3647	The earth provides enough for every man's need... Not for every man's greed! Preserve the Boundary Waters.	EOO
<b>Sender Last Name:</b> Maccabee		<b>Submission ID:</b> 3666
1	For purposes of potential future litigation, these comments explicitly include by reference the positions of tribal cooperating agencies reflected in Appendix D of the Draft Environmental Impact Statement (DEIS), additional comments on the DEIS submitted by the tribal cooperating agencies, comments made by the United States Environmental Protection Agency (U.S. EPA) on the preliminary draft environmental impact statement (PDEIS) released for agency review in July 2009 and comments of other environmental organizations regarding the DEIS, specifically Minnesota Center for Environmental Advocacy, Friends of the Boundary Waters Wilderness, Center for Biologic Diversity, Sierra Club North Star Chapter. WaterLegacy also incorporates by reference for purposes of future litigation any and all individual comments submitted pertaining to the PolyMet NorthMet DEIS by WaterLegacy members and by other attorneys who may represent individual WaterLegacy members, including but not limited to comments of Bruce Johnson, Len Anderson, Joel Roberts, Alphonse Gerhardstein and Matt Tyler, whether or not such comments are specifically cited in these Comments. Although some legal citations are provided in the succeeding pages, WaterLegacy's comments focus primarily on scientific, factual and analytic deficiencies of the DEIS. WaterLegacy expressly reserves the right, in any potential future litigation related to this matter to raise any and all legal issues raised by the asserted deficiencies, whether or not the specific argument is made in the succeeding comments or comments incorporated by reference.	G15
2	The final EIS for the PolyMet NorthMet project must be deferred until a comprehensive supplement to the DEIS has been prepared, with appropriate scoping, notice and public comment, which supplement would perform a detailed analysis of the specific lands proposed to be exchanged for the NorthMet mine site and the impact of this exchange on the public interest, the environment and cultural resources of affected tribes with usufructuary rights in the 1854 Ceded Territory. Comment ID	Comment Text	Theme Codes
3	Based on the EPA’s recommendations, the post-closure activities required by the project and the characteristics of its proponent, it would be irresponsible to prepare a final EIS for the PolyMet NorthMet project without a clear and specific financial assurance analysis based on a schedule and costs for closure and post-closure reclamation, maintenance and treatment. If no such specific assurance is provided, the final EIS should provide a detailed analysis of adverse environmental impacts assuming that no closure or post-closure reclamation can or will be sustained.	ALT8,PD2,PD3
4	The final EIS must specifically analyze how the closure and post closure activities required by the PolyMet project comply with Minnesota statutes and rules requiring stable and maintenance free closure and reclamation. For at least the following, the EIS should specify how 8 maintenance or treatment at closure and post-closure would meet water quality standards and comply with non-ferrous mining reclamation rules: • Waste Rock Stockpiles. Pollutants in drainage from stockpiles have the potential to exceed groundwater criteria for up to 2000 years after the mine is opened under the Proposed (DEIS, p. 4.1-84).1 Maintenance, collection of drainage and potential treatment should be discussed in terms of water quality and conformity with post-closure rules. • West Pit Lake. The west pit lake will overflow post-closure, discharging water predicted to exceed water quality standards for arsenic, cobalt, copper and nickel and containing significant sulfate levels. West pit lake overflow is also likely to exceed mercury water quality standards. Tribal agencies have noted the likelihood that the west pit lake will remain at the site “in perpetuity and will exceed water quality standards” (DEIS, Tribal Positions p. 3-19). The EIS requires a plan to prevent long-term water quality exceedances, not just a monitoring plan. • East Pit Wetland. The DEIS has not characterized water quality of east pit outflow or overflow. (DEIS, p. 4.1-72) or what measures would be taken to address potential inefficacy of constructed wetlands reduction of pollutants. • Tailings Basin. Maintenance of tailings saturation to reduce oxidation, maintenance of embankments to prevent catastrophic dam failure, treatment of seepage collected from the toe of the tailings basin and treatment of discharge once the seepage barrier is removed from Second Creek all require explicit discussion in terms of post-closure costs and legal compliance. • Hydrometallurgical Residue Cell Closure. Maintenance of a geomembrane barrier, geosynthetic clay barrier cover and liner system to control impacts over highly contaminated material over time should be discussed in terms of activities, costs, and the potential need to replace containment materials.	PD2,PD3,PD5
5	For these reasons, an EIS may not defer fundamental questions of design to a potential permitting process. As explained by tribal cooperating agencies, “The lack of a stability analysis for the stockpiles is a serious data gap given the serious environmental consequences of a structural failure of a stockpile.” (DEIS, p. 4.13-2).	GT1
6	The DEIS notes that the Minnesota Department of Natural Resources recommends that a “Dam Break analysis and risk assessment” be done, but suggests that the analysis could be deferred until permitting. If the design is still deemed unstable, the DEIS suggests that additional rock buttress and dewatering of tailings could be evaluated. (DEIS, p. 4.13-4). However, reducing the saturation of tailings may increase acid and leachate generation within the tailings basin, creating adverse water quality impacts. In addition, there is no indication that either of these mitigation measures would be sufficient to prevent a dam break at the tailings basin, with potentially catastrophic consequences for water quality in the Embarrass and Partridge Rivers and in groundwater impacting residential drinking wells. This long-standing concern must be solved before a final EIS is released. Explain tribal agencies:	GT1
7	The DEIS proposes no measures that might provide assurance of hazardous waste containment if the hydrometallurgical facility is found to be located on slimes 11 and suggests no alternative methods of dealing with these waste materials if unstable materials underlie the disposal site. Tribal agencies stressed the need for data on stability of this hazardous facility:	EOO

Comment ID	Comment Text	Theme Codes
8	The PolyMet NorthMet project should not proceed to release of a final EIS unless and until objective and reasonable engineering demonstrates that there is a design or set of designs capable of demonstrating geotechnical stability under all reasonably predicted conditions, including water saturation. Among the mitigation measures and designs that should be considered to provide reasonable assurance that there would be no catastrophic release of contaminants should be at least the following: <ul style="list-style-type: none"> <li>• Storage of waste rock in an off-site location (proposed in Final Scoping Decision);</li> <li>• Reduction in the scope of the project;</li> <li>• Construction of a new fully lined and structurally sound basin for tailings;</li> <li>• Construction of a new structurally sound hazardous waste facility for hydrometallurgical residues.</li> </ul> Even once a design has been developed that meets requirements for geotechnical stability, the final EIS should analyze a “worst case” scenario categorizing the risk that each of these structures will fail catastrophically. This analysis should both be specific to each major source of contaminants and cumulative, if there is a multiple failure. Historic information on slope instability and dam breaks at other mines should be used to identify factors, whether related to weather or maintenance issues, that increase or decrease the risks so that members of the public as well as regulators can better appreciate the degree to which uncontrolled release of pollutants may or may not be controlled.	GT2
10	The EIS must include a thorough analysis of the extent of contamination from the LTVSMC site, a 60,000 acre contaminated brownfield site proposed for the PolyMet NorthMet plant and for disposal of polluted water, sludge and residue from the PolyMet NorthMet project. The LTVSMC tailings basin continues to contaminate groundwater and surface water more than 20 years after operations have ceased. In the wells that do exist near the tailings basin, pollutants including iron, manganese, and aluminum exceed drinking water standards, while mercury exceeds Great Lakes Initiative limits. (DEIS, Table 4.1-7, p. 4.1-13) Wells near the northern property line show substantial contamination of the groundwater aquifer, and recent well data show that the plume extends in some areas at least as far as private wells along the Embarrass River. (DEIS, Tribal Positions, pp. 4.1-2 to 4.1-3) Surface water discharges at the tailings basin also demonstrate exceedances of mercury, pH and hardness as well as several metals. (DEIS, Table 4.1-30, p. 4.1-43).	WR1E,WR3I,PD2
11	The EIS must fully characterize the existing contamination plume, including impacts on wells, aquifers and surface waters and evaluate the cumulative impacts of existing contamination along with the additional loadings proposed by the PolyMet project. As recommended by tribal cooperating agencies, the EIS must at least do the following: <ul style="list-style-type: none"> <li>• Develop a groundwater flow model to show the direction and rate of groundwater flow;</li> <li>• Provide a complete characterization of contaminant plumes to groundwater, including impacts on private wells along the Embarrass River;</li> <li>• Provide a detailed characterization of background contamination and an accurate prediction of groundwater water quality including the PolyMet inputs;</li> <li>• Conduct water samples from lakes near the tailings basin (Hiekillilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants at the existing tailings pile have caused contamination;</li> <li>• Provide a detailed characterization of background contamination and an accurate prediction of surface water quality including the PolyMet inputs;</li> <li>• Develop an up to date closure plan, including remediation of groundwater seepage from the tailings basin. (DEIS, Tribal Positions, pp. 4.1-2, 4.1-3, 4.1-118)</li> </ul>	WR1E
12	The gaps in information are more striking because the PolyMet plant and tailings basin site are proposed to be located on a contaminated brownfield that, for the most part, has neither been investigated nor remediated. The DEIS states that PolyMet has “acquired surface ownership of approximately 7,000 acres of real property and portions of the taconite processing facility formerly owned by LTVSMC, and approximately 8,100 additional acres from Cleveland-Cliffs, Inc.” (DEIS, p. 3-19). Under applicable law, to the extent that unremediated contamination remains on this property, if the property has already been acquired PolyMet would be legally responsible for remediation whether or not the PolyMet NorthMet mine and processing facility are developed.	WR1E,PD2

Comment ID	Comment Text	Theme Codes
13	According to summary information in the DEIS, PolyMet is responsible for 29 of the 62 areas of concern at the LTVSMC brownfield site. Of these 29 areas of concern, 22 require further investigation and action. (DEIS, Table 4.1-9, p. 4.1-17) Not only has closure and remediation not been completed, but in many case no Phase II investigation of the extent of contamination has been prepared or response action plan approved. The remainder of the areas of concern at the LTVSMC brownfield site, for which PolyMet would not be in the chain of title, similarly, are only in the early stages of VIC investigation, having neither completed Phase II investigations, obtained approval of response action plans or conducted remediation and closure activities. (DEIS, Table 4.1-10, p. 4.1-18).	WR1E,G9
14	The DEIS fails to provide detailed information on the extent of contamination of groundwater, surface water and wells, the nature of remediation required and the cost and schedule of remediation and closure, all of which and more would be developed through the VIC program prior to acceptance of a response action plan for a brownfield site.	WR1E
15	Perhaps most troubling, even as compared with earlier drafts, the DEIS contains less information about the LTVSMC brownfield site, in some cases removing pertinent information about contamination and effectively concealing this critical issue from the public.	PD3
16	As with other areas of critical environmental concern, the DEIS defers consideration of remediation of the contaminated LTVSMC site proposed to be used by PolyMet for disposal of tailings and hydrometallurgical wastes to a potential permit process. The DEIS defers the nature of the activities required for clean-up, the environmental impacts of legacy pollution and corresponding requirements for financial expenditures. (DEIS, 4.1-116). As emphasized by tribal agencies (See DEIS, Tribal Positions, pp. 4.1-2, 4.1-3; DEIS, p. 4.1-19), this approach is contrary to the purpose of environmental review. Knowing the extent of LTVSMC site contamination and the likely costs for remediation is critical to understand the likely environmental impacts of a mining and processing project dumping materials on a site that is already contaminated. This information must be included in the EIS to provide reliable information on water quality impacts from the plant site. Detailed Phase II, response action and remediation information is also critical to provide a credible analysis of the “no action” alternative in the EIS. A “no action” scenario would require investigation and remediation of the LTVSMC site in a timely fashion and would provide environmental benefits as a result of this clean-up. If the use of the LTVSMC site for additional waste disposal by PolyMet would delay site investigation and remediation for many decades until mine closure or post-closure, the environmental harm due to this delay as well as due to the incremental wastes dumped by PolyMet must be investigated. The EIS must also contain detailed information on the extent of contamination and the costs of remediation to determine the level of financial assurance that will be required for the PolyMet project. The economics of the project itself might be affected by knowledge of the nature and level of response needed to address existing contamination at the LTVSMC site. Particularly since the PolyMet Corporation has few obvious assets and no history of production, it would seem irresponsible to proceed with the EIS without detailed information on the extent of resources needed to address brownfield contamination.	PD3,PD5,G9
17	In its listing of permits that will be sought for the PolyMet NorthMet project, the DEIS neither references the need to comply with federal Resource Conservation and Recovery Act (RCRA) or Minnesota Hazardous Waste statutes or rules pertaining to regulation and permitting of hazardous waste disposal. (See DEIS, pp. S-2 to S-3) The DEIS identifies no mitigation measures for hazardous materials. (DEIS, S-17). Perhaps most striking, although the DEIS acknowledges that the project would use or generate thousands of tons of hazardous materials including mine site waste water treatment facility chemicals – (calcium hydroxide or hydrated lime, aluminum hydroxide, sodium hydrosulfide) and plant reagents (sodium hydrosulfide, sodium hydroxide, acids, flocculants and anti-scalants) (DEIS, p. 4.12-1), the DEIS provides little explanation of how the identified hazardous materials will be utilized or the way in which hazardous residues, reactants, or by products of these hazardous chemicals would be disposed of, consistent with federal and state hazardous waste disposal statutes and rules.	HM2,HM4

