goal, then, is to have the safest and cleanest form of mining possible. Polymet has achieved that standard by pursuing the policy of having the cleanest copper mine in the world. I know this because of the various statements made by its president and legal counsel, but also because of the EIS itself. The EIS is like a contract and Polymet is the bound party. That policy will be continued as the DNR, MPCA, and other various governmental and private agencies monitor Polymet's continued activities, assuming the plan is adopted. Therefore, not only is Polymet starting at an extraordinarily high standard, but it is seeking to sustain that standard into the future. Therefore, the Iron Range achieves the best of both worlds: continued economic growth and development and doing so in a responsible and clean manner. Please approve the Polymet mining project so that we can all get to work. Thank you. Sincerely, Erik J. Honkanen Law Office of Erik J. Honkanen

EOO,G1,G2

20687 f. The DEIS reported recharge rates of precipitation and snowmelt through till from calibration of mathematical models, but these values for recharge seem many factors less than probable as determined by the USGS. I recommend that DNR determine recharge rates directly from hydrograph analysis in monitoring wells installed in glacial till at the mine site. Without doing this, there are no assurances of the validity of any of the model calibrations.

2	In leu of groundwater extraction wells along the northern perimeter of the tailings basin, consider the emplacement of a permeable reactive barrier (or wall) to treat leachate. A PRB of GAC & ZUI would treat leachate impacted groundwater for 30+ years. Also this would alleviate flow increase to Embarrass River and increase stabilization of the [illegible] N. Wall.	WR3A
3	Allowing the PolyMet Project to proceed without foolproof environmental safeguards and full financial assurance would be the height of irresponsibility; which means that allowing the Project to proceed would be the height of irresponsibility. The wetlands, waters, and long-term welfare of Northeastern Minnesota will be ill-served by sulfide ore mining. The short-term gain for a few workers is not worth the irreparable damage to the ecosystem and the long-term clean-up costs to our children and grandchildren. This project should not proceed.	EOO,G2
3	Im a 20 yr old Boilermaker. I support PolyMet! It creates jobs not only for Boilermakers but other Union Crafts as well. With the economy so low I dont see why people wouldnt support Polymet. It would give hundreds of people jobs not only in the area but for hundreds of miles around. Thanks for the consideration and for all the jobs possible.	EOO
4	Environmental concerns – this type of mining project has never been able to prevent seepage. Why is this one suppose to be different?	EOO
5	I support this project. It seems to me by all of the support that the economic impacts would out way the enviromental impacts. I understand there are criteria that has to be met but all the impacts shared were potential risks not proven facts lets get this project going it is already 2 years to late. Boilermaker local 647	EOO,G1
6	I would like to see this done right, and that means some changes then so be it. As long as it is for the better of everyone involved.	EOO
7	This project has been long awaited. I would like to see it prosper, and that it would be a good advantage for the people of Hoyt Lakes and the surrounding area. I think that Polymet has met all of its requirements. So please get the project going	EOO
8	My name is Thomas Sturgis. I live in Biwabik, Minnesota, and I would just like to say that I would really like to see this PolyMet go. I believe Minnesota has some pretty stringent pollution control regulations, and I don't think we need to add more to this. I would like to see it go. I would like to see my kids not have to leave the area when they grow up and be able to have the opportunity to have a good-paying job here, I would like the grandkids to have the opportunity, and I just think it would be a big burden if this doesn't go through, and it is going to start a precedent where all of these opportunities for really good employment are going to not be available to the area. That's all I've got.	EOO,G5
9	I am pro polymet because it will do good for community's schools and jobs in Northern MN. People are starving loosing there houses and giving what they shouldn't have to give away because of poor economy and not having jobs like this will bring to MN. I would like to live + play in a State that is known to provide work and people live comfortably not in a State that is falling apart cause there is no work. Polymet has made the right steps to make this happen go let them build and provide the food on the tables these people + I need.	EOO
10	This project would put many people to work, which would boost the economy and help everyone. From what I have been told it is safe. I am all for the project.	EOO
11	This project means jobs for Minnesota. It can and will be done in the most prudent environmentally sound way as possible.	EOO
12	This is a well planned – thought out project that will create jobs, produce local copper and will help the local economy. Please move this project forward.	EOO
14	This is great. Let's get going with it. We need jobs.	EOO
15	I support this project because I believe it will create much needed jobs in Minnesota. I believe that, with modern practices, the construction and operation of this facility will maintain a safe and healthy environment. I have personally visited the site and I look forward to seeing it operation again.	EOO

16	I am attending tonight in support of the Polymet project. I live in NE Minnesota and have raised my family there in the midst of many projects operating similar to Polymet. One environment is of a concern to me. If I thought the MPCA permitting process was deficient I would say so. If Polymet can meet their requirements I feel comfortable that we are doing what we can to protect the environment and shore up the economic vitality of the region.	EOO
17	My name's Darrell Godbout, I'm with the Ironworkers. I'm an Ironworker Business Agent. I represent about 1800 union ironworkers and we are in support of the PolyMet project. This is an existing mine site already. The property can't be developed for anything else. We all have families, friends, relatives living in the Aurora-Hoyt Lakes area who enjoy clean air and water. PolyMet has taken its steps to assure these areas stay that way. We import about 80 percent of our copper into this country from overseas; companies that work with no environmental restrictions. PolyMet has addressed all the environmental concerns to make sure that they are a good community member and a company to have in our community. A lot of the people in charge of PolyMet are from the area. You see them in our supermarkets, our kids' ball games, around town; they want to be good community people. Knowing that the project is environmentally safe, they can walk around town with their heads high. PolyMet will increase -- will create about 400 full-time jobs and hundreds of spinoff jobs, which is good for our community, our schools, our local businesses. Things to remember about PolyMet: They've addressed all the environmental concerns; PolyMet will provide millions of dollars in local, state taxes, support the community, and, again, our schools. The last is the job creations in the area which -- which are well-needed. And local people growing up in the community, having their kids graduate and having an opportunity to live at home is a big thing for the Ironworkers. That's it.	EOO
18	pro jobs, taxes, and deficit reduction. Get this up + running.	EOO
19	This is an excellent opportunity to provide jobs to the state of MN. I am concerned also about environmental issues but, I am confident that closely monitored, which of course it will be, we have very little to worry about.	EOO,G2
20	Secondly, consider a SRB Cell to treat eventual overflow of the pit discharge, and allow natural drainage to the lower Partridge River thus not effecting flow volume or quality. Constructed SRB Cells for acid mine drainage can be effective for 50+ years, and the matrix can be easily and effectively replaced. Enjoyed the meeting!!	WR3C
21	I believe that this project is good for Northern Minnesota. It is good for the Economy providing much needed jobs which in turn helps people keep their homes, stimulate our local and State businesses as well as a solid tax base for Minnesota.	EOO
21	I am in total support for the PolyMet Project. As an ironworker from Northern Minnesota we could all use the work that comes from this project, and all of the spinoff it would create for families in the area. I believe that it would produce jobs for all walks of life including building trades, vendors and environmentalist. From building, maintenance, and pollution control.	EOO
22	The PolyMet mine will be a positive impact to our region providing jobs to construction, jobs for mining, jobs for the spin [illegible] bay taxes. It is important for our area to have a strong economy. PolyMet mining will provide diversity to our current mining within the area. This mining is providing necessary metals for our society. The metals are necessary and will [illegible] [illegible] here if not here more than likely for our country which will [illegible] with [illegible] not as stringent as we have have in the USA and Minnesota. The mine will not be operated in a random will nilly [illegible] but will be managed, operated [illegible] [illegible] [illegible] professionals with consensus toward the environment as if its protection will be regulated and controled by our States Regulatory Agencies.	EOO
22	This is Minnesota's own economic stimulus program -without tax dollars. Five years of work – over 20 million dollars to date just for the draft Eis. Private dollars no tax dollars. The jobs this project brings to N. Mn is well over 1,000 in full production to say nothing of the ancillary jobs! Tax revenue to State is [illegible] \$40, million. Let's rule this Eis "adequate" – all on the issuance of permits. Do not put these folks through any more "hoops". Move forward – Jobs – State revenue. What more can be said.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
23	I would like to see this project moved forward. I was the Investment Banker for this company to help my fellow Minnesotan in the area of jobs. Most of the Shares were bought here in Minnesota. this company has demonstrated very Ethical Standards in quality of their work on the EIS Draft which should be view as adequate. The State needs the Revenues for employment, Company Taxes and hopefully alot of Capital gains Taxes. from my understanding the Company will be paying in the neighborhood of 50mil in St taxes. give these people Hope! They need it with Housing Collapse	EOO
24	I support All Projects that create Minnesota jobs Please Count on Me	EOO
25	I support the PolyMet Project for the following reasons: • The minerals that will be mined are critical for “Green Projects” that are being developed in the US such as electric cars, computers and emission control devices. • We Live in a Progressive State that will enforce environmental permits that will be used to monitor/regulate the mining operations. • We have the responsibility to use our own natural resources when-ever possible and not relay on resources from 3rd woold countries. • The Project will provide Jobs and promote the economic developo of Minnesota.	EOO
26	So I came here, we are the mill lining manufacturer from Canada, and we supply liners here at U.S. Steel and all the other Iron Range, and this is a very important project. The metal price is going up, the economy is picking up, so it is a good project to be in here, and that's why I'm here. And I understand there are some issues about the environment which is being discussed today, but, you know, I started from India, then I worked in Sweden, I was in the UK, and worked in Africa in gold mines, and now I'm in Canada. You know, these plants are everywhere in the world, and these are being -- this technology is not new or the first time Minnesota will be using it, so it is a proven technology. And you can have all types of precautions and arrangements to check the environmental control, and that can be done. It is not the first time somebody is inventing a wheel. So that's all I would like to say. This is a good project to go, and the metallurgy is good, and you can do good economically here.	G5
26	I am all for the Polymet if they adhere to the EIS. Minnesota needs the revenue from non-ferrous mining. It should have started long ago. The ore contains less than 1% SO4. Therefore emissions from Polymet are miniscule compared to other industries. Polymet has the wastewater treatment plant proposed. It seems to me that Polymet is being held to a higher standard. This is a good thing. I drove my car here. It has copper wiring. The catalytic converter has platinum in it. As long as Polymet follows the recommendations of the EIS, there should be no reason to not build the mine. Lets get through this. If we have to make changes to speed up the process, Let’s do it now. But let’s get this State some more revenue. The metal is just sitting there waiting to be mined. I have a cabin on the north shore. Polymet would affect me if it were done in an unfriendly way. I have no reservations to Polymet being built.	EOO
27	We Need This!!!	EOO
28	I would say that I love the out doors and I am for the Polymet project it will be safe for the out door and great for jobs and tax base they have meet every thing that need to be these metals could be take out in any part of the globe with no reg that would be very bad for the globe. Let do it here were it will be done right!!! We need this it is time to get it moving.	EOO,G1
29	I’m a 23 year old Boilermake Apprentice. I have an 11 month old son and with the economy work is slow. Last year when we had our son I was out of work for 4 months. I would love to see this pass therefore giving us more work. I have 3 mouths to feed and with this work it wouldn’t be as hard. I would greatly appreciate the work and so would the economy.	EOO
30	28 year old boilermaker. Second year apprentice. Need work like this to help pay bills, feed children, keep a roof over our heads.	EOO
31	I’am 2nd year apprentice. family of 4. We need this job. Boilermaker local 647 Ramsey MN.	EOO
32	I feel that PolyMet is doing a great thing for trying to build this mine here in Minn. I will create alot of jobs especially in this slow economy it would really help if u ask me!!!	EOO
32	We have to keep jobs here! I am tired of seeing made in China! Made in U.S.A. Union Made!	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
33	I support Polymet because it will create lots of jobs for many workers in Minnesota and surrounding areas. Work is slow right now and it would really help the economy to pass Polymet.	EOO
34	My name is Pat Tammen. I'm from Soudan, Minnesota. I taught for 30 years in Ely, and so I'm a retired teacher from there. I have lakeshore property on Birch Lake very close to where the proposed copper mining is going to be, which is four portages away from the beautiful Boundary Waters, and I'm very, very concerned about the copper mining that might be taking place if the permits are granted; that for less than one percent copper, I'm not sure that ruining -- or what I see as ruining our water is worth it. Raping our land is the way I'm kind of looking at it, because we are talking about 6700 acres of our beautiful Superior National Forest, which about one-third of that is wetlands, and how they can replace that or mitigate for that, I'm not convinced of that either. I really think that this is a poor way to go for 400 jobs; that I think that we can think of other ways for people to get jobs, and my idea with that is figure out how we can get some manufacturing plants up on the Iron Range or any place in Minnesota, for that matter, but right now the Iron Range is hurting. As we all know, it is pretty high unemployment. So instead of building windmills in Mongolia, maybe we could do that up on the Iron Range, or Duluth, or the Twin Cities, or wherever. But I would like to take and save our water and our land. That's all. Thank you.	G2A,G7C
35	I need work to support my family on this type of work. Boilermaker USA Eric Wudtke	EOO
36	I am currently a business agent for Pipefitters local 539 and we are suffering an unemployment rate above 30%! My members need jobs, jobs, jobs As well as all the different trades in the construction industry. This project would put 1000's of people to work, It would also create 100s of permadent job for the area!	EOO
37	I believe it is time to stop the cumulative loss of Minnesota jobs and time to start rebuilding our great state and put people back to work. I am a proud member of Boilermakers Local 647.	EOO
38	first off I want to say I am a UNION Boilermaker and am very proud of my job and UNION work. I believe that doing the PolyMet project would be nothing but good for this state and all its residents not to mention the rest of the country that will benefit from it. this project will creat many jobs for people and will be nothing but good in my eyes. this is exactly what we need in this economic times.	EOO
39	It looks like a good project I think it should be built.	EOO
40	What monitoring safeguards will be in place to protect the surrounding lakes?	WR1A
40	I am in full support of this project that PolyMet and Minnesotans are ready to do. I myself am a union electrician, and have not worked in Minnesota for almost 3 years. I am not alone in this, there are thousands of union construction workers laid off (out of work) in Minnesota. And tens of thousands out of work in Minnesota. We need projects/ jobs like this in MN. As well as in the U.S. To many jobs have been shipped overseas. To me the jobs, tax revenue and stimulas of the economy this project would creat is a no-brainer. This project can be done and continued to operate with the enviroment standards held at the level they need to be at. Lets give Minnesotans jobs so they can feed their family. Lets build, create & save jobs in America.	EOO,G1
<b>Sender Last Name:</b> Houdek		<b>Submission ID:</b> 1248
1405	This project will have detrimental effects on the natural resources of the region and its watershed. It is impossible for PolyMet to control the leaching from waste for thousands of years. Minnesota's children and grandchildren should not be burdened with cleaning up a long-term waste site from PolyMet's quick resource extraction scheme.	G7A

20	Ray Howard, I am from West Duluth, and I support PolyMet where it will help our economy, bring in jobs and employ a lot of the people up on the Range. And I just hope they do everything environmentally safe, and that's it.	EOO
<b>Sender Last Name:</b> Howd		<b>Submission ID:</b> 1496
519	Will the sulfide bearing materials exposed and removed from the bottom of the pit be piled on the top of the overburden piles where the leached sulfuric acid can be taken to the watershed and then to Lake Superior?	RFI,WR3D
1793	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I am a property owner in Itasca County and regularly see the environment created by open pit mining I also appreciate the value to the United States in providing iron for steel for our use. Minnesota was a pioneer in protecting the environment through the efforts to protect Lake Superior from taconite tailings which contain asbestos. This took great courage and effort by Minnesotan's who are willing to fight for a healthy environment. Now the PolyMet sulfide mine is again threatening our environment and most politicians and all bussiness leaders chose to ignore the concerns and allow this potentialy dangerous action to proceed.	EOO
1794	At a meeting a few weeks ago for people concerned about the environment the director of the Minnesota Mining organization said "This is only the beginning". The BWCA is a very special place on our planet and God has given us the responsibility to protect it. The current recession is no excuse to compromise the health of Minnesota. It is the responsibility of an elected representative government to look after the safety and health of our people. Our founding Fathers did not give the business owners the right to do what ever they want irespective of the consequences. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	G2
<b>Sender Last Name:</b> Howick		<b>Submission ID:</b> 3600
3871	To whom it may concern: The potential mining by the PolyMet Mining, Inc. in Northern Minnesota poses as a great risk to our natural resources. When considering this project you must take into account the long term effects on the water quality, the biodiversity, and the tourism industry of the BWCA area. As a scientist and a lover of the outdoors I think these effects are not justified by the creation of unsustainable jobs.	EOO
<b>Sender Last Name:</b> Hughes		<b>Submission ID:</b> 3
3	My name is Dave Hughes. I'm in favor of the PolyMet project. I think it's environmentally sound and socially responsible.	EOO
4	I'm Brenda Hughes and I'm in support of the PolyMet project. I think it's good for the economy, and I believe they'll do everything they can to make it environmentally responsible.	EOO
<b>Sender Last Name:</b> Hund		<b>Submission ID:</b> 2931
3274	Some of my favorite memories growin up and in College was spent in the north of Minnesota, which is a gift we North Dakotan's and Minnesotans get to charish. I do not want this precious area that I feel so proud of, to be destroyed. Please say no to the Poly Met mines.	EOO

1	The costs of any long term damage to the environment will likely exceed by many times the value of the copper, nickel, platinum and other minerals extracted. Your decisions and those of other agencies involved must make sure that long term damage to the environment does not occur and that the corporation proposing the mine bears all costs of damage prevention and mitigation and restoration of all resources. The long term advantages must outweigh the long term risks in order for this proposal to be approvable, and there must be strong scientific and factual evidence substantiating the analysis. The DEIS does not provide sufficient evidence to conclude that the long term advantages outweigh the long term risks	G2
2	The sulfide ore that will be brought to the surface will interact with air or moisture to produce sulfuric acid. ANY escape of that acid into the groundwater, surface water, or air will damage the environment.	WR1E,AQ4
3	In general, the technologies proposed to contain, treat, and neutralize contaminants must be proven, tested, and supported with evidence demonstrating that water quality, habitat, human health, and the environment in general will not be impaired. Projections and computer-based models, without real-life demonstration of effectiveness, are insufficient for this purpose, given the risks. Remediation techniques in the proposal are not sufficient to remediate increased acidification, once released into surface water and groundwater. Once the damage is done, it can't be repaired.	WR1E
4	unreliable technologies provide the assurance this proposal surely requires. Consequently, responsibility for monitoring quality of surface water and groundwater must be assigned and must NOT be left to taxpayers and local inhabitants. No loopholes in this responsibility should be allowed. If variances will be allowed, the responsible agencies must be required to provide full public disclosure of variance applications, with adequate time for public comment and filing of objections before agency decisions are made.	WR1A,PD4
5	This brings to light the sight and noise pollution. Can you imagine living with the constant noise of the mining operation and then having the beauty of the pristine forests and lakes disappear forever to be overtaken by ugly huge piles of rock?	EOO,N2
5	Any increase in the acidity of surface waters will increase mercury methylation, leading to increased accumulation of mercury in fish. There are already significant concerns about the amounts of mercury in fish in the lakes and rivers in the area; the Minnesota Department of Health publishes annual consumption advisories restricting the numbers and types of fish that can safely be consumed. Mercury can cause brain damage, especially in the unborn, infants and children. All possible measures must be taken to avoid exacerbating this existing problem. All impacts of increased mercury in the fish usually consumed by local residents and by visitors should be analyzed.	WR4B,FM1
6	The argument that the amount of sulfide is low in the ore proposed to be mined is not sufficient protection—even sulfide content of less than 1% can produce sulfuric acid, which can produce the damages described above.	PD2
7	The DEIS recognizes that the tailings basin would have high sulfate concentrations which will seep into the wetlands nearby and ultimately into lakes and streams. This is unacceptable. Moreover, there are grave concerns about the stability of the tailings basin. A breach of the basin could have catastrophic results from uncontrolled spillage of contaminated liquids. The tailings basin alternative still would result in seepage into the Partridge River, either directly or indirectly, so it, too, is inadequate. The technologies proposed to treat contaminated water and to prevent release of contaminants are insufficient.	EOO,WE6,WE8
8	The project proposes storage of waste rock subaqueously in pits, with permanent liners and cover systems to prevent leaching to the surrounding landscape. Yet liners and cover systems will not last into perpetuity; they will eventually fail and the contaminated water will leach into groundwater and surface water. How long are the linings projected to last? For the entire life of the operation? Is that 20 years? That's certainly not long enough. Dikes and ditches will be built to capture surface run-off, but what about run-off that seeps into groundwater via breaks, fissures, etc? Will these systems—the tailings basin, liners, dikes and ditches be sufficiently strong and stable enough to guarantee against breaks, leaks, overflows, and other damage for centuries? Treatment of contaminated water before discharge is proposed, to minimize adverse effects; this treatment, too, should be required until the risk eliminated, which likely is long after the mine would be closed. Financial guarantee of payment for the costs should be in hand before any work begins.	WR2D,WR31,PD2

Comment ID	Comment Text	Theme Codes
9	Increased acidification of groundwater and aquifers will leach mercury and other minerals into the drinking water used by municipalities and families and individuals, which are likely to produce adverse health effects to people and animals, whether or not they eat fish.	WR4B,AQ4
10	The DEIS predicts that the West Pit will begin leaking/overflowing contaminated water beginning at about year 65—again, long after mine closure. Full analysis is needed of the potential increase in concentrations of cobalt, copper, nickel, arsenic, cobalt, and selenium as well as sulfate, is needed, and adequate protection against leakage and/or overflow must be required. The DEIS states that the overflow “could be mitigated if it would occur.” How can mitigation be effective once the contaminated liquid is flowing through wetlands, streams, rivers and lakes?	WR3A,PD2
11	The project would directly or indirectly affect over 1,500 acres of wetlands, including peatlands. Peatlands are known to be effective in carbon sequestration; impairment of these peatlands would	AQ3
12	Financial assurance needed Post-closure water quality monitoring, treatment, and remediation may be needed for centuries. In some other states, mining companies have gone bankrupt, abandoned mines, or sold out to other companies with the result that the taxpayers are left shouldering the costs of cleanup. If acid mine drainage finds its way into the streams, rivers, lakes, and aquifers, cleanup may be impossible, and at least will take decades or longer. The DEIS must ensure that monitoring, treatment, and remediation/cleanup measures will be taken regardless of any default, bankruptcy, transfer of ownership, or other change in responsible party— and will be the responsibility of the mining company/companies. Financial protection for taxpayers must be fully in place at the outset of permitting so that the mining companies are financially responsible for these measures and to guarantee that none of these costs will fall to the taxpayers.	PD3,PD4
13	Inadequate assessment of land exchange The DEIS presumes that the land exchange with Superior National Forest to consolidate ownership will be successfully completed. It does not adequately evaluate the effect of the land exchange on wetlands, forests, other ecosystems in the area, endangered species, hydrology, and taxpayer interests. This should be done before considering the effects of a project dependent on the land exchange.	PD1
14	Inadequate assessment of socioeconomic considerations The predicted increase in employment, economic benefits to the local economy, and income to state and local government and schools is not sufficiently analyzed. The analysis should include the “boom-andbust” cycle of mining: what will be the effects when the mine closes (its predicted life is 20 years or less)? What mitigation measures should be put into place to clean up the effects of job loss when the mine closes? The economic impacts should be evaluated well beyond the closure of the mine. It is important to consider in this analysis the viability of eco-tourism as an economic engine in the region if environmental damage has occurred. Impacts in areas downstream, including the St. Louis River area and Lake Superior, should be evaluated.	SE3
15	Inadequate assessment of effect on Tribal lands and resources and economic, social, and cultural effects The loss of Tribal access to lands and resources should be fully analyzed, as well as the impact of reduced water quality on Tribal and wild rice harvesting. Cultural impacts as well as economic impacts should be considered. It is not satisfactory that it was “not possible to reach agreement”.	G3,CR1,CR4
16	Inadequate assessment of the "No Action" alternative The alternative of closure and reclamation of the current sites would avoid the environmental and social impacts of the proposed project. The DEIS states that, with this alternative, the economic benefits would not occur. This conclusion takes at most a 20-year view. The economic benefits of No Action should also be evaluated --including the economic benefits of avoiding the environmental damage long past the expected 20-year life of the mine. The comparison should include a comparison of the economic conditions that can be predicted, say, 40 years from now if the Polymet proposal does not go forward with the economic conditions at that same time if the proposal does go forward, the mine closes, the highpaying jobs go away, and the environment has sustained even noticeable long-term damage.	ALT8
17	Cumulative effects are not sufficiently analyzed What are the cumulative effects of the biological consequences of the proposed mine and the remaining closure, remediation and reclamation efforts, and the need for ongoing monitoring and “fixing” of additional problems that emerge in the future? The contamination currently occurring on these sites must be considered in determining cumulative effects. More information is needed on the legacy responsibilities and longer-term mitigation needs.	CR1

18	Other matters Concerns registered by the Environmental Protection Agency and the Bois Forte and Fond du Lac Tribes must be given full consideration and detailed responses.	G15
19	Request for notice of final EIS We request e-mail and postal service mail notice of the final EIS in this matter, according to Minn. Rules 4410.2700, Subpart 3.	RFI
22	The quest of PolyMet sulfide mining is said to bring 400 new jobs for 20 years. What temporary assurance is that in comparison to the economic stability and continual attractiveness as a natural prime wilderness that draws visitors here annually by the thousands?	SE4
1162	PolyMet's sulfide mining seepage will pollute the rivers, streams, lakes, wetlands, eventually Lake Superior, with not only Sulfuric Acid produced when the sulfide rock is exposed to air and water, but also with increased levels of Mercury. Tribal Treaty rights would be imposed upon by the increased mercury, sulfates, and heavy metals levels in their wild rice and other vegetation areas. All wildlife, fish, birds, forests, and yes - human beings - would be subject to the poisoning of water and air. To date, PolyMet has admitted they have no proven proof that present technology exists in terms of safety. Wisconsin has banned sulfite mining for this very reason.	WR1E,WR4A,WR4B,WR4F
2043	Furthermore, PolyMet has offered no financial data to prevent taxpayers from having to pick up costs of failures or pollution caused by sulfide mining.	PD4
2663	For over 60 years, three generations of our family have chosen canoeing/camping summer vacations in the Boundary Waters Area. The groundwater, upon which the permanent residents in NE Minnesota as well as annual tourists are dependent, is now seriously and forever threatened by the sulfide mining industry.	G7
2664	Although the PolyMet mining at Hoyt Lakes would not directly affect the Boundary Waters at present, the result of the EIS could directly determine actions of other mining companies pursuing interests in the Kawishiwi Watershed including the Boundary Waters.	G8C
2665	Minnesota citizens have the right to know all the negative facts which sulfide mining would bring to our state, and these are not sufficiently addressed in the present Draft Environmental Impact Statement.	G8
3869	1. EPA reports sulfide mining is the single largest source of toxic pollution in the U.S. 2. PolyMet mining seepage would pollute all waters flowing into Lake Superior, largest freshwater lake in the world. 3. All waters would poison wildlife, fish, birds, forests, and human life forever. 4. The lake-based economy of NE Minn. would become extinct. Noise and sight pollution from mining operations and large water treatment facilities would be deafening. 5. Vacation Land has put NE Minn. on the map. Sulfide mining would destroy this. 6. Other states have been left with their taxpayers cleaning up the residue after mining has pulled out. A warning to the U.S. and the World. 7. The DEIS has many shortcomings.	G2A,G7A,G11
<b>Sender Last Name:</b> Husman <b>Submission ID:</b> 2153		
2558	I am writing to express my support of the proposed action to construct a mine, build stockpiles, and crush and concentrate ore on the former LTV Steel Mining Company property. Minnesota has a long and rich mining heritage in this part of the state and I would like to see additional mining in the region. As Americans, I feel it is also our responsibility to produce the metals that we consume and Minnesotans would benefit from new mining through jobs and taxes. I believe that mining can be conducted in environmentally friendly ways and that an additional mine in northern Minnesota will not cause significant damage to the environment of the area. I am in favor of the proposed action as listed on page S-8 of the Draft EIS summary paper.	EOO

3853	As a lifelong resident of Northeastern Minnesota and business owner in Duluth, I am writing to express my support for PolyMet Mining's North Met Project. PolyMet's draft environmental impact statement provides a thorough review of the project and its impact. I believe the EIS lays the proper groundwork for developing an environmentally and economically sustainable project, and I support the project one hundred percent. The North Met Project will provide vital metals that we all use every day, using environmentally sound methods. Our air, water and natural resources will be safe. This project will provide thousands of direct and spinoff jobs that will be a major boost to our struggling economy, not to mention the millions in tax dollars that will be generated. The homework has been done; the proof has been provided. This is a project that looks good from every angle. I urge you to move it forward.	EOO
<b>Sender Last Name:</b> Hylton		<b>Submission ID:</b> 3626
3908	This letter is in regards to the proposed open-pit mine in northeastern MN. It is time that everyone realizes our most precious resources are the life sustaining plant communities on the surface of our planet. These complex systems can never be replaced yet we continue to destroy them in the name of progress. We can't afford to lose another acre of forest land. As stated in the Jan/Feb 2010 issue of the MN Volunteer Magazine "It is widely recognized that people have become a geological force in changing while ecosystems" "we must take responsibility for that and realize that our choices in the next decade will determine the forest of the future" Each acre of Mn forest holds an average of 99 metric tons of carbon, protecting forest from development keeps stored carbon from being released into the atmosphere. An open pit mine is going to destroy a large area of forest land and will also end up polluting our waters. Please deny the permits required for this mine MN's environment cannot afford it.	EOO
<b>Sender Last Name:</b> Ibele		<b>Submission ID:</b> 1744
747	PolyMet's plan to use existing mine tailing basins for disposal of its tailings raises a red flag. As demonstrated by the failure of the coal ash slurry retaining basins at Oak Ridge Tenn., such retention structures develop instabilities over time and fail, with disastrous	EOO
1077	environmental damage to air, earth, or waters: 2) be required to post bond of such size that unforeseen health and safety impacts on mine workers will be fully covered. The experience with taconite dust and tailings is a warning that in projects of such size and complexity always contains unpleasant surprises.	PD4
1117	I have these comments on the PolyMet Mining Corp North Met mining project DEIS. There are serious concerns with this proposal. The first is the negative impact on water quality. The proposed project anticipates the use of large volumes of water which, together with leachate from waste rock, form a serious environmental problem. There must be a clear,explicit description of the treatment process which will restore all used water to safe quality standards before release into the natural water system. The anticipated presence of high sulphate concentrations is of particular concern.	WR2G
1118	consequences. Before granting approval for this proposal to proceed PolyMet should 1) be required to demonstrate on a small scale,in the field. under actual conditions,whether it is possible to recover the specified metals without	EOO,WR1E,AQ4

- 1 Franconia Mine. It literally breaks my heart to realize that if this project is approved, it is likely that I will not be able to teach my son to fish in these same beautiful lakes, because as we know, past sulfide mining elsewhere has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Given the rarity of protected forest and lake country in America, and the undeniable preciousness of Minnesota's Superior National Forest and the nearby BWCA, I cannot understand why we would risk potentially catastrophic pollution in exchange for the short-term profits that could be earned from exploiting these lands for their limited mineral resources. I am strongly against this project, and I fear greatly that it will be approved in the end. I ask that every one of the 5 steps cited below be taken to limit to the as much as possible the environmental damage I believe to be unavoidable, and attain every possible assurance that Polynet will pay for the cleanup necessary, and for the economic losses the region's outdoor tourism industry will suffer.
- 2 1) Analyze the land that is going to be exchanged for Superior National Forest land to make this project possible. Make sure that the land swap would protect wetlands, endangered species, hydrology, tribal rights and taxpayers' interests.
- 3 2) As the U.S. EPA suggested, make sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.
- 4 3) Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.
- 5 4) Get better information on existing pollution, the nature of wetlands, endangered species, wild rice stands and other resources that would be affected by the project.
- 6 5) Require the PolyMet Company to show that their waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for hundreds or thousands of years.

- 270 As a resident of Chisholm, Minnesota, I am writing to express my support for the Polymet Mining Corporation project. I am a proud member of my community, have built my career here and have raised my family in this area that has been hit so hard economically in the past 18 months. This Polymet project is vitally important to our region. As a part of an area that has survived the rise and fall of the steel industry many times, I strive to support my local community whenever possible. With that in mind, I have invested my own dollars in the Polymet Mining Corporation, and have encouraged my family, friends and neighbors to do the same. It is my understanding that Polymet will produce the copper, nickel, platinum, gold and cobalt in an environmentally sound manner and generate significant economic activity in this depressed part of Minnesota. In addition, it will provide millions of dollars in local and state taxes that will, in turn, give a boost to our communities and educational systems, while providing employment opportunities to our young adults so they do not have to leave the area. It is my request that you make every effort to see the Polymet Mining Corporation project through to completion.

EOO

- 1232 As a concerned carer for our earth, I must oppose the Polymet project on several grounds. One is that it is not for our people to have jobs, but is to destroy our area for the benefit of China. And already the plant at former LTV spot is teaching sulfates without even being in full production. We deserve. They spoiled land + jobs that are likely only short-term as metals run out.

EOO,G7A

<b>Sender Last Name:</b> Jacobson		<b>Submission ID:</b> 3728
1	The conclusion that there is little risk of sulfate-enhanced mercury methylation in the St. Louis River estuary (4.1-194) is unsubstantiated and should be modified or deleted.	WR4B
1	Conclusions based on sulfate and methylmercury concentrations at sites along the Embarrass River (4.1-126,4.5-21) rest on questionable data and should be modified or deleted	WR1E
2	The water chemistry of area lakes and streams represents a legacy of past iron mining activity with many surface waters enriched with sulfate leaking from old mine pits and tailings basins. A proper sampling of this system could have provided a powerful analog for predicting the methylation effects of additional sulfate discharges. But again, only minimum sampling was done, and nothing conclusive can be drawn from the results.	WR1E
3	The assessment of mercury methylation risks (supporting documents HG01 and HG02) by PolyMet's consultant, Barr Engineering, are scientifically biased and rely on inappropriate models and incorrect assumptions. Rebuttal memos by DNR and PCA staff scientists sharply criticize these documents, and as a result few if any of Barr's conclusions are included in the DEIS. The lack of a balanced and unvarnished assessment of methylation risk in supporting documents weakens the DEIS.	WR4A,WR4B
4	The DEIS does not fully consider the methylation risks posed by sulfate discharges to several key locations: the St. Louis River estuary, the wetland complex north of the tailings basin, hypolimnetic (bottom) waters of the Embarrass chain of lakes, and beaver impoundments along the upper Partridge River. All of these locations represent high-risk situations for sulfate-enhanced mercury methylation.	WR4B,WE8
1350	The stability of the existing LTVSMC tailings basin that PolyMet plans to use for their disposal is a well-recognized concern. Rather than generating a plan that increases the safety margin of the basin, PolyMet concedes that "further design and analysis is needed." o A stability analysis and acceptable basin design should be part of the Draft EIS. o Known deficiencies should be addressed before permitting PolyMet to pile additional waste tailings on top of existing tailings.	GT1
1351	PolyMet should develop and test a plan that increases the safety margin of its planned use of unstable, old tailings basins.	GT1
3332	The Draft EIS states that water from waste rock piles will likely remain contaminated with heavy metals for up to 2,000 years. And yet, after only 65 years, this contaminated water is expected to overflow from the west pit, contaminating nearby water.	WR3A
3333	• Seepage from the tailings pit is expected to create "high risk situations" for mercury methylation in wetlands and lakes downstream.	WR4B,WE8
3334	• PolyMet's proposal to construct a wetland for the purpose of treating contaminated water is unproven. o Previous tests of small-scale treatment wetlands have shown wide seasonal variations in effectiveness. o No-one knows if these wetlands can continue to absorb pollutants over thousands of years. o Full-scale testing should be completed before relying on a wetland to protect high quality watersheds and important wilderness areas in the nearby BWCA W. o PolyMet should propose a different method for treating the water.	WR3L
3335	Polymet should develop a full-scale wetland treatment system and demonstrate its effectiveness over all seasons and for a projected term of years equal to the expected discharge of polluted water from the mine.	WR3L

3120	<p>I am writing to oppose the issuance of any permits to Polymet for the development of a metallic sulfide mine in the Superior National Forest until and unless the issues raised in the DEIS are fully resolved. Also, that the company be required to purchase a bond to cover the potential costs to address any environmental damage done during or in the aftermath of the mining period. The DEIS makes it clear that the proposed mining operation presents too many dangers to our waters, critical habitat areas and other precious resources. They include the following: Water from waste rock piles will be polluted for up to 2,000 years (Table 4.1-45). One analysis in the DEIS predicts that arsenic, cobalt, and selenium will exceed water quality standards. Another analysis predicts cobalt, copper and nickel will exceed water quality standards. Both analyses predict high sulfate concentrations. (4.1-113). “Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent ‘high risk situation for mercury methylation’” (S-9). When mercury is “methylated” it can bioaccumulate, making fish unsafe to eat. PolyMet proposes to construct a wetland to treat contaminated waters. DEIS: effectiveness of constructed wetlands to remove metals has “strong seasonal variability.” Also: “A limited literature review also reveals wide range of variability in the pollutant removal effectiveness of constructed wetlands....” (4.1-112). The proposed wetland would cause the destruction of 1,000 acres of peatlands. This would result in a two percent increase in Minnesota’s overall CO2 emissions. The DEIS acknowledges that “project facilities and operations would result in additional greenhouse gas (GHG) emissions in the Arrowhead region”(S-1 DEIS acknowledges the potential for project to result in a loss of critical habitat for both Canada lynx and gray wolf (federally listed species) . There would also be an increased risk of vehicle strikes for both species. PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials, but the stability of the tailings basin has been a serious concern since the project was first proposed, and has resulted in multiple designs. The DEIS acknowledges the potential for basin structural failure: “The NorthM Tailings Basin and hydrometallurgical residue facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin” (S-10). PolyMet has failed to address the safety issues, indicating instead that “further design and analysis would occur during permitting...” (4.13-2). In addition to the specific findings of the DEIS, it is my understanding that this form of mining has generally occurred in the arid western parts of the country, where there is not the danger to surface waters as there is in NE MN.</p>	EOO,G2C,G4A,G6,G7A,G7

314 I am writing this letter in support of the Polymet Mining's NorthMet Project. There are a few points that I would like to make. First, it is my understanding that Polymet will be a 0 discharge plant in terms of water and thus there will not be any contamination of the local watershed. It is also my understanding that Polymet has spent over 20 million dollars for the EIS in order to provide an environmentally sound project. I have reviewed the summary of the EIS and it would seem to me that the extensive EIS document and the rigorous review that the current regulating agencies have done would suggest that Polymet and the regulating agencies have done their due diligence. I also found two websites that ranked the states in terms of environmental success. Forde.com ranked Minnesota 15th for a "green" state with number one being the best. Scorecard.com ranked Minnesota 43rd in terms of air pollution with number one being the worst. Both of these suggest that Minnesota is a leader in terms of environmental regulations and Polymet will meet the required regulations. I would much prefer to have these raw materials come from a plant that has met the rigorous environmental requirements imposed by Minnesota versus coming from those countries with less stringent requirements. There is a demand for copper and nickel worldwide. One has to wonder that if this plant is not allowed to be built here, where will these minerals come from and what type of environmental controls will it have. Would China or Brazil's environmental regulations be as stringent as our current ones? I doubt it. In addition, the process that Polymet is proposing does not include a smelter which is a source of pollution. What would they have in other parts of the world? I would also like to note that there was a copper mine in the upper peninsula of Michigan that is no longer operating. It is in a very pristine area as it was when it was operating and is still after having been closed for many years. These plants can operate in harmony with nature under the current rules. I know many of the Polymet people that are currently involved in designing the Polymet process and environmental control systems. Like me, they live in Northern Minnesota and are raising families here. Typical of people of this area, they are avid outdoorsmen whether that is fishing, hunting, skiing, or just enjoying the beauty of our area. We are all very conscious of our environment and are good stewards of the environment. It is in their personal best interest to have a clean environment for themselves and their children. The economy of Northern Minnesota has been reliant on one major industry for over 50 years: iron ore. We now have the opportunity to diversify the market with a new industry that is in demand and will be for many years. Polymet alone is projecting over 350 jobs excluding the spin-off jobs. In an area that currently has an unemployment rate of over 10%, these jobs would be a welcome relief to the unemployment. The impact to the local school districts would also be significant through the school trust fund. My company's 33 employees and families would certainly benefit from this plant being built. Given the current state of the Iron Ore industry, we need this new industry to insure jobs now and for our children such as my son and daughter. In closing, we all have to weigh the risks of projects with the rewards. In my view, due to the current rigorous environmental regulations in the State of Minnesota, the environmental risk is very small yet the reward to the state is very large. I strongly encourage you to grant Polymet the permits required to make this project a reality.

1	<p>Although the relationship between sulfate loading and mercury methylation is complex and difficult to model quantitatively, prior mining activity at the NorthMet site and nearby taconite operations have left a legacy of leaking mine pits and tailings basins that could provide a useful analog for predicting effects of future sulfate discharges on mercury methylation. The DEIS and supporting technical memo (HG01) report results from a modest sampling program conducted over a two year period (2006-2007) at 10 sites on the Partridge and Embarrass Rivers and smaller tributaries. Unfortunately this data set is grossly inadequate to assess sulfate effects on methylmercury levels in area surface waters. There are far too few sites to spatially characterize this large and complex drainage system, sampling frequency is too low to properly assess the effects of changing stream discharge on methylmercury and sulfate levels, and the analytical results for total mercury concentrations are nearly useless because of poor (high) detection limits and other analytical problems. Fully half of the 53 samples reported in Table 2 of Technical Memo HG01 report total-mercury levels below detection, which itself varies between 2 and 8 ng/L. Standard and widely used analytical procedures for total-mercury in water provide detection limits in the range of 0.5-1.0 ng/L, which is well below normal surface water concentrations. The lack of reliable numbers for total-mercury means that the %MeHg (the proportion of total-mercury present as methyl) cannot be calculated. %MeHg is a widely accepted and useful metric for the methylation efficiency of the environment, which allows for comparison across sites where total-mercury and other water chemistry variables may range widely (see MPCA response to HG01). The DEIS points out that methylmercury concentrations in the upper Embarrass River are greater in low-sulfate waters above the LTV tailings basin than they are at a downstream site that receives tailings-basin drainage and has higher sulfate (4.1-126, 4.1-133). However, the difference in methylmercury between the two sites is not statistically significant and furthermore cannot be expressed as %MeHg for lack of reliable total-mercury data. Moreover, some of the highest methylmercury concentrations (and %MeHg) are reported from Second Creek, which also has very high sulfate levels from mine drainage (4.1-169, see also DNR response to H001). But basically, the data set for the NorthMet site is far too sparsely populated with reliable numbers to allow for any statistically robust assessment of possible minedrainage effects on methylmercury levels. In all fairness, the DEIS does, point out that additional sampling of area waters is currently being conducted, which may help address the effects of legacy mining and sulfate loading on mercury methylation (4.1-113, 4.1-161, 4.5-1). One final note on mercury monitoring of surface waters is that a sampling plan that focuses solely on water samples is likely to be uninformative (Harris et al. 2007a; Mason et al. 2005). This is because water samples provide only an instantaneous snapshot of environmental conditions, especially in flowing waters where concentrations and fluxes can change quickly. Most mercury monitoring programs today include, and indeed focus on, biotic indicators of ecosystem mercury exposure. Forage-fish, zooplankton, and aquatic insects integrate mercury exposure over meaningful periods of time, yet if properly selected, represent discrete food-web (trophic) positions that are comparable across sample sites and through time. These lowtrophic indicators are also highly correlated with, and predictive of, mercury levels in game-fish and hence of human mercury-exposure risk.</p>	WR1E,WR4A,WR4B,FM2
1	<p>There is little in the DEIS that would mitigate the effects of sulfate discharge on mercury methylation potential. A tailings-basin alternative that would intercept groundwater discharge to a wetland complex along the Embarrass River is likely to be essential, though the flow would ultimately be redirected to the Partridge River, rather than being eliminated. No consideration is given to sulfate-removal alternatives that might reduce sulfate concentrations in discharges to something approaching background (natural) levels.</p>	WR3I,WR4C

718	If you allow this beautiful part of the country be destroyed it will be a sin above all sins. The time set forth is not enough to allow for all that needs to be studied and understood. There should be at least 30 to 45 days extended to allow for such review. There should also be more public meeting in more locations so that all who wish to participate in this matter have a chance. The current schedule you have set forth is limited. There should also be an option for citizens to produce statements and a discussion should be held during the meeting on all presented materials.	PRO6
<b>Sender Last Name:</b> Janson		<b>Submission ID:</b> 3656
1	The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific	PD3
2	mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held in escrow as a damage deposit and that amount should be specific and included in the final EIS.	PD4
3	2. There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting.	WR2A
4	3. The mine site disrupts natural corridors for the movement of wildlife. Specifically the Canada lynx which is a federally-listed threatened species that requires large territories and benefits from undisturbed forest corridors. No provision is made for mitigating this loss of habitat in the DEIS.	WI5
5	4. The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet can not be looked at as a single, one-time event in N.E.	G9
6	5. Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. Do we just depend on the mining company to do its own monitoring? There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR.	PD8
7	6. Sulfates are a problem that are not dealt with rigorously in the DEIS. Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition sulfates react with elemental mercury in a process known as mercury methylation. Methylmercury is the form that bio-accumulates in fish and animals that eat fish, including humans. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for? For me personally, I have enjoyed recreating in the Boundary Waters Canoe Area Wilderness and adjoining Quetico Provincial Park over the past 20 years, and look forward to similar activity for the next 20 or more years. Contamination of these wilderness areas must be prevented to the greatest degree, even beyond what is technologically possible today even if that means Polymets (a.k.a. NorthMets) application to do extractive mining is delayed or denied until such technology exists. Perhaps Polymet (a.k.a. NorthMet) could invest similar effort and monies in recycling waste electronics to recover a similar amount of copper and nickel. Recycling efforts may be more costly now, but the collateral costs of not recycling are becoming astronomically unaffordable for each and every one of us.	WR4B,WR4F,FM1,FM4,A

6	4.2-19 paragraph 2 No one can drink any groundwater from the aquifers contaminated by this mine - virtually forever.	EOO
7	4.2- 26 4.2.3.4 A passive reactive barrier would require undefined periodic replacement of a significant amount of material in addition to other long term maintenance.	EOO
7	4.2-26 paragraph 2 Proposing to capture and treat all process water over the long life of these large project sites is not practical. Expected leakage and failure risks should be incorporated. Modeling basis must be based on actual maximum head testing and hydrogeology.	WE2
7	4.9.1.1 Federal Land Management: A discussion regarding the feasibility for a land exchange between USFS and PolyMet is discussed. This DEIS should not be approved or move forward until such time as the feasibility and legality of this idea be decided. The statement: "This analysis is based on a successful completion of the land exchange and elimination of National Forest lands from the Project" suggests the authors of this DEIS can predict the future. It is impossible for the public to fairly evaluate this DEIS with such speculation.	CPLU3
8	4.2-32 Filtering criteria are not requirements of statute or rules. More detailed justification of criteria used relating to economics is necessary. The choice of 1.1 miles from a ditch and at least 100 contiguous acres appear to be arbitrary . "Anticipated difficulties" is not specific enough for a final EIS / permitting. It can be argued that smaller projects spread over a wider area will provide more benefits (i.e. similar to prairie potholes.)	WE2
9	4.2-33 p3 Again, criteria not required are being used based on perceived costs. Actual costs should be defined for any comparisons.	EOO
10	That brings me to my next concern, which is: what happens to this mercury-rich peat at the mine site when it is dug up and stockpiled? In the RS73B document by Barr 2008 we read that about 1,536 acres of clear cut forest, soil and wetland disruption could occur if the project is approved. All soil sequesters mercury. The inorganic Hg in the peat stockpile has a high potential to mobilize and methylate, thus adding to the methyl mercury burden of the already polluted aquatic system. The stockpile should be capped unless moved within one year. Such mitigation measures are not discussed in the DEIS. The DEIS suggests such a potential major problem with methyl mercury from the mine site. In PolyMet documents under Peatland Disruption we read, "NorthMet mine site would result in a nominally estimated increase of 7-42 % in export of methyl mercury from the watershed". (2) This methyl mercury would be transported down the Partridge River to Colby Lake, both of which already have prohibitively high fish tissue mercury. Is this acceptable to the state and federal agencies involved?	WR4B,WR4C,PD8
11	The atmospheric Hg emissions from the proposed PolyMet mine and processing plant would contain three species of Hg: elemental Hg, ionic Hg and Hg attached to particles. The ionic Hg and Hg attached to particles, which are the most chemically reactive, will be deposited locally and the local wind rose (DEIS Figure 4.6-1) shows that the prevailing winds will deposit those species disproportionately within the Lake Superior watershed. This is not what the Clean Water Act demands for the watershed. The Clean Water Act Section 303 demands the implementation of a mercury TMDL that results in the delisting of waterbodies contaminated for fish tissue mercury. (3)Will the company have to buy "off sets" as defined by the State Mercury Implementation Plan, for any new mercury source?	AQ4,AQ6A

12	<p>Another mercury problem for these waterbodies that are already listed for fish tissue consumption advisories by the Minnesota health department (Colby Lake, the Whitewater reservoir and the St Louis River) is the proposed water level fluctuations, due to drawdown at the Whitewater reservoir. Addressed on page 4.1-176 we see that under the Proposed Action there will be a reduction in flow to the Partridge River of -10.5 cubic feet per second. And that reduction is intermittent and the magnitude varies. According to Figure 4.1-29 70-Year Cumulative Effects on Partridge River Hydrology, these intermittent reductions could result in a maximum drawdown to the Whitewater reservoir leading to as much as 300 feet of exposed sediments on some shorelines. It would also expose sediments in the many beaver ponds on the Partridge River and they are not addressed in the DEIS. Water level fluctuations have been shown to be a major contributor of methyl mercury to the sub-watersheds of the Red River and would do the same thing to the Partridge River and the reservoir in this case. Fluctuating water levels have been identified by the MPCA as putting a waterbody at risk for methylation. This DEIS does not discuss all the reasonable design and operating strategies needed to reduce these draw downs. There needs to be an attempt to schedule the water releases and withdrawals of the three mining operations, one city and one power plant that use this river, to minimize sediment exposure and therefore methylation. If we are going to allow them to use our water, then we have the responsibility to mandate that they use it in such a way that minimizes environmental degradation. That has not been suggested in this DEIS and needs to be addressed before it can be deemed adequate. (4) It needs to be addressed with a serious scientific attempt to quantify mercury methylation from water level fluctuations. That has not been done.</p>	WR4A,WR4B,FM1,FM5
13	<p>There are natural fluctuations in aquatic systems that present high risk for mercury methylation as defined by MPCA (2006). I am referring to spring snow melt and storm events in which the waters rise into wetlands and bring with it a higher than normal load of sulfates. On page 4.1-23 of the DEIS we read that 54% of the Partridge is a Type C channel according to a Level I Rosgen Geomorphic Survey. Type C channels are characterized as having a well developed floodplain. It goes on to say that in general the Partridge River has a well developed floodplain for all but the Type B reaches. Only 13% of the channel is Type B. That means 87% of the Partridge has a well developed floodplain and is at high risk for mercury methylation if the operation delivers the high sulfate waters that are predicted in this document. Currently, sulfate concentrations are often a limiting factor on mercury methylation and therefore on fish tissue mercury throughout Northeastern Minnesota. If sulfate levels increase as a result of these projects, mercury methylation may markedly increase. All of our wetlands are presently contaminated with decades of air borne mercury deposition. Most of them also have high carbon contents. Oxygen fluctuates by season, so the one sulfate reducing bacteria nutrient we can control is the sulfates. The research is clear that there is a sulfate threshold below which bacteria cannot convert inorganic mercury into the dangerous bioaccumulating form known as methyl mercury. That threshold is around 3 mg/l (Barr, 2008) and then it goes up from there. Our waterways are naturally around that threshold. Sometimes they are above it and sometimes below. Adding sulfates would clearly increase fish tissue mercury and that is not acceptable in such high quality watersheds. (8) Is this acceptable to the MPCA?</p>	WR4B
13	<p>Clearly, the statement on page 4.14-9 of the EIS is in error when it says, "Therefore, the NorthMet Project is not expected to contribute to cumulative effects on mercury in water and fish tissue in the Partridge River watershed." On the bottom of the page they make the same erroneous conclusion about the St Louis River watershed, even though they did no Geomorphic Survey of that river. If you survey the St Louis River below the US highway #2 bridge, along the Fond du Lac Reservation boundary, you will find a well developed floodplain all the way down to the Knife Falls Dam. (5)How will the EIS consider sulfate loading to floodplains, reservoirs and the estuary in the down river reaches where the additional sulfate loading will push concentrations towards and above 10 mg/L which is the wild rice standard and also push to levels that support higher rates of methylation?</p>	WR5A

- 13 It just so happens that the area from the Scanlon Dam on down to Lake Superior has the highest recreational use of the entire river. Spearing spawning fish that come up out of the Thompson reservoir is a longstanding local tradition. Jay Cooke State Park boasts a fantastic small mouth bass fishery. Even more important, is the St. Louis River estuary fishery. This estuary is home to world class walleye, muskellunge and sturgeon population. This is where the excess sulfate from PolyMet may have its worst impact and it is not even mentioned in the DEIS let alone analyzed to evaluate cumulative harms to natural resources. This is where sulfate levels are currently low enough so that often the lack of sulfate inhibits the sulfate-reducing bacteria that methylate mercury. This inadequacy of the DEIS must be addressed. Section 303(d) of the Clean Water Act demands that it be addressed. The St. Louis River was listed for mercury impairment in 1998 and it still doesn't have a mercury TMDL. EPA guidelines developed in 1999 show that a TMDL that will bring mercury in the St. Louis River to a level that would allow delisting needs to be done in the next couple of years. I maintain that it is a violation of the Clean Water Act to permit this mining proposal, knowing that the excess sulfate ions are likely to enhance methylation to the point that it would preclude the successful implementation of a mercury TMDL. Permitting of this mine could prevent for decades or even longer, delisting of the St. Louis River, an impaired water body under Section 303(d) of the Clean Water Act. Upon closure of these mines, it is proposed that leachate will be routed through an artificially created and perpetually maintained wetland. The carbon and water and sulfate and mercury in these artificial wetlands may lead to additional methylation of mercury, (Page 4.1-123 of the DEIS) which will further pollute adjacent aquatic systems. We have known since 1985 (Compeau, G.C. and R. Bartha. 1985, "sulfate-reducing bacteria: Principal methylators of mercury in anoxic estuarine sediment", Applied and Environmental Microbiology, Vol 50, Pages 498-502) that carbon and water and sulfate and mercury are the nutrients necessary for the metabolism of the sulfate reducing bacteria that produce methyl mercury. Also according to their own documents in the Executive Summary of RS54/RS56, about water released from the tailings basin, "Sulfate is predicted to exceed the secondary drinking water standard during the operational period and again in about mine Year 60." Any of these proposed mines in water rich environments would be massive sulfate generators. Waste water could be polished in a wetland treatment facility if the high sulfate concentration of both the mine site leachate and tailings basin leachate were first reduced by the use of nanofiltration or a Permeable Reactive Barrier. However, that would require waste water treatment for perpetuity. If that is what is needed to protect this watershed from harmful fish tissue mercury for perpetuity, so be it. (7) Will treatment of waste water for perpetuity be addressed and not just dismissed?