Comment ID	Comment Text	Theme Codes
18	The wastewater treatment facility will use chemical precipitation technologies, resulting in chemical precipitates and solids that may be processed in the hydrometallurgical plant. (DEIS, p. 3-10). Hazardous materials used in the hydrometallurgical process will be included in the materials pumped to the hydrometallurgical residue facility. (DEIS, Table 3.1-12, p. 3-30, p. 3- 25). Based on the chemical constituents of these processes, it is likely that precipitates and residues would have at least one of the characteristics by which hazardous wastes are identified under federal and state law: ignitability, corrosivity, reactivity, toxicity, oxidizers, lethality. (See 40 C.F.R. §261; Minn. R. 7045.0131)	HM4
19	The DEIS section on hazardous materials provides no discussion of the process and life cycles for the hazardous chemicals described above, or their reactants, residues or by-products. Without this discussion, it is not possible to determine whether either wastewater facility effluent or tailings will contain corrosive or other hazardous material. This gap is yet more troubling for the hydrometallurgical residue waste facility. Although it is clear that the hydrometallurgical residue facility will be a disposal site for hazardous wastes, the DEIS does not use the term “hazardous waste” and does not describe either the regulatory, permitting or environmental consequences of creating a waste facility at the plant site, particularly on an existing contaminated brownfield site with potentially unstable soils. The EIS must include a complete life cycle analysis of hazardous wastes and permitting and disposal requirements under applicable laws. Assessment of the potential for leakage, seepage or geotechnical failure of the hydrometallurgical residue disposal facility must consider the implications of release of hazardous and toxic materials.	HM4
20	WaterLegacy and the tribal agencies have taken the position that the public notice for the Section 404 permit should be reissued and the MPCA should be given the opportunity to analyze and make a determination under Section 401 of the Clean Water Act. The tribes site significant changes in the design of the project and adverse impacts identified in the environmental review process among their reasons for requesting a reissuance of the notice. (DEIS, p. 4.2-1, fn 1) Project designs, impacts and policies of the Minnesota Pollution Control Agency have changed since 2005. Providing an up-to-date notice of the Section 404 permit for the PolyMet NorthMet project would ensure that Section 401 water quality certification proceeds consistent with federal laws and policy guidance, making the most effective use of resources.	WE4
21	The nature and magnitude of the project and the character of proposed activities and discharges have changed or only become evident since the May 2005 notice. Since May 2005, specifically, It has been determined that the PolyMet project will directly and indirectly impact 1,522 acres of wetlands on and adjacent to the mine and tailings basin site. It has been determined that of these 1,522 acres of impacted wetlands only 300 acres of the wetlands (175 of which would only be replaced post-closure) will be replaced within the St. Louis River watershed or even the Lake Superior Basin watershed. It has been determined that sulfate discharge, seeps through the tailings basin and hydrological changes create the risk of mercury methylation and that the proposed wastewater and constructed wetlands treatment methods at the project will be ineffective in removing mercury. It has been proposed as an alternative that wells be dug and seepage pumped from the toe of the tailings basin for direct discharge to the Partridge River. Creation of a west pit lake has been proposed and it has been determined that this pit lake will exceed water quality standards and will overflow post-closure. Wild rice production areas downstream of the project have only recently been surveyed, implicating Minnesota’s unique water quality standards to protect this resource. In addition, it should be emphasized that the MPCA’s waiver of Section 401 certification did not reflect a policy determination, but the severity of budget constraints. Since late 2006, the 20 MPCA has changed its practice of systematically waiving Section 401 authority, and has established criteria to identify projects where Section 401 authority will be exercised to ensure that projects comply with state water quality standards. Those criteria would strongly support exercise of MPCA Section 401 authority in connection with the PolyMet project. ( <a href="http://www.pca.state.mn.us/water/401.html">http://www.pca.state.mn.us/water/401.html</a> ) Federal policy favors states’ exercise of Clean Water Act Section 401 authority to protect wetlands and water quality. ( <a href="http://www.epa.gov/owow/wetlands/facts/fact24.html">http://www.epa.gov/owow/wetlands/facts/fact24.html</a> ). In addition, particularly with respect to mercury releases and methylmercury, the MPCA has developed important expertise that could be applied if an opportunity to exercise Section 401 jurisdiction were afforded by reissuance of notice. Since 2005, the MPCA has completed a Statewide Mercury TMDL, which was approved by the U.S. EPA in 2007 and has analyzed waters impacted by the PolyMet project for fish tissue methylmercury and impaired under Section 303(d) of the Clean Water Act. Reissuance of the Section 404 notice would be appropriate under applicable law and allow an efficient use of expertise related to mercury, methylmercury, sulfates in wild rice waters and other important water quality issues under federal and state law.	WE2,WE3,WE4,WE8

Comment ID	Comment Text	Theme Codes
22	SUMMARY The DEIS relies on a number of inappropriate assumptions regarding the Clean Water Act, NPDES permits and applicable standards preventing degradation of surface water and groundwater quality. Whether the Proposed Action, the Mine Site Alternative or the Tailings Basin Alternative is implemented, the PolyMet project will require an NPDES permit for industrial discharge. That permit may only be issued in compliance with statutes, rules and regulations protecting water quality, many of which the DEIS misinterprets or disregards. The DEIS needs to be revised consistent with NPDES permitting requirements and consistent with water quality standards and nondegradation regulations for both surface water and groundwater.	WR31
23	There are too few public meetings to provide members of the community an opportunity to learn about this precedent-setting project and express their opinions. The perspective of which Mr. Arkley informed us on Monday, December 7, 2009, that the oral comments of members of the public cannot be made openly since so many participants are expected, heightens our concern about having only two meetings for such a significant project. We do not believe that a public meeting process where citizens are sequestered to make comments is adequately informative or participatory. If having too few meetings is contributing to the need for this type of process, the solution should be to schedule more meetings.	PRO6
23	The DEIS suggests that the only National Pollutant Discharge Elimination System (NPDES) permit required by the PolyMet NorthMet project is a stormwater permit for construction activity disturbing an acre or more of land and then diminishes the significance of a discharge of stormwater in implicating Clean Water Act requirements. Neither assumption is consistent with facts or with law. Although the DEIS attempts to suggest that there is no direct surface water discharge until the west pit overflows in approximately year 65 (DEIS, pp. 4.1- 107, 4.1-108, 4.1-109), facts belie this assumption: • Under all alternative scenarios, tailings basin seepage will upwell into wetlands draining into the Embarrass River, which wetlands as well as the river are navigable waters under federal law as well as waters of the state. Even if the Tailing Basin Alternative were to recover 95 percent of NorthMet groundwater seepage, total seepage from the NorthMet and LTVSMC tailings from Cell 2W would still significantly exceed aquifer flux capacity. (DEIS, p. 4.1-129). • Tribal agencies have identified a direct surface water connection between the northwest corner of Cell 2W of the tailings basin, through wetlands and to the Embarrass River. (DEIS, pp. 4.1-95, 4.1-107). • Water levels in the east pit and west pit after year 20 would be established by “outlet structures” used to route surface water overflows from the east pit to the west pit and from the west pit to wetlands west of the pit draining into the Partridge River. (DEIS, p. 4.1-64) • The Tailings Basin Alternative proposes direct discharge of collected tailings basin seeps to the Partridge River. (DEIS, pp. 4.1-139, 4.1-141) As acknowledged in the DEIS: [S]everal potential pathways for surface water quality impacts remain, including noncontact stormwater runoff; seepage from rock stockpile liners, the hydrometallurgical residue storage area, the Tailings Basin; and pit lake overflows. Recent hydrogeologic investigations of the Tailings Basin area show that there is not sufficient transmissivity in the downgradient aquifer to transmit the predicted seepage from the basin. As a result, the seepage upwells to the surface and affects surface water quality. (DEIS, p. 4.1-107) [N]on-contact stormwater runoff; unrecoverable groundwater seepage from the temporary and permanent waste rock/lean ore stockpiles, mine pits, overburden storage/laydown areas, various sumps, process water ponds, and the WWTF equalization ponds; and the ultimate overflow of the West Pit represent potential pathways for the Project to affect water quality in the Partridge River. (DEIS, pp. 4.1-108, 4.1-109) NPDES permits will apply to all potential sources of discharge to surface waters from various pathways, irrespective of PolyMet’s attempts at characterization. In addition, “non contact” stormwater runoff must meet water quality standards, including non-degradation standards for Great Lakes Initiative waters as well as numeric concentration limits. The final EIS should be rewritten to acknowledge the application of NPDES permits to a variety of pathways for surface water discharge and to assess the potential for each and all cumulatively to violate water quality standards. To the extent that the effort to preserve a fiction that there are “no direct discharges” of surface water under the proposed alternatives has constrained a robust and candid consideration of alternatives to mitigate water quality impacts (See Section G (2), infra), the recognition that NPDES compliance is non-discretionary may improve the quality of DEIS analysis.	WR3C

24	The timing of the public meetings is too soon after the release of the massive and complicated draft EIS. Experts have not had a chance to review information and members of the public are often just learning of this issue for the first time. Scheduling public meetings in the weeks between Thanksgiving and Christmas is also inconvenient for many people, further diminishing the efficacy of public participation. Additional meetings are needed after the New Year, and the time for public comment should be extended by another two months to permit adequate public participation in review and comment on the DEIS.	PRO6
24	The DEIS contains additional errors and omissions in the application of water quality standards. For example, the DEIS states that Great Lakes Initiative standards supersede healthbased water quality standards in Minnesota rules (DEIS, p. 4.1-33), disregards nondegradation standards applicable to both Minnesota surface water and groundwater and suggests that compliance with mercury standards requires only a demonstration that water column concentrations of discharge will not exceed 1.3 ng/L. The DEIS should be revised in light of the following, more accurate highlights from federal and state water quality laws: • Where receiving surface waters do not meet applicable water quality standards for any pollutant, no discharge is permitted that will cause or contribute to the violation of water quality standards, unless there are sufficient remaining pollutant load allocations to allow for the discharge and the existing dischargers into that segment are subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards. (40 C.F. R. §122.4(i)) • Where a pollutant in the Great Lakes System exceeds a fish tissue based standard for that pollutant, it is provided in law that any facility that discharges a detectable level of such pollutant to the water has the reasonable potential to cause or contribute to an excursion above water quality standards. (40 C.F.F. §132, Appendix F, Procedure 5, F.4; Minn. R. 7052.0220, Subp. 7). • Minnesota’s health based standards, including specifically the health-based standard of 0.2 mg/kg for mercury in fish tissue is not superceded by Great Lakes Initiative water column standards. (Minn. R. 7052.0100, Subp. 1; Minn. R. 7050.0150, Subp. 2; Minnesota Statewide Mercury TMDL (2007). • Federal and Minnesota nondegradation requirements apply both to Great Lakes Initiative pollutants (Minn. R. 7052.0300, Subp. 2) and generally to pollutants that may affect uses of the surface waters in question. (40 C.F.R. §131.12(a)(1); Minn. R. 7050.0185). 23 • Minnesota nondegradation requirements apply to groundwater as well as surface water. (Minn. R. 7060.0500). • More stringent requirements for demonstration of nondegradation apply to Great Lakes Initiative bioaccumulative chemicals of concern (BCCs) and bioaccumulative substances of immediate concern (BSICs). Mercury is both. (40 C.F.R. 132.2, Table 6 (BCC); Appendix E, II.A (BSIC)). • By definition, a significant lowering of water quality for purposes of nondegradation occurs when there is a new or increased loading of any BCC (including mercury) from any new facility, whether from a point or nonpoint source. (40 C.F.R. 132, Appendix E, IIA). • Any discharger of BSICs such as mercury, into outstanding international resource waters including surface waters of the Lake Superior Basin must provide a complete nondegradation demonstration, including an analysis of best technology in process and treatment to eliminate or reduce the extent of the new or expanded discharge. (Minn. R. 7052.0010, Subp. 34, defining outstanding resource waters; Minn. 7052.0320, Subp. 3). • No variances apply to new discharges of mercury to Great Lakes Initiative waters. (40 C.F.R. 132, Appendix F, Procedure 2.A.1; Minn. R. 7052.0280, Subp. 1). • No mixing zones apply to new discharges of mercury to Great Lakes Initiative waters. (40 C.F.R. § 132, Appendix F, Procedure 3, C.1, C.4; Minn. R. 7052.0210, Subp. 3).	WR31,WR5A
25	Many of the DEIS discussions of possible impacts to surface water and groundwater inadequately or inappropriately apply the Clean Water Act and federal regulations and State rules implementing the CWA. The DEIS needs to be revised consistent with NPDES permitting requirements with respect to water quality standards and nondegradation regulations for both surface water and groundwater.	WR31
25	The locations of the current public meetings are inconvenient to large groups of citizens both in Greater Minnesota and in the Twin Cities area. The PolyMet project and its environmental review will set precedent for any future sulfide mining proposals. Setting a venue in the Hoyt Lakes area and placing a single Twin Cities meeting remote from the population center seem poorly designed to permit members of the public to access information and oral comment opportunities. Additional meetings are needed at more convenient locations.	PRO6

26	A public meeting process that allows the consultant for the responsible government agencies to explain its perspective on its own draft EIS document and allows no other perspective to be voiced is neither a public meeting nor an informational meeting. This meeting format not only deprives members of the public of the opportunity to hear from each other, but prevents citizens from hearing from the cooperating agencies, who have a unique and official perspective on the findings and positions taken in the DEIS. Whether intentionally or inadvertently, it is certain that some members of the public who only hear from a consultant promoting the perspectives of the DEIS will be intimidated and will be less likely to express comments that differ from those in the DEIS	PRO6
26	The PolyMet DEIS takes this flaw a step further. The PolyMet NorthMet DEIS minimizes the primary risks of sulfide mining on water quality. The term “acid mine drainage” is contained only in the definition section, it is not used in the DEIS. Even the more euphemistic term “acid rock drainage” is used only to explain the sorting of waste rock into piles (DEIS, pp. 3-13, 4.1-65). There is no discussion in the DEIS of the risk of acid rock drainage from sulfide mines, and the experiences of other mines, including the nearby Dunka Mine, that have had this type of environmental pollution. (See e.g. U.S. EPA, Technical Resource Document Extraction and Beneficiation of Ores and Minerals, Vol. 3, August 1994, “U.S. EPA Tech. Report Ores,” pp. 1-35,1-39)	PD3
27	The PolyMet DEIS also contains no discussion of the impacts of copper, nickel and other metal leachates separately or in combination on aquatic toxicity. The Regional Copper Nickel Study data and experience at the Dunka mine underline the risk of metals releases to the aquatic food chain. <sup>2</sup> The DEIS Section on fish and macroinvertebrates (Section 4.5) does not mention the potential for copper, nickel or other metals toxicity. Yet, since at least 1981, Dunka Pit leachate has exceeded aquatic toxicity standards: The Minnesota Department of Natural Resources (DNR) found that more than 95 percent of all leachate samples taken from the mine site between 1976 and 1980 had pH values between 6.0 and 8.5, but values as low as 4.5 were reported. Specific information regarding sampling procedures was not provided. Concentrations of trace metals (copper, nickel, cobalt, zinc) exceeded ambient levels by 10 to 10,000 times. Toxicity testing showed that copper and nickel concentrations exceeded the 48-hour lethal concentration (LC50) for <i>Daphnia pulex</i> , while nickel concentrations also exceeded the 96-hour LC50 for fathead minnow. . . . Copper and nickel concentrations as high as 1.7 and 40 mg/L, respectively, have been observed in seepage/runoff from Duluth Complex waste rock stockpiles at the site. Toxicity testing of the leachate showed that copper and nickel concentrations exceeded the 48-hour lethal concentration (LC50) for <i>Daphnia pulex</i> ; nickel concentrations also exceeded the 96-hour LC50 for fathead minnow. Concentrations of calcium, magnesium, and sulfate in the stockpile drainage were also elevated (MDNR, 1990). (U.S. EPA Tech. Report Ores,” supra, p. 2-43) 2 See also DEIS Comments of Bruce Johnson, which WaterLegacy has incorporated by reference. 25 Discharge from the Dunka Pit, in 2009, still fails to comply with additive toxicity (copper, nickel and zinc are combined to calculate additive toxicity) limits and Cliffs Erie continues to request variances from the Minnesota Pollution Control Agency for additive toxicity calculation, hardness and specific conductance. The extraordinary failure of the PolyMet NorthMet DEIS to address additive toxicity to the aquatic environment or acid rock drainage and the DEIS’ sanguine predictions regarding water quality result from assumptions made in the modeling, rather than the lack of real world risks from the PolyMet mine and processing facility. The next section of this comment explains some of the ways in which the PolyMet DEIS seems to assume away, rather than disclose water quality impacts.	WR3D,FM1,FM2
27	Extend the comment period on the DEIS from February 3, 2010 to at least March 26, 2010. Ensure that members of the public as well as experts have sufficient time to review and understand the DEIS before the comment period lapses.	PRO6
28	Schedule at least two meetings in late January and early February in convenient locations in Duluth and in St. Paul, Minnesota. Since the PolyMet project is the first sulfide mine to be considered for permitting in Minnesota and there are copper sulfide mining prospects in southeastern Minnesota as well, it is strongly recommended that there also be a public information meeting in Rochester.	PRO6

Comment ID	Comment Text	Theme Codes
28	Stockpiling would expose overburden to oxidation and could result in acidic conditions and release of metals, especially cobalt, copper, nickel and zinc. NorthMet saturated overburden produced low pH in laboratory tests; although median sulfur concentrations were 0.06 percent, overburden has some areas of sulfur concentration of as high as 0.63 percent, equivalent to Category 4 waste rock reactivity. (DEIS, pp. 4.1-65 to 4.1-66). Despite areas of high sulfur concentration, the DEIS suggests that PolyMet would not sample overburden, but would place all saturated overburden in Category 1 and 2 waste rock stockpile. PolyMet would compact the overburden as it is placed “to limit oxidation and infiltration, although “the effectiveness of compaction to limit oxidation is uncertain.” (DEIS, p. 4.1-66). The DEIS does not state what quantity, acid formation or metals leachate is assumed from overburden or how compaction is considered in this calculation. The DEIS does not discuss how compaction of overburden might affect liner integrity and leachate. Without this data transparently provided, it is not possible to determine whether (for purposes of all of the water quality calculations thenceforth) the DEIS has accurately modeled or has underestimated the potential for acid and metals pollution from the overburden.	WR1E,WR2D
29	Ensure that the additional public information meetings operate as public meetings. Allow members of the public to come to a microphone in front of the group and have their comments transcribed by a court reporter. This is the customary practice for environmental impact statement public meetings in energy proceedings throughout Minnesota. It is well-known and successful in helping the public understand complex issues.	PRO6
29	The DEIS assumes uniform sulfur concentrations within waste rock piles and uniform solute production throughout the rock. (DEIS, pp. 4.1-70, 4.1-71). These assumptions conflict with reports going back to the 1970s characterizing Duluth Complex rock as containing disseminated mineralization that may leach heavy metals even when it does not create low pH and acid drainage. (See Bruce Johnson DEIS Comments). The DEIS did not disclose the assumptions about pH made in deterministic modeling for the Proposed Action, stating only that the caps were based on the concentration in a water chemistry database for a given pH. (DEIS, p. 4.1-70). For the uncertainty analysis, the DEIS assumed a neutral pH range of 6.6 to 8.0 for Category 1 and 2 waste rock stockpiles and a pH of less than 4 for Category 3 lean ore. The DEIS states that copper and cobalt concentrations were higher in the uncertainty analysis as a result of using the pH range from 6.6 to 8.0 (which is a neutral rather than acidic range) and that “the maximum concentration for each of these metals is very sensitive to changes in pH.” (DEIS, p. 4.1-83). The DEIS also used an acidification factor of 10 to account for the effect of a drop in pH in copper and nickel, even while admitting that this factor is very low for copper and nickel based on real-world data from the AMAX test piles. (DEIS, p. 4.1-85). The assumed rates of leaching used as inputs were based on less than six months of data, and did not predict changes in solution rate that may occur over decades or even hundreds of years. (DEIS, p. 4.1-85). The model’s improbable assumptions about uniform sulfur content and uniform solute production at a specified pH are critical to the Mine Site Alternative, where the DEIS assumes that permanent stockpiles of Category 1 waste rock overburden will only contain materials with a sulfur concentration of less than 0.12 percent. (DEIS, p. 4.1-135). The DEIS does not explain how PolyMet would propose to test the 292 million tons of Category 1 waste rock piled as high as a 20 story building (74 percent of 394 million tons, DEIS, p. 3-13; maximum height of 240 feet, DEIS, p. 3-16) to ensure that no disseminated areas of higher mineralization are contained in these piles. As for the overburden, the Mine Site Alternative does not contradict the fact noted above that overburden may contain areas of high sulfur concentration and that PolyMet does not intend to test its sulfur content before stockpiling. For the Mine Site Alternative, an additional improbable assumption is then made that adding limestone to reactive waste rock stockpiles (Category 2, 3, 4 and lean ore) will maintain a uniform pH of 8 in order to limit metal solubility. (DEIS, pp. 4.1-135).	WR1E
30	Provide all meeting attendees (including attendees at the meetings this week) with a balanced perspective on the DEIS. Along with the consultant’s point of view on the DEIS that EMR prepared, specifically invite a representative of the cooperating agencies to explain the alternative findings and positions developed by the Tribes. This will allow members of the public who haven’t been able to wade through the thousands of pages of the DEIS and appendices to understand both points of view from the agencies formally involved in this process.	PRO6

Comment ID	Comment Text	Theme Codes
30	The DEIS deterministic and uncertainty analysis models both used concentration caps to place an upper limit on the leachate concentrations that would otherwise have been predicted from scaling up smaller scale waste rock/lean ore stockpiles. (DEIS, pp. 4.169, 4.1-70, 4.1-82). The DEIS admits that the concentration caps require further evaluation and “may not be conservative as the amount of mineral surface area contacted by water passing through the full height of a waste rock stockpile is much greater than the surface area contacted by water passing through a humidity cell.” (DEIS, p. 4.1-85). The DEIS also acknowledges that the vertical infiltration (seepage) rate for the Category 1 and 2 stockpiles will be higher than predicted. (DEIS, pp. 4.13-1, 4.13-2). Yet the water quality predictions in the DEIS are based on these questionable assumptions.	WR2F
31	The Poly Met proposed design, if achieved, is asserted to result in leakage at the “low” or average” rate. Concern regarding the ability of this system to maintain design criteria resulted in modeling a “high” liner leakage rate in the deterministic model. However, even the “high” liner leakage rate is based on defects per acre, rather than a wholesale or catastrophic failure. (DEIS, pp. 4.1-71, 4.1-75, 4.1-76). The assumptions in the uncertainty analysis regarding leakage are less transparent, but it is clear that liner failure was not among the range of probabilities analyzed. (DEIS, pp. 4.1-82 to 4.1-83). The DEIS does not state the total volume of contaminated water proposed to be contained by each liner system for each type of waste material so that the percentage of leakage from the liners that was assumed can be transparent. This is particularly problematic given the history of catastrophic failure at the Dunka Mine and some of the AMAX test plots. (See Bruce Johnson DEIS Comments). The proposed Mine Site Alternative makes even more questionable assumptions regarding liners. First this alternative appears to assume that tens of tons of Category 2, 3 and 4 waste rock can be removed to the east pit and the stockpiles where this material was piled “converted” to store hundreds of tons of Category 1 waste rock without tearing the liner system for the waste rock piles remaining in perpetuity. (DEIS, p. 4.1-135). Second, the Mine Site Alternative assumes (without citation or reference) that concerns about higher rates of liner leakage no longer apply to the more reactive waste rock since the stockpiles existing for more than a decade are temporary, so groundwater quality modeling results were evaluated using only “low” and “average” liner leakage rates. (DEIS, p. 4.1-136). The Mine Site Alternative also appears to assume that in the 10 to 20 years during which the “temporary” stockpiles of Category 2, 3 and 4 waste rock and lean ore are stockpiled, the absence of the geomembrane and overliner drainage layers in the Proposed Action would not affect oxidation, acid generation and metals leachate to groundwater from any of the stockpiles. (DEIS, p. 4.1-135). No data is provided to justify this assumption. The only cap system for waste rock in the Mine Site Alternative is a layer of soil and vegetation placed over the Category 1 rock (DEIS, pp. 3-17, 3-52)	WR2D
31	In addition, WaterLegacy would express our concern that the Minnesota Department of Natural Resources (MDNR) email address for public comments has been out of service for several days during the past week. We have repeatedly heard from citizens that their efforts to comment bounced back. We would not only request that this problem be immediately rectified and that the Department ensure that no additional shut-downs occur.	PRO6
32	We have also heard from citizens that paper copies of the DEIS are not yet available at all of the locations where the MDNR web site states that they will be available. We would request that paper copies be immediately provided at each of the referenced locations and that both paper copies and CD copies of the DEIS be available to citizens on request	PRO6
32	In addition to the above assumptions that would tend to reduce predicted water quality impacts, the PolyMet DEIS appears to disaggregate the total impacts on groundwater by analyzing each flow path from waste rock piles separately. (DEIS, pp. 4.1-79, 4.1-80, 4.1-85). It is possible that solutes from a single flow path might comply with water quality standards, while the total flow, once aggregated would not.	WR2E
33	In addition to concerns raised herein about the public hearing process and the magnitude and complexity of the environmental issues raised by the PolyMet DEIS (documented in previous letters by WaterLegacy and many other environmental groups), these technical problems with the comment process and with the availability of information to citizens provide yet further justification for extension of the time for public comment to at least March 26, 2010.	PRO6
33	Solute loading assumptions in the DEIS are also questionable, particularly the assumption of exponential decay used in the uncertainty analysis for predicting solute loading. (See Joel Roberts DEIS Comments, pp. 5-7).	WR2E

Comment ID	Comment Text	Theme Codes
34	The DEIS states that submerged wall rock “is not a substantial source of contaminants.” (DEIS, p. 4.1-71). This analysis is flawed. Although it is highly probable that submerging wall rock reduces oxidation, it is virtually certain that it doesn’t eliminate leaching of metals and acid. Inundated bulk samples in Minnesota and underground mines nationally have demonstrated leaching of both metals and acid. Seasonal turn over of water, wind and wave action will raise dissolved oxygen in open pits. In addition, even if oxidation is reduced, submerged rock will leach metals far above water quality standards. (See Bruce Johnson DEIS Comments). The Mine Site Alternative compounds the flaws in this assumption, asserting that filling the east pit with all Category 2, 3 and 4 waste rock (rather than providing liners, covers and leachate collection) will have the result of “virtually eliminating long-term sulfide oxidation and associated solute release.” (DEIS, p. 4.1-134). The modeling then assumed, without references or citations, that “all backfill rock would not oxidize further once submerged.” (DEIS, p. 4.1- 137).	WR2E
35	It is proposed both that the east and west mine pit will fill slowly over time and that, even when the pit lakes reach their final elevation, the water level will be 10 to 20 feet below the pit rim. (DEIS, p. 4.1-71). Although the DEIS seems to suggest that there will be a static water elevation (DEIS, p. 4.1-71), it is likely that precipitation and evaporation will cause variability in pit lake elevations, oxidizing and flushing solutes from the exposed pit rock. The DEIS fails to describe the level of solute loading from the exposed portions of the mine pits.	WR3C
36	The DEIS proposes that PolyMet will apply limestone to the pit wall rock face while backfill is being placed during pit flooding and will place overburden and a low permeability cover against the exposed Virginia Formation high wall after flooding. The DEIS admits that “successful application of this measure has not been demonstrated.” Despite the lack of evidence of efficacy the DEIS states that the groundwater quality modeling in subsequent sections “assumes that these mitigation measures are successfully implemented.” (DEIS, p. 4.1-66)	WR2E
37	In addition to capping solute loading from waste rock piles, the DEIS imposes limits on the prediction of solute loading from mine pits using concentration caps (DEIS, p. 4.1-72), apparently relying short-term testing of small rock piles. No specific pH, duration or chemical composition variables are explained and no scientific literature or real world verification of this assumption is provided. The Mine Site Alternative applied a concentration cap based on a pH of 8 (basic) to the oxidized solutes that would be leached during the flooding of the east pit, stating that lime would be added to the stockpiles or the pit if necessary. (DEIS, p. 4.1-137). The DEIS provided no empirical basis for the assumption that a uniform basic pH could be maintained in a sulfide rock stockpile or mine pit, yet its conclusions reflected markedly diminished predictions of leachate from many of the metals of greatest concern (copper, nickel, zinc, cobalt).	WR2F
38	The DEIS provides no information on the sulfates or solute concentrations in contaminated water entering the wastewater treatment facility (WWTF) or the specific chemical reactions and efficacy levels assumed in order to reach WWTF targets. Although the DEIS states that the WWTF will be designed for a maximum flow of 3,000 gpm, it does not disclose the volumes of contaminated waters that would be directed to the WWTF or the way in which “equalization ponds” would store contaminated water if the WWTF were operating at full capacity. (DEIS, p. 4.1-67). The DEIS, thus, provides no information from which it could be verified that WWTF effluent would attain its target concentrations and no way to estimate the size and pollutant levels of ponds storing excess contaminated water on site. The DEIS asserts that the PolyMet DEIS “targets” for treated process water need not meet state surface and groundwater standards, “since the facility does not actually discharge directly to either surface or groundwaters.” (DEIS, p. 4.1-68) In fact, many of the salient water quality targets for the WWTF fail to meet one or more of Minnesota’s water quality standards. The pH target (6.0-9.0) exceeds the acceptable range of both the groundwater criteria and surface water standards (6.5-8.5). The total dissolved solids target (700 mg/L) exceeds the groundwater criteria (500 mg/L). Antimony (31 µ/L) and beryllium (4 µ/L) targets exceed groundwater criteria (6.0 µ/L and 0.08 µ/L, respectively). The target for lead (19 µ/L) exceeds both the 31 groundwater (15µ/L) and the surface water (3.2 µ/L) criteria! For several metals of concern, WWTF water quality targets exceed surface water standards as follows: WWTF Target (µ/L) Surface Water Standard (µ/L)3 Cadmium 4.0 2.5 Copper 30 9.3 Nickel 100 52 Zinc 388 120 Since effluent from the WWTF will affect both groundwater and surface water, treatment targets that exceed standards are highly problematic.	WR2G,WR3I