13	All of the watersheds in this part of Minnesota are naturally sulfate poor. This was documented by the highly respected DNR scientist, John B Moyle. He was the first to suspect the now well-documented relationship between sulfate pollution and wild rice decline. Moyle found in DNR Fisheries Report No 69, April 2, 1944, sulfate concentrations of only .3 mg/L in the Partridge River. Even today undisturbed portions of the watershed have low sulfate concentrations. According to the DNR Study of the St Louis River (John Lindgren, Nancy Schuldt) released August 29, 2006, at river mile 171 the St Louis River has a sulfate concentration of only 2 mg/L and "Wild rice dominates this reach". That stretch of river above the confluence of the mining impacted Partridge River was packed with migratory waterfowl this last fall. DNR research, done by Dr. Michael Berndt in 2008, shows that the Mud Hen watershed which is not impacted by mining has only 2.05 mg/L of sulfate. However, sulfate levels in the Embarrass River could climb as high as 63.4 mg/L at closure of the PolyMet operation, according to this DEIS. The St Louis River from river mile 160 on down stream for the next 60 miles has been heavily polluted with sulfates, as have been all the tributaries on the north side of the river. The taconite industry lies to the north of the river. In a DNR report on sulfates in 2008, Mike Berndt found high sulfates from the Partridge river on down. For example, he found 35.38 mg/L of sulfate below the Partridge River, 43.13 mg/L above the East Two River and 37.42 mg/L above the Whiteface River. Where did all this sulfate come from? It came from taconite waste that leaked sulfate into the sub-watersheds. For example, the East Two River went from a sulfate concentration of 5.5 in 1947 to 106.05 mg/L in 2008. The Embarrass River went from .2 in 1947 to 27.37 mg/L in 2008. The Partridge River went from .3 in 1947 to 77.42 mg/L in 2008 and the West Two River went from 1.0 in 1947 to 71.20 mg/L of sulfate pollution in 2008. All of the new sulfate produced in the proposed mine waste heaps, tailings basin, sulfuric acid mist and acid rain, has to go somewhere. Of course, it is headed downstream to river reaches and associated wetlands that are lower in sulfates. In 2008 it appears that sulfate releases associated with mining in this watershed are still significant 100 river miles later. That is correctable and PolyMet can either exacerbate the problem and push the sulfate impact all the way to Lake Superior or improve the situation, depending on how they treat or don't treat their leachate.	EOO,WR1E
13	I, Carla Arneson, support and hereby incorporate by reference all comments submitted by the Tribal cooperating agencies, as set forth in Appendix D to the Draft EIS, and also set forth within footnotes throughout Volume I of the Draft EIS.	G15
14	4.7 Noise: It is stated that the effect of noise on wildlife is reviewed in section 4.4. However, a review of 4.4 reveals a dearth of references to the wealth of science regarding the compelling adverse impact of noise on wildlife and human health. A separate section devoted to this topic should be written and included in the DEIS. The cumulative effects of noise as animals move along corridors over ranges of a few meters to > 100 miles must be considered. (Radle AL. Effect of Noise on Wildlife: A Literature Review. <a href="http://interact.uoregon.edu/MediaLit/wfae/library/articles/radle_effekt_noise_wildlife.pdf">http://interact.uoregon.edu/MediaLit/wfae/library/articles/radle_effekt_noise_wildlife.pdf</a> . The DEIS fails to provide evidence regarding the serious and growing human health effects of noise. Former U.S. Surgeon General William H. Stewart said in 1978: "Noise must be considered a hazard to the health of people everywhere." (Goins L, Hagler L. Noise Pollution: A Modern Plague. S Med J 2007: <a href="http://web.ebscohost.com/ehost/pdf?vid=2&amp;hid=102&amp;sid=72c7f778-d60d-4a16-9a7f-010ec30d90a7%40sessionmgr104">http://web.ebscohost.com/ehost/pdf?vid=2&amp;hid=102&amp;sid=72c7f778-d60d-4a16-9a7f-010ec30d90a7%40sessionmgr104</a> ) Summary: p4.7-9. The use of the word "continuous" is confusing. Does not "discontinuous" noise matter, eg, blasting; 100 ton mine truck traffic; etc? For those people who frequent the environs of the proposed Project for recreation, fishing, hunting, and such activities, the data presented in 4.7 would likely adversely affect their experiences.	N4,N5,N6
14	Two specific waste issues at the tailings basin are as follows. Toxic filter cake sludge from the Dunka Mine site containing copper and nickel was placed in the tailings basin and needs to be addressed in detail by the agencies. The 1992 MPCA Hoyt Lakes inspection report stated it was placed in the southeast corner of the tailings basin. How have the agencies determined in the DEIS that "little evidence remains" and where off site was the sludge taken? Any testing done to determine impacts from the sludge must be included in the revised DEIS evidence.	PD2

Comment ID	Comment Text	Theme Codes
14	The agencies must also address in detail the coal ash (bottom and fly ash) from the Hoyt Lakes and Taconite Harbor operations that was disposed of within the permitted area of the tailings basin, and placed on a base of tailings approximately four feet thick in order to keep the ash above the standing water in the area. Also, ash from the 1993 coal ash pile failure near Taconite Harbor was placed in the tailings basin and must be included in a detailed DEIS accounting . Approximately 1/2 million cubic yards of ash was released from the Taconite Harbor pile; a minimum of 300 cubic yards of ash per day was moved and disposed of in the tailings basin after the spill. What was the total moved there? Once described as "tiny bbs rolling around" by a Minnesota Pollution Control Agency official, ash is notoriously unstable and must be addressed in more detail when located within a tailing basin proposed for reuse.	PD2,GT3
15	The agencies must address in more detail the ash, the sludge from Dunka, and all other materials within the basin permitted area, their impacts to the cumulative toxicity of the basin waste, as well as to the stability of the tailings basin itself. This DEIS does not include all information concerning basin wastes and toxicity, so it does not fully assess impacts. A revised DEIS must do so.	PD8,GT3
15	All water going out of the plant must be tested before it goes to the tailings basin using Toxic Characteristic Leaching Procedure (TCLP) to determine hazardous waste. All water must pass the following testing criteria for hazardous waste: Ignitability, Corrosivity, Reactivity, Oxidizer, Toxicity, Lethality (Minn. Rules Ch. 7045.0131) and must also not be a specifically 'listed' chemical that is automatically a hazardous waste by name. This must be stated in a revised DEIS.	WR1A,PD2
16	When determining hazardous waste at the Plant Site the revised DEIS must take into account reports from the 1992 MPCA inspection of the Hoyt Lakes facility and any other reports of violations. The 1992 report found violations of hazardous waste rules. These included manifest deficiencies, inadequate personnel training, and in two instances, failure to evaluate certain wastes. Such information would raise questions about the validity of historical records and their influence on decisions made for the PolyMet/NorthMet Project.	HM6
17	The Tribal cooperating agencies' position must be implemented concerning hazardous waste as follows; "The hydrometallurgical residue facility would contain the most hazardous waste materials produced by this project that, if released to the environment, would cause serious and long lasting contamination. The unknowns...are a serious data gap and the tribal cooperating agency position is that the analysis should be conducted and included in the DEIS to comply with NEPA and so that the public can review a complete set of possible environmental impacts associated with this project."	PD2,PD5

18	<p>The U.S. Environmental Protection Agency's Design and Evaluation of Tailings Dams (1994) stated, "More recently, concerns have been raised about the stability and environmental performance of tailings dams and impoundments. Stability concerns are raised in part by the use of tailings materials in tailings dams/embankments; to mitigate these concerns, such embankments often rely on a certain amount of controlled seepage to enhance stability, which in turn affects environmental performance." In PolyMet/NorthMet's case, under the current DEIS, there is no viable solution except "No Action". If the "necessity to prevent the pollutant from being discharged" is met, then geotechnical stability of the tailings dam will not be possible to achieve with PolyMet's compounded stability problems. If the tailings dam is allowed to continue to seep for stability reasons and thereby discharge the substantial pollutant amounts listed (as well as unidentified pollutants) than "the necessity to prevent the pollution from being discharged" will not be possible to achieve. Further, disadvantages to tailings impoundments detailed in EPA's Design and Evaluation of Tailings Dams (1994) and credited to Environment Canada 198 are: "difficulty in achieving good flow distribution, difficulty in segregating drainage from uncontaminated areas, difficulty in reclamation (particularly with acid - generating tailings because of the large surface area and materials characteristics), inconsistent treatment performance due to seasonal variations in bio-oxidation efficiency, costly and difficult collection and treatment of seepage through impoundment structures, and potentially serious wind dispersion of fine materials unless the surface is stabilized by revegetation, chemical binders, or rock cover." "Inactive tailings impoundments also are receiving more attention due to the long-term effects of windblown dispersal, ground water contamination, and acid drainage. In many cases, the costs of remediation can be considerable, exceeding the costs of original design and operation of the tailings impoundment." (Design and Evaluation of Tailings Dams) The question must be addressed in a revised DEIS whether the NorthMet Project will be literally covering up a current contamination problem so it does not need to be properly dealt with now. (DEIS 4.1-7): As the LTVSMC Tailings Basin was built up over time, a groundwater mound formed beneath the basin due to seepage from ponds located within the various cells. Surface seeps have been identified on the south, west, and north sides of the Tailings Basin, although the number of seeps and the seepage rate have declined since January 2001 when LTVSMC terminated tailings deposition in the basin. " Now NorthMet is proposing to add millions of tons of waste to an already leaking basin, which will logically increase and surpass previous seepage. "Current groundwater seepage from the LTVSMC Tailings Basin to the north toward the Embarrass River is estimated at approximately 1,795 gpm (Hinck 2009, Personal Communication). This seepage rate exceeds the aquifer flux capacity, resulting in upwelling of as much as approximately 1,600 gpm of groundwater to the surface. This upwelling, in conjunction with the surface seeps, has inundated some wetlands immediately downgradient of the Tailings Basin (DEIS 4.1-7)." "The LTVSMC Tailings Basin, proposed for reuse by PolyMet, was operated from 1953 until it was shutdown in January 2001. The existing Tailings Basin is unlined and the perimeter embankments do not have a clay core or cutoff, which allows for both surface seepage through the embankment and groundwater seepage under the embankment" (DEIS 4.1-29). PolyMet/NorthMet does not propose a liner for the Tailings Basin .</p>	WR1E,GT2

Comment ID	Comment Text	Theme Codes
18	<p>In August of 2009 the USEPA (Re: NorthMet Project — Preliminary Draft Environmental Impact Statement) stated: "In several sections, the Tailings Basin Alternative notes that groundwater will be pumped downgradient from the tailings basin, and recycled back to the tailings basin. In some options, the water will be discharged to the Partridge River – either during operation or post closure. Treatment is mentioned only as a potential option to be assessed later. We have several concerns about the discharge of this water to the Partridge River or to the unnamed creek also mentioned. We recommend that impacts from discharges and mitigation discussions be evaluated as part of this decision-making phase and not deferred to some later discussion outside the NEPA process." The subsequent DEIS contained two Tailings Basin Alternative options. The two options are "Maximum Recycle Option" and "No Recycle Option" which both discharge seepage directly to the Partridge River. All seepage and waste water of concern must be treated or contained, and a plan for doing so must be identified and open to public comment before any permitting is considered. Putting the decision-making phase, in this and other decisions, outside the realm of the NEPA process is a disregard for the EIS process and ultimately lack of respect for the rights of the citizens of the state. The Minnesota Environmental Quality Board, Tailings Basin Design report, 1978, states: "When the water contains a serious pollutant, the tailings dam must be designed to retain water for longer periods until the harmful chemicals have degraded or until the water evaporated. A completely closed system is preferred in all such cases, not only for conservation of water, but as a necessity to prevent the pollutant from being discharged. The seepage water from this type of dam must be controlled, treated, and pumped back to the mill for reuse." Vertical well pumping being proposed must be fully examined for total effectiveness in the revised DEIS. Used at superfund sites, its effectiveness is questionable. The revised DEIS must also be clear that long-term vertical well pumping is being proposed for an indeterminate period of time and likely equates as perpetual treatment.</p>	WR1A,WR2C
19	<p>In the past did Cliffs Erie, or any other party, have stability issues during the construction, filling, and operation of the tailings dam that would be considered accidents by ICOLD standards (A1, A2, or A3)? If so these incidents must be part of the revised DEIS record and included in stability studies of all NorthMet impoundments.</p>	GT1
19	<p>Fractured bedrock must be determined and all impacts dealt with in a revised DEIS. "Aquifer testing in the bedrock has not been performed in the Tailings Basin area, but the bedrock is believed to have a significantly lower hydraulic conductivity than the overlying drift (Barr 2009, Technical Memorandum: Results of Tailings Basin Hydrogeological Investigation)." Again, adding PolyMet tailings to an already leaking Tailings Basin will only increase seepage of pollutants. This must be solved. The agencies must include as part of the revised DEIS a detailed analysis of exactly how adding millions more tons of tailings to the Tailing Basin will improve the seepage of pollutants from the Basin to the groundwater. Kinetic testing is not reality.</p>	GT2

Comment ID	Comment Text	Theme Codes
20	<p>"The single most important criteria for the application of the upstream construction method is that the tailings beach must form a competent foundation for the support of the next dike. Vick (1990) states that as a general rule, the discharge should contain no less than 40 to 60 percent sand . . . Other references state that the determining factor for upstream versus downstream construction is grain-size distribution of the tailings. In addition to grain size tests, Brawner, et al, (1973) suggested that, "If a tractor cannot be operated on the first 100 to 200 feet of beach, the grind is too fine for upstream construction methods." (U.S.EPA Technical Report, Design and Evaluation of Tailings Dams, 1994 ) In addition to tailings gradation, several other factors can limit the applicability of this method. These factors include phreatic surface control, water storage capacity, seismic liquefaction susceptibility and the rate of dam raising. Upstream embankment construction offers few structural measures for control of the phreatic surface within the embankment (U.S.EPA Technical Report, Design and Evaluation of Tailings Dams, 1994)." In the NorthMet Project DEIS Summary it states, "The NorthMet Tailings Basin and hydrometallurgical residue facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin." In 4.13.1.2 it further states, "Geotechnical investigations of this tailings basin (Sitka 1995 &amp; 1997) indicate a significant portion of the peat and clay soils under the dam have the potential to develop instability under certain loading conditions. There are also layers of loose saturated slimes (fine silty tailings) within the LTVSMC stored tailings material that extend from the central portion of Cell 2E northward and connect with the perimeter embankment, which are subject to liquefaction under certain conditions and therefore may create instability of the perimeter dam. In addition, several seeps occur along the toe of the northern and southern embankments." (4.13-2) "Review of the proposed NorthMet Tailings Basin preliminary design (Barr 2009, FTMP) geotechnical stability analysis indicates the perimeter embankments would be stable for unsaturated conditions, but have a low margins of safety for stability for saturated or static liquefaction conditions . Previous studies (Sitka 1995) have showed that slimes close to the dam face and clay beneath the peat in the foundation are the primary reasons for the lower factors of safety. This is a special concern for Cell 2E, the area where the NorthMet tailings would be deposited, as it contains the thickest and most extensive peat in the foundation and has the weak slimes close to the dam face." The contents of the Tailings Basin and its embankments must be examined further concerning liquefaction and catastrophic failure. Liquefaction contributed to the Taconite Harbor, Minnesota ash pile failure and the Kingston ash failure in Tennessee. At Taconite Harbor, in July 1991, "a new dike was constructed along the downhill side of the existing dike at the pile toe, and a grouted seal placed along the bedrock . The water pond at the toe of the pile was cleaned out and deepened to about 20 feet, and pumps were installed at the pond to recycle accumulated water (Sitka Corporation Failure Report)." Yet in July 1993, there was a failure. The Kingston ash pond dike had its annual stability inspection less than a year before it failed in 2008.</p>	GT1,GT2
21	<p>Regardless of the type of dams and the type of materials, dams can and do fail, even when not expected. To begin the NorthMet Project with an acknowledged possibility of failure is hard to fathom; ". . .there is a risk that static liquefaction (fluidizing of the saturated slimes by strain or deformation) could occur and may cause a flow failure along the impoundment perimeter if an event or stress condition triggers the liquefaction (Sitka 1997) DEIS (4.13.3.2). "</p>	GT2
22	<p>Sloughing must be addressed, particularly with the steep sides of the current tailing basin already making it very unstable. Historically Cliffs Erie had great difficulty keeping the basin stable because of sloughing problems, especially after rains. Sloughing, saturation, slumps and liquefaction contributed to the Taconite Harbor and Tennessee failures. These issues must be dealt with now at LTVSMC, not later.</p>	GT2
23	<p>All Tailings Basin issues must be fully solved. To state in the DEIS that "Geotechnical stability will be further analyzed during permitting when final designs will be available" is to circumvent the purpose of the DEIS . All information must be made available for public comment before any permitting is considered. If the information was not available than the DEIS should not have been released.</p>	GT1
23	<p>A Dam Break analysis and risk assessment must be done now, not during permitting. To suggest that the stability answer is to bring the NorthMet Tailings Basin "to within an acceptable margin of safety" by buttressing, as stated in the Tailings Basin Alternative, is high risk at best. Further investigations must happen in a revised DEIS, and not put off until permitting when they are not transparent and not consistent with the federal EIS process.</p>	GT1

24	The Minnesota Environmental Quality Board's Copper, Nickel Study, 1978, Tailings Basin Design, contains valuable information pertinent to this Project. "In the case of a tailings embankment, at least one borehole in the foundation soil should extend to a depth equal to 1.5 times the ultimate embankment height (MEQB Regional Copper Nickel Study, Tailings Basin Design). There was little information concerning test bores done for bedrock determination on the DEIS map, Figure 4.1-5 Depth to Bedrock at Tailings Basin Area. It appeared from the map that only one soil boring was done more than a mile from the tailings basin. 4.1-6 of the DEIS mentioned a Barr 2009, Technical Memorandum: Results of Tailings Basin Hydrogeological Investigation site boring logs but did not indicate where it could be found. Barr documentation must be made available to the public.	PD2,PD5
24	The tribal cooperating agencies' position was, "The structural stability of the tailings basin has been a serious concern since the PolyMet project was first proposed. This concern has led to the development of at least 3 different tailings basin designs that have been presented in various draft documents. Contractors reviewing these designs have expressed serious concerns with both the short-term and the long-term stability of the facility. Tribal cooperators take the position that given the history of design problems, it is irresponsible to postpone a serious analysis of the structural integrity of the latest tailings basin design until the permitting stage. A complete stability analysis must be included in the DEIS to comply with NEPA and so that the public can review a complete set of possible environmental impacts associated with this project." This position must be followed in a revised DEIS.	GT1
25	When considering NorthMet in a revised DEIS, particular attention must be paid to the MEQB Study's concern with winter conditions. "Freezing can affect tailings embankment design in several ways. Spigotting or cycloning operations may be impracticable during the winter, thus preventing raising of the embankment crest during this season. Meanwhile, with continued disposal of tailings into the pond, the pond level will continue to rise. Particularly with embankments constructed by spigotting, the freeboard available at the end of the winter for storage of the spring, snow-melt runoff may be very small, involving a real danger of overtopping or piping failures. This seasonal variation in disposal procedures may also affect the distribution of tailings materials in the pond, winter dumping of tailings at points distant from the embankment sometimes causing the fine 'slimes' fractions to settle near the face of the embankment. Subsequent raising of the embankment crest over these slimes may then lead to instability of the embankment. "	GT1
25	Also in MEQB's study; "A common error is in defining the bedrock surface. Often large boulders occur in the foundation well above the bedrock surface and provide cores that seem to be compatible with bedrock . . . where bedrock is irregular and where large boulders may be overlying the bedrock coring may have to extend 50 feet into rock for high embankments." "Where dams are to be constructed on or near bedrock, surface springs or artesian water can be a danger (MEQB)." Design for tailings dams with high embankments "requires careful and detailed study of the foundation materials, especially if clay, silt, or peat is present . . . soil samples should be tested for in-place density, gradation, shear strength, consolidation, and moisture content (MEQB). " "Organic soils are generally very compressible, have low shear strength, and should be removed from embankment foundations. When saturated or under load, they could act as a lubricant and cause a failure (MEQB)." More information concerning the bedrock and overlying drift under the tailings basin must be available in a revised DEIS. Composition of underlying drift must be clearly determined in relationship to the instability of the tailings basin. "The existing former LTVSMC tailings basin is unlined and was constructed in stages beginning in the 1950's. It was configured as a combination of three adjacent cells, identified as Cell 1E, Cell 2E, and Cell 2W and was developed by first constructing perimeter embankments (starter dams) and placing tailings from the iron-ore process directly on native material (DEIS 3.32) ."	PD2,PD5
26	It is doubtful that the concerns above and others from the Minnesota Environmental Quality Board's Regional Copper Nickel Study, Tailings Basin Design were implemented in the original LTVSMC Tailings Basin design before it was operational in 1953, or subsequently. Thus all possible inadequacies must be determined and solved before any permitting is considered for reuse of a tailings basin that would create an unstable base for the proposed NorthMet's Tailing Basin, with the distinct possibility of catastrophic basin failure throughout the life of the mine.	GT1,GT2

27	I am aware that the Dunka mine was the most polluted site in Minnesota and yet was not reported as such by the agencies. In 1989 it was "strongly recommended" that Dunka be listed on the EPA's 304(L) list. Was the EPA informed of the extent of the Dunka problem when they agreed the MPCA could issue Dunka variances? At one time variances were not given by the Minnesota Pollution Control Agency. If variances are now given because it is not possible to clean up existing mining pollution, then that must be addressed in a revised DEIS. It will directly impact the ability of the agencies to deal with the PolyMet/NorthMet Project in any substantive manner. As long as variances are given there is not a law or regulation that can be unequivocally enforced, so our current mining laws in Minnesota mean little or nothing. When companies know a variance option exists or they can participate in a Voluntary Investigation and Cleanup Program (VIC) there is far less motivation for any meaningful compliance. See DEIS Table 4.1-9. Shutting down until pollution is cleaned up would motivate adherence to regulations.	PD8
28	I strongly suggest the LTVSMC tailings basin must not be used for NorthMet. And the existing site must be cleaned up rather than monitored and inspected	EOO
29	The West Pit will become a toxic lake. The West Pit is equally, if not more, frightening than the instability of the Tailings Basin. The initial sixty-five years of wetting and drying mineralized rock will equate to a pool of acid water. "An important factor of pit lake water quality is the interaction of groundwater with the walls and surrounding host rock of the pit. In an open pit, oxidation reactions on the exposed walls release sulfate, acid, and metals into the lake. Additionally, when a pit is excavated below the regional water table, the aquifer in the host rock is dewatered. The typically sulfide-rich host rock will oxidize when exposed to air that is pulled into the evacuated pore spaces, generating reaction products on the exposed surfaces. As the aquifer recovers following mining, those oxidation products will be flushed into the pit lake by groundwater flowing into the cone of depression. For every acre-foot of water that is replaced with air, sufficient oxygen is introduced to generate 514 mg/L of sulfate, initially as sulfuric acid (Precious Metal Pit Lakes, Controls on Eventual Water Quality, Glenn C. Miller, Ph.D.)." The Cove Pit Lake south of Battle Mountain, Nevada illustrates the potential impact of oxidation reactions in the dewatered aquifer. In 1999, geochemical models predicted the pit water would contain 120 to 260 mg/L of sulfate, primarily from oxidation of the wall rock surface. However, in early 2002, the sulfate concentration in the lake was 1240 mg/L, five to ten times higher than the 1999 prediction. The modeling underpredicted the amount of oxidation by up to one order of magnitude . . . Metal solubility, particularly of divalent problematic metals such as cadmium, nickel, zinc, and copper, is much higher at low acidic pHs and can render poor water quality – a potentially toxic prospect for birds or other wildlife that may attempt to utilize the lake. The Berkley Pit in western Montana, for instance, has essentially no neutralizing capacity; as a result the pH is low and metal loadings are high (Precious Metal Pit Lakes, Controls on Eventual Water Quality, Glenn C. Miller, Ph.D.)." In 1995 at least 342 snow geese landed and died, likely as a result of the toxins in Berkeley Pit. In a revised DEIS the West Pit must be recognized as the potential hot spot that it is and if its potential toxicity cannot be solved, "No Action" is the only responsible choice.	WR2F
30	There have not been adequate decisions made regarding the handling, storage, and seepage issues surrounding the various stockpiles. All the stockpiles will be reactive to some degree, some exceedingly so, and yet the DEIS is again putting off decision making in favor of a "we'll deal with it later approach." These stockpiles are going to be pollution piles.	PD2,PD5
31	Revised DEIS must clearly determine sources of arsenic in the Tailings Basin. Are concerns with arsenic within the tailings basin due to the dumping of fly ash from the Taconite Harbor failure and disposal of ash generated from electrical plants at Hoyt Lake and Taconite Harbor? What is the impact from the use of limestone? When addressing arsenic fugitive dust emissions from the Tailings Basin, as well as treatment of sulfide bearing ore tailings, it must be acknowledged in the revised DEIS that, "Limestone may not be useful in remediating acid mine drainage resulting from weathering of arsenic - sulfides because As release from these minerals increases at higher pH values. Further, mobility of arsenic oxyanions at higher pH values may not be limited by sorption processes because surfaces of oxide/hydroxide minerals are negatively charged. Thus, mining impacted waters treated with limestone to increase pH may be affected by high As concentrations if arsenic-sulfides are present" Oxidation Kinetics of Arsenic-Sulfide Minerals by Regina Tempel.	PD2,AQ1

Comment ID	Comment Text	Theme Codes
32	Also, lime is used to render soils non dispersive. Is this contributing to arsenic levels? Revised DEIS should contain information on uses of lime/limestone, the effects of its use on all toxicity levels, and whether use of lime is being used to increase stability. If being used for stability in conjunction with compaction, a revised DEIS must state under Geotechnical Stability that, "reliance only on good compaction with or without lime modification is a relatively high risk option and is not recommended" (Geotechnical Engineering of Dams by Robin Fell et al) . In 4.6.3.1 of the PDEIS there is a reference to "arsenic emissions associated with fugitive dust from the Tailings Basin." Information such as this has been left out of the DEIS for various reasons and must be included in a revised DEIS because without all toxin information there are skewed and invalid conclusions in a number of areas.	EOO,PD2
33	The tribal cooperating agencies position is that, when considering a permit for PolyMet, all future development by companies already doing exploratory drilling must be included in the analysis of cumulative effects. I would add that an estimation of all possible additional development by mining companies holding large leases must be included in a revised DEIS analysis of possible cumulative effects. Cumulative effects must include cumulative air and water quality effects on lakes and rivers from all sources, including other mines. The EIS may set the standard for all water quality impacts analysis, and good cumulative impacts analysis is critical to protect water quality in the White Iron Chain of Lakes and elsewhere. Of paramount importance when addressing cumulative effects is the enormous amount of electricity that will be generated in the operation of all the projects and the resulting effect on air quality, particularly Class 1 areas already being impacted. This must be fully and transparently addressed in a revised DEIS. Air quality and inhalation is not the only risk concerns involved. Arsenic, nickel and other heavy metals can be deposited in water and soil to enter the food chain. The soil and water itself can be rendered unable to sustain life. Mercury methylation is already an issue in all of our northern waters. When considering cumulative effects the current levels of mercury contamination in all lakes, rivers, and streams that may be impacted by PolyMet/NorthMet must be added to the equation to achieve an accurate assessment of risk. A revised DEIS must also include an indepth analysis of all possible endocrine disruptors and possible impacts. "The Tribal cooperating agency position is that even though cumulative effects to groundwater, vegetation (other than threatened and endangered species), visual and noise effects, hazardous wastes, and cultural resource weren't considered during the initial scoping period, they were identified later in the process and therefore should have been made a part of the cumulative impacts analysis and incorporated into the DEIS. It is the Tribal cooperating agencies position that some mine features (e.g. pit lakes) would become permanent features of the landscape. Therefore post closure impacts should also be included in the analysis. (DEIS 4.14-3)." These Tribal cooperating agency positions much be implemented in a revised DEIS.	WR5A,AQ4B,AQ6A
34	Using wetlands for mitigation and replacing them is an oxymoron. Wetlands that developed over generations cannot be replaced in the short term. DEIS: "impracticable to replace all impacted wetland types with an equivalent area of in - kind wetlands". If wetlands cannot be replaced they should not be used for mediation. An MPCA official at the time of the Dunka Mine contamination wa s quoted as having said, "The MPCA may not allow LTV to use the wetlands as a sponge to soak up the metals." What has changed? Are we sacrificing our wetlands because despite all the research there are no other solutions; or only other solutions that would require mining companies to pay more than they are willing to pay? If wetlands are the only solution, then this needs to be stated clearly in a revised DEIS, so citizens understand the full implications of sulfide mining to our state waters. If not, then other alternatives need to be included in a revised DEIS, regardless of cost to PolyMet. The protection of our water must not be negotiable. The environmental impacts of the project on the 100 mile swamp, an undisturbed and very high quality wetland complex must be top priority in a revised DEIS.	WE2,WE3

35	<p>Low sulfide ore myth "The folks who talk about low sulfide ore content are using the 'game of units' to try to minimize the potential for impacts by the reactive component - sulfide expressed in percentages. While the potential impacts for significant water concentration changes are at water concentration units of parts per billion, or percent changes of 0.000 000 001 % expressed in terms of weight of water . By expressing the concentration of sulfide as a percentage, by weight, in the ore or ore tailings, the values computed are made to appear small, but in reality, they are not insignificant! Try expressing the 'low sulfide ore' concentrations in parts per million of parts per billion, and you will get a better idea of the 'impact potential' for making changes in water concentrations for precipitation percolating through an unprotected pile of waste rock or sulfide ore tailings containing 0.1% sulfide (0.1% = 1/1000 = 1,000/1,000,000 or 1 thousand parts per million!). Consider the following simplified, hypothetical calculation: a sample containing 0.1% sulfide ore was contained in a box of one cubic decimeter in size, was air oxidized, followed by leaching with the same volume of water such that 1% of the sulfide resulted in acid sulfate dissolved. The amount of acid, in water, would be approximately 10 parts per million and the pH of the water would be about 5.0. If 10% of the sulfide leached the water pH would be about 4. (The actual amounts of acid would be higher (by 3x) due to the difference in density between ore and water.) As for impacts, most freshwater aquatic life can not tolerate water pH below 4. And this hypothetical calculation is just for the acid content, and is only the beginning of what happens as the metal content of the ore dissolves in low pH water giving toxic concentrations of heavy metals including aluminum, to aquatic life. The reaction times may be in the range of months to years, depending on amount of air present and volume of water infiltration and transport (Gary Glass, EPA retired, Ph.D. in Chemistry)."</p>	EOO,PD2,FM1
36	<p>Loons and Mercury and Us - A revised DEIS must look at research being done in areas with waters that have similar poor buffering capabilities. The current problems in the Adirondacks would be a place to start. Acid rain and acid mine drainage, despite different dissemination methods, have much the same effect on lakes that have little buffering ability. The Adirondacks started out with mercury advisories for fish consumption. Now many of its lakes contain no fish and scientists are seeing aberrations in the behavior of the loon population, including young who are no longer able to get on the parent loon's back. Consequently experts there are deeply concerned about the effects of methylmercury on humans since it is bioaccumulative. In Minnesota, we have had mercury advisories on the consumption of fish taken from our lakes for many years. One of the consequences of PolyMet/NorthMet, and other proposed projects, will be a significant increase of methylmercury in our waters. In the Adirondacks, ironically most of their problem came from Midwest industrial pollution.</p>	EOO,WI5
37	<p>Comments concerning Agency and Government Responsibility, Transparency of Environmental, Social and Economic Impacts In a 2001 State Master Agreement it was stated, " . . .the DNR will meet with Cliffs Erie and Rainy River Energy Corporation to discuss the status of non - ferrous metallic mining projects in this area and ways to mitigate any development plans that would interfere with non-ferrous metallic minerals mining." Disproportionate funding and support have been given to mining companies by organizations, agencies, and elected officials charged with promoting the economic diversity essential to building a strong economy in northern Minnesota. This needs to be addressed in the economic portion of the revised DEIS . Bringing sulfide mining to the Lake District of northern Minnesota is not only environmentally reprehensible; it is committing eventual economic suicide for the region. PolyMet/NorthMet will set the precedent for other sulfide mining projects on the edge of the Boundary Waters. The beautiful Kawishiwi River area will be decimated by both underground and open pit mines on its shores. Franconia's most lucrative scenario is an open pit mine. Clean up Dunka first. It may be true that no one knew what the outcome of mining in sulfide bearing ore would be when Dunka was permitted, but now it can't be cleaned up and that should be a warning in itself. Dunka looks like an anthill next to NorthMet. Once our waters require perpetual treatment, if treatment is even possible, the sustainable tourist industry will decline along with the fish in our lakes. A property owner on my chain of lakes has already decided to put plans on hold to build and move here. Realtors have buyers who do not want to buy land if they do not own the mineral rights, which doesn't leave them much to choose from; some are just scared away by the idea. The money these people bring to the economy in northern Minnesota is huge and a sustainable source, as long as the area retains what attracts them. As demonstrated by the struggling mining towns on the Range, mining's legacy makes it unlikely that new families and businesses can be attracted to an area with decimated lakes and landscapes. Instead of pouring money into an industry that will significantly damage if not eventually destroy the true wealth of our State, our water, government officials need to pour money into creating jobs compatible with that water.</p>	SE4

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
38	In Minnesota, if we choose sulfide mining over our water, we will have no one to blame but ourselves. However, we will have to answer to those who rely on us to keep the three major watersheds that originate here clean. And the next generation will not thank us for selling their birthright.	G7
39	In 2009 CNN did a piece on Picher, Oklahoma, highlighting the last resident to leave the town. Once a bustling mining town the entire place was basically condemned as one of the most toxic Superfund sites in the nation. The Picher aquifer was shallow and when the aquifer was mined and flooded anoxic leaching occurred. Acid leached from lead sulphate minerals with resulting contamination that, along with collapsing mine shafts, left Picher a ghost town. It is important to note here that the PolyMet/NorthMet proposed on-site subaqueous disposal (Proposed Action and Mine Site Alternative) must be reexamined in a revised DEIS. Subaqueous disposal does not mean that leaching, even severe leaching, cannot occur. This would be especially true of ore stockpiled for an indeterminate period of time. Also some concerns exist about another method that leaching occurs which is galvanic action. Tiny electrical differences between different metals create tiny amounts of electrical current that cause the metals to dissolve. Generally this occurs in damp tightly packed fines such as tailings and does not require oxygen. "The Picher site is a stark reminder of the limits of the federal government's ability to clean up the messes of the industrial age. And it raises questions about whether some Superfund sites have such intractable problems that no amount of money, time and effort will make them safe (Mines and Communities)." NorthMet is being designed for the 100-year flood. In the era of global warming a design for the 100-year flood is not enough. The 500-year flood should be the new standard. A revised DEIS must include a NorthMet tailings basin design based upon the 500-year flood. In order to ensure protection enough freeboard must be provided for this emergency excessive precipitation. As remote as the possibility is in northern Minnesota, the final blow to Picher was a tornado that further contaminated the town with a blanketing of fugitive dust blown from the chat piles. The impact of a repeat blowdown like the one that hit the BWCAW a few years ago is worth considering. Acts of God must be seriously planned for in a revised DEIS.	PD2,G1
40	The words alone in this DEIS are reason for alarm . Minimize, Minimum requirements, Mitigation (definition: make less severe), Could, Reduction, Reduced ("arsenic loadings from the Tailings Basin in closure could be reduced by 20%"), and "Help avoid the need", to mention just a few. Minimize when referring to pollutants is inexact. With a massive amount of waste, the amount of pollution left after being "minimized" could still be massive. This DEIS is incomplete, lacking in adequate science and ways to solve its inherent problems. Another example: "Mercury in the water – Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River to represent 'high risk situations' for mercury methylation. There is some uncertainty as to whether the West Pit overflow would meet Lake Superior mercury standard, but this impact could be mitigated if it would occur (DEIS)." In other words make it less severe, but less severe than what? That is a question that must always be addressed in a revised DEIS.	EOO,PRO3
41	This DEIS is incomplete and must be revised and rewritten so the citizens of the State of Minnesota are fully and clearly informed and can make comments on all the information, not just some of it. This DEIS has dangerous gaps that must be filled, not by the agencies behind closed doors, but in the open so citizens, the tribal cooperating agencies, and NEPA will all be a valid part of the decision making. If this cannot be done then "No Action" is the only responsible action to protect our waters. I would also like to add that I object to citizens being denied the amount of time for comment writing that the EPA requested. Also, comments having to be received by instead of being postmarked on February 3rd further shortened the time for comments. The length of time the citizens of Minnesota were given to try to read, understand the information in the DEIS, and make comments was insufficient and a form of censorship.	PRO6
42	Our agencies are charged with the protection of our state waters. They must do so now. The No Action Alternative is the only choice that protects our waters, but only if it is combined with an ironclad requirement that the existing contamination at the site be cleaned up and no further contamination allowed.	EOO

Comment ID	Comment Text	Theme Codes
44	Referring to the No Action Alternative the DEIS states, "This alternative would avoid the environmental and social impacts associated with the Proposed Action, Mine Site Alternative, and Tailings Basin Alternative; however, the social and economic benefits from the proposed Project (increased employment and economic revenue) would not occur." What about the decreased employment and economic revenue that would occur? When addressing social and economic revenue the revised DEIS must include projected figures for what this area and this state stand to lose when promoting an unsustainable industry for short term profits that results in long term loss (economically and environmentally). When addressing economic benefits a revised DEIS must acknowledge that towns whose livelihood is still dependent on mining are dependent because mining itself has left them with no other options. The DEIS must include projections of economic loss and impacts to the recreation and tourism industry, businesses, homeowners, health and public services, among others. The figures that mining companies use are projections. The precedent has been set.	SE3
45	The agencies must adhere to State Statute. If they had done so, this DEIS would not have been released. In Minnesota water trumps everything else. Minnesota State Statute 116D.04, Environmental Impact Statements, Subd. 6, Prohibitions: "No state action significantly affecting the quality of the environment shall be allowed, nor shall any permit for natural resources management and development be granted, where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state, so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air water, land and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify." The Minnesota Department of Natural Resources (MDNR) must practice what its publication "A Strategic Conservation Agenda 2009-2013 " says: The mission : . . ."to provide for commercial uses of natural resources in a way that creates a sustainable quality of life." "The goals: . . . "Minnesota's water resources and watersheds will be conserved and enhanced" . . ."Our vision for the future includes clean water and plenty of it. Aquatic ecosystems are healthy and sustainable" . . . "Waterways have integrity. Natural characteristics of shorelines, aquifers, and wetlands are protected" . . ."Ground water and other water resources are used in a way that preserves their integrity for future generations." Before an EIS can be issued for PolyMet, the State of Minnesota must clean up all polluted mining sites in the state. If they cannot be cleaned up, the state must not consider a sulfide mine. It is not logical to believe that the much more toxic waste from such a mine can be stopped, or cleaned up after the fact, when faced with the evidence of numerous past failures.	PRO7
46	At its core PolyMet/NorthMet is an unscientific Project. If it were being advanced scientifically it would never be proposed in the most water intensive region possible. It would be done first in an area with little water, then in progressively more wet environments, until scientific evidence could be compiled (including impacts over time) that prove whether it can be done safely. PolyMet's claim to have new technology, when much of the operation is based on old technology, is a publicity smoke screen. It must be clear in a revised DEIS that this 'new technology' is unproven on a mine of this scope in a water rich environment. The citizens of Minnesota need to be informed that they are being asked to be first in line to see if it can be done safely. If it can't, it's too late. If our agencies are unable to take the necessary steps to protect our water, as the release of this seriously flawed and incomplete DEIS indicates, then the answer is a Minnesota Moratorium.	G8B,G12
46	One of the most serious flaws in the DEIS is the proposed Tailings Basin. It is incomprehensible that a seeping, unstable tailings basin at the LTV site is going to become stable and non-polluting by adding millions more tons of mining waste. First of all the agencies must deal with the toxic waste that is already there and clean it up. They must account for all toxic materials deposited within or adjacent to the tailings basin over the life of the basin site and extrapolate resulting toxicity. There must be cumulative effects understood from all toxins that were deposited in or adjacent to the tailings basin and all toxins that will be deposited. Their chemical reactions with each other must be documented. Materials that have been or will be deposited, but are not normally considered toxic, must also be examined in combination with all other materials with which they may combine to achieve toxicity. Degradation information of past and future materials deposited must also be taken into account and made available. It is crucial that a revised DEIS examine all possible cumulative effects and interacting toxic impacts of tailing basin wastes. Only then can a plan be developed for their containment.	HM6,GT1

47	I object to State of Minnesota Revenue being used in any manner to further the planning or permitting for an project which is contrary to and prohibited by federal law, the Weeks Act of March 1, 1911 (Public No. 435 .) The national forest lands that would be destroyed by this project are protected "to secure the maintenance of a perpetual growth of forest." The NorthMet project is contrary to the purpose of the Weeks Act. Quoting Henry S. Graves, forester, US Department of Agriculture Forest Service (issued march 27, 1911) on the purpose of the Weeks Act: "The general purpose of this law is to secure the maintenance of a perpetual growth of forest on the watersheds of navigable streams where such growth will materially aid in preventing floods, in improving low waters, in preventing erosion of steep slopes and the silting up of the river channels, and thereby improve the flow of water for navigation. While the improvement of the flow of navigable streams is the fundamental purpose, other benefits incidental in character but nevertheless important will be kept in view. Among these are (1) protection against disastrous erosion of the soil on mountain slopes and against the destruction of the soil and soil cover by forest fires; (2) preservation of water powers, since, like navigation, they depend for their value upon the evenness of streamflow; (3) preservation of the purity and regularity of flow of the mountain streams, with a view to their use for the water supply of towns and cities; (4) preservation of a timber supply to meet the needs of the industries of the country; (5) preservation of the beauty and tractiveness of the uplands for the recreation and pleasure of the people. " [PUBLIC-NO.435.] [H. R. 11798] "AN ACT To enable any State to cooperate with any other State or States, or with the United States, for the protection of the watersheds of navigable streams, and to appoint a commission for the acquisition of lands for the purpose of conserving the navigability of navigable rivers. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the consent of the Congress of the United States is hereby given to each of the several States of the Union to enter into any agreement or compact, not in conflict with any law of the United States, with any other State or States for the purpose of conserving the forests and the water supply of the States entering into such agreement or compact . . . .SEC. 9. That such acquisition may in any case be conditioned upon the exception and reservation to the owner from whom title passes to the United States of the minerals and of the merchantable timber, or either or any part of them, within or upon such lands at the date of the conveyance, but in every case such exception and reservation and the time within which such timber shall be removed and the rules and regulations under which the cutting and removal of such timber and the mining and removal of such minerals shall be done shall be expressed in the written instrument of conveyance, . . ." (emphasis added)	PRO7
47	4.8 Cultural Resources: Regulatory Framework: It is stated that Cultural Resources management within Federal and State agencies seeks identify cultural resources and balance the need for development with protection. Not included here is an analysis of public opinion in the Arrowhead as to whether the regulatory process is fairly achieving this balance. Development is driven by economic considerations that would likely overshadow the power of those whose goal is to protect Cultural Resources. This DEIS should provide evidence to support conclusions that suggest there are no cumulative effects associated with cultural resources.	G3,CR1,CR2,CR4
48	Characterization of wetland hydrology is sorely lacking and should use the USACOE technical note "Technical Standard for Water-Table Monitoring of Potential Wetland Sites by U.S. Army Corps of Engineers" (see #48 below )	WE2
49	The assumption that all water reaching the entire mine, transport, and processing sites will be contained and treated is ludicrous and without basis. Accurate site characterization, water infiltration rates, and leakage must be accounted for.	WE1
50	Specific Polymet HydroMet Project Draft EIS Wetlands Section 4.2 Comments, sequentially numbered with section and paragraph references. 1) In my judgment the use of words and phrases: "potential, would, non-field analysis, where available, based primarily on signatures presented by aerial photograph, portion of wetland located within the sites, may, would, generally, relatively (with no reference), approximately, believed, modeling, professional judgment, and it is not expected" are not adequate for analysis of the risk of perpetual permanent environmental damage this project represents. Use of these words indicates a project favorable biased choice of language.	EOO
50	A recent Pew report documents the situation of a small but similar recent sulfide mine that has been abandoned:	G4
51	2) 4.2.1.1 Wetlands that are Minnesota Public Waters are supposedly protected regardless of isolated or incidental status. A separate EIS is required before filling or draining of a public water.	WE4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
52	3) 4.2.1.2 Minnesota Public Waters Maps & Lists are conspicuously missing from the list.	WE1
53	4.2-4 and elsewhere the analysis is limited to wetlands on the sites without data supporting this limitation.	WE1
54	4.2.1.4 should list the wetland biome as the most productive type	WE1
54	4.2.2 No mention of the location component of impact. MOU between BWSR & ACOE gives capability of mitigation outside of the same watershed but this does not mean that impact should not be considered!	WE2,WE3
54	The draft DEIS is obligated to provide the burden of proof that the Polymet project holds sufficient value incentive to cover the risks inherent in the project. The unknowns of the DEIS analysis far outweigh the proven risks. In his Thursday Jul 17, 2003 Report To Shareholders On behalf of the Board of Directors, William Murray- President and CEO of Polymet said "The NorthMet project as defined in the 2001 pre-feasibility study did not meet minimum economic criteria required by investors or potential mining partners; essentially caused by low metal prices, a high dilution factor in the mine plan and perceived high technical risk." I do not believe the currently proposed project and Draft Environmental Impact Statement {DEIS} are sufficient to change this conclusion. The volatility of the metals market, the unproven status of overzealously named "safe" sulfide ore mining and the proposed processing along with the undeniable acid mine drainage risks on a geologic time scale lead me to conclude that the Polymet project should not be permitted. We should not recklessly dare to leave this extremely high risk legacy to future Minnesotans for a relatively short term of false gain. I see no possibility that this project will result in a net gain to Minnesota or society as a whole.	G8
55	4.2.2 It seems ludicrous to omit the inevitability of AMD impacts - it is my understanding that there are no sulfide ore mines without AMD to some extent.	WE2
55	4.2.3.1 What about direct and indirect effects off site and in downstream watersheds - inevitable with AMD .	WE2
56	4.2-16 paragraph 2 Is the receiving stream a Minnesota Protected Water? All fish and other life production will be lost to post closure overflow AMD.	WE1
57	4.2-18 paragraph 2 Maintaining flow would increase (not decrease) impacts of AMD. The practice described would not reduce anything from current status. How can you claim a reduction from maintaining very localized existing conditions that are not measured but only inferred from aerial photos and generalized vegetation interpretations ?	WE2
57	4.2-18 paragraph 3 Where does the apparently arbitrary "within 50 feet" limit to indirect impacts come from?	WE2
57	4.2-18 paragraph 1 Real problems will come with post closure leakage/overflow of AMD to the watersheds.	WE2
58	4.2-19 paragraph 2 The first sentence is a fallacy. Polymet "proposes" to capture and treat all water touching any disturbed ground. This is arguably a practical impossibility for a 3,016 acre mine site and 1,000 acre plant site! Where are the numbers? This would require containing every drop by sealing every inch of the entire site while digging a huge open pit . I roughly calculate that this would require handling somewhere around 30 million gallons of water for each inch of rainfall.	EOO
58	4.2-19 paragraph 1 The "belief" that the wetlands are bogs does not make it so. Therefore, one cannot assume hydrological isolation from impacts.	WE1,WE2
59	4.2-19 paragraph 2 Groundwater contamination exists from LTVSMC tailings basin hydrological connection. 4.2-2 paragraph 2	WE2

60	The "no-action" alternative needs to be given fair treatment. Informed and meaningful consideration of alternatives – including the no action alternative – is an integral part of NEPA's statutory scheme. An alternative may not be disregarded merely because it does not offer a complete solution to the problem. The DES provides very little discussion as to the costs and benefits of the no-action alternative relative to other proposals. The no-action alternative is not given sufficient consideration when it is treated as a hands-off alternative. By establishing the purpose and need as providing metals and some general sales benefits, the agency may inappropriately conclude that the no-action alternative should be rejected. To not give the no action alternative adequate consideration is a violation of NEPA.	ALT8
61	4.2-20 paragraph 1 I have a real problem with the BWSR / ACOE MOU which allows mitigation outside of the watershed. It does not follow letter and intent of CWA & ACOE rules. See 33 CFR Part 332.	WE4
61	4.2-19 paragraph 2 The last sentence is an incredible conclusion. It is obvious to me that water not meeting wetland standards flowing into the Partridge river will affect all surface and ground water connected wetlands with very high confidence due to the long time frame.	EOO
62	4.2-20 paragraph 2 Indirect impact in areas beyond the site will assuredly result in huge impacts. This could be better quantified by tracer flow studies. Empirical inferences from dissimilar mining are not acceptable. Monitoring and after the fact detection is not protection and does not meet the Minnesota WCA requirement of mitigation before impact.	WE2,WE3
63	4.2-20 paragraph 2 What requires monitoring during mining and after closing to detect impacts. If not required by law it will not happen. Who pays forever after closure?	WE3
64	4.2-21 paragraph 2 Ore rock and fines will admittedly escape during transportation. Since huge amounts of ore will be transported the indirect impacts to wetlands along the transportation route will be significant.	WE2
64	4.2-21 paragraph 1 Loading and transportation spillage control should be passive and secondary. The amount of ore to be handled is huge and even a small loss percentage will be significant.	EOO
65	4.2-21 paragraph 3 s2 Indirect impacts will occur from processing plant site because runoff, seepage, and infiltration will occur both routinely and during extreme weather events.	WE2
66	4.2-21 paragraph 3 Collection of "essentially" all of the seepage to surface and ground water from the plant site is not practical. Significant indirect impacts will occur from seepage to surface and ground water.	WE2
67	4.2-21 paragraph 4 s2, 4.2-22 pl Estimates are not adequate. Impacts estimated from dissimilar use are not an adequate basis for an EIS / permitting. Modeling is not definitive. Actual hydrogeology should be determined. Actual maximum head dye tracer testing that includes the entire watershed should be required.	WE2
67	4.2-22 paragraph 2 Assumption of the evaluation boundary is not adequate.	EOO
67	The "Platsol" extraction process has never been operated on an industrial mine scale. Sulfide ore mining benefits do not justify the risks in Minnesota. There has never been a sulfide ore mine that has not created acid mine drainage environmental damage. According to the U S EPA, acid mine drainage is the biggest toxic pollution problem in the US. The reality is that "total recovery of all sulfides is not achievable, so that the remaining wastes may nevertheless be acid-generating." (WISCONSIN DEPARTMENT OF NATURAL RESOURCES BUREAU OF SOLID & HAZARDOUS WASTE MANAGEMENT JULY 1995 Updated October, 1997 ) Common sense and experience support the conclusion that foolproof containment systems are not possible, especially when there is no time limit to the risk.	G7A
67	4.2-23 paragraph 2 Modeling is not definitive, especially when the basis of modeling is flawed or incomplete.	EOO
67	4.2-23 paragraph 2 Use of the site should require cleanup of past degradation to meet groundwater MCL as a minimum baseline (cumulative effects.)	WE5

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
67	4.2-23 paragraph 1 Trends and boundaries of degraded groundwater should be definitively established. Offsite contamination should be delineated and documented as a definitive baseline.	WE2
68	4.2-24 paragraph 1 Again, modeling basis is not adequate to infer water quality will meet wetland standards.	WE2
69	4.2-24 paragraph 2 Monitoring of wetlands after the fact is not adequate. Pre-permit monitoring and dye testing during project maximum head conditions should be conducted.	WE3
69	4.2-24 paragraph 3 & 4, 4.2-25 paragraph 1 & 2 Significant testing, definition of hydrogeology, and wetland typing based on defined hydrogeology are necessary to define the extent of wetland impacts to accomplish proper mitigation before approval of an EIS, permitting, and project commencement.	WE1,WE2,WE3
70	4.2-27 4.2.4.1 The no action alternative would avoid wetland impacts.	EOO
71	4.2-28 paragraph 4 4.2.4.2 Mitigation in an adjacent watershed means in one of the 81 Minnesota watersheds directly adjacent to the site. The functions of a wetland include it's benefit to the watershed it is in. Moving function out of one of the 81 defined watersheds meets the threshold of environmental harm.	WE3
72	The effects of changing climate have not been considered. A change in condition of the waste from a water isolated condition to a washed or dry condition or an increase in severe storm physical degradation and water table variations have not been considered.	EOO,WR5A,AQ3
73	4.2-28 paragraph 4 4.2.4.2 More information is required to justify out of watershed mitigation: 19598 Federal Register / Vol . 73, No . 70 / Thursday, April 10, 2008 / Rules and Regulations	WE3
74	4.2-28 p4 4.2.4.2 There is no mention of the watershed plan required by federal EPA/ACOE rules: 19610 Federal Register / Vol. 73, No . 70 / Thursday, April 10, 2008 / Rules and Regulations "District engineers will determine whether an existing watershed plan is appropriate for use in determining compensatory mitigation requirements (see § 332.3(c)(1) [§ 230.93(c)(1)]). In general, watershed plans will be developed by governmental and/or nonprofit resource planners, in consultation with watershed stakeholders. The purpose of a watershed plan is to maintain and improve the quality and quantity of aquatic resources within a watershed, not to facilitate development. District engineers will ensure that watershed plans used to determine compensatory mitigation requirements for DA permits have been developed through appropriate processes to satisfy this purpose."	WE3
75	4.2-28 p4 4.2.4.2 33 CFR PART 332 COMPENSATORY MITIGATION FOR LOSSES OF AQUATIC RESOURCES Authority: 33 U .S.C. 401 et seq. ; 33 U .S.C. 1344; and Pub. L. 108-136. Source: 73 FR 19670, Apr. 10, 2008, unless otherwise noted. "(3) Compensatory mitigation for unavoidable impacts may be required to ensure that an activity requiring a section 404 permit complies with the Section 404(b)(1) Guidelines. During the 404(b)(1) Guidelines compliance analysis, the district engineer may determine that a DA permit for the proposed activity cannot be issued because of the lack of appropriate and practicable compensatory mitigation options."	WE3,WE4

76	<p>33 CFR PART 332 COMPENSATORY MITIGATION FOR LOSSES OF AQUATIC RESOURCES Authority: 33 U.S.C. 401 et seq . ; 33 U.S.C. 1344; and Pub. L. 108-136. Source: 73 FR 19670, Apr. 10, 2008, unless otherwise noted. § 332.3 General compensatory mitigation requirements. (b) Type and location of compensatory mitigation. "(1) When considering options for successfully providing the required compensatory mitigation, the district engineer shall consider the type and location options in the order presented in paragraphs (b)(2) through (b)(6) of this section. In general, the required compensatory mitigation should be located within the same watershed as the impact site, and should be located where it is most likely to successfully replace lost functions and services, taking into account such watershed scale features as aquatic habitat diversity, habitat connectivity, relationships to hydrologic sources (including the availability of water rights), trends in land use, ecological benefits, and compatibility with adjacent land uses. When compensating for impacts to marine resources, the location of the compensatory mitigation site should be chosen to replace lost functions and services within the same marine ecological system (e.g., reef complex, littoral drift cell). Compensation for impacts to aquatic resources in coastal watersheds (watersheds that include a tidal water body) should also be located in a coastal watershed where practicable. Compensatory mitigation projects should not be located where they will increase risks to aviation by attracting wildlife to areas where aircraft-wildlife strikes may occur (e.g., near airports)."</p>	WE3,WE4

76	4.2-28 p4 4.2.4.2 33 CFR PART 332 COMPENSATORY MITIGATION FOR LOSSES OF AQUATIC RESOURCES Authority: 33 U.S.C. 401 et seq.; 33 U.S.C. 1344; and Pub. L. 108-136. Source: 73 FR 19670, Apr. 10, 2008, unless otherwise noted. § 332.3 General compensatory mitigation requirements. "(c) Watershed approach to compensatory mitigation. (1) The district engineer must use a watershed approach to establish compensatory mitigation requirements in DA permits to the extent appropriate and practicable. Where a watershed plan is available, the district engineer will determine whether the plan is appropriate for use in the watershed approach for compensatory mitigation. In cases where the district engineer determines that an appropriate watershed plan is available, the watershed approach should be based on that plan. Where no such plan is available, the watershed approach should be based on information provided by the project sponsor or available from other sources. The ultimate goal of a watershed approach is to maintain and improve the quality and quantity of aquatic resources within watersheds through strategic selection of compensatory mitigation sites. (2) Considerations. (i) A watershed approach to compensatory mitigation considers the importance of landscape position and resource type of compensatory mitigation projects for the sustainability of aquatic resource functions within the watershed. Such an approach considers how the types and locations of compensatory mitigation projects will provide the desired aquatic resource functions, and will continue to function over time in a changing landscape. It also considers the habitat requirements of important species, habitat loss or conversion trends, sources of watershed impairment, and current development trends, as well as the requirements of other regulatory and non-regulatory programs that affect the watershed, such as storm water management or habitat conservation programs. It includes the protection and maintenance of terrestrial resources, such as nonwetland riparian areas and uplands, when those resources contribute to or improve the overall ecological functioning of aquatic resources in the watershed. Compensatory mitigation requirements determined through the watershed approach should not focus exclusively on specific functions (e.g., water quality or habitat for certain species), but should provide, where practicable, the suite of functions typically provided by the affected aquatic resource. ii) Locational factors (e.g., hydrology, surrounding land use) are important to the success of compensatory mitigation for impacted habitat functions and may lead to siting of such mitigation away from the project area. However, consideration should also be given to functions and services (e.g., water quality, flood control, shoreline protection) that will likely need to be addressed at or near the areas impacted by the permitted impacts. iii) A watershed approach may include on-site compensatory mitigation, off-site compensatory mitigation (including mitigation banks or in-lieu fee programs), or a combination of on-site and off-site compensatory mitigation. (iv) A watershed approach to compensatory mitigation should include, to the extent practicable, inventories of historic and existing aquatic resources, including identification of degraded aquatic resources, and identification of immediate and long-term aquatic resource needs within watersheds that can be met through permittee-responsible mitigation projects, mitigation banks, or in-lieu fee programs. Planning efforts should identify and prioritize aquatic resource restoration, establishment, and enhancement activities, and preservation of existing aquatic resources that are important for maintaining or improving ecological functions of the watershed. The identification and prioritization of resource needs should be as specific as possible, to enhance the usefulness of the approach in determining compensatory mitigation requirements. (	WE3,WE4

76	4.2-28 p4 4.2.4.2 33 CFR PART 332 COMPENSATORY MITIGATION FOR LOSSES OF AQUATIC RESOURCES Authority: 33 U.S.C. 401 et seq.; 33 U.S.C. 1344; and Pub. L. 108—136. Source: 73 FR 19670, Apr. 10, 2008, unless otherwise noted. § 332.3 General compensatory mitigation requirements. (d) Site selection. (1) The compensatory mitigation project site must be ecologically suitable for providing the desired aquatic resource functions. In determining the ecological suitability of the compensatory mitigation project site, the district engineer must consider, to the extent practicable, the following factors: (i) Hydrological conditions, soil characteristics, and other physical and chemical characteristics; (ii) Watershed-scale features, such as aquatic habitat diversity, habitat connectivity, and other landscape scale functions; (iii) The size and location of the compensatory mitigation site relative to hydrologic sources (including the availability of water rights) and other ecological features; (iv) Compatibility with adjacent land uses and watershed management plans; (v) Reasonably foreseeable effects the compensatory mitigation project will have on ecologically important aquatic or terrestrial resources (e.g., shallow sub-tidal habitat, mature forests), cultural sites, or habitat for federally- or state-listed threatened and endangered species; and (vi) Other relevant factors including, but not limited to, development trends, anticipated land use changes, habitat status and trends, the relative locations of the impact and mitigation sites in the stream network, local or regional goals for the restoration or protection of particular habitat types or functions (e.g., re-establishment of habitat corridors or habitat for species of concern), water quality goals, floodplain management goals, and the relative potential for chemical contamination of the aquatic resources. (2) District engineers may require on-site, off-site, or a combination of on-site and off-site compensatory mitigation to replace permitted losses of aquatic resource functions and services. (3) Applicants should propose compensation sites adjacent to existing aquatic resources or where aquatic resources previously existed.	WE3,WE4
77	44) 4.2-28 4.2.4.2 Preservation of wetlands for mitigation does not meet the no net loss intent of the Minnesota Wetlands Conservation Act. Preserved wetlands already exist and the destruction mitigated is a loss with no replacement of function. Minnesota has decided to protect wetlands based on their functional value (MN 103B.3355) while allowing destructive activities where avoidance of activity is not feasible and prudent (MN 103A .201 Subd. 2 b.) The Board of Water and Soil Resources (BWSR) derives its authority from MN 1038.3355 (c) The first value of the public values listed in statute for wetlands is water quality. (MN 1036.3355 (a) (1) ) Many of our waters are impaired. Some are impaired as a result of the destruction of sentially all of the wetlands in a watershed. The destruction of wetlands in our watersheds, overall loss in quantity and quality of our waters and wetlands are consequences of development that we need not and should not easily accept.	WE3,WE4
78	4.2-30 Wetland Mitigation Study Limits — Due to the enhanced benefits to the sub watershed the second priority should be within the Partridge River and other adjacent sub-watersheds.	WE3
86	The DEIS does not address the recreational value of the arrowhead region and the potential loss of that value that sulfide mining would impose. It should.	SE4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
87	4.10 Socioeconomics: The major and growing contribution to the Arrowhead region in MN of tourism is not presented in this section and should be so that a more complete view of the economy of this region may be understood. Tourism contributes \$11 billion to MN economy, with >41 million visitors annually. These numbers have increased steadily in recent years. The Northeastern region has 16% of the >41 million visitors or about 6.56 million visitors with generation of >\$719 million in Gross Sales. This activity contributes 17,932 private sector jobs. (Explore Tourism 2008: <a href="http://www.tourismroi.com/Content_Attachments/26124/File_6334_80214451131154.pdf">http://www.tourismroi.com/Content_Attachments/26124/File_6334_80214451131154.pdf</a> . A critical question not addressed in the DEIS is the extent to which current and proposed major increase in mining in the region will increase, have no effect or decrease tourism to the Arrowhead of MN. This DEIS needs to address this critical question with data. To focus on short-term financial gain from sulfide mining and not incorporate long-term consequences, including the predictable “boom” and “bust” mining cycles, in the DEIS analyses is a major deficiency of this DEIS. Potential depression of the tourism industry and land values in the Arrowhead, would have a devastating adverse effect on the entire region for decades to come. (Thomas M. Power (Economics Dept., University of Montana: “The Economic Role of Metal Mining in MN: Past, Present, and Future” prepared for MN Center for Environmental Advocacy and the Sierra Club, 2007.; <a href="http://www.sosbluewater.org/mn_mining_economics_power.pdf">http://www.sosbluewater.org/mn_mining_economics_power.pdf</a> .) Unfortunately, a study funded by industry (Labovitz School of Business, Duluth) failed to incorporate destabilizing boom and bust cycles and adverse impacts on the growing tourism industry in their narrowly focused analysis. ( <a href="http://www.ironrangeresources.org/_site_components/documents/user/aboutreports-publications230.pdf">http://www.ironrangeresources.org/_site_components/documents/user/aboutreports-publications230.pdf</a> .)	EOO,SE3,SE4
88	4.10.2: Impact Criteria: This sections fails to include explicit review of the “boom” and “bust” cycles of mining (as noted above) that are extensively documented in the literature and relevant to the DEIS Northmet.	SE3
89	4.10.3: Socioeconomic Consequences: Impact Analysis for Planning (IMPLAN) was based on old data that does not reflect the current fiscal crisis. What impact will this have on estimating the “boom” and “bust” predictable cycles of the proposed mining?	SE8
90	4.10.3.1: Proposed Action: Environmental Justice: What assumptions are being made to support the statement that: “Therefore the Proposed Action would not have disproportionately high or adverse effects on minority populations?” While it is suggested that the proposed “boom” resulting from the proposed mining would benefit low income persons, isn’t it logical to assume that the “bust” that could occur at any time during the proposed 20 year operation of the mine would have a deleterious impact on low income families—potentially a devastating impact on persons who lack safety nets of community support?	SE2
91	4.10.4: Cumulative Effects: Note is made that the data in Tables 4.10-15-16 do not appear to be based on the recent, unique fiscal situation in the U.S. and MN. Also note that neither this section nor the section “Socioeconomics” p S14 (Summary) reflect on compelling data regarding the “Boom” and “Bust Cycles”, an issue of critical importance to the integrity of the Draft EIS Northmet as reflected by Thomas M. Power (Economics Dept., University of Montana: “The Economic Role of Metal Mining in MN: Past, Present, and Future” prepared for MN Center for Environmental Advocacy and the Sierra Club, 2007.; <a href="http://www.sosbluewater.org/mn_mining_economics_power.pdf">http://www.sosbluewater.org/mn_mining_economics_power.pdf</a> )	EOO
590	Blasting and explosive detonations produce nitric oxide and nitric dioxide as a by product. When inhaled, these cause irritation of the trachea which leads to increased risk of infection and/or emphysema. This health issue is not addressed. Mining may also cause inhalation of silica dust and/or iron oxide particles causing siderosis. This health issue is not addressed. Because of Minnesota’s experience with increased incidence of mesothelioma among miners and their families and the state government’s current studies, perhaps these health problems will be addressed. Results and recommendations of the studies should precede further sulfide mining. At a minimum these potential problems should be included in the EIS.	SE5,AQ4C,AQ6
591	In addressing air pollution problems the DEIS cited data from the Hibbing Monitoring station. Why is data from the Ely station not included? Wind patterns will affect that area for the months of April through September. (University of Minnesota: <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> .)	AQ4
593	3) Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	WR4B,FM1,AQ6A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
595	4.6: Air Quality: (See 4.6.4.7 re Haze) Even in MN's two Class I areas (BWCAW and Voyageurs NP), visibility impairment is being quantified. New construction and development, including mining companies on the Iron Range, threaten to add to the problem. Global sources of air pollutants are increasing. The projected added air pollution from the proposed activities in this DEIS and subsequent proposed sulfide mining must be evaluated in the context of such changes. Fine particles (which have serious human and environmental adverse effects) will clearly be generated from multiple sources associated with this Project including forest disruption, soil erosion, road building, mining, vehicular traffic, etc.	AQ4B,AQ9
596	4.6.1.1 Existing Conditions: Regional Climate and Meteorology: Surface data are reported from the Hibbing Monitoring Station with estimates of the wind direction, etc. Why aren't other closer monitoring data provided. For example, wind roses for MN and surrounding cities ( <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> ) provide data from Ely, MN Municipal Airport. Since one of the major wilderness areas in the U.S. and MN is near Ely (BWCA) it would be imperative to know what impact Northmet Project will have on air quality of the BWCA, which is already suffering from degradation of ambient air quality from power plant and other point sources. While wind roses for Hibbing show a north north west through west-northwest direction 25% of the year and south-southeast through southeast 15% of the year, Ely shows a pattern of west westsouth for the months of April through September. (University of Minnesota: <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> .) Thus, the BWCA which is only 34km or 21 mi from the Project Site would receive winds from the Polymet Project Site for several months of the year. To what extent will this add to the worrisome burden currently being experienced by Class 1 areas BWCA and Voyageurs NP? At BWCA, visibility impairments have been documented for 200 days in a recent year. Has the potential impact of the Northmet Project on BWCA been quantified as part of this DEIS? Has the potential impacts of other mining activities between the Northmet Project Site and the Franconia; Duluth Metals; Encampment and Tech Cominco projected mining sites been quantified as part of this DEIS? These are critical data that must be included in the Final EIS.	AQ4,AQ4B,AQ9
597	4.6.1.2 Local and Regional Air Quality: On p 4.6-2 it is noted that "ambient monitoring data from the closest monitoring stations to the Project are provided in Table 4.6.2." It is not clear where the "nearest monitor" to the Northmet Project Site was; the data are from MPCA 2008 but the monitor source is not listed. If the data in Table 4.6-2 are from a remote monitoring site, the Northmet Project should request relevant data from MPCA for the Site environs. Also, note is made that the MPCA data was for 2004-06. These data are out of date and should be updated to ensure reliable baseline data are available from the Site.	AQ5
598	4.6.1.4 Minnesota Standards of Performance: on p 4.6-6 the first point, the statement "that facilities are required to take reasonable precautions to prevent the discharge of visible fugitive emissions beyond the property line" raises serious concern for the following reasons: Particulate Matter (PM) especially, PM 2.5 micrometers is invisible so one would not expect to see it. Yet these fine particles pose threats, not only to the environment, but to human health. Fine particles are a known cause of cardiovascular disease (heart attacks; strokes); respiratory disease (asthma, COPD) and cancer, particularly, lung cancer. (Department of Health and Human Services: <a href="http://www.atsdr.cdc.gov/general/theair.html">http://www.atsdr.cdc.gov/general/theair.html</a> ). The language in this DEIS should be revised to reflect the above. Finally, vehicular traffic and exhaust adds fine particles and other air toxicants to ambient air. Have estimates been made of the contributions to fine particle pollution over the life of the proposed Project?	AQ6

599	4.6.3.1 Proposed Action (Criteria Pollutants): The assessments of human toxicity from exposure to chemicals used at the Mine Site (Table 4.6-17) need to consider the lung health of workers at the time of their employment. Preexisting respiratory diseases may be exacerbated by exposure to chemicals included in this table. Of great importance is the documentation of cigarette smoking status of workers since some chemicals on this list are mutagens or carcinogens. In general, combined exposure to inhaled chemicals and cigarette smoke may increase the likelihood of development of lung cancer. The Northmet Project should have ready access to state- of- the -art smoking cessation program, including a Quit Line to support workers' smoking cessation. (these resources may be obtained from the MN Department of Health) In addition to the above threats to human health, the mining activities, miners but protect from inhaling fine particles of hard rock dust. Lung neoplasms have been associated with mining and are markedly increased in tobacco smokers. There are concerns about the risk of mesothelioma among hard rock miners: (Univ. MN: <a href="http://taconiteworkers.umn.edu/about/study_goals.html">http://taconiteworkers.umn.edu/about/study_goals.html</a> . Lemen RA, et al. Epidemiology of Asbestosis-Related diseases. <i>Envir Health Persp.</i> , 1980: <a href="http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1568524/pdf/envhpe_r00470-0008.pdf">http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1568524/pdf/envhpe_r00470-0008.pdf</a> )	AQ4,AQ4C,AQ6
600	4.6.4.5 Cumulative Mercury Emissions. As noted above, the projected hard-rock mining operations of Franconia; Duluth Metals; Encampment and Tech Cominco must be included in this analysis and Table 4.6-22.	AQ4B
601	4.6.4.7 Summary of 2006 Visibility Class I Study Scope (Updated 2009): Regional Haze and Visibility Impairment. : On p 4.6-50 a table of projects and actions are presented. Again, this table needs to include all "foreseeable" projects that will adversely impact the air quality of northeastern MN, including Franconia; Duluth Metals; Encampment; and Tech Cominco projects.	AQ4B
1129	4.2 Wetlands: It would seem reasonable that "non-field" and field analyses be used to determine wetland locations unless there are scientific data that confirm that "non-field" analyses provide as much information as "non-field" plus "field" review. This DEIS states that only "non-field" analyses were used. Why? 4.2.1.2 Wetland Delineation: Since wetlands in MN are protected by both federal and state laws, it would seem critical that precise definitions of wetlands, including their characteristics be included in the Draft EIS. This is especially true in light of the fact that 70% of the wetlands are "high quality." (p4.2-25) 4.2.1.3 ; 4.2.1.4; Wetland Classification System: The question is whether the Wetland Classification System Descriptors (see Table 4.2.1 and 4.2-2) may be ascertained by only "non-field" analyses or whether a more accurate description would result from both non-field and field assessments as noted above.	WE1
1130	4.2.3.1: Proposed Action: Potential Indirect Wetland Impacts: It is not clear in the DEIS that robust methodology exist to quantify the changes in surface or groundwater flow rates and patterns needed to project wetland impacts from the Project. What specific methodologies have been used and have they been validated?	WE2
1131	4.2.4.3: Monitoring: A wetland monitoring plan is not included in the DEIS. But such a plan "should" be implemented. Such a plan has apparently been initiated by Barr 2005 and "may need to be expanded." Several features of this plan are suggested (p4.2-37). Since wetland monitoring is arguably the most important element of the Project's role in ensuring minimum harm to wetlands, it would seem critical that this plan be included in the EIS. This deficiency should be corrected.	WE3