Comment ID	Comment Text	Theme Codes
39	The east pit wetlands is presumed to provide secondary treatment of wastewater treatment plant effluent starting at year 20 and to provide the primary treatment of waste rock stockpile leachate after the WWTF is decommissioned. (DEIS, p. 4-111). PolyMet’s modeling assumed wetlands removal efficiencies ranging from 50 percent “low” removal to 80-90 percent “high” removal for six key parameters (antimony, arsenic, cobalt, copper, nickel and sulfate). These assumptions are poorly supported even in the data reflected in the DEIS. Constructed wetlands achieved 0 percent arsenic reduction, and highly variable copper and nickel reduction, and reduction rates as low as 25 percent for copper and 0 percent for nickel. Performance at the Dunka Mine wetland, with similar waste rock, was highly variable with as low as 30 percent reductions in cobalt and copper and reduction of nickel and sulfate designated only as “highly variable.” (DEIS, p. 4.1-112). As noted by the tribal cooperating agencies, “the effectiveness of the passive wetland system has not been demonstrated and it is likely that the wetland treatment system would not function as the applicant has suggested.” (DEIS, p. 4.1-112).	WR3L,WE6
40	The DEIS modeling acknowledges that west pit overflow could exceed surface water quality standards for arsenic, cobalt, copper, nickel and selenium. (DEIS, p. 4.1-113). Concerns about the reliability of modeling used are evident in discrepancies among the data, with cobalt, copper and nickel (released at lower pH) as much as 800 percent higher in the uncertainty analysis model. (DEIS, p. 4.1-114). Even in the case of west pit overflow, despite the continued presence of oxygen in the water and the perpetual exposure of the mine pit rim, the DEIS predicts, without citation to any	WR3C
41	Even with all of the above assumptions that minimize predicted water quality impacts, the DEIS predicted that waste rock stockpiles in the Proposed Action have the potential to exceed groundwater criteria for antimony, manganese, nickel and sulfate and to leach solutes for over 2,000 years. (DEIS, p. 4.1-84). However, the DEIS predicts no exceedance of surface water quality standards in the Upper Partridge River, except “initially” when the west pit overflows and no surface water quality exceedances in the Lower Partridge River, Colby Lake, Whitewater Reservoir or the Embarrass River. The DEIS minimizes the exceedance of groundwater quality downgradient from the tailings basin is for aluminum. (DEIS, pp. 4.1-130). Unsurprisingly, since the Mine Site Alternative assumed away most sources of acid drainage and metals leachate, the only remaining potential groundwater exceedance at the mine site was for antimony (DEIS, pp. 4.1-138 to 4.1-140). The DEIS could thus conclude, based on insufficient if not contrived information, that the Mine Site Alternative would significantly improve groundwater quality at the mine site as compared with the Proposed Alternative. The Tailings Basin Alternative does not affect predictions regarding mine site impacts. (DEIS, pp. 4.1-148, 4.1-149). Assumptions regarding the Tailings Basin Alternative as well as the tailings basin disposal system are addressed in Section B(2).	WR1E,WR3I
42	The final EIS must discuss the risks of acid mine drainage/acid rock drainage and summarize the nature of conditions at sulfide mines that increase or diminish acid production;	ALT8
43	The final EIS must discuss metal leachates as related to aquatic toxicity, particularly salient metals such as copper, and nickel, cobalt and zinc;	WR3A
44	The final EIS must model and disclose probable acid and leachate (metals and metalloids) generation from overburden, assuming the presence of uneven levels of sulfur, localized high acid and solute generation and the risks of liner rupture, potentially exacerbated by compaction;	EOO
45	The final EIS must model and disclose probable acid and leachate generation from waste rock piles, assuming disseminated mineralization and non-uniform solute formation at areas of higher mineralization even in rock that has a lower average sulfur content. It should not be assumed that any category of rock or overburden will not generate some level of acids or leachates;	WR2E
46	Whether or not lime is applied, the final EIS models should not assume uniformity of pH throughout any waste rock pile, particularly a uniformly basic pH. The effectiveness of lime in neutralizing pH in Duluth Complex rock is known to be highly variable. (K. Lapakko, MDNR Duluth Complex Mine Waste Drainage Research, presentation 3/4/09)/	WR1E
47	The final EIS must disclose leachates from dissolution rate inputs without imposing “concentration caps” and must verify that results are adequately conservative by comparing levels of leachate observed in real-world sulfide mine waste rock and lean ore piles.	WR1E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
48	The prediction of both groundwater and surface water contamination at every stage of the project must be revised based on solute concentrations that are not artificially capped.	WR1E
49	The final EIS must explain the differential acid and metal leachates likely to be produced in Category 2, 3 and 4 waste rock piles and the lean ore pile in the Mine Site Alternative as a result of having no geomembrane.	WR1E
50	The final EIS must detail the total water volumes proposed to be contained in waste rock stockpiles liners and provide a justification based on real-world experience for presumed leakage rates, including a transparent statement of the percentage of leakage assumed.	WR2D
51	The final EIS must also include modeling of water quality impacts based on catastrophic failure of and release from waste rock and lean ore liners and estimate the increased risk of liner failure due to removal of waste rock in the Mine Site Alternative.	WR1E,WR2D
52	The final EIS must also explain how each alternative complies with the requirements of Minnesota's non-ferrous rules (Minn. R. 6132.2200) stating that substantially all water should be prevented from moving through or over waste rock.	WR3I
53	The final EIS must address cumulative impacts on groundwater quality in addition to any separate analysis by flow path.	WR4A,WR5A
54	The final EIS must detail, based on peer-reviewed literature and real-world experience with submerged mine walls and reactive waste rock, the levels of acid and metals likely to continue to leach and contaminate water if pit walls and waste rock are submerged.	PD2
55	The final EIS must explain the levels of solute loading from pit walls above water levels, including the volume of contaminated water and the concentrations of acids and leached metals.	WR3C
56	The final EIS must candidly disclose the impacts of pit wall exposure on acid and leachates predicting a range of results that include inefficacy of limestone application and cover and the potential that some metals leaching would continue under a wide range of pH conditions	WR1A,WR3C
57	As with the waste rock pile solute caps, the final EIS must provide an analysis of solute loading from mine pits under the Proposed Action and the Mine Site Alternative without concentration caps.	PD2
58	If any caps are to applied, the final EIS must provide transparent information justifying the caps given the mineralization, fragmentation and pH in the mine pits over decades and even hundreds of years. The final EIS may not assume a uniform pH of 8 throughout a mine pit in which reactive waste rock has been disposed.	PD2
59	The final EIS must provide detailed information on the volume and characteristics of all inputs to the wastewater treatment facility, including solute concentrations and the treatment efficacy levels and treatment methods proposed to achieve WWTF targets.	WR2G
60	Unless specific proof is provided that a proposed secondary treatment will reduce pollutants to a level sufficient to meet both surface and groundwater standards, the final EIS must demonstrate that WWTF effluent will meet all groundwater and surface water quality standards.	WR3I
61	The final EIS must explain the size, construction and chemical composition of ponds storing contaminated water at the WWTF, including the extent of seeps to groundwater, the surficial aquifer or discharge to wetlands or surface waters likely to result from this storage.	WR3I
62	The final EIS must revise modeling of water quality impacts to reflect inefficacy of constructed wetlands to remove pollutants of concern, including copper, nickel, arsenic and sulfates as well as mercury.	WR1C,WR3L
63	The DEIS does not explicitly state the volume and concentrations of solutes in flotation tailings or wastewater effluent that would be disposed of in the tailings basin. Flotation tailings may contain flotation activators, such as copper sulfate, which is toxic to fish and other processing chemicals as well as solutes and acids. (DEIS, pp. 3-24, 4.12-6). Even if proposed targets for WWTF effluent were to be met, effluent inputs to the tailings basin would not meet surface water quality standards for pH, cadmium, copper, nickel, zinc and lead, would not meet groundwater criteria for pH, total dissolved solids antimony, beryllium or lead and would have 36 high sulfate levels. (Section B(1) supra). WWTF effluent would also have mercury levels exceeding surface water quality standards, as explained in Section B(5).	WR3I

Comment ID	Comment Text	Theme Codes
64	The DEIS explicitly excludes liner leakage from the hydrometallurgical residue cells within the tailings basin from groundwater modeling of the area north of the tailings basin in the Proposed Action (DEIS, p. 4.1-64, 4.1-91). Hydrometallurgical cell liner leakage will have very high sulfate concentrations – over 7,300 mg/L (DEIS, p. 4.1-118). Although the DEIS does not describe the chemical composition of hydrometallurgical residue cells and liner leakage, materials used in the hydrometallurgical plant process include toxic, corrosive and hazardous chemicals as well as the non-recoverable metals from the wastewater treatment process. (DEIS, pp. 3-30, 3-33, 4.12-1, 4.12-5, 4.12-6, Section A(6), supra).	WR2D
65	Existing LTVSMC tailings seeps result in surface water exceedances, contribute to downgradient groundwater quality violations and contain high concentrations of sulfates. Surface discharges from the tailings basin violate water quality standards for pH, hardness and mercury and have concentrations of sulfate as high as 473 mg/L. (DEIS, p. 4.1-43, Table 4.1-30). Downgradient wells from the LTVSMC tailings violate standards for pH, aluminum, beryllium, iron, manganese and mercury and have concentrations of sulfate ranging to 235 mg/L, approaching groundwater limits. (DEIS, p. 4.1-15, Table 4.1-8). LTVSMC tailings represent a significant source of sulfate and arsenic loadings. (DEIS, p. 4.1-168). Paradoxically, despite the proposed addition of a high volume of contaminants to a tailings basin already seeping and discharging sulfates and metals, the PolyMet DEIS predicts no exceedance of surface water quality standards in the Proposed Action other than for aluminum, which the DEIS explains away (DEIS, pp. 4.1-118, 4.1-119, and none in the Tailings Basin Alternative except for thallium, the significance of which is minimized. (DEIS, p. 4.1-155). The DEIS asserted that the Proposed Action would have “relatively little” adverse effect on downgradient groundwater quality. (DEIS, p 4.1-93)	WR3I
66	PolyMet would be legally responsible for any seepage from LTVSMC tailings and NorthMet and LTVSMC tailings would be physically and chemically combined. As suggested by tribal agencies, the variable pH, increased sulfates and other solutes in LTVSMC leachate must be considered in determining the level of acids, metals and metalloids that would seep from combined wastes in the tailings basin.	WR1E
67	The NorthMet tailings would be deposited with a spigot and a diffuser, which could oxygenate tailings. (DEIS, p. 4.1-87). Yet, as with submerged pit rock, the DEIS assumes that tailings that are saturated with water would be “essentially non-reactive” (DEIS, p. 4.1-86) and that the oxidation rate would be reduced to “essentially 0.” (DEIS, p. 4.1-89). No references to either literature or real-world examples are provided to support this assumption. The DEIS model also assumes no segregation of tailings, although it is known that some segregation will occur and increase oxidation. (DEIS, p. 4.1-94).	WR1E
68	The DEIS states that the sulfur content needed to produce acid drainage is between 0.14 percent and 0.17 percent sulfur, and then models releases from the tailings basin based on the average range of sulfur in pilot testing of the processing plant design (range of 0.10 percent to 0.13 percent), which just barely stays below this limit. (DEIS, p. 4.1-86). However, even in the 38 small scale plant testing, it is acknowledged that some of the tailings exceeded 0.13 percent, so that tailings could produce lower pH and higher release of nickel and cobalt. (DEIS, p. 4.1-95). It appears that the DEIS predictions may assume that sulfur in the tailings basin is below the threshold for acid drainage. Particularly since impacts of sulfates from wastewater effluent, hydrometallurgical liner leakage or LTVSMC tailings are not referenced, the DEIS may artificially limit levels of sulfur and leachate in tailing basin materials.	WR1E,WR3I

Comment ID	Comment Text	Theme Codes
69	For the Proposed Action, the DEIS steady state flow model predicted potential exceedances of groundwater standards for aluminum, antimony, arsenic, fluoride, iron, manganese, and sulfate. (DEIS, p. 4.1-92). The DEIS then altered assumptions in a “transient flow” analysis to predict lower concentrations, suggesting that monitoring would be used to “ensure that actual groundwater concentrations are within model predictions.” (DEIS, pp. 4.1-92, 4.1-93). It appears in this section that modeling assumptions were designed to achieve a prediction of no exceedances and that there is little confidence in its reliability. A similar “transient flow” model is applied for the Tailings Basin Alternative, with similarly sanguine results. (DEIS, pp. 4.1-151, 4.1-152) DEIS applications of surface water quality standards to tailings basin seepage also require greater transparency. Looking at a single parameter, surface water quality standards for copper, the DEIS cites water quality standards at two locations on the Embarrass River in predictions for the Proposed Action (DEIS, p. 4.1-119, Table 4.1-66), but cites only the less stringent standard (20.7 mg/L at P-13) for the Tailings Basin Alternative (DEIS, p. 4.1-158, Table 4.1-84). The DEIS does not apply a surface water standard for tailings basin seepage even though the seepage would be directly discharged to the Partridge River under the Tailings Basin Alternative. Even under the limiting assumptions in the DEIS (as described above) tailings basin seepage would have maximum copper concentrations of 12µg/L to 14 µg/L, exceeding copper standards applied by the DEIS to the Partridge River. (DEIS, pp. 4.1-151, Table 4.1-79; p. 4.1-36, Table 4.1-24 hardness condition of 100 mg/L).	WR1E,WR3I
70	DEIS Comments prepared by Joel Roberts reflect flaws and inconsistencies in the technical reports pertaining to the tailings basin. Models are poorly documented, poorly validated and may exclude captured seeps to exclude solute pollution. (Joel Roberts, DEIS Comments, pp. 9-13). The modeling assumptions for the tailings basin seem to be designed to conceal rather than evaluate potential impacts on water quality. This section of the DEIS must be revised prior 39 to the final EIS as follows: • The nature and extent of contamination from the LTVSMC must be characterized through sampling as well as monitoring and considered as potential additive releases; • The volume and concentrations of inputs to the tailings basin from WWTF effluent must be quantified; • The volume and concentrations of inputs to the tailings basin from the plant must be quantified, including the volume and chemical composition of flotation tailings and volume and chemical composition of leaks from the hydrometallurgical residue facility; • Assumptions for tailings basin seepage should include conservative and “worst case” scenarios such as failure of WWTF effluent to meet target concentrations and liner leakage or liner failure from hydrometallurgical residue cells; • Modeling of the level of acid generation and metals leachate must not assume saturated tailings have “zero” reactivity, but must use predictions grounded in experience and literature, anticipating segregation of tailings and oxidation within the tailings, as well as modeling oxidation through unsaturated areas. • Modeling must not assume that tailings will remain uniformly below 0.14 percent sulfur or uniformly non-acid generating. Predictions must be based on a transparent and realistic range of potential pH from all inputs to the tailings basin, including the virtual certainty that pH will not be uniform throughout the entire tailings facility. • Chemical interactions between existing LTVSMC tailings and NorthMet inputs must be characterized for the full range of chemicals of concern. If the way in which most sulfide minerals react with existing tailings provides no “treatment” other than dilution, this result must be disclosed and appropriate regulatory limits on discharge applied. • Seepage from the tailings basin must be compared with both groundwater and surface water quality standards, applying the most stringent applicable standard. • The potential ecological and/or human health consequences of exceedances of water quality must be explicitly described. Ecological consequences must include aquatic toxicity and human health consequences must evaluate both mercury methylation in fish and effects of exceedances, including aluminum, iron and manganese, in residential wells not subject to public water quality treatment.	WR1E,WR3I,WR5A

71	<p>Analysis of underlying technical documents by individual WaterLegacy members reflects identical concerns about the extreme sparseness of the data and the lack of proof for extremely low hydrologic conductivity rates, which are orders of magnitude below those accepted for Duluth Complex. (Joel Robert DEIS Comments, pp. 2-5). It is troubling that the DEIS would rely on a consultant's email for conclusions about groundwater-surface water connections. It is even more troubling that the DEIS failed to provide information regarding reports and recommendations made by the United States Geological Survey in connection with this project. These omissions not only undermine the modeling on which the entire DEIS is based, but the fundamental requirements of public information and disclosure. The final EIS must be based on a rigorous and data-based hydrological model at the mine site, the plant site and impacted surface and groundwaters. Prior to the final EIS, the additional assessment, monitoring and characterization needed to accurately determine impacts on groundwater, surface water and hydrology must be performed, as recommended by the U.S. G.S. (See U.S.G.S. Minnesota Water Science Center, Quarterly Progress Report, February 25, 2009, Project 8607CEW) and tribal cooperating agencies, including but not limited to the following: • Identify, map and characterize major bedrock fractures at the mine site, identifying potential critical areas of ground-water flow between mine workings and local streams. Focus on areas where the effects of mining would have the greatest impact; • Design a monitoring-well network to assess ground-water-flow in fractures and bedrock fractures and in more permeable glacial sediments. Use borehole tools to characterize ground-water conditions in fractures and perform a series of tracer tests to establish flow conditions along important flow paths of concern; • Conduct aquifer testing and other hydrogeologic tests using a monitoring well network to determine whether a porous-media simulation could represent groundwater flow at the scale 43 of the mine site. (Recalibrate and validate models and incorporate high hydraulic conductivity features before model results are used for any ground-water-flow prediction or any geochemical modeling); • Assess vertical flow conditions between upper bedrock and glacial material based in the most critical areas of concern (shortest paths of flow between the project site and crucial water resources and habitats, and the orientation of major fracture patterns at the site); • Use geophysical surveys to map and borings and hydrologic tests to assess the extent and hydrogeology of glacial deposits and permeable glacial sands. Modeling based on lesser estimates of specific yield would affect predictions of water entering the mine and recovery after cessation of mine dewatering. • Perform current assessment of Partridge River and Embarrass River flows based on field collection of data, current and proximate stream gage information and variability of weather and precipitation, including low flow conditions; • Analyze groundwater flow direction, water tables, the extent to which water in aquifers can rise due to hydrostatic pressure (potentiometric surface), fluxes to wetlands, streams and rivers impacted by the mine site and the tailings basin. • Update and verify assessment of impacts on wetlands as well as groundwater and surface water impacts from the mine site; • Update and verify assessment of groundwater impacts on residential wells as well as impacts on wetlands surface waters from tailings basin seepage;</p>	WR1E,WR2A
72	<p>This analysis is completely inappropriate for mercury pollution. No mixing zones are allowed under either federal or state regulations for new discharges of bioaccumulative chemicals of concern into Great Lakes waters, including all waters impacted by the proposed PolyMet project. (40 C.F.R. § 132, Appendix F, Procedure 3; Minn. R. 7052.0210, Subp. 3).</p>	WR4D
73	<p>For other water pollutants, the Clean Water Act applies not only to a down-stream sampling site in the Partridge River, but would require compliance in streams (including intermittent streams) and wetlands that are connected with the Partridge River, which are also legally waters of the United States. (40 CFR § 122.2). Violation of water quality and nondegradation standards, thus, can consider no dilution for mercury and must apply to the nearest unnamed receiving water for all pollutants. The final EIS must analyze violation of water quality and nondegradation standards resulting from west pit lake overflow allowing no mixing zone for mercury and assessing impacts of all pollutants at the nearest receiving waters. It is also likely that the west pit lake itself would be protected by water quality standards under the Clean Water Act and under Minnesota law, as suggested by the tribal cooperating agencies. (DEIS, Tribal Positions, p. 4.1-103). This is particularly salient since the pit lake could exceed surface water quality standards for thousands of years, if not in perpetuity. (DEIS, Tribal Positions, pp. 4.1-101, 4.1-130) The weight of precedent holds that pit lakes can be regulated under the Clean Water Act if there is a "significant nexus" to waters that are navigable.</p>	WR3C,WR3I

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
74	As part of its assessment of water quality standards, the final EIS must: 1) describe the nexus between proposed west pit lake overflow and seepage to streams and wetlands draining into Partridge River; 2) evaluate water quality parameters and violation of water quality standards in the west pit lake, its seeps and overflow; and 3) analyze the adverse impact of water quality violations on aquatic life and water fowl exposed to the pit lake, including but not limited to piscivorous and migratory birds. (See DEIS, Tribal Positions, p. 4.4-17).	WR3C
75	All of the waters impacted by the PolyMet NorthMet mine and plant are within the Lake Superior Basin (DEIS, p. 4.1-33) and subject to the Great Lake Initiative amendment to the Clean Water Act and the federal and state regulations implementing the Great Lakes Initiative. (Minnesota Rules, Chapter 7052; Code of Federal Regulations, title 40, part 132). No new mercury discharge to these waters may exceed 1.3 ng/L. (Minn. R. 7052.0005). Although the Scoping Decision for the project suggests the potential for a variance if PolyMet discharge could not achieve this standard (DEIS, Final Scoping Decision, supra, p. 17), federal and state law prohibit variances for new discharges of mercury within the Lake Superior Basin. (40 C.F.R. §132, Appendix F, Procedure 2; Minn. R. 7052.0280). All discharges to surface waters from the project must comply with the Great Lakes Initiative mercury concentration limit. The DEIS does not clearly identify all of the ways in which the PolyMet NorthMet project could discharge mercury to surface waters. It is acknowledged that west pit overflow would be a discharge required to meet the Great Lakes Initiative mercury standard. (DEIS, p. S- 9). However, there are other aspects of the Project that are likely to be considered discharge under the Clean Water Act. Under applicable law, collected and channelized runoff, process water, pumped water from mine dewatering and waters discharged after treatment in the wastewater treatment facility would all be viewed as point source discharge if they were either directly released to the Partridge River, as in the tailings basin alternative, or if they seeped or leaked from channels, basins or pits into wetlands, streams, rivers or other surface waters.	WR4D
76	The DEIS fails to appropriately and transparently characterize the level of mercury in each of these potential discharge sources. This deficiency should be rectified in the final EIS.	WR1E
77	The EIS must evaluate the level of mercury in seeps and discharges from pit lakes and constructed wetlands, recognizing that neither the wastewater treatment facility (WWTF) nor the constructed wetlands will be consistently effective in removing mercury. (DEIS, pp. 4.1-123, 4.1-128). The average mercury concentration in drainage before treatment at the WWTF is predicted to be 8.5 ng/L, while the average after treatment is predicted to be 7.1 ng/L (DEIS, p. 4.1-123) both of which levels are far above the 1.3ng/L limit. As far as constructed wetlands:	WR3I,WR4B
78	The DEIS' reliance on dumping mercury-containing runoff water through the tailings basin to reduce mercury concentrations in seeps to below the 1.3 ng/L GLI standard, based on laboratory bench studies (DEIS, p. 4.1-124), is not consistent with real world data on mercury seeps and discharge. Testing of the groundwater beneath the existing LTVSMC tailings basin shows substantial exceedances of the GLI standard ranging from 4.2 ng/L to 7.7 ng/L (DEIS, p. 4.1-12, Table 4.1-6). Surface discharge from the tailings basin also shows repeated and significant exceedances of the GLI standard, ranging from 2.6 ng/L to 5.5 ng/L (DEIS, p. 4.1-43, Table 4.1-30). As noted by the tribal agencies, bench studies fail to take the impacts of leaching from existing tailings; their conclusions have not been adequately vetted and are illogical. (DEIS, Tribal Positions, pp. 4.1-16, 4.1-50 to 4.1-51). After treatment at the WWTF, PolyMet process water and runoff are predicted to have mercury concentrations of 7.1 ng/L (DEIS, p.4.1-123). Inputs of mercury are predicted to include 107.5 pounds per year from concentrations in the ore and 5.5 pounds per year from process materials (DEIS, p. 4.1-124). There is no basis in this data from which it could be reasonably concluded that adding WWTF effluent would reduce mercury in tailings basin seeps. The final EIS must also include a comprehensive analysis of mercury discharge to surface water and seeps to groundwater from the tailings basin based on realistic data. Groundwater modeling of the area surrounding the tailings basin must also include the mercury and sulfate load from the hydrometallurgical residue, which appears to have been excluded in the current analysis. (DEIS, p. 4.1-64).	WR3I,WR4A

79 The DEIS released to the public removed both this summary and any quantitative assessment of the impacts of increased sulfate on mercury methylation. (Compare DEIS, pp. 4.5- 21 to 4.5-22). The DEIS also relies on a highly disputed characterization of wetlands to suggest that the tailings basin alternative, in particular, would avoid mercury methylation risks. (See e.g. DEIS, Tribal Findings, p. 4.1-113. Without analyzing downstream impoundments in the St. Louis River or the Lake Superior estuary, the DEIS asserts that the PolyMet project is not expected to “contribute significantly” to cumulative effects on mercury and methylmercury in the St. Louis River. (DEIS, p. 4.1-196). The impacts of mercury and sulfate loadings from the project to the Partridge and Embarrass Rivers must be considered with substantial cumulative sulfate loadings from other mining and minerals processing activities. (DEIS, p. 4.1-188, Table 4.1-96; p. 4.1-192, Table 4.1-99). The effects of PolyMet’s increased mercury air emissions and the increased localized mercury air emissions from other mining, minerals processing and other emissions sources must also be considered. Recent MPCA data show that mercury emissions from the materials processing sector were at 735 pounds in 2005 and are anticipated to reach 841 pounds in 2010. These increases in mercury emissions are attributable to the Minnesota Steel Industries electric arc furnace steel mill and the Mesabi Nugget iron nugget production plant located in the Mesabi 51 Range and Hoyt Lakes areas, near the proposed PolyMet project. (MPCA, Estimated Mercury Emissions in Minnesota for 2005 to 2018, April 22, 2008, pp. 2, 18) Regulations under the Clean Water Act and the Great Lakes Initiative require that the point and nonpoint sources that could increase mercury methylation in impaired waters be analyzed cumulatively and quantitatively. (See *Friends of Pinto Creek v. EPA*, 504 F.3d 1007 (9th Cir., 2007). EPA guidance recommends, in connection with metals mining and processing that this analysis be performed in a TMDL for the affected watershed, investigating cumulative loads from point sources and localized nonpoint sources such as abandoned mines, contaminated sediments, atmospheric deposition and sulfate loadings. (U.S. EPA, 2009 Guidance for Implementing the Methylmercury Water Quality Criterion, p. 113 and Appendix D The DEIS analysis of the cumulative impacts of mercury discharge, mercury air emissions, sulfate loadings, wetlands inundation, hydrologic changes and other existing and foreseeable localized impacts on the St. Louis River watershed is clearly inadequate. The EIS should provide a realistic, comprehensive, quantitative and cumulative analysis of likely impacts on the ability of waters downstream to attain Minnesota’s health-based fish tissue standards of 0.2 mg/kg (Minn. R. 7050.0220), including but not limited to the following: 1) Mercury discharges from the PolyMet project, including all nonpoint as well as point source discharges during mine operation, closure and post-closure; 2) Sulfate discharges from the PolyMet project, including all nonpoint as well as point source discharges during mine operation, closure and post-closure; 3) Quantitative analysis of mercury methylation inputs from the PolyMet project under a “worst case” scenario including high precipitation and flooding and drying weather events, based on at least the following factors during mine operations, closure and non-closure: • Increased sulfate discharge from the project, impacting methylation in streams, wetlands and impoundments from the mine site and plant site downstream until the juncture of the St. Louis River with Lake Superior. This analysis must be based on an accurate wetlands delineation and analysis of the places within the watershed where low availability of sulfates places a limitation on mercury methylation; • Hydrologic changes, particularly to the Partridge River, Colby Lake and Whitewater Reservoir result

80	Protection of wild rice is uniquely recognized under Minnesota water quality laws. It is explicitly provided that the quality of wild rice waters and the habitat necessary to support wild rice must not be degraded: Wild rice is an aquatic plant resource found in certain waters within the state. The harvest and use of grains from this plant serve as a food source for wildlife and humans. In recognition of the ecological importance of this resource, and in conjunction with Minnesota Indian tribes, selected wild rice waters have been specifically identified [WR] and listed in part 7050.0470, subpart 1. The quality of these waters and the aquatic habitat necessary to support the propagation and maintenance of wild rice plant species must not be materially impaired or degraded. The quality of these waters and the aquatic habitat necessary to support the propagation and maintenance of wild rice plant species must not be materially impaired or degraded. If the standards in this part are exceeded in waters of the state that have the Class 4 designation, it is considered indicative of a polluted condition which is actually or potentially deleterious, harmful, detrimental, or injurious with respect to the designated uses. (Minn. R. 7050.0224, Subp. 1) The St. Louis River is explicitly identified in Minnesota law as a wild rice water (Minn. R. 7050.0470). Concentrations of sulfates above 10 mg/L are defined as degradation and prohibited in this wild rice water. Yet the DEIS both tries to minimize the presence of wild rice on the St. Louis River (an argument precluded by the regulatory classification of these waters) and provides no analysis of the impacts of cumulative sulfate loadings from the PolyMet NorthMet project on the St. Louis River. (See DEIS, p. 4.1-195). The EIS must provide detailed information on sulfate loadings to the St. Louis River from the PolyMet project. If these loadings, taken together, increase sulfate above 10 mg/L in this designated wild rice river, changes in project design, mitigation or treatment will be required to avoid violations of law.	WR1E,WR4F
81	The cumulative impacts analysis of the PolyMet project, along with other mining and minerals processing expansions acknowledges, “The activities included in this cumulative effects assessment have the potential to increase sulfate concentrations in the middle segment of the St. Louis River between the confluence with the Embarrass River and Knife Falls Dam. (DEIS, p. 4.14-9) The DEIS then provides no numeric analysis of the sulfate concentrations that would result from the cumulative impacts of these projects to the St. Louis River. This failure must be rectified in the final EIS and sulfate loadings from other sources may also need to be reduced.	WR5A
82	Tribal agencies have reflected a high level of concern that the environmental review process has failed to appropriately assess and recognize the prevalence of wild rice growing in the Partridge, Embarrass and St. Louis Rivers downstream of the project. The DEIS notes that field surveys of wild rice were recently done (four years after the application for the project was made to the U.S. Army Corps of Engineers): Recent (August and September 2009) field surveys found wild rice at various locations along the Upper and Lower Partridge River, to Embarrass River, and further downstream in the lower St. Louis River. Fairly dense stands were found in the Lower Partridge River and Cedar Island Lake along the Embarrass River. (4.8-13 to 4.8-14)	WR1E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
83	Water quality analysis and claims that project parameters “meet surface water quality standards” must be revised throughout the EIS to reflect exceedance of sulfate standards in the Lower Partridge and the Embarrass Rivers. (See e.g., DEIS, Tribal Positions, pp. 4.1-116, 4.1- 147). The sulfate levels in the new DEIS, Table 4.1-67 at page 4.1-121, Effects of the Proposed Action on Wild Rice Areas and Table 4.1-86 at page 4.1-160, Estimated Effects of the Tailings Basin Alternative on Wild Rice Areas, reflect potential exceedances of Minnesota’s wild rice sulfate standard in various areas of the watersheds downstream of the project. A more rigorous and comprehensive analysis of the implications of sulfate effects of the proposed action should be provided in the final EIS: • The wild rice 10 mg/L sulfate standard should be applied to the St. Louis River and any areas of the Partridge and Embarrass Rivers historically producing wild rice. (See DEIS, Tribal Positions, pp. 4.1-105, 4.1-108, 4.1-109, 4.1-128, 4.1-159, 4.1-161). • Dilution estimates in particular, should receive additional scrutiny along with the potential that hydrologic changes from pit dewatering and tailings basin seepage. (See DEIS, Tribal Positions, p. 4.1-14 to 4.1-15). • Potential capture and treatment of all discharge to the Partridge or Embarrass Rivers to reduce sulfate concentrations must be considered in the final EIS. (See DEIS, Tribal Positions, pp. 3-51 to 3-52, 4.1-133). 55 • The EIS must analyze cumulative impacts on wild rice in the Partridge, Embarrass and St. Louis Rivers from other mining and processing activities. • The historic pre-mining prevalence of wild rice in the St. Louis River watershed under low sulfate conditions must also be considered, testing sediment cores for pollen as well as reviewing historical records. (See DEIS Comments of Len Anderson). • Consultation with tribes regarding the cultural significance of wild rice must be completed, including an objective and thorough wild rice survey. (DEIS, Tribal Positions, p. 4.1-33). • The EIS must evaluate impacts of wild rice impairment on cultural resources and environmental justice, as well as defining the extent of violations of the 10 mg/L water quality standards pertaining to sulfates in waters designated for or producing wild rice.	EOO,WR1E,WR3I,WR4B,
84	Rather than reporting potential exceedances of iron, manganese, arsenic and aluminum in drinking water and discussing the potential health risks of ingestion, the DEIS seems to take every possible opportunity to dismiss risks. Specifically, the DEIS adjusts predictive models to reduce apparent risk of arsenic exceedance, discounts aluminum concentrations and, without scientific references, dismisses iron, manganese and aluminum levels as having no human health risk. These defects of omission and commission are inconsistent with the comments made by the U.S. EPA Region 5 and contradict federal public health authorities on human health toxicity.	WR3I
85	There are at least 27 existing domestic wells located between the proposed NorthMet tailings area and the Embarrass River. (DEIS, p. 4.1-20). Several of the residential wells located downgradient from the existing LTVSMC tailings basin have manganese and fluoride concentrations exceeding the groundwater evaluation criteria, and at least one exceeds aluminum criteria. Samples also show levels of arsenic close to exceedance. Although groundwater downgradient from the tailings basin is heavily contaminated with iron (at 4,743 µg/L, more than 15 times the standard of 300 µg/L), the DEIS reports no sampling of residential wells for iron. (DEIS, p. 4.1-15, Table 4.1-8). DEIS predictions of groundwater impacts of the PolyMet tailings basin on residential wells do not evaluate the additional loading of chemicals combined with any existing contaminant plume from the LTVSMC tailings (DEIS, p. 4.1-94, Fn 27). The cumulative impacts discussion of water quality doesn’t even mention residential well drinking water. (See DEIS, pp. 4.14-3, 4.14-6, 4.14-8, 4.14-9). The DEIS is clearly inadequate to evaluate water quality at residential wells near the tailings basin.	WR1E,WR3I,WR5A
86	As the U.S. EPA Region 5 noted in their comments, although the DEIS altered its predictive model by “readjusting variables to less conservative inputs” the predicted arsenic concentration of 1.9 µg/L is still very close to Minnesota’s chronic water quality standard of 2.0 µg/L and is still a concern. (USEPA, PDEIS Comments, supra, p. 4, altering of predictive model see DEIS, p. 4.1-115).	WR3I,WR5A
87	Dismissal of human health concerns related to arsenic, iron, manganese and aluminum is inadequate if not misleading, as even the brief summary below demonstrates.	WR5A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
88	The DEIS did not discuss the contamination of Colby Lake with amphibole or asbestoslike mineral fibers. However, tribal cooperating agencies suggest that amphibole fibers have been identified as existing pollutants in the Hoyt Lake community water supply and that they are known to cause digestive tract cancers. (DEIS, Tribal Positions, p. 4.14-4). Both the background level of amphibole fibers in Colby Lake and the potential for their increase should be identified in the EIS.	WR3F
89	Minnesota rules proscribe degradation of groundwater irrespective of whether it is used for drinking water. (Minn. R. 7060.0500). Cumulative increases in groundwater contamination must be evaluated according to nondegradation policies as well as to assess human health risk.	WR5A
90	The DEIS states that the City of Hoyt Lakes water treatment plant is able to remove nearly all iron at its water treatment plant. (DEIS, p. 4.1-116). However, U.S.EPA Region 5 Comments suggest that the methods used by Hoyt Lakes – open basin sedimentation, gravity sand filtration and corrosion control – are not the most effective in making significant reductions. (USEPA, PDEIS Comments, supra, p. 4). The final EIS should clarify what levels of iron reduction are achieved by the Hoyt Lakes treatment plant. Even if the Hoyt Lakes water treatment plant is effective in reducing iron contamination, cumulative exceedances of iron in residential wells may have serious health consequences. A portion of the public is vulnerable to hemochromatosis, or “iron overload” disease. This vulnerability is genetic, and the specific gene mutation was discovered in 1996. According to the Centers for Disease Control and Prevention (CDC), hemochromatosis is the most common genetic disease in the U.S.A. One in 8 are "silent carriers" of the single gene mutation and 1 in 100-200 have the double mutation putting them at high risk for developing the disease. The symptoms of hemochromatosis vary and can include: chronic fatigue, arthritis, heart disease, and liver problems including cirrhosis and cancer. Hemochromatosis can lead to organ damage and even death.	WR3F
91	Although the DEIS suggests that iron is effectively removed from the Hoyt Lakes water plant, no similar control of manganese is even suggested. Hoyt Lakes has had problems with manganese in the water supply in the past, due to release of manganese from lake sediments in late summer. There is no basis to believe that the method used to reduce this risk – increasing the height of the intake valve – would protect drinking water contamination from upstream sources. (See DEIS, p. 4.1-116) Manganese is a toxic chemical (CAS#: 7439-96-5) classified by the Agency for Toxic Substances and Disease Registry (ASTDR). In laboratory studies, ingestion of manganese has been found to cause kidney and urinary tract illnesses, impairments of fertility and sperm damage and nervous system dysfunction. Manganese has been shown to cross the blood-brain barrier and can cross the placenta during pregnancy, enabling it to reach a developing fetus. Very high levels of manganese ingested in water have reportedly resulted in death and there are several studies linking manganese ingestion to neurological damage. ( <a href="http://www.atsdr.cdc.gov/toxprofiles/tp151-c3.pdf">http://www.atsdr.cdc.gov/toxprofiles/tp151-c3.pdf</a> )	WR5A
92	U.S. EPA Region 5 Comments express particular concern about increasing aluminum concentrations over time, especially at sampling points upstream of Colby Lake. The U.S. EPA notes that, although there is no Safe Drinking Water Act Maximum Contaminant Level (MCL) yet set for aluminum, “several studies over the past several years have shown various health effects related to aluminum” so that a conclusion that predicted levels would not pose human health risks would need verification and supporting documentation. (USEPA Comments, PDEIS, supra, p. 3). The CDC’s ATSDR toxicological profile reports that in some studies, oral exposure to aluminum has been associated with increased risk of Alzheimer’s disease. It is well-established that persons with kidney disease who have difficulty removing aluminum from the body can develop bone disease or neurotoxicity attributable to excess aluminum. ( <a href="http://www.atsdr.cdc.gov/toxprofiles/tp22-c3.pdf">http://www.atsdr.cdc.gov/toxprofiles/tp22-c3.pdf</a> ). Potential health consequences of aluminum exceedances should not be dismissed.	WR5A