Comment ID	Comment Text	Theme Codes
1192	4.4 Wildlife; The fact that numerous species are deemed fragile in MN: federally and state listed endangered, threatened, and species of special concern (ETSC—7species); MN Species of Greatest Conservation Need (SGCN-58 species); the USFS Regional Foresters Sensitive Species (RFSS—23 species), indicates that, while conservation and environmental policies in northern MN have merit, there are major threats to this region from human activities, including mining, proposed sulfide mining and logging and industrial development. It is in this context that this DEIS must be viewed with the plausible likelihood that the Northmet Project will only add to these environmental burdens and threats to wildlife. I found no evidence in the DEIS that the proposed Northmet Site was monitored over time for evidence of the species noted above. This deficiency should be corrected. Canada Lynx: on p4.4-3 it is stated that “.portions of the Mine site lie within the revised boundaries of federally designated lynx critical habitat. A recovery plan has not yet been issued for the Canada Lynx.” Will specific responsibilities for the Northmet Project regarding protecting Lynx habitat be included in the final EIS? Has PolyMet physically inspected the proposed Project site for lynx dens? Under NEPA and CEQ regulations, cumulative effects must be evaluated for project proposals, including alternative proposals, along with direct effects and indirect effects. It is therefore critical that a comprehensive assessment of the current and proposed mineral mining impacts on Lynx and snowshoe hare populations be conducted for the areas under consideration for mining and adjacent areas of Lynx habitat. Snow compacting from current and proposed activities and temporary roads and human activities are now and will continue to impact the lives of these creatures. The question is: How and to what extent will proposed Project activities affect these species and other species, in the context of all changes in human development in northeastern MN that may compound the adverse effects of mining? Road density has been found to directly affect predators high in the food chain: elk, wolves, wolverines, bears and lynx. (Switalski TA. How many is too many: A review of road density thresholds for wildlife. Wildlands CPR Newsletter, RoadRIPorter, 2006). Although the extent of proposed road development in this DEIS NorthMet may not suggest a deleterious effect on Lynx, it is the combination of multiple seemingly small changes across Lynx range and habitat that must be assessed, since seemingly minor effects in a complex system may in aggregate cause profound and deleterious, often unforeseen, adverse impacts. (Emmons & Olivier Resources. Cumulative effects analysis on wildlife habitat loss/fragmentation....Prepared for MN DNS, May 15, 2006; Fed Reg 2003 vol 68, No. 128. Part III. Dept of Interior: Fish and Wildlife Service. 50CFR Pt 17: Endangered and Threatened Wildlife and Plants; Notice..re Canada Lynx. Final rule. Pp 40076- 40101; Hickenbottom JR et al USDA Forest Service Biological Assessment (Canada Lynx) Lynx biological Assessment, Dec. 1999). The current DEIS Northmet does not provide sufficient information to clarify this issue?	WI1,WI2,WI5
1193	4.4.3.1 Proposed Action (Environmental Consequences): It is stated that the Final EIS will include results of consultation between USACE and USFWS regarding potential effects on Canadian Lynx and other federally listed species. I suggest that this consultation summary as well as the “process” be included with specific findings from research, assumptions and methodologies used. What specific efforts have been made at the Project site to identify Lynx? Have trail cameras been deployed? Have there been searches of the site for Lynx den sites. Or are statistical data being used to describe the potential impacts of mining on these species?	WI1
1194	4.4.5 Approach (Wildlife Travel Corridors): The list of projects identified as potentially impacting wildlife corridors does not include the Franconia; Duluth Metals; Encampment and Tech Cominco projects in the nearby Ely area. Please include these projects in your analyses. It is inconceivable that further development of mining in these areas is not relevant to the cumulative impact of the Northmet Project and other human activities in animal corridors in northeastern MN. Will Table 4.4-9 be revised to reflect these projects?	WI5
1371	Discharge of toxic Materials from unstable tailings basin is a possibility. The DEIS acknowledges the potential for basin structural failure; “The NorthMet Tailings Basin and hydrometallurgical residue facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin” (S-10) PolyMet has failed to address the safety issues, indicating instead that “further design and analysis would occur during permitting ...” (4.13-2_ Failure of the basin would result in serious and long-lasting contamination. Health issues related to heavy metals released into ground water are documented in Table 125-6 in Churchill, Roscoe and Furtman, Laura. The Buzzards Have Landed! Deer Tail Press, LLC, 2007. A complete stability analysis and acceptable basin design should be a part of the DEIS. Before any of PolyMet’s tailings are deposited on top of existing tailings, existing structural deficiencies must be addressed.	WR3A

3957	4.14 Cumulative Effects: The USFS must ensure that a full range of cumulative impacts, past, present and foreseeable future, from mining in this area and adjacent areas or regions are included in the analyses. The DEIS Northmet 2009 is narrowly focused and it appears to this reader not meet the CEQ definition and intent of the National Environmental Policy Act. The cumulative and related effects of mining exploration and hard rock mining in this area and the impacts of extending the 100 mile plus Iron Range corridor deep into northeastern Minnesota's SNF and BWCA wilderness areas, have not been addressed adequately as required by National Environmental Policy Act (NEPA) of 1969 (29) (CEQ Sec. 1508.7: Cumulative Impact). Cumulative Effects analyses on wildlife habitats in this region have demonstrated the need for such information. (Emmons & Olivier Resources, Inc. Cumulative effects analysis on wildlife habitat loss/fragmentation and wildlife travel corridor obstruction/landscape barriers in the Mesabi Iron Range and Arrowhead regions of MN. MN DNS, May 15, 2006). 4.14.1.1 Resource-Specific Scale: Table 4.14-2 presents findings of the Resource-Specific Cumulative Effects Analysis. Of note is that the DEIS Northmet 2009 Project, according to projections contained herein would cause the following changes: a. increase emissions re air quality; b. increase PM 10 emissions; c. increase deposition of SO2 and NO2; d. add new mercury emitting sources; e. add new emissions sources re visibility impairment; f. have measurable impact on vegetation; g. cause 1.0% - 3.4% loss in wetland area -Partridge and Embarrass River watersheds; h. largest impact: temporary habitat conversion; i. negative impacts in 10 of 18 wildlife travel corridors. Although the DEIS states for many projected changes above the levels would be within MN or related law, it is the case that these increases and adverse impacts will combine into the aggregate of such changes in other mining activities to produce a net negative impact on the environment in the Arrowhead. It is noted (4.14-4) that there is major disagreement with the conclusions of DEIS authors regarding the significance of the above findings. In addition, the legitimacy of the analytical approach to the Cumulative Effects approach is problematic for several reasons: 1. Major data elements are missing e.g. baseline data for the Partridge and Embarrass Rivers. 2. In the watersheds, concentrations of aluminum, iron, copper and mercury exceed MN Water Quality Standards; 3. Analytic methods were not robust, e.g., no dynamical systems analysis of these complex environments. 4. No inclusion of data regarding Climate Change impacts on the ecosystems.	G8C
18606	A) Make sure the financial assurances for the public are included in the EIS before any permitting gets underway.	PD4
18610	C) Analyze the land that is going to be exchanged for Superior National Forest land to make this project possible. Make sure that the land swap would protect wetlands, endangered species, hydrology, tribal rights and taxpayers' interests.	PD1
18611	D) Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	WR4B,FM1,AQ6A
18616	Financial assurance (damage deposit) for clean restoration is missing in the DEIS. The Contingency Closure Estimate would be provided and updated annually as part of the Permit to Mine and its annual report. The DEIS states that the Contingency Closure Estimate would be the basis for computing financial assurance requirements for the Project. However, this is too late to realistically evaluate the impact of the mine closure and ensure that adequate funds are in place. This must be part of the DEIS and must be addressed.	PD4
18617	Baseline Water Quality Page 4.1-13 and 4.1-14 From the data in the DEIS, a logical conclusion is that the existing LTVSMC tailings are contributing substantially to the level of constituents observed in the groundwater. It also true that the modeling of PolyMet contaminants at the basins does not take these or other existing constituents adequately into account. This oversight leads the authors of the DEIS to the illogical conclusion that seepage water from PolyMet, after passing through both LTVSMC and PolyMet tailings, will be cleaner than the existing seepage that is passing only through the LTVSMC tailings. It is not a logical conclusion that the addition of mine waste to the basins would cause seepage water quality to improve.	WR1E

Comment ID	Comment Text	Theme Codes
18618	Page 4.1-94 The DEIS concludes that on the basis of deterministic modeling, the Proposed Action would have relatively little adverse effect on groundwater quality downgradient of the Tailings Basin. However, groundwater contamination from the previous mining activities is still an issue near the LTVSMC tailings basin more than twenty years after operations ceased. Water quality is important and this concern must be acted upon. Because of the limited distribution of monitoring wells, the extent of the contaminant plume is not known. However, recent well data show that the plume extends in some areas at least as far as private wells along the Embarrass River. In the wells that do exist near the tailings basin, pollutants including iron, sulfate, manganese, aluminum, and fluoride exceeded drinking water standards. Recent wells near the northern property line show substantial contamination of the groundwater aquifer (Barr 2009, Memorandum: Results of Tailings Basin Hydrogeological Investigation. June 2, 2009). The baseline data on which to base estimates of the impact of the proposed project on water quality at the mine site and the tailings basins is insufficient. The existing analysis for the PolyMet project calculates the additional constituents that the project will add to groundwater but is unable to realistically estimate what the resulting water quality will be because background water quality has not been incorporated into the estimates. Private domestic wells lie between the tailings basin and the Embarrass River where tailings basin discharge water is expected to ultimately discharge. Some of the sampled private wells have contaminants at levels several times the drinking water standard (Barr 2009, Memorandum: Results of residential well sampling north of LTVSMC tailings basin. January 27, 2009) Samples from these wells show that they exceed the manganese standard and close to exceeding the arsenic standard. There must be a groundwater flow model to show the direction and rate of groundwater flow, using that pattern of flow should to plan a groundwater-sampling scheme to map the extent of the existing contaminant plume. This data and analysis should then feed into estimates of how the proposed project would interact with existing contamination. The combination of existing conditions with impacts due to the proposed project would show what groundwater quality can be expected during and post project.	WR1E
18619	The PolyMet Project would significantly increase mercury levels in local fish, creating human health and ecological risks. Sulfates would impair wild rice. The DEIS studies are inadequate to prevent degradation of water quality.	WR4B,WR4F,FM1
18621	The PolyMet project would take over 6,700 acres of public land in the Superior National Forest. Yet, the DEIS has done no analysis of a land exchange to protect the environment, tribal rights and public taxpayer assets.	PD1
18622	1) Analyze the land that is going to be exchanged for Superior National Forest land to make this project possible. Make sure that the land swap would protect wetlands, endangered species, hydrology, tribal rights and taxpayers' interests.	PD1
18623	2) As the U.S. EPA suggested, make sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.	PD4
18630	To understand the potential impact of the proposed Project and related projects, systems analyses are required. The DEIS is narrow in scope and fails to address important questions regarding the impact of proposed hard-rock mining on the forest and related natural systems. The conclusions do not follow a principle of the USDA U.S. Forest Service: "We use the best scientific knowledge in making decisions and select the most appropriate technologies in the management of resources." ( <a href="http://www.fs.fed.us/aboutus/mission.shtml">http://www.fs.fed.us/aboutus/mission.shtml</a> ) With science-based and unequivocal dynamic changes in global climate (WHO; UNEP Intergovernmental Government Panel on Climate Change: <a href="http://www.ipcc.ch/">http://www.ipcc.ch/</a> (reflected in Ely environs weather in recent years), coupled with multiple recent and pending major human developments in northern MN (mining; new roads; new building; new power sources; and the like) the failure to use the best science, including dynamic systems methodologies, will have grave implications on the future sustainability of these treasured forest and wilderness areas. The data and information provided in this DEIS is inadequate for formulating conclusions let alone formulating the critical questions regarding effects of sulfide mining in SNF,	PD1

18631	<p>4.0 Existing Conditions and Environmental Consequences: 4.1.1.2 Groundwater Resources (see 1.6.1 above): The lack of hydrologic data for the Northmet Project that would allow clear characterization of current bedrock groundwater, flow directions at the mine site and tailing basins is outlined. My review of the supporting data does not provide such detail. Question: Do the DEIS Lead Agencies have a disagreement regarding the facts of available data upon which key hydrological estimates can be made? The data is either available for such analyses or it is not available. There should be no “difference of opinion”. Also, on p4.1.5 footnote a similar “difference of opinion” is noted regarding the “underlying surficial aquifer.” If it is the tribal cooperating agencies’ position that any conclusions “..based on this aquifer test data have a great deal of uncertainty given the variability in the results” do the DEIS lead agencies have data that refute the “uncertainty given the variability in the results?” It would seem that variability can be quantified and the degree of uncertainty ascertained. Isn’t it the responsibility of the DEIS and lead agencies to clarify this? On p 4.1-3 note is made of fractures and joints in the bedrock and groundwater flow through fractures. If fractures occur at deep water levels, one could expect potentially contaminated mine waste chemicals to reach areas other than the Partridge and Embarrass River watersheds and perhaps distant sites such as Birch Lake. The geology of this region could allow this scenario. Have analyses been done to explore such possibilities? Contaminated pits will be present for many years during which time extremes in weather will occur; thus a plausible scenario would involve entry of mine contaminants into adjacent watersheds (see Fig 4.2-9). Please clarify this question. On p 4.1-8: Groundwater Quality: a quote from MN Rules, pt. 7060.0600 states: “The groundwater may in its natural state have some characteristics or properties exceeding the standards for potable water supplies. Where the background level of natural origin is reasonably definable and is higher than the accepted standard potable water and the hydrology and extent of the aquifer are known, the natural level may be used as the standard.” It is not clear in the accompanying tables and text how this applies to the current DEIS data. How frequently has this been observed in data collected for this DEIS? The definition of “natural state” would be critical since polluted water left to resume a “natural state” could still be polluted and thus require remediation. This raises the question: What is the position of the proposers and lead agencies for managing water quality not in conformance with state quality standards and prior to approving a new mining operation. Shouldn’t the existing water quality variances from standards be corrected before approvals are given for new mining projects?</p>	WR1E,WR2A,WR1E

18632	<p>4.1.1.3: Surface Water Resources: Mercury in Water: (p 4.1-48). It is noted that “PolyMet is conducting additional sampling in wetlands, streams, and downstream lakes in the Embarrass River watershed under an MPCA approved plan to help better understand mercury dynamics.” It should be noted that mercury is an important water hazard but the MPCA should broaden its project to include detailed quantification of acid mine drainage; sulfates; and other heavy metals. Focusing only on mercury provides an incomplete assessment of impacts of hard-rock mining. Since baseline and current mercury and methyl mercury concentrations in watersheds of this Project are critical to assessing virtually all priority categories of this EIS (Water; Fish; Humans; etc) it is surprising that such data are not available to better inform the water assessments and resulting conclusions. The MN Regional Copper-Nickel Study prepared by the MN Environmental Quality Board (EQB) addressed water quality from mineral mining as a concern in 1979 study of Filson Creek, S Kawishiwi River and environs. Increased metals levels of Nickel, Copper and Zinc were found. Related studies of Unnamed Creek and Birch Lake at Bob Bay related to taconite mining (Erie Mining Company’s Dunka Pit ) documented increased concentrations of sulfates and nickel. Specific information should be included in the final EIS regarding: who is doing the sampling, who will do the measurements and what will be the timetable for accomplishing the assessments. The details of this MPCA plan should be appended to the DEIS. Such attention is needed for this matter given the hazards of mercury, particularly methyl mercury on fragile ecosystems and also the consequences for bioaccumulation of mercury and implications for human consumption of fish. MN has a growing problem with mercury in water and has existing statewide mercury fish advisories that limit human consumption of fish: see <a href="http://www.health.state.mn.us/divs/eh/fish/index.html">http://www.health.state.mn.us/divs/eh/fish/index.html</a>. Seemingly “low” concentrations of mercury in water do not necessarily reflect mercury in the biota and fish tissue concentrations which may be logs higher and directly toxic to humans and on wildlife who feed on fish. The critical importance of these issues has led to creation of proposed national mercury monitoring network: see: <a href="http://toxics.usgs.gov/highlights/mercnet.html">http://toxics.usgs.gov/highlights/mercnet.html</a>. Tables such as 4.1-97 (p 4.1-190) and text (eg, p 4.1-189 and 4.1- 193), throughout the Draft EIS Northmet, contain measures of mercury and methyl mercury concentrations. Since there are significant methodological issues involving such measurements of mercury, the question is whether the analyses reported reflect recognized causes of and degrees of variation in mercury concentrations. For example, significant daily variations have been noted by researchers: <a href="http://toxics.usgs.gov/highlights/mercury_streams.html">http://toxics.usgs.gov/highlights/mercury_streams.html</a> and <a href="http://toxics.usgs.gov/highlights/metals_variation.html">http://toxics.usgs.gov/highlights/metals_variation.html</a> . Have models used to project methylmercury concentrations included estimates of expected variation in measures under varied conditions? Please clarify. 4.1.2.4 Mercury Impact Criteria: Note is made of the relationship between sulfate and production of methyl mercury. MPCA (2006) policies relevant to this issue are outlined and recommendations are to “avoid or minimize the discharge of water with elevated sulfate concentrations to methylmercury “high risk” situations.” It is not clear, however, to what extent the Northmet Project incorporates these recommendations into their operating plans. No details are provided and “high risk” is not defined. This should be clarified.</p>	WR4B,WR4C,FM2,AQ6A
18635	<p>4.1.3 Environmental Consequences: It is stated: “The mining, ore processing, and tailings disposal operations associated with the Project may cause changes to the quantity and quality of ground and surface water in the Project area.” The word “may” should be changed to “will”. Has there ever been a circumstance reported in the peer-reviewed literature when such mining operations have not caused such changes? Hard-rock mining causes clear predictable and adverse acid and metal-rich drainage. This DEIS focuses primarily on mercury but as noted above numerous metals leach from mining sites with toxic consequences for the biota. (Kimball BA. Assessment of metal loads in watersheds affected by acid mine drainage..Applied Geochemistry; 17; 2002:1183-1207) 4.1.3 Environmental Consequences: Note is made of Uncertainty re key assumptions and the use of “Uncertainty Analysis” for selected contaminants. Since uncertainty analysis requires a variety of objective and subjective data inputs, such simulations may produce highly variable outputs. It is stated that the analyses were approved by the resource agencies? Could the methodology, data input and analyses be appended to this EIS?</p>	EOO,WR1E

18636	4.1.3.5 Mitigation and Monitoring Measures. On p 4.1-172, Mercury monitoring is noted the MPCA Mercury Strategy (2006) that recommends water monitoring for sulfate releases and effects on methylmercury production and establishment of five monitoring sites on streams draining wetlands..." The language in this paragraph and the next paragraph where it states: "PolyMet should develop a similar mercury monitoring plan for the Mine Site..." are ambiguous. What specifically is the responsibility of PolyMet for achieving the MPCA 2006 recommendations and what does the word "should" mean? Please clarify.	WR4C
18637	4.1.4 Cumulative Effects on Water Resources: It is most disconcerting that there is "...existing seepage from the LTVSMC Tailings Basin" and that the Draft EIS suggests that the duration of these impacts would be extended. Why have the seepage problems not been corrected? The law requires polluting offenders to comply with remediation plans. The current problems should be corrected before any new mining operations are approved. As noted earlier, shouldn't the Cumulative Effects summaries in this and other Chapters include major projected mining activities of Franconia; Duluth Metals; Encampment; and Tech Caminco? If not, please provide rationale.	WR5A
18638	4.1.4.2 Water Quality: Northern MN, including the area of Northmet Project, has significant existing mercury impaired waters. (Fig4.5-4 and p 4.1-189 re Colby Lake) Almost 1,500 waterbodies in MN require Total Maximum Daily Load (TMDL) list. Remarkably a TMDL pollution reduction study has not been performed for Colby Lake to address this impairment. It would seem reasonable that this Draft EIS Northmet address when this will be accomplished and by whom. Is this planned prior to the projected operation of the Northmet Project?	WR3F
18639	On p 4.1-196 it is noted that MPCA (2006) "recommends avoiding "discharges" of sulfate to "high risk" situations, which include wetlands, low-sulfate water...where sulfate may be a limiting factor in the activity of sulfate-reducing bacteria...re the potential for methylmercury production." Has Northmet Project accepted this recommendation? Who will be responsible for ensuring that the recommendation is followed?	WR4C
18640	Note: Please clarify: Throughout the DEIS statements are made that recommendations have been made after study (such as the above by MPCA.) I am unclear as to what the disposition is on such statements. Are these all included in the final EIS? Are these negotiated with Polymet? Who makes the decision and what is the process? The current DEIS does not provide information to answer this question.	WR1E
<b>Sender Last Name:</b> Jenkins		<b>Submission ID:</b> 2865
3214	There are to many open ended environmental issues at stake to let anyone mine in or near the Boundry Waters.	EOO
<b>Sender Last Name:</b> Jennings.pdf		<b>Submission ID:</b> 2667
765	The project allows the degradation of 1200 acres of wetlands in St. Louis County and the St. Louis River watershed, with an inadequate mitigation plan. The loss of these wetlands will result in a net loss in carbon sequestration provided by these wetlands (peatlands).	WE3
793	The DEIS does not adequately address the mining project's impact on Canada Lynx and Grey Wolf Habitats. It also does not address the destruction of existing wildlife corridors. The project is located on land the USFWS designated less than one year ago as critical habitat for the Canada Lynx.	WI1,WI5
1493	The mine's tailings basin will also produce discharges high in sulfate concentrations, which will turn mercury into methlmercury, making fish dangerous to consume.	WR4B,FM1
2377	Divide, meaning that surface waters run either into the Boundary Waters Wilderness (note the word) Area through Birch Lake or into the Lake Superior watershed. Wetlands and ground water would be affected in perpetuity. Water quality concerns have not been adequately addressed in the PolyMet project's DEIS. And where they are mentioned, the vocabulary is horrifying: "exceed water quality standards;" "high risk situations, etc" Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years.	WR1A,WR1E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2638	The DEIS should expand its analysis of the Cumulative Impacts of the PolyMet project to include a review of past, present and foreseeable future actions within the project vicinity. The state of Wisconsin has passed a law demanding this type of review and as yet no company has been able to meet its requirements.	PD8,G9
2639	As recommended by the EPA, the DEIS must include an evaluation of the financial assurance that would be provided to ensure postclosure reclamation of the PolyMet NorthMet mine and plant. Sulfide mining places huge burdens on taxpayers. These mines often require long-term or perpetual pollution and treatment. PolyMet has few assets or financial history. Mining is by nature a boom-and-bust activity, with many bankruptcies. The question of where the funding will come from for post-closure treatment, monitoring and maintenance has not been adequately addressed, and Minnesota taxpayers will have to pay millions of dollars for clean up, which is not a guarantee of return to pristine condition, after PolyMet has gone.	PD4
2640	The PolyMet project proposes a land exchange of 6,700 of federal land within the Superior National Forest. This "connected action" is required to be part of the EIS under federal law. Knowing which what lands will be exchanged is important in evaluating the environmental and cultural impacts of the PolyMet NorthMet Project.	PRO4,PD1
3158	How are jobs in sulfide mining, such as the ones seriously being discussed in the Lake Superior and Boundary Waters watersheds, good jobs? Pitting neighbor against neighbor, human being against wildlife habitat, irreplaceable pristine wilderness against iffy, onetime, short-term, destructive gain isn't a good trade-off. The economic advantage we now enjoy as a tourist, hunting and fishing destination will be forever lost.	EOO,G1,G2

- 278 I am a third generation iron miner and I fully support PolyMet Mining's NorthMet project. My grandfather worked for Pickands Mather, my father worked for M.A. Hanna Company, and I worked for almost 30 years for National Steel and for U.S. Steel at Keewatin Taconite. I currently work at Hibbing Community College and my current position as Director of Continuing Education and Customized Training is also dependent on NE Minnesota's mining industry. As a Quality Manager for almost 15 years I worked closely with our Environmental Manager and watched our company and the mining industry significantly improve their dedication to protecting the environment. Mining companies in NE Minnesota today understand the importance of sustainable practices and the long term cost savings associated with them. The process that will be utilized at PolyMet Mining is significantly different than the leaching process used in the non-ferrous mining industry in the past and will minimize any effects on the environment. I believe that PolyMet Mining's draft EIS has provided Minnesota's regulators with the information necessary to ensure that the mining and processing of the non-ferrous ores will be completed in an environmentally sound manner. I have watched the migration of Iron Range youth, including my children, since the early 1980's due to a shrinking job market. Investment in the non-ferrous mining industry will allow those who want to stay on the Iron Range opportunity to stay here. In addition, the domestic production of metals by Poly Met Mining critical to our way of life will reduce our dependence on foreign supplies. I firmly believe that domestically produced minerals and metals is in our country's long term best interests and will minimize effects on our global environment. I appreciate the opportunity to comment on this important issue.
- 2383 What liability will Poly Met agree to? Will they pay for any and all leakage and spills from the ponds? All liners do eventually leak. When the soils are contaminated and water carries contaminants into new territory, how will they deal with it? How will Poly Met compensate? Will they pay for health issues of populations far and wide? Will they pay for care of sickened wildlife? An entire landscape and neighborhood surroundings are at risk. It should be studied far more carefully than anything I have read thus far. Who has inspected other Poly Met mine sites, tested the surroundings? Who has interviewed people in similar mine situations?

2619	MR. JENSEN: I fully support the project. Okay? Primarily because I have two children that my entire life I told them, "There is no jobs up here, you are going to have to move." My daughter just graduated or is graduating on Saturday with a doctorate in chemical engineering. With these types of projects there may be opportunity for her to come back to northeastern Minnesota. Most of my generation is there. Our children are all gone because we haven't had jobs. I really believe that we can do this environmentally friendly. I have looked at the process and I would again like to say that I support the project and I think it would be good not just for northeastern Minnesota, but the entire state, and the country, because of the metals that we will be doing in the mining.	EOO
2668	The International Falls Area Chamber of Commerce, with direction and support of the Board of Directors, desires to go on record supporting PolyMet Mining Co., to develop a copper, nickel, palladium, gold and cobalt mine and process ore at the former LTV Steel Mining Company plant near Hoyt Lakes. The Chamber Board of Directors and its members understand the importance of buying locally and sees this mine as a critical component to the area's economic viability. It only makes good sense for PolyMet to mine and produce some metals not currently mined anywhere else in the United States. PolyMet, we understand, will produce these metals in an environmentally sound way and generate significant economic activity in our part of the state, while following Minnesota's strict environmental requirements to protect air, water and land. Additionally, it is our understanding that the PolyMet mine will create 400 full time jobs with an annual payroll of \$40 million. The spin off economic benefit will be more widespread than st. Louis County and could also have an economic impact in the northern most cities in Minnesota with increased employment opportunities and a larger tax base. We support and applaud all of your efforts with this project and the adequacy of the draft EIS and we thank you for the opportunity to support and voice our opinion on this important project.	EOO,G5
3118	As a new Cook County, Mn resident, as a biologist, and health science practitioner, who has read of other mining disasters, I am disturbed about how little scrutiny there has been of the potential long term affects of the Poly Met mining plan. The only incentive seems to be SHORT TERM JOBS. Perhaps to recover from the long term health problems will provide additional jobs at the expense of all taxpayers.	G2

<b>Sender Last Name:</b> Jerich		<b>Submission ID:</b> 2171
2576	There is much mis-information being circulated by groups such as the one that solicited me to send out a canned letter to you both. I grew up in Ely, and understand the environmental at risk issues, and also the view of the people that live there and need meaningful jobs to replace those lost over the last 30 years in forestry, mining and supporting industries. My request is to exercise all caution as to the environmental impact. If you have ever seen the copper mines in Arizona, and the devastation they create, you know what I mean. There are new processes being presented here that may change the impact. Please be unbiased and balanced and protect the people economically with this opportunity as well as the area they and their children live in.	G14

1162	I am acquainted with the management and some of the directors of Polymet, and I believe they are honest trustworthy executives who keep their word. I believe they have conducted their business to date in an environmentally responsible manner and will continue to do so. I am aware of advances in mining technology which will allow Polymet to comply with the strict environmental standards of Minnesota. Minnesota regulations are among the most environmentally advanced in the world. Minnesota regulatory agencies are technically superior to those of other states. I am confident that our agencies will provide complete oversight and control over the Polymet project to safeguard our environment. I have no fear that Polymet will be allowed to damage the environment in any manner. I trust our regulatory agencies due to my past experience in dealing with them. Our environmental special interest groups will provide a complete examination of Polymet's practices and will result in a stronger template for future non ferrous development. Non ferrous mining in Minnesota will result in an improvement in the overall world environment as other areas have less stringent environmental policies and protections in place. Worldwide demand for non ferrous metals is increasing and is expected to continue to increase. Minnesota mining of these metals will result in the least environmental impact while providing needed jobs in the area. The economic impact of the Northmet project of and by itself is a compelling reason for everyone 'make this happen'. Although the Northmet plan initially contemplates a 20 year production horizon, mineral deposits have been identified to extend the economic benefit for many years beyond. Benefactors of this economic boon would be the state itself, school districts, regional businesses and the many direct and indirect jobs created by this project. I fully support the Polymet Northmet project.	EOO
<b>Sender Last Name:</b> Jiricko		<b>Submission ID:</b> 3659
1	The PolyMet DEIS describes significant environmental problems associated with this proposed mine. These issues should be resolved before this mine is permitted by the responsible state and federal agencies. The PolyMet proposal's risks to water quality are unacceptable.	EOO
2	Water from waste rock piles will be polluted for up to 2,000 years (DEIS, Table 4.1-45). We can't expect mining companies to be responsible for these operations for that long.	PD3
3	One analysis in the DEIS predicts that arsenic, cobalt, and selenium will exceed water quality standards. Another analysis predicts cobalt, copper and nickel will exceed water quality standards. Both analyses predict high sulfate concentrations (4.1-113). Minnesota waters should not be polluted with heavy metals and sulfates. A different design is needed to prevent contaminated overflow into nearby water bodies.	WR3A
4	PolyMet proposes to construct a wetland to treat contaminated waters. Effectiveness of constructed wetland treatment systems has not been proven. This method should not be relied upon as a water treatment method. The company should design another method for cleaning polluted waters.	WE6,PD5
5	The DEIS does not outline the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held as a damage deposit and that amount should be specific and included in the final EIS.	PD4
6	The DEIS Northmet proposes a form of mining that is highly controversial. There is a consistent pattern of hard-rock mining companies overstating the benefits of hard-rock mining while not revealing the true costs. The DEIS Northmet should provide evidence that the proposed Project will provide citizens of MN with benefits that exceed the risks.	PD4
3121	The Boundary Waters and Northern Minnesota are an International treasure. Visited by the World for its unique attributes, culture, and wilderness we have a strong duty to ensure no risk is taken to damage its preciousness. The sulfide mining process comes with inherent risk of long-term degradation to the environment. This has been demonstrated historically and currently with sulfide mines in other locations. When risk is unpredictable, as is the case for this mining type, analysis of future damage to the local ecosystem, economy, and environment, are impossible to mitigate accurately. Zero risk policy for this area is prudent given its World status. Please make Zero risk a fundamental part of your decision making tree.	EOO,G2,G6

3671 All the proposals should be shot down because it would pollute Minnesota’s environment. It could kill a lot of fishing opportunities and would basically kill all aquatic life. Is it smart to mine for a few minerals for a profit and lose all the fishing and tourism profits? The video showed that less people are coming to that area because of the noise of drilling. Hard rock mining has proven to be very toxic and the leading pollution producer in the US. The economical gain is short term and if this proposal is passed it will have long term economical affect. Please do not pass this proposal.

1847 A particular concern of mine is the approval a project that will pollute in such close proximity to the treasured Boundary Waters Canoe Area Wilderness. I am very concerned about the precedent this project will set, and any failure to fully mitigate the potential impact of pollutants that result from this project would, I believe, do serious harm even to those non-BWCAW lakes and rivers that are such a critical part of northern Minnesota's unique ecosystem.

G2C,G7B

162 I am writing in support of Polymet Mining's NorthMet project. The draft EIS submitted has determined, without question, the viability and the environmentally safe foundation with which this project will be undertaken. This project is vital to the long term well being of the Range and the State of Minnesota. The jobs it will create, the products it will produce, and the tax revenues it will supply are critical to the economy. 400 plus jobs are dependent upon our acceptance of this safe mining solution. The contribution it will provide to the expanded industries it will support is the very best opportunity we have been provided in decades. We need the jobs, we need the revenue. We need to support the resources this state provides. As a citizen of Minnesota I recognize that pro-business and pro-mining is not what we have been known for. It is time this trend changes and allow us the benefits our state and our citizens deserve. I strongly support this project and all of the benefits we will realize once a permit for mining is issued. Please, let's not let another opportunity for prosperity slip through our fingers.

EOO

186 I have not previously felt so compelled to submit comments for a DEIS. As an unemployed resident of the region that will be impacted by this mine, I understand the need for jobs, especially in NE Minnesota. But I believe the long term economic impact of sulfide mining will be strongly negative for the region and for the people of Minnesota. Please consider the following comments to reject the risk to the waters of Minnesota, truly our most precious resource. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota’s natural resources.

EOO

Comment ID	Comment Text	Theme Codes
214	We strongly support the advancement and allowance of mining of non ferrous minerals by Polymet in Hoyt Lakes. The EIS submitted for review clearly demonstrates that this mining system is safe and secure. Every caution has been researched and addressed. This mine will set the standards for the world for clean and sustainable mining for the future. The positive impact it will bring to the people and the economies of this state are unmeasurable. This resource deposited in Minnesota is valuable to all the people of Minnesota and the world. We need these metals to provide the United States with an uninterrupted supply of minerals not available in our United States. It eliminates our dependence on foreign producers of these metals. It is time to provide to this state and the people on the range jobs, revenues, taxes, and an improved and sustainable economic future. 400 new jobs and countless other construction and off shoot jobs will be created. We need this type of economic stimulus, not the governmental type we have grown used to. Jobs create pride and earned stimulus. Governmental stimulus creates liability and uncertain futures. It is time for this type of safe and environmentally friendly mining to be employed for the greater benefit of the citizens of the State of Minnesota. We need this venture to go forward.	EOO
717	I am requesting : (1) a time extension of 30 to 45 days for review of the EIS. The allotted time of the review is sparse (2) more availability of public meetings The current schedule is too limited. (3) Request that the public meetings include the option for citizen statements and discussion in the open meeting.	PRO6
745	Also, if there is to be any spirit of cooperation and compromise for the common good, we must listen to each other. Will there be another meeting with a more public format?	PRO6
1119	As a concerned Minnesota citizen, I feel it is my obligation to let you know that I support PolyMet Mining's NorthMet Project. At a time when our economic situation is unstable, I think we need the contribution that PolyMet will make to the state and local economy. The estimated 400 employees and hundreds of spin-off jobs will give a big boost to the financial situation in the Arrowhead Region, as well as the State of Minnesota, and a big boost to the morale and spirits of the people. It seems clear that PolyMet has completed an extensive environmental impact study that shows they can operate the proposed facility in an environmentally friendly atmosphere that will have a minimal impact on our environment. As a person who lives in northern Minnesota, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. The draft EIS demonstrlites PolyMet can mine these metals AND protect air, water and natural resources, and I support the project. PolyMet will provide millions of dollars in local and state taxes to support our communities and education system. Let's get on with pennitting this mine. We need the jobs.	EOO
1185	No project is without risk, but with the proper procedures and controls in place we can significantly reduce the level of risk on all projects. I know this first had,working as a safety directorfor,J.R. Jensen Construction Company. I feel that the 'benefits of this project'to the regIon and state far outweigh the potential negative impacts. Please pass the environmental permits needed to get this project up and running.	EOO
1190	I support Polymet Mining's NorthMet mining project. As with any project of this scale, there are many challenges. There are many important aspects to consider. :rhe EIS is an important step to address many environmental aspects of a project. This EIS was well prepared and answered many important questions, and has my support Consider in these hard economic times how'important it is to create revenue generators for the state, Creating local opportunities for workers,-and sources of materials for manufacturers, only increases the strength of our state moving forward into the future. Also it is important to think how complete and thorough this EIS is, and consider what kind of EIS other countries would produce for such a project. Apart fonn the quality differential, most countries would not provide any consideration for the natural environment. We are competing on a global stage in the modern world we need to stay competitive and manage our resources intelligently.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
1191	I support PolyMet Mining's NorthMet project. The draft environmental impact statement does an excellent and thorough job of defining and addressing the potential environmental concerns. The NorthMet project will be an example and set the precedent for future mining operations. More than enough time and money has been spent preparing the draft EIS. It is time to move forward with this project. The demand for these metals will be met by world markets. We can be sure that the environmental concerns addressed by this EIS document, will not be taken into consideration by other countries around the world. -That is why, it is important to mine these metals here in Minnesota, where we know that the mining will be done to minimize environmental impacts. The economic impact of this project will benefit the local economy of northeastern Minnesota as well as the rest of the state. Given the current economic conditions, it is important that the jobs provided by this project become a reality. With some of the highest unemployment in the state, -northeastern Minnesota needs the jobs created by this -project. The jobs include construction, mining, venter support, and all the other trickle down employment opportunities that-will result from the PolyMet's NorthMet project. Thank you for considering my support for this very important project.	EOO
1310	I am deeply concerned about the environmental impacts implement in the North Met, and specifically the impact that sulfide mining will have on the surrounding communities and local watershed. As a concerned citizen, I plead with you that this project will not pass.	EOO,G7B
2000	g. The DEIS provided insufficient documentation of the degree to which contaminants will move in the subsurface at and near the mine site, particularly in the upper weathered bedrock-till interface, to lead to the necessity of adaptive management in the future once the mine is closed.	WR2E
2000	a. The DEIS needed to present temporal field data on the Partridge River discharge near the mine site. Given the duration of the studies done at the site (years), I am surprised that these data appear to have not been collected. Rather than directly obtain surface water data, the DEIS presented the results of a surface-water numerical model, XP-SWMM, incorporating data collected years ago by the USGS at stations removed from the mine site and within a much larger watershed, and extrapolated these results to the mine site at a smaller watershed size. The recharge rates calculated from this model to get it to agree with assumptions produced recharge rates through the glacial till that seem implausible, at least based on well hydrographs in till collected by the USGS in the general area. The DNR should reconcile these results at the least, optimally by measuring recharge from water table well hydrographs. Otherwise, the amounts of water reaching the mine pit may be larger than anticipated and the validity of their surface water model for the Partridge River can be questioned.	WR2H,WR3J
2000	b. The DEIS surface water model results did not calibrate well to periods of high flow, despite broad sensitivity analysis done to try and assess what factors mostly affect the stream discharge. Getting field data closer to the site to use in the modeling process would have been invaluable. The DEIS needs to link more directly the extent to which the surface water model error affects interpretation on plausible effects on water quality to the Partridge River caused by AMD from the closed mine.	WR3J
2001	b. The AMAX and INCO field experiments do bear on what might happen, as the broader analysis and data compilation of water quality generated from sulfide mines, in general. The DEIS discussion of AMD at Polymet in the context of other mines constituted the strongest line of evidence that, given the low grade of are at Polymet, serious acid mine drainage should not evolve over time, compared to that found at other mines.	EOO
2001	2. I found the groundwater modeling approaches used by Polymet were insufficiently documented to allow me to evaluate their degree of certainty. These models may, in fact, be inappropriate to address the problems considered; a) dewatering of surficial aquifers and bedrock aquifers near the mine pit caused by the mine and b) how rapidly potentially contaminated water might move from , the closed mine to the Partridge and Embarrass Rivers. Additional documentation should be provided to support the conclusions reached in the DEIS from the groundwater modeling approaches used, including water table maps, potentiometric surface maps and hydrogeologic cross sections showing drawdown of groundwater levels around the mine during its operation, groundwater flow velocities (MODPATH simulation module), and how model results calculate the pits will fill over time after closure.	WR2E

Comment ID	Comment Text	Theme Codes
2001	a. I find that the results of the humidity experiments done at benchtopscale bear little, if anything, on what will happen in the actual stock piles or subaqueously to waste rock deposited in the former mine pits. The DEIS must address the matter of scale more directly and why these studies were done.	WR1E
2002	c. From first principles, and assuming the quality of the waste rock meets what the DEIS reports, the generation of serious acid mine drainage from Polymet should not occur except in small pockets within stock piles. Having said this, I urge DNR to develop an adaptive management plan in case unanticipated surprises evolve, particularly in light of the serious modeling uncertainty, lack of direct pertinent information on the surface water and hydrogeologic system as it now stands, and the national history of the inability of the environmental review process to project the extent of AMD at heavy metal mining operations elsewhere.	WR1E,WR2E
2002	Polymet considered all the bedrock formations a single hydrostratigraphic unit to prepare a potentiometric surface map, which implies that all the rocks behave as a single kind of water bearing unit. Yet, Polymet divided the rocks into clearly different horizontal hydrostratigraphic units based on differences in hydraulic conductivity, a measure by which water can move through soil and rock. This conceptual difference between characterizing the bedrock formation as a single hydrostratigraphic unit, and then later dividing rocks into different horizontal hydrostratigraphic units based on hydraulic connectivity, appears to be a major contradiction.	WR2A
2002	Polymet neglected to collect important hydrogeologic information needed for full characterization of the mine site. Without this data, no direct means can be used to characterize groundwater flow in the vertical direction, up or down, from the water table or surface waters under natural or perturbed conditions. As a result, there is no means to determine the accuracy of the broad results of Polymet's groundwater modeling efforts. Furthermore, some bedrock piezometers were constructed so they obtained water across the contact between the Duluth Formation and the underlying Virginia Formation. More piezometers isolated within presumed hydrostratigraphic units in the bedrock (individual water bearing zones) were needed.	WR2A
2003	I view it plausible, compared to what Polymet assumed, that flow paths in the bedrock diverge from directions defined by the water table in the overlying surficial materials. Ground water in the deep bedrock could very well move under the Partridge River to places beyond. The Partridge River hardly can be the regional discharge zone for water moving in the deep bedrock, despite what the Polymet DEIS modeling boundary conditions forced it to do. The Partridge River only serves as the discharge point of local systems in the very upper bedrock and surficial aquifers--but not to deeper waters.	WR2A
2003	I found it unfortunate that Polymet did not install piezometer nests in key locations to determine the potential for vertical head gradients. They could have been installed both north and south of the mine to intersect individual fracture sets in each rock unit and also near the Little Partridge River. The water levels measured in these could have been directly used to characterize vertical groundwater flow directions before, during and after the mine as well as the degree to which the bedrock connects with the river. Water quality measurements could also have been obtained from these to determine the degree to which fractures connect. Pumping tests could have been done from individual piezometers in such nests to determine vertical connectivity as well and the data obtained be used to calibrate the 3-D groundwater modeling effort.	WR2F
2003	The direction that ground water moves depends on the water levels measured in the wells. Ground water moves from high to low water elevations, and not only side to side, or horizontally. Water can also move up and down, vertically. Hydrogeologists routinely characterize vertical hydraulic gradients with multiple piezometers placed at the same location and called "couplets" or "nests" to determine whether ground water moves up or down, and this should have been done at Polymet. During mining, one would expect greater downward migration of water in bedrock aquifer to the open mine pit. Ground water flow directions in the deep bedrock at Polymet may not be the same as that predicated from a water table map. But when the mine opens, I would expect it to act as a drain, inducing water horizontally and vertically to hit both surficial materials and underlying bedrock where fractures connect. Since the Little Partridge River does not cut deep into the bedrock, it seems unlikely it could be a drain to anything but groundwater in the surficial materials, despite Polymet considering it a drain for ground water both in surficial materials and in deep bedrock.	WR2A

Comment ID	Comment Text	Theme Codes
2004	Indeed, the contours of the potentiometric surface for all bedrock in Polymet's groundwater modeling report (Fig. 6.2, RS74A Surface Water and Groundwater Draft 02) do not bend upriver when they cross the Partridge River, which implies flow under the river. Polymet's analysis of flow paths did not address the potential that flow paths in bedrock could extend under the river, even though Polymet's groundwater modeling report indicated that potential. But, had Polymet installed bedrock wells near the Partridge River south of the proposed mine, it could have directly determined whether the river receives or loses water to the bedrock. Without such wells, only untested assumptions can be made regarding river-bedrock groundwater interaction and the validity of their solute transport model post mine remains questionable with respect to the deeper flow system.	WR2A
2005	To some extent, I agree with the position by the tribal cooperating agencies (DEIS, Vol. I at 4.1-2) that Polymet needed to install more instrumentation to characterize the hydrogeologic setting of the mine. But, I do not think a great deal more is needed. At least the potentiometric surfaces in the bedrock and surficial materials needed to be better characterized with respect to the Partridge River. Finally, the monitoring wells that Polymet installed in the wetland peat soils bears little on what the water table in surficial drift might do with mining. The wetland soils have very low hydraulic conductivity compared to other soils and effectively can be viewed as disconnected from the broader hydrologic system except very locally. I am not concerned about wetlands being drained by the mine, short of the ones that are directly in the mine footprint.	WR2A
2318	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I have been trying to find a sulfide mining operation that has not caused major water pollution but I can't find any. I believe that you know this to be true but it appears that the corporate power will have a big impact on your decision. With clean water becoming harder and harder to find on the planet I think taking a chance like this for a couple hundred short term jobs is totally irresponsible. How can I tell my grandchildren that I allowed this to happen?	EOO,G7
2319	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Don't turn Northeastern Minnesota into a mining wasteland.	G8
2833	The DEIS text has only five citations to the Regional Copper-Nickel Study. This is a glaring omission of important data that was prepared especially for this environmental impacts evaluation of copper-nickel mining. This environmental impact statement is for copper/nickel/metals mining in the very same area of the Study. The DEIS does have a few citations for the Study so its authors knew the Study existed, but the DEIS does not even discuss the fact that the Study exists, its purpose, and applicability. The DEIS cannot be adequate without acknowledging and utilizing the Study data and subsequent research.	EOO,WR1E
2834	p. 4.1-34. The DEIS indicates that there are limited data pre the Peter Mitchell Mine. This infers there is data. The DEIS should provide the data that exists. The DEIS should also describe any problems or issues with each of the sets of data, as provided in any quality assurance lab reports or by the providing data source.	WR1E
3152	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. Do not initiate a project that will permanently degrade our state's greatest natural resource. Once again, business ahead of conservation will turn our state into another Louisiana. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	G2

Comment ID	Comment Text	Theme Codes
3247	The DEIS basically says that they think bad contamination will not happen, in spite of metals releases in several places nearby which have not yet been controlled and continue to pollute. PolyMet must show that they have a reliable, appropriate capture/ treatment/ extraction/ disposal systems for any and all contamination that might be released, in addition to the financial assurance for performance. No matter who pays the bill, it is always cheaper to prevent contamination than to clean it up later. These comments put the preparers of the DEIS on notice of the existence and applicability of the entire study and subsequent research in the Legislative Library, which should lead to additional more recent applicable research. Because of the potential for pollution disasters in situations like this, regulatory agencies require financial assurance for pollution cleanup, closure, and required post-closure action. The DEIS should discuss an estimate of future dollars costs if an accidental contaminant release should occur, and if PolyMet or a successor should go bankrupt or leave the project area without closure or with uncontrolled contamination occurring. Please, avoid unintentional stupidity or Ponzi schemes to lay these costs on the public.	PD3,PD4
3248	Elements that should be included in the EIS are energy consumption and carbon use analyses. Will energy demand by the plant affect local residents' available supply, or their prices? What will the company do to minimize its energy and petroleum usage? What will the energy company require the mine to do to fulfill its obligations to the State to meet 25/25?	PD8
3249	This mine is in the Lake Superior watershed, an international water, and the mine is a short enough distance from the international boundary to consider international air quality issues. The DEIS should discuss what obligations the mining company has to the International Joint Commission serving both the United States and Canada. ...the Commission rules upon applications for approval of projects affecting boundary or transboundary waters and may regulate the operation of these projects; it assists the two countries in the protection of the transboundary environment, including the implementation of the Great Lakes Water Quality Agreement and the improvement of transboundary air quality; and it alerts the governments to emerging issues along the boundary that may give rise to bilateral disputes. (www.ijc.org) Was public notice of this DEIS specifically served to the IJC, the Minister of Environment Canada, and affected provinces?	G2B
3292	I also note that the DEIS generously uses terms to evaluate data including, but not limited to, slow, fast, low, little, high, elevated, significant, insignificant. These are editorial terms that do not belong in a scientific document such as the DEIS without actual data and a discussion about how it relates to other similar data and other numbers arising from the Copper-Nickel Study, toxicity studies, health concerns and risk, and regulatory standards. If other authors disagree about editorial terms, this should be included in the text discussion. Footnoting disagreement is an insult and makes it appear that the DEIS authors think they know best. Good scientists know that they do not know everything and avoidance of the appearance of arrogance will be better evidence of non-bias.	EOO
3293	A non-ferrous mining sector EIS for certain aspects may be needed. Issues may arise if the NorthMet project moves forward at this time. If NorthMet is determined not to significantly contribute to haze, and does not need to follow through on certain air emission controls, what will be done when other mining applications come along and it is determined that the sector cumulative impact on haze exceeds the limit? At least four companies have been in headlines and in USFS permitting, moving forward. Do the first applicators get the breaks?	G8C,G10
3498	To Whom It May Concern: I support PolyMet Mining's NorthMet Project. Thank you for your consideration, Nancy Johnson njohnson@ulland.com	EOO
3530	Are we to auction off our public National Forest lands to the highest bidder these days? The exchange of a few temporary jobs for a polluting time bomb that could threaten the BWCA will never be a good idea. As a frequent visitor to the BWCA and Arrowhead region, I beg the DNR to take a firm stand against this mine proposal. Thank you.	EOO,G2
3612	This is ridiculous. It will ruin so many things that mean everything to people and to nature. If you cant clean it up don't make a mess! Think about the long term, not the short term.	EOO
3768	I am all in favor of the polymet project let's move forward and start building ..... Lois Johnson	EOO

3909 Many of us who live in NE Minnesota have been disregarded by our area legislators! They live in fear of the red neck, snowmobiler, 4 wheeler coalition & live in fear of being called "queenies". They do not represent the mostly silent group, maybe even majority, that is not ready to turn over our lakes, rivers, logs, etc. that we have loved all of our lives to the mining interests (copper, nickel etc.) From Alaska to NE Minnesota, mining development with all of its ugly baggage, looms. It is instructive & interesting to think back to Teddy Roosevelt & his thoughts and actions back when things were pristine & there was very little development west of the Mississippi. He warned about development, especially mining, and how it would spoil those areas perhaps for all time. He worked to set aside vast areas of unspoiled grandeur that we still have today. We still haven't learned the lesson that he laugh. Yet, were are considering using unproven technology that could have very bad long term consequences. Please side with all of us who want to preserve whats left of the Northern Minnesota. I could have loved elsewhere, but I chose to live here where I grew up, loving the area from the iron range to the Canadian border. Our area legislators no not represent the views of many, many of us. They have their formual for re-election & that is what concerns them. None of them seem to have any pro-environment feeling at all. They have a very skewed perspective. Please stop the development by being unconvinced by the technology & convinced of the risks. P.S. Enclosed is evidence that other mining projects are being considered.

280 The Twin Ports Construction Liaison Committee is made up of local unions and union employers. Our purpose is to promote the construction industry and show the cooperation between labor and management. On behalf of the committee and our many members we are writing to comment on and support Polymet's EIS. We have worked closely with Polymet for many months and are very knowledgeable about the effort they have made to make sure this project is safe environmentally. They have explained to us a number of times how they will proceed and operate to ensure an environmentally safe operation. Comparing this mining operation to those in the past that were not environmentally friendly is wrong Today's technology is far superior to that of the past. It should also be clear that Polymet is not in the BWCA's watershed. As local citizens we are very concerned about anything that would harm the environment; therefore we have made a very concerted effort to educate ourselves on Polymet's project. We understand the need to balance resources and the preservation of our water and air. We feel that this EIS supports Polymet's effort to develop and environmentally and economically sustainable project. This mining location contains the second largest deposit of cobalt in the world. Currently the United States is importing 80% of its copper. Polymet will be a domestic supplier of critical metals and will reduce our dependence on foreign metals and create a large tax base for the area and state. It will bring life back into a mining facility that now sits idle and once employed hundreds It is estimated that Polymet would create 900 permanent jobs, 400 at the mining facility and 500 spin off jobs. It will create 1.5 million much needed construction man hours. Northeastern Minnesota has one of the highest unemployment rates in the state. The tax base is becoming smaller, schools are being forced to merge, and government agencies are being forced to cut back their services. We are asking that you approve Polymet's EIS.

1	<p>Summary: The DEIS lacks and has ignored valid and related scientific literature, coming to conclusions that are nothing more than conjecture. It further lacks critical definitions essential to the public’s understanding of mining. It lacks important toxicological information. Discussion: Because of the essential, unavoidably scientific nature of environmental issues in identifying environmental impacts, the Draft Environmental Impact Statement (DEIS) must include scientific statements. A wealth exists of published and peer-reviewed literature regarding the potential impacts of copper/nickel mining in Minnesota (especially the Regional Copper-Nickel Study 1976-1979 by the State Planning Agency, a compilation of work by Minnesota Department of Natural Resources (MnDNR) and many others), and also a wealth of real-world data regarding seeps, discharges and leachates, yet the DEIS appears to rely on poorly referenced studies and computer models provided by advocates for the project, rather than existing studies and data. Private PolyMet-funded reports are unlike open scientific literature in that they have not been accessible to the public, nor have they been peer-reviewed as to data, data sources, data analysis and conclusions, and therefore lack the credibility of peer review. Presenting accurate detailed information includes how the DEIS is supported scientifically (the purpose of citations), and enables comment, including verification, by the public in a reasonable time frame. Most citations infer technical support for technical statements and conclusions. On the other hand many conclusions do not include citations to the scientific basis for the conclusions, which gives the appearance of conjecture. In addition, the citations that are included refer to documents that are not made easily available for review by the public (personal experience). The emails attached document that I requested the cited documents twice. I never did receive the CD as DNR stated would be sent. I continue my position in these comments that an extension should be granted so that I and other scientists can have the opportunity to review the scientific basis of the statements with such citations.</p>	G8
2	<p>The state of Minnesota spent millions of dollars on the Regional Copper-Nickel Study (Cu-Ni Study), which was a detailed study of a 500 square-mile area, including the PolyMet NorthMet site, from 1976 through 1979, and subsequent reports based on further research. The Cu-Ni Study is based on over 180 technical reports taking up 20 linear feet in the Legislative Library, prepared by the MnDNR, Minnesota Pollution Control Agency (MPCA), University of Minnesota, U.S. Bureau of Mines, US Environmental Protection Agency (EPA), many other government agencies, and contractors, for the purpose of providing relevant background for the event of a proposal of Cu-Ni mining in Minnesota. The preponderance of the Cu-Ni Study is directly related and currently timely to projects such as this. Metallurgical processes and toxicological and environmental data have not changed significantly since the time of the Cu-Ni Study. The differences between the DEIS and the Cu-Ni Study are glaringly apparent. I found only one cited publication from that study. Potential environmental impacts identified in the Cu-Ni Study have been ignored. Many of the authors of this study are still working for MnDNR, MPCA, U of M, or are now retired or working elsewhere but are still alive and available for discussions about the study, as I am. Many other scientific reports in the open literature have also been ignored. In the short time allowed for review of this document, I have only touched on the depth needed to address the multitudinous shortcomings of this DEIS in my field of expertise. Simply addressing my specific comments will not create an adequate EIS in the areas on which I comment. The DEIS must incorporate into its text -- lock, stock, and barrel -- the entirety of the Cu- Ni Study and its literature, using proper citations and providing all cited documents to the public. The current DEIS needs to be disregarded and a scientifically supportable document must be developed.</p>	G8,G14
3	<p>Polymet Corp is likely a corporate “veil” for other corporation(s) in a position of parent, partner, owner, financier or other supporting function. Many mining companies use veils to protect the veil corporations from liability. It is important to make the names of the veil companies public in the Draft Environmental Impact Statement DEIS for at least four reasons: 1. Past behavior is an excellent predictor of future behavior. If a veil company has a continuing poor environmental record, it should be taken into account when the DEIS is evaluated. 2. Properties owned by the veil corporations may be negotiable for properties that will produce fewer impacts than the existing ownership allows, e.g. a veil company may propose an environmentally poor place to dispose of waste, yet close by there is a far better site owned by a veil company. This may allow internal corporate negotiations to acquire the better disposal site. 3. If Polymet goes bankrupt, State and or Federal Superfund will have records to pursue any veil companies to clean up any contamination. 4. If Polymet obtains all its permits and is operating, a veil company may purchase Polymet and demand changes to agreements that have been made with the State.</p>	G4A

Comment ID	Comment Text	Theme Codes
4	A clear definition is needed between mineralized rock and ore, and other terms, like disseminated, used throughout the DEIS with important concepts to making decisions.	G8
5	Unlike many copper (Cu) deposits in the nation, this deposit includes significant quantities of nickel, cobalt, and zinc (Ni, Co, Zn). The DEIS ignores the fact that toxic metal releases of Cu, Ni, Co, Zn have already occurred from the Duluth Complex stockpiles and test plots at the LTV Dunka Taconite Mine (AKA Erie Mining Dunka Mine), Amax test site, Spruce Road Bulk Sample Site at near neutral pH. The release of Cu can be reduced with circumneutral pH (pH 6.7 to 7.2). This is not true for Ni, Co, and Zn (MnDNR, 1980; EQB, 1977; Eisenreich S.J., May 1976, p. 27; Lapakko K., 1980, Table 2). The Cu-Ni Study Executive Summary p. 45 states these leachate impacts are of significance. This DEIS fails to address how circumneutral releases of Ni, Co, and Zn will be addressed.	PD2
6	The concept of a 20-year mine operation is misleading to most novice readers. The 20- year mine concept is the standard way mining companies plan their operations; the 20- year time frame has nothing to do with final closure dates. All mine closures are dictated by the ore resource available, the current market price, and the profits the company requires. For example, most of the taconite mines in Minnesota started in the 1950's and are still in operation 50 years later. In that time 2.5 20-year plans have come and gone. During the 50 years many operational changes have been made without holistic environmental review. For example, a flotation process was implemented by LTV Steel, AKA Erie Mining circa 1985. Polyacrylamides were used to remove silicates from the taconite. This process change was a major change in the basin and it was not assessed for environmental impacts by the regulatory agencies. No EAW or EIS was opened to assess impacts of the polyacrylamide discharge and its breakdown products. Data was available indicating this chemical may have an environmental impact. However the MPCA managers determined testing would not be required. Now scientific information has come to light that a breakdown product from polyacrylamides is acrylamide (Smith, 1997, introduction). Additionally, both the European Union and the USEPA have determined acrylamides to be toxic (USEPA, 1994, IV.; EUROPA, 2001, effects assessment). This highlights the fact that companies' operational changes are seldom denied since the companies threaten regulators and politicians with closure and the loss of jobs unless they are allowed the change (personal experience). A 20-year operation should be just that, 20 years. At the end of 20 years all equipment and capital expenditures should be retired. After that time if they wish to continue operations, Polymet or its successor must be required to develop an entirely new DEIS, taking into account past impacts from the previous 20-year operation of the mine and the adequacy of the first EIS. In a 20-year mine-life, significant process changes can be expected. For example, in past years the taconite process crushed the rock, magnetically extracted the iron and formed it into a pellet. To reclaim wastewater from the process, a thickener chemical was added to the crushed rock wastewater to help precipitate the solids before it was discharged to a tailing basin to settle. In the past 20 years most, if not all, companies have added flotation cells to remove silicates. This requires chemicals be added to the process. Initially all tailing basins were designed for the process without flotation and allowed waste water to seep through the walls and bottom of the dikes to the surface and underground water. These seepages have changed the chemical characteristics of the local surface waters. The law of conservation of matter states that matter cannot be created or destroyed in a normal chemical reaction. This means any chemical added to the process must go somewhere (into the product, air, or waste water, soil, etc). In theory, each process change is reviewed by an agency staff person who may or may not understand the process well enough to make a scientifically credible environmental review. This has resulted in a "creeping" of impacts beyond what was delineated in the initial EIS. The DEIS must address its impacts as being cumulative to already current impacts. All future process changes must be approved through the use of a supplemental EIS to insure all aspects of potential impacts are properly evaluated though the use of numerous technical experts from numerous agencies and the public.	G9
7	The Cu-Ni Study Executive Summary indicates Polymet mine site is in the report's development Zone II (State Planning Agency, August 31, 1979, Fig 4). Zone II has the highest quality mineralization but 2/3 of this resource is below 1000' (State Planning Agency, August 31, 1979, p 9). It is unlikely that an underground operation will be ignored for this operation in the future. This may be the reason the 800' West pit is not proposed for a underwater waste rock dump. Future development (beyond 20 years) must be addressed fully in the DEIS for adequate environmental planning.	G9

8	Under the “General” section of the Memorandum Of Understanding, it is relevant to identify all potentially problematic chemicals (DEIS, Volume III MOU, p. 2). This has not been addressed. All chemicals, both those contained within the Duluth Complex rock and those extraction chemicals that are proposed to be added, and their mixture and degradation products, must be clearly identified with their toxicology. Here is an example of some of these chemicals:	PD2
9	The impacts of each chemical and combination of chemicals and their degradation products must be clearly discussed in the DEIS. For example, the DEAW and DEIS identified a number of metal elements of interest found in the Duluth Complex proposed to be mined. The US Agency for Toxic Substances and Disease Registry (ATSDR) ( <a href="http://www.atsdr.cdc.gov">http://www.atsdr.cdc.gov</a> ), part of the Center for Disease Control, assesses chemical toxicology for Superfund sites and other public health purposes. The ATSDR has listed a number of the DEIS-identified elements as chemicals that have been found in the environment and are of concern such as: Mercury, Copper, Nickel, Cobalt, Zinc. There is no acknowledgement by the DEIS of these concerns identified or discussed in the DEIS. This omission strikes at the heart of the purpose for having DEIS. Adequate environmental decisions simply cannot be made by ignoring this type of information commonly available to and well known by most environmental governmental units.	PD2
10	Computer models are used extensively in the DEIS. In the scientific realm, models must be appropriate for the purpose, calibrated against actual field data, tested and peer reviewed to be proven to be accurate for their proposed use. Models must be populated with data that is both appropriate and of sufficient quantity to allow the model to work within its design parameters. Additionally, a tested model must identify its design error percentage, e.g., + or – x%, which is a measurement of the risk of being wrong. The use of models within the DEIS is not transparent as to the above criteria describing limitations. This inadequacy must be corrected. Adequate environmental decisions simply cannot be made ignoring this information.	G8
11	The DEIS must include accurate groundwater and surface water flow direction and volume maps.	WR1E
12	Summary: The stockpile design is inappropriate for sulfide bearing waste rock. It relies on laboratory cutoff values, inappropriately designed containment, and ignores construction practices that would allow near 100% of precipitation to be channeled out and away from the piles. It further ignores the uncontrolled circumneutral leaching that will occur from allowing infiltration to reach mineralized material.	PD2
13	Summary: The dike construction ignores good engineering principles.	PD8
14	Summary: Ground water infiltration into the pit is basically ignored, yet being able to predict kinetic water movements around mineralized materials and rates of metals dissolution is critical in sizing waste water treatment plants.	WR2E
15	Summary: The DEIS fails to discuss the details of wastewater treatment design, its input chemicals, and chemical quality of both wastewater discharges and sludge production.	PD2
16	Summary: The east and central pits closure relies on laboratory scale thinking with no substantive data to prove the water quality from the pit would come close to meeting state water quality standards. It amounts to nothing more than a large experiment at taxpayer’s expense. The DEIS ignores existing scientific information that demonstrates after closure the west pit will for 65 years have acid mine drainage filling it with no feasible way of treating the leachate water. The DEIS further speculates that once filled, the acid leachate will flow into the central and east pits. This disregards the fact that about 30 feet of granular material surrounds the pit and almost assuredly the outflow of the west pit will infiltrate into the glacial till rather than overflowing into the central pit. Even if the pit overflows it is inconceivable that the east and central pits will provide anything close to mitigation that will meet surface water quality standards.	PD2,PD4
17	Summary: Sulfide mineralized rock should be avoided in any construction due to the disseminated nature of the waste rock and possible spreading of circumneutral metals contamination throughout the area.	PD8