Comment ID	Comment Text	Theme Codes
93	The final EIS must more completely assess contamination of groundwater and drinking water, including human toxicity, as follows: • Conduct (or report) more complete testing of residential water quality, including testing for iron exceedances; • Use additional wells to monitor and model the plume of groundwater contamination from the LTVSMC site; • Provide a cumulative analysis of the impacts of the LTVSMC, NorthMet project and other sources of groundwater contamination on residential wells, including but not limited to potential exceedances of iron, manganese, aluminum and arsenic; • Assess the background level of amphibole fibers in Colby Lake and any potential for their increase as a result of the NorthMet project; • Model cumulative exceedances of iron, manganese, aluminum and arsenic in Colby Lake, identifying whether and the degree to which current water treatment methods do or do not reduce concentrations; • Evaluate increases in predicted groundwater contamination under Minnesota’s nondegradation rules; • Explain the potential human health consequences of all exceedances in drinking water, using available public health references, such as CDC, ATSDR, U.S. EPA and MDH publications and guidance.	WR1A,WR1E,WR5A
94	The DEIS has estimated a total of 667.9 acres of indirectly impacted wetlands, 318.6 at the mine site and 349.3 (DEIS, p. S-9) at the plant site. Due to flaws in wetland delineation, limitation of the scope of wetlands analyzed, inadequacies in analysis of hydrology and lack of explicit consideration of impacts of the project during 20 years of operation and post-closure, it is virtually certain that the indirect impacts of the project on wetlands at these sites have been significantly underestimated. The final EIS must rectify these deficiencies and provide a transparent, science-based analysis of wetland impacts over time and throughout the potentially affected watershed. The DEIS both states and implies that the indirect impacts of the PolyMet NorthMet project on wetlands would be minimal due to its characterization of the nature of the wetlands on and near the mine site as coniferous and perched bogs that are dependent on precipitation, rather than ground water for their moisture and nutrients. (PolyMet DEIS, pp. 4.2-3, pp. 4.2-11 to 4.2- 14, Table 4.2-3). The DEIS states that few acres of mine site wetlands not excavated by the project are dependent on groundwater and then concludes that no indirect impacts on wetlands from groundwater are expected at the mine site. (DEIS, p. 4.2-19). This conclusion, with its obvious strategic importance, is vigorously disputed by the tribal cooperating agencies, who object to the scientific validity of determining wetlands delineation from aerial views referenced in an email (DEIS, Tribal Positions, pp. 4.2-1, 4.2-21; DEIS, pp. 4.2-1 to 4.2-2, 4.2-19). Tribal agencies state that many of the wetlands that have been identified during delineation as "perched bogs" are cedar swamps, northern wet ash swamps, forested rich peatlands, northern alder swamps, and poor fens, all of which require groundwater inputs. (DEIS, Tribal Positions, pp. 4.2-3, 4.2-4, 4.2-5, 4.2-22, 4.2-23, 4.2-27, 4.2-49; DEIS, p. 4.2-10). Characterizing various wetland types as unconnected to groundwater may also be inconsistent with classifications published by the MDNR. (See Matt Tyler DEIS Comments). Even the underlying project wetland delineation study suggests that many wetlands potentially impacted by the project are dependent on groundwater resources:	WE1,WE2
95	Insufficient wetland delineation has been provided around the tailings basin, although wetland impacts from inundation are likely to occur. (DEIS, Tribal Positions, pp. 4.2-1 to 4.2-2). This is particularly significant since the area described as the “tailings basin” is a vast area as much as two miles in diameter, much of which is surrounded by wetlands. (See DEIS, Appendix A, Figures 3.1-27, 4.1-11). Accuracy of the DEIS wetland delineation along the Partridge River is also disputed by the tribes. (DEIS, p. 4.2-43, 4.2-48). The accurate delineation of wetlands is critical not only on and immediately adjacent to the project site, but along the Partridge and Embarrass Rivers and downstream on the St. Louis River. Although not mentioned in the DEIS, studies show that both the Partridge and the Embarrass Rivers contain extensive wetlands environments. The Partridge River tributary has 20.3 square miles of wetlands (approximately 12.5 percent of its area is wetlands) and the Embarrass River has 19.3 square miles of wetlands (approximately 10.7 percent wetlands). (Berndt & Bavin, Sulfate and Mercury Chemistry of the St. Louis River in Northeastern Minnesota: A Report to the Minerals Coordinating Committee, MDNR, Draft Report, June 2009, p. 30). Depending on the nature of these wetlands, they may be more or less vulnerable to impacts of the project due to hydrologic changes and chemical inputs.	WE1,WE2

96	In addition to relying on an email reporting aerial views for wetlands delineation, it appears that the DEIS has relied upon an email containing anecdotal information and aerial photographs from other mines to estimate groundwater drawdown impacts on wetlands from the project. (DEIS, p. 4.2-20; DEIS, Tribal Positions p. 4.2-21). The DEIS contains no quantitative assessment of mine related drawdown of the regional water table, creating a serious data gap in the ability to adequately assess indirect impacts upon wetlands. (See Section B(3), supra, DEIS, Tribal Positions, p. 4.2-20, 4.2-22).	WE2
97	The DEIS' suggestion that, instead of performing a hydrological analysis in environmental review to verify the prediction of impacts on wetlands, PolyMet could monitor for hydrological impacts and mitigate if they are found (DEIS, p. 4.2-20) is inconsistent with the legal requirements for environmental review. The core purpose of both NEPA and MEPA is to disclose environmental impacts, not to defer their recognition until a project has been built and it is too late to prevent harm.	EOO
98	Tribal agencies maintain that a more scientifically rigorous delineation of wetland types and hydrological impacts to wetlands would demonstrate more significant indirect impacts to wetlands than described in the DEIS. (DEIS, Tribal Positions, pp. 4.2-21, 4.2-22, 4.2-23). Tribal agencies have also proposed a more customary method for estimating indirect wetland impacts developed by the Army Corps of Engineers for the Crandon sulfide mine project and presented by tribal staff at professional conferences. (DEIS, Tribal Positions, p. 4.2-25). The final EIS must include the following: • An objective, transparent and comprehensive delineation of wetlands at the project site and along downstream water bodies, consistent with MDNR classifications; • Absent specific scientific justification for deviating from this methodology, the EIS should use methodology developed for the Crandon mine to estimate indirect wetlands impacts.	WE1,WE2
99	Loss of wetlands from the direct and indirect impacts of the PolyMet NorthMet project constitutes one of the most significant irreversible losses of natural resources resulting from the project. Even without considering downstream impairment of wetlands in the Embarrass, the Partridge or St. Louis River channels, the PolyMet project would have approximately 854.2 acres of direct wetland impacts and 667.9 acres of indirect wetland impacts, for a total predicted impact of 1,522.1 acres. (DEIS, p. 4.2-24). Of these wetlands, all but one coniferous bog community wetland, all shrub community wetlands and all forested swamp community wetlands are rated high quality. (DEIS, pp. 4.2-5 to 4.2-6) Minnesota law requires that, if impacts on wetlands cannot be avoided or restored, wetlands must be replaced. (Minn. Stat. §103G.222). Replacement ratios are set in rules, and the baseline requirement in the PolyMet project area is that wetlands must be replaced on a 1.5 to 1 ratio if the wetlands used for replacement are either outside the watershed or different in kind from the wetlands being lost. (Minn. R. 8420.0117, see DEIS, p. 4.2-29) It is evident from the DEIS that no plan has been developed to fully replace the wetlands impacted by the PolyMet project. The plan proposed in the DEIS suggests that there would be 175 acres of on-site mitigation of wetlands, mitigation outside the project's watershed in Aitkin with 810 acres of wetlands and 123 acres of buffer, and mitigation outside the watershed in Hinckley with 313 acres of wetland and 79 acres of buffer, for a total of 1170.3 acres of wetland credits. It is suggested that the closure plan is designed to add another 175 acres of wetlands and that the current plan provides 1,287 acres of mitigation credits. (DEIS, p. 4.2-38) First, the on-site mitigation documented in the DEIS does not add up to the 350 acre total claimed in the above summary. Just a few pages earlier, the DEIS states that the current plan includes the creation of 30 acres of wetlands on the contaminated LTVSMC emergency basin, 75 acres on the tailings basin at closure, 30 acres on the mine stockpile areas and 40 acres at the east pit, which would not be eligible for wetland credits. (DEIS, p. 4.2-30). The DEIS then goes on to state that, although other location were identified, "At the current stage of planning it is not possible to estimate the potential extent of wetland mitigation in these areas." (DEIS, pp. 4.2-30 to 4.2-31). Identified on-site mitigation, thus, adds up to a total of 135 acres of wetland credits, including post-closure mitigation. The final EIS must reconcile this discrepancy.	WE2,WE3

Comment ID	Comment Text	Theme Codes
100	The suggestion that evaluation and mitigation of critical environmental impacts, such as loss of wetlands can be deferred until permitting or to project operations and closure is inconsistent with the National Environmental Policy Act and the Minnesota Environmental Policy Act. NEPA requires agencies to evaluate and mitigate environmental impacts of projects before the permitting stage, the core purpose for which NEPA was enacted. (See e.g. Mexico v. Bureau of Land Management, 565 F.3d 683, 703 (10th Cir. 2009). Any wetlands for which the replacement is not identified in the final EIS should be considered unmitigated. (DEIS, Tribal Positions, p. 4.2-42). The final EIS must detail replacement of all impacted wetlands, including a discussion of replacement quality or must acknowledge the irreversible loss of the equivalent of nearly 1,000 acres of highly valuable wetlands.	WE3,WE4
101	Since the mine site would be removed from the Ceded Territory in order for the PolyMet project to proceed, none of the wetland replacements proposed in the DEIS, including those on the mine site, would be within the 1854 Ceded Territory. At most, the 175 acres proposed to be restored on the mine site or the 175 acres to be restored post-closure (DEIS, p. 4.2-38) might have some relation to waters within the remaining Ceded Territory. The planned wetland replacement, thus, would lead to a substantial loss of wetlands within the Ceded Territory. (DEIS, p. 4.14-5).	WE3,CR1
102	The Ceded Territory represents an important cultural resource that may be impacted by loss and impairment of wetlands. The DEIS does not include this issue in its description of impacts on wetlands (DEIS, Section 4.2). The final EIS must analyze the cumulative impacts of the PolyMet project on the 1854 Ceded Territory, including but not limited to the loss of wetlands and changes in wetland functional values during operation, closure and post-closure, the additive effects of air and water emissions on wetlands, and the loss of tribal access to wetlands due to the above changes and the mitigation of wetland impacts by replacements occurring outside the ceded territory. (DEIS, Tribal Positions, p. 4.2-44) Any loss of wetlands or loss of wetland functionality within the Ceded Territory that is not replaced within the Ceded Territory must be considered an irreversible and irretrievable loss of cultural resources resulting from the PolyMet project	WE3,WE5,G3,CR1,CR3,CR
103	The DEIS identifies direct impacts from other mining projects of approximately 328 acres, but describes no indirect effects on wetlands from other projects. (DEIS, p. 4.2-46) Then, in analyzing impacts on wetlands in the Partridge River watershed, the DEIS suggests that existing wetland conditions will only be reduced by 1,155 acres (DEIS, p. 4.2-47, Table 4.2-9) even though its own analysis (which tribal agencies believe is understated) identifies 1,132 acres of impacted wetlands within the Partridge River watershed from the PolyMet mine project alone. (DEIS, p. 4.2-9) Simple addition suggests that impacts are understated.	WE2

104	Although the DEIS acknowledges that acid mine drainage from the tailings basin has impaired the quality of surrounding wetlands (DEIS, p.4.2-52) the DEIS impacts analysis does not address the impacts of sulfate discharge, air emissions or hydrological changes beyond the mine site on wetland functionality in the Partridge River. Even with this constraint, the DEIS acknowledges that, due to the high quality of the Partridge River wetlands (3.4 percent according to the DEIS) impacted, “the function and values served by the wetlands in the watershed would be expected to be significantly affected” by the direct and indirect losses of wetlands from the PolyMet project. (DEIS, p. 4.2-48). The failure to consider functional impairment of wetlands and the impacts of increased tailings basin drainage on surrounding wetlands renders the analysis of impacts to the Embarrass River watershed meaningless. The DEIS minimizes the loss of wetlands around the existing tailings basin due to their low quality without an assessment of how increased discharge at the PolyMet plant might impair the function of additional wetlands. (DEIS 4.2-52). This analysis is inadequate. Minnesota Rules recognize that the public value of wetlands is based upon their function, including filtration of pollutants to surface water and groundwater, using nutrients that would otherwise pollute public waters, trapping sediments, recharging groundwater, flood and storm water retention and fish, wildlife and native plant habitats. (Minn. R. 8420.0522). Minnesota Rules on replacement of wetlands require analysis of both the value and function of wetlands that may be impacted. (See Minn. R. 8420.0515). Although the DEIS acknowledges that there would be significant impacts on the Partridge River watershed as a result of the PolyMet project, no characterization is provided as to the nature of the functions that would be impacted or the relationship of that loss of function to water quality and fish, wildlife and plant habitat. In order to assess wetlands impairment and mitigation, the final EIS must: • Recalculate the acreage of wetlands functionally impacted, including wetlands impacted by acid mine drainage, air emissions or hydrological changes under both the Proposed Action and the Tailings Basin Project alternative • Evaluate the impacts of loss of wetlands and wetland functionality throughout the Partridge, Embarrass and St. Louis River watersheds (See DEIS, Tribal Positions, pp. 4.2- 43, 4.2-44). • Consider cumulative indirect as well as direct impacts from other foreseeable projects in evaluating wetlands impacts to watersheds; • Provide and evaluate a mitigation plan for the NorthMet project that replaces wetlands and wetland functionality within affected watersheds. Although it might be more convenient to mitigate wetlands with large remote tracts, the Minnesota Wetlands Conservation Act may require identifying and securing smaller parcels of wetlands within the watershed to protect water resources and wetlands functionality.	WE2,WE3,WE5
105	The DEIS fails to document consultation with the USFWS pertaining to the potential that additional and cumulative mining activity will further impact critical lynx and wolf habitat. This oversight is particularly striking given the environmental impact statement process underway to address dozens of prospecting permits in the Superior National Forest ( <a href="http://www.fs.fed.us/r9/forests/superior/projects/prospecting.php">http://www.fs.fed.us/r9/forests/superior/projects/prospecting.php</a> ) and the fact that cumulative impacts from historical, present and future mining-related activities in the Mesabi Iron Range are estimated to be 153,184 acres, including impacts on 31,000 acres from future mining activities. (DEIS, p. 4.4-29).	WI1
106	Statements in the DEIS that impacts from the PolyMet and other mining projects on loss and fragmentation of wildlife habitat that extend for many decades should be considered “temporary” and not “significant” (DEIS, p. 4.14-5) have no legal or scientific basis. The DEIS cites no biological assessment that might support this conclusion. Destruction of endangered species habitat may impact species survival not only due to the destruction of acreage, but due to the impairment of wildlife travel corridors that permit endangered and other species to move between remaining areas of habitat. The DEIS acknowledges that destruction of wildlife corridors may lead to population and genetic isolation, reducing population stability and persistence. (DEIS, p. 4.4-30). The DEIS appears to rely on studies done for other proposed intrusive actions to assess the impacts of the PolyMet project on wildlife corridors. Based on this analysis, the DEIS notes that the project would impact 2 of the 13 wildlife corridors identified in a comprehensive study. (DEIS, p. 4.4-31, citing Emmons and Olivier Resources, Inc. 2006). With reference to impacts on Corridor 11 the DEIS states that the LTVSMC tailings basin, despite two decades since closure, “provides poor habitat.” ((DEIS, p. 4.4-31). The DEIS characterizes the impacts on Corridor 12(17) as indirect and does not describe any impact to Corridor 10(14), southwest of the PolyMet plant site, which might be impacted, since the Mesabi Nuggett project is its other side. (DEIS, Appendix A, Figure 4.4-1). An independent USFWS consultation on corridor impacts is needed.	WI1,WI5

107	This analysis of cumulative impacts turns environmental review upside down. Cumulative impacts analysis under the National Environmental Policy Act (42 U.S.C. §4332(2)(C); 40 C.F.R. §1508.11 and 1508.25(c)) and under the Minnesota Environmental Policy Act (Minn. Stat. §116D.04; Minn. R. 4410.1700, Subp. 7) is not intended to justify resource loss if other foreseeable projects may also be destructive, but to identify significant or even irreparable harm to the environment -- in this case, to two endangered species -- resulting from cumulative destruction. See e.g. Citizens Advocating Responsible Development v. Kandiyohi County, 713 N.W. 2d 817, 830 (Minn. 2006)(The point of the "cumulative potential effects" criterion is "to determine whether the project, which may not individually have the potential to cause significant environmental effects, could have a significant effect when other local projects already in existence or planned for the future are considered.")	WI5
108	The final EIS must be based on Endangered Species Act law and scientific analysis of the impacts on lynx and wolf habitat and wildlife corridors rather than reassuring platitudes that impacts are not expected to be significant. Specifically, the final EIS must contain: • A biological assessment and consultation with the USFWS regarding impacts on lynx, wolf, critical habitat and wildlife travel corridors (See 50 C.F.R. 402); • Recognition that mining impacts represent a total habitat loss and that a 40 or more year loss of habitat for endangered species should be considered a permanent loss; • A cumulative impacts analysis in consultation with the USFWS based on reasonably predicted mining as well as forestry activities, consistent with the objectives of NEPA and the ESA prohibition of destruction or adverse modification of habitat for endangered species.	WI1
110	Assuming a high level of efficiency from the wet scrubber system at the hydrometallurgical facility, the DEIS identifies 8.3 pounds of new mercury emissions from the proposed PolyMet NorthMet project (DEIS, p. 4.6-34, 4.6-39). Based on a stakeholder-devised recommendation for mercury reductions, the DEIS then describes an offsetting plan for project mercury emissions that might include any of the following: offsets from purchasing emissions credits from in-state taconite or energy facilities, entering into a partnership with another mercury-emitting sector such as crematoria, collecting mercury products, or doing research with publicly owned treatment works. (DEIS, p. 4.6-35, 4.6-40 to 4.6-41). This plan is inconsistent with Clean Water Act protection of mercury-impaired waters and with Minnesota's Statewide Mercury TMDL.	WR4C,AQ6A
111	Before the final EIS is released, a more thorough investigation of cumulative mercury emissions and sector increases must be conducted. The implication of compliance schedules for waters impaired for mercury and compliance with sector reduction targets should require a new analysis of the potential for offsets of project mercury emissions.	WR5A,AQ6A
112	The DEIS analysis of the human health risk from inhalation of pollutants at the PolyMet NorthMet plant and mine site and the analysis of risks and mitigation from hazardous air pollutants is incomplete. The final EIS must include at least the following additional analyses: cumulative cancer and non-cancer health risks including particulate emissions and amphibole fibers, identification of all hazardous air pollutants released at the mine and plant site, including releases attributable to fugitive emissions and diesel combustion, and explicit discussion of mitigation of cancer and non-cancer health risks, particularly when human health risks exceed Minnesota Health Risk Values.	AQ4B,AQ6
113	The cancer and non-cancer health assessment from the tailings basin and the mine site in the DEIS did not include amphibole fibers and does not appear to have included impacts from particulate matter or fine particulates. (DEIS, p. 4.6-23, Table 4.6-16, p. 4.6-26, Table 4.6-17). • The final EIS must clarify whether inhalation risks of particulates and fine particulates were included in the health risk assessment and explain what assumptions were made as to their chemical composition.	AQ6
114	In order to accurately characterize cancer and non-cancer risks from air emissions at the plant and mine sites, the additive risk of amphibole fibers must be included. • Additional testing should be conducted to verify that the grinding process did not interfere with the identification of amphibole fiber length; • The final EIS should estimate inhalation health risks including amphibole fibers. Given the level of uncertainty as to toxicity of the particular fibers found, a "worst case" analysis should be done under a "worst case" assuming that the toxicity of fibers in the NorthMet is similar to asbestos fibers and a "best case" analysis under less conservative risk assumptions.	AQ6

Comment ID	Comment Text	Theme Codes
115	Although inhalation health risks from both the NorthMet plant and the mine site are predicted exceed Minnesota health risk values, the DEIS does not describe any mitigation targeted to reduce cancer or non-cancer human health risks. This is a shocking omission. The final EIS must include mitigation to ensure that emissions from the NorthMet project do not increase health risks above acceptable levels under Minnesota Rules.	AQ5
117	The DEIS does not contain any analysis of health risks to on-site workers. • The EIS must analyze cancer and non-cancer inhalation risks to workers at the mine and the plant.	AQ6
118	The DEIS stresses that point source emissions from the PolyMet NorthMet project are below the 250 tons per year (tpy) “major source” thresholds for the prevention of significant deterioration (PSD) program so that neither technology-based requirements nor limits on incremental pollution apply. (DEIS, p. 4.6-4). This is somewhat misleading. Minnesota rules referenced in the DEIS do not set a 250 tpy threshold for a major source. Under Minnesota law, a major stationary source of pollutants for which a Part 70 permit is required is a facility that emits or has the potential to emit 100 tons per year of any air pollutant (Minn. R. 7007, Subp. 2.B.) In Minnesota, the PolyMet project would be a major source as a result of its point source criteria pollutant emissions alone, including 178 tpy of particulates (PM10), 150 tpy of fine particulates (PM 2.5), 193 tpy of total suspended particulates (TSP) and 102 tpy of volatile organic compounds (VOCs). In addition, when fugitive and mobile source emissions from the mine and the tailings basin are combined with “smokestack” emissions from the plant, the PolyMet project far exceeds even federal major source thresholds of 250 tpy for each pollutant. Mobile source emissions of nitrogen oxides (NOx) from the mine site are projected at 315 tpy, fugitive emissions of particulates (PM10) from the mine site (685 tpy) and plant site (122 tpy) combined are 807 tons per year and fugitive emissions of fine particulates (PM2.5) from the mine and plant site together are 116 tons per year. (DEIS, p. 4.6-10, Table 4.6-5). The Tailings Basin Alternative adds another 96 tpy of PM10 and 11 tpy of PM2.5 (DEIS, p. 4.6-13). The PolyMet will have a major source impact on air quality, especially as a result of particulate emissions. Criteria pollutant totals from the PolyMet project are summarized in the chart below	AQ7
119	The emission of hazardous air pollutants (HAPs) from the PolyMet project may also exceed federal source thresholds for HAPs. As noted in the preceding section E(2), the USEPA has questioned the analysis of HAPs in the DEIS, stating that mobile source toxic emissions must be included to determine whether the project exceeds major source thresholds for HAPs. (USEPA PDEIS Comments, supra, p. 2).	AQ7
120	The PolyMet NorthMet project would be located in a Class II area, rather than a Class I category applicable to wilderness areas. The first air quality analysis is whether the additional pollution from the project exceeds the increment by which pollution is allowed to increase. The DEIS estimates that the PolyMet project, combined with other regional sources will use up 97 percent of the increment in Class II areas for particulate emissions averaged over 24 hours at the mine site (29 µg/m3 of an allowable 30 µg/m3) and 83 percent of the increment at the plant site (25 µg/m3 of an allowable 30 µg/m3). (DEIS, pp. 4.6-13, 4.6-15, 4.6-16, Table 4.6-9).	AQ8
122	The DEIS air quality model included the Peter Mitchell Mine, Mesabi Nugget Phase I, Cliffs Erie Pellet Yard, Laskin Energy Center, and LTV Steel Mining Company emissions. (DEIS, p. 4.6-11). However, as the U.S. EPA highlighted in their comments, this air quality analysis did not consider all current and foreseeable projects. The Mesaba Energy power plant, Mesabi Nugget Phase II and the Keetac Expansion should have been considered in analyzing cumulative impacts on air quality, including Class II increments. (USEPA PDEIS comments, supra, p. 1). It is not clear from the DEIS whether all fugitive and mobile source emissions were included, whether cumulative impacts of the PolyMet project on mine or plant site receptors were considered or whether the increased emissions from the Tailings Basin Alternative were included. In addition to stating that additional foreseeable projects such as the Keetac expansion should not have been excluded from the cumulative analysis, tribal cooperating agencies suggest that modeling of compliance with Class II PSD increments, compliance with NAAQS and MAAQS air pollution standards and cumulative Class I PSD increment analysis failed to include complete particulate emissions from the tailings basin. (DEIS, Tribal Positions, pp. 4.6-40, 4.4- 41, 4.4-42). Since particulate emissions already approach the Class II increment limit, it is likely that if all cumulative sources and project emissions are included in the model there will be insufficient Class II increment to permit emissions of particulates at the levels proposed by PolyMet.	AQ8