Comment ID	Comment Text	Theme Codes
18	Summary: The DEIS fails to use proper chemical names for the chemicals to be used in the facility. It fails to test the facility's residuals including sludges and wastewater to determine: 1. are they hazardous waste; 2. the chemicals that will be discharged into both tailing basins. They further fail to discuss the toxicological and degradation products that will be discharged into these basins. Without a substantive scientifically based review, comparison to surface water and ground water standards and resultant impacts from these discharges cannot be assessed in any relevant manner.	PD2
19	The concentration and mass of chemicals and minerals in the wastewater (tailing discharge) must be identified and quantified. The DEIS uses company product names (MIBC, DF250, PAX, etc.) for many of these chemicals. This makes it almost impossible to research these products. The DEIS must use standard chemical nomenclature and CAS numbers so the public can track information regarding these products. Currently, MIBC, DF250, PAX, MagnaFlox10, Copper Sulfate will be added in this process. The ecological toxicity of these products and their breakdown products, interactions and half-life must be evaluated by qualified experts (see Minn. Rules 7050.0218 Subp. 5, 6, 7, 8). If these chemicals cannot be categorized as "environmentally safe" due to lack of data, the DEIS must not allow them to be discharged into the old LTV unlined tailing basin, which is a seepage pit.	PD2, HM4
20	The tailing slurry discharge into the basin must be tested to determine if it is hazardous waste, this includes testing for lethality (the oral rat test) and toxicity (Minn. Rules Ch. 7045.0129).	HM4
21	Since the DEIS proposes to discharge the tailing into the unlined basin, the DEIS failed to provide the chemical and toxicological information necessary to evaluate impacts of the tailing wastewater. At minimum the DEIS must: 1. Evaluate the tailing discharge to determine if it will meet stream water standards (chemical & toxicological). If the tailing fails to meet these standards, then a scientific study is required of the controllable chemical treatment (if any) that the old taconite tailing basin itself provides. This discussion must be based on scientific testing results and not speculation. 2. If the sole purpose of the basin is to filter solids and dilute the chemicals discharged, then the discharge must meet stream water standards at the end of the pipe -- not at the seepage points at the base. If this cannot be accomplished the residual chemicals must either be removed from the water before discharge to the basin or a basin should be underlined and the drainage water collected and reused as process makeup water. 3. Evaluate the tailing for sulfide and residual metals (including zinc) content and scientifically demonstrate these waste materials will not produce heavy metal leachates (at the time of discharge, in transit, and for perpetuity).	PD2
22	The concentration and mass of chemicals and minerals in the waste slurry was not identified and quantified as to its chemistry and toxicology. It is not possible to determine the adequacy of the containment proposal. Without the above information impacts cannot be assessed, nor whether the basin design is adequate to prevent impacts. Because the DEIS proposes a limited life (5 years) to each underlined basin, it appears that the waste will not meet either surface water or ground water standards. Open basins with liquids attract wildlife as a water source. If these basins require at least one under liner, they must also have covers to keep wildlife from using the waste liquids as a water source.	PD2
23	Summary: The current tailing basin condition is not adequately discussed. Tailing basins must be designed to deal with the wastes that they are to hold. The current tailing basin design appears to only serve to dilute potential toxic process chemicals. The DEIS cannot assess impacts without a full understanding of how the current basin is designed to handle both the mineral waste and chemical process wastes.	PD5, GT1
24	Summary: The proposed surface water standards do not take into account cumulative impacts from other mining operations, allowing a higher concentrations of chemical discharges.	WR5A
25	1. The DEIS must be based on scientific literature, include what we already know as pertinent field results from northeast Minnesota, and conclusions must include citations for supporting data.	G8
26	2. The basis for any copper-nickel DEIS must be the 180 + reports of the Regional Copper-Nickel Study.	G8
27	3. The corporate veil companies and financial stability must be part of the DEIS to avoid "Ponzi" schemes on the taxpayers.	PD4

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
28	4. Clear definitions and concepts are essential to identify chemical risks associated with mining.	G6
29	5. The DEIS must discuss implications of circumneutral metals leaching as related to water quality standards.	WR1E
30	6. The DEIS must address not only the 20-year mine life but also subsequent mine lives.	G9
31	7. The DEIS must fully and thoroughly discuss the toxicological implications of the metals encountered and chemicals that will be used, to then fully discuss impacts on human health and the environment.	PD2
32	8. The DEIS must provide sufficient information about computer models to enable the reader to understand the extent of basis in actual data, assumptions, and the measure of risk of being wrong, that all affect the validity of the results.	G7
33	9. The DEIS must include accurate and detailed ground water and surface water flow, volume and direction maps.	WR1E
34	10. The DEIS must reject the use of taconite stockpile design. All stockpiles must be designed to keep 100% of water out of the stockpiles. The only practical way is using synthetic membrane cap over the entire pile, have lower slopes even though the footprint will be larger, be repairable, and must control and direct precipitation away. Underliner installation must be redesigned, knowing the subsurface contours to prevent catastrophic rips and uncontrolled releases.	PD2
35	11. The materials used in ditch and storm water leachate collection systems must preclude seepage and be resistant to freeze/thaw cycles.	WR3K
36	12. A more detailed analysis of ground water inflow to the pits must be done.	WR2A
37	13. A detailed description of the WWTF is required to include but not limited to chemical characterization and volume of the discharged waste water and sludges. Failsafe controls and fall back plans are required if inflow volumes or chemistry exceed the capability of the facility to treat the water. Plans may include mining shutdown.	WR2G,PD2
38	14. Because the east pit and central pit closure plan entirely lacks scientific credibility to meet water quality standards, the DEIS must demonstrate that such a treatment scheme will in fact succeed. The new plan must show how massive variances will not be needed.	WR2G,PD3,PD4
39	15. Further more the DEIS must have a backup plan if discharges fail to meet surface water standards, both during mine operations and after shutdown.	WR1A
40	16. The DEIS must scientifically and conclusively demonstrate that 65 years of filling in the West Pit will not result in a lake filled to the brim with acid mine drainage from the mineralized side walls.	PD8
41	17. The DEIS must address the probability of acid mine seepage through the granular materials surrounding the pit and ultimately to the Partridge River with all of its impacts on the Lake Superior watershed.	WR2E,PD8
42	18. The DEIS must demonstrate how anoxic waters will not leach above surface or ground water standards.	WR1E
43	19. The DEIS must demonstrate how oxygenated surface waters in the pit will not provide continuing slow leaching of the side walls above standards for perpetuity.	WR3C
44	20. The DEIS must demonstrate how the Central and east pits will be able to successfully treat the West Pit's large volumes of heavy metals in the order of milligrams per liter and possible acid drainage, with a discharge that fully complies with water quality standards on the order of micrograms per liter.	WR1E
45	21. The DEIS must describe how the West Pit oxygenated waters flowing in to the Central and East anoxic pits will not provide the kinetic actions releasing the metals in Category 3 and 4 materials in the Central and East Pits, and how standards will be met.	PD2
46	22. The DEIS must address the probability of galvanic anoxic leaching.	PD2

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
47	23. The road construction materials and engineering must avoid spread of Duluth Complex material and address water flow and species habitat.	PD7
48	24. The DEIS must discuss whether it will process zinc or not.	PD9
49	25. The DEIS must address impacts of emissions of the crusher's airborne fine metalcontaining particles on surrounding waters, soils, and plant vegetation, the worker safety issues, and haze regulations.	AQ4,AQ6
50	26. The DEIS must fully, completely and properly name with CAS numbers all the flotation chemicals.	G8
51	27. The outflow waters from the rougher and scavenger flotation to the basin must be chemically analyzed, conduct hazardous waste analyses, determine mixtures and degradation products, and toxicology of all the chemicals, mixtures, and degradation products.	WR3A
52	28. The DEIS must provide a scientific discussion of how the unlined basin treats, other than dilution, the discharges coming into it.	PD5
53	29. The DEIS must discuss the interactions between the residual heavy metals from the rougher/scavenger flotation discharge and other chemicals in the basin, and how these metals will be permanently sequestered in the basin for perpetuity.	PD2
54	30. The DEIS must identify the form of cobalt, and assure it is not a radioactive species.	PD2,HM5
55	31. The DEIS must identify the chemistry and toxicology of the hydrometallurgical residue and ensure the material is not a hazardous waste before placement in the lined basin.	PD2,HM4
56	32. The DEIS must discuss how wildlife will be prevented from utilizing the basin.	WI2
57	33. The DEIS must scientifically evaluate and discuss how the 1950 tailing basin design is adequate to deal with the sulfide waste and floatation chemicals it is planned to hold.	EOO
58	34. The DEIS must discuss how both the discharge into the basin and the seepages out of the basin will meet or exceed water quality standards. Dilution is not acceptable if this is the only treatment in the basin.	WR1A
59	35. The DEIS must discuss the mass loading of chemicals from the basin into the environment over its 20-year period.	PD2
60	36. The DEIS must discuss the changing anthropologic contributions of hardness and cumulative impact from adding NorthMet's discharge as it relates to the water quality metals standards that change with natural hardness values.	WR5A

1	Metallic mineral development in northern Minnesota carries with it potential for very serious environmental harm. Much of this potential impact is associated with the fracturing and disposal of the large volumes of mining ore and waste which will be generated by mining operations. Waste created by mining of sulfide mineral deposits such as proposed have always resulted in the creation acidic drainage conditions which can persist for thousands of years and result in extensive environmental degradation. Such conditions are well-documented at mine sites throughout the United States and Canada. Citing the past failures of the mining industry to manage and reclaim sulfide waste materials, the State of Minnesota and Department of Natural Resources should prohibit mining of all ore bodies containing sulfide minerals until adequate technology has been proven to deal effectively with the sulfide ore waste management issue. If necessary the Department of Natural Resources should take the initiative to fulfill it's mission to protect the state's natural heritage and request the legislature to provide a moratorium on sulfide mining. The mission of the DNR reads:	G7A,G12
2	Wetlands: Some wetlands will be destroyed within the mine footprint. Some of the wetlands immediately adjacent to the rim of the pit will be drained. The effect to wetland resources further away from the pit is a point of contention. If there is a connection between the surface and bedrock 'aquifer' then the mine pit will drain wetlands further from the pit (this is the considered opinion of the tribes). If there is a confining layer between the surface and the groundwater aquifer, then the wetlands further from the mine pit will be unaffected (this is the considered opinion of the MnDNR). Both opinions have validity. The MnDNR assertion is based upon general experience with other open pit mines in the area. Additional site-specific data would offer the opportunity to help affirm this assumption prior to construction and provide additional opportunity to address potential effects prior to their occurrence. If there is a greater connection between surface and the bedrock aquifer, the mitigation options may be more limited, may be less effective, and potentially more expensive.	EOO,WE2
3	Page 4.5- 1: Section 4.5.1.1 Special Status Fish and Macroinvertebrates - Presence of suitable habitat for Regional Forester Sensitive Species - There is likely suitable habitat for Northern Brook Lamprey, Creek Heelsplitter Mussel, and Black Sandshell Mussel in the Analysis Area. The Forest Service recommends consider this when analyzing the downstream extent of potential impacts. Since detection of these species is low due to limited numbers and distribution, analysis and effects disclosure is better served in the context of potential habitat rather than actual species presence/absence based on limited searches and sample intensity. In addition, survey methods for northern brook lamprey (i.e. electrofishing for ammocoetes buried in soft sediment) show limited success and may not be reliable.	FM1,FM2
4	Page 4.10-14: Tribal footnote. There is acknowledgement of possible net loss of acres to 1854 authority, however the DEIS could use discussion further disclosing effects to tribal concerns. For example, the DEIS could contain an analysis of acreage of lost hunting land and what that could mean for loss in money or subsistence to tribes. This could be done in terms of effects to wild rice as well.	SE1
5	Page 1-3: The DEIS indicates that the land exchange is a connected action (e.g. "This DEIS identifies and analyzes the potential alternatives and impacts for the Project based on the successful completion of a land exchange...") (emphasis added). If the Army Corps of Engineers (ACoE) and Minnesota Department of Natural Resources (MN DNR) choose not to complete a Supplemental DEIS for the land exchange, the ACoE/MN DNR FEIS may want to explain why the land exchange is being done separately in more detail.	PRO7,PD9

6	Surface water quality at the Project remains insufficiently characterized or left uncharacterized, and the defects in analysis are profound in this area. The limited data used indicates that surface waters have already been adversely impacted by mining activity, which should give rise to more scrutiny, not less. <sup>60</sup> Contaminant transport modeling suggests that the PolyMet Project will cause manganese, aluminum, and sulfate to exceed Minnesota Water Quality Standards ("MN WQS"). <sup>61</sup> Mercury, sulfate, and specific conductance have already exceeded surface water criteria in surface water samples collected near the tailings basin at nearby Area Pit 5, and mercury and aluminum exceed surface water criteria in the Partridge River downstream of Colby Lake. <sup>62</sup> Aluminum, iron, manganese, and mercury all exceed MN WQS in Colby Lake. <sup>63</sup> Contaminants from the Project will likely contribute additional loading to these existing exceedances of MN WQS in the Embarrass River, Colby Lake, and the Partridge River. No water samples have been collected from lakes near the tailings basin (including Hiekkilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies. Aerial photography and state Public Waters inventory maps indicate that there is currently a direct surface water connection between the northwest corner of the old LTVSMC tailings basin cell 2W and the Embarrass River that has not been considered in the PolyMet tailings basin design or water quality predictions. <sup>64</sup> Determination of the final water quality of the west pit was not included in the DEIS so that potential long-term water quality impacts to the Partridge River, St. Louis River, and Lake Superior can even be characterized.	WR3A
7	The wetland delineations that were done did not encompass all of the wetlands that may be affected by the Project because no initial determination of the Project's area of influence for wetlands was made. <sup>96</sup> The site field surveys of wetland and other vegetation were limited to an area within the Project fence at the mine site, which covers less than one half of the area that might reasonably be expected to be impacted by disruption of the existing hydrology. <sup>97</sup> Around the tailings basin virtually no wetland delineation has taken place although wetland impacts from inundation are likely to occur. <sup>98</sup> The USACE is developing a monitoring plan to assess the Project's impacts to wetlands but it has not been finalized or implemented. <sup>99</sup> Moreover, this monitoring plan will only identify impacts after they have occurred. Additional analysis must be done and the DEIS supplemented.	WE1,WE2,WE3
8	There are also wetland areas of particular note that may be impacted. Potentially impacted wetlands that are part of the 100 Mile Swamp were identified by a United States Fisheries Service biologist in 1997 as "lacking ecosystem representation in protected areas. <sup>100</sup> Interest in protecting the unique character of these wetlands was based on their "watershed integrity, the presence of riverine ecosystems, and large amount of interior forest present." <sup>101</sup> This information was further substantiated in a report by the MNDNR titled "Evaluation of Selected Potential Candidate Research and Natural Resource Areas." <sup>102</sup> This document describes the 100 Mile Swamp wetlands as representing "the highest quality remaining examples of characteristic ecosystems in each ecological Landtype Association on the Superior National Forest." <sup>103</sup>	WE3
9	There are also wetland areas of particular note that may be impacted. Potentially impacted wetlands that are part of the 100 Mile Swamp were identified by a United States Fisheries Service biologist in 1997 as "lacking ecosystem representation in protected areas. <sup>100</sup> Interest in protecting the unique character of these wetlands was based on their "watershed integrity, the presence of riverine ecosystems, and large amount of interior forest present." <sup>101</sup> This information was further substantiated in a report by the MNDNR titled "Evaluation of Selected Potential Candidate Research and Natural Resource Areas." <sup>102</sup> This document describes the 100 Mile Swamp wetlands as representing "the highest quality remaining examples of characteristic ecosystems in each ecological Landtype Association on the Superior National Forest." <sup>103</sup>	WE2,WE3

9	Similar to the problems with measuring water quality impacts, the DEIS's failure to properly model and mitigate seepage rates could result in profound impacts on wetlands. Under the Proposed Action, the unrecovered seepage rate is predicted to increase to a maximum of approximately 3,800 gallons per minute ("gpm") in Year 20, over 2,900 gpm of which would be attributable to PolyMet.104 Therefore, under the Proposed Action, a significant increase (more than 100%) in groundwater upwelling relative to existing conditions would be expected. Some of this seepage water would drain to existing streams, but because of the generally flat topography and extensive wetlands, much of this water would be expected to form ponds and inundate wetlands. A more thorough hydrologic impact analysis that incorporates actual seepage rates from the tailings facility must be conducted. In addition, these seepage rates must be used, in conjunction with tailings basin water chemistry information, to assess the effects of this untreated discharge to the biota and functional values of the Embarrass River watershed wetlands.	WE2
10	The following "Technical Standard for Water-Table Monitoring of Potential Wetland Sites by U .S. Army Corps of Engineers" should be used for wetland hydrology, type determinations and delineations: <a href="http://el.erdc.usace.army.mil/wrap/pdf/tnwrap05-2.pdf">http://el.erdc.usace.army.mil/wrap/pdf/tnwrap05-2.pdf</a>	WE1
11	Since Minnesota has no coal mines, it has no experience with acid mine drainage or the Surface Mining Control and Reclamation Act funding for ongoing clean-up and treatment costs. Sulfide or hard rock mining projects pose unique regulatory and technical challenges . The industrial sector of mining work affects every major EPA program, including programs implementing th e National Environmental Policy Act (NEPA), the Clean Water Act (CWA), the Clean Air Act (CAA), the Safe Drinking Water Act (SDWA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and the Resource Conservation and Recovery Act (RCRA) which should all be addressed in comprehensive detail in the NorthMet EIS .	G5
12	I find the basis and assumptions for estimating wetland impacts lacking sufficient data to justify the limited impacts that were assumed by the DEIS: 1. Modeling basis assumptions are the downfall of many model outcomes. If the assumptions are wrong the model is wrong. Ground water flow assumptions made for this DEIS are not adequate to justify the conclusions about indirect wetland impacts. Tracer testing of hydrology following the US Army Corps of Engineers guideline attached below should be required for the basis of any modeling results considered. "Technical Standard for Water-Table Monitoring of Potential Wetland Sites by U.S. Army Corps of Engineers"	WE2
13	Water Resources and Wetlands □ The water resources and wetlands analysis were a primary focus of our review. It appears that these are areas within the DEIS analysis that could benefit from more discussion or clarification of the current analysis. The analysis in these areas may also be strengthened with further data collection (e.g. wetlands connectivity to groundwater) and including more detailed monitoring plans (e.g. surface water quality and stream flow) describing in detail what would be monitored as well as when and how the monitoring would occur.	WR1A,WR1E,WE2,WE3
13	My husband and I own a home in northern Minnesota on White Iron Lake. I am extremely concerned about the socioeconomic aspect of proposed plans to develop the Polymet project. The DEIS does not adequately address this.	EOO
14	Page 3-36: Section 3.1.7.2 – Need to address how and when the waste water treatment plant will be reclaimed. If there are no reclamation plans for this system (operations to treat water at this facility would extend in time beyond when mining and processing stops), the EIS needs to explain when the Waste Water Treatment Facility (WWTF) will be removed and site reclaimed, and how long it is estimated to be needed to treat wastewater for the mine waters.	PD4
14	Mining provided jobs, but the cost of those jobs far outstripped what the men were paid. Eastern Kentucky was basically a single-industry region, and when the mines shut down or the men were laid off due to automation, they had nothing. It was a poor area when I lived there and still is.	SE3
15	Page 3-49: Tribal Cooperating Agencies indicate that maintenance/monitoring would be required for hundreds or thousands of years or ‘in perpetuity’. How w this be addressed or handled? Would it be addressed in the Response to Comments to the FEIS? If ACoE/MNDNR thinks that maintenance would not be required in perpetuity, need to state why.	PD11

Comment ID	Comment Text	Theme Codes
16	Page 3-51: As indicated by the Tribal Cooperating Agencies, it appears that there would be both positive economic/social benefits and negative economic/social impacts. It is not likely that this project would have zero negative economic/social impacts. It is likely that there would be some negative effects to tribal values since thousands of acres of 1854 authority surface resources (the Mine Site) would be eliminated. In addition, recreational opportunities at the Mine Site would be negatively impacted, with indirect negative effects to the tourism industry. The size of these negative effects might be debated, but these are greater than zero.	PD3,PD5
17	Page 3-51: State that the no action alternative is required by CEQ NEPA implementing regulations.	G1
18	Page 3-64: Footnote - The Tribal Cooperating Agencies cited a U.S. Steel study which recommended underground mining. The FEIS should address how the U.S. Steel study is or is not valid.	CR1
19	Proposed Action and Ch. 4.0 – Our last review comments asked for more information to be presented on the waste water treatment facility. This still needs to be addressed. There is very little information on the Waste Water Treatment Facility (WWTF). This is a critical facility for water quality protection and will be the major treatment process relied upon. It should be clearly described in the EIS (not just in technical reports). Please explain the facility and treatment process design in more detail, effectiveness, and what constituents it will and will not handle. Will it treat nitrates? This should also be better addressed in the water resources section where more information is provided, especially since the DEIS states that the constructed wetlands performance is highly variable and will only be used to “polish” treated effluents.	WR2G
20	Sulfate and Mercury There will an increase in the sulfate concentration in the rivers as a result of the project. This can result in an increase in available mercury to the environment due to increased microbial activity. The result of this is an increase in mercury concentrations in downstream fishery. Two arguments are presented that this will not be a concern. First, mercury concentrations related to microbial activity in the area may be not be sulfur limited and are more reactive to organic carbon concentrations. Secondly, downstream sulfate concentrations are already very high because of other mining and power generation activity. Recent monitoring on the Partridge River also indicates downstream levels at 289 mg/l (due to other sources related to mining and power generation). Background levels in the bedrock groundwater range from about 4 mg/l to 95 (Table 7 in the 1976 Copper-Nickel study) and from about 4 to 1,200 mg/l (Table 4.1-5) in the EIS. Hence, the proposed increase in sulfate could still be considered within the existing and perhaps natural range. The only existing Minnesota Pollution Control Agency (MPCA) surface water standard for sulfate is for wild rice systems (10 mg/l). It should be noted that the wild rice found in the Partridge River was in the area of highest sulfate concentrations (see Figure 4.1-16). Apparently MPCA is presently in the process of developing standards for other waters. However, even if the existing system is not limited by sulfate concentrations immediately downstream of the project, at some point (either within the St. Louis River, the estuary, etc.) it would seem reasonable that sulfate does become limiting and the increased loading may increase the available mercury. This may mean the project would require additional resources will be required to remove the fish consumption advisory for the downstream fishery. It also appears that the Northmet Project would increase direct mercury loading to the rivers. Although it is unclear how much the project would increase the loading to the rivers, some evidence points to meeting water quality standards at the point of discharge and some suggest that it would exceed the standard for the Great Lakes of 1.3 ng/ l (= 0.0000013 mg/l). The existing Upper Partridge River mercury concentration is about 2.3 ng/l and (Colby Lake is between 4.8 and 6.0 ng/l) (pg 4.1-48). The mercury loading may also be under-represented. The DEIS indicates the project would strip off the organic soil and put it on the stockpile. This would be a source of mercury. Although the DEIS indicates that this would be treated by the wastewater treatment facility and the treatment wetland the analysis recognizes that these treatments would not work very well.	RFI,WR1E,FM1

Comment ID	Comment Text	Theme Codes
21	The DEIS shows that there would be a wastewater treatment system at the downstream end of the project that would include a system of ponds and a pump to send water back through a wetland treatment system (the East Pit at the end of the project). The effectiveness of the constructed wetland system is based upon activity at the existing Dunka constructed wetland system. However, the Dunka constructed wetlands are not designed to remove sulfate and there is little mercury loading to the system. In addition, there may be more than one theory on how the mechanisms work for sulfate and mercury treatment. Table 4.1-63 could be more informative in its representation of effectiveness of the Dunka Mine constructed wetland (it is presently described as “Highly Variable”). Perhaps “Effectiveness Unknown” or similar verbiage would reflect the present level of understanding. Although nitrates have not been identified as an issue in mining in the area and the Northmet Project would be using some of the same processes, nitrates (from explosives) are often a concern in western mines. It should be noted that nitrates have not been considered an issue at other mines in the area. Treatment for nitrates have not been addressed (treatment has not described). Nitrates can be a concern in downstream reservoirs (in some cases increasing algal blooms and at very high concentration causing concerns for drinking water quality).	WR2G,WR3I,WR3L
22	In summary, estimates of impacts are difficult to discern because of inherent limits of understanding of the rock characterization, biochemical, and physical processes. Additional information and insight may be developed to help understand the processes and effects. However, as with all modeling, there will still be the necessary assumptions regarding the existing conditions and processes. Given these uncertainties, the DEIS appears to lean on the ability to implement adaptive management strategies through the life of the mine and throughout closure. The DEIS should reflect the need for additional resources to implement the essential adaptive management strategy, facility maintenance, and operation support in perpetuity. Additional data can be collected to characterize the background conditions and affirm accuracy of modeling assumptions to reduce the uncertainty in the analysis. Given the effects that are estimated in the DEIS, the uncertainty of the analysis, and the risk to water resources that arise from these uncertainties, it would be seem advantageous to consider additional mitigation measures and alternatives that would further reduce the impacts to water resources. It appears the Mine Site Alternative and the Tailings Basin Alternative are both superior to the Proposed Alternative at reducing impacts to water resources.	WR1E,WR1F,WR3I
23	Cumulative Effects Analysis □ While the DEIS demonstrates the ongoing efforts to address environmental consequences, some of the discussion on cumulative effects in some sections in Chapter 4.0 seem to indicate that cumulative effects analysis may be not completely shown in the DEIS.	G8C
24	Page 4.1-2: Groundwater – In comments to the preliminary DEIS, the Forest Service voiced an overall concern relating to the limited amount of actual on-site data gathered and used for the groundwater and water quality and quantity effects analysis. Confidence in the analysis and predicted project results may be improved by gathering more data and completing further analysis. Better representation of existing groundwater conditions, would improve the reliability of the analysis in predicting accurate project outcomes and effects	WR2A
25	Page 4.1-69: Solute Loading from Rock Stockpiles – Previous Forest Service comments on the preliminary DEIS included a comment on nitrate loading in solutions from the wasterock stockpiles due to blasting agents utilized during mining. This still needs to be addressed. What is expected and how will the nitrates be treated effectively?	WR2E
25	Page 4.1-112: Constructed Wetlands -This section does not provide information that supports the Minnesota goal for maintenance free closure. It actually supports the need for primary water treatment at the WWTF long term and possibly in perpetuity. More information and supporting documentation is needed to show that the wetlands will function adequately and that they can be relied upon to treat after the WWTF is closed. In addition, will nitrate be treated in the wetlands for the WWTF and at what effectiveness?	WR3L
25	Page 4.2-2: Section 4.2.1.2, Soils: ELT 13 and ELT 16 are errantly listed as being hydric soils. These soils are both well-drained which would not be a characteristic of hydric soils. These are, in fact, upland soils.	WE1

Comment ID	Comment Text	Theme Codes
26	Tribal Cooperating Agencies □ The DEIS does a very effective job recognizing the input and concerns that the Tribal Cooperating Agencies provided on preliminary versions of the DEIS reviewed by cooperating agencies for this project. However, the DEIS could improve on incorporating these concerns into the text of the DEIS with less reliance on footnoting differences between the lead agencies and the Tribal Cooperating Agencies. The DEIS would be improved by describing any resolution on concerns raised and more fully developing support of the lead agencies analysis and processes disclosed in the document.	G8C
27	The DEIS addressed all terrestrial RFSS species. At some point, a BE will need to be completed that includes determinations for these species (as well as aquatic and plant species).	WI1
28	The Forest Service also would like to see some sort of monitoring program for the active goshawk territory in the nearby forested habitat. This could be included in the goshawk section or the other mitigation section later in the chapter. If the territory stays active or another one is found they following the SNF Forest Plan Standard S-WL-10 (Forest Plan page 2-34) would help protect the nest site and the guideline G-WL-22 (Forest Plan page 2-35) would help protect the post-fledging area. These would mainly come into play if the potential land exchange happens. It would help minimize overall effects if monitoring for nest sites were to be done and then protect active nests as possible.	WI2
28	Page 4.4-14: The Forest Service agrees with the Tribal Cooperating Agency comment #6 that wood turtles may use the possible new nesting sites that may be created. This could lead to increased mortality. The Forest Service would like to see some sort of monitoring included in the proposal to document if wood turtles start nesting in the area, and if they do protect the nesting sites from disturbance or discourage the use if protecting is not possible. This could be included in the wood turtle section or the other mitigation section later in the chapter.	WI2
29	Existing Condition and Cumulative effects of LTVSMC Tailings Basin The Forest Service requests that the DEIS address the assumptions of environmental liabilities to this proposal as they relate to (a) past and future environmental effects, (b) remediation, and (c) mitigation measures at the former LTVSMC tailings basin. (also see tribal cooperating agencies footnote #9, page 4.5-14, DEIS)	FM3
30	Page 4.5-5: Section 4.5.1.2 Habitat Conditions and Biotic Assemblages in the Partridge River and Embarrass River - Cumulative effects of Peter Mitchell Mine and LTVSMC Tailings Basin - Cumulative effects from both the Peter Mitchell Mine and LTVSMC Tailings Basin needs to be further developed in this and other sections of the document; especially in relation to potential anthropogenic effects on invertebrates (and fish) in the Partridge and Embarrass Rivers. Even though these systems represent lower-diversity, headwater communities, the potential for effects from past actions within the watersheds seems likely to have contributed to present biological and physicochemical conditions (e.g. low %EPT in Trimble Creek; high conductivity in Embarrass River and Trimble Creek; modified flows during critical periods on the Partridge River).	FM3
31	Page 4.5-12: Section 4.5.3.1 Physical Habitat Effects / Water Quality Effects - Potential Impacts to Colby Lake and Whitewater Reservoir - Under the higher water withdrawal scenarios, Whitewater Reservoir would fluctuate enough to potentially increase methylmercury formation rates and increase bioaccumulation fish and other aquatic organisms. Fluctuations under this scenario are also likely to negatively affect fish populations (e.g. declines northern pike populations due to loss or disturbance of spawning habitat) The Forest Service recommends that the DEIS clearly define "Historical water levels" on Whitewater Reservoir and Colby Lake. Under what environmental conditions were these levels established. For example, if historic levels were influenced by LTVSMC water use/yield, it would seem inappropriate to use these fluctuations as baseline, historical, or natural for comparing with the present proposal effects.	FM1,FM2
32	Potential Land Exchange □ Review of the DEIS has raised concerns about potential land exchange between the Forest Service and PolyMet to resolve the situation and ramifications of the "split estate" between the Forest Service surface ownership and PolyMet's reserved mineral rights. Although a Feasibility Analysis has not been completed addressing this potential land exchange, it is reasonable to continue to review options on conducting potential effects analysis on any future land exchange between the Forest Service and PolyMet and to strive to resolve issues relating to a potential land exchange being a connected action to the Northmet Project mining proposals.	EOO,PD3

33	Page 4.5-17: Section 4.5.3.3/4 Mine Site and Tailings Basin Alternative - Both the mine site and tailings basin alternative would result in better water quality and healthier aquatic communities than the proposed action. The reduction of water level fluctuations in Whitewater Reservoir and less of a reduction in Lower Partridge River flows would likely result in better water quality and healthier aquatic communities than the proposed action	FM1
34	Page 4.6-37: Section 4.6.3.5 – Visibility - The discussion on visibility mitigation options goes into great detail on a number of options that have been dismissed for different reasons but is lacking in detail on the option that has been identified as the likely one. The idea is working with EPA’s mobile source staff in Ann Arbor, Michigan to plan and implement a pilot test of selective catalytic reduction (SCR) on a haul truck to control nitrogen oxide emissions. This has been discussed since 2008. The Forest Service met with the company and the MPCA in March of 2009 to discuss not only the idea of piloting SCR on a haul truck but also exchanged conceptual permit language. The Forest Service submitted comment on the PDEIS noting the absence of a discussion of this option and asked for a description of it. Discussion for this mitigation option needs to be included in the EIS.	AQ5
34	Page 4.5-19: Section 4.5.4 Mercury and Bioaccumulation in Fish - The Forest Service requests that the DEIS further address the potential loading of sulfate to the Partridge and St. Louis River and disclose potential effects as they relate to mercury in aquatic organisms within these watersheds. It seems likely to assume that increasing or releasing sulfate in these lotic systems would eventually deliver them to more lentic systems where they, in turn, may increase Methylmercury formation.	FM1
35	Page 4.6-60: The discussion of additional mitigation strategies includes options for which important details have not yet been determined. For example there is discussion of the possibility of Polymet purchasing mercury offsets from another source to offset its own mercury emissions. Establishing an offset system for mercury emissions is a considerable undertaking and to this point we were unaware that the MPCA was planning to establish one. Many details would need to be worked out before such a system could be implemented such as: • If reductions made in one year are usable in another, how long are the offsets good for? • What happens to the offset system after 2025 when the sector TMDL emission goal should be achieved? • How would the determination be made regarding what portion of the emission reductions made at another source are creditable (surplus)? • How will offsets be tracked and by whom? • What year is the baseline year for the offset system? 2005 appears to be an appropriate baseline since the goal of the Implementation Plan is a 75% reduction (from 2005) in mercury emissions from the minerals sector by 2025 (pg. 13). Reductions at a facility due to decreased activity or closure would not generate reduction units if they occurred before the baseline. • The integrity of an offset system is dependent on the quality of emissions information. In the federal mercury cap and trade rule that was proposed by EPA, mercury continuous emission monitors (CEMs) were required. Will mercury CEMs be required for Polymet and any other source it purchases offsets from to verify emissions? • Does the establishment of an emission offset system by itself require a separate rulemaking with a separate public notice and comment period? • How will timely progress toward the demonstration of mercury controls within the existing mineral industry be encouraged when the prospect for someone else to pay for the installation of controls exists? Paying for research studies was not mentioned as a mitigation option in the Guidelines for New and Modified Mercury Air Emission Sources (Guidelines) which is a part of the Implementation Plan. While alternative mitigation strategies were mentioned, this approach was viewed “as a last resort after all other equivalent reduction possibilities have been fully explored. The Guidelines go on to say “Alternative mitigation strategies should demonstrate an environmental benefit related to mercury and should be consistent with the objectives of the TMDL.” Please explain how funding research studies would lead to timely environmental benefits.	AQ5,AQ6A
35	Pages 4.7-13 – 4.7-14: Section 4.7.4 Cumulative Impacts - The DEIS needs to more clearly state the specific geographic and timeframes the cumulative effects analysis is considering and to clearly provide the rationale for these aspects of the analysis. The DEIS considers various distances from various potential noise sources yet it does not clearly relate these to the Noise Sensitive Areas listed in Table 4.7-4. The DEIS also identifies a 20 year timeframe yet does not provide the rationale for this time frame. Presumably it is because of the timeframe of the mining operations but the DEIS does not make this clear.	N3

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
35	Section 4.6.3.5 – Mercury - The Forest Service has an employee who serves on the Implementation Oversight Board for the statewide Mercury TMDL. As outlined in the Implementation Plan for Minnesota’s Statewide Mercury Total Maximum Daily Load (Implementation Plan), Implementation Oversight Board members meet regularly to review and evaluate progress toward achieving the goals of the Statewide Mercury TMDL and to determine whether additional measures are needed to meet these goals. In light of this special role and background of Forest Service staff, the following comments outline specific concerns.	AQ6A
36	The heritage section write-up (4.8) is well written. However, it is clear that the Area of Potential Effect (APE) has not been clearly established, particularly in regard to Tribal concerns (4.8-13). In addition the Tribal Cooperating Agencies have commented that all Section 106 (NHPA) has been “incomplete and inadequate” (4.8-15). If the APE is more clearly established, then there will be a clearer picture of potential effects on heritage resources (including TCPs).	CR2,CR3
37	Page 4.9-3: State Land Management Heading. The Forest Service recommends that the revegetation plan would not include the use of NNIS?	PD1
37	The Forest Service recommends that the DEIS indicate how National Forest System (NFS) may be affected by the mine, and the ability to comply with the Forest Plan on this land. In this section of the DEIS, that would be lands that would not be included in a potential land exchange. Example A: Would the mine increase upland young/upland open in the HUC 6 watershed over the threshold and preclude future vegetation management on non-exchanged NFS land within the same HUC 6 watershed? Example B: How would the mine affect lynx habitat in the relevant Lynx Analysis Unit, and affect the Forest Service’s ability to comply with Forest Plan lynx standards and guidelines when considering future management on non-exchanged NFS land within the same Lynx Analysis Unit? Example C: To what degree would water quality on non-exchanged NFS land be degraded? How would this affect the Forest Service’s ability to achieve Forest Plan desired conditions? How much non-exchanged NFS land downstream of the mine?	CPLU3
38	Page 4.9-4: As indicated in the footnote for the Tribal Cooperating Agencies footnote, effects of the no action alternative should be disclosed.	EOO
38	Page 1-1: The DEIS states that the purpose is to ‘open pit mine’ but section 1.2 Project Purpose and Need, the DEIS on page 1-3 does not mention ‘open pit mine’. It is important to have consistent discussions throughout the project description and the Purpose and Need.	PD9
39	Page 4.10-11: Recreational Facilities Heading. The DEIS erroneously indicates that the Voyageurs National Park is a part of the SNF. Also, the sentence about how the National Wilderness Preservation System prohibits motorized use except the motor lakes needs is incorrect.	COR
40	Page 4.10-21: Recreation heading. The Forest Service recommends that the FEIS more fully discloses potential effects to hunting and fishing opportunities, particularly downstream from the project area. How opportunities would or would not be affected and why. This disclosure could be linked to other sections of the EIS regarding wildlife, fish, and vegetation.	SE4
41	Page 4.10-21: Potential Mitigation Measures. A potential mitigation measure might be identifying non-federal lands in a potential land exchange that contain wild rice and attempting to achieve close to an equivalent acreage in the 1854 territory to what could be lost.	EOO
42	Page 4.10-22: Cumulative Effects Heading. Why does cumulative effects only look at jobs and income generated-what if cumulative actions result in more 1854 territory lost? The Forest Service recommends that the FEIS contains more discussion and good rationale as to why loss of 1854 territory is not an issue that needs to be analyzed in cumulative effects, more discussion regarding potential negative cumulative effects to recreation/tourism in the area, more discussion regarding potential negative cumulative effects to income from hunting or wild rice gathering?	SE4
43	Page 4.11-5: Section 4.11.4 Cumulative Impacts - Although the DEIS at this section gives a very brief evaluation of the potential for cumulative effects, this section states that “...and no cumulative effects analysis would be warranted.” More detail is needed here to demonstrate how this project relates to the visual resource at this time and in a defined future time frame, and addresses any past, present, and reasonably foreseeable management that may or may not be applicable and why.	EOO

43	Page 4.14-2: The DEIS lacks information on why no cumulative effects to tribal interests (e.g. size of 1854 territory, wild rice, hunting opportunities) exist. It is likely that cumulative effects exist for recreation/tourism, non-TEES wildlife of interest (e.g. moose), non-TEES plants of interest (e.g. white pine), fisheries, and groundwater. It appears that there is inadequate rationale for these topics to not be discussed in the DEIS. If the existing cumulative effects analysis already covers these concerns elsewhere in the DEIS then they need to be fully referred to here. Pages 4.14-9 to 4.14-12 do have some info addressing some of these topics. For example: The analysis area for cumulative effects to tribal interests should be the 1854 territory and it may be useful to quantify the analysis given that this is an EIS and the tribes are really concerned about this. Do proposed mines, power plants, land exchanges, land purchases or other projects eliminate or add 1854 land? How many acres? What is the cumulative total loss or gain of 1854 acres in physical existence? In public ownership? For noise and vibration, if it can be shown that the areas affected by noise or vibrations from the Project do not overlap other projects, then this could be eliminated from cumulative effects analysis, or at least reduced. But it appears that the DEIS does not indicate if that is true or not is true or not.	G3,CR1,CR2,CR4
44	Page 4.14-3: If effects on water quality, etc are perpetual, it would be helpful to disclose that in the temporal scale explicitly. If not, need to explain in the FEIS why it is incorrect that effects are perpetual.	WR3I
45	Page 4.14-7: Lack of analysis on climate change could be a problem since this is an industrial scale project. There is a paragraph on climate change on p. 4.14-7, however this may not be enough to fully address the concern. The lead agencies should consider if there should be a quantification of greenhouse gas emissions since this is an industrial scale project?	AQ3
46	Page 4.14-11: Please edit the sentence about USFS roads to indicate that USDA FS national forest system roads are available to the public	ALT8
46	Page 1-3: The DEIS states that 6,700 acres of National Forest System (NFS) lands on the Superior National Forest (SNF) have been identified for a land exchange. At this time, a Feasibility Analysis for a potential land exchange with PolyMet has not been completed by the Forest Service.	PRO8,PD1
47	Overall: There is a table of comparison of alternatives which is good. The lead agencies might consider adding some quantitative information such as numbers from key indicators for each resource.	ALT6
48	Page 5-16: The Tribal Cooperating Agencies say closure information is incomplete. Does the DEIS provide enough information about closure to estimate effects related to closure? If not, need to add more to FEIS	PD3
48	The extensive footnotes where the Tribal Cooperating Agencies disagree indicates that the FEIS could address these concerns either by adding more information into the FEIS incorporating these concerns into the text of the FEIS.	EOO
48	Page 5-18: The Tribal Cooperating Agencies say that a wetland monitoring plan should be available. The Forest Service recommends including at least a general description of monitoring plans in the FEIS/ROD. We do that for our projects.	ALT5
49	Overall: Please consider if water quality will permanently change in any way from the current existing conditions, even if the change is minor or meets water quality standards but it is somehow changed and could affect natural resources in some way. If there is a change, then this should be disclosed as irreversible and irretrievable. In addition, is there irretrievable loss of biological resources outside the mine site (e.g. wild rice)?	IR2
50	Page 3-2: Section 3.1.2 – Please provide representative cross sections (figures) for the pits and representative stockpiles for appropriate years such as 10, 20 and post reclamation. The locations for the cross sections should be shown on the plan view maps. This would provide clarification for understanding what is proposed and what will be completed.	PD1
50	Pages 2-5 – 2-6: Section 2.3.1 – Although the EIS explains why reclamation financial assurance will not be discussed, it is important to explain and disclose in a broad sense what would be covered, what the process would be, and how the potential for water treatment in perpetuity will be addressed especially given increasing costs in the future. Financial assurance could potentially have economic consequences to the public in the future.	PD1

51	<p>Thank you for this opportunity to provide our input, information, concerns and recommendations for this proposed project of PolyMet Mining, Inc. Audubon Minnesota members have studied the DEIS and its associated technical background documents. Based on our review of the DEIS and associated documents, Audubon Minnesota has significant concerns about the lack of information about impacts to the environment of the PolyMet proposed mining operation. We are concerned about acid drainage from the waste piles leaking metals such as mercury, contaminating wetlands, rivers and lakes for hundreds of years after the mine has closed. Such contamination will negatively affect aquatic ecosystems, destroy wild rice beds, contaminate fish, and affect the health and reproductive capacity of birds, other wildlife and humans who consume fish and other organisms from the contaminated systems. We are particularly concerned about the risk of this mine mobilizing toxic metals such as mercury and feel the risks of such mobilization are incompletely analyzed with regard to likely impacts over hundreds of years to the aquatic ecosystems of the wetlands near the proposed mine to the estuary of the St. Louis River where it connects to Lake Superior. Additional issues identified in our comments attached include: - Extensive and persistent water contamination; - Potential failure of the tailings basin; - Methylated mercury impacts to fish, birds, other wildlife and humans; - Lack of analysis of impacts to birds and wildlife found in the Sax-Zim Bog Important Bird Area; - Wetland loss, degradation, and inadequate mitigation plans; - Potential loss of wild rice beds downstream; - Destruction of rare plants and rare plant communities, and the introduction of invasive, non- native plants to the area; and - Lack of any financial assurance calculations that would enable understanding the full risks of long-term environmental impacts of the project. These concerns are detailed further in the comments, which accompany this letter. We have included with our comments "Suggested Actions" which if taken, will make the final Environmental Impact Statement more useful to citizens and decision-makers in Minnesota. We strongly urge your full consideration of these actions.</p>	G7A,G7B,G7C,G8A
52	<p>1) Extensive and persistent water contamination: Analyses in the DEIS predicts that discharges of heavy metals and sulfates, which are known as acid mine drainage, from the proposed mine and associated waste disposal facilities will cause nearby lakes and streams to exceed water pollution standards. Tables in the DEIS show that these discharges of pollution will persist for up to 2000 years. Studies have shown that acid mine drainage kills most aquatic life. PolyMet proposes to use created wetlands as a water treatment method, but has not demonstrated that a created wetland system can effectively function in this manner. Despite this lack of supporting data, the Proposed Action relies heavily on the assumption that it will work. At the nearby Dunka Mine, where constructed wetlands were put in place to treat acid mine drainage, monitoring results show that concentrations of zinc and nickel actually increased. The DEIS acknowledges that a literature review “reveals a wide range of variability in the pollutant removal effectiveness of constructed wetlands treating mine drainage and other pollutant sources” (DEIS pg. 4.1-112). The DEIS also notes, “Constructed wetlands performance, however, is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards” (DEIS pg. 4.1-113). The DEIS acknowledges that the constructed wetland will not likely remove mercury either. “There is very limited data regarding the effectiveness of constructed wetlands in removing mercury...Since neither the WWTF nor the East Pit constructed wetlands, which are the two primary treatment facilities for inflow to the West Pit, are expected to be consistently effective in mercury removal, concerns exist regarding the potential mercury concentration in the West Pit...There is some uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury and additional analysis of this issue is recommended” (DEIS pg. 4.1-123, 124). The DEIS also notes: “...a wetland treatment system in this location could promote mercury methylation, depending on the mercury and sulfate concentrations in the effluent” (DEIS pg. 4.1-167). Suggested Action: The proposed wetland system must not be relied on for mercury removal. Other methods for preventing mercury contamination must be analyzed in the EIS. Additional analysis of the issue of West Pit overflow not meeting Great Lakes Initiative standards must be conducted and presented in the EIS. The risk of the proposed "treatment" wetlands actually promoting the methylation of mercury must be thoroughly examined, as well.</p>	WR3I,WR4B

Comment ID	Comment Text	Theme Codes
53	2) Failure of the tailings basin: The DEIS acknowledges that “the NorthMet Tailings Basin and hydrometallurgical residue facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin” (DEIS pg. S-10). Despite this alarming and dangerous condition, the Proposed Action intends to use the existing tailings basin for the mine project’s own tailings wastes. It appears to Audubon that this waste disposal area is acknowledged to have a low probability of successfully containing the tailings permanently, as is necessary to avoid environmental harm. Suggested Action: The final EIS must examine alternative tailings disposal systems with less potential for catastrophic release and resulting environmental damage.	GT1
54	3) Methylated mercury impacts to fish, birds, other wildlife and humans: The DEIS states that, “Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent ‘high risk situations’ for mercury methylation.” When mercury is “methylated” it can bioaccumulate in fish, making them unsafe to eat for birds, other wildlife and humans. Waters in the project area already are mercury impaired. Four lakes downstream of the project on the Embarrass River are listed for mercury in fish tissue impairments. Most of the water bodies in the project’s area are already listed as impaired for mercury and have fish consumption advisories. We are particularly concerned about the potential impact of mercury to move into the food chain and bio-accumulate particularly in fish-eating birds, such as bald eagles, loons, and osprey and waterbirds in general. Many of these species have already received special conservation recognition, as state species in greatest conservation need, or federal status under the Endangered Species Act. Suggested Action: . Too many of our lakes and rivers are already under mercury advisories, including most of the waterways into which the PolyMet mine pollution would flow. Other methods should be examined in the EIS to eliminate sulfate pollution from the mining waste, and the resulting methylation of mercury. The proposed high sulfate discharges in this DEIS are not acceptable and should not be permitted.	WR4B,WI2,WI5,FM1
55	4) Impacts to birds and wildlife found in the Sax-Zim Bog Important Bird Area: The proposed mining sites are upstream from the Sax-Zim Bog Important Birding Area (IBA). Sax-Zim IBA provides habitat for over 240 bird species, many dependent upon clean water. We are particularly concerned about those 23 bird species dependent upon the area’s patterned peatlands (such as America Bitterns and Yellow Rails), 35 species dependent upon conifer swamps (such as Magnolia Warblers and Boreal Owl), and the 22 species requiring floodplains forests (such as the Black-billed Cuckoo and Barred Owl). Audubon is concerned that the DEIS does not document the likely impacts to birds living in the Sax-Zim IBA of elevated mercury methylation and other bioaccumulative pollutants in nearby aquatic systems which will have a detrimental effect on the large bird populations residing there. Suggested Action: The EIS should analyze impacts to birds found in the Sax-Zim IBA from mercury and other pollution flowing from the mining area.	WR4B,WI2
56	5) Wetlands loss, degradation and inadequate replacement: The DEIS concedes that the NorthMet Project would result in the direct destruction of 854.2 acres of wetlands and 667.9 acres of indirect impacts to wetlands. Indirect impacts are likely to result from hydrologic changes in the project area from activities such as pit excavation, pit dewatering, and the development of dikes and ditches. Wetlands are an importance source of nesting and feeding grounds for waterfowl and other birds. The wetlands located around the proposed mining sites are high quality peat lands. The proposed mining project will have a direct or indirect impact on over 1,500 acres of these high quality wetlands. The DEIS claims PolyMet will mitigate the loss of some of these high quality wetlands by replacing them with constructed wetlands in Aitkin and Pine Counties - far from the mine site. However, these constructed wetlands will not be of the same type or quality as the destroyed wetlands. The overall result is a loss of high quality wetlands and the inadequate replacement of wetlands. Many wetlands near the mining sites that are not destroyed will suffer degradation due to contamination from the mines’ proposed discharges. Suggested Action: The EIS should consider alternative mitigation sites to those proposed in the DEIS that are both geographically closer, and that more closely replicate the quality and type of wetlands to be destroyed.	WE2,WE3

Comment ID	Comment Text	Theme Codes
57	6) Elevated sulfate contamination leading to the loss of wild rice beds: Large numbers of resident and migratory waterfowl, including mallards, teal, wood duck, ringnecks, and coots, use the wild rice grown on rivers and lakes downstream from the project area as a major food source. The proposed discharges from the mines will elevate sulfate concentrations in waters in which wild rice grows. "Research in Minnesota has demonstrated that healthy and viable wild rice beds occur in waters with less than 10 mg/L of sulfate" (DEIS pg. 4.1-46). The PolyMet project presents a very real risk of raising sulfate concentrations above the 10 mg/L wild rice standard, with potential impacts on the health of wild rice beds. Suggested Action: The EIS should provide more information about expected sulfate concentrations downstream of the project site, and the anticipated affects on wild rice beds, and wildlife which use them for feed. This analysis should cover the time period during mine operations, immediately after closure, and for the hundreds of years during which sulfate discharges are expected from waste disposal basins.	WR4F,WR5A
58	8) Lack of information about financial assurances: The extensive and persistent water contamination anticipated from this project and documented in the DEIS will require ongoing clean up and monitoring for several decades, if not hundreds of years. Given the low probability that PolyMet corporation will persist as a legal entity during this entire period, the risk to the environment of failing or failed water treatment systems is real. Without upfront payment of secure financing to prevent the failure to maintain water treatment systems, Minnesota citizens will face the choice of environmental damages to public resources, or fiscal damages in the form of paying to maintain the water treatment systems. Suggested Action: Provide full examination in the EIS of projected financial assurance mechanisms and amounts necessary to assure maintenance of water treatment and other critical environmental remediation systems over whatever time is necessary to protect environmental resources. Thank you for allowing us this opportunity to provide this input. Sincerely, Mark R. Peterson Executive Director, Audubon Minnesota	ALT8
59	Additionally, the hydrologic characterization using MODFLOW models is too narrow in scope; it was only done for the immediate area of the mine pit and the tailings pile. <sup>59</sup> It plainly cannot be used to characterize groundwater flow direction, watertables, potentiometric surface in the aquifers, fluxes to rivers and streams, or to predict drawdown or mounding impacts to the water tables or surface waters.	WR2F
59	The issuance of a proper EIS has already been long delayed-the Final Scoping Decision came out more than three years ago. <sup>3</sup> Regardless of the time taken to prepare it, the Band is reissuing many of the same comments on the DEIS that it has issued on the last two preliminary DEISs ("PDEISs") calling for basic evaluation of Project impacts and application of well-established CEQ standards for EIS preparation, and incorporates all those comments by reference here. <sup>4</sup> Regardless of the complexity of the Project and many changes in Project proposals over the past three years, and despite the preparers' own delays, the co-lead agencies have refused to extend the 90-day comment period on the DEIS, despite repeated requests, including from the EPA. <sup>5</sup> This will only contribute to serious problems in correcting the gaps and defects in analysis in this lengthy DEIS.	PRO6
60	Likewise, groundwater contamination from the previous mining activities is still an issue near the LTVSMC tailings basin more than twenty years after operations ceased. Over the decades of operations at the LTVSMC tailings basin, thousands of gallons per minute of tailings basin water were discharged through the bottom of the basin into groundwater. <sup>65</sup> This plume of contaminated water has been slowly moving down gradient into surrounding wetlands and the Embarrass River. <sup>66</sup> The monitoring wells that do exist near the tailings basin have concentrations of pollutants including iron, sulfate, manganese, aluminum, and fluoride that exceeded drinking water standards. <sup>67</sup> But because of the limited distribution of monitoring wells, the extent of the existing contaminant plume is not known. However, domestic wells near the northern property line show substantial contamination of the groundwater aquifer. <sup>68</sup> Regardless, modeling of Poly Met contaminants at the tailings basin did not take existing pollutant concentrations into account. This resulted in the contaminant modeling that concluded that seepage water from PolyMet sulfide mine tailings and hydrometallurgical waste, after passing through LTVSMC tailings, will be cleaner than the existing seepage water that is passing through only the LTVSMC tailings. In other words, by pretending that existing contamination is an acceptable "baseline" from which only new contamination should be measured, the DEIS entirely skirts the question of overall impacts on the groundwater aquifer from putting an already-contaminated site back into production, and then releasing yet more contaminants. This approach is both deceptive and destructive.	WR1E

61	<p>The DEIS indicates that mine pit dewatering impacts will be very limited or non-existent based on the assumption that there is little or no connection between the bedrock and surficial aquifers.<sup>69</sup> But this assumption is not supported by the data used to characterize mine site hydrology; instead, it is based on an unsupported "professional opinion."<sup>70</sup> In fact, the data implies that there may be substantial connection between the bedrock and surficial aquifers.<sup>71</sup> Such a connection would mean that dewatering of the mine pits could cause significant drawdown of the water table in the surficial aquifer, potentially dewatering wetlands and ephemeral streams. Impacts to surface waters, groundwater, and wetlands for a project of this size and complexity demand a scientific, data-driven approach rather than one based on opinion and scant, selectively used data.</p>	WR2I
61	<p>Furthermore, the effectiveness of the passive wetland treatment system the applicant proposes to treat mine pit and stockpile wastewater with high concentrations of metals and sulfate is untested and it is likely that the system would not function as the applicant has suggested.<sup>72</sup> All cap and liner systems leak;<sup>73</sup> therefore, some pumping of water that enters the hydrometallurgical residue cells would be needed in perpetuity, which the system does not include. The effectiveness of lime treatment to the stockpiles is very important in the final water quality of mine effluent, yet it remains uncertain in the DEIS. Additionally, 20 feet of pit wall will never be submerged and as such constitutes a perpetual source of mine related contaminants.<sup>74</sup> Because of continued inputs from the stockpiles, the tailings basins, and the pit walls, the pit lake could exceed surface water quality standards for thousands of years. Therefore, it is possible that the wastewater treatment facility ("WWTF") would need to operate for thousands of years in order to treat leachate from the tailing basin, stockpiles, and contaminated pit water. However, the DEIS does not provide a range of probable water quality scenarios, much less a proven method to treat these problems over the life of the Project and beyond.</p>	WR3I,WR3L
62	<p>The Band is profoundly concerned at the preparers' refusal to consider past state agency experience with this site that had disastrous consequences for water quality. The Band has located an MPCA document from the Minnamax Exploration Project, a test shaft drilled into the Duluth Complex, the rock formation where the mine would be sited, by AMAX Corporation in the 1970s approximately three miles from the Project mine site.<sup>75</sup> This document states that water was encountered 147 feet below the surface infiltrating into the test shaft at approximately 14 gallons per minute and identified another potentially water bearing fracture zone at 900 feet below the surface.<sup>76</sup> This means that the volume of groundwater that may be encountered by the Project mine pit has been vastly underestimated. Other MPCA documents detail an unexpected saline water discharge that resulted as part of the AMAX Exploration Project from a water pocket 1,391 feet below the surface.<sup>77</sup> The large quantities of saline water discharged, as much as 275 gallons per minute to Langley Creek, killed much of the vegetation en route.<sup>78</sup> Data shows severe impacts to wetlands in the vicinity of the project.<sup>79</sup> Water from stockpiles that were minuscule in comparison to the stockpiles proposed for the PolyMet Project drained water with very high concentrations of nickel, cobalt, copper, zinc, and sulfate, and discharged that water into Langley Creek and the Partridge River.<sup>80</sup> The project polluted streams, groundwater, and a large wetland complex in its vicinity in order for the MNDNR to study potential impacts and mitigation strategies for non-ferrous mining. Yet the data collected from the AMAX project was not used to predict water quality or wetlands impacts presented in the PolyMet DEIS.</p>	WR1E

63	Also ignored was experience with the Dunka Pit, located on the old LTVSMC site approximately five miles north and east of the PolyMet Project mine site. In the Dunka Pit, LTVSMC contacted the Duluth Complex and the Virginia Formation while mining for taconite in the Biwabik Iron Formation. <sup>81</sup> By 1991, LTVSMC had removed about 50 million tons of Duluth Complex material from the Dunka pit and placed it in "gabbro" stockpiles. <sup>82</sup> Monitoring of the drainage from these stockpiles beginning in 1976 revealed a decrease in pH and an increase in trace metals. <sup>83</sup> Copper and nickel concentrations as high as 1.7 and 40 mg/l respectively were observed in seepage/run-off from the Duluth Complex waste rock stockpiles and pH was observed as low as 5.0 at seep 1 between 1976 and 1980. <sup>84</sup> Most of the seepage from waste rock piles at the Dunka site was discharged to Bob's Bay in Birch Lake via Unnamed Creek. <sup>85</sup> A 1976-1977 study of trace metals in Bob's Bay found that concentrations of copper, nickel, cobalt, and zinc in the water of the Bay were higher than regional average concentrations and decreased with distance from the mouth of Unnamed Creek. <sup>86</sup> Additionally, it was determined that Unnamed Creek contributed more than 90 percent of the trace metals to Bob's Bay load. <sup>87</sup> The NPDES pennit for this discharge expired in 2005 <sup>88</sup> and another variance request is expected. A WWTF located at the site has been inactive because Cliffs Erie, LLC, the owner after LTVSMC, declared bankruptcy and claims it is simply too expensive to continue running. <sup>89</sup> Unfortunately, the passive wetland treatment system has not functioned well enough to remove nickel and copper in waters still discharging from the mine pit and stockpiles to a concentration that comports to comply with MN WQS. <sup>90</sup>	WR1E
64	Similarly, the Mining Simulation Project (funded in part by a Minnesota Legislative appropriation of \$185,000 to the MNDNR and MPCA) was a cooperative study to identify and resolve environmental issues associated with non-ferrous mining and to anticipate industry and government data needs to address those issues before commercial development occurred in Minnesota. <sup>93</sup> The study clearly identified those state ground and surface water quality regulations that would apply to copper-nickel mining operations in Minnesota, including applying the 10 mg/l sulfate criterion to effluent discharges where wild rice is present, and prioritized nondegradation of both surface and groundwater and protection of groundwater as a drinking water source, and rejected using natural wetlands for mine effluent treatment ("as a toxic metals dumping ground"). <sup>94</sup> Yet the DEIS states that there is "uncertainty" if the sulfate criterion to protect wild rice should be applied to wild rice waters in the vicinity of the Project, or if state groundwater standards are enforceable. <sup>95</sup> As stated in the Mining Simulation Project report, no such uncertainty exists and the DEIS must comply.	WR3I
64	But water quality impacts from prospecting and mining operations that have contacted the Duluth Complex are well known to the MNDNR and MPCA. <sup>91</sup> The State of Minnesota spent \$4.3 million over three years in the late 1970s to produce the Regional Copper-Nickel Study, a 5-volume compilation of technical information regarding the potential impacts of copper-nickel mining in the Duluth Complex. <sup>92</sup> Nevertheless, predicted water quality impacts and ineffective mitigation methods referenced in the Study were ignored when the technical documents and DEIS were drafted for PolyMet. Therefore, water quality impacts have likely been underestimated and the mitigations proposed may not be effective.	WR1E
65	Similarly, the Mining Simulation Project (funded in part by a Minnesota Legislative appropriation of \$185,000 to the MNDNR and MPCA) was a cooperative study to identify and resolve environmental issues associated with non-ferrous mining and to anticipate industry and government data needs to address those issues before commercial development occurred in Minnesota. <sup>93</sup> The study clearly identified those state ground and surface water quality regulations that would apply to copper-nickel mining operations in Minnesota, including applying the 10 mg/l sulfate criterion to effluent discharges where wild rice is present, and prioritized nondegradation of both surface and groundwater and protection of groundwater as a drinking water source, and rejected using natural wetlands for mine effluent treatment ("as a toxic metals dumping ground"). <sup>94</sup> Yet the DEIS states that there is "uncertainty" if the sulfate criterion to protect wild rice should be applied to wild rice waters in the vicinity of the Project, or if state groundwater standards are enforceable. <sup>95</sup> As stated in the Mining Simulation Project report, no such uncertainty exists and the DEIS must comply.	WR1E,WR3I

66	The National Environmental Policy Act ("NEPA") <sup>6</sup> requires that an EIS at least discuss mitigation measures with "sufficient detail to ensure that environmental consequences have been fairly evaluated." <sup>7</sup> With the current DEIS, such evaluation is impossible. The DEIS does not take the required "hard look" at all the environmental consequences of the Project, including polluting surface and groundwater resources and drying up or inundating thousands of acres of wetlands in the 1854 Ceded Territory. Without adequate study of the adverse effects and determination of possible mitigation measures, the DEIS does not provide sufficient information for either public review or agency decision making. The lead agencies must significantly supplement the DEIS and provide a full opportunity for agency and public review before issuing a final EIS.	PRO3
66	The cumulative public information regarding risks to area hydrology from mining the PolyMet site cannot be dismissed and new, favorable data be inserted into the EIS instead. Experience requires much more evaluation to be done and the water sections of the DEIS must be significantly supplemented.	WR5A
1591	We've been deeply disappointed with current plans to develop Polymet and the multiple sulfide mining projects planned for northeastern Minnesota. There has been a disheartening rush to begin operations without the careful environmental study we've come to expect in our state.	EOO,G8A

1028	come costing us tax payers millions. The DEIS predicts that arsenic, cobalt, and selenium will exceed water quality standards. It also predicts high sulfate levels in the water. The DEIS table 4.1-4.5 states that water leaching from waste rock would contaminate water for up to 2000 years. To my knowledge there are no provisions to prevent waste rock to exposure from rain water. The DEIS estimates the west mine pit will overflow within 65 years. The apparent flowage would be into the Partridge River which flows into the St Louis River and ultimately into Lake Superior. Even the slightest chance of polluting any of these bodies of water is grounds to turn down this permit. In addition it is expected to destroy approximately 1000 acres of wet lands. Minnesota has lost most of its wetlands already; we should not allow this project to destroy any more. The tailings basin has structural problems which could cause it to fail, which would cause even more environmental contamination. As it is the groundwater contamination is expected to exceed water quality standards. No sulfide mining should be allowed in Minnesota unless it is proven completely safe during extraction and into the future long after the mine closes. Plastic liners aren't the answer, nor is filtration. I strongly oppose this project and for the good of our state and the citizens of this state you should	EOO,WR2D,WR3A

1	I could not find information in the DEIS or supporting documents regarding temporal changes in ground water levels in either surficial or bedrock wells. An analysis of temporal changes in ground water is essential to understanding the recharge from seasonal precipitation to surficial and bedrock water levels. From my reading of the DEIS and supporting documents, it seems that groundwater quality was analyzed once (DEIS, Vol. I at 4.1-8), which would be insufficient to evaluate any dilution by recharge. Groundwater levels and water chemistry change seasonally if recharge occurs during snowmelt, and these changes can be used to directly calculate recharge rates within the groundwater system. I think the DNR should have demanded such data and analysis to determine directly what the hydrology might be doing to the geochemistry at the proposed mine site, rather than rely on theoretical models to the degree that it did. If temporal data on water levels were not collected with sufficient frequency to evaluate recharge directly, it would be a major gap in the groundwater data set. There would be no direct means by which to test the hydrologic and geochemical models prepared in the DEIS and their results would have to, in some measure, be taken on "faith."	WR2A,WR2F
742	I would like to state my ardent disapproval of the process for public comment at the recent "public" hearings. There was no real access or open forum. In my opinion allowing gubernatorial candidates to have the floor with no rebuttal or chance for questions is ridiculous.	PRO1,PRO6
<b>Sender Last Name:</b> Kane		<b>Submission ID:</b> 1807
1135	Water quality is just too important to fool around with. Northern Minnesota has irreplaceable beauty that is a resource that should be preserved and nurtured, not squandered for such a short term goal. The tourist industry, the quality of life and recreation, and the natural beauty would be forever affected by this kind of mining. Can we risk the pollution that will inevitably occur when water leaching from waste rock piles at the site impairs water quality for up to 2,000 years? This is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care.	PD4,PD10,G1
2392	I am writing to comment on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I'm very concerned about this type of mining in such a water-rich area as northern Minnesota. Other mines of this type have created extraordinary pollution in western states and the people of those states have been left to clean up the mess.	EOO
2393	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Please do not approve this mine. It is far too risky to the health of the water table and there is no assurance that the pollution it will create will be able to be cleaned up. Thank you.	G4A,G7C
<b>Sender Last Name:</b> Kang		<b>Submission ID:</b> 3308
3601	Please consider my opposition to the NorthMet Project. As a physician, I value and use the natural wilderness to promote physical as well as mental health. We have so little pristine land left, it would be short sighted to mine for quick profit at the expense of long-term environmental damage. Sulfide mines are only bad, only dirty, only toxic. Please add this to the voices of opposition.	EOO,G2

272	Essar Steel Minnesota LLC (ESML) is building a state-of-the-art Open Pit Mining, Concentrator and Pellet Plant operation which will be followed by DRI plant and Slab Caster. Once operational, Essar Steel Minnesota will be the first fully-integrated mine through steel-making facility in North America. We are located on the west end of the Mesabi Iron Range in northeastern Minnesota, and are adjacent to the community of Nashwauk. PolyMet will create several hundred permanent jobs and several thousand construction and other "spin off" jobs at a time when economic stimulus from manufacturing projects is so sorely needed on the Iron Range and in the United States. PolyMet, like Essar, is a company that is committed not only to protecting the environment we live and play in, but also providing for a safe, sustainable way for Minnesotans to make a living and provide for the future.	EOO
<b>Sender Last Name:</b> Kappes		<b>Submission ID:</b> 3235
3141	I live to the north of one of the designated tailings ponds that will be used to store the waste from the mineral removal process. I am not in favor of this facility to begin operation, as to the uncertainty of the possible devastating outcome for the area.	EOO
3594	The creation of jobs is a pretty poor excuse to allow this to go through, if after twenty years the area can't be used for anything else but a dump. Who will be responsible for making things right if their so called patented process fails?	PD4
<b>Sender Last Name:</b> Karon		<b>Submission ID:</b> 1071
99	What do we have to do to get a hearing in Duluth on the EIS for PolyMet? A certain number of signatures? A request or two?	PRO6
100	Otherwise who to contact to request an EIS hearing on sulfide mining in Duluth. Seems kinda silly to only hold two hearings in very small towns.	PRO6
1176	We're paying attention in Duluth, and we think that we have a stake in the potential pollution issues from sulfide mining on The Range.	G2B
<b>Sender Last Name:</b> Kate		<b>Submission ID:</b> 3517
534	<b>AIR QUALITY IN PRISTINE BOUNDARY WATERS:</b> The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet can not be looked at as a single, one-time event in N.E. Minnesota. With permitting of Polymet will come at least 2, perhaps 4 or more new applications for permitting from other mining companies. What will be the total impact on the environment by all these potential mines and how will the EIS deal with mitigation of all these in concert? Specifically the Boundary Waters, which is down wind of all these projects, will be negatively impacted in terms of atmospheric haze from dust particles and other emissions blown into the air. According to the U.S. Forest Service, the Polymet project alone will cause significant haze impairments in the Boundary Waters 36 days each year! Tell us how this cumulative effect on air quality must be dealt with for Polymet and all future applications. In addition how is global warming affected by this mining operation and the combinations of all potential mines in the future?	AQ3,AQ4B
1125	<b>WILDLIFE:</b> The mine site disrupts natural corridors for the movement of wildlife. Specifically the Canada lynx which is a federally-listed threatened species that requires large territories and benefits from undisturbed forest corridors. No provision is made for mitigating this loss of habitat in the DEIS.	WI5
3248	<b>BOUNDARY WATERS WATERSHED:</b> There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting.	WR2A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3249	SULFATES IMPACT: Sulfates are a problem that are not dealt with rigorously in the DEIS. Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition sulfates react with elemental mercury in a process known as mercury methylation. Methylmercury is the form that bio-accumulates in fish and animals that eat fish, including humans. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for? The Boundary Waters is a very unique National Park that deserves to be fiercely protected. Developing open mine pits without the proper monitoring and regulations spells doom for this pristine paradise - if not in our generation, certainly in our grandchildren's time. Please do the right thing and protect this national treasure by addressing the above issues.	WR1E,WR4B,WR4C,WR4F
3703	The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held in escrow as a damage deposit and that amount should be specific and included in the final EIS.	PD3,PD4
3704	MONITORING PLAN?: Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. Do we just depend on the mining company to do its own monitoring? There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR.	PD2,PD3,PD5

1133 I am writing to you in support of Poly Met Mining Company, which is proposing to develop a copper, nickel, platinum, palladium, gold and cobalt mine, and process ore at the former LTV Steel Mining Company plant near Hoyt Lakes, Minnesota. My six brothers and I were born and raised on the Iron Range, and, as a young boy, we lived a short time in the area of the proposed PolyMet Mining Company. Our family later moved to Virginia. With the exception of the years I attended college, and the short time I worked in west central Minnesota, I have lived my entire life on the Iron Range. My wife and I currently reside in Hibbing. During my years living on the Iron Range, I have witnessed times when the mining industry has been prosperous, and have experienced lean years of layoffs and unemployment. The Iron Range has an eager, willing and ambitious labor force that is hungry for stable employment. PolyMet Mining will certainly fill some of the industry's current void! PolyMet and its vendors will provide our young people with multiple opportunities for challenging and exciting careers providing critical metalls needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential products. PolyMet will also provide millions of dollars in local and state taxes to support our Iron Range communities. I am excited to see the benefits that PolyMet Mining will be providing our local area, and I hope that Department of Natural Resources will find that PolyMet has properly addressed all potential environmental impacts of its mining and has shown that air, water, and natural resources will be still be protected.

2265	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. Though only twenty, I have paddled hundreds of miles over Boundary Waters Lakes and have an intimate relationship with the region. For the past two summers, I have worked as a canoe guide of sorts for the Charles L Sommers Canoe Base run by the Boy Scouts of America (located on Moose Lake). These two summers have made me aware of the peculiar and unique nature of the Boundary Waters. Only when one considers the extent of the environmental degradation that has occurred on American soil, the astounding way in which almost all of our land has become domesticated, tamed, and paved over, can someone see what the Boundary Waters is--a last vestige of the American wilderness, a final hiding ground for untrammelled nature. For me, just on these purely emotional and abstract terms, that would be enough to question any decision to dig a sulfide mine in the BWCA region. However, I think that there are also inherent economic reasons why the decision to allow mining would be detrimental to the region. Northern Minnesota has hosted several phases of resource extraction. The first white people to come into the region came for the furs, the second wave came for the lumber (in fact cutting down much of the BWCA), and the final wave mined iron. What is notable about all three of these historical economic booms is their negligible current effect: Where did the lumber wealth go? What jobs do the iron miners have now? What sustainable economy did these resource-based industries create? In reality, all of these industries created short-term, low-skill jobs while encouraging the growth of an unsustainably high population. Most of the profits went to companies based in other places and other cities (as would currently be the case with the Canadian mining companies who proposed the current project), and the end result was environmental degradation with little long-term development of the infrastructure or economic self-sufficiency of the region. In contrast, the money brought in by tourism is sustainable and generally promotes a healthy long-term economy for the region. Obviously, tourism will never create the short-term boom of the mining town. But it will also never create a painful bust. In the longterm, it is best to recognize that Northern Minnesota has finite resources. Perhaps it is best if we employ them in a sustainable manner rather than endangering our environment for the sake of a cheap and ephemeral buck.	G2,G11
3332	As a yearly user of BWCAW, I cannot imagine a Minnesota without this incredible expanse of untouched, singing wilderness. Have you ever read Sigurd Olsen? His book, "Singing Wilderness," perfectly describes the incredible, unique, and powerful majesty of the BWCAW. There is no where else on Earth like this place; to permanently damage its integrity and purity for a few years of economic profit is practically immoral. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO
<b>Sender Last Name:</b> Kemp		<b>Submission ID:</b> 2425
2916	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. As a former member of the Minnesota Pollution Control Agency Board, I toured th abandoned copper-nickel test mine near Babbit many years ago. There was pollution leaching out of that facility years after its closure, and there still is, requiring its ongoing monitoring for all time, apparently.	EOO
2917	The EIS is not adequate, and must more throughly consider the long term impacts on Minnesota's environment and future generations. I do not want future pollution officials to have to expend resources eternally monitoring and attempting to clean up toxic pollution at taxpayer's expense.	G8

3490	I am writing to express my concern about the possible negative environmental impact of copper sulphide mining on the northeastern MN ecosystem. I worry that the current economic climate may lead us to overlook possible long term pollution problems in an effort to provide good jobs in the short term. I don't understand the scientific and technical questions well enough to judge the assertion that this kind of mining can now be done so as to ensure that pollution will not occur. I am also saddened at the thought that this question may continue to divide us as a community, and would like to pursue other less environmentally risky ways of making a living than extractive industry to sustain the local economy. I am a thirty-year resident of the area and a property owner on the White Iron Chain of Lakes near Ely. Thanks for your efforts in trying to make a careful, informed decision.	G1,G2
<b>Sender Last Name:</b> Kennedy		<b>Submission ID:</b> 3475
3750	I believe the proposed PolyMet mine is an eventual inevitable future for NE Minnesota. I am all for the economic development that will be a result of this project. I am all for mining of the Platinum Group Metals when a tried, sound, safe process has been defined that will not result in serious environmental impacts for this area. PolyMet's proposal will leave too much degradation to the environment if allowed to proceed as proposed. Even the alternatives allow for too much degradation to the surface and ground waters in our area. The freshwater resource in NE MN needs to be protected for future generations. There are too many insults taking place in the name of progress to our environment, immediate and world wide that are irreversible. Need we allow for one more which impacts an already limited resource in our nation? The South Dakota mines, the Montana mines, the Colorado mines that have devastated areas from sulfide mining in the name of progress need not take place here. We have a choice to proceed differently. Let us take the time and allow those who are making large profits to define a process that will not leave our environment devastated and the local/state governments with a large investment of cleanup after the profits have all walked away. Require that the waste water be treated before being released into the environment, so the acidic properties of the water do not methylate the mercury into organics which can be taken up the food chain. I believe we can all benefit from PGM mine here, and, there is a way to make it a win-win	EOO,G2C,G7A
<b>Sender Last Name:</b> Kermeen		<b>Submission ID:</b> 363
52	This company which is newly formed has no holdings in producing mines & as of January 31, 2009 had a huge deficit & only 20 full-time employees. The company does not have finances to assure post-closure reclamation, maintenance and treatment which tribal agencies studies conclude would be necessary for a minimum of 2000 years.	PD4
402	I live in Cloquet and clean water is imported to me and is vital to people, animals, fish and the entire world, not just Minnesota. In the past I have read of the devastation the sulfide mining process has caused and left behind in the western states of the United States—even after so called promises to care for and monitor the land and water perpetuity.	G7
403	I am very concerned about the permanent damage that would be caused by the PolyMet proposal which would be only a short term economic boost to a business that would be only temporary.	G1,G2
2000	The DEIS descriptions of the modeling design as well as results from this modeling were so minimal it was impossible to review the effort properly. Polymet used many assumptions in the modeling, the most important of which related to fracture flow in the bedrock. Polymet, for convenience, assumed the bedrock hydraulically behaved equivalent to a granular porous media, i.e. soils, and that the bedrock did not have any preferred direction of hydraulic conductivity (anisotropy). But, at the scale of the modeled area, the bedrock cannot be assumed to behave as if it were an equivalent homogeneous silty-clay. The area modeled is insufficiently large, given the infrequent occurrence of fractures, to merit such an assumption.	WR2A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
2000	The DNR should request Polymet explain more thoroughly why their 3-D modeling efforts were not simply coupled to MT3D to characterize contamination transport. The DNR should request that all properties used in the modeling (e.g. hydraulic conductivity, effective porosity etc.) be discussed and explained in detail, and insist that the modeling should at least meet ASTM standards for modeling. This includes sensitivity analysis, and statistical calculations comparing measured and calculated water levels and water fluxes (movement) to streams, etc. to show the degree to which the modeling can be relied upon for projection in the future. Without this degree of explanation, the modeling results have to essentially be accepted with a large degree of faith that the work was properly done.	WR2E
2000	It cannot be assumed that the fracture pattern in the crystalline rocks does not have a preferred orientation. Fractures evolve because of regional and large-scale stress fields that geological processes impose on rocks. I expect that geologists have determined the predominant directions and even the frequency distributions of fractures in the bedrock of the Iron Range, given decades of geological research that have been done there. Polymet could even have had their geologists visit other Iron Range mines and determined the frequency of fractures and their orientation by direct observation. Using this data could very well have changed the assumptions used in the groundwater modeling effort of the DEIS and led to a different conclusion regarding how much potential mine water moving in bedrock aquifers might reach the Partridge River and other water bodies from the mine site and tailings basin.	WR2A
2002	I looked at groundwater hydrographs from multiple wells the USGS installed during the Copper-Nickel regional study (Siegel and Erickson, 1980) and saw that water levels fall on the order of 10 feet in thick till during the year. I multiplied that value by reasonable specific yields for clayey soils and came up with recharge at least several times more than that determined from Polymet model results. The amount of water calculated to potentially discharge to the mine may be factors too low, which could lead to unanticipated mine discharges to streams.	WR2A
2003	Polymet could have directly determined the order of magnitude of the amount of recharge to both bedrock and surficial groundwater systems from changes in the water levels in their observation monitoring wells, coupled to approximate specific yields of the materials (e.g. <a href="http://www.co.portage.wi.us/groundwater/undrstnd/soil.htm# Specific%20Yield">http://www.co.portage.wi.us/groundwater/undrstnd/soil.htm# Specific%20Yield</a> ; and <a href="http://water.usgs.gov/ogw/gwrp/methods/wtf/">http://water.usgs.gov/ogw/gwrp/methods/wtf/</a> ). From this direct data, Polymet could have better calibrated their surface water models and reduced error. Indeed, from monitoring water levels in their own piezometers in the bedrock, they also could have determined the extent to which the bedrock connects to or is isolated from surficial deposits and the water table. So, despite all the work done, Polymet did not collect sufficient data to easily evaluate several major aspects of the hydrogeologic system directly, but rather, chose to use a Model to do it.	WR2A
2003	Similarly, recharge to underlying bedrock groundwater could be determined directly from water level variations if available. Indeed, if conservative solutes (e.g. chloride) in groundwater sampled in deep piezometers changed from one year to the next, it would imply recharge to that horizon tapped by the well. The amount of recharge could be calculated using a simple mixing model. With respect to water levels, if Polymet did not measure water levels over time, there will be no direct way to test a major model assumption, how much recharge of precipitation and snowmelt occurs to surficial aquifers and underlying bedrock aquifers at the mine site.	WR2A
2003	I cannot emphasize too much that a difference between measured recharge rates from that assumed from modeling results does make a difference in understanding what goes on hydrologically at the mine site. All models are non-unique. Polymet argues they "calibrated" the MODFLOW model against some real hydrologic data. But this doesn't mean the models are "right". All it means is that the model could be calibrated by trial and error, changing assumptions to get a "fit." Without independent data to test the model results or history matching, there can be no assurance that the model results can be useful for future prediction.	WR2A

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2004	With respect to the Polymet groundwater modeling results, Polymet produced no water table maps or potentiometric surface maps during the mining operations, no MODPATH simulations to show groundwater velocities and flow paths before or during mining, and no hydrogeologic cross sections showing vertical flow directional and velocities. Polymet did not present critical values for effective porosity for any of their subsurface solute transport calculations or water flex calculations from the pits post closure to the Partridge River. The effective porosity in bedrock can be less than 1%, compared to 10-30% for surficial materials. The lower the porosity, the faster the water will move. So, if Polymet used a default value in MT3D of tens of percent, typical for surficial material aquifers, their solute transport could be, wrong by many times- resulting in the possibility that contaminants could reach the Partridge River much faster than what the model projected. I did a search for the word "porosity" in document "RS74A Surface Water and Groundwater Quality Modeling: Mine Site Draft 02" I found it mentioned once in the introductory material.	WR2F
2004	Nor did I see how dewatering of the surficial aquifers during mining was handled by MOD FLOW. Did modeled areas, called nodes, mathematically lose all their water? I understand that groundwater draining from surficial materials into the mine will be inhibited by engineering, whereas drainage from underlying bedrock will still occur. How did Polymet use MODFLOW to handle this engineered condition, continual saturation of the upper layer of the model, while allowing the middle of the model to drain with little recharge to replenish it? I wonder if the model basically failed to converge to a proper mathematical solution.	WR2F
2005	What MODFLOW algorithm did Polymet use to handle de-saturation in the first place? Does dewatering in the ~700 foot mine induce dewatering from the Partridge River to the mine as the pit is excavated? If the river were in hydraulic communication with the bedrock, water from the river could plausibly recharge the mine from the south. Potentiometric surface maps for all layers and fluxes calculated from the river during mine operation needed to be presented.	WR2F
<b>Sender Last Name:</b> Kern		<b>Submission ID:</b> 2208
2615	MS. KERN: I grew up on the Iron Range so I know a little bit about the project and I am in support of the project and I would like to see it move forward. I would like everything to stay safe. I know there is environmental issues about it, but I feel from the information that I have read that it is a good project and I would like to see PolyMet get some support to move forward with their copper mining.	EOO
<b>Sender Last Name:</b> Keseley		<b>Submission ID:</b> 329
34	In fact, a possible "mining moratorium law" such as in Wisconsin should be considered.	EOO
<b>Sender Last Name:</b> Kett		<b>Submission ID:</b> 2360
2847	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. I also do not believe that this project will contribute to any meaningful jobs beyond the extreme short term. If any long term jobs do come out of this, they will likely involve the clean up and monitoring of the site (i.e. government jobs).	EOO,G1
<b>Sender Last Name:</b> Ketten		<b>Submission ID:</b> 1192
1307	As a Minnesota native, I am writing with deep concern about the proposed mining project. The waters of MN are our most precious resource and should not be polluted with heavy metals and sulfates. These contaminants are dangerous to fish and the delicate ecosystem. We have to care for our waters and mining near them is not an option.	G2C,G7B

18318 Franconia believes that this draft report is a good effort and reflects the extensive work that was behind its preparation. It is also our view that, after responding to the comments, it can lead the way to a Final EIS and a conclusion of Adequacy. EOO

18319 The draft EIS is very thorough and covers all the potential impacts identified in the Scoping EAW and Draft Scoping Decision Document (June 6, 2005), including some additional concerns that were not initially identified. However, there is one aspect of the draft EIS that is somewhat confusing; that is where it appears to contain two sets of conclusions: one in the body of the report and others in footnotes. This issue was quite evident at several public meetings we have attended recently where the opinions of the American Tribal Cooperating Agencies (footnotes) are expressed as statements of fact rather than the viewpoints of one group. These opinions are often not based on facts in the Draft EIS. The carefully studied and factual conclusions of the Responsible Governmental Unit were often ignored at the meetings. This has created confusion and is misleading to the public. As you are aware, the draft EIS is intended to provide full disclosure of the technical information. Opinions should be supported by technical information contained in the draft EIS. PRO9

18320 and most of its platinum and palladium. This exacerbates our international trade imbalance, exports jobs to other countries, and creates opportunities for others to limit our availability to vital raw materials (e.g. oil). It also ignores the environmental damage in other countries where responsible mining and processing practices are widely ignored. Additionally, having to import these resources also affects our country's ability to produce value added products, including "green" products (hybrid cars, wind generation, etc.), which use these important metals. The result is further loss of job creation opportunities. According to the International Platinum Group Metals Association, <http://www.ipa-news.com/pgm/index.htm>, "One in four of the goods manufactured today either contain PGMs (platinum group metals) or had PGMs play a key role in their manufacture". As we noted, we import nearly all of our Platinum Group metals. G1

18321 Franconia believes that the EIS is complete, thorough, and well documented. We believe this should lead to a conclusion by the Agencies that the Northmet Environmental Impact Statement is Adequate. Thank you for this opportunity to comment on the Environmental Impact Statement. EOO

**Sender Last Name:**    Kightlinger **Submission ID:** 3133

3503 wanted to let you know that I am strongly opposed to the idea of sulfide mining in northeast Minnesota and the BWCA area in particular. Water is such a precious resource for Minnesota and sulfide mining does not have a good track record re: controlling environmental damage. Because northern Minnesota is such a watery area it's very naïve and foolish to think the mining operation can be safely contained. Please do not approve these mining permits – it's a bad idea and makes no sense. The few jobs that might be gained from mining can't even come close to the adverse economic impact to the Arrowhead region and BWCA due to water damage from mining. G1,G2,G7

**Sender Last Name:**    King **Submission ID:** 1152

1266 I spent many childhood summers in the BWCA and this last summer as well. Its pristineness is very important to me. No drilling sounds! EOO

3144	As a parent and a lifelong Minnesotan, I am very concerned about making short-term financial decisions that permanently diminish the natural legacy we are leaving to our children. I am very much afraid that is exactly what is happening here. Please reconsider and require that the DEIS completely answer these environmental concerns.	G2
3525	I am REALLY tired of so called 'environmental activists' completely mis-representing the draft EIS and PolyMet's proposed mining venture. These 'environmentalists' want to HALT any PROGRESS by deliberately lying and distorting the facts about this proposed project. The amount of sulfur in the rock in our area (1-2%) is drastically less than the sulfur amounts found in other areas where open-pit sulfur mines are operating (typically 20% and greater). Nowhere do they acknowledge that the water will be safe for human consumption after PolyMet has processed it. Nowhere do they admit that the existing wetlands from the old LTV plant NOW supports fish and wildlife; and this was the case BEFORE the LTV plant had access to the environmental controls that PolyMet will provide. Northeast Minnesota NEEDS the type of jobs that PolyMet will provide; and NE Minnesota should NOT be held captive to a SMALL group of rich Twin Cities citizens that visit our area for one week every year or so. These 'environmentalist extremists' claim that PolyMet is RUSHING the EIS process when in fact the process started in 2006!!! I do not consider 5 years and millions of dollars spent in complying with EIS guidelines to be RUSHING anything! Please let us enjoy the benefits of working again in the industry for which we have been trained - MINING; and do not let a bunch of rich fat cats using lies and distortions prevent us from providing for our families!!!!!!	EOO
3870	As a resident of the arrowhead region, I feel strongly that the potential resources available from this initiative are not worth the impact it will have on a local and greater environment. Elli King PO Box 526 Finland, MN (No unrelated mailings please) 1800-619-3772	EOO
<b>Sender Last Name:</b> Kingery		<b>Submission ID:</b> 3331
3624	Issues to think about: A short term economic gain is the main issue at stake. There are other options to build economic strength. This project has so many issues and the people of MN and the rest of the world deserve better. Health issues, water quality, wildlife, eco-tourism – Look what is in danger. The main threat is water – 50% of the endangered species need water or wetlands to live. Let’s make the right decision about the environment + economic strength.	G1,G2C,G7,G11
<b>Sender Last Name:</b> Kingston		<b>Submission ID:</b> 3111
1289	4) Require resolution of tailings basin geotechnical stability and seepage issues identified by the Tribes and the U.S. Environmental Protection Agency.	GT2
1884	3) Require detailed and cumulative impacts of potential mercury increases in fish as related to the PolyMet project and other nearby pollution sources, including mercury methylation as well as discharge and emissions. All lakes in the White Iron Chain of Lakes currently have mercury advisories for fish consumption, and this is an area of vital importance to members.	WR5C,FM1,FM3,AQ6A
3516	1) Include cumulative air and water quality effects on lakes and rivers from all sources, including other mines. This EIS may set the standard for all water quality impacts analysis, and good cumulative impacts analysis is critical to protect water quality in the White Iron Chain of Lakes.	WR5A,CR1,AQ4B
3517	2) Include future development of sulfide-mining by companies already doing exploratory drilling in the analysis of cumulative effects. (Tribal position)	G9
3518	5) Require financial assurances in the EIS before any permitting process gets underway. (U.S. EPA position)”	PD4

2025	Lake Superior is one of the largest fresh water sources left on the planet. With global climate change progressively making fresh water more of a commodity, I find the idea of allowing this kind of pollution to take place incredibly irresponsible and arguably suicidal.	EOO,G7B
<b>Sender Last Name:</b> Kireta		<b>Submission ID:</b> 3520
1126	The PolyMet mine will obstruct at least 2 of the remaining 13 corridors where wildlife can cross the 120 miles of the Mesabi Iron Range. These corridors are important not only for mammals like moose and wolves but also for the northward migration of the deciduous forest and all its components in the face of climate change. The DEIS ignored the mine's impact on wild corridors	WI5
3251	I am concerned about the impact on fish and wildlife of the proposed PolyMet Mine in Superior National Forest and urge you to better analyze the proposed mine. Of particular concern are the following issues, which were not adequately explored in the Draft Environmental Impact Statement (DEIS): 1) Mercury. Increased levels of sulfates leached from the PolyMet Mine will increase mercury accumulated in fish tissues, causing harm not only to the fish but to animals and people who eat the fish. The DEIS did not adequately analyze the potential impact of the mine on mercury levels in surrounding waters and fish.	WR1E,WR4B,FM1
3252	The PolyMet Mine will result in enormous sulfate releases that will exceed the state standard for wild rice, which is sensitive to sulfates. These sulfates will likely eliminate wild rice in the Partridge and Embarrass Rivers, and diminish the famous wild rice beds in the St. Louis River estuary near Duluth, which is 100 miles away from the mine. The DEIS did not adequately analyze impacts on wild rice and the associated health and economic impacts. Please protect the fish and wildlife that currently thrive in Superior National Forest and safeguard this area for future generations.	WR1E,WR4F
<b>Sender Last Name:</b> Kise		<b>Submission ID:</b> 1545
1889	This is not okay. As a person that goes to the boundary waters area multiple times during the summer i think this is absolutely not okay. It's going to ruin the environment and the atmosphere up there as we know it with irreversible changes during our life times. Stop.	EOO,G11
<b>Sender Last Name:</b> Kitterman		<b>Submission ID:</b> 3173
716	SLOW DOWN - EXTEND THE PERIOD IN WHICH YOU CONSIDER ALL ASPECTS OF THIS ISSUE!! DON'T MAKE AN INCREDIBLE ENVIRONMENTAL STEWARDSHIP MISTAKE HERE FOR THE SAKE OF SHORT RUN JOB NUMBERS IN NORTHERN MN!	PRO6
2517	I am writing today to express my extreme concern over the mining project that is being considered in northern Minnesota adjacent to the BWCA. I do not feel that adequate consideration has been given to the citizens of this state to decide if this mining project is a good long term decision for our future generations. Only a nominal amount of research on my behalf suggests that this class of hard rock sulfide mining is extremely deleterious to the health of the watershed. Historical records reveal that the prophylactic measures suggested by the mining companies are likely to be only marginally effective in the short run - and the effects of the acidic runoff are there to be delt with for thousands of years to come. Actually, I am a little shocked that our political and civic leaders - who we depend upon to protect our clean waters - would allow this process to develop to the point that it has without allowing for adequate input from individuals like myself that love the BWCA and Voyageurs' Ntnl Park. Please I admonish you to take a step back and reconsider this process that seems to bringing a potential threat closer to reality. Don't you want your grandkids to be able to hook a smallmouth bass in the BWCA? Wake up! I am not a political radical - just another guy who loves the BWCA - don't class my letter in with the tree huggers and bunny humpers. I am all for jobs in Northern MN, but we MUST KEEP this in perspective.	G1,G7

3124	We (my family members) are deeply concerned about the long range effects of sulfide mining on the watersheds on north side of the divide. Short range measures to minimize the deleterious effects of acidic runoff and groundwater penetration have not been proven to effectively halt the long term pollution potential for the BWCA which is just adjacent to the north of the Duluth Mining and the Franconia test sites.	WR1A
<b>Sender Last Name:</b> Kivela		<b>Submission ID:</b> 3662
1	Worldwide demand for copper and nickel continues to increase. Minnesota has legislated power companies to generate 25% of their electricity from renewable energy sources by 2025 with wind turbines providing a significant portion. Across the U.S. the demand for electricity generated by renewable resources is also rising. Mega-watt for mega-watt the construction of the average wind generation facility consumes 1.5 times more copper than a similar sized coal fired facility. Assuming the demand will be met, we must ask ourselves is it better to purchase foreign supplied materials produced under less strenuous environmental practices, or produce it where we can monitor the process. Though the draft Environmental Statement appears to have several figures improperly labeled, tables improperly referenced in the text, and typographical errors the document appears to address the environmental and economic impacts. The errors do not appear significant and additional EIS findings and mitigation review will be short and a decision of adequacy is in the near future. I have seen the good and bad of mining. I live, work, and play near the proposed PolyMet Mining operation and could be among the first to experience any impacts. Understanding the need to balance the preservation of our local and global environment versus the economic impacts, I feel the project is environmentally and economically preferable and sustainable and I wholeheartedly support it.	EOO

113	I am for the Polymet project. It will benefit our portion of the state with jobs and tax revenue, and the whole state which definitely needs more tax revenue. I live in the area and want clean air and water and believe Polymets plan will assure this will happen.	EOO
3554	I am 100% in support of PolyMet. We need to do everything we can to bring industry and jobs to the Iron Range. Right now, most of our young people are moving away to the Twin Cities and other large cities. We must make life on the Iron Range sustainable to preserve our way of life and our industrial history. And the address part should not be optional. The residents of northern Minnesota should take precedence over "once-a-year-if-that" visitors. We have families to feed, and we are struggling to stay here. They shouldnt have any say in what we do with our area. We do not have any say about how they live in the Twin Cities!	EOO
3574	I am for the Polymet project. It will benefit our portion of the state with jobs and tax revenue, and the whole state which definitely needs more tax revenue. I live in the area and want clean air and water and believe Polymets plan will assure this will happen.	EOO

2000	There needs to be further documentation of flow velocities that MODFLOW (Mod path) and MT3D calculated throughout the model domains before mining, during mining and after to provide credence to the model results. The essential conclusions of the modeling relating to discharge of potentially harmful waters from the closed mine site tie directly to the values of effective porosity used in the models. I do not think, from my reading, that Polymet only considered groundwater flow through surficial materials from the pits postclosure, and readers need to clearly know how the models were put together and the degree to which they are calibrated on real data or simply "heuristic" or theoretical.	WR2F
2000	Given these modeling uncertainties in recharge rates, flow rates, flow velocities, effective porosity, dispersivity, and calibration points, even if water levels and discharge to streams numerically agree with that measured, the modeling does not provide certainty in forecasting. In the absence of proper and multidisciplinary field calibration using chemistry and water levels, there can be no assurance the models, in fact, worked. For example, hydrologists for decades have used isotopes of water and carbon to measure groundwater ages and how long water in groundwater flow paths has been in the ground after recharged as rain or snowmelt. These independent data could have been used to clearly determine if the timing of water flow in complex flow systems calculated by models are at least in the right ballpark. For example, if no tritium were measured in water sampled from the deep Virginia Formation, then it can be at least assumed that the water in it must be at least 60 years old (Clark and Fritz, 1997). From the carbon isotopes in the dissolved inorganic carbon in it, Polymet could have determined if the water in the Virginia formation were 100's or 1,000's of years old. If water were that old, the issue of bedrock water impacting the mine would have been moot-flow rates to the mine would be so small as to be negligible.	EOO
2000	In the case of the flow paths south of the hypothetical closed mine, I was struck that a constant head boundary (same and constant water level) was used throughout the complete extent of the surficial sediment to the base of the rock units as a boundary condition upgradient, as well as on the Partridge River side. Polymet needs to justify this kind of boundary condition, akin to what would be a lake edge. Doing this forces water flow to be horizontal and technically speaking, "over-conditions" the flow system hydrodynamics. Basing flow paths on a constant head boundary in this manner forces discharge from the bedrock into the river, conceptually as if the river cut through the bedrock hundreds of feet. Moreover, actual head values (water levels) for these boundaries used in the model seemed arbitrary and "selected" to match the predicted hydraulic gradient. Yet, Polymet prepared a working three dimensional groundwater flow model for the mine. Why did Polymet choose not to simply add onto this model a solute transport component? This is what MT3D was designed to do, calculate solute transport in three dimensions coupled to MODFLOW. So, I don't fully understand why Polymet downgraded their model for solute transport post-mining to two dimensions along multiple flow paths, when the presumptive theoretical plumes of multiple contaminants from the closed mine could have been broadly simulated through normative coupling of the modeling modules and locally adding more rows and columns in the model as needed where more detail was desired.	WR2F
2000	3. I found that Polymet installed insufficient ground water monitoring wells and piezometers inbedrock to either characterize where and how ground water in bedrock moves across the mine site, or how it interacts with the Partridge River. The DNR should request additional (~6) monitoring wells in bedrock be installed south of the proposed mine area in an array sufficient to determine these issues. At several of these installations and some north of the mine site, piezometer nests should be installed in the Duluth formation and underlying Virginia formation to determine vertical head gradients. Installations with screens crossing these units serve no purpose in determining what happens between them. Finally, the DNR should install piezometers and water table wells adjacent to the Partridge and Embarrass Rivers where presumptive flow paths may end to determine if these streams lose, gain, or have no influence on groundwater flow in the bedrock underneath them.	WR1B,WR2A
2001	However, the boundary conditions used by Polymet for their post model scenario 2-D modeling do lead to a worst case scenario for the Partridge River, insofar as all the water from the mine winds up in the river, but it does not show what might happen under the river. Perhaps Polymet can do a sensitivity analysis to show that putting a constant head boundary only at the river node and in surficial materials, but not in the bedrock too, would not change, the results. When the pit water might reach the river is highly predicated on effective porosity values for which I have no information. Perhaps Polymet did their model at steady state after it was assumed that flow paths reached the river. This needs more clarification.	WR2F

2005	I found it particularly troubling that Polymet could have directly determined how water moves in the shallow subsurface and bedrock at the mine site area in the field, but it was not done. The overall properties of the surficial materials and their connectivity to the uppermost bedrock probably are generally similar in the mine area, including where the tailings basin occur. The existing tailings pond at the proposed plant site has been in operation for decades. Had a series of piezometer nests (wells at different depths at the same location) been placed in the bedrock with a water table monitoring well perpendicular to the pond downgradient direction relative to the pond (towards the Embarrass River), a great deal could have been evaluated about how contaminant transport occurs in surficial materials over large distances and under elevated heads (driving force)-including characterization of the degree to which loss of potential contaminant metals by sticking to organic matter (sorption) to soils might occur, natural attenuation. Instead, Polymet chose to use modeling to estimate the effects of solute transport from the future new mine tailings pond to the subsurface. Yet, the opportunity was there to actually calibrate such a model against real field data. My suggestion does not constitute a "research topic" from an academic reviewer. Rather, doing this exercise would have provided proof of the concept that the models being prepared, material properties assumed, and so on, were properly configured. I have the same concerns with the modeling Polymet did from the tailings basins as with the other groundwater models done by Polymet: poor documentation of results, assumptions that cannot be tested very well because of insufficient instrumentation, and inarticulated logic behind the work. This is a missed opportunity if I have ever seen one.	EOO
2006	The quantification of ground water discharging to the Polymet mine may be reasonable. But, insofar as groundwater discharge seems to be the largest part of water entering the mine, the modeling needs to be clarified and maybe tested by some simple back of the envelop calculations using Dupuit Foresheimer equation or even Darcy's Law outright. I am not saying the results of the modeling are wrong. I am saying I can't tell if Polymet may be right or wrong from what was provided in the DEIS and supporting technical documents which I reviewed. If they are wrong, then contaminated ground water could very well reach the Partridge River faster than assumed in the future, and dewatering of aquifers around the mine may be greater than assumed from the models. Additionally, the amount of water entering the mine may be less than anticipated with attendant issues related to disposal.	WR2A
2006	So, I have to ask, What background values will the DNR use to compare future scenarios against each other? Will they use these compromised metal values or something else? Will the DNR only look at sulfate? Specific conductance? Dissolved heavy metals of interest? Or will the DNR choose to have consultants continue only to sample for "total" metals, thereby insuring false positives some of the time by virtue of human error and natural hydrology? Total analyses do not reflect what is dissolved in the water, but incorporate nonsystematic introduction of sediment and other debris during sampling and easily produce false-positives, leading to indications of contamination when it does not occur.	RFI
2006	Total and dissolved metals concentrations are apples and oranges. Total metals concentrations for major dissolved metals, calcium and magnesium, as well as iron and manganese may not be useful either for MCL comparison purposes for the same reason---they measure a combination of entrained sediment and what actually is dissolved in the water. Polymet compromised the ability to use the gathered background data for scientific comparison to aid in assessing potential future contamination by adhering only to the regulatory standards that use totals metals for all but a few of the metals of regulatory interest. This concern includes samples of ground water collected at the tailings basin area. Here too, there appear to be some violations of standards that may reflect not what is dissolved in the water, but what was stirred up into the water from the surrounding immobile soils as part of the sampling process. Perhaps the DNR insists that total analyses be used to characterize contamination, but if so, it is wrong, and Polymet's consultants needed to protect their client from unreasonable false positives. Nobody will drink dirty water, and my evaluation of much of the groundwater water quality data is that much of that sampled water was dirty from soil and rock flour particles stirred into the sample during the sampling process.	WR1E

2006	Most of all, even EPA recognizes that MODFLOW models produce very limited results when water moves in fractured media at the scale of this investigation. (e.g. <a href="http://www.epa.gov/tio/tsp/download/2003_meeting_fall/final_modeling_panel.pdf">http://www.epa.gov/tio/tsp/download/2003_meeting_fall/final_modeling_panel.pdf</a> ). The MODFLOW approximations used by Polymet, while possibly reasonable with respect to quantities during mining, do not have sufficient robustness. with respect to directions and rates of groundwater flow before and after mining concludes, and the degree to which subsurface contamination might move to the Partridge River. The modeling discussion and reportage did not include what normally are considered minimal requirements for model reporting suggested in textbooks (e.g. Anderson and Woessner,1992; American Society of Testing Materials, available at: <a href="http://www.astm.org/Standards/D5718.htm">http://www.astm.org/Standards/D5718.htm</a> ). Any description of a groundwater or solute transport model should at least include: 1. maps showing boundary conditions for each layer and distribution of material properties; 2. plots of calibration data against modeled results, and calculation of root-mean squared and other statistical parameters to show model calibration results statistically; 3. water level maps for transient conditions for water table and underlying stratigraphic units (mining conditions, in the case of this study); 4. hydrogeologic cross sections at steady state and under transient conditions (if appropriate), including flow paths and seepage velocities; and 5. a sensitivity analysis to show how assumed parameters condition model results.	WR2E
2006	Polymet characterized surface water resources in the proposed mine area by synthesizing USGS, MPCA and other prior and existing data resources and then developing mathematical models to evaluate the extent to which leakage from the closed mine via ground water and potential pit overflow would impact the Partridge River; which already receives significant discharges from taconite mines. The USGS and other agencies have no stream gage near the proposed mine site, so Polymet used modeling approaches to estimate what streamflow might be. It would have been far more valuable had Polymet installed stream gages immediately upgradient and down-gradient of the proposed mine, and then made discharge measurements there and at former USGS sites. Then, the assumed relationships between river discharge at the mine and much further downgradient at the USGS site could have been statistically verified.	WR3J
2006	I agree with using empirical analog observations, looking at what water levels may have done elsewhere when a mine excavation occurs, as a check for what would be probable and whether MODFLOW results can be considered reasonable or not. Indeed, looking at what has happened at other mines can be very useful given the similarity of broad hydrogeologic settings in the Iron Range. But these analogs examples need to be explained in much further detail than found in the DEIS to argue convincingly that water level changes to shallow and bedrock waters around the proposed mine will be negligible (DEIS, Vol. I at 4.1- 61).	WR2A
2007	But, knowing the true flow path directions and if groundwater in bedrock flows under the river may be important. For example, if subsurface contaminated water bypasses the Partridge River, it could move north towards the larger regional lake hydrologic discharge zones within the Boundary Waters Wilderness. The volume of water and degree of contamination probably would be slight, but at least the plausibility of it happening should have been addressed for completeness.	WR2A

266	I am writing to show my support of the Northmet project and am urging your Agency to support the recommendations of the draft EIS. The development of a precious metals mining industry is vital to the economy of Minnesota and especially to the economic future of Northern Minnesota. More importantly, the draft EIS indicates that the NorthMet project can be developed successfully while at the same time taking the needed precautions to minimize negative impacts on our environment. Our company has been engaged in the environmental engineering practice for more than 40 years and we are confident that the NorthMet project can be designed, constructed and operated in an environmentally safe manner. Additionally, the iron mining industry has been a significant economic driver in Northern Minnesota for more than 75 years, providing jobs to area families and enhancing the local tax base. The opportunity to diversify our mining industry to include precious metals mining indicates that mining can continue to contribute to our economy well in to the future. Another vital component to this economic initiative is that by generating and processing strategic metals here in Minnesota, we are able to reduce our dependence on importing these materials, and this is in the strategic best interests of the United States. Supporting the Northmet project is in our collective best interests and I urge the State and Federal Agencies involved to show their approval of this project.	EOO

**Submission ID:** 3663

1	This letter is in regards to the proposed PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Upon personal review of the draft DEIS it is my opinion as a resident of Minnesota that this project should absolutely not be allowed to proceed.	EOO
2	What proof does Polymet have that they can mine sulfide ores without environmental pollution? Have they mined sulfide ores in the past and not polluted? What is their track record and what assurances do we, as citizens of Minnesota, have that OUR environment will not be permanently damaged?	PD2
3	Polymet's own DEIS statement predicts violations of water quality from water running off waste rock piles for up to 2000 years (DEIS Table 4. 1-45). It also predicts that the West Pit will overflow at year 65, contaminating the Partridge River (Table 4. 1-64) which flows into the St. Louis River and then into Lake Superior. This water pollution contains mercury which negatively affects the fish population. Part of the DEIS statement includes that waste rock from the sulfide mine will be piled on old LTV waste sites, some of which have liners, and some don't. How can a company pile waste rock from the sulfide mine on top of taconite waste piles that are already polluting and call itself environmentally conscious? Please explain to me how the DNR will allow this type of water pollution? It is not a matter of if, but when and how bad the pollution will be according to the DEIS. How can the DNR allow a major polluter to operate	RF1,WR1E,WR3A,WR5A,G
4	methylation? Polymet proposes to use the existing taconite mine tailings basins for disposal of sulfide mine tailings, but the stability of these tailing basins has been a serious concern since the project was first proposed. The DEIS acknowledges the potential for basin structure failure and Polymet has failed to address the safety issues and indicated instead that "further design and analysis would occur during permitting" (4.13-2). How can a mining company receive a permit to sulfide mine when appropriate due diligence is not performed? Failure of these basins would result in serious and long-lasting contaminations. What measures are in place to prevent the basins from failing? What happens when they fail?	GT1,GT2

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
5	I have a couple of major concerns. I think the issue of the tailings basin is a big concern. I think the tailings basin itself is going to fail. There is no plan in place to save the environment once that tailing basin breaks loose. We've had that issue happen before, we had the pit up at Milepost 7 in Silver Bay that blew loose. We had the pit at Taconite Harbor that vacated how many millions of cubic feet of taconite tailings and that went across Highway 61, and we've waiting for an environmental disaster to happen in northern Minnesota again, so my concern is the -- I should say is the inaccuracies and poorly designed tailing basin that LTV Steel had that they plan on using; the liners, construction of the basin itself I think is inadequate. The boulders that they're going to be dumping from these massive 200-plus-ton trucks are going to rip through the liner and cause extensive damage to the liner.	EOO
5	Polymet's DEIS statement predicts that designated critical habitat for the protected species of the Canadian Lynx and the gray wolf will be destroyed. Deer habitat and travel corridors will be destroyed. The DEIS acknowledges that habitat will be lost for all animals and that there will be an increased risk of animal/vehicle collisions. Please explain how a federally protected animal such as the gray wolf should be allowed to lose critical habitat. Under the proposed land exchange, does the DNR come into possession of designated critical habitat for the protected species of the Canadian Lynx and the gray wolf? How does the DNR rationalize that this is a good decision for Minnesotans who pride themselves on the diverse environment in which they live?	WI1
6	Polymet proposes to destroy both directly and indirectly 1500 acres of wetland in the mining of sulfide ores. This would be the single biggest loss of wetlands in the history of the Army Corps of Engineers. Most of these wetlands are high-quality peatlands. The destruction of 1,000 acres of peatlands would result in a two percent increase in Minnesota's overall carbon dioxide emissions. Mr. Ahlness, please explain how you rationalize this destruction of our precious wetlands? Reports from the MN State Legislature and Governor Pawlenty call for the protection of peatlands for their ability to capture and secure carbon. How can this destruction be permitted? These wetlands cannot be replaced, so what are the other options? How can the Army Corps of Engineers allow this wetland destruction? How do we offset the two percent increase in carbon emissions?	WE2,WE4
7	The DEIS acknowledges pollution as fact. Who will pay for the cleanup of the pollution? What happens if PolyMet declares bankruptcy and cannot financially pay for any cleanup? Who is financially responsible for the cleanup – the taxpayers of Minnesota? The environmental cleanup costs should not fall on the citizens of Minnesota. If monies are not in place from PolyMet, than the project should not be allowed to proceed. If PolyMet, a foreign company, is allowed to reap the financial benefits of its proposed mine while ravaging the environment of Minnesota without penalty than that will be a travesty. What assurances do the taxpayers of Minnesota have that they will not be saddled with a cleanup bill?	PD4
8	4.7-1—"The region has traditionally supported various mining activities as well as logging on federal, state, county, industrial and private forest lands. Review of aerial photography and public records indicate that there are few noise sensitive areas or receptors such as residences, campgrounds, and national wilderness areas within the Project vicinity." What tests determined that noise won't be heard in the Boundary Waters 20 miles away? How do you determine effects of noise by sight rather than by sound (aerial photographs)? Was it determined that more noise is ok because there has traditionally been noise in the area? How does 24 hour a day noise affect the character of the land? This doesn't give credibility to the impacts on wildlife.	RF1,WI2,N1,N3,N4
11	I talked to the people at the meeting in Aurora last night and they had no plan in place to catch this water that's going to be exiting, they had no way to monitor it, so it's an intangible, so we need to address the water coming out of the tailings.	WR3A
12	The next big problem is the leaching that's going to come from the waste piles. The waste piles are the same thing, you take a 900-foot hole and you take 900 feet of earth, how many thousands of cubic yards, pile it up on top and you get the rain water leaching into that sulphur-based core and it's going to run off that pile and it's going to run right down into the Embarrass River and the Partridge River. There is no containment that can be designed and there's nothing that's been designed in the pilot plant in Hibbing, Minnesota, situated in the control lab atmosphere that's taking into account what the actual situation is going to happen, and this is a big concern of everybody. Everybody is concerned about clean water and what we're going to have to live with.	WR1C

13	Counsel for WaterLegacy. Furthermore, why does PolyMet’s DEIS not contain an alternative underground mine option?	ALT3
14	3-50. (3.2.1 No Action Alternative)—Tribal cooperating agencies disagree with the assumption that the proposed project would only result in social and economic benefits. The environmental impacts of the project on the 100 Mile Swamp, an undisturbed and very high quality wetland complex, would constitute a social impact. Furthermore, economic development that is not centered on heavy industry (tourism for example) would be adversely impacted by the project. How will these social and economic problems be dealt with: the social impact of the 100 Mile Swamp and the loss of tourism revenue to dependent businesses? The economic reality of Northeastern Minnesota clearly shows that the stable source of the economic engine is from non-mining jobs. According to Tom Powers from the University of Montana Economics Department, mining only represents 5% of the total personal income in Minnesota’s iron range counties.	ALT1,SE4
32	<b>SOCIOECONOMIC IMPACTS</b> • Weakness of a mining economy are not adequately addressed in the DEIS. As quoted from the Tom Powers report, “The Economic Role of Metal Mining in Minnesota”: Mining inevitably depletes economically viable ores, forcing mines to be abandoned. Usually the very process of mining, concentrating, and refining the metal ores creates relatively permanent environmental damage: huge open pits, massive waste piles, extensive settling ponds, heavy metal pollution, acid mine drainage, etc. These reduce the attractiveness of mined-over areas to new residents and businesses, making it difficult for mining areas to diversify their economies. • The advancement and possibility of PolyMet being permitted has destabilized the real estate market in areas of northeastern Minnesota where the MDNR has leased and offered for lease state mineral leases. People do not want to live near a sulfide mine and property values are already being affected by the possibility of PolyMet's approval. • The economic analysis of the DEIS must be rewritten to address the above concerns.	SE4
42	This is not the old “mining as usual” of the past, such as seen in iron ore or taconite mining. When compared to sulfide mining, iron ore and taconite mining is quite benign, yet has left plenty of environmental pollution problems that we, in Minnesota, are still dealing with. Sulfide or nonferrous mining poses serious environmental threats to water via acid mine drainage or AMD which is one of the worst mining related environmental problems. AMD typically occurs in sulfide mining operations where sulfide-bearing ore comes into contact with air and water. Sulfuric acid is produced and can then leach into other bodies of water and pollute entire water sheds. The PolyMet proposed project’s AMD will flow into the Partridge River joined with the Embarrass River, flows into the St. Louis River, and finally into Lake Superior---the cleanest of the Great Lakes.	WR3D
59	1) Too few public meetings There simply are too few public meetings in the state of Minnesota to adequately inform the public of this precedent-setting mining project. At both of the meetings held already, the public was sequestered because the expectation was that there would be too many people at the “public” meetings to be able to discuss openly, and have questions and answers given, as is the case in a NORMAL public meeting process. Procedures for the two “public” meetings were changed in response to your concerns over having too many people at the meetings. Obviously, on such a significant project, to be able to allow active participation by the public there should be more public meetings scheduled throughout the state, which would result in more manageable numbers of people at each of the meetings.	PRO6
60	2) Timing of the public meetings The Draft EIS, which came out in mid November, 2009 allows for a public comment period until February 3, 2010. The timeline and procedure for public study and review of the 1500+ page DEIS, as determined by the DNR and the Army Core of Engineers is utterly ridiculous. It took almost five years to create the DEIS. Could not the public of Minnesota have more than 100+ days to review it? The people of Minnesota are just now becoming aware of this massive issue.	PRO6
61	There are not sufficient paper copies of the document—most libraries in the northern cities and towns have not even been allocated one DEIS paper copy. Many people do not have access to a computer for the length of time it takes to read through this huge and complicated Draft EIS to learn about this precedent-setting project and express their opinions. Many people in outlying Minnesota do not have reliable computer service or do not have computer service at all.	PRO6

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
62	Experts have hardly had the chance to review the information and many members of the public are just now beginning to learn what sulfide mining is. Thus, the urgent need for additional public meetings after the New Year so that the public can become educated about the environmental impact of this type of mining, and to become informed enough to make up their own minds. Only two public meetings, both in the month of December, which is most inconvenient for many people is certainly not enough for this controversial landmark project.	PRO6
63	3) Location of the public meetings The location of the two public meetings was poorly designed. The need for public meetings in many locations is imperative instead of just one meeting in northern Minnesota in Aurora, and a single Twin Cities meeting in Blaine, which is remote from the population center. This review process set up by the DNR was designed to make it difficult, if not impossible, for effective public access to information and the opportunity of give oral comments.	PRO6
64	4) Format of the public meetings The entire public meeting process is flawed, by not soliciting public comments at the two meetings held in Aurora and in Blaine on this massive project. No public debate or open discussion was allowed. The public was deprived its right to having the opportunity to publicly	PRO6
65	voice their opinion and hear other people's opinions. Furthermore, hearing only from the consultant for the agencies on its own draft EIS is simply ridiculous. Then, adding "salt to the womb", let's be sequestered and made to listen to two politicians in Aurora and three politicians in Blaine promote their belief that the PolyMet project is the best thing since "sliced bread" for the state of Minnesota! This cannot be called a "Public Meeting."Both meetings were "a one-sided propaganda" meeting in favor of PolyMet and sulfide mining. It is my belief that some members of the public who only hear from the consulting firm for the mining company and the politicians promoting the DEIS will certainly be intimidated and will be reluctant to express concerns that are different from those in the DEIS. Interestingly, the following legislative officials: US Rep. Oberstar, US Senators Klobuchar and Franken, State Senators, Tomassone, Bakk and Saxhaug, and State Representatives Rukavian, Dill, Anzelc, and Sertich had all come out in support of the proposed mine prior to the public meetings.	PRO1,PRO6
66	1) Extend the comment DEIS period to at least the end of March, 2010, or later. The public needs this amount of time to read and understand the implications of the DEIS before the comment period is over.	PRO6
67	2) Schedule more meetings in January and February in Duluth, Rochester, Mankato, Brainerd, St. Paul, and other cities. This is the first ever proposed sulfide mine in Minnesota being considered for permitting---the people of Minnesota have the right to be informed.	PRO6
68	3) Let's get the "public" back into the public meeting. Operate as a public meeting with members of the public being able to speak into a microphone before a group and have their comments transcribed by a court reporter. (Instead of a one-on-one speech to a court reporter as in the Aurora and Blaine "public" meetings.) This is the standard procedure used for meetings involving environmental impact statements. By listening to and having the opportunity to respond to others at the meeting, the public becomes informed and more understanding of the very complex issues involved in the DEIS.	PRO6
69	4) Get rid of the politicians! Along with the consultant's opinions on the DEIS, let's get some balance into who gets to present. Other cooperating agencies who are formally involved in the process (the Tribes) should have a representative speak before the public. Furthermore, it is my belief that a representative of a formal environmental organization should also be allowed to speak at the public meetings, and share more fully the concerns that this new type of mining to Minnesota will have on the environment.	PRO1,PRO6
114	I just wanted to say that I am for clean water. I am against the mine operation starting in theAurora-Hoyt Lakes area. I think the environment should trump everything. I think clean watershould trump everything. It's a resource that cannot be renewed, once it's polluted, and I think that's what the mine will do. There is a lot of jobs at risk, obviously, but there is a lot of other avenues that I think we can take, other avenues such as industry, manufacturing, that would create jobs, rather than a mine, that's going to affect the environment, so that's it.	EOO,G7
125	And my concern is the impact of PolyMet and the water that is going to be exiting the plant and creating the sulphide issue that everybody's concerned about. This is not jobs, this is clean water; I am for clean water and I'm for preserving what we have.	G7

126	The State of Wisconsin has boycotted it, the State of South Dakota has boycotted it, why does Minnesota have to be a guinea pig for 400 jobs. After 20 years, 95 percent of the jobs that are going to be let -- are actually going to be gone and these people are going to leave the area, so we're going to have five percent of 400, 400 jobs and the environmental disaster that's going to happen here is just paramount, we cannot allow this. So as a citizen of northern Minnesota and the state of Minnesota, I am strongly against this until further studies have been done.	G1,G8,G12
127	The EIS that's been written is not up to the standards it should be and I think we need to take a strong look at this, 400 jobs is not worth it. We can stick to something that's more sustainable. We've got somebody that's going to get a job there 25 years old and they're going to work for 20 years and what happens then; unemployment. We can continue the situation that northern Minnesota has right now; uneducated kids finish school, high school, go get a job in the mine, running around with their truck and that's it, and that's it, what do they have, children, and then situations exist, it continues on and on and on, so we need to, as the State of Minnesota, evaluate this and stop the action right now and a no-action plan on this and let this thing lie. We don't need the minerals that bad. And that's it.	G1
134	My name is Kevin Koschak from Andover, Minnesota. And as far as the PolyMet proposal goes, I am against the creation of a sulphide mine in northeast Minnesota. I think that after reading the Draft EIS proposal, the admittance of PolyMet at this -- the tailings pile would leak and ground water will be compromised, whether it's in ten years or 20 years, they don't know. Our Great Lakes and Boundary Waters are our precious natural resources that the State of Minnesota promotes and hawks for tourism and generates billions of dollars to the state in tourism and revenue, and to see those areas possibly polluted would kill a viable tourism industry that as of now is supporting small towns such as Ely and all the other Iron Range facilities. As far as the Lake Superior tourism goes, if they had dead sea caused by sulphide waters that are polluting, killing fish, that would be a big black eye for the State of Minnesota all for the short-term economic gains of 400 jobs that most of which are not even going to be hired from in-state or locally in the Hoyt Lakes/Ely area, and I believe most of those jobs are going to be outsourced or they'll be brought in. I don't know, there's not many four-year graduates in geology that live in Ely, Minnesota, right now, so I think that a lot of those jobs are going to be filled from either the Canadian firm themselves or likewise. As far as the Canadian firm goes, I just don't think that Minnesota needs to be a guinea pig for a foreign firm to come in and decide to try, and I stress the word "try," to do this sort of mining in an environmentally responsible way. I think that it has never been proven to be done in any sort of an environmentally responsible way. Michigan has gotten some severe problems, as far as the Colorado River in Colorado is completely destroyed because of sulphide mining and all they're asking to do is put a different liner in for tailing and I don't think it's going to work. The State of Wisconsin has a moratorium on mining, this type of sulphide mining, and I believe Minnesota should have the same thing. I mean, we have only X amount of precious resources that we have left, I think we need to protect them. If we want to mine, I think the iron ore mining is great, that's a totally different animal, that's been wonderful to the northeastern portion of the state, and obviously in the country as well, with the iron ore exports and steel production, but this type of mining I think has got far too many economic consequences that could possibly wreak havoc to the Boundary Waters, which, you know, generates over a million visitors a year. And then Lake Superior, I just think it's just too much, in terms of environmental and tourism, you know, destruction, I think it does not add up to the fact that we're going to get 400 jobs that in the end are going to fizzle out in less than 20 years. Because progressively, according to the EIS, as there gets less and less rock to mine, you're going to have less and less people to do it, so these 400 jobs are going to be mostly short-term in the state of Minnesota and, in essence, the taxpayers are going to pick up the tab for the clean-up after that Canadian firm pulls out and calls it aday. That's what I have.	EOO,G1,G4A,G7A,G11,G1
362	I have grave concerns about the PolyMet copper sulfide-mining project because I firmly believe that our present clean water sources are in jeopardy if this project is permitted. Furthermore, the lives of those who depend upon these water sources will be negatively impacted into perpetuity.	G7
363	If approved, other mining companies such as the Franconia Minerals and Duluth Metals, also both Canadian companies, will be right behind seeking their permits to mine in Minnesota. These later two mines, if approved, would be mining at the doorstep of the Boundary Waters with their AMD flowing into Birch Lake, the entire Kawishiwi Watershed, into the BWCA and all the way to Hudson Bay.	G9

364	<p>The politicians do not want to allow the public to make their own decision on the DEIS. No, let's tell them [the public] what they should think and do. Let's allow the mining companies to continue to convince our legislative officials and politicians that sulfide mining is the best solution to solve the "jobs" problem for northern Minnesota. Note the following information from the book "The Buzzards Have Landed" by Laura Furtman (regarding the Flambeau Sulfide Mine in Ladysmith, WI): HOW MINING COMPANIES MAKE INROADS INTO A COMMUNITY A mining company makes inroads by: • Getting to know those people presumed to be the decision makers in the community. Mining officials will woo local leaders, become their friends and join the right churches and local clubs • Learning everything about the political arena affecting the area in which the mine is to be built. All levels of government will be infiltrated, including the township, county, city and state. None will be ignored. • Claiming its mine will bring jobs and prosperity to the area, even though such claims have not proven to be true in other mining towns. • Declaring that its project will be environmentally safe, even though there is not a single example of a sulfide ore mine anywhere in the world that has operated without polluting the water. • Using all forms of the media to spread its message. It will contact local newspapers and place advertisements. It will get on the local radio station and explain how its project is environmentally safe and will supply good jobs. It will arrange to broadcast information on the local television stations so people will be able to see how the mining company is willing to address the concerns of "regular guys" like you and me. Anaconda Mining Company is a good example of this. It actually owned daily papers, magazines and radio station in Montana where it mined. • Spreading many "gifts" around the community for this and that to prove what a "good neighbor" it is, even though these gifts are but a drop in the bucket for a multi-national corporation. • Sending its lawyers to sit down at the table with the local people and town officials to discuss and clear up any problems or "misunderstandings" about the mine. This is the company's way of convincing the doubters in the community of G-364 how safe the mine will be and how good it will be for the local economy. The officials will appear only too happy to explain everything to the local country bumpkins. (Franconia Metals is an expert on above method. It provides a box lunch with its tour of the barge that sat for two summers on the water of Birch Lake, along with a tour to show its drill rigs, plus, a slide show with much "information" on its plans for sulfide mining and how wonderful it will all be. I know, because I was "honored" to be invited to one of its promotional programs.) • Discrediting the large numbers of people in the community who are opposed to the mine, claiming they are just a "small group of uninformed troublemakers." The company also will claim these people are "outsiders," even though the mining company is the real outsider and those who are opposed to the project live right there. • Sitting in on the drafting of any new rules or laws that will govern the mining project and spending lots of money on lobbying to weaken mining regulations and other environmental laws." I think that it is obvious that the mining companies have influenced our legislative officials, who in turn are influencing the people of Minnesota to believe that sulfide mining will be the panacea for all of our job and economic woes before the public has sufficient opportunity to learn more about this type of environmentally dangerous mining, and make up their own minds.</p>	EOO
481	<p>3. I have read that the air emissions from this potential plant will affect the air quality (haze) of the BWCA on 36 days. How well will the emissions be regulated? What will the tolerances be?</p>	AQ5
505	<p>S-11- under Cumulative Effects—"General increase in air emissions, however, no significant effect on regional air quality." What determines whether an effect is significant?</p>	AQ4
506	<p>4.4-10—"The Project would generate approximately 970 (948 vehicle and 22 rail) trips per day, totaling about 3,989 miles, between the Mine and Plant Sites. ..An additional 3,930 miles per day of vehicular traffic are expected within the Mine Site itself, primarily to haul ore to rail siding and waste rock to the stockpiles." Are these miles included in carbon and particulate emissions for the mining operation? What is the economic liability of so heavily relying on equipment that uses expensive fuels while emitting pollutants that contribute to global warming and haze?</p>	G8C,AQ3

507	4.6-32—However, while energy use is reduced by one-half, greenhouse gas emissions do not decline per unit of production from what would be expected. . .principally because of the large load of non-energy process emissions associated with hydro processing.” How could a cap and trade policy or carbon tax affect the economic viability of this plant? Since this process is based upon a small pilot study done in Canada, what is the economic liability of this plant not operating in an economically efficient of a way as proposed? The hydrometallurgical plant will take approximately two years to construct, after PolyMet comes up with the money to start construction. PolyMet earlier asked for the option of hauling crushed rock from the site, prior to plant construction. Where is this addressed in the DEIS? What is the economic liability of transporting crushed rock rather than semi-processed metals? Why isn’t the cost comparative stated in this DEIS? Would copper be able to be electroplated on site without going through the autoclave process? How would the copper be separated from the ore in order to do so? How would the resulting acid mine drainage trail, especially that of the rail line, be addressed?	PD4,PD7,PD8,AQ3,AQ4
508	4.6-32—However, while energy use is reduced by one-half, greenhouse gas emissions do not decline per unit of production from what would be expected. . .principally because of the large load of non-energy process emissions associated with hydro processing.” How could a cap and trade policy or carbon tax affect the economic viability of this plant? Since this process is based upon a small pilot study done in Canada, what is the economic liability of this plant not operating in an economically efficient of a way as proposed? The hydrometallurgical plant will take approximately two years to construct, after PolyMet comes up with the money to start construction. PolyMet earlier asked for the option of hauling crushed rock from the site, prior to plant construction. Where is this addressed in the DEIS? What is the economic liability of transporting crushed rock rather than semi-processed metals? Why isn’t the cost comparative stated in this DEIS? Would copper be able to be electroplated on site without going through the autoclave process? How would the copper be separated from the ore in order to do so? How would the resulting acid mine drainage trail, especially that of the rail line, be addressed?	PD4,PD7,PD8
510	The project could also increase air pollution that results in regional haze and create a risk of perpetual pollution. The PolyMet DEIS states that PolyMet would have no significant effect on regional air quality. This conclusion is taken in isolation. Cumulative effects of other proposed mining must be included in order to make the DEIS adequate.	AQ4B
511	Acid rain from the autoclave/hydromet plant must be taken in a cumulative context with sulfates and acid leaching into the ground water as part of the DEIS. PolyMet’s contribution to Regional Haze in the Class 1 airs of the BWCAW and Voyageurs National Park, have not been adequately addressed in the DEIS. PolyMet’s ore bodies potential to disperse toxic asbestiform fibers across northeastern Minnesota has not been adequately addressed. How will you address these concerns regarding air pollution?	AQ4C,AQ4D,AQ9
1021	4.6-33—“This additional mitigation of wetland types other than Type 8 (open and coniferous bog) would contribute to compensating for the Project’s impacts on Type 8 wetlands.” Which agency, and under what laws and rules was it determined that it is ok to lose open and coniferous bogs as long as they are replaced by other types of wetlands? How was it determined that wetland replacement for PolyMet could be made out of the county and out of the watershed?	WE3
1070	4.4-9—“Consultation between the USACE and the USFWS regarding the potential effects on federally –listed species is currently ongoing.” Will this go on until those species are extinct? How will this be reported in the FEIS?	RFI,WI1
1072	4.7-7—“Impacts from blasting are expected to be minimal.” How do these impacts affect wildlife? What studies determined use of the word “minimal”?	RFI
1195	7. Make sure that the potential waste rock and tailings piles will not collapse and dump uncontrolled pollution into nearby waters, creating pollution that will last for many years.	GT2
1292	3. How will PolyMet change the rubber liner that is proposed to be underneath the newly constructed tailings pond? How will they change the liner under the 20+ story high stripping pile? It is obvious that any sharp edge of even the smallest overburden will damage, if not ruin, the rubber liner.	GT1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
1293	3-34—"LTVSMC coarse tailings layer would be placed to create the covered surface on which vegetation could be sustained." How stable are coarse tailings as a foundation?	RFI
1294	It is vitally necessary to require the PolyMet Company to show that its waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for hundreds or thousands of years. I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. This is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time, and it is an unfair to future generations of taxpayers to pay for the reclamation and clean up of this faulty project.	PD2,PD3,PD6,GT2
1733	6. Are there potential dangers to humans, wildlife, aquatic life and vegetation that could destroy or reduce them? I would not like to see anyone contract diseases from sulfides.	FM1
2000	Could the State anticipate everything? No. But with adaptive management approaches, at least the State, the public, and the mining company could all feel comfortable with the process. How to define the "triggers" that would lead to changing activities or remediation strategies would need to be determined in a fair and equitable manner. I would recommend a clear statistical approach to document trends in water quality in the Partridge River post mining. Given the inherent uncertainty in both the hydrology and geochemistry, there need to be clear contingency plans upfront before any surprises emerge after the mine is permitted.	WR1A
2000	For example, provisions could be put into place in case the water quality of the Partridge River should systematically change to exceed MCLS that could be attributed to closed mine discharge. I note what looks to be the makings of a reasonable monitoring approach in place (DEIS, Vol. I, Table 3.1.S.13-C), but some modification related to solutes and hydrology would be appropriate.	WR1A
2000	I think a different regulatory approach based on adaptive management should be considered by the DNR. In an adaptive management approach, water quality, groundwater levels, and fluid discharges would be monitored sufficiently to formally trigger remedial changes during the mining activity and thereafter.	WR1E
2001	This conclusion probably is correct, although it would be more compelling had the modeling efforts been done clearer and conforming to standard practice.	WR1E
2001	4. Polymet insufficiently characterized how water leaking from the present and future tailings ponds may carry potential contaminants north to the Embarrass River. The hydrologic conditions caused by tailings ponds have been present for many years and offer a unique opportunity to directly evaluate important contaminant transport properties at the proper distance (scale) along subsurface pathways to the river prior to mine opening. Polymet chose not to do this, but to develop models and other methods to infer what might happen. The DNR should insist that Polymet directly take advantage of this opportunity and install a series of shallow piezometer nests (and water table monitoring wells) along appropriate transects from the existing tailings pond, and from these, determine flow directions, characterize changes in ground water quality and characterize material properties governing solute transport.	WR2A,WR2E
2001	As a result of these statements, the tenor of the public meeting was changed and, for me, the integrity of the process, which was ostensibly meant to provide an unbiased presentation of information regarding the environmental review process and a summary of the information in the DEIS, was called into question.	PRO6

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
2001	I bring these philosophical points up to put my review into context. The DNR and Polymet layered deterministic mathematical model on top of deterministic model in their evaluation of future hydrogeochemistry and fate and transport of dissolved substances in water at the mine site. Each model had some, but insufficient data, to fully characterize what it tried to do. But, without sufficient data to calibrate (match) on, these and other models cannot arrive to compelling "right" answers, only approximations of what might happen within a factor or two, at best. The properties of ground water and geochemical systems, as water moves through them, notoriously change spatially and with flow-path distance (e.g. hydraulic conductivity, retardation coefficients, interconnected porosity in fractured rock; Allison and Allison, 2005; Neuman, 1990; SchulzeMakuch et al. 1999; Schulze-Makuch, 2005). Indeed, the large range in natural variability of material properties of porous media and aspects of water-rock chemical reactions are such that models can be forced to mimic field data used to match modeled results by changing many combinations of assumptions.	WR2E
2001	Recognizing the difficulties of accurately projecting the environmental impacts from a mining operation of this nature, I strongly recommend that the DNR and other appropriate agencies develop an adaptive management plan to address closure of the mine. Parts of this adaptive plan would include: a. Developing a scientifically robust program of water quality monitoring in the Embarrass and Partridge Rivers adjacent to pit. This monitoring program would be tied to scientifically well-known changes in water chemistry caused by seasonal variations in river discharge (e.g. rising water levels at snowmelt, low flow in September), rather than some kind of rigid temporal monitoring protocol; b. Developing statistical methods to characterize changing trends in water quality over time (not occasional violations of State maximum concentration levels); and c. Developing remediation strategies should unexpected but plausible water quality changes occur. For example, should unanticipated post-closure AMD cause the pH of the Partridge River to drop below acceptable levels for some environmental receptor, how would this change be handled locally before subsequent dilution and mixing downstream ameliorates the problem at a regional scale?	WR2E,WR1E,EOO
2001	a. The DEIS provided inadequate documentation of the 3-D groundwater modeling before and during the mine operation to allow a proper review of the modeling effort, including the documentation of the solute transport properties; dispersivity, and effective porosity, that affect how contaminants migrate. I found no statistical sensitivity analysis, no maps prepared of water table or potentiometric surface drawdown over time at the mine, and no hydrogeologic cross sections showing flow paths and ground water flow velocities. I refer the DNR to ASTM (2000) for guidance, or any textbook on groundwater modeling. I recommend that DNR obtain and present the fundamental materials used to document a groundwater model. Without this documentation, the validity of the modeling effort cannot be determined.	WR2E

Comment ID	Comment Text	Theme Codes
2001	who lives on Birch Lake in the Superior National Forest. I have grave concerns about the PolyMet NorthMet mining project Draft Environmental Impact Statement (DEIS) proposed on 6,700 acres of public land in the Superior National Forest, not only for the safety of the proposed project, but for its potential impact on Minnesota's natural resources, and the future of its present sustainable economy. I have not taken this proposed project lightly, as I firmly believe it is a dangerous, unprecedented "mining experiment" in water-rich northern Minnesota, where this type of mining has never before occurred. I have spent many hours studying the enormous amount of information included in the DEIS and on the internet related to the danger of sulfide mining, and the multitude of disasters that have occurred in other states and other countries who have done hard-rock mining. It does not come without serious environmental consequences that every citizen in Minnesota has a right to know about since we all depend upon our water sources for life itself. The short amount of time since the release of the DEIS for PolyMet has NOT allowed sufficient time for serious study by Minnesota's citizens, and proper public input. Right now Americans are facing a not only dwindling water supply throughout our country, but a water crisis. "In the southeast, Georgia, Florida and Alabama are slugging it out in federal court over access to the waters of Lake Lanier outside Atlanta. In the Midwest, states around the Great Lakes have signed an alliance, telling everyone else to keep their hands off Great Lakes water. There is a growing gap between our demand and supply of water." CBS Reports: Where America Stands: January 8, 2010, Mark Strassman. The decisions "the powers that be" make now will affect Minnesota's water supply for the generations to come. The grave decision to even consider giving a permit to allow a proven dangerous type of mining that will pollute and destroy our fragile waters in our state is unfathomable. Our present life style is permitting pesticides, herbicides, pharmaceuticals, plastics and a myriad of industrial chemicals to end up in our water supply. These are believed to be one of, if not the cause of, rapid increases in asthma, Alzheimer's, youth behavioral problems, cancer, autism, and Parkinson's diseases. What more do we need to know about that connection? We cannot afford any further degradation of our water supply and should be doing all that we can to improve it, but we are not. Instead, our politicians have decided that we can tolerate a little pollution of our waters, within regulations (regulations that equal a permit to pollute), for the politically expedient and popular JOBS they promise. Take a look at the pollution on both coasts, The Chesapeake Bay and the Duwamish River in Seattle in "Poisoned Waters" <a href="http://www.pbs.org/wgbh/pages/frontline/poisonedwaters/view/">http://www.pbs.org/wgbh/pages/frontline/poisonedwaters/view/</a> A Boeing environmental engineer stated that he didn't think we should expect to ever again subsistence fish, as the Native Americans attempt to do, in the Duwamish River currently a Federal Mega Fund Site. It seems once we create pollution we cannot clean it up. Minnesota environmental review law provides: Minn. Stat. 116D.04(6). "No state action significantly affecting the quality of the environment shall be allowed, nor shall any permit for natural resources management and development be granted, where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state, so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air, water, land and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct". Both the Indian tribes and the United States	G2A
2002	The DEIS does not adequately address loss of habitat or mining impact on threatened species, including that of lynx, wolves and rapidly diminishing moose populations. Wildlife corridors will be impacted if PolyMet is permitted and the effect that past and future mining projects, including associated roads, etc, has not been adequately addressed in the DEIS.	WI2,WI5
2002	The DEIS does not address the balance within an ecosystem between predator and prey. It does not address bird species and cumulative impacts on habitat of migrational species.	WI2
2002	The DEIS does not address the loss of Superior National Forest land or the legal restrictions against strip mining within Superior National Forest	PD1
2002	The wetlands (peat lands) at PolyMet's mine site have been identified as worthy of protection by the USFS and DNR. The DEIS is inadequate in not addressing this issue.	WE1,WE2

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2002	The DEIS allows the loss of wetlands in St. Louis County and the St. Louis River watershed, and the loss of open and coniferous bogs. The wetlands would be mitigated in Aitkin County, which is in the Mississippi River watershed. (This does not help St. Louis County's loss of wetlands!) This loss of wetlands goes against the Wetland Conservation Act. PolyMet's wetland mitigation plan is inadequate. Most of the wetlands that will be impacted at the mine site are peat lands. Peat lands have been identified as one of the best terrestrial environments for sequestering carbon, a contributor to global warming.	WE3
2002	The loss of 1200 acres of wetlands will have an impact on the local climate, due to destruction of the carbon sequestering ability of wetlands. The DEIS is inadequate in that it does not address how PolyMet's increased greenhouse gas emissions will affect the Arrowhead. The DEIS acknowledges that "project facilities and operations would result in additional greenhouse gas (GHG) emissions in the Arrowhead region" (S-10)	AQ3
2003	Acid rain from the autoclave/hydromet plant must be taken in a cumulative context with sulfates and acid leaching into the ground water as part of the DEIS.	AQ4D
2003	The PolyMet DEIS states that PolyMet would have no significant effect on regional air quality. This conclusion is taken in isolation. Cumulative effects of other proposed mining must be included in order to make the DEIS adequate.	AQ4B
2003	PolyMet's contribution to Regional Haze in the Class 1 airs of the BWCAW and Voyageurs National Park, have not been adequately addressed in the DEIS.	AQ9
2003	PolyMet's ore bodies potential to disperse toxic asbestiform fibers across northeastern Minnesota has not been adequately addressed	AQ4C
2004	Weakness of a mining economy are not adequately addressed in the DEIS. As quoted from the Tom Powers report, "The Economic Role of Metal Mining in Minnesota": Mining inevitably depletes economically viable ores, forcing mines to be abandoned. Usually the very process of mining, concentrating, and refining the metal ores creates relatively permanent environmental damage: huge open pits, massive waste piles, extensive settling ponds, heavy metal pollution, acid mine drainage, etc. These reduce the attractiveness of mined-over areas to new residents and businesses, making it difficult for mining areas to diversify their economies.	SE3
2004	It would have been appropriate had Polymet provided an analogy where this approach has worked.	EOO

2004	<p>The PolyMet “NorthMet” copper-nickel strip mine project is proposed to be sited on approximately 6,700 acres of United States Forest Service lands in the Superior National Forest. Pursuant to law, the project depends on the completion of a successful land exchange of Superior National Forest lands for non-federal lands. (PDEIS), p. 1-3. The proposed land exchange tracts and the characteristics of such land are not described in the DEIS and have not yet been publicly disclosed. Across Minnesota, there are dozens of applications for permits to prospect for nonferrous metals. Understanding land exchange and mineral rights is critical for the PolyMet Project and for future proposed strip mine development. The need for a land exchange prior to permitting of the PolyMet strip mine project must be transparent to the public and the DEIS, for the PolyMet project must include an analysis of the environmental impacts of the land transfer, including potential impacts on tribal rights. This precludes any possible permitting of the PolyMet DEIS as it stands now. A. PolyMet reserved mineral rights do not support strip mining on Superior Forest Land. PolyMet proposes to develop a copper-sulfide strip mining operation located primarily on Superior National Forest Lands. Although PolyMet has claimed that the mineral rights “reserved” in its 1935 deed authorize mining in any form, the U.S. Forest Service has maintained that the deed does not permit strip mining, so PolyMet must buy land to exchange before obtaining permits for the NorthMet mining project. The analysis conducted by the U.S. Forest Service is consistent with prevailing law. Strip mining necessarily entails massive removal of soil and plant life to access underground minerals. This results in irretrievable loss to the environment as well as a fundamental change in forest land use. Prepared by Bride Seifert, William Mitchell Law School, Intern for WaterLegacy; Paula Maccabee, Counsel for WaterLegacy. Furthermore, why does PolyMet’s DEIS not contain an alternative underground mine option? B. Land exchange process requires equal value and environmental review. In order for PolyMet to purchase Superior National Forest land, a land exchange needs to occur. PDEIS, p. 3-1. Under The Federal Land Policy and Management Act of 1976 § 206, 43 U.S.C. §1716, lands exchanged must be of equal value, in the public interest and in line with the forest land and resource management plans. Public interest assessment examines the needs of State and local community, looking at the economy, recreation, fish and wildlife as well as food, fiber and minerals. 43 U.S.C. § 1716(a). Environmental concerns are clearly included. A critical first step in a public lands exchange is the public interest determination. No land exchange can take place unless it is in the public interest. The public interest determination considers the needs of State and local residents, fish and wildlife habitats, wilderness and recreation values, economic interests and cultural resources, and watershed issues. 36 C.F.R. § 254.3(1). C. Environmental Review – National Environmental Policy Act. The National Environmental Policy Act (NEPA) calls for the preparation of an Environmental Impact Statement (EIS) for any Federal activity that will have a significant impact on the environment. It is clear that the land exchange proposed for the PolyMet strip mine, which would involve approximately 6,700 acres of Superior National Forest land, will require an EIS. Tribal lands and rights will be impacted, with potential environmental justice, as well as Treaty rights implications. Wildlife and wetlands, including pristine areas, would be acquired by PolyMet and disrupted or degraded to develop the NorthMet strip mine and processing facility. Conclusion. Before the PolyMet NorthMet project could proceed, the PolyMet Company would need to find approximately 6,700 acres of land to exchange for the Superior National Forest lands on which the strip m</p>	PRO2,PRO4,PD1,PD3,PD8
2005	<p>The advancement and possibility of PolyMet being permitted has destabilized the real estate market in areas of northeastern Minnesota where the MDNR has leased and offered for lease state mineral leases. People do not want to live near a sulfide mine and property values are already being affected by the possibility of PolyMet's approval.</p>	SE4
2005	<p>I have read most of the Polymet documents and the studies done and their conclusions fall within a plausible range of what has been reported or expected.</p>	EOO
2006	<p>PolyMet’s DEIS is based upon PolyMet using 1/3 of its plant capacity, as purchased from LTVSMC /Cleveland Cliffs. Excess capacity is planned to be utilized by neighboring Teck Cominco, Franconia, Kennecott and Duluth Metals. The Excess Capacity of PolyMet's processing plant is not addressed in the DEIS. The PolyMet DEIS is inadequate in not allowing for public knowledge or participation in the discussion of the creation of a sulfide mining district in the Arrowhead Region of Minnesota.</p>	G9

Comment ID	Comment Text	Theme Codes
2006	The DEIS is remiss in considering the potential impacts of sulfide mining within the Arrowhead Region. The USFS has begun an EIS for Federal Hardrock Minerals Prospecting Permits Project for the Superior National forest. The DNR continues to sell exploratory leases to companies exploring the Duluth Complex of mineralization. Duluth Metals is advertising its Nokomis deposit of copper-nickel-platinum-palladium-gold minerals on its website. The Nokomis deposit is located alongside the Boundary Waters Canoe Area. Franconia Minerals is advertising its Birch Lake, Maturi and Spruce Roads deposits, all within the Boundary Waters Canoe Area watershed. The PolyMet DEIS is inadequate in addressing PolyMet as an isolated copper-nickel mining project.	G8C
2006	Cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district	SE4
2006	The economic analysis of the DEIS must be rewritten to address the above concerns. [see comments 20-21 from this letter]	EOO
2007	At the least, sufficient piezometer nests needed to be installed to determine both the vertical gradients between surficial aquifers and underlying bedrock aquifers, and the extent to which assumptions on isotropic conditions were valid for bedrock aquifers. Without this information, the degree to which the Partridge River could receive future closed mine waste water and whether potential contamination by-passes this river to parts unknown cannot be determined. Perhaps Polymet has this kind of data among the observation wells, but if so, it needs to be presented in a manner easy to review.	WR1E
2007	But using the AMAX stock pile results as a benchmark for the Polymet mine ore, having far less sulfide, seems the prudent and wise approach. Based largely on that, Polymet argues that there should be little, if any, environmental problem with respect to contamination of surface waters at the NorthMet facility closed pits and tailings basin, and probably ground water as well from AMD. I think this conclusion may be right, but to invoke some measure of the precautionary principle, I think a bit more effort needs to be expended as discussed above.	WR1E
2007	I do understand that the proposed PolyMet mine is not in the Boundary Waters watershed. Water from the proposed PolyMet mine (and pollution) would flow through the Embarrass and Partridge Rivers into the St. Louis River, and ultimately Lake Superior. Pollution in those waters is unacceptable; the mine would also set serious precedents for future proposals and all interest, after PolyMet, is focused squarely in the BWCAW watershed.	G7A
2007	The DNR 's exploratory leasing is opening up the entire Arrowhead to become a sulfide mining district. An EIS needs to be completed on the mineralization of the entire Duluth Complex prior to the permitting of any one project.	PRO4
2007	As the owner of both a resort facility and a Boundary Waters canoe outfitting business since 1976, (and it has been in our Koschak family since 1944), I find it unbelievable that the DNR and the Corp of Engineers, have the sole power to determine if northeastern Minnesota will exchange its present sustainable tourism industry (a billion dollar industry— <a href="http://www.exploreminnesota.com">www.exploreminnesota.com</a> ) for a “non-sustainable” sulfide mine (and possible sulfide mining district) that will destroy our natural resources and forever more alter the incredible beauty of the lakes region of northeastern Minnesota for the sake of PolyMet’s 400 short term jobs, and additional spin off jobs for a lifespan of just 20 years. The tourism industry of 34 Minnesota contributes substantially to the tax base-... “Unlike US Steel which paid precious little in property taxes on its 3,000 acres...” Timberjay Newspaper, January, 21, 2010. The questions for you to evaluate are: Is this really what we want for this part of our state? Do we want to forever more change surrounding forests and wetlands as they are today? To no longer count on clean water? To deal a fatal blow to the sustainable economic base of this area? Timberjay Newspaper Editorial, January 21, 2010 “Don’t for a minute discount the value of tourism, as some local officials are often quick to do. Over the past few years, the area’s timber industry has all but collapsed and area mines went through extended layoffs that may not be over yet. Through it all, tourism has held surprisingly steady. It’s been the one leg of our timber, tourism and taconite economic stool that didn’t go wobbly on us when the broader economy went south. Tourism is a sustainable, long term industry for our area. It may not pay the wages of the mining industry, but unlike mining, it doesn’t run out and it doesn’t come with a long list of environmental ills.”	PD1,AQ4B,AQ4D

2007	But, at the least, Polymet needed to obtain or present the limited data it could get to use it for maximum value in interpreting and evaluating its modeling efforts.	WR1E
2008	The stochastic modeling conducted by Polymet did provide calculated frequency distributions of results, and even "confidence levels" and "probabilities" of which combinations of geochemical and hydrological factors related to transport and reaction can produce common results. But what does this mean? I think it gives no more confidence than back-of-the-envelope calculations might, given all the uncertainty.	EOO
2008	Sufficient piezometers needed to be installed in separate bedrock units to get a sense for hydraulic continuity to the Partridge River, and across the mine site in each bedrock unit considered a hydrogeologic unit. Perhaps the bedrock aquifers are partitioned into small compartments, isolated from each other, because of fractures. If so, then water levels within different parts of a single bedrock unit, say the Duluth Complex, would be hard to evaluate because they would not show a clear trend.	WR2A
2008	Some piezometers were needed in deep formations adjacent to the Partridge River to determine the extent of deep underflow and surface water-groundwater interactions. For example, groundwater chemistry optimally should have been obtained seasonally (if it was, it should be presented as such, graphically, etc.) to see the extent to which snowmelt dilution occurred at depth and if seasonal hydrographs of groundwater elevations agreed with the dilution pulse.	WR2A
2008	These hydrographs, if the data are there, should be prepared to directly calculate estimated recharge rates through the bedrock and surficial materials rather than using estimates from modeling and produce - as Polymet has done - which led to a recharge rate akin to what I see in the arid west. With respect to recharge, the opinion by the tribal cooperating agencies that no recharge can occur to saturated soil near the tailings pond is wrong (DEIS, Vol. I at 4.1-6). Recharge depends on the ground water flow rate horizontally and vertically, and where the precipitation falls. Even peatland ground water is replenished from rain, although though some wetlands have soils with standing water on them in places.	WR2A
2008	Alternatively, Polymet can use analogy to existing mines that have been around for along time to estimate what ground water might do when the mine is opened. It seems unreasonable to me to think that groundwater discharging from the Duluth Complex and Virginia Formations will occur at significantly larger rates than has discharged to deep mines from rocks used for taconite. These metasedimentary rocks, because of bedding planes, would yield more water than fractures in a granite-like rock. However, the discussion of such analogy, and why it would generally apply to the NorthMet site, needs to be very clear, not just citation of an email by Adams and Liljegen (2009).	WR2F
2008	5. Having said the above, Polymet's comparison of their proposed mine to other mines (particularly in their geochemical analysis) does suggest that little acid mine drainage (AMD) should occur from the mine site or tailings basin, assuming that the ore quality and metal concentrations in waste rock will be as presented, and sub-aqueous disposal of it does not lead to unusual conditions of sulfide oxidation. Nevertheless, I think that the DNR should apply the precautionary principle, given the a priori failure of predicting the long-term extent of AMD from many other copper and other heavy metal mines, despite best intentions.	WR1A
2008	The DEIS does not address accumulation of toxic metals in wildlife and fish species used as game.	WI3,FM1
2009	Contaminated discharge from waste rock piles. Water from waste rock pile swill be polluted for up to 2,000 years (DEIS, Table 4.1-45)	WR1E

2009	Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with the evaluation of this project. The following was announced on January 25, 2010 related to this huge problem: "Cliffs Cited for Extensive Minnesota Iron Mining Pollution: January 25, 2010" "Three groups today announced their intent to file a lawsuit against Cliffs Erie, a subsidiary of Cliffs Natural Resources, for ongoing water pollution from previous taconite iron mining at three sites on Minnesota's Iron Range. PolyMet Mining Co. plans to utilize two of the sites in order to dispose of wastes from its proposed metallic-sulfide NorthMet project. As part of a purchase agreement, Cliffs would maintain a roughly 7% stake in the project. The other Cliffs site, at the old Dunka Mine, is closer to Franconia Minerals and Duluth Metals' proposed sulfide projects. A news release issued by the Center for Biological Diversity noted that, "according to Cliffs Erie's own monitoring reports, there are numerous ongoing violations of water-quality laws relating to management of the former LTV tailings basin. PolyMet's proposal for its copper-nickel mine is to pile its own tailings waste on top of those from a former taconite mine that are still polluting." The Center for Biological Diversity, Save Lake Superior Association, and the Indigenous Environmental Network filed a formal notice letter today that acts as a "prerequisite to filing a citizen enforcement action under the Clean Water Act." The Save Lake Superior Association, a grassroots citizen group, proved instrumental in holding the Reserve Mining Co. to account for dumping iron mining waste into Lake Superior from 1955 into the 1970s. The pollution introduced asbestos-like material into the lake and harmed fishing in the area. "Before the state even considers the approval of a new wave of mining in northeastern Minnesota, it should first require the mining companies to clean up the pollution from past taconite mines," said Marc Fink, an attorney with the Center for Biological Diversity. "As we all learned as kids, you should clean up one mess before making another one." The LTV basin, located six miles north of Hoyt Lakes, was used for taconite tailings from the 1950s until 2001. The unlined basin is the source of numerous seeps and discharges of polluted wastewater into groundwater and surface waters, which eventually reach the Embarrass River. For the proposed NorthMet mine, PolyMet proposes to process more than 225 million tons of ore at the LTV processing facility, and use the same LTV tailings basin already known to be leaking. "While past mining has already polluted these waters, the proposed heavy metals mining would bring severe new threats of pollution to these waters, which ultimately flow into Lake Superior at the Duluth harbor," said Le Lind of the Save Lake Superior Association. "This new threat includes sulfuric acid runoff and higher levels of mercury in waters that are already impaired." <a href="http://lakesuperiorminingnews.net">http://lakesuperiorminingnews.net</a>	GT2
2009	I do not think NorthMet should meaningfully affect the environment with regard to the hydrology and geochemical impacts from the mine except immediately adjacent to it during operation and thereafter, assuming Polymet does what they propose. I am not saying there will be no impacts. In any major industrial activity, local mishaps occur, occasional spills, breaks and so on. But I see no reason why significant, regional, environmental problems should occur related to either geochemistry or hydrology. From surface area and sulfide concentrations alone, the water quality at the mine site after closure cannot be similar to what occurs in ore stockpiles and fluids in the stockpiles, nor can it be similar to that found in open pit mines elsewhere with richer ore. During operation, the leachate from the stock piles will be processed to remove metals and other solutes prior to later use. Indeed, some stockpiles will remain, capped, and continue to produce leachate for many years. But the probability of a catastrophic stockpile failure that would affect the Partridge River or other waters seems very improbable to me. There remains the question of the potential for groundwater flowpaths under the Partridge River. However, I suspect that this potential is low, but it can be evaluated with a few more sites for instrumentation should the decision be made to do so.	EOO
2009	Habitat for wood turtles is not addressed.	WI2
2009	The DEIS does not address loss of wild rice and berries as food crops, or whether plants uptake toxic metals.	PRO4,PD1,PD3
2009	The DEIS does adequately address the instability of the LTCSCM tailings basin, especially considering the large amount of tailings that would be added from mining a less than 1% ore body.	GT2

2010	Determination of the amount of financial assurance that will be required should be included in the EIS. Bonding is one of the most critical aspects of mine permitting, and one that is least understood and examined by the public. Many of the measures that will be taken to avoid environmental impacts depend on adequate bonding. For instance, the DNR will not be able to assert that a particular remediation plan will be instituted when the mine closes unless bonding is sufficient to ensure the remediation. Bonding is crucial to any determination that potential environmental effects will be avoided	PD4
2010	PolyMet is sited on USFS public lands which have protective covenants against strip mining, yet the DEIS does not contain an alternative underground mine option. Any possible Federal land exchange with PolyMet should be part of PolyMet's EIS. NEPA and MEPA require that all potentially significant impacts be addressed in the EIS (National and Minnesota Environmental Policy Acts)	PRO2
2010	Explain the sense of moving forward with the approval of a permit for a much more dangerous mining operation- PolyMet- when other mining companies have yet to clean up previous pollutions from much more benign mining operations than sulfide mining?	G10
2010	The DEIS does not adequately address the instability of waste rock pile slopes, especially considering the size due to mining less than 1% ores.	GT1
2010	The mitigation approaches seem appropriate, but the monitoring measures appear scant in detail regarding the "what if" question? What if the water in the remaining waste piles or in the closed pits actually becomes far more acidic than we think will happen, for reasons we have not thought of (environmental "surprises")? Or what if some acid mine drainage carrying metals does escape and enters the Partridge River? Then what do the State and Polymet do?	WR1E
2011	S-9—"There is some uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard, but this impact could be mitigated if it would occur." Explain how the mercury would be mitigated.	WR4C
2011	DEIS relies too heavily on modeling and predictions that things will go as planned. Uncertainty remains as to whether rock classified as nonreactive will remain nonreactive after fifty years, 100 years, 1,000 years, etc. An impermeable liner will be created under reactive waste rock piles, but some uncertainty will remain as to whether and when that liner will leak; all liners leak. The DEIS does not adequately address the degree of uncertainty involved (for issues that involve uncertainty) and the potential impacts on the environment if assumptions and conclusions prove to be wrong	PD2
2011	The St. Louis River watershed is already contaminated with sulfates, which become part of a biochemical process converting mercury into methylmercury. This methylated form of mercury accumulates in fish, resulting in fish consumption adversaries. Allowing PolyMet to store tailings on top of already leaching LTVSMC tailings would increase the amount of sulfates in the watershed. DEIS: "Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent 'high risk situations' for mercury methylation" (S-9) When mercury is "methylated" it can bioaccumulate in fish, making them unsafe to eat. The DEIS is inadequate in not addressing state standards regarding sulfates and methylmercury.	WR3I,WR4B,FM1,FM5
2012	3-34—"LTVSMC coarse tailings layer would be placed to create the covered surface on which vegetation could be sustained." How stable are coarse tailings as a foundation?	RFI
2012	S—11- "If water quality monitoring demonstrated the need, treatment of the pumped seepage could be provided prior to discharge to the Partridge River." What would the treatment consist of and what impacts might the treatment have upon the water quality?	RFI
2012	Who does the monitoring, how often would the monitoring be done, and how would treatment be monitored?	RFI
2012	S-11- under Cumulative Effects—"General increase in air emissions, however, no significant effect on regional air quality." What determines whether an effect is significant?	AQ4

2013	4.1-135—"PolyMet proposes to mitigate the increased solute load expected in the East Pit from the disposal of the higher sulfide waste rock by pumping East Pit water to the WWTF for additional treatment for approximately 30 years (years 21- 50)." What happens after 30 years? Does the pollution disappear?	RFI,WR1E
2013	What motivation is there for the company to spend money on treatment after the mine is closed and no longer making money?	G4A
2013	When PolyMet gets bought out by another company, how will the transfer of this responsibility occur?	RFI
2014	Does the DNR have enough of a budget to maintain this?	RFI
2014	What role does the DNR have in monitoring the pollution and the treatment?	PD8
2014	Plant closure plans extend to year 50 (30 years after closure) but do not account for acid mine drainage that can last for hundreds to thousands of years, requiring perpetual or near perpetual treatment. The DEIS does not provide adequate plans for monitoring or mitigation. There is no adequate means of enforcement for clean-up or for any financial assurances that the mining company will be responsible. Instead, the MN taxpayers will bear the burden of clean-up cost of toxic wastes for decades—and into perpetuity.	PD3,PD4
2015	4.4-9—"Consultation between the USACE and the USFWS regarding the potential effects on federally –listed species is currently ongoing." Will this go on until those species are extinct? How will this be reported in the FEIS?	RFI
2015	4.1-143—"The deterministic modeling results suggest that three parameters (i.e., arsenic, cobalt, and selenium) could exceed surface water standards, in addition to relatively high sulfate concentrations. The Uncertainty Analysis for the Proposed Action suggests that copper and nickel could be underestimated by the deterministic modeling." What are the cumulative effects of these water quality exceedances?	RFI
2015	4.4-136—"Reservations existed about relying on just the low and average liner leakage rates for groundwater quality predictions, as it may not fully account for the essentially permanent use of the liner (e.g., liner degradation over time, differential settlement, and accidental tears during waste rock placement)." Exactly which liners would be able to be replaced in five years time, or as needed, according to statements made by Joe Scipioni and Frank Ongaro?	PD2
2015	How can we project such costs up to 50 years in the future?	RFI
2015	4.1-137—"It should be noted that aluminum, beryllium, iron, , manganese, and thallium exceeded the groundwater evaluation criteria in the model; however, this was due to high baseline concentrations that were not attributable to the Project and these solutes were not carried forward for detailed transient flow modeling." If the modeling was not attributable to the Project, what is the significance of the modeling?	WR2E
2016	Since this process is based upon a small pilot study done in Canada, what is the economic liability of this plant not operating in an economically efficient of a way as proposed?	AQ3
2016	4.4-10—"The Project would generate approximately 970 (948 vehicle and 22 rail) trips per day, totaling about 3,989 miles, between the Mine and Plant Sites. ..An additional 3,930 miles per day of vehicular traffic are expected within the Mine Site itself, primarily to haul ore to rail siding and waste rock to the stockpiles." Are these miles included in carbon and particulate emissions for the mining operation? What is the economic liability of so heavily relying on equipment that uses expensive fuels while emitting pollutants that contribute to global warming and haze?	AQ3
2016	4.6-32—However, while energy use is reduced by one-half, greenhouse gas emissions do not decline per unit of production from what would be expected...principally because of the large load of non-energy process emissions associated with hydro processing." How could a cap and trade policy or carbon tax affect the economic viability of this plant?	AQ3
2017	Why isn't the cost comparative stated in this DEIS?	RFI
2017	What is the economic liability of transporting crushed rock rather than semi-processed metals?	RFI

2017	This is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time (once they extract the metals and make a ton of money, they will run back to Canada). This is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care.	G4A
2017	The hydrometallurgical plant will take approximately two years to construct, after PolyMet comes up with the money to start construction. PolyMet earlier asked for the option of hauling crushed rock from the site, prior to plant construction. Where is this addressed in the DEIS?	PD7
2018	How would the copper be separated from the ore in order to do so?	RFI
2018	4.6-33—What is the cost of using electric drills in comparison to diesel drills? How expensive are Gen-Set locomotives? Has access to the amount of electricity and natural gas required been determined and laid out in this DEIS?	AQ3,AQ4
2018	How would the resulting acid mine drainage trail, especially that of the rail line, be addressed?	HM3
2018	Would copper be able to be electroplated on site without going through the autoclave process?	RFI
2019	4.7-1—“The region has traditionally supported various mining activities as well as logging on federal, state, county, industrial and private forest lands. Review of aerial photography and public records indicate that there are few noise sensitive areas or receptors such as residences, campgrounds, and national wilderness areas within the Project vicinity.” What tests determined that noise won’t be heard in the Boundary Waters 20 miles away?	N1
2019	4.6-33—“This additional mitigation of wetland types other than Type 8 (open and coniferous bog) would contribute to compensating for the Project’s impacts on Type 8 wetlands.” Which agency, and under what laws and rules was it determined that it is ok to lose open and coniferous bogs as long as they are replaced by other types of wetlands?	WE3
2019	How was it determined that wetland replacement for PolyMet could be made out of the county and out of the watershed?	WE3
2020	How do you determine effects of noise by sight rather than by sound (aerial photographs)?	N1
2021	Was it determined that more noise is ok because there has traditionally been noise in the area?	N3
2022	Bill H.F. No. 2560, as introduced-86th Legislative Session (2009-2010). Posted on Jan 08, 2010 is a bill for an act relating to natural resources; providing for financial assurance for nonferrous metallic mineral mining; amending Minnesota Statutes 2008, sections 93.481, by adding a subdivision; 93.49; Minnesota Statutes 2009 Supplement, section 93.481, subdivision 1; proposing coding for new law in Minnesota Statutes, chapter 93. This new bill introduced by Representatives Alice Hausman and Bev Scalze is a first step in providing financial assurances to protect MN taxpayers from the cost of clean up and reclamation resulting from sulfide mining. However, I believe that a total moratorium on mining must occur in Minnesota, the same which presently exists in Wisconsin after their Flambeau sulfide mining disaster. This would allow for time to further evaluate sulfide mining in Minnesota and its expressed dangers with full and transparent disclosure to the public, since current MN laws have plenty of “gaps” in safeguards that expose the state and its citizens to significant risks. Some of these gaps are 1) Only the DNR can make decisions in calculating the amount of financial assurances and in determining the appropriate form of financial assurance. Presently, the Pollution Control Agency and the Dept. of Management and Budget are not involved in this process. 2) Mining could also be allowed up to the very borders of the Boundary Waters Canoe Area Wilderness and adjacent to (or under) water bodies that flow into the wilderness. 3) Mining companies are not required to discuss financial assurance or damage deposit, in the DEIS for their mine proposals, which is a key opportunity for public involvement in the process. These present “gaps” must be addressed and changed for the protection and safety of the state of Minnesota and its citizens.	G2,G12
2023	How does 24 hour a day noise affect the character of the land?	N1

2024	This doesn't give credibility to the impacts on wildlife.	EOO,N4
2025	4.7-7—"Impacts from blasting are expected to be minimal." How do these impacts affect wildlife? What studies determined use of the word "minimal"?	RFI,N4
2831	4. The same holds true for the waters the mine will use and the waters it will affect. How well will these be regulated? What will the tolerances be? Will run-off water affect streams, rivers and perhaps Lake Superior or more. Since we are located on the Continental Divide, is there a possibility that the discharge waters could affect the BWCA? Will the water tables of the BWCA be affected?	WR1A,WR3B,WR3D
2832	5. What will be the monitoring process for the waste rock, the tailings basin, the ponds and any other things that must be tracked?	RFI
3080	Secondly, how can one justify permitting a mine that in its own DEIS says it will pollute the waters? WATER CONSIDERATIONS: Contaminated discharge from waste rock piles. Water from waste rock pile swill be polluted for up to 2,000 years (DEIS, Table 4.1-45) • The St. Louis River watershed is already contaminated with sulfates, which become part of a biochemical process converting mercury into methylmercury. This methylated form of mercury accumulates in fish, resulting in fish consumption adversaries. Allowing PolyMet to store tailings on top of already leaching LTVSMC tailings would increase the amount of sulfates in the watershed. DEIS: "Relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent 'high risk situations' for mercury methylation" (S-9) When mercury is "methylated" it can bioaccumulate in fish, making them unsafe to eat. The DEIS is inadequate in not addressing state standards regarding sulfates and methylmercury. • Plant closure plans extend to year 50 (30 years after closure) but do not account for acid mine drainage that can last for hundreds to thousands of years, requiring perpetual or near perpetual treatment. The DEIS does not provide adequate plans for monitoring or mitigation. There is no adequate means of enforcement for clean-up or for any financial assurances that the mining company will be responsible. Instead, the MN taxpayers will bear the burden of clean-up cost of toxic wastes for decades—and into perpetuity.	WR1A,WR1E,WR3I,WR5A
3081	These present "gaps" must be addressed and changed for the protection and safety of the state of Minnesota and its citizens. Representative Rukavina has referenced "tough US environmental laws" in Minnesota that would hold PolyMet accountable in recent newspaper articles. However, the reality is that the leaking tailings ponds in his district are polluting public waters right now from past "benign" mining procedures. These same waters will be more dangerously polluted from the acid mine drainage from the stripping piles and the leaking tailings pond of the proposed PolyMet project. How then can you even consider permitting such a project?	EOO
3082	1. How will the existing tailings pond be stabilized to prevent the sulphuric acid from running out of the bottom of this pit. Wells and dikes will not work. Impossible. The best of the dams out west cannot contain all the water. Some always leaks.	WR3A
3083	2. There is nothing in the DEIS that addresses the future association of PolyMet and other mining companies, such as Franconia Minerals and Duluth Metals, who may want to use the same processing plant that PolyMet will use. How can the magnitude of the waste water be treated under this DEIS?	WR5B
3084	4. How can PolyMet 100% guarantee that there will be no leakage from the stripping piles flowing into the Embarrass River and on into Lake Superior?	WR3A
3085	5. How can the MN DNR and the Army Corp of Engineers even consider that states that the West Pit will overflow with toxic waste water and flow into Lake Superior?	WR3C
3086	• Arsenic, cobalt, selenium, copper, nickel, aluminum, beryllium, iron, manganese, and thallium from PolyMet's operations may all exceed water quality standards. Analysis predicts high sulfate concentrations. (4.1-113) The DEIS would allow this to happen. The DEIS does not address the cumulative or synergistic impacts upon fish, wildlife or humans as we ingest water containing all of these pollutants. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Third, will we be trading a lakes district for a mining district in northern Minnesota?	WR4C,WR5A,FM1,FM3,F

3087	I do understand that the proposed PolyMet mine is not in the Boundary Waters watershed. Water from the proposed PolyMet mine (and pollution) would flow through the Embarrass and Partridge Rivers into the St. Louis River, and ultimately Lake Superior. Pollution in those waters is unacceptable; the mine would also set serious precedents for future sulfide mining proposals and all interest, after PolyMet, will be focused on the Boundary Waters watershed.	WR1E,WR3B
3089	S—11- “If water quality monitoring demonstrated the need, treatment of the pumped seepage could be provided prior to discharge to the Partridge River.” What would the treatment consist of and what impacts might the treatment have upon the water quality? Who does the monitoring, how often would the monitoring be done, and how would treatment be monitored?	WR1A
3090	4.1-135—“PolyMet proposes to mitigate the increased solute load expected in the East Pit from the disposal of the higher sulfide waste rock by pumping East Pit water to the WWTF for additional treatment for approximately 30 years (years 21- 50).” What happens after 30 years? Does the pollution disappear? What motivation is there for the company to spend money on treatment after the mine is closed and no longer making money? When PolyMet gets bought out by another company, how will the transfer of this responsibility occur? What role does the DNR have in monitoring the pollution and the treatment? Does the DNR have enough of a budget to maintain this? How can we project such costs up to 50 years in the future?	RFI,WR1A,WR3I
3091	4.4-136—“Reservations existed about relying on just the low and average liner leakage rates for groundwater quality predictions, as it may not fully account for the essentially permanent use of the liner (e.g., liner degradation over time, differential settlement, and accidental tears during waste rock placement).” Exactly which liners would be able to be replaced in five years time, or as needed, according to statements made by Joe Scipioni and Frank Ongaro?	WR2D
3092	4.1-137—“It should be noted that aluminum, beryllium, iron, , manganese, and thallium exceeded the groundwater evaluation criteria in the model; however, this was due to high baseline concentrations that were not attributable to the Project and these solutes were not carried forward for detailed transient flow modeling.” If the modeling was not attributable to the Project, what is the significance of the modeling?	WR2E
3093	4.1-143—“The deterministic modeling results suggest that three parameters (i.e., arsenic, cobalt, and selenium) could exceed surface water standards, in addition to relatively high sulfate concentrations. The Uncertainty Analysis for the Proposed Action suggests that copper and nickel could be underestimated by the deterministic modeling.” What are the cumulative effects of these water quality exceedances?	WR5A
3245	1. What happens when the mine closes down? Who is responsible for any leakage or potential disasters. The mine is expected to operate for 20 years, but what then? There is not a specific plan for reclamation after the mine site is closed. Is the mining company required to set aside dollars or financial assurance for potential disasters after closing? The citizens of Minnesota do not want to be left holding the bag for potential cleanup for scores of years.	PD3
3246	2. You must make sure that there is protection of wetlands, tribal rights and also the taxpayer's interests if and when the land swap is completed.	PD1

3511	on the environment. Presently, a lawsuit is pending on Cliffs Erie, a subsidiary of Cliffs Natural Resources, for ongoing water pollution from previous taconite iron mining: “Cliffs Cited for Extensive Minnesota Iron Mining Pollution: January 25, 2010” “Three groups today announced their intent to file a lawsuit against Cliffs Erie, a subsidiary of Cliffs Natural Resources, for ongoing water pollution from previous taconite iron mining at three sites on Minnesota’s Iron Range. PolyMet Mining Co. plans to utilize two of the sites in order to dispose of wastes from its proposed metallic-sulfide NorthMet project. As part of a purchase agreement, Cliffs would maintain a roughly 7% stake in the project. The other Cliffs site, at the old Dunka Mine, is closer to Franconia Minerals and Duluth Metals’ proposed sulfide projects. A news release issued by the Center for Biological Diversity noted that, “according to Cliffs Erie’s own monitoring reports, there are numerous ongoing violations of water-quality laws relating to management of the former LTV tailings basin. PolyMet’s proposal for its copper-nickel mine is to pile its own tailings waste on top of those from a former taconite mine that are still polluting.” The Center for Biological Diversity, Save Lake Superior Association, and the Indigenous Environmental Network filed a formal notice letter today that acts as a “prerequisite to filing a citizen enforcement action under the Clean Water Act.” The Save Lake Superior Association, a grassroots citizen group, proved instrumental in holding the Reserve Mining Co. to account for dumping iron mining waste into Lake Superior from 1955 into the 1970s. The pollution introduced asbestos-like material into the lake and harmed fishing in the area. “Before the state even considers the approval of a new wave of mining in northeastern Minnesota, it should first require the mining companies to clean up the pollution from past taconite mines,” said Marc Fink, an attorney with the Center for Biological Diversity. “As we all learned as kids, you should clean up one mess before making another one.” The LTV basin, located six miles north of Hoyt Lakes, was used for taconite tailings from the 1950s until 2001. The unlined basin is the source of numerous seeps and discharges of polluted wastewater into groundwater and surface waters, which eventually reach the Embarrass River. For the proposed NorthMet mine, PolyMet proposes to process more than 225 million tons of ore at the LTV processing facility, and use the same LTV tailings basin already known to be leaking. “While past mining has already polluted these waters, the proposed heavy metals mining would bring severe new threats of pollution to these waters, which ultimately flow into Lake Superior at the Duluth harbor,” said Le Lind of the Save Lake Superior Association. “This new threat includes sulfuric acid runoff and higher levels of mercury in waters that are already impaired.” <a href="http://lakesuperiorminingnews.net">http://lakesuperiorminingnews.net</a>	G7
3512	Explain the sense of moving forward with the approval of a permit for a much more dangerous mining operation- PolyMet sulfide mining- when other mining companies have yet to clean up previous pollutions from much more benign mining operations than sulfide mining?	G4

3513	<p>I have extreme concerns about the PolyMet NorthMet mining project Draft Environmental Impact Statement (DEIS) proposed on 6,700 acres of public land in the Superior National Forest, not only for the safety of the proposed project, but for its potential impact on Minnesota’s natural resources, and the future of its present sustainable economy. Minnesota environmental review law provides: Minn. Stat. 116D.04(6). "No state action significantly affecting the quality of the environment shall be allowed, nor shall any permit for natural resources management and development be granted, where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state, so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air, water, land and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct". According to Tom Powers, economic rationality requires that mineral deposits be left in the ground undeveloped. Especially, since according to the Polymet data only 1 to 5 percent of the ore contains the non-ferrous metals, relegating the 95 to 99 percent not used to the tailings area. From my perspective, the environmental risk is one no rational person would take. Please review Comparison of Predicted and Actual Water Quality at Hardrock Mines: The reliability of predictions in Environmental Impact Statements and Predicting Water Quality at Hardrock Mines: Methods and Models, Uncertainties, and State-of-the-Art, Ann Maest and Jim Kuipers. The results of this study are: • 100 percent of sulfide mines predicted compliance with water quality standards before operations began; • 76 percent of mines, studied in detail, exceeded water quality standards due to mining activity; • Mitigation measures predicted to prevent water quality exceedances failed at 64 percent of the mines studied in detail. Other environmentally conscious companies embarked upon “safe” sulfide mining projects with every intention of being environmentally friendly. However, the facts are that three out four ended up be polluters. Statistically, that means that the PolyMet project has a 75% chance of polluting! That risk is untenable and one that should not be taken.</p>	G7A,G14
3514	<p>However, I believe that a total moratorium on mining must occur in Minnesota, the same which presently exists in Wisconsin after their Flambeau sulfide mining disaster. This would allow for time to further evaluate sulfide mining in Minnesota and its expressed dangers with full and transparent disclosure to the public, since current MN laws have plenty of “gaps” in safeguards that expose the state and its citizens to significant risks. Some of these gaps are 1) Only the DNR can make decisions in calculating the amount of financial assurances and in determining the appropriate form of financial assurance. Presently, the Pollution Control Agency and the Dept. of Management and Budget are not involved in this process. 2) Mining could also be allowed up to the very borders of the Boundary Waters Canoe Area Wilderness and adjacent to (or under) water bodies that flow into the wilderness. 3) Mining companies are not required to discuss financial assurance or damage deposit, in the DEIS for their mine proposals, which is a key opportunity for public involvement in the process.</p>	G4A,G12
3515	<p>The DNR ‘s exploratory leasing is opening up the entire Arrowhead to become a sulfide mining district. An EIS needs to be completed on the mineralization of the entire Duluth Complex prior to the permitting of any one project. As the owner of both a resort facility and a Boundary Waters canoe outfitting business, I find it unbelievable that the DNR and the Corp of Engineers, have the sole power to determine if northeastern Minnesota will exchange its present sustainable tourism industry (a billion dollar industry—www.exploreminnesota.com) for a “non-sustainable” sulfide mine (and possible sulfide mining district) that will destroy our natural resources and forever more alter the incredible beauty of the lakes region of northeastern Minnesota for the sake of PolyMet’s 400 short term jobs, and additional spin off jobs for a lifespan of just 20 years. The questions for you to evaluate are: Is this really what we want for this part of our state? Do we want to forever more change surrounding forests and wetlands as they are today? To no longer count on clean water? To deal a fatal blow to the sustainable tourism economic base of this area?</p>	G1,G8C,G11
3517	<p>It my sincere hope that you will give proper evaluation to this landmark controversy facing the state of Minnesota and its citizens. We must learn from the mistakes made across our country in other states that allowed sulfide mining companies, usually from other countries, the opportunity to destroy its natural resources with the promise of lucrative jobs. A degree in engineering, geology or hydrology is not necessary to realize that the landscape changes alone will forever alter this northeastern Minnesota. This would mean centuries or more of potential water pollution left for our grandchildren and future generations. I urge you to not permit this DEIS, as it is flawed and totally unacceptable. Are the precious metals worth more than the value of our precious waters? A response is requested.</p>	G2,G8

3518	Minnesota environmental review law provides: Minn. Stat. 116D.04(6). "No state action significantly affecting the quality of the environment shall be allowed, nor shall any permit for natural resources management and development be granted, where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state, so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air, water, land and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct". I believe that we, as a state, have to follow the environmental review law. In no way are 400 short term mining jobs worth the risk to our environment, especially our precious water and air. We have to start to think about our future generations and not be so easily persuaded to exchange our natural resources for very few jobs now just because of the poor economic conditions. In better times, I doubt we would even consider this drastic proposal. Why are we in Minnesota so gullible to let this happen? Our neighbors to the east in Wisconsin have a moratorium on this type of mining. . . why don't we have this until PolyMet and other hard rock mining companies can prove that there project is a 100 percent clean project which would result in zero damage to the environment?	G2,G12
3519	The DNR 's exploratory leasing is opening up the entire Arrowhead to become a sulfide mining district. An EIS needs to be completed on the mineralization of the entire Duluth Complex prior to the permitting of any one project.	G8C
3520	The questions for you to evaluate are: Is this really what we want for this part of our state? Do we want to forever more change surrounding forests and wetlands as they are today? To no longer count on clean water? To deal a fatal blow to the sustainable economic base of this area?	G1,G2
3546	How can PolyMet be permitted without the land? How can PolyMet be permitted without completing a land exchange for the 6,700 acres? As an Industrial Engineer, every project I have ever developed begins with a solid foundation and from there the project proceeds. There are serious flaws in the PolyMet DEIS because the most important aspect of this project is the need for 6,700 acres of land---the foundation—for the project, and the land has yet to be exchanged with the USFS. Both the Indian tribes and the United States Environmental Protection Agency have pointed out this very serious inadequacy in the PolyMet/NorthMet Draft environmental impact statement. Before PolyMet can even be considered for permits, the following gaps NEED to be filled: The PolyMet "NorthMet" copper-nickel strip mine project is proposed to be sited on approximately 6,700 acres of United States Forest Service lands in the Superior National Forest. Pursuant to law, the project depends on the completion of a successful land exchange of Superior National Forest lands for non-federal lands. (PDEIS), p. 1-3. The proposed land exchange tracts and the characteristics of such land are not described in the DEIS and have not yet been publicly disclosed. Across Minnesota, there are dozens of applications for permits to prospect for nonferrous metals. Understanding land exchange and mineral rights is critical for the PolyMet Project and for future proposed strip mine development. The need for a land exchange prior to permitting of the PolyMet strip mine project must be transparent to the public and the DEIS, for the PolyMet project must include an analysis of the environmental impacts of the land transfer, including potential impacts on tribal rights. This precludes any possible permitting of the PolyMet DEIS as it stands now. A. PolyMet reserved mineral rights do not support strip mining on Superior Forest Land. PolyMet proposes to develop a copper-sulfide strip mining operation located primarily on Superior National Forest Lands. Although PolyMet has claimed that the mineral rights "reserved" in its 1935 deed authorize mining in any form, the U.S. Forest Service has maintained that the deed does not permit strip mining, so PolyMet must buy land to exchange before obtaining permits for the NorthMet mining project. The analysis conducted by the U.S. Forest Service is consistent with prevailing law. Strip mining necessarily entails massive removal of soil and plant life to access underground minerals. This results in irretrievable loss to the environment as well as a fundamental change in forest land use. Prepared by Bride Seifert, William Mitchell Law School, Intern for WaterLegacy; Paula Maccabee,	PD1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3547	<p>B. Land exchange process requires equal value and environmental review. In order for PolyMet to purchase Superior National Forest land, a land exchange needs to occur. PDEIS, p. 3-1. Under The Federal Land Policy and Management Act of 1976 § 206, 43 U.S.C. § 1716, lands exchanged must be of equal value, in the public interest and in line with the forest land and resource management plans. Public interest assessment examines the needs of State and local community, looking at the economy, recreation, fish and wildlife as well as food, fiber and minerals. 43 U.S.C. § 1716(a). Environmental concerns are clearly included. A critical first step in a public lands exchange is the public interest determination. No land exchange can take place unless it is in the public interest. The public interest determination considers the needs of State and local residents, fish and wildlife habitats, wilderness and recreation values, economic interests and cultural resources, and watershed issues. 36 C.F.R. § 254.3(1). C. Environmental Review – National Environmental Policy Act. The National Environmental Policy Act (NEPA) calls for the preparation of an Environmental Impact Statement (EIS) for any Federal activity that will have a significant impact on the environment. It is clear that the land exchange proposed for the PolyMet strip mine, which would involve approximately 6,700 acres of Superior National Forest land, will require an EIS. Tribal lands and rights will be impacted, with potential environmental justice, as well as Treaty rights implications. Wildlife and wetlands, including pristine areas, would be acquired by PolyMet and disrupted or degraded to develop the NorthMet strip mine and processing facility. Conclusion. Before the PolyMet NorthMet project could proceed, the PolyMet Company would need to find approximately 6,700 acres of land to exchange for the Superior National Forest lands on which the strip mine and processing facility would be located. According to the guidance of the U.S. EPA’s NEPA Compliance Office and pursuant to applicable law, the NorthMet proposal and the land exchange are connected actions, requiring environmental review in a single EIS. It is inappropriate to release a draft EIS or commence substantive evaluation of the NorthMet project until an EIS analysis is performed for the proposed land exchange, addressing tribal rights and economic valuation as well as environmental issues. In 2002, my wife and I entered into the final stage of a land exchange involving the US Forest Service, Lake County and us. Our facility was located on federal land on Birch Lake at that time. We had followed the protocol for this land exchange which took nine years and 27 steps. Only after completing all aspects of the land exchange, including an EIS, did the land become ours. It is inappropriate, unfair, and totally unbelievable that a mining company such as PolyMet, could possibly be allowed to circumvent the environmental review, and public input, and the National Environmental Policy Act. In fact, if PolyMet is permitted without following the correct procedures for securing the land they need, we have grounds for a lawsuit. Compliance for the law regarding land exchanges for the “common person” should also be law for a mining company. How can they act and be “above the law?” Because the politicians endorsed it? That does not cut it. We provide jobs, and have not only provided jobs for 34 years to hundreds of people, but have brought thousands of tourists into northern Minnesota whose dollars spent make the tourism industry not only beneficial to merchants, restaurants, gas stations and others, but continue to make it a sustainable, non-polluting industry. We did not get any latitude to circumvent the law for our land exchange. Our economic contribution makes dollars that stay in the area, not like those of a Canadian mining company that extracts the natural resources, makes their money, lay off the workers, closes the plant, an</p>	PD1,G1,CR1
3548	<p>This is unacceptable. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time (once they extract the metals and make a ton of money, they will run back to Canada). This is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care. Bill H.F. No. 2560, as introduced-86th Legislative Session (2009-2010). Posted on Jan 08, 2010 is a bill for an act relating to natural resources; providing for financial assurance for nonferrous metallic mineral mining; amending Minnesota Statutes 2008, sections 93.481, by adding a subdivision; 93.49; Minnesota Statutes 2009 Supplement, section 93.481, subdivision 1; proposing coding for new law in Minnesota Statutes, chapter 93. This new bill introduced by Representatives Alice Hausman and Bev Scalze is a first step in providing financial assurances to protect MN taxpayers from the cost of clean up and reclamation resulting from sulfide mining.</p>	PD3,PD4,PD5

3549	<p>CUMULATIVE IMPACTS • The DEIS is remiss in considering the potential impacts of sulfide mining within the Arrowhead Region. The USFS has begun an EIS for Federal Hardrock Minerals Prospecting Permits Project for the Superior National forest. The DNR continues to sell exploratory leases to companies exploring the Duluth Complex of mineralization. Duluth Metals is advertising its Nokomis deposit of copper-nickel-platinum-palladium-gold minerals on its website. The Nokomis deposit is located alongside the Boundary Waters Canoe Area. Franconia Minerals is advertising its Birch Lake, Maturi and Spruce Roads deposits, all within the Boundary Waters Canoe Area watershed. The PolyMet DEIS is inadequate in addressing PolyMet as an isolated copper-nickel mining project. • PolyMet’s DEIS is based upon PolyMet using 1/3 of its plant capacity, as purchased from LTVSMC /Cleveland Cliffs. Excess capacity is planned to be utilized by neighboring Teck Cominco, Franconia, Kennecott and Duluth Metals. The Excess Capacity of PolyMet’s processing plant is not addressed in the DEIS. The PolyMet DEIS is inadequate in not allowing for public knowledge or participation in the discussion of the creation of a sulfide mining district in the Arrowhead Region of Minnesota. • Cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district.</p>	PD1,G9,CR1
3553	<p>Contrary to what our short-sighted politicians (Klobuchar, Franken, Bakk, Oberstar, Rukavian, etc.) who endorsed this project without performing their “due diligence”, would like us to believe, there are thousands of concerned Minnesota citizens, and countless vacationers to Minnesota who have serious issues with this proposed mining project. We owe it to our future generations to give a 100% assurance that this politically-touted, 20-year sulfide mining project can be accomplished without irreversible harm to our waterways and our wetlands. Our waters are the most precious of our resources, and we need to seek out sustainable industry for northern Minnesota instead of locking ourselves into a permanent resource-extraction economy—at the price of long-term water pollution from Lake Superior to the Boundary Waters—while driving away other industry and points of view. Too bad our politicians have apparently failed to ask this question.</p>	PD3
3554	<p>Furthermore, the most important fact is that PolyMet does not even own the 6700 acres yet. Explain to me how the state can even consider permitting this mining company without even following the proper protocol for a land exchange? Sounds like you are putting the cart before the horse:</p>	PD1
3555	<p>The PolyMet “NorthMet” copper-nickel strip mine project is proposed to be sited on approximately 6,700 acres of United States Forest Service lands in the Superior National Forest. Pursuant to law, the project depends on the completion of a successful land exchange of Superior National Forest lands for non-federal lands. (PDEIS), p. 1-3. The proposed land exchange tracts and the characteristics of such land are not described in the DEIS and have not yet been publicly disclosed. Across Minnesota, there are dozens of applications for permits to prospect for nonferrous metals. Understanding land exchange and mineral rights is critical for the PolyMet Project and for future proposed strip mine development. The need for a land exchange prior to permitting of the PolyMet strip mine project must be transparent to the public and the DEIS, for the PolyMet project must include an analysis of the environmental impacts of the land transfer, including potential impacts on tribal rights. This precludes any possible permitting of the PolyMet DEIS as it stands now. Thus, before PolyMet can be permitted for the land that is to be exchanged for Superior National Forest land to make this project possible must be analyzed. Include impacts of the land swap on wetlands, endangered species, hydrology, tribal rights, and taxpayers' interests.</p>	PD1
3556	<p>Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, and interfere with tribal treaty rights and tribal resources, like wild rice. The state must analyze ALL of the CUMULATIVE impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in accumulates in fish and causes brain damage to children and to fetuses.</p>	WR4C,WR5A,FM1,FM3,C

3558	I find it unbelievable that the DNR and the Corp of Engineers, have the sole power to determine if northeastern Minnesota will exchange its present sustainable tourism industry (a billion dollar industry—www.exploreminnesota.com) for a “nonsustainable” sulfide mine (and possible sulfide mining district) that will destroy our natural resources and forever more alter the incredible beauty of the lakes region of northeastern Minnesota for the sake of PolyMet’s 400 short term jobs, and additional spin off jobs for a lifespan of just 20 years. The tourism industry of Minnesota contributes substantially to the tax base-... “Unlike US Steel which paid precious little in property taxes on its 3,000 acres...” Timberjay Newspaper, January, 21, 2010.	G1
<b>Sender Last Name:</b> Koschaka		<b>Submission ID:</b> 2196
342	One thing also that bothers me too that hasn't been talked much about is the air pollution problems with the mining project that is proposed or the ash disposal issue that will occur in Minnesota from the immense amount of electricity that will be needed to operate these proposed sulfide mines. Where will the electricity come from? If the plant includes a new power plant, Minnesota cannot right now meet our air emissions standards. One quarter of the haze presently sitting over Northern Minnesota, including the Boundary Waters and Voyagers National Park, is produced by sources within the State, five power plants and six taconite mining and processing plants, and that comes from the Minneapolis Star and Tribune, December 1, 2009.	AQ4B
999	Irrevocable damage to our environment, sustainable natural resource of water, air, wildlife and wetland greatly, greatly concerns me. PolyMet and their mining efforts always wave the job flag, but as proven by our neighbor to the east, Wisconsin, when it came time to employ people for the Flambeau mining project, people from other places, not Wisconsin, got the high paying jobs; and the low paying jobs, the first to be let go were the people from Wisconsin. Short-term jobs at best 20 years I don't think that is a reason to pollute our natural resources. 400 jobs at best for maybe 20 years, again, I don't think that is a reason to pollute our natural resources. I do have grave concerns about the AMD, the acid mine drainage. The deposits here that we are looking out for the sulfide mines, 99 percent of it will be overburdened, will rot, which will be producing sulfide and the sulfuric acid, and only 1 percent of the ore body has the precious minerals. So it's really not a very high producing property, if you will, that they are talking about.	SE3,SE6,SE7
1811	I do not support PolyMet's efforts. I am totally concerned about protecting clean water. I am very skeptical that since the, how can I say it, the testing site thus far for this mine has been in a lab, if you will. There has been no proven, for-sure sulfide mine that has operated anywhere in the whole world that can do so without polluting the environment.	G7
2005	Also I have grave concerns that once again like most of the mining companies exploring in Minnesota these are Canadian companies. So once they take our precious minerals and tout jobs, make their money for all their investors, they will be gone and leaving us with the big mess to clean up.	PD3,G1
2602	MS. KOSCHAKA: I guess I will just wrap it up right now that I am extremely concerned about the DEIS, the contaminated wastewater discharge from waste rock piles that will be polluting for up 2,000 years, DEIS Table 4.1-45, and the fact about 40 years after the mine is closed the West Pit will overflow and begin discharging polluted water into the Partridge River, drained by the St. Louis River, and ultimately to Lake Superior. And then, of course, the fact that the groundwater at the mine site will be contaminated with heavy metals. I have grave concerns about the tailing basins where the grinding and slurry are going to end up that it's not going to hold. It would be similar to Taconite Harbor when the tailing spewed across Highway 61 when that broke. So, again, I really have grave concerns about this. I strongly oppose sulfide mining in Minnesota until it can be proven to be safe. (At this time the five minutes were up, but	G7

2603 MS. KOSCHAKA: I read a really excellent book called *The Buzzards Have Landed* by Laura Furtman and Roscoe Churchill about the Flambeau Mine in Wisconsin. It talks about how mining companies make inroads into a community, and I have seen this happen in our area. One of the first ones is getting to know those people presumed to be the decision-makers in the community. Mining officials will lure local leaders to become their friends and join the right churches and local clubs. Number 1, learn everything about the political arena affecting the area in which the mine is to be built. All levels of government will be infiltrated, including the Township, the County, the City, and the State, none are ignored. Number 3, claiming its mine will bring jobs and prosperity to the area even though such claims have not been proven to be true in other mining towns. Four, declaring that its project will be its lawyers to sit down at the table with local people and town officials to discuss and clear up any problems or misunderstandings about the mine. This is the company's way of convincing the doubters in the community of how safe the mine will be and how good it will be for the local economy. The officials will be only too happy to explain everything to the local bumpkins. One of the most important ones, sitting in on the drafting of any new rules or laws that will govern the mining project and spending lots of money on lobbying to weaken mining regulations and other environmental laws. I have grave concerns related to all of those and more. I guess the last thing that I want to say is that my sincere hope is that really true proper evaluation is given to the DEIS. I have read it. I have seen many things that are flags to me just as a layperson. We need as citizens of Minnesota to really take a good, hard look at this and learn from the mistakes that have been made across the country by elected officials in other states that allowed sulfide mining companies, usually from other countries, the opportunity to destroy its natural resources with the promise of jobs. You know, there are many other types of jobs such as manufacturing that wouldn't create the environmental pollution that is for certain going to happen with a sulfide mining project like is being proposed. In reality those jobs filter out when the mines are exploited, the companies make a ton of money for their respective companies, and their investors are leaving behind an environmental disasters for our State to attempt to clean up in perpetuity. This would be Minnesota's legacy. I pray not. I am wondering have the Northern Minnesota legislative people, including Al Franken and Amy Klobuchar, convinced themselves that our waters will be fine just because they want jobs at any cost. The facts are clear, sulfide mining cannot be accomplished without polluting our water. We may be Minnesota nice, but we, and I for one, am not Minnesota stupid. Thank you kindly.

1365 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. It didn't work in Wisconsin, and it won't work here.

**Sender Last Name:**    Koskins **Submission ID:** 1184

1299 I and my family are deeply concerned about how our XX XXX will respond to this issue of sulfide mining. It is not worth the short term gain that will be enjoyed by a few corporations and not enough citizens of the area. The water in Minnesota is a key resource that allows its residents to enjoy a high quality of life. Please strongly consider these impacts that effect the natural resources and people of this state. These issues will effect our children and our childrens children. I and my family oppose this kind of mining. Thank You.

164	My profession occasionally takes me to northern Minnesota, a place of beauty. I also vacation in the area and will be retiring there. I would be the last person who would support any development that would harm the environment. This projects first priority is protection of the environment. I understand the importance of balancing the need for the use of resources and preserving the quality of our air and water. I have been following the development of PolyMet Mining's NorthMet Project. I have read portions of the EIS and have had numerous discussions with those involved in the development. I support this project because I believe that the precautions that this company has taken will prevent any environmental concerns. Not only is the economic impact to the area huge, this project will also increase the supply of needed metals and will decrease our reliance on foreign supply. There will be a substantial increase in tax revenue for the local area, schools and state. Minnesota can become a leader in the production of these metals, several of which are not mined anywhere in the US. I encourage you to support the EIS statement and recommend to the state that PolyMet be given the permit to proceed with this project.	EOO

140	Hello. I am a landowner on Birch Lake from Ely, in Ely, Minnesota, and was born and raised in Ely, Minnesota, so I am very much aware of the BWAC, and the controversy that surrounded that. And also, I am a proponent of our waters in the Boundary Waters Canoe Area. I'm very fearful that if this project goes through, it's going to be a precedent setting for the rest of the other mines that might follow. That being said, in general, any nonferrous mine in that -- in the region proposes a lot of hazards that I don't think are fully -- have fully been addressed by the environmental impact statement. We -- I -- I really am -- have problems thinking about this containment of the waste rock. I don't believe that -- I just don't know how that would work. The -- the sulfur acid, I believe, will still be able to be leached out of that containment system that they're proposing. The other thing that I think that we should bring up into the DNR and the Army Corps of Engineers is the situation in Wisconsin, whereby they have proposed -- no, they have a moratorium on mining until it's proven that it is a safe and effective way to -- until it's proven that they have a safe and effective way to mine. And I really think that Minnesota, Minnesota's legislature should consider the problems that they've had there.	EOO,G7A,G12
293	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, interfere with tribal rights guaranteed by Treaty and with tribal resources, like wild rice, increase air pollution that results in regional haze and create a risk of perpetual pollution with no financial assurance that the public won't end up paying the costs. The Indian tribes working on the EIS and the United States Environmental Protection Agency have provided helpful information on the inadequacy of the PolyMet draft EIS. Before this sulfide mining project is even considered for permits, please fill these gaps:	G2B,G2C,G3,G4,G8
<b>Sender Last Name:</b> Kubinek		<b>Submission ID:</b> 1972
2476	To allow this permit process to go forward would be a huge mistake and losing proposition for all of the taxpayers and residents of the state of Minnesota. As it will only open the floodgates to more permit applications such as this From other Carpet Bagging Mining Companies. This is such a process that, really isn't even known if it is safe and far more importantly, what the future impact can or might be to the region's groundwater. By far and above, Minnesota's most valuable resource is it's Watershed. So valuable, That no one should ever even attempt to ever put a Dollar amount on it. Why then, would anyone ever consider to gamble any of it's future? By allowing this permit process to go forward, that is the only thing that will ever happen. As these mining companies don't care about the enviroment, they only care about their profits, at ANY Cost!	G7

2972	As a Graduate student of Conservation Biology at the University of Minnesota, I wanted to take a moment to express my deep concern over the possibility of the PolyMet Mining Corporation implementing their proposed sulfide mining project in Northeastern Minnesota. In terms of impact on water quality, I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. This is a completely unacceptable timeframe. Additionally, it is my understanding that heavy metal contaminants from the mining operation would end up in surrounding rivers and streams, and ultimately Lake Superior. Such pollution, among its many impacts on the aquatic ecosystem and the human populations that depend on them, will lead to contamination of the fish populations that Minnesotans have long enjoyed. Minnesota – a state literally named for its water – already suffers greatly from water contamination issues, especially concerning heavy metals. The State should be condoning action that will result in undoing this natural resource problem – not intensifying it. The water quality impacts alone should provide the State with ample reason to prevent this operation, as proposed, from occurring. However, the reach of the consequences will extend even further, including a total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf – as well as potentially dire ramifications to nature-based tourism industries in and around proposed mining regions. To allow such an operation to occur would be acting with a complete and utter lack of foresight, not to mention undue selfishness. In addition to the health and economic impacts for current residents and visitors to the area, the short-term gain acquired in this case would result in a long term burden left to millennia of future generations of Minnesotans. As the Native American proverb goes, “We do not inherit the Earth from our Ancestors, we borrow it from our Children.” Let us not leave them with nothing to borrow from their own. Minnesotans are fortunate to live in a state that is rich in a diverse array of both natural and social resources. To fall victim to the tunnel vision of the mining industry by focusing on such a narrow component of this resource base is to risk jeopardizing all of the others. As a recent popular film stated, “The wealth of this world is not in the ground, but all around us.” I ask you to please consider this and the above thoughts when you consider the proposed mining project’s Draft Environmental Impact Statement.	G2C,G7A,G11

2742	I no longer live in Minnesta, but recreate there regularly. It appears the water movement through and over bedrock is unknown and may move toward the Boundary Waters watershed. Testing should be done before any mineral extraction is performed. The BWCAW is a unique place on earth, and needs to be preserved. It also draws thousands of visitors anually that have a huge impact on the northeastern Minnestoa economy. I know people who still drink unfiltered lake water there, and i would hate to think they may drink in metals in solution due to mining miles away.	WR2A
3177	I understand there is no financial structure or requirement for funding of mitigation after the mine closes. There needs to be, as any damage done to waters, soils, and habitats should be returned to their original condition. And, should their be leaks or evidence of damage to flora and fauna post closure, funds need to be set aside for damage to correct it. Unintended consequences can easily occur. Here in Green Bay, it has taken 20 years to determine who should pay for the PCB removal and capping in our local Fox River. (Our water source is not the river, happily)	PD3,PD4
3178	I am concerned that the permitting for this mine will be an open door for others who will apply later. There will be material in suspension in the air, dust, that I would not want to breathe. More mines equal more air pollution, pollution that has no place in the BWCAW's magnificent clarity.	G9
3179	A mine needs monitoring of its waste material for water pollution run off, and proper storage and disposal of tailings. This needs to be a requirement of permitting.	PD2

3855 I am writing to express my full support for the pending PolyMet project in Aurora. As a construction electrician, I have a special interest in this project due to future job opportunities it will bring. PolyMet will significantly contribute to the state and local economies at a time when we are in need the jobs and economic benefit, especially in the Iron Range area. Given the large number of jobs this project will create (estimated to be 400), I believe that this project will provide local workers an opportunity to secure living-wage jobs at a time when this is needed most. Not only will this project directly impact the workers and their families, but the millions of dollars that PolyMet will provide in local and state taxes will support our communities and schools. PolyMet has demonstrated that it can produce critical metals while following Minnesota's strict environmental regulations that protect our air, water and land. This issue is critical to many of us who enjoy the pristine wilderness in Northeastern Minnesota, especially the Boundary Waters Canoe Area. Based on documentation produced by PolyMet representatives, I believe that impacts to the air and water will be minimal. As you are well aware, this project has been designed to minimize environmental impact; several examples include the reuse of a brown field site, the reuse of existing infrastructure and the minimization of the disturbance of wetlands. I appreciate any support your office may offer to this project. Thank you for your time.

1304 In regards to the structural stability of the tailings basin at the old LTV Mining site. I was an employee at this mine from 1981 to 2000. The company hired an engineering outfit several years before they closed down to determine the stability of the basin. They used drilling and other means to determine the stability. The report the company received said it would be structurally sound and stable for at least 40 years or more. I personally talked to one of the lead employees from the engineering firm and he told me that as far as he was concerned it would be stable for another 100 years. I'm sure you could contact someone from the old LTV plant to verify this and he/she may be able to even produce the report they received from the engineering firm.

405	I support the Polymet Mining proposal. The jobs that will be created are sorely needed for a region that has been seriously depressed economically for years. The tax revenue that will be created for the region and State of Minnesota as a whole will be very beneficial. The size of the metal deposits in the Duluth Complex will generate a significant source of revenue for the State of Minnesota for many years to come. In addition, Polymet has demonstrated that they will be able to mine without significant detriment to the environment, and they have set aside sufficient funding to address any environmental issues that may arise. With this improved mining technology, Minnesota can lead the way in showing the world how to mine with minimal environmental damage.	EOO
1144	I support Polymet Mining for numerous reasons and feel the DNR should find the DEIS document adequate so that Polymet can begin mining operations as soon as possible. First of all, Polymet offers our state self respect, pride, honor and happiness, all these human qualities are key to building a healthy community. Also, Good paying jobs which will last for multiple generations are what we need in Minnesota. I have read the Draft EIS statement and I believe Polymet in coordination with the DNR and supporting agencies have put together a document so complete and detailed that I highly doubt there is anything like it in the country to date. I believe environmental protections are in place to ensure the minimum amount of seepage of sulfates into the ground water, lakes, rivers and wetlands. The cost vs benefit are such that it imperative we expand this industry to include Non Ferrous minerals, it is this State's duty to initiate and assist the creation of future business growth in the mining sector that helps to protect the world's environment from further degradation by all the bad actors who practice careless and irresponsible mining ethics. These unethical practices continue to increase the global carbon footprint and present the world with a moral hazard that we (Minnesotans) as good stewards of the environment worldwide can not, and should not ignore. Further more, the state of Minnesota has discovered by way of business cycles, that it is now clear our mining sector needs additional diversification to include these strategic metals which are increasingly important to our national security. Moreover, when it comes to ethical practices I believe that the executive and managerial team that Polymet has assembled is a world class team beyond a doubt. I have reviewed their backgrounds and expertise levels respective to their roles and found them all extremely qualified and motivated to do the job of mining these metal safely and responsibly according to state regulations. I also believe when the time does come for closure, that Polymet has and will have in place financial assurances that are sufficient to cover all aspects of mine closure so as not to cause any public financial burden.	EOO,G4
<b>Sender Last Name:</b> Langford		<b>Submission ID:</b> 2317
2768	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Our family enjoys this area of Minnesota quite a bit in the summer. It is tranquil and provides our children with the ability to learn life skills, while enjoying, and learning how to respect nature. We are so lucky to have this gem of nature so close to us. Please take the time to make sure there is no impact to the BWCA from this mining project BEFORE hand. We have seen too many projects like this proposed, and the outcome has had a much greater impact on the environment than promised. This BWCA area is an asset to Minnesota and, and is worth protecting in every way possible.	G6
<b>Sender Last Name:</b> Languth		<b>Submission ID:</b> 3559
3822	To whom, I support PolyMetMining's NorthMet Project. I feel it would be a great benefit to our area financially and would protect our environment. I hope you will move this project forward. Tim Langguth DDS 324 W Superior St, Duluth, MN 55802	EOO

3589 have not equated to environmentally responsible mining, or to clean-up afterwards. It is therefore imperative that the DNR require very large surety bonds from Polymet, to be paid before mining and from profits during each year of mining, so that foreseen and unforeseen environmental problems due to the mine may be cleaned up. These funds must remain in escrow, in safe investments, for decades or longer, so that when some containment measure fails (as is common), the funding to start the cleanup is quickly available and will not fall on taxpayers. Also, these funds can be used for the very long-term monitoring of the mine waste that will be necessary. After decades have passed, if these funds have not been used, they may begin to be repaid to Polymet. PD4

**Sender Last Name:**    Larkin **Submission ID:** 2106

2495 I am writing to voice my objection to the proposed hard rock mining in the Hoyt Lakes district of Minnesota by Polymet or any other, similar mining enterprise. My concern is, of course, environmental. The exposure of these rocks will cause leaching of sulphide into the nearby streams, affecting the water quality of those adjacent streams and rivers and, ultimately, Lake Superior. Sulphide pollution will also affect the wild rice grown in the region. Even more significant for fish and, therefore, humans is the leaching of mercury which has poisonous effect. The Izaak Walton League notes, in addition, the disruption of wildlife corridors across the Mesabi Iron Range due to the size and location of such mining. The need for jobs is, I understand, severe. Adding to the tax base is important. None the less, because of the importance of water, I urge you to look for solutions that are environmentally secure; this type of mining is not. As I'm sure you are aware, our natural resources are limited; water quality is the most important. Diminish water quality, and you diminish the amount (quantity) available for consumption, irrigation, recreation. Contaminated waters translate into poor health. Stewardship of our water is essential to life. It's my understanding the local American Indian tribes focus on actions that will benefit the seventh generation. If not for the environment, please act for the health of our children and work to deny this type of mining in Minnesota, land of sky-blue waters. Many thanks for your consideration. G3B,G7A,G15

2717 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I believe the environmental impact of hard rock mining/sulfide mining proposed by Polymet and Franconia Minerals will be deleterious and severe. The exposure of the rocks and the fracturing of the rocks that will occur as a result of this type of mining inevitably signifies pollution. The history of similar mines points to this effect. There is no way of avoiding such pollution. Our Boundary Waters, a resource for humans as well as wildlife, need permanent protection from such assault. Once contaminated by the acidic result of this mining, the local rivers & streams, and ultimately Lake superior, will be contaminated; aquatic life will be much compromised if not terminated. That result will affect wildlife that ingests those waters. The environment is a resource and treasure every citizen, including those promoting this ravage of the land, should not only understand but also fight to protect. The devastation of our natural resources is approaching crisis levels; water quality is particularly important to the sustenance of life and health. Hard rock mining in the proposed areas IS NOT safe. I believe the Environment and the quality of our Minnesota waters are far more important than the proportionately small amount (compared to the quantity of rock removed) of mineral that can be extracted. G2C,G7A

Comment ID	Comment Text	Theme Codes
3	2. We believe the area impacted by the Polymet Northmet project is much larger than the area studied, that the project will negatively impact waters more than 100 miles away and for hundreds, perhaps thousands of years. We believe that even if plans were present to mitigate / render clean the waste anticipated to stream from the plant in perpetuity no calculations exist for anticipating such action.	WR1A,WR3B
4	3. Adding massive amounts of tailings waste to the existing problem of the existing leaking LTV tailings basin is only one example of how this project heaps insult upon injury – waters near the taconite dumps have been impacted by sulfide leaching from the pits with increased levels of sulfide as the waters are closer to the mines and pits.	G9
5	4. The company states the level of sulfate released from the tailings basin will exceed the secondary drinking water standard during the operational period and again at year 60. What about year 90? Year 200? It is a well known fact that drinking waters standards have not been updated to include all harmful substances, and are not appropriate measures to equate animal and plant habitat.	WR3A
6	5. Allowing companies that come to Minnesota to use our waters in ways that leave it harmed is unlawful and flies in the face of the economic realities extant in the world today – water is THE most precious resource.	G7
7	6. Wetlands in one watershed cannot be replaced by “creating wetlands” in another watershed. The watershed is impacted and changing another watershed does not fix the impact. The plants and animals impacted by destruction of one watershed are harmed or rendered extinct or kept from reviving regardless of what happens in another watershed or habitat. There is a proposal to divert waters seeping into the great wetlands surrounding the area of the Northmet Polymet existing dumps which would pull water seeping from the dumps and divert it to other waters – the Partridge River is one consideration. The idea that you can have an existing problem, add to it, take away an unquantified amount, dilute it and presume that this equates to no net gain is absurd on it’s face.	WE2,WE3
8	7. Human health impacts have not been quantified nor calculated in the EIS. In this video it is made clear that increased methylated Mercury will harm infants in utero. Each human being gets one chance to develop a healthy nervous system in the womb and the increased methylated mercury in our water will affect every living thing that comes into contact with it and by the process of bioaccumulation humans will be grievously impacted. In the EIS it is presumed that methylated mercury will increase but it is not quantified in the increased amounts coming from this project’s impact on humans. In addition the report states there will be increases	WR4B,FM1,AQ6
9	8. There is a prudent alternative to the Northmet Polymet strip mine project which may substantially reduce many of the concerns. This alternative has been rejected as not being economical without any investigation or study. It may be assumed that underground mining will be substantially less profitable however the statute says that economic considerations alone shall not justify pollution, impairment or destruction of the environment. A fair look at underground vs strip mining should be undertaken and should be coupled with the cost of underground mining remediation vs the cost of strip mining remediation and ensuing impacts. One mining company has announced it intends to mine underground. Underground mining is NOT out of the question.	ALT8
10	9. The northmet mine site surface rights are owned by the federal government and the mineral rights are subject to covenants agreed to by the holder of the mineral rights when the surface rights were sold to the federal government. The covenants are designed to protect the wetlands and were required by the Weeks Act <a href="http://www.foresthistor.org/Publications/*weeks*%20*act*.pdf">www.foresthistor.org/Publications/*weeks*%20*act*.pdf</a> as a condition of the sale of the surface lands to the federal government. The Weeks Act is a long standing law which is intended to protect wetlands and the environment. Both the DNR and the USFS have acknowledged that the Northmet mine site wetlands are worthy of protection are worthy of protection. The EIS is inadequate in that it merely assumes that the only type of mining possible is strip mining and this is based solely upon assumed economic considerations, the EIS does not adequately	WE7

Comment ID	Comment Text	Theme Codes
11	10. The EIS is incomplete in that it does not address the remedial costs after closure and establish estimated costs including treatment of water for perhaps hundreds or thousands of years. It has to be a type of cash deposit or bond that is realistic for such estimation. Treatment in perpetuity is on its face incalculable. Even with a finite time of 100 years there must be specific planning in place to establish and maintain adequate water treatment. One can only surmise the reason Polymet says one must wait for the actual design is to get the permit, get the money, and leave a situation where the waste of resources invested and the socio economic impact is such that the political element will dominate and decree continuation and exceptions to the permit and law. In the common vernacular “too big to fail”.	ALT8,G9
744	The weather is so bad today, Weds Dec 9th that I do not want to be out on the roads tonight driving back home from Aurora. Is it possible you will reschedule the meeting?	PRO6
764	The Friends of the Cloquet Valley also submits the following comments and concerns: 1. The time period allotted for feedback has not been sufficient for us to respond fully. We will send additional comments as soon as we are able and again request an extension of time for public review. 2. We believe the area impacted by the Polymet Northmet project is much larger than the area studied, that the project will negatively impact waters more than 100 miles away and for hundreds, perhaps thousands of years. In addition the report	WR3B,WR3I,WR4B,WE2,
2592	STEVEN LARSEN: My name is Steven Larsen. I live in Esko, Minnesota, and I'm an electrician. I've been an electrician for 30 some years. And at this time, with the possibilities of jobs being created by this project, as well as for construction people and with the -- for people to work at the plant as it comes online, it would be great for northern Minnesota, as well as the whole state, both as an increase in tax base and also for the economy for the immediate area as well as other areas. The economy has kind of been shaken up with all the problems around the world, but I believe at this time Minnesota has a lot of opportunities to continue its tradition of creating jobs and being creative at the same time. And I'm running out of words. At this time, in Minnesota, there is a high unemployment rate among all the construction people. There has been work that has been done on the range recently that have employed construction people from both the immediate area as well as the greater parts of Minnesota and the metro area Blaine Steno Atkinson-Baker pt E because work has frankly been really curtailed because of the way of the economy and has helped a lot of people keep their homes and pay their bills and keep the way of life here in Minnesota, which has been a great tradition. And I ran out again.	EOO

2633	My name is Steven Larsen, and I live in Esko, Minnesota. I've been an electrician for 30-some years, and I believe this project is going to be good for northern Minnesota and as well as work for construction people but also for the communities that are around it and good for Minnesota and increase tax funds to help the tax base, which they're finding that we have a dwindling one at this time with so many people unemployed. And I think the more jobs we create in northern Minnesota, the better it is for the whole state and for the communities that have been losing their children to move elsewhere to find work and -- when there has been none, and it's quite a few years since they closed the original LTV site where PolyMet will be at. And I've run out of words.	EOO
3730	Feb 3, 2009 The Friends of the Cloquet Valley State Forest supports and hereby incorporates by reference all comments submitted by the Tribal cooperating agencies, as set forth in Appendix D to the Draft EIS, and also set forth within footnotes throughout Volume I of the Draft EIS, and the comments the League of Women Voters, and the comments and observations provided by on the chapter's behalf Minnesota; Izaak Walton League, as prepared by Len Andersen; and those of the Friends of the Boundary Waters. 1192	[have been to most seminars put on by PolyMet Mining. I believe PolyMet has viable products produced safely for the environment. We need to get this project moving for our economic well being! Please support this project and move: it forward.	EOO
3176	This project cannot be started unless there is an absolute guarantee that toxins will not be released into our environment.	EOO
3470	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. I fell in love with the Boundary Waters Canoe Area years ago when I experienced it for the first time at the age of 6. My parents took me and my 4 year old brother because they had a strong desire for me to experience the same wonder they had when they camped there. I have been there many times since and still cannot get over the awe I feel for such a beautiful place. It is truly a unique treasure! I have never been to a place that is anything like it. As a Minnesota resident and college student in Minneapolis, I feel I have a duty to speak out against the possibility of mining away the northern area of my home state and polluting our sensitive air and waters. I love living in Minnesota because I believe it has a commitment to sustainability and strives to protect the environment of our citizens and natural world. Historical evidence shows that sulfide mining has a tremendous negative impact on the surrounding areas, including the land, water habitats, and air quality. I thank you for offering to use to best technology available to protect the environment with regard to this mining project, however, I do not believe that it will be enough to protect the land, water, and air around the area. I will not stay silent as proposals are put forward to pollute my home, and undoubtedly corrupt the level of purity of the BWCA, with noise, evidence of human impact, and toxins. I ask you to cease all project proposals and activity for sulfide mining in northern Minnesota. I am not in support of the proposals for mining near the Boundary Waters Canoe Area in northern Minnesota because it is heavily invasive effort near an irreplaceable area of protected land. I will continue to respectfully speak out against such a mining project in every way I can. As a college student majoring in environmental science, I am also asking my fellow students and professors to rally around this issue and speak out against this mining. Please do not take away my dream of taking my children and grandchildren to the BWCA to experience the incredible clean air, land, and water it has to offer. I want them to be able to drink from a lake and eat freshly caught fish. I want them to see what the environment can be like when we respect it and choose to make decisions that promote sustainability. I do not exaggerate when I say I believe the pollution of this area in any way is an utter tragedy. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	EOO,G2,G7

3570	I think the Northmet project would be a good project for northern Minnesota. I think they have looked at operating this project with the environment as there first priority. It would also give some needed work to the iron range in these times. Thanks for being able to comment on this project.	EOO
<b>Sender Last Name:</b>	Lasky	<b>Submission ID:</b> 3454
3734	After reviewing the extensive work done by PolyMet, MDNR and the Federal Corps of Engineers and associated regulatory agencies, I commend the agencies and the company for this very thorough assessmet of the potential impacts of the proposed project. The determinations and mitigation alternatives highlighted seemed reasonable and appropriate given this proposed new non-ferrous mining activity. I stongly support the approval of this draft EIS and the ongoing permitting of the project. It represents a sound economic development venture for Minnesota, has addressed potential environmental impacts with appropriate mitigation measures and alternatives given its location in the eastern Iron Range. These are stratgic minerals important to the country and our homeland security and also needs to be taken into consideration as we look to balance environemntal protection needs, economic development and jobs and the basic strategic needs of our country and the state. Thank you for the oppourtunity to provide these brief comments and support.	EOO
<b>Sender Last Name:</b>	Latimer	<b>Submission ID:</b> 2584
3140	•Sulfide mining proposals threaten our clean waters and tax dollars • Please support legislation that provides needed safeguards for this kind of mining • Pollution almost always occurs with sulfide mining, despite industry predictions that it won't • Future generations of Minnesotans deserve to inherit clean waters and a healthy environment. • I am a concerned lakeshore property owner in northern Minnesota	G5,G7
<b>Sender Last Name:</b>	Lauth	<b>Submission ID:</b> 2529
3096	I am anxious to submit a comment regarding the PolyMet Corp. NorthMet mining project Draft Environmental Impact Statement. I am concerned about the consequences this project will have on Minnesota's economy and precious natural resources. I am certain you have received a number of responses outlining concerns about 1) safety, 2) impacts on water quality, including water leaching from waste rock piles, 3) long-term responsibility for clean-up, 4) subsequent tax burdens, 5) high sulfate (and therefore mercury) levels, 6) stability of tailings basins, 7) long-lasting contamination. I share these concerns, and I urge the DNR and the U.S. Army Corps of Engineers to more carefully examine the DEIS, working with PolyMet to complete stability analyses and create a realistic long-term plan for containing pollutants and striving for minimal impact. I am encouraged by the relationships which have been set up in Wisconsin between the DNR and potential mining companies, because I value the care and thought put into permit grants. I would appreciate a similar prudence and critical eye from the Minnesota DNR. I understand the value of increased economic opportunity in northern Minnesota. I am a Minnesota resident and have spent significant time in the ecosystems under consideration for these PolyMet mines. I know the economy could use a boost. However, I know that the pristine nature of these ecosystems is a huge part of their appeal, both for tourism and for agriculture and for industry. For these reasons, I strongly urge the DNR to not only reconsider the PolyMet proposal but to implement a creative problem solving team to move towards sustainable innovation in northern Minnesota. The solution is not simply to abandon all mining prospects. I see the solution situated somewhere within a compromise, one that protects Minnesota's natural resources so they can continue to build an economy with vibrant tourism, fish and wildlife opportunities, and safe communities. I have grave concerns about the PolyMet proposal as it stands, and I fervently hope the DNR will reconsider before approval.	G4,G6,G7A,G11,G14

1813	And I started asking the people at the different tables very simple questions about what's going to happen and getting this explanation about the water and the water from -- that's going to be used in the old ponds from the old mine, and they're already leaky ponds and they're already causing a leakage problem, but they don't feel like that's a big deal and could not get a straight answer as to what's going to happen with the water and with the water quality. When you're using an old site that's already causing environmental problems, now you're going to add more problems to that, and it was suggested, so that it wouldn't leak out into -- and bubble up and create mercury, that the water would be recycled, and when you recycle and reuse water, it's going to be higher and higher concentrations. Well, at what point do you get rid of that very highly-concentrated water, and where does it go? Well, it was going to go down the Partridge River. Well, what happens? I said, "What happens?" Well, it goes down the Partridge River into the St. Louis River into Lake Superior. But my question had been, what's the impact of that? What happens to the environment when you're putting that kind of chemicals into the river?	WR1E,WR2D
2008	And, really, that's -- that's foundational law, and I think it is a high violation of our law when a company can be allowed to pollute and to not come up with solutions and not -- I could not get a question answered as to the amount of bond that this company is going to be required to post. I think it's very important that the worst-case-scenario-time-shell bomb of an environmental problem be analyzed and that this company be required to post a bond for that so if it does happen, that everything falls apart and their equipment fails or whatever happens, we, the people of the state of Minnesota, are not left with the mess to clean up.	PD3,PD4
2632	I guess, foundationally, I have a really serious problem with this project and with the -- I don't believe the Environmental Impact Statement is adequate; I don't think it's strong enough. I believe that every person has the right to their property; they have the right to their mineral rights on their property, but I also have the right to my body and that my water doesn't get polluted and that my neighbor's water doesn't get polluted. So that's my concern on this. I think that there should be no tolerance whatsoever and that they can do whatever they want with their property as long as it does not affect other people.	G2,G8

1321	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, and interfere with tribal treaty rights and tribal resources, like wild rice. The project could also increase air pollution that results in regional haze and create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs. Both the Indian tribes and the United States Environmental Protection Agency have pointed out serious inadequacies in the PolyMet/NorthMet Draft environmental impact statement (EIS). Before Polymet can be considered for permits, the following gaps NEED to be filled:	G2B,G2C,G3A,G4A,G7A,G
3134	I am very concerned about how this mine will affect the quality of the BWCA. It is concerned that the study notes that 36 days of the year there will be a haze associated with this project. I hope we can think long term impact, long after the materials are taken.	G2
3575	The PolyMet Mining Corp's intentions to rape and slaughter the majestic north-minnesotan wilderness are fueled by greed and heartlessness. Giving your support to these corporate slanderers would be a direct assault against mother nature, and all which she has given to man as a race.	EOO,G2
<b>Sender Last Name:</b> Lehmann		<b>Submission ID:</b> 2272
2687	We have reviewed the subject Draft EIS and find that it is thorough and competently prepared by the agencies concerned and by the consultants for the DNR and the Corps. We fully understand that an EIS needs to fairly present the project being proposed and the range of possible impacts, both positive and negative. We note that the lengthy EIS is supported by about 600 reference and reports. We believe that the draft, as prepared makes a fair and scientifically support assessment of the project and its impacts except perhaps not sufficiently as to the positive social and economic impacts of the proposed project. It is always important to keep in mind that an EIS is not a decision or permitting document. We view the footnotes which mainly set out issues apparently raised by some tribal representatives, as being based on weak science and faulty thinking. We support the project as being well conceived and using the latest technology for mining and processing of these geologically complex ores and for handling waste materials from the proposed operations. We also believe that the project will substantially benefit the region and the state by creating well paying, long term, direct jobs and many indirect jobs, as well as tax revenues for the state and the region. The project also will reduce, in an environmentally responsible manner, the nation's import dependence for the strategic and critical materials that will be the products of the mine.	EOO,G6
<b>Sender Last Name:</b> Lehnert		<b>Submission ID:</b> 2033
2487	Wisconsin has banned this type of mining until it can be proven safe. Let's do the same here in Minnesota.	G14

Comment ID	Comment Text	Theme Codes
1	The proposed project has numerous effects on groundwater levels and quality, which are summarized in Table 4.1-68 (page 4.1-129). This table and the accompanying summary make it clear that both at the proposed mine site and at the proposed project's tailings basin significant environmental degradation of groundwater resources is expected to occur. At the mine site, storage of chemically reactive waste rock is predicted to result in long-term exceedances of USEPA and MDH limits for antimony, manganese, and nickel. Further, long-term exceedances of groundwater evaluation criteria for sulfates are also predicted. The failure of the proposed project to meet these standards means that long-term, active treatment of residual seepage from the mine site would be required to reduce the impacts of these pollutants on the surrounding environment. The State of Minnesota has established the goal of closed mines being maintenance free, and this project fails to meet that goal. The perpetual treatment of mine site wastes that this project would require constitutes an unacceptable financial and environmental risk to the State of Minnesota. At the tailings basin, the DEIS establishes that greatly increased groundwater seepage rates will inundate wetlands and introduce high concentrations of sulfates to wetlands and water bodies in the area. These sulfates will acidify the area, causing the familiar and well-documented problems associated with acid mine drainage, including damage to aquatic life and increased methylization of	WR1A
2	pumping and drainage. The No Action Alternative for the tailings basin would not result in elevated concentrations of sulfates in groundwater, and thus avoids the serious long-term problems associated with acid mine drainage.	PD3
3	The proposed project has numerous effects on surface water levels and quality, which are summarized in Table 4.1-68 (page 4.1-129, 130). This table and the accompanying summary make it clear that both the proposed mine site and the proposed project's tailings basin will cause significant environmental degradation of surface waters in the watershed. Both the West Pit (upon mine closure) and the Tailings Basin (during mine operation and upon mine closure) are expected to pollute surrounding waters. The West Pit overflow is predicted to fail to meet water quality standards upon closure, thus impacting the Partridge River and downstream waters to Lake Superior. Release of sulfates and the resulting acid mine drainage are unacceptable long-term impacts of the proposed project's plan for the West Pit. At the Tailings Basin, increased groundwater seepage will result in upwelling that will affect surface waters, including the Embarrass River. Table 4.1 shows that sulfate concentrations at Embarrass River PM-13 are expected to increase from 33 mg/L to 53 mg/L, a jump of 60%. Increased sulfate levels will result in acid mine drainage, which will damage the watershed's biota. This environmental degradation is an unacceptable risk of the proposed project.	WR2C
4	Further, the DEIS shows that numerous groups have serious concerns about the geotechnical stability of the Tailings Basin (4.13-2). Failure of the Tailings Basin, either during mine operation or after closure, would result in catastrophic releases of sulfates and heavy metals into surrounding waters. The DEIS says that "further design and analysis would occur during permitting to ensure that construction meets acceptable design standards" (4.13-2). It is unconscionable to approve a project that has not yet determined that construction of the Tailings Basin can safely mitigate risk of basin failure. The scale of the environmental disaster that would result from such a failure makes it imperative that a full structural and design analysis of the Tailings Basin be part of the DEIS, to comply with NEPA and to allow the public to fully review, understand, and comment upon the environmental risks associated with the proposed project.	GT1
5	C. Methylmercury formation The releases of sulfates generated by the proposed project will significantly increase methylization of mercury in downstream waters. This methylmercury will bioaccumulate in aquatic life, further impairing a watershed that is already severely impacted by mercury. The proposed project will exacerbate mercury contamination by destroying peat wetlands (which sequester mercury), by releasing mercury from peat excavated from these wetlands, by causing atmospheric emissions of mercury, by releasing sulfate ions from the proposed mine site, and by releasing sulfate ions from the Tailings Basin. Many people consume fish from waters that will be affected by the proposed project, and most of these waters are already impaired by mercury. The St. Louis River is already too polluted by mercury for the State of Minnesota's mercury TMDL process to remedy, and thus is excluded from that process. The proposed project will severely impact the river all the way down to the St. Louis River Estuary, which supports world-class populations of walleye, muskellunge, and sturgeon. The DEIS fails to assess the proposed project's impacts on fisheries in the St. Louis River, fisheries that are of huge regional importance. These impacts will have social and economic as well as environmental consequences, none of which are analyzed in the DEIS.	WR4B,WE8,FM1,FM5,AQ4

Comment ID	Comment Text	Theme Codes
6	The proposed project would directly and indirectly affect 1,522.9 acres of wetlands, which are detailed in Table 4.2-3 (pp. 4.2-11 through 4.2-15). The PolyMet company's current proposal for mitigating the destruction of these wetlands includes on-site mitigation totaling 175 acres of wetland creation and off-site restoration of 1,123.2 acres. Further, 202 acres of off-site upland buffer zones would be preserved, leading to an assumed total of 1,287 wetland mitigation credits. This total "may not be sufficient to satisfy the compensatory mitigation requirements" for the total acreage of wetlands affected directly and indirectly (4.2-38). The enormous scale of the proposed destruction of wetlands places great importance on the quality and quantity of the wetlands to be restored or created. Leaving aside the fact that human-made wetlands cannot approach the quality of natural wetlands, at least on a human time scale, the fact that a significant portion of the wetlands mitigation plan is left undetermined by the DEIS violates the public's right to understand, review, and comment on specific details of the proposed project.	WE2,WE3,WE7
<b>Sender Last Name:</b> Leningang		<b>Submission ID:</b> 157
148	I just want to say I think it would be good for the economy -- so -- because it's suppose to provide up to 400 jobs. And then I'm in construction so that part is good for us in our Local 647 because we're kind of slowing down because of the economy now. This would be a good project for us to be on. And that's it.	EOO
<b>Sender Last Name:</b> Leoni		<b>Submission ID:</b> 30
28	I've been following PolyMet's progress for the last five years. I've been to a number of the DNR presentations. I understand exactly what the safeguards are, and it's totally different than any of the concerns that the environmentalists have regarding seepage or leakage of contaminated processes that they fear is going to go into the environment and/or into the Boundary Waters. This is a totally different mining system than any of the environmentalists are contesting. They're publicizing false information on what PolyMet is actually doing. They're basing it on phosphorus mining from different areas of our country and different areas of the world where sulfur and -- and minerals like this are mined. They haven't taken a true analysis of all of the environmental protections that PolyMet has done, and, therefore, the -- what they're projecting and what they're publicizing is incorrect. Now, on the positive sides of PolyMet, I truly believe that the economic position of not only Northern Minnesota but the state of Minnesota and the United States calls for a project like this. It will only benefit all of the workers in Northern Minnesota, the state of Minnesota, and the United States. It develops jobs, it is safe for the economy, and it also is necessary for the minerals that we will need in the future. We shouldn't rely on the minerals that are projected to be down in Brazil and also that are anticipated or they're trying to find in China. We have a resource here that is identified. It's going to be built on a preexisting mine that will never be reclaimed. Nothing will be done with it. It will always be a abandoned mine. And it's -- it's only a win-win situation for the state of Minnesota and for the United States.	EOO
<b>Sender Last Name:</b> Leplatt		<b>Submission ID:</b> 141
132	My name is Herb LePlatt and we have a cabin in Ely, Minnesota. I believe that the sulphide mining project that PolyMet is anticipating putting in will be a tremendous disaster for the entire area. It would eliminate not only the wilderness and the things that northern Minnesota is known for, but it would eliminate fresh water, fresh fish. It would take hundreds of years to clean up the mess and our grandchildren's children will be working with this same project when they're alive, trying to fix what we've allowed to happen, so I believe it's a real travesty to let this go through.	EOO,G2,G7
141	We have a cabin, which we hope to retire to, on Kawishiwi River in Ely, Minnesota, and we're very concerned for the water quality, for the forest, for the boundary waters, with the potential of sulfide mining. So I think that's the extent of it. We're just very concerned for the environment up there.	G2,G7

379	The loss of recreational jobs will offset any gains planned by mining. Plus there are no assurances that PolyMet will hire and maintain a Minnesota work force. They could bring in Canadians or Mexican miners that will work for less in the very near future. Please don't allow this travesty to happen.	EOO,G1,G11
<b>Sender Last Name:</b> Leppala		<b>Submission ID:</b> 5
5	My family is from up here, third generation working in the mines or working on them. I have a family of three and really need the work. I believe that the Iron Range was built on mines and mining natural resources, so I feel it's really important for the economy and families around this area in general.	EOO
<b>Sender Last Name:</b> Lermon		<b>Submission ID:</b> 3217
3547	I don't believe the extraction industry when they say there will be no environmental effects from this mine. As a frequent vacationer in the northern Mn areas I see no evidence from the past mining operations that the future will be better. There are scores of abandoned pits and mines all over Minnesota, and there will always be ways for mine owners to skip out on their obligations to take care of the mines once they are played out. The material they intend to mine has only a 1% value of the materials they want, and 99% waste rock. The companies would do better to mine municipal landfills, the metals content there is estimated at 10% or more! Using hazardous materials to get a 1% yield while destroying clean water for the sake of jobs makes no sense.	EOO,G4A
<b>Sender Last Name:</b> Leschak		<b>Submission ID:</b> 330
351	1. Peatlands Cannot Be Replaced in Any Practical Manner. To remove peat and stockpile it for restoration seems dubious at best. On page 4.2-38 we read: "Due to both on-site and offsite limitations and technical feasibility, it was not found practicable to replace all impacted wetland types with an equivalent area of in-kind wetlands." The PolyMet mining project would destroy (not damage) approximately 2000 acres of natural area that was identified as special habitat worthy of protection in ecological assessments done by the US Forest Service and the MNDNR a decade ago. About 1000 acres of this is peatland, and Governor Pawlenty's "Minnesota Climate Change Advisory Group" stated in 2008 that, "Protecting these enormous carbon resources (peatlands)...is critical." Furthermore, in a report (2008) requested by the Minnesota Legislature, the "Minnesota Terrestrial Carbon Sequestration Project" presented as its primary recommendation: "Preserve the existing large carbon stocks in peatlands and forests by identifying and protecting peatlands and forests vulnerable to conversion, fire, and other preventable threats." In an era when mitigating negative effects of climate change is a global priority, the PolyMet mine, due to the destruction of forest/peatland, would increase Minnesota's overall emission of greenhouse gas carbon dioxide by 2%. That alone is good reason to scrap this project.	G2A,G7C
352	2. History Tells the Tale. From the perspective of human health and environmental safety, there has never been an effective metallic sulfide mining operation on this continent - not a single one. PolyMet has not offered a significant modification to the customary sulfide mining process that would prevent what history demonstrates is inevitable poisoning of water resources longterm. The disasters at Butte, Montana and Sudbury, Ontario spring readily to mind. The astronomically expensive clean-up of the inevitable mess will fall to the taxpayer. It is likely that water escaping from the tailings basin will deliver excessive sulfates to the Embarrass River (and beyond), thus facilitating the conversion of natural mercury to the deadlier methyl mercury. All cap and liner systems leak. There is no reason to expect that typical acid mine drainage will not spread from the site, dissolving heavy metals such as copper and lead, and contaminating ground and surface waters. The "No Action Alternative" seems the most prudent course for this project.	G4A,G7A,G7B

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
42	I am writing on behalf of the Sierra Club and its members to request a minimum thirty (30) day extension of the public comment period for the draft Environmental Impact Statement (“DEIS”) for PolyMet’s proposed NorthMet open pit sulfide mine project, located within the Superior National	PRO6
43	Forest in Minnesota and to request that the U.S. Army Corps of Engineers and Minnesota Department of Natural Resources hold three (3) additional public hearings regarding this DEIS so that all members of the public who wish to participate are afforded an opportunity to do so.	PRO6
44	through 4:30 p.m. on Wednesday, February 3, 2010. Given the enormous size and technically complex nature of this DEIS, the Sierra Club respectfully submits that an extension of the comment period so that it is no less than 120 days will allow the public and other agency stakeholders the opportunity to make complete, accurate and meaningful comments on this DEIS.	PRO6
45	More time is needed for the public comment period to provide a sufficient opportunity for meaningful comments regarding the environmental impacts of this project for numerous reasons. First, the DEIS and its accompanying appendices are a staggering 1,800 pages, many of which discuss complex technical material. Given the technical nature of this material, Sierra Club and other public stakeholders wish to retain expert assistance to help analyze the DEIS. However, since the current comment period straddles a few major holidays (Thanksgiving, Christmas, and Hanukah), Sierra Club is having a difficult time finding experts with availability. In addition, this project is very controversial. It is the first large-scale cooper mine in Minnesota’s history and it is proposed on a portion of the Superior National Forest.	PRO6
46	The Sierra Club, therefore, requests that the U.S. Army Corps of Engineers and Minnesota Department of Natural Resources extend the public comment period on the DEIS by 30 days. This reasonable and necessary extension would set the comment period to close on Monday, March 8, 2010.	PRO6
47	Sierra Club is not alone in its request to have a 120-day comment period. The U.S. EPA has also recognized that an expanded review period is needed to provide the public and agency stakeholders adequate time to review and comment on the DEIS. On August 25, 2009, the U.S. Environmental Protection Agency submitted comments on “red flag” issues concerning the proposed Northmet mine and urged the U.S. Army Corps of Engineers to adopt a 120-day comment period stating: The complexity and potential impacts of this project warrant a longer public review period than the 45-day minimum for a DEIS published in the Federal Register. Recent similar projects elsewhere in the country . . . have similar 120-day review periods . . . We observe that public interest in copper mines in the Upper Midwest is high. Decisions made for this project may be precedent-setting, as it is the first large-scale copper mine in Minnesota. We have consistently urged USACE to adopt a realistic comment period for this project over the past two years and will address this concern regarding the comment period with the USACE St. Paul District Colonel separately. Letter from Kenneth Westlake, Supervisor of NEPA Implementation, U.S. Environmental Protection Agency, to Tamara Cameron, Chief, St. Paul District Regulatory Branch U.S. Army Corps of Engineers (Aug. 25, 2009) (attached hereto).	PRO6
48	In addition to requesting an extension of the public comment period, Sierra Club also requests that the agencies schedule three (3) additional public meetings on the Fond du Lac Chippewa reservation and in the cities of Ely and Duluth.	PRO6
49	The residents of cities of Ely and Duluth and on the Fond du Lac Chippewa reservation have a considerable interest in this proposed project – the project may adversely affect the Fond du Lac Chippewa reservation and its residents; Ely, the entry point to the Boundary Waters Canoe Area Wilderness, is surrounded by metallic mineral exploration bordering the PolyMet site; and Duluth is the St. Louis County seat and is located at the mouth of the St. Louis River. By holding public meetings only in Aurora and Blaine, a vast majority of interested and concerned members of the public would not have the opportunity to participate in the public hearings. This is unfair for the public and does not further the policies behind public hearings.	PRO6
50	Therefore, Sierra Club requests that the agencies schedule three additional public meetings to accommodate all of those who wish to attend. Moreover, these hearings should have at least thirty (30) days notice and allow for the open exchange of information by permitting the public to pose questions to agency representatives.	PRO6

355	The U.S. Army Corps of Engineers and Minnesota Department of Natural Resources will benefit from more public input, because your agencies will have a better understanding on a host of issues before issuance of the final environmental impact statement. The Sierra Club, along with other public and agency stakeholders, will address numerous important, highly complex technical issues in its comments, which call for additional expert input and a more thorough analysis than it can accomplish in the current limited comment period. Just a handful of these issues are listed below: <ul style="list-style-type: none"> <li>o Water quality impacts, including impacts to surface waters, ground water, tailings basin seeps, and changes in hydrology are an immense issue for public and agency consideration, and these impacts are related directly to the proposed action, and alternatives and mitigation measures thereto.</li> <li>o Financial assurances and the implications that inadequate financial assurances would have on environmental impacts of the proposed project with regard to reclamation and closure.</li> <li>o Impacts to endangered species, such as the Canada Lynx and grey wolf, including but not limited to habitat loss, fragmentation, and degradation and impacts from disease and environmental contaminants. As you can see, a complete analysis of the enormous proposed sulfide mine and its accompanying environmental impacts will require extensive analysis, and the list above is in no way exhaustive.</li> </ul>	G2C,G4A,G7,G10

2407	Why don't you require a lining on the old tailings basin?	PD5
<b>Sender Last Name:</b> Licari		<b>Submission ID:</b> 280
294	I am writing to you to pledge my suppOJ1 for the PolyMet Mining Co. 's NorthMet Project. Having grown-up on the Iron Range in Biwabik, MN, I know first hand the impact the Mining Industry has had on NE Minnesota. I have seen the good times in the 1970's and the down times in the 1980's and 1990's. This project would add 400 full-time jobs as well as 500 spin-off jobs to our area! It would also add millions of dollars in state and local taxes that help support our communities and education system. But more than that, the PolyMet Mining Co.'s NorthMet Project, along with the Mesaba Nugget Project has brought renewed hope to the Eastern Iron Range. This renewed hope propelled the citizens of the Mesabi East School District to approve a multi million dollar expansion and up grade of their schools. PolyMet Mining Co.'s NorthMet Project would go a long way in re-energizing an area of Minnesota that has seen its share of downturn and hard times. As impressive as the employment numbers are, what is also very encouraging to all of us is the commitment from PolyMet Mining Co. to be a good citizen with respect to technology and environmental controls. I was even more impressed with how PolyMet Mining Co.'s NorthMet Project is going to reuse the mining infrastructure from the old LTV site. As an added bonus for our state, the NorthMet Project would be the first to mine and produce several metals not currently mined anywhere else in the United States. This is not surprising as Minnesota has always found a way to be a leader in many areas, including proper environmental stewardship. Being an employee of AmeriPride Services Inc., I know first hand the commitment needed to maintain a healthy environment. This is very important to all of us who live in NE Minnesota. I know and understand there is allot to consider with this project. The leadership at PolyMet Mining Co. is Minnesotans who know and understand the commitment needed to complete a project in a responsible and environmentally friendly way. I congratulate the DNR and MPCA for doing their due diligence in making sure this project is done right. But I am also a firm believer that if we work together, we can come to solutions that will benefit everyone. This project is very important to the entire state of Minnesota. Please see to it that it moves forward to completion. Thank you very much for your time and consideration.	EOO

1320	As a concerned citizen, frequent user of BWCA and cabin owner near Spruce Road, I would appeal to decision makers to carefully consider longer term effects of externalizing all the sulfide waste (99% of rock mined), in a nature preserve area of our state. That is the part of our state that is supported by conservation and nature protection. Short term monetary gain will destroy this. Shame on you – DNR!	G2A
2748	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I cannot express my disappointment enough that the DNR of this great state would even consider potentially spoiling that which it is bound to protect. It would be ludicrous to allow sulfide mining adjacent to such a magnificent water park, as the boundary waters. With its track record around the world, it seems likely it will spoil the water shed and leave the public with the clean up. I agree that the people of the Iron Range need new jobs and industry, but the nature of this industry is obviously incompatible with the region it is currently proposed. The tourist industry in northern Minnesota is viable. The world is trying to become 'greener', so why spoil this area of the state for short term goals?	EOO,G7A,G11
<b>Sender Last Name:</b> Light		<b>Submission ID:</b> 3181
3127	Dear Sir or Madam, I am concerned for the welfare of the water quality not only on the St. Louis River but also Lake Superior. No matter how careful the mining could be conducted in this region, there will be acid drainage from the open pits and therefore the water pH will change. I know that most species live within a very specific range of tolerance of the change of environmental conditions such as pH. I hope that the impact study would include a lab review of the speices present in the aquatic environments and there ability to survive the change in pH that will occur no matter how careful the copper will be extracted. I feel that this study is being finished too quickly. It seems that the ultimate decision should be postponed until a more involved and extensive study can be conducted. I mean this is the Lake Superior watershed which is one of our largest sources of surface fresh water we have available to us. It would be a shame if we acted in haste to grab up what resources we could while impacting an even more vital and important resource in the process.	WR3D,PRO3,FM2
<b>Sender Last Name:</b> Lillemo		<b>Submission ID:</b> 3502
3693	Polymet has been unable to stop current seeping from their tailings pit. How can anyone trust what the people at Polymet are saying when they tell us they won't add any more pollution to the watershed. They have an incentive to minimize the environmental impact of their operations. The DNR has a responsibility to the citizens of Minnesota to counter that incentive with strong, ironclad, legally binding, financially backed assurances that any operations going forward do not add to the pollution they are currently generating and that they will go back and clean up the pollution that is already occurring. Without that COMMITMENT, they should be denied any new permitting. Cleaning up there current mess would also provide jobs. I also note that other states more concerned with their water resources than Minnesota have banned the type of mining that Polymet is proposing. That should cause the Minnesota DNR to be extra cautious when it comes to taking Polymet's words at face value since Polymet has no incentive to be honest about scope of the problem they will be creating. Polymet should clean up their current pollution before being allowed to go forward with any other projects.	PD4,G9

Comment ID	Comment Text	Theme Codes
1	Acid generation potential The DEIS underestimates the potential for waste rock to generate ARD. We are aware that mine plans have changed since the tests to evaluate waste rock chemistry and acid generation potential were completed, and it is not clear if relative proportions of the waste rock in the current mine plan will be the same as those used in the waste rock characterization. We question whether the waste rock analyses are still representative of the waste rock that will be generated by the project. For example, we note from supporting technical documents that Unit 7 was not included in the analysis, although it will contribute to the waste rock. In addition, the DEIS states that more extensive characterization of the overburden is needed. (Page 4.1-65, Section 4.1.3.1). Recommendation: The revised/supplemental DEIS should evaluate whether the waste rock chemistry predictions, waste rock management plans and post-closure needs are taken into consideration in the current mining plans. We further recommend that USACE and the applicant determine what additional tests may be necessary to reflect the current mine plan, then complete those tests.	WR1E,PD2
2	Hydrogeology/hydrology assessment and impacts: plant site The Partridge and Embarrass Rivers already exceed or are close to exceeding water quality standards for some constituents. Section 4.1 of the DEIS describes storm water discharges from the Plant Site (excluding the Tailings Basin). These discharges would be routed to Second Creek, a tributary to the Partridge River. However, the DEIS has not adequately assessed these rivers. For example, the Partridge River flow-data summarized on page 4.1-21 and Table 4.1-12 is outdated (1980 to 1988). The Embarrass River flow data summarized in Table 4.1-17 is extremely old (1942-1964) and for this reason alone is not appropriate for characterizing existing flow conditions. Recommendations: More information is necessary to evaluate impacts to these rivers. We recommend the following. The revised/supplemental DEIS should provide a complete impact analysis of the Partridge River and Embarrass River based on an accurate characterization of their flow and assimilative capacity, under current and project conditions. More data is needed to describe conditions in the downstream lakes. Where current data is lacking, data collection may be warranted. Where historical data is not available, we recommend considering reference data from other similar streams in the area.	WR3J
2	The DEIS lacks an adequate groundwater characterization at the tailings basin. There are information gaps related to the extent of existing contamination, potential releases from the project, the groundwater pathway of potential releases, and the potential for contaminated groundwater to impact surface water. As evidence for inadequate analysis, EPA points out the following data deficiencies that should be addressed:	WR2A
2	Tailings basin stability The DEIS does not include a recent, detailed engineering analyses on the structural stability and integrity of the existing LTV tailings basin. Consequently, the stability of the existing tailings basin and its ability to retain the project's additional tailings and processing residues is not known, and this is an unacceptable data gap. The DEIS notes that geotechnical stability studies will be conducted during permitting (Section 4.1.3). These issues should be addressed in the revised/supplemental DEIS. The following issues should be addressed: • The tailings basins are already leaking. • The effect of the additional weight of new tailings and process wastes has not been estimated or analyzed. • The understanding of water flow through the waste is not well understood or described. • Groundwater data surrounding the tailings basin is scant; the groundwater flow regime is poorly characterized here, as is the potential for groundwater to impact surface water down gradient of the tailings basin. • NorthMet proposes to dispose of hydrometallurgical wastes in lined cells on top of existing tailing ponds - the integrity of the tailings basin to accommodate this management option is not described. Recommendation: EPA believes that analyzing tailing basin stability is important as part of informed decision-making for this project; clearly, the basin's ability to retain additional mine tailings and hydrometallurgical wastes is crucial to preventing releases to the environment. The revised/supplemental DEIS should include a stability analysis of the tailings basin in its current state and under the project's operating and post-closure conditions. Furthermore, if the basin is found potentially unusable as proposed, another disposal area would need to be evaluated as an alternative as part of the revised/supplemental DEIS.	GT1
3	Recommendation: Additional support is necessary to confirm the conclusions regarding improved water quality when NorthMet tailings are added to the LTVSMC tailings. We note that these experimental results cannot be interpreted further unless it can be established that the experiments that form the basis of this conclusion accurately simulate long-term behavior of the tailings under in situ conditions (i.e., pH, redox conditions, microbial effects, etc.).	WR1E

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3	The DEIS' finding that the addition of NorthMet tailings to the LTVSMC tailings basin would improve leachate quality is not well supported. The DEIS concludes the effects of interaction between the NorthMet seepage and underlying LTVSMC tailings suggest that the latter will remove certain constituents from the NorthMet leachate. These column experiments were conducted for a limited period of time (~35 weeks; RS46); long-term results may differ significantly. In addition, the results of these experiments assumes that solutes from the NorthMet seepage are sorbed onto hydrous ferric oxide, manganese oxide, and aluminum oxides surfaces, but these are stable only under oxidizing conditions (assumed to be the experimental conditions, as no details of redox controls in the experimental columns were provided). Under the subaqueous conditions that are expected to prevail in the long term at the Mine Site, depletion of oxygen and the onset of reducing conditions will result in dissolution of oxides and the release of sorbed metals. This scenario should be reconciled with the conclusions drawn from the column experiments.	WR1E
3	Proposed seepage trench placement should be based on or adjusted to provide a more complete understanding or model of area hydrogeology. We recommend more comprehensive monitoring, including installation/expansion of a monitoring well network, around the tailings basin.	WR1B
4	The proposed hydrometallurgical plant would use selective leaching and precipitation to collect target metals out of solution. While hydrometallurgical processes are currently being used in both the gold and copper sectors, the DEIS states that the proposed hydro metallurgical plant process has not previously been employed on a commercial scale (p. 4.1-95) and that predictions of residue chemistry, settling times, and consolidation are uncertain. The DEIS, however, assumes for all the modeled environmental impacts that this plant will operate as proposed and that all of its wastes or discharges into the environment will meet the expected design parameters. The DEIS does not address the scenario of the plant not operating as designed and if the process may generate an unanticipated range of wastes and discharges that are not described in the DEIS, requiring treatment.	WR1E,PD11
5	II. Wetlands Synopsis: Insofar as the USACE is using the DEIS to support the CWA Section 404 wetlands fill permit decision, the revised/supplemental DEIS needs to address several wetlands permitting issues, including alternative mine plans, an assessment of wetlands functions, mitigation ratios, and a complete analysis of and mitigation for the indirect impacts to wetlands. EPA has determined that the DEIS does not contain sufficient information to demonstrate compliance with the CWA 404(b)(1) Guidelines (Guidelines). Pursuant to the Guidelines, the applicant bears the burden of clearly demonstrating that the preferred alternative is the least environmentally damaging practicable alternative (LEDPA) that achieves the overall project purpose, minimizes impacts to the aquatic environment to the maximum extent practicable, and does not cause or contribute to significant degradation of waters of the U.S. The Guidelines contain four main requirements (40 CFR 230.10(a) through (d)) and each must be satisfied to comply with Section 404.	WE2,WE3,WE4
5	In our June 9, 2005 letter the to the District Engineer, EPA reserved its right to elevate our objections to the individual wetlands fill permit for this project, under CWA Section 404(q) due to the potential that this project may result in substantial and unacceptable impacts to aquatic resources of national importance (ARNI). The proposed Mine Site contains approximately 1,300 wetland acres, which are within the Partridge River Watershed, which flows through Colby Lake to the Embarrass River and then to the St. Louis River and Lake Superior. Of these, 73% of the more than 1,100 wetlands acres proposed to be impacted consist of open bog and coniferous bog communities. Other wetland types at the Mine Site are coniferous swamp, alder thicket, hardwood swamp, wet meadow, and some shallow marsh. The wetland functional assessment included in the DEIS indicates that more than 90% of the wetlands to be impacted have Minnesota Rapid Assessment Method (MnRAM) scores corresponding to high vegetative diversity and high overall wetland quality. The DEIS also states that the Minnesota County Biological Survey (MCBS) has identified the Mine Site as having High Biodiversity Significance. For the above reasons, EPA believes the coniferous and open bogs, comprising a large percentage of the approximately 33,880 total wetland acres within the Partridge River Watershed to be an ARNI due to the values they provide in terms of unique habitat, biodiversity, downstream water quality, and flood control.	WE1,WE2,WE4
6	Recommendation: EPA recommends that additional ground water data be collected to adequately evaluate the interconnection between bedrock and the surficial aquifers and wetlands.	WR2A,WR2I,WE2

Comment ID	Comment Text	Theme Codes
7	Proposed actions are connected if they are interdependent parts of a larger action and depend on the larger action for their justification (CFR 1508.25). The National Forest land in question would not be transferred out of USFS ownership if not for the nature of the proposed mining project, making the proposed land transfer a connected action. As a connected action, impacts associated with the land transfer should be identified and analyzed as part of this DEIS. EPA finds the DEIS incomplete without the following: 1) a discussion of USFS regulations governing land transfers, 2) an analysis focused on the trade-offs between the two parcels, and 3) information explaining that any decision made by USACE is conditioned upon a successful land exchange between the USFS and PolyMet. Effects to threatened and endangered species, timber production, and recreation are among the issues that should be identified and analyzed for both parcels.	PRO4
7	Impacts along rail lines We recommend quantifying the potential for releases of ore and other mine debris along rail lines between the mine site and processing plant. The revised/supplemental DEIS should describe and address any consequent impacts to soil, surface water, groundwater, and wetlands along the rail lines.	PD4
7	Asbestos-like minerals The DEIS does not evaluate the potential for asbestos-like minerals to be released in water effluent or air emissions, although asbestos-like minerals and their health effects are emerging concerns on the Iron Range. Section 4.6.5.1 of the DEIS indicates that asbestos and asbestos-like fibers may be found in the ore deposit. The DEIS concluded that "impact [from asbestos fibers] is of uncertain magnitude." This conclusion is not supported by the analysis, and the potential impacts to air and water quality from this source bear further discussion and quantification. Recommendation: EPA recommends that the revised/supplemental DEIS include an appendix that reevaluates the potential for asbestos-like minerals to be found in the ore deposit. It should discuss an adaptive management approach that includes how the company proposes to monitor, and if necessary, address the potential release of asbestos-like minerals into the environment during operation, closure, and post-closure.	WR3I,AQ4C
8	Recommendation: We recommend the revised/supplemental DEIS address analysis pertaining to the land transfer with the USFS and impacts to tribal trust resources. The subsequent Final EIS would encompass impacts from all aspects of the proposed project and present a comprehensive, cumulative impacts analysis. This information is necessary to make an informed decision regarding the proposed project.	PRO4
8	Federal trust responsibilities should also be addressed since the land proposed for the Mine Site is part of tribal 1854 Treaty Ceded Territory. The DEIS should be revised to identify and analyze all impacts to tribes and Tribal trust resources that would result from a land transfer. Issues related to tribal resource availability and tribal access will be particularly important. The following questions should be addressed: • What will this new parcel(s) contribute to treaty rights or resources? • What impacts to quality and quantity of tribal trust resources will occur due to a potential land transfer? • What cumulative impacts to 1854 Treaty Ceded Territory trust resources will occur as a result of this land transfer (for example, impacts to moose movement and habitat quantity and quality over the entire 1854 Treaty Ceded Territory)? As federal agencies, USACE, USFS, and EPA need to ensure that federal trust responsibilities are adequately addressed in this analysis.	CR4
9	Recommendation: We recommend the revised/supplemental DEIS evaluate and disclose impacts to all media collectively across the 1854 Ceded Territory as a whole. We also recommend removing references to the draft work known as "the Protocol to Assess Expanded Cumulative Impacts to Native Americans." The referenced work is a draft document in development and is neither published by EPA nor publicly available.	CR4,CR5
9	Impacts in the 1854 Ceded Territory and to tribes practicing reserved rights in the Territory Insofar as a cumulative impacts study's geographic area need to reflect the geographic range of an individual resource outside a project property line, so should it reflect the geographic range of uses. In this case, the 1854 Ceded Territory functions as a single geographic area of legal jurisdiction in which tribes may engage in certain practices of cultural heritage and subsistence.	CR4

Comment ID	Comment Text	Theme Codes
10	<p>Potential mercury generation from waste rock EP A supports the goals of the 1991 "Binational Program to Restore and Protect the Lake Superior Basin" to establish a Zero Discharge Demonstration Program for critical pollutants (of which mercury is one), and we question whether the waste rock and the project overall have been adequately evaluated for their potential to introduce mercury into the Lake Superior watershed. The DEIS states that results from 36-day batch tests suggest that mercury will be absorbed by minerals in the waste rock (p. 4.1-122). Details of these experiments are not provided, but it is not clear that conditions expected to occur under field conditions were accurately simulated in the batch tests, nor is it established that the time scale under which these tests were conducted is adequate for predictions of long-term mercury behavior. In addition, EPA does not agree that "scientific understanding of mercury methylation and bioaccumulation is limited" (p. 4.1-122). A large body of work has been done on this topic (see, e.g., the references cited in the section discussing mercury methylation beginning on p. 4.1-125). Recommendation: The revised/supplemental DEIS should include information upon which conclusions regarding mercury behavior at the site were based. Depending on this information, EPA may suggest that the applicant perform additional or more appropriate studies on potential for mercury mobilization.</p>	WR4B,WR4E
10	<p>The DEIS analysis relies on unproven measures to limit oxidation of waste rock and assumes full success of these measures. EPA does not believe this assumption is supported, in part because several of the approaches proposed to control ARD (such as compaction, membrane covers, and lining of pit walls) have not been demonstrated as effective. For example, the East Pit closure cover includes ARD reduction measures that the DEIS admits have not been demonstrated successfully in the U.S. (Section 4.1-16). In addition, the plan to isolate the Category 4 in-situ material (Virginia formation) in the final backfill is not clear, inasmuch as the narrative indicates that four inches of limestone will be placed over this material that will be developed in a steep face. The DEIS also notes that waste rock oxidation will be limited by compaction measures, another unproven approach. Subsequent management plans based on these assumptions may lead to potential water quality impacts. Therefore, EPA believes the DEIS should assume that waste rock will in fact be oxidized and the extent should be predicted. Recommendation: EPA suggests that the revised/supplemental DEIS model ARD inflows assuming various degrees of effectiveness of covers and other designs. We further recommend analyzing other management strategies to prevent ARD and developing adaptive management options that can address the likely situation that ARD will be generated post-closure from pit walls. Regarding the stockpile liners, we recommend the revised/supplemental DEIS consider measures to protect the permanent stockpile liners from erosion or other surface impacts that could occur over the long term. These liners have potential to be damaged if they are exposed.</p>	WR1E,WR2D,PD2
11	<p>Waste rock management According to the DEIS, all waste rock at the site is acid generating. The proponent's plan to segregate waste rock into four categories (based on potential to generate ARD) is a key management approach in reducing the potential for acid generation. Supporting documentation has noted that acid generation in Category 2 waste rock is sensitive to the inclusion of Category 3 and 4 waste rock, meaning that if some proportion of the latter category rock is included in the Category 2 rock, the resulting overall drainage could be acidic and result in increased metal solubility (Report RS53/42). The DEIS explains that no sampling of the overburden will take place during stripping; instead, field determinations will be relied on for assessing overburden type (p. 4.1-66). Once acid generation begins, it cannot be reversed and will require more extensive management to minimize environmental risks. The DEIS does not describe how successful segregation will be achieved on a real-time basis; therefore, EPA does not have confidence that segregation will happen so as to assure that waste rock is stored properly according to its reactivity in a real-time operational timeframe. EPA is very concerned about the possibility that segregation would fail to separate reactive waste categories effectively to prevent eventual ARD. Recommendation: Waste rock management needs to be described thoroughly to allow decision-makers to evaluate whether it will sufficiently prevent ARD from entering the aquatic environment. EPA recommends the revised/supplemental DEIS describe how waste rock would be sorted during operation, and how the success of segregation will be determined. We also recommend a discussion of criteria for the field determinations and any plans for quality assurance in these field decisions. We also recommend the revised/supplemental DEIS describe how waste rock management and pits would be adaptively managed should segregation be compromised or ineffective in preventing ARD.</p>	WR1E,PD2

Comment ID	Comment Text	Theme Codes
12	The DEIS proposes an artificial wetland to treat contaminated water at the mine site in perpetuity. Artificial wetlands have successfully treated low flows of acid waters; however, their success has been quite limited in treating flows containing a range of metals. The DEIS does not demonstrate that this treatment option will be successful in the severe winter environment found at the site or that if the artificial wetland fails how treatment will be accomplished. Other management decisions are contingent on the success of this proposed mitigation measure. Recommendation: The revised/supplemental DEIS should include information about the operation of the treatment wetlands. The information should include a long-term adaptive management plan for the treatment wetlands, especially with regard to plant maintenance, removal of accumulated metals in the wetland plants and sediment, and monitoring for effectiveness. Given that the performance history on treatment wetlands of this size and scope is limited, EPA further recommends the revised/supplemental DEIS explore additional alternatives for treating this wastewater.	WR3L
12	The DEIS does not offer supporting data that the proposed wastewater treatment facility (WWTF) has the capacity to treat all ARD effluent and will be sufficient to address waste rock pile drainage over a long-term timeframe. The proposed WWTF is intended to capture and treat all drainage from waste rock piles and recycle the water into the processing plant, or to discharge treated water into the Partridge River, in the event that process water is not needed. WWTF capacity is not described; therefore, there is inadequate information to know whether it could process all the contaminated stormwater flows during a maximum spring snow melt situation. In addition, the design capacity of the WWTF may be inadequate, since the project plan assumes that pit walls will not generate ARD. Recommendation: We recommend describing the WWTF further, in particular its capacity relative to anticipated flows. We also recommend using revised ARD assumptions (as described in above comments) to evaluate loading to the WWTF. Management plans should recognize that long-term treatment and discharge will likely be necessary in the post-closure period.	WR2G
12	EPA believes Category 1 waste rock should not be used for construction material since it has ARD potential, which could be increased if segregation techniques are not sufficient to prevent mixing.	PD2
13	West Pit overflows The predicted West Pit overflows to an unnamed tributary of the Partridge River will cause serious water quality impacts. The DEIS indicates that arsenic, cobalt, copper, nickel, and selenium would exceed water quality standards (p. 4.1-113). The DEIS notes uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury (p. 4.1-124). The presumption that the unnamed tributary would "essentially function as a mixing zone" is questionable. Considering that the Partridge River ambient levels for several of these parameters are already high (Table 4.1-24) and, in the case of aluminum, exceed the water quality standard, dilution is not a feasible solution to any West Pit overflows. In addition, many of these constituents will accumulate over time, especially in sediment. Sediment is where the majority of mercury methylation will occur. The results of the deterministic modeling and follow-up uncertainty analysis suggest that "as many as five parameters (i.e., arsenic, cobalt, copper, nickel, and selenium) could exceed surface water quality standards, in addition to relatively high sulfate concentrations." Recommendation: EPA recommends the revised/supplemental DEIS develop operations and closure alternatives that will avoid or prevent pit overflow. The overflow scenario should include measures that will protect water quality downstream, among them treatment alternatives, a monitoring plan, and adaptive management plans for the overflow. We also recommend further evaluation of whether overflow from the West Pit will meet Lake Superior mercury standards.	WR3C
14	Our issues fall into the following categories: Inadequate data collection Neither the number of wells (3) nor the frequency of monitoring (once a year in 2005, 2006, and 2009) constitutes adequate characterization of the surficial aquifer.	WR1E

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
14	Inadequate model assumptions The DEIS states "The MODFLOW model was not developed to accurately predict drawdown in the surficial aquifer or the impact, if any, such drawdown would have on adjacent wetlands and surface waters" (p. 4.1-60). Consequently, its use and ability to represent potential impacts due to pit dewatering and maintenance pumping are very limited. Furthermore, given this caveat to using MODFLOW to evaluate the effects of mine pit dewatering on the Partridge River flows, it is not the optimal tool for predicting this information. The DEIS assumes the complete effectiveness of unproven anti-oxidation measures for groundwater modeling purposes (see above comments). This is not a conservative approach, and, therefore, modeling results based on this assumption are not credible. Several conclusions are provided that refer to groundwater elevation recovery following the closure of the mine. However, the DEIS states, "MnDNR believes that actual hydrogeological characteristics of the project site do not fit the model assumptions of homogeneous porous media flow (uniform vertical and horizontal conductivity) for the bedrock and till layers" (p. 4.1-57). With the potential deficiencies of the model, it is not consistent to provide relatively precise post-closure groundwater recovery elevations and dates of recovery based on the MODFLOW model.	WR2A
14	Hydrogeology/hydrology assessment and impacts: mine site The model assumptions and the amount of data used for groundwater modeling at the mine site are inadequate and may not be protective of water quality. The DEIS states that concentrations of several solutes could exceed water quality standards at mine site boundaries. In addition, the DEIS states that firm conclusions cannot be drawn due to conflicts between the results from deterministic modeling and the Uncertainty Analysis at the mine site (p. 4.1-84). Given the DEIS-stated potential for long-term (> 2000 yrs) leaching of solutes from waste rock to groundwater, further evaluation is necessary.	WR2A
15	Insufficient discussion/disclosure of empirical and reference data The revised/supplemental DEIS needs to present the available empirical or reference data that was used to assess potential impacts to the adjacent wetlands and surface water bodies. Based on comments in the DEIS, this data appears to include groundwater information and maps from dewatered mines in the area.	WR2I
16	Recommendations: The revised/supplemental DEIS should include an adequate hydrogeological and hydrological evaluation of the mine site. EPA maintains that additional data gathering is crucial to assessing impacts. Additional field data may be necessary. Furthermore, the revised/supplemental DEIS should clarify how and why the MODFLOW model is appropriate for use in the mine pit area.	WR2A
17	We also believe model assumptions should be re-assessed to take into account previous comments on the potential for ARD and less-than-complete success of untested anti-oxidation measures. If models continue to prove uncertain in this area, we suggest reevaluating groundwater analysis and developing more protective management and mitigation measures. The same applies to the use of the model for evaluating mine dewatering impacts on the Partridge River.	EOO
18	Mine pit water quality and wildlife EPA recommends that the revised/supplemental DEIS further evaluate the impacts of mine pit water quality on wildlife. The DEIS indicates fencing will be used as a deterrent for potentially sensitive wildlife species; however, aquatic-dependent migratory birds may use the pit lakes as a stopover, exposing wildlife to contaminants. The Endangered Species Act of 1973 (ESA) mandates all federal departments and agencies to conserve listed species and to utilize their authorities in furtherance of the purposes of the ESA. Given the potential for exposure near or at the West Pit, migration potential through the project area should also be considered for endangered species typically using this migration path (e.g., piping plover). Section 4.4.1.1 on page 4.4-1 only addresses federally- and state-listed endangered, threatened and species of special concern that are potentially present in the project area. Recommendation: We suggest the revised/supplemental DEIS discuss mine pit impacts to migratory birds, whether Federally-listed or not, as well as opportunities to reduce the risk of adverse impacts to tribal members' health due to subsistence consumption of potentially contaminated trust resources.	WR3C,WI2,WI3
19	Plant site storm water management Although the DEIS states that the lack of stormwater management facilities could result in increased pollutant loadings to the Partridge River, none are described. The nature of this discharge (construction, industrial) is not described nor is the method of conveyance to surface waters. Recommendation: We recommend that the revised/supplemental DEIS include information to determine whether and what type of NPDES permit coverage is required at the plant site.	WR3C

Comment ID	Comment Text	Theme Codes
19	The DEIS needs to evaluate how ground water exceedences from the mine site may affect downstream fish populations. Groundwater sampling and modeling at the mine site (noted in Table 4.1-5) indicate that data from 9 bedrock wells exceed water quality standards for aluminum, iron, and manganese with occasional exceedences of beryllium, nickel and sulfate. Fish populations located in areas with high metal concentrations often adapt to a water quality level that allows for decent sustained population stability. Often, however, slight increases or decreases in metal loadings can have serious adverse affects. Recommendation: We recommend the revised/supplemental DEIS determine potential impacts to fish populations in waters downstream of the Mine Site. Water quality standard exceedences that may ultimately affect fish populations should be mitigated.	WR2C,FM1,FM2,FM4
20	• Some groundwater quality constituents were monitored only one to three times (p. 4.1-12 and 4.1-13, Tables 4.1-6 and 4.1-7), which we believe resulted in an extremely large range of concentrations.	WR1E
21	• Some constituents in water from the Tailings Basin and Tailings Basin area have only been measured a few times in the period reported (2001-2004), and this monitoring period and sampling frequency do not constitute adequate characterization (pp. 4.1-12 to 4.1-13, Section 4.1.1.2, Tables 4.1-6 and 4.1-7).	WR1E
22	• The number of monitoring points and the sampling frequency of wells downgradient from the LTVSMC Tailings Basin are not adequate to characterize groundwater in this area (p. 4.1-15, Section 4.1.1.2, Table 4.1-8).	WR1E
23	• The tailings basin model did not address the potential fate and transport of constituents that would mobilize at higher pH (e.g. antimony and arsenic), of particular concern because the current effluent is higher pH than proposed acidic tailings and mixing effects aren't evaluated.	WR2E
24	• Monitoring data relating to the LTVSMC Tailings Basin seeps was not available in the DEIS.	WR1E
25	• The extent of on-site contamination from previous operations is not characterized.	WR1E
26	Upwelling groundwater beyond the tailings basin barrier will potentially cause exceedences of water quality standards in waters receiving flow from the tailings basin. The DEIS suggests a connection between the tailings basin and surface water. In addition, upwelling flow at the tailings basin may continue past the closure of the tailings basin, requiring continued monitoring and management of surplus water. The DEIS states that current groundwater seepage from the tailings basin to the north toward the Embarrass River exceeds the aquifer flux capacity, resulting in upwelling of groundwater to the surface. This upwelling, in conjunction with the surface seeps, has inundated some wetlands immediately down gradient of the tailings basin. This seepage contains high levels of contaminants, such as aluminum, manganese, lead, and total dissolved solids. Under the proposed action, seepage from the tailings basin and long-term groundwater upwelling will continue. In addition, the surface seepage to Second Creek is expected to continue indefinitely (p. 4.1-56). This upwelling would inundate portions of the wetlands north of the tailings basin and potentially introduce high sulfate concentrations to the wetlands and downstream lakes on the Embarrass River. The Closure Plan does not propose any remediation of groundwater seepage from the tailings basin.	WR1A
27	Recommendations: We recommend that a revised/supplemental DEIS include adequate information about groundwater flow at the tailings basin and about the contribution of upwelling groundwater to surface water. Adequate information will also include an analysis of existing contamination. We recommend the revised/supplemental DEIS address the potential for metals or other contaminants to mobilize at higher pH (antimony and arsenic) and evaluate how mixing current and project-related tailings may affect contaminant mobility.	RFI

Comment ID	Comment Text	Theme Codes
28	Tailings basin seepage The DEIS states that surface seeps will continue at the tailings basin during operation and following the closure of the mine. The DEIS does not provide adequate data on the anticipated amount of surface seepage at the tailings basin, because it appears the anticipated surface seepage conditions are based on conditions present in October 2008 (measurements made about seven years after the closure of the LTVSMC mine). DEIS predictions of basin seepage does not account for additional tailings loadings and different chemistry. Furthermore, the expectation that most seeps will dry out is unlikely given the addition of NorthMet's project tailings and process water and changes to the topographic and hydraulic features. Based on the continued seepage over seven years following the closure of the LTVSMC Tailings basin, without additional mitigation, probable seepage will continue following the closure of the NorthMet operations. Recommendation: Further study and justification is needed to validate the conclusion that conditions present in October 2008 will represent conditions when the NorthMet mine is active. EPA believes that a revised/supplemental DEIS should re-evaluate the estimated flow, location or duration of existing and potential future seeps. We also recommend the revised/supplemental DEIS describe the monitoring program that would address seeps, and the alternative remedies needed in the event that continued postclosure seepage does not meet water quality standards.	WR3A
28	If the contaminated flow is directly hydrologically connected to surface water, a NPDES permit would be required for the discharge. The DEIS should evaluate this possibility.	WR3C
29	Data supporting predictions that the proposed seepage collection system would be adequate to capture tailings basin seepage is inadequate. Table 4.1-35 indicates that 2 to 4 percent of the total seepage toward the Embarrass River will be recovered. In addition, the collection system places wells mainly in the area of current seeps, which may not be protective, given that past seepage occurred on the western tailings basin face and that the potential exists for additional seeps on other basin faces. Regarding the seepage recovery trench located to the south of the tailings basin, we note that the tailings basin MODFLOW was not prepared to evaluate the impact of seepage on the adjacent unconsolidated sediments. The proposed location of the recovery trench does not include groundwater monitoring points, so model calibration in this area was not possible. Recommendation: Additional justification needs to be provided ensuring that future mining operations will not result in the west side surface seeps to again become active. Depending on the results of this work, the seepage collection system may need to be enhanced to address these potential seeps. Any potential groundwater recovery system will also need to be evaluated for use along the western boundary of the tailings basin.	WR1A
29	EPA recommends further evaluation of the plan to use LTVSMC tailings as embankment material. The LTVSMC tailings are thought to be a source of sulfates and arsenic; we recommend modeling the chemical interaction between the chemically-different old and new tailings and evaluating other inert materials.	WR1E
30	Tailings Basin Alternative The DEIS should include adequate information on the efficacy of the Tailings Basin Alternative to prevent water quality impacts, particularly because hydrogeological information and analysis are inadequate. In addition, the DEIS indicates that this alternative would not remove the possibility of significant groundwater upwelling, particularly after closure.	WR1E
31	While the DEIS describes that pumping will occur until no longer needed, it also acknowledges that the total groundwater seepage rate (NorthMet seepage plus residual seepage from Cell 2W) would still significantly exceed aquifer flux capacity during operations and would approximately be four times the aquifer capacity during the post-closure period. Section 4.1-64 states that the total unrecovered groundwater seepage from tailings would be 1600 gallons per minute (gpm) in year 1 and up to 2900 gpm in year 20. A maximum seepage rate of 3800 gpm could be reached in year 20. The DEIS inadequately described how groundwater modeling on unrecovered seepage was conducted and whether unrecovered seepage exceed water quality standards. The levels of sulfate are well above levels that are considered protective of wild rice and will generally lead to increased mercury methylation and higher fish tissue levels of mercury in downstream waters. The Tailings Basin Alternative mitigation measures, as summarized on Page 4.1-162 and in Table 4.1-88, indicates that this option would still significantly increase sulfate loading and reduce assimilative capacity.	WR2F,WR4A,WR4F

Comment ID	Comment Text	Theme Codes
32	The placement of collection wells appears to be based on existing or past seepage incidents, without modeling for future project conditions, and, therefore, may not adequately address seepage. Furthermore, it is unclear whether this alternative would address long-term discharges to groundwater occurring post-closure. The DEIS description of the duration of pumping and long-term goals is open-ended.	WR1A
33	Recommendations: The revised/supplemental DEIS should also include a discussion of adaptive placement of collection wells, a discussion of long-term performance goals for this alternative, and an analysis of how this alternative will achieve water quality standards. We also suggest including a year-by-year modeling of this seepage to determine if its metal loadings increase over time.	WR1A
34	The DEIS indicates that PolyMet is conducting additional sampling to better understand mercury behavior in the Project Area. EPA recommends completing this study and presenting the results and conclusions in the revised/supplemental DEIS, prior to formulating conclusions regarding potential mercury impacts associated with the Tailings Basin Alternative.	WR1E
35	Under the Tailings Basin Alternative, groundwater seepage captured by the groundwater recovery system would be discharged, untreated, to the Partridge River. While the DEIS states that the effluent would meet water quality standards, adequate supporting data is not included and this discharge may need to be treated.	WR1A
36	Recommendation: The Tailings Basin Alternative should include a water quality monitoring program to assess groundwater quality prior to its discharge.	WR1B
37	EPA recommends the revised/supplemental DEIS evaluate using a non-discharge alternative for storm water runoff, if it can be carried out without increasing ground water flow to the pit, as opposed to the direct discharge of stormwater to the river. Benefits can include enhanced recharge to wetland areas, as well as providing groundwater storage and increased base flow during drought periods.	EOO
38	Recommendation: The revised/supplemental DEIS should provide more information on the PRB aspect of this alternative, including the proposed design of the PRB and a discussion of the mechanisms invoked for the simultaneous removal of sulfate, arsenic, and selenium. Given the uncertainty of this approach, we recommend the revised/supplemental DEIS evaluate contingency treatment alternatives for metals-contaminated water if the barrier system were to fail to meet its operating design and describe an approach for adaptive management.	ALT5,WR2D
38	The Tailings Basin Alternative would use a permeable reactive barrier (PRB) to reduce metals loadings (e.g., arsenic, sulfate and antimony). While there is published research on how such barriers may operate, EPA had found no data for the proposed barrier at the commercial scale. EPA also believes the proposed PRB would not address all contaminants because, while microbial sulfate reduction (with added organic substrate) is presented in the DEIS as "the only viable alternative for sulfate removal" (pp 4.1-169 through 4.1-171), the use of zero-valent iron does not appear to address the removal of arsenic and selenium (both oxyanions).	WR2D
39	Hydrometallurgical plant and wastes The uncertainties associated with the design and operation of the hydrometallurgical plant and with management of the hydrometallurgical processing waste disposal cells within the existing tailings basin cell 2W must be addressed.	PD11
40	Hydrometallurgical waste disposal into cells within the existing tailings basin are assumed to be fully contained and to cease drainage after 34 years. The project description does not adequately discuss where the drainage is occurring relative to the cells or how it is captured. It appears to indicate some drainage is exiting the cells on a regular basis, but will cease 34 years after operations begin. This assumption seems unlikely, since the area has a positive water balance. In addition, we understand that a lime mixture will be added to reduce process waste acidity. Since the hydrometallurgical waste cell units would be lined but not covered until closed, rain water and snow melt will accumulate in the units, and flows may continue for many years.	WR1E,PD2
40	Recommendation: The revised/supplemental DEIS needs to further clarify information on hydrometallurgical waste drainage, and we recommend adopting a management plan to monitor for drainage and, as necessary, manage drainage beyond year 34 from these cells. The revised/supplemental DEIS should more fully explain how the 34-year limit would be appropriate for hydrometallurgical cell drainage.	WR1E,PD2

Comment ID	Comment Text	Theme Codes
41	Downstream lakes and drinking water sources The limited amount of monitoring data for Colby Lake and the Whitewater Reservoir are inadequate to accurately evaluate water quality (p. 4.1-37 and Table 4.1-25). The existing high levels of aluminum and mercury in Colby Lake are a concern. Mean levels at this site from available monitoring data exceed the chronic Class 2Bd water quality standard for aluminum, which is 125 ug/L, and the range of data shows significantly high values. Even given the lack of sufficient data, the modeling results show concentrations for several contaminants in Colby Lake in excess of the water quality standards. Furthermore, the modeling does not appear to evaluate potential mercury impacts. The DEIS acknowledges that there is little water quality information on Whitewater Reservoir. Our review finds the evaluation of water quality impacts in the DEIS to be inadequate.	WR3F
41	Recommendation: We recommend collecting adequate additional data for Colby Lake and the Whitewater Reservoir that will support the proposed action will meet water quality standards.	WR3F
42	The amount of arsenic predicted to be in Colby Lake is 4.9 ug/L; the standard is 2.0 ug/L (p. 4.1-141). The text describes adjusting the model to achieve lower concentrations, but does not offer the data and reasoning behind the adjustment. Readjusting variables to less conservative inputs still produced a highest predicted arsenic concentration of 1.9 ug/L.	WR3F
42	Predicted concentrations of other constituents in Colby Lake may call for long-term prevention or management. Predicted elevations of iron, manganese, thallium and sulfate will exceed the wild rice standard of 10 mg/L. Colby Lake is classified as a Class 1 B water which only requires disinfection as a treatment for use as a public water supply. This treatment would not successfully address the constituents mentioned above.	WR3F
42	Recommendation: We recommend the revised/supplemental DEIS evaluate mitigation options that will reduce arsenic levels from the proposed action.	WR3F
43	Regarding manganese, there are sufficient studies and data currently available to generate a water quality criterion for this chemical. While this has not been done by EPA at the national level, or by the Minnesota Pollution Control Agency at the state level to date, the data are available and are being used by other states to develop criteria. For example, Illinois EPA has a proposed acute aquatic life water quality standard for manganese before the Illinois Pollution Control Board; the proposed standard (which is below 10 mg/l) has a hardness relationship and was developed for 50 mg/L hardness. (At higher hardness levels, the toxicity of manganese is lower and the resulting criterion would therefore be higher.) The hardness in Colby Lake seems to be within a range of 50 mg/L, and manganese would be elevated under project conditions. This information is mentioned here for consideration when discussing possible impacts on aquatic life.	WR3F
44	Recommendation: We recommend the revised/supplemental DEIS address the potential for additional management to prevent contamination to Colby Lake, or additional treatment at the Colby Lake Public Water Supply.	WR3F
45	There is no Safe Drinking Water Act maximum contaminant limit (MCL) for aluminum, however, several studies have shown various health effects related to aluminum. Aluminum, iron and manganese are easily removed by certain treatment technologies; however, the DEIS does not specify whether these technologies are in use in the Hoyt Lake public water system (PWS). We understand that the Hoyt Lake PWS uses open basin sedimentation, gravity sand filtration and some form of corrosion control. Although these techniques will help reduce the concentration of these metals, they are not the most effective at making significant reductions. A discussion of metals removal is needed to determine impacts on the public water systems of Hoyt Lake. It may be adequate to cite the American Water Works Association 2006 survey of 52 utilities that primarily used "conventional treatment" and the effectiveness of this treatment on manganese removal. The average manganese removal was 86%.	WR3F
46	Recommendation: The revised/supplemental DEIS should include information to support the DEIS conclusion that there will not be any impacts to the public water system in Hoyt Lakes. An analysis of the water systems treatment removal capabilities, especially for aluminum, should be included to ensure that these contaminants will not be an issue.	WR3F

Comment ID	Comment Text	Theme Codes
47	Tribal water quality standards Reservation lands of the Fond du Lac Band of Minnesota Chippewa are located directly downstream from the mining site along the St. Louis River and have EPA-approved tribal water quality standards. Many of the Tribe's water quality standards are more stringent than Minnesota's standards because the Tribe uses a higher fish consumption rate in the numeric criteria calculations (i.e. 60 grams/day compared to 30 grams/day for Minnesota). The project's potential to affect water quality on the reservation needs to be evaluated. Recommendation: The revised/supplemental DEIS should include the Fond du Lac downstream water quality standards in its discussion of applicable water quality standards and how the standards will be met (pp. 4.1-30 - 4.1-32).	WR3I,CR1
47	Wild rice The DEIS does not clearly address whether the Minnesota water quality criterion of 10 mg/L for wild rice waters will apply to the project. The DEIS acknowledges that isolated patches of wild rice were found in the Upper Partridge River, a tributary of the St. Louis River. Minn. R. Ch. 7050.0470 designates the St. Louis River as a wild rice water. The DEIS concludes, however, that both the proposed action and the Mine Site Alternative would comply with all surface water quality standards along the Partridge River, though the project may cause sulfates to exceed 10 mg/L. Recommendation: The revised/supplemental DEIS should clarify the application of the Minnesota wild rice sulfate water quality standards in Minn. R.Ch. 7050.0220 and 7050.0224, given that the DEIS acknowledges the presence of isolated patches of wild rice in the Upper Partridge River, and describe whether sulfates from the project will impact the St. Louis River. We recommend the revised/supplemental DEIS include the 10 mg/L sulfate number within the tables of lists of applicable standards and predicted water quality (Page 4.1-141) and include a discussion of how it applies to on-site and downstream waters potentially affected.	WR3I,WR4F
48	Recommendation: The revised/supplemental DEIS should define the subsistence fish consumption levels used to support the DEIS conclusions. It should also consider other Tribes located on Lake Superior that may also be adversely affected by higher mercury levels in fish tissue due to consumption rates higher than the general population (e.g., the Bad River and Red Cliff Reservations in Wisconsin, and the Keweenaw Bay Indian Community's Ontonagon Reservation on the Upper Peninsula of Michigan). We recommend the revised/supplemental DEIS describe how the NorthMet project may contribute to exceedance of the Grand Portage Band's water quality standards for wildlife.	WR4B,WR5C,FM1,FM2,W
48	The Grand Portage Band of Minnesota Chippewa, whose reservation is located northeast of the project site, has EPA-approved water quality standards. Many of that Tribe's human health numeric criteria, for example mercury, are calculated using a subsistence fish consumption rate of 142 grams/day, so any additional mercury (either direct discharges, or indirectly through the sulfate influence on methylation) to Lake Superior may have indirect impacts on the Grand Portage Band and their subsistence resources due to the bioaccumulation of mercury through the food chain. Page 4.5-20 of the DEIS concludes that there will be no incremental risks to recreational or subsistence fishers; however, the fish consumption levels for "recreational" and "subsistence fishers" are not defined. The Grand Portage Band has wildlife mercury standards to protect fish-eating birds (e.g., bald eagles, kingfishers, mergansers, etc.), as well as fish-eating mammals (e.g., otter and mink). The DEIS acknowledges that mercury will be discharged to the Partridge River and may eventually end up in Lake Superior.	WR4B,FM1,CR1,WR5C,CR
49	Cumulative Impacts to Water Quality The water quality analyses in the DEIS mentions existing high constituent baselines (for example, arsenic in Colby Lake) when discussing the reasons that the project will potentially bring the water body nearer to exceeding water quality standards. EPA points out that the purpose of the cumulative impacts assessment is to identify just these instances. However high the baseline, a new project should not contribute an increment that brings the water body to the point of exceeding water quality standards. Recommendation: We recommend re-evaluating cumulative impacts based on relevant data on project impacts, as noted in the comments in the water quality section above.	WR3I,WR5A
50	The lack of information on mining alternatives could be an issue in determining if the proposed mine plan is practicable based on 40 CFR 230.10(a) of the Guidelines. EPA believes that the DEIS does not support the Proposed Action as the least environmentally damaging practicable alternative (LEDP A). EPA is concerned that alternatives exist that would have less adverse impacts to the aquatic environment. The DEIS states that underground mining is not a feasible alternative because it would not be economically viable (Table 3.2-4: Alternatives E7 Underground Mining and Footnote 22), but the DEIS lacks information to justify this statement.	WE2,WE4

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
51	As detailed above, the water quality impacts are also a concern with regard to the Guidelines. In particular, 40 CFR Section 230.10(b), prohibits "discharges that will result in a violation of the water quality standards." If water quality standards cannot be met in conjunction with this project as described within the DEIS (e.g. West Pit Overflow-Page 4.1-113), we would not support the issuance of a permit for this project.	WR3C
51	The DEIS lacks information to justify that the project will not cause or contribute to significant degradation of aquatic resources because (1) even with mitigation some of the proposed mitigation options are unlikely to replace lost aquatic resource functions, and (2) the DEIS underestimates the amount of indirect wetland impacts.	WE2,WE3,FM1
52	Because much of the wetland impact monitoring and mitigation will be finalized during the permitting process, the revised/supplemental DEIS should include a description of the status of the 404 permit review and, if applicable, further 401 certification review (such as timeline, agency and public participation).	WR3I,WE4
52	Recommendations: We recommend the revised/supplemental DEIS include information about the feasibility and economic viability of underground mining for this project.	PD5
52	We recommend resolving water quality concerns prior to the 404 permit review.	WR5A,WE4
53	Wetland compensation and mitigation EPA recommends that mitigation for forested and bog wetland types have a minimum ratio of 2:1 for restoration due to the quality of the wetlands, the relative uncertainty of mitigation success, and the extended period of time (decades) that functions associated with forested/bog wetland types will be lost while mitigation areas are establishing themselves. The DEIS presumes a ratio of 1.5:1 and states that the actual replacement ratios required in permitting may exceed the minimum allowed, based on wetland functions and values (Page 4.2- 29). Pursuant to 40 CFR Part 230.94, Compensatory Mitigation for Losses of Aquatic Resources (Mitigation Rule), a compensatory mitigation plan must be submitted and approved by the Corps before the District Engineer can issue an Individual CWA section 404 permit. This plan must address a number of critical details regarding mitigation including: clearly articulated project goals and objectives; project site selection criteria; site protection instruments (e.g., conservation easements); detailed quantitative and qualitative baseline information describing both the impact and compensation sites; a detailed discussion of the mitigation project's credit determination methodology and results; a maintenance plan; ecological performance standards used to evaluate the degree to which the compensation projects are replacing lost functions and area; detailed monitoring requirements; a long-term management plan describing necessary long-term stewardship of the compensation sites and who is responsible for performing this stewardship; an adaptive management plan; and financial assurances to ensure project construction, implementation, and long-term management. Compensatory mitigation is intended only for unavoidable impacts after the LEDPA has been determined.	WE3
53	Given the magnitude of direct and indirect impacts, we believe that the revised/supplemental DEIS should include specific information on the wetland mitigation plan for all impacts and describe how the wetlands mitigation plan will address functional replacement. More information is also needed on the proposed on-site wetland mitigation, as well. Currently, the mitigation plan described in the DEIS does not account for functional replacement of the impacted wetlands, which include high quality forested wetland types. The DEIS projects that 175 acres of on-site wetlands will be used for compensation, but few details are outlined in either the DEIS or the referenced Wetlands Mitigation Plan Supplement. The DEIS also states that 40 acres of created wetlands would be established within the East Pit, separate from treatment wetlands created to treat effluent from the WWTF. It is not clear how the treatment wetlands would be separated from the mitigation wetlands.	WE2,WE3
54	The mitigation plan does not include compensation for the additional 475 acres of wetlands impacts at the mine site that were identified in the DEIS.	WE3
55	Recommendations: • EPA recommends adopting a 2:1 mitigation ratio for restoration, given the relative uncertainty of success and the extended period of time (decades) that functions associated with forested/bog wetland types will be lost while mitigation areas are establishing themselves.	WE3

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
56	• EPA recommends adding the following in the revised/supplemental DEIS regarding the wetland monitoring plan: when the plan will be developed, how long monitoring will be required, and who will have the opportunity to review the plan.	WE3
57	• We recommend the revised/supplemental DEIS describe how the wetlands mitigation plan will address functional replacement.	WE3
57	• We recommend that the wetland mitigation and monitoring plan also include a description of financial assurances that will be established to ensure adequate long-term implementation.	PD5
58	The procedure used to estimate the area of indirect wetland impacts north of the tailings basin needs further support. The use of this methodology should be supported by its use at other similar open pit mine sites or cited by its use in scientific literature.	WE2
58	• We recommend using native seed mixes and weed-free mulch in the on-site wetland mitigation site. (This approach is described only for minimizing direct wetland impacts in the DEIS.)	WE3
58	The potential for releases of ore and other mine debris and consequent impacts to soil, surface water, groundwater, and wetlands along the rail lines should be quantified and addressed in this document. On page 4.2-21, the text asserts that spillage of ore from rail cars is difficult to estimate. If so, the DEIS should offer information to support the conclusion that predicted impacts to wetlands along the transportation corridor are likely to be insignificant. The discussion of predicted indirect wetland impacts to areas beyond the mine site is based in part on empirical evidence from taconite mines in the area (p. 4.2-20, Section 4.2.3.1). Before the conclusion that little indirect impact is anticipated at the Mine Site can be accepted, additional support should be provided with details of the experience at other sites and in particular how those sites compare to the proposed project.	WR1E,WE2
58	• The revised/supplemental DEIS should include additional information on the 175-acre on-site compensation (such as wetland type, soil characteristics, and past history of wetland creation on copper mine spoils) to assess its viability.	WE3
58	• We recommend the DEIS address mitigation for the remaining potential 475 acres of wetlands impacts.	WE3
59	The assessments of indirect impacts at the tailings basin and along rail lines should be supported by specific information from other sites, if they are referenced, or by a discussion of methodologies. We recommend describing proposed monitoring.	WE2,WE3
59	Recommendations: EPA recommends the revised/supplemental DEIS include a complete discussion of indirect impacts to wetlands along rail lines and at the mine site.	WE2
59	Page 4.1-21, Section 4.1.1.3, 3rd paragraph: The DEIS states that base flow to the Partridge River is low during winter months because of reduced groundwater recharge. This statement appears accurate; however, on page 4.1-5, 1st paragraph, the DEIS cites extremely low seepage rates from wetlands to the underlying surficial aquifer. Does the low base flow during winter, as opposed to more steady base flow conditions, reflect a closer interactive between wetlands, unconsolidated aquifer underlying wetlands, and surface water than expected?	WE2
59	Page 4.1-5, Section 4.1.1.2, 3rd paragraph: While information gained from the aquifer tests will be important to evaluate potential interaction between the wetlands and the deeper aquifers, these tests may not provide direct evidence on whether wetlands adjacent to the mine pits will be indirectly impacted by mine dewatering activities. The pumping test methodology is not provided in the DEIS. The pumped well will affect groundwater heads in the pumped aquifer; this stress mayor may not influence groundwater heads in the wetland sediments. However, conceptually, the ability of the pumping test to evaluate future mining dewatering conditions is not clear. The project is proposed to be an open pit mine, with the overlying unconsolidated material removed to extract the ore - this is conceptually different from the presumed pumping tests where the overlying wetland sediments were present. The open pit would then provide a direct conduit for potential infiltration of wetland sediments adjacent to the pit.	WE2

Comment ID	Comment Text	Theme Codes
59	Page 4.2-19, Section 4.2.3.1, 1st and 2nd paragraphs: The distinction between wetlands that are bogs (precipitation-supported) and other communities dependent on groundwater (e.g., swamps) is critical. The assertions in this section regarding the lack of communication between perched bogs and the underlying groundwater require additional support with data from the project area before the conclusion that "no indirect wetland impacts are anticipated at the Mine Site from groundwater quality" can be accepted. Some data and analysis from the site suggests a connection between bedrock aquifers and surficial aquifers, such as the presence of ammonia and nitrates in the deeper aquifer.	WR2I,WE1,WE2
60	Mercury emissions The DEIS states that the facility could emit up to 8.3 pounds of mercury per year (p. 4.6- 34). Minnesota's Statewide Mercury Total Maximum Daily Load (TMDL) recognizes mercury air emissions as a chief source of depositional mercury to surface waters. In the TMDL implementation plan, MPCA notes a need for mercury emission reductions overall. The DEIS does not, however, discuss plans to control mercury emissions. Current gold mining operations in Nevada currently employ either activated carbon filters or the Boliden chlorine treatment method to essentially remove all elemental mercury from the gas exhaust streams. Nevada gold mines also effectively treat mercury emissions from autoclaves using activated carbon filtration.	AQ5,AQ6A
61	Recommendation: We recommend the revised/supplemental DEIS describe mercury mitigation measures for the project.	AQ5,AQ6A
62	Cumulative impacts modeling EPA notes that the air quality modeling presented in the DEIS excluded emissions from the Keetac Taconite Mine and Processing Expansion Project and other proposed projects in the vicinity of the NorthMet project. Tribal cooperating agencies have noted this in several comments in the DEIS. Recommendation: The air quality modeling to assess cumulative impacts should consider all current and reasonably foreseeable projects in the area. We recommend adding these sources into the model and including the new information in the revised/supplemental DEIS.	AQ4B
63	IV. Financial Assurance Financial assurance should be discussed in a revised or supplemental Draft EIS because it is critical to determining whether all funding will be available and adequate for proper closure, reclamation, and post-closure care can be met by the mining company. Because the amount and viability of financial assurance are critical factors in determining the effectiveness of these activities, EPA believes it is necessary to analyze these factors in the revised/supplemental DEIS to determine the significance of potential impacts and the feasibility of long-term mitigation measures. For example, if appropriate closure, reclamation, and post-closure care measures are significantly under-funded, contamination of surface water and groundwater may not be controlled. EPA believes the adequacy of financial assurance for these activities could make the difference between a project sufficiently managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the Federal government and the public, e.g., under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Recommendation: We recommend USACE ask the mining company to describe adequate financial assurance as part of a revised/supplemental DEIS so that the information on the feasibility and commitment to long-term controls and/or treatment can be evaluated during the decision-making process. The State requirements for financial assurance should be described in the revised/supplemental DEIS, as well. We recommend that the revised or supplemental DEIS identify the estimated bond amounts needed for each closure and reclamation activity for the proposed project facilities and also discuss whether and how the state can modify the bond during the course of operations if temporary, long-term, or perpetual treatment and/or remediation needs are discovered during operations. We recommend identifying responsible parties for any post-closure cleanup actions should they be necessary, as part of financial assurance.	ALT8,PD4
64	We recommend the DEIS estimate contingency reclamation cost. While the DEIS acknowledges that Minnesota Rule 6132.1200 requires the mining company to establish financial assurance one year after the beginning of operations, this information is not included in the DEIS. There is no discussion of how NorthMet intends to meet the Minnesota contingency rule, except that it pledges to comply.	PD4
64	EPA suggests the revised/supplemental DEIS include a reasonable determination of contingency closure cost estimates based on the plan of operations.	PD3

281	This letter is a declaration of my support for PolyMet Mining's Northmet Project. Not since the early 1960's when the Taconite Amendment provided for the beginning of a major construction boom era and a stabilization of the Iron Range economy have we had an opportunity like this. The economic impact, especially in view of the current economic and employment conditions in Minnesota and this country, would provide a lasting bright spot with far reaching benefits, not only to the local area, but the entire State of Minnesota and beyond. We have been mining here for over 120 years, which means, we have the knowledge, natural resources, strict state and federal environmental laws, and the experienced workforce to do it better than any place else in the world. I believe that PolyMet Mining has demonstrated that they will produce precious metal products needed in this world, especially in this country and the State of Minnesota, in an environmentally sound manner that protects our air, water and land, while providing the much needed economic benefits. PolyMet Mining has done a thorough job of plan development for this project and has spent many millions of dollars ensuring that its process and facilities will comply with the highest environmental standards known. It is now time to proceed with the permitting process.	EOO,G1,G6
282	PS: Please email any status updates to me at: aalind@msn.com	RFI

299	Re: My Support of PolyMet Mining's NorthMet Project • I have been a resident of Northern Minnesota my entire life. • I do not want my environment destroyed. • I believe that the technology exists to allow PolyMet to proceed. • PolyMet has met or exceeded all requirements. • As citizens of the United States we cannot allow projects like PolyMet to go elsewhere in the world. • We have the most stringent environmental requirements in the world. If you build the PolyMet project in other countries where there is very low environmental protection in place, the world will be a far worse place to live. (We must remember that we are in a world environment not just a local one). • In order for the United States to remain strong, we need to be a producer not just a consumer. • If PolyMet is not allowed to proceed, where will we be? Where will you find companies to invest \$25M or more in permitting and have it denied a permit to mine at the end? • This is our chance to set the seeds for the nonferrous industry to bloom. This is very much like the importance of the passage of the "Taconite Amendment" without which there would be no taconite industry. • We cannot become CAVE Men. CAVE = Citizens Against Virtually Everything As citizens of Northern Minnesota we should consider ourselves lucky that PolyMet has pursued this project whereas most companies would go elsewhere. PolyMet has gone above and beyond what has been required by federal, state and tribal agencies. As opponents voice their concerns, we must see through the smokescreen and see reality. Therefore, I support PolyMet's NorthMet project.	EOO

3572	While reviewing the Draft EIS summary I was dissappointed not to find a benchmark to which to compare the proposed precious metal mining operation. Without this comparison it is difficult to decide the merits of this undertaking. There was also no estimate of the of the long term impact upon the lives and well being of the residents (human and otherwise) of northeastern Minnesota. My solution is to decide support/opposition for such mining on the response to the following two questions: What are the positive/negative comparisons of the proposed mining operation to existing precious metal mining operations in the United States? Is the anticipated negative environmental impact of precious metal mining in northeast Minnesota expected to be less than/equal to/greater than the known impact from past iron ore/taconite mining and logging activities? If greater, how much greater? These answers will enable state/environmental agencies and local residents to more confidently decide what is best for the long term benefit of the area.	G8
<b>Sender Last Name:</b> Liquard		<b>Submission ID:</b> 3523
535	AIR QUALITY IN PRISTINE BOUNDARY WATERS: The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet can not be looked at as a single, one-time event in N.E. Minnesota. With permitting of Polymet will come at least 2, perhaps 4 or more new applications for permitting from other mining companies. What will be the total impact on the environment by all these potential mines and how will the EIS deal with mitigation of all these in concert? Specifically the Boundary Waters, which is down wind of all these projects, will be negatively impacted in terms of atmospheric haze from dust particles and other emissions blown into the air. According to the U.S. Forest Service, the Polymet project alone will cause significant haze impairments in the Boundary Waters 36 days each year! Tell us how this cumulative effect on air quality must be dealt with for Polymet and all future applications. In addition how is global warming affected by this mining operation and the combinations of all potential mines in the future?	AQ3,AQ4B
1127	WILDLIFE: The mine site disrupts natural corridors for the movement of wildlife. Specifically the Canada lynx which is a federally-listed threatened species that requires large territories and benefits from undisturbed forest corridors. No provision is made for mitigating this loss of habitat in the DEIS.	WI5
2849	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. In addition a 30-45 day time extension is needed for review of the EIS; as well as more public meetings in more places to gather input. The current schedule is too limited. Public meetings should include the option for citizen statements and discussion in an open meeting.	G10
3254	BOUNDARY WATERS WATERSHED: There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting.	WR1E
3255	SULFATES IMPACT: Sulfates are a problem that are not dealt with rigorously in the DEIS. Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition sulfates react with elemental mercury in a process known as mercury methylation. Methylmercury is the form that bio-accumulates in fish and animals that eat fish, including humans. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for? The Boundary Waters is a very unique National Park that deserves to be fiercely protected. Developing open mine pits without the proper monitoring and regulations spells doom for this pristine paradise - if not in our generation, certainly in our grandchildren's time. Please do the right thing and protect this national treasure by addressing the above issues.	WR1E,WR4B,FM1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3705	RECLAMATION: The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held in escrow as a damage deposit and that amount should be specific and included in the final EIS.	PD3
3706	MONITORING PLAN?: Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. Do we just depend on the mining company to do its own monitoring? There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR.	PD8
<b>Sender Last Name:</b> List		<b>Submission ID:</b> 3742
1	3-50. (3.2.1 No Action Alternative)—Tribal cooperating agencies disagree with the assumption that the proposed project would only result in social and economic benefits. The environmental impacts of the project on the 100 Mile Swamp, an undisturbed and very high quality wetland complex, would constitute a social impact. Furthermore, economic development that is not centered on heavy industry (tourism for example) would be adversely impacted by the project. How will these social and economic problems be dealt with: the social impact of the 100 Mile Swamp and the loss of tourism revenue to dependent businesses?	RFI
1	The DEIS is premature. It should not have been released until the required land exchange between the US Forest Service and PolyMet has been completed. The DEIS is required to examine all potential environmental impacts associated with the Project. The land exchange may well introduce substantial impacts and these may in turn interact with other aspects of the Project which should be examined in the DEIS.	PRO4

2	<p>The PolyMet DEIS describes significant environmental issues and other issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Unfortunately, the continued “poisoning” of our waterways and watersheds is what we Americans are almost getting used to: Poisoned Waters by Hedrick Smith, April 21, 2009: “More than three decades after the Clean Water Act, iconic American waterways like the Chesapeake Bay and Puget Sound are in perilous condition and facing new sources of contamination. With polluted runoff still flowing in from industry, agriculture and massive suburban development, scientists note...that these toxins are being found in drinking water of millions of people across the country and pose a threat to fish, wildlife, and potentially, human health...” “the environment has slipped off the radar screen because it’s not a hot crisis like the financial meltdown, war or terrorism, but pollution is a ticking time bomb. It’s a chronic cancer that is slowly eating away the natural resources that are vital to our very lives.” Sulfide mining industry in the great state of Minnesota must not become reality....if it does...the same ticking time bomb of polluted water seen on the east and west coast with be the new reality in water-rich Minnesota. Let us not experiment with our natural resources. I have asked myself: If I was told that there is a new vaccine, but it has never been used successfully on a human yet, would I be first in line to try it? Highly doubtful. Mr. Arkley and Mr. Ahlness, you both would probably answer in the same manner. One can use the same analogy with the PolyMet project. Water rich Minnesota is being told to be first in line to try it...to be a large-scale experiment for sulfide mining. With the scope of the exploratory mining being done right now throughout MN, no area with minerals beneath its soil will be immune from the possible effect of sulfide mining and damage to the precious waters for all to live, and to recreate on...and that are the lifeblood of Minnesota’s tourism industry. Water is undervalued Water is undeniably scarce Water boasts unrivaled demand Water is priceless Water is our most precious resource If you have not already done so, I urge you to consider what this project could mean to the generations to follow our decisions of today. What will be the consequences of the decisions made you? Will those decisions safeguard our “natural world” for the future, or will those decisions simply provide a few jobs for a few “lucky” Minnesota citizens for the short-term of 20 years. Let’s work toward other sustainable industries in addition to tourism, for northern Minnesota that protect our waters. Let’s not lock Minnesota into a “permanent resource-extraction economy” at the price of long term pollution to our waterways---while driving away other industry and points of view. Contrary to what our short-sighted politicians (Klobuchar, Franken, Bakk, Oberstar, Rukavian, etc.) who endorsed this project without performing their “due diligence”, would like us to believe, there are thousands of concerned Minnesota citizens, and countless vacationers to Minnesota who have serious issues with this proposed mining project. We owe it to our future generations to give a 100% assurance that this politically-touted, 20-year sulfide mining project can be accomplished without irreversible harm to our waterways and our wetlands. It my sincere hope that you will give proper evaluation to this landmark controversy facing the state of Minnesota and its citizens. We must learn from the mistakes made across our country in other states that allowed sulfide mining companies, usually from other countries, the opportunity to destroy its natural resources with the promise of lucrative jobs. A degree in engineering, geology or hydrology is not necessary to realize that the landscape changes alone will fore</p>	G2C
2	<p>Factual evidence from mining projects in other parts of the USA demonstrates that clean up and restoration of most mine sites “do not work.” A. Reference the Flambeau mine (with lawsuit pending over it “reclamation”). B. Reference the Appalachian Mountains where mountain top coal mining parallels some of the same concerns with sulfide mining as would exist in Minnesota if PolyMet mining is permitted: “ According to Margaret Palmer of the University of Maryland Center for Environmental Science, “clean up laws may not be working. Federal and state laws require mining companies to clean up and restore mined areas. But Palmer and 11 other scientists who published their review in the journal Science say that's not working. "Even after a site has been reclaimed and attempts have been made to re-vegetate it," says Palmer, a biologist, "the streams that remain below that, that weren't filled, have high levels of all sorts of nasty things." Things, she says, like selenium, which in high amounts can harm fish and other aquatic life; and sulfates, which alter the water chemistry. Palmer and her colleagues say many animals in these valley streams — from algae to fish and birds — could be seriously harmed. ““““Experts Urge Official To End Mountaintop Mining” by Christopher Joyce, January 7, 2010</p>	PD3,PD4

3	Contaminated overflow from the West Pit The DEIS predicts that at year 65, the West Pit will begin discharging polluted water • Arsenic, cobalt, selenium, copper, nickel, aluminum, beryllium, iron, manganese, and thallium from PolyMet’s operations may all exceed water quality standards. Analysis predicts high sulfate concentrations. (4.1-113) The DEIS would allow this to happen. The DEIS does not address the cumulative or synergistic impacts upon fish, wildlife or humans as we ingest water containing all of these pollutants. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	WR3I,WR5A,WI5,FM3

153	Please see that the mine gets a fair chance to hire people and startup production. My family and I live withing 10 miles of the mine and feel perfectly safe with Poly Met producing there products. The vast majority of the nay sayers are not local people. They have never lived on the Iron Range and seen that mining is the basis for this area. I think the various government agencies have jerked Poly Met around long enough..... Let them begin. bob lloyd aurora, mn	EOO
<b>Sender Last Name:</b> Lockhart		<b>Submission ID:</b> 1780
2340	I can't say I'm an expert on mining, but I've heard a bit about the PolyMet mines being proposed in Northern Minnesota and I haven't heard anything good. Especially about the impact this could have on the environment. I grew up in Northern Minnesota. I grew up practically in the water of Lake Superior. I spent most of my summers up in the Boundary Waters Canoe Area Wilderness. I want to take my children and grandchildren there to have the same experiences I had. If this mine goes up they won't have that chance. The effect this mine could have on the environment is devastating to even think about. The river and lake eco-systems could be destroyed for hundreds of years by the by-products made by the mine. I understand that there are treatments that can be undertaken to prevent the pollution by the waste products, but I highly doubt these can reasonably be maintained for the length of time it would take for the by products to lose their toxicity. This mine doesn't just threaten one area, it threatens a huge part of our state - a state which is known for it's clear waters, fishing, canoeing and outdoor recreational activities. Any possibility of damage to the environment should be eliminated to the absolute best ability of both the state and the company proposing the mine. I don't want to lose the state I love to pollution and short-term economic gain. Please think about the future. What a mine now could mean to the environment ten years from now, twenty years, thirty.	G7,G11

20795	The board, staff and members of the Friends seek the protection of the Boundary Waters Canoe Area Wilderness and the larger Quetico-Superior ecosystem. The organization values healthy ecosystems, clean water, wilderness character, and primitive recreation. Our members from all over Minnesota and the country enjoy the area for its canoeing, camping, fishing, hunting, birdwatching, and many other reasons, as well as the region’s natural, largely-undeveloped character. The risks presented to many of these activities and attributes by nonferrous mining have been a significant concern for our organization for many years.	G11

20795 A. Financial Assurance 1.) The DEIS fails to provide information about the amount of financial assurance that will be required for the project. This is a fundamental problem with the DEIS. “Any additional detail regarding the amount of financial assurance associated with reclamation actions cannot be estimated until these actions are understood at a deeper level of design detail. This detail is more typically made available during the permitting process. Therefore, further discussion of financial assurance figures and instruments are not included in the DEIS” (DEIS pg. 3-48). But the inclusion of information regarding financial assurance is key if the public is to understand and assess the potential effectiveness of reclamation and closure activities. Financial assurance and a reclamation closure plan inform the public about the potential long-term environmental impacts of the mine and their absence in the DEIS is glaring. Financial assurance should be fully explored in the EIS. The DEIS outlines the possibility that long-term water treatment, monitoring, and maintenance may be required for the Proposed Action, making a timely analysis of financial assurance essential in fully appreciating the potential impacts. It is unclear, after years of design preparation by PolyMet, what new information regarding design details will become available between the release of the DEIS and permitting that would dictate that financial assurance calculations cannot be determined and outlined in the EIS. The U.S. Environmental Protection Agency (EPA) has also urged that financial assurance disclosure occur during the NEPA process. In an August 2009 letter regarding the NorthMet project, the EPA stated regarding the lack of financial disclosure for this project: “The EPA recommends including financial assurance information because one key component to determining the environmental impacts of a mine is the effectiveness of reclamation and closure activities...EPA has recognized the importance of disclosing financial assurance in EISs...” (U.S. EPA August 2009). The EPA’s National Hardrock Mining Framework recommends that the: “EPA should evaluate the adequacy of EISs for mining operations in predicting the long-term environmental impacts of mining operations. Assessment of financial assurance mechanisms that will be utilized to provide funding of required long term environmental management systems is critical to this analysis” (U.S. EPA 1997). Dr. David Chambers has also highlighted the omission of financial assurance calculation as a major flaw in the document. “...the financial surety for the project could easily be in excess of \$100 million. This is a very significant potential impact to the public, who is ultimately accountable should the mine operators go bankrupt without an adequate financial surety to close the mine and treat waste water” (Chambers 2010). Recommendation: Including financial assurance information in Environmental Impact Statements has become standard practice, especially for mining projects in which long-term water treatment is expected. The PolyMet project anticipates long-term water treatment needs, and its EIS must include the necessary financial assurance calculations for the public to assess risks and impacts. Financial assurance calculations must be included in the EIS. It is critical to fully understanding the potential environmental impacts from this project. The lack of financial assurance in the DEIS renders the analysis incomplete and inaccurate. This analysis should not be delayed until permitting.

PD3

20796 A. Cultural Impacts The NorthMet project would impact resources with cultural significance to the Ojibwa. Significant impacts to water resources, wetlands, wild rice and wildlife are possible from the project, and would affect natural resources available for Ojibwe use. Compensatory wetlands are proposed for outside the 1854 Ceded Territory and would result in a loss of these lands to the Ojibwa Bands. If the land exchange occurs, giving PolyMet ownership of the mine site lands, this area would be removed from public ownership and would diminish both Ojibwa Band members’ and the general public’s access to these lands. The potential impacts to wild rice beds from increased sulfate concentrations, and the potential impacts to fish consumption from methylmercury contamination pose significant cultural impacts to the Ojibwa Bands. Recommendation: The EIS must include the identification of land to be exchanged and the potential cultural resource impacts associated with this exchange.

2327	I feel that the impact on the BWCA, based on the fact that the water from the rivers will leak to the BWCA, is unacceptable. This is our only earth, home to the humans, animals, and all walks of life that we know of. To pollute our home on purpose, for the sole luxury of economic success, is not a balanced action. luxury does not outweigh environmental hazard. Our planet has already begun the downfall of human's impact based on the evidence of the Arctic melting away: (Global Warming). To drive the point across, to pollute our earth is like polluting a household, since earth is a home to humans and a house is a home to families. We would not sacrifice the safety of our loved ones for profit. Therefore one can conclude that it is unacceptable to pollute one's earth.	G2,G7

3763	To whom it may concern, This message is in regards to the pending PolyMet Mining Corporation's NorthMet Mining Project Draft Environmental Impact Statement. This proposed plan is counter to the interests of Minnesotans, both current and future. The environmental impacts will be felt for 50 generations, long after PolyMet Mining is no longer around to cover the tab. Minnesota has already converted or lost so much of its natural heritage; I strongly feel that this is an unwise use of some of its remaining natural areas. The proposed site is on National Forest land. Trees can be harvested from this land sustainably for perpetuity while providing habitat for endangered and otherwise threatened species; once the open pit mine is created, that's it. Please do the responsible thing and tell these folks to go elsewhere; Minnesota's better than this. Sincerely, Ben Lowe PhD Candidate University of Minnesota's Dept. of Ecology, Evolution, and Behavior 1987 Upper Buford Circle, Ecology 100 St Paul, MN 55108 Lowe0160@umn.edu	G2A,G2C