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
123	Data on potential exceedances of National Ambient Air Quality Standards (NAAQS) and Minnesota Ambient Air Quality Standards similarly show that standards for particulate will nearly be exceeded, even under DEIS modeling assumptions that may minimize cumulative impacts. Particulate emissions from the plant, combined with background levels of particulates are at 79 percent of allowable limits averaged over 24 hours (118 µg/m <sup>3</sup> as compared to a standard of 150 µg/m <sup>3</sup> ), while fine particulate emissions from the mine, combined with background are at 97 percent of allowable limits (34 µg/m <sup>3</sup> as compared to a standard of 35µg/m <sup>3</sup> ). (DEIS, p. 4.6-17, Table 4.6-10). Again, since particulate and fine particulate emissions already approach NAAQS and MAAQS limits, if all cumulative sources and project emissions are included in air modeling, federal and state air quality standards for particulate pollution are likely to be exceeded. Similar to the Class II increment at the project site, PSD analysis at the nearest Class I location, the Boundary Waters Canoe Area Wilderness (BWCAW) twenty-one miles away, suggests that total cumulative modeled air concentration would consume 94 percent of the increment (7.5 µg/m <sup>3</sup> , out of a PSD increment limit of 8µg/m <sup>3</sup> ) for short term particulate pollution (DEIS, p. 4.6-4). The analysis of particulate (PM <sub>10</sub> ) pollution, like the Class II and NAAQS analysis discussed previously, doesn't include the Mesaba Energy power plant, Mesabi Nugget Phase II and Keetac Expansion and may not include all project emissions from the tailings basin, in particular. If all cumulative sources and project emissions are included in the Class I increment analysis, it is likely that there would be insufficient remaining increment to accommodate PolyMet's increased PM <sub>10</sub> emissions. In addition, despite requests by tribal cooperating agencies for this information (DEIS, Tribal Positions, pp.4.6-16, 4.6-18) the DEIS provides no Class I increment analysis for fine particulates. (PM <sub>2.5</sub> )	AQ8,AQ9
124	Air emissions from the PolyMet NorthMet mine and plant sites have the potential to adversely impact aquatic and terrestrial ecosystems as a result of deposition of pollutants as well as resulting in deterioration of air quality and visibility impairments. Particulates and fine particulates released by the project will contain nano particles of sulfates and heavy metals that may impact sustainable production of nearby forests. (Bruce Johnson DEIS Comments). Particulate emissions may also impact aquatic systems and increase mercury methylation:	EOO
125	Although the DEIS contains some assessment of impacts of air deposition, the analysis does not appear to include particulate or fine particulate deposition, but only sulfur dioxide and nitrogen oxide deposition. (See e.g. DEIS, pp. 4.6-20, 4.6-44). The DEIS also focuses on relatively remote receptors in Class I areas at least 21 miles away or on diffuse ecosystems, discussing the effects of NorthMet acid deposition on a four-county area including Itasca, St. Louis, Lake and Cook Counties. (DEIS, p. 4.6-44). Even without considering particulate depositions and looking at this highly diffuse four-county assessment area, the DEIS predicts that the NorthMet project will increase sulfur dioxide emissions by 6 percent and nitrogen oxides by 12 percent. (DEIS, p. 4.6-44). It should also be noted that while coal plant pollution controls may cushion the impacts of NO <sub>x</sub> and SO <sub>2</sub> increases, particulate pollution is increasing throughout the region. (DEIS, p. 4.6-53).	EOO

126	<p>The misplaced advocacy in the DEIS against a finding that the NorthMet project is a major source increases suspicion that air quality modeling may fail to include appropriate inputs in order to attain a desired outcome. The final EIS must both revise its air quality analysis and provide greater transparency on sources and levels of emissions in order to dispel this concern, as follows: • Provide transparency regarding all project emissions sources, including specification of volatile organic compounds and total suspended particulates from mobile and fugitive sources and specification of the tons per year for hazardous air pollutants. Provide transparency and include in air quality modeling (Class II increment, Class I increment and compliance with NAAQS and MAAQS) all emissions from the mine and plant, including mobile and fugitive source emissions, additional emissions from the Tailings Basin Alternative and cumulative impacts from one project site to receptors at the other project site; • Revise modeling of compliance with/exceedance of Class II and Class I increments and federal and state air quality standards to include cumulative impacts of all current and foreseeable projects, including but not limited to the Mesaba Energy power plant, Mesabi Nugget Phase II and the Keetac Expansion; • In addition to the above revisions, calculate PSD Class I increment for fine particulates (PM<sub>2.5</sub>); • Revise calculations of light extinction and visibility impacts at the BWCAW based on inclusion of all project emissions and cumulative impacts of current and foreseeable projects; • Assess the chemical composition of particulate and fine particulate emissions from the mine site and plant site, including levels of sulfates and heavy metals; • Analyze the effects of deposition of particulates and fine particulates in aquatic and terrestrial ecosystems and the cumulative impacts of particulate, sulfur dioxide and nitrogen oxide deposition. • Base the analysis of deposition effects on areas of predicted highest deposition, in addition to a remote Class I or a diffuse multiple-county analysis.</p>	AQ4,AQ8,AQ9
127	<p>The PolyMet NorthMet DEIS contains an appropriate definition of environmental justice, but a glaringly insufficient and inappropriate analysis of this issue, in conflict with applicable law. Environmental justice requires that no group of people, including racial, ethnic, or socioeconomic groups, should bear a disproportionate share of the negative environmental consequences resulting from industrial operations, such as the PolyMet mine and processing facility. Executive Order 12898 directs federal agencies to make achieving environmental justice part of their missions by identifying and addressing disproportionately high and adverse effects of agency programs,</p>	SE2
128	<p>The DEIS discussion of environmental justice is brief and laughably inappropriate, addressing primarily the Native American population census of St. Louis County as compared to the Native American population census for the State of Minnesota, rather than the actual impacts of the PolyMet project on property rights, health, or natural resources that are of significance to the culture and social and economic well-being of Indian tribal members. (DEIS, pp. 4.10-14 to 4.10-15). Based on this narrow and contrived analysis, the DEIS then concludes: The Project was evaluated for effects relating to the social, cultural, and economic well-being and health of minorities and low-income groups through a review of socioeconomic and demographic data compiled from the 2000 U.S. Census. Such effects are termed environmental justice issues, and none were identified for the Project. (DEIS, p. 4.10-14) The EIS must start over and provide an environmental justice analysis sufficient to comply with Executive Order 12898 and applicable civil rights laws. The environmental justice analysis should include evaluation of the disparate impacts of at least the following adverse environmental impacts of the project on Indian tribes, minority and low-income communities.</p>	SE2
129	<p>Indian tribal members, a protected population under civil rights laws and environmental justice analysis, are the only individuals directly and adversely impacted by loss of usufructuary rights in the 1854 Ceded Territory due to the potential transfer of Superior National Forest land to the PolyMet Mining Company. Although the DEIS suggests that the land to which Chippewa Tribes have rights will be exchanged for other land in the Ceded Territory, (DEIS, p. S-18), the DEIS neither identifies the land to be exchanged nor demonstrates that its size and functional value to the Tribes will be at least equal to that of the 6,700 acres lost. Unless the final EIS contains a detailed environmental analysis (including cultural as well as economic and environmental values) demonstrating that specific land to be exchanged for the PolyMet site creates no such adverse effect upon the Tribes, the project is discriminatory in its effect and creates a disparate adverse impact upon the Tribes.</p>	SE2,PD2,G3,CR1,CR3,CR4

130	The DEIS acknowledges that at least 1,222 acres of wetlands would be directly or indirectly impacted at the mine site (DEIS, p. 4.2-9). None of these wetlands are planned to be replaced in the Ceded Territory; even replacement on the mine site will no longer be within Ceded Territory once the land exchange is completed. Loss of wetlands and the cultural, social and environmental benefits they provide, will disproportionately impact the Ceded Territory to which only Indian Tribes, and no other populations have distinct rights. Since a substantial majority of the wetland acres lost as a result of the PolyMet project are within the Ceded Territory, under the current wetland replacement plan, loss of wetlands creates a substantial and unmitigated adverse impact on Indian Tribes.	WE3,WE5,SE2,G3,CR1,CR
131	Although the DEIS analysis is incomplete, it is clear that seeps and discharge from the mine and plant, local deposition of mercury emissions, sulfate mobilization of methylmercury and hydrologic changes are likely to increase the mercury contamination of fish tissue. The EIS must analyze the degree to which increases of mercury in fish tissue impact tribal waters and fisheries and the degree to which increased mercury in fish throughout the St. Louis River and Lake Superior Basin watersheds disproportionately impact Indian tribal members, other minority communities and low income persons. This analysis should address, as did proceedings to establish the Minnesota Statewide TMDL, the particular impacts on people who fish for subsistence and to whom the ability to fish for subsistence has cultural as well as social and economic significance.	WR4B,WR5C,SE2,FM1,AQ
132	Although the DEIS and Tribal Positions reflect disputes as to the degree to which wild rice will be impacted in the Partridge, Embarrass and St. Louis Rivers (See Section B(7), supra) some level of impairment is virtually certain. Any impairment of wild rice creates an environmental justice concern, since Indian tribal members gather rice at a rate greater than their census numbers and since impairment of wild rice harvests is likely to have a greater adverse impact on Indian cultural, social and economic well-being. Statewide, the DEIS acknowledges that more than 3,000 tribal members participate in wild rice harvesting statewide along with about 1,500 non-tribal individuals (DEIS, p. 4.1-44, citing MnDNR 2008). It is obvious that the rate participation in wild rice harvest is far greater for tribal members, who represent only 1.2 percent of the population in Minnesota. (DEIS, p. 4.10-14). In addition to analyzing compliance with 10 mg/L sulfate standards in wild rice waters, the final EIS must analyze environmental justice impacts of impairment of wild rice.	WR4F,WR5C,SE2
133	The DEIS has begun a more comprehensive analysis of the impacts of the project on natural resources and species of importance to Indian tribes. For each adverse impact, an environmental justice analysis is required, since “any impacts to natural resources will disproportionately affect tribes due to their subsistence consumption of wild rice, fish, and other wildlife within the 1854 Ceded Territory.” (DEIS, Tribal Positions, p. 4.10-15) In addition, since data in the DEIS suggests that the City of Hoyt Lakes has a higher percentage of families below poverty level and a lower percentage of persons in the labor force than the State of Minnesota as a whole (DEIS, p. 4.10-4, Table 4.1-06), specific potential adverse impacts to Hoyt Lakes, such as violation of water quality standards in Colby Lake, must be analyzed from an environmental justice perspective. The fact that persons in an economically depressed area might be willing to accept health risks if jobs are promised is precisely why an environmental justice analysis adverse impacts on low-income communities.	SE2
134	Without citing any references, the DEIS suggests only negative social and economic outcomes from the No Action Alternative, including declining employment, population decline, underutilized housing and aging population. (DEIS, p. 4.10-21) The DEIS fails to reference economic gains in St. Louis, Itasca and Lakes Counties over the past decades despite reduction in mining employment due to mechanization. See Thomas M. Power, <i>The Economic Role of Metal Mining in Minnesota: Past Present and Future</i> , October 2007, “Power Report,” pp. iii-v, 22-28) The DEIS also does not address adverse social or economic consequences of the risk that project could create an unfunded Superfund liability for taxpayers, as other mining projects across the nation historically have done.	SE1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
135	Missing from the DEIS analysis is any acknowledgement of the boom and bust cycle of extraction industries in Minnesota and the adverse social and economic impacts associated with the cycle once ores that can be economically extracted and processed are used up. Research pertaining to Northern Minnesota documents repeated booms and busts in the mining industry, leading to community instability and long-term decline. From 1979 to 2005, 83 percent of the iron jobs in Minnesota were eliminated, while 80 percent of the nation's copper mining jobs disappeared between 1972 and 2002. (Power Report, supra, pp. ii, 6, 7, 29). Price volatility affects the decline cycle. When metal prices are high, lower grade deposits are brought on line, adding to supply and moderating price increases. In a global market, poorer nations also attempt to secure mining jobs, displacing American sources. In addition, technical change steadily displaces labor with more powerful equipment and new electrochemical processes, resulting in a smaller workforce even for the same amount of ore extraction. Although mining inevitably depletes economically viable ores in a relatively short period of time, the process of extraction and processing creates relatively permanent environmental damage. (Power Report, supra, pp. ii, 6, 7). The EIS must assess the adverse impacts to local communities of the bust cycle, when population and payroll drop due to temporary shut-downs or inevitable closure. (DEIS, Tribal Positions, p. 4.10-14)	SE3
136	In correlating a "no action" alternative with adverse consequences, the DEIS also fails to analyze the actual economy of Northern Minnesota and its reliance on sectors of the economy that depend on residential preference and, thus, indirectly on environmental amenities, as well as tourism and recreation, that depend directly on environmental quality. Mining related income is only a small percentage of earnings in Northern Minnesota and the growth of other sectors of the economy has provided sources of income many times larger than the loss of the iron industry payroll. (See Power Report, supra, pp. iii, 10,11, 22-23, 25) The EIS must acknowledge negative economic and social impacts to local communities if natural resources are lost or damaged due to the project. (See DEIS, Tribal Positions, pp. 3-50, 4.10-14).	SE4
137	Finally, the DEIS fails to analyze the price assumptions on which both the opening and continued operation of the project depend. This is not an academic inquiry. Interest in the project was, no doubt, spurred by the quintupling of copper prices from 2001 to 2006, rising from about \$0.75 per pound to about \$3.80 per pound. In the 1970's, a similar sharp increase in copper prices spurred interest in development of Minnesota's copper ore deposits, but copper prices fell in the early 1980s and copper mines shut down nationwide rather than opening in lower-grade Minnesota deposits. (Power Report, pp.1, 5). Recent economic recession and predicted economic factors that might lead to the intermittent operation, early shut down or failure to fund adequate reclamation and post-closure activities if the project were to move forward should be analyzed in the EIS.	SE3
138	The final EIS should include adverse economic and social impacts of the project and potential benefits of the no action alternative, considering the following: • Information on Minnesota's mining industry, including historical and reasonably predictable cyclical "boom and bust cycles; • Analysis of the regional economy's current reliance on perceived environmental amenities, including tourism, recreation and industries such as health and finance which may be located based on residential choices; • Analysis of the adverse economic and social impacts of population and payroll loss when mining activities stall or cease, or resulting from mechanization, including impacts on unemployment, demand for social services, and tax revenues required to fund social services. • Analysis of the price structure needed to support opening of the PolyMet mine and processing facility, maintaining operations and salaries and funding closure and post-closure treatment and reclamation. • Analysis of the potential public economic risk that unfunded closure and post-closure reclamation and pollution remediation costs would become a burden on taxpayers.	SE3

Comment ID	Comment Text	Theme Codes
139	<p>WaterLegacy shares the concern raised by tribal agencies that the underground alternative was prematurely eliminated, even though it would pose less harm to high quality wetlands and may be less damaging to water resources. (DEIS, p. 4.2-25). As stated by the tribes: It is the position of the tribal cooperating agencies that this alternative was eliminated prematurely and without sufficient consideration. . . The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative. (DEIS, p. 3-64) An EIS is deficient if alternatives to the project are not adequately set forth and discussed: A rigorous exploration and objective evaluation of the environmental impacts of all reasonable alternative actions, particularly those that might enhance environmental quality or avoid some or all of the adverse environmental effects, is essential. Sufficient analysis of such alternatives and their environmental benefits, costs and risks should accompany the proposed action through the agency review process in order not to foreclose prematurely options which might enhance environmental quality or have less detrimental effects. <i>Nelson v. Butz</i>, 377 F. Supp. 819, 823 (D. Minn. 1974), citing <i>Environmental Defense Fund, Inc. v. Froehlke</i>, 473 F.2d 346 (8th Cir. 1971). The final EIS must include a rigorous and objective exploration of the underground alternative, including but not limited to: • Characterization of the ore body depth, location and quality, including disclosure of the nature of resources that would not be extracted under either an underground or an open-pit method of extraction; • Independent analysis of the feasibility of underground mining, considering all costs of operation, maintenance, pollution prevention and remediation during mine operations, closure and post-closure under a range of reasonable assumptions regarding commodity pricing; • Detailed discussion of the ways in which an underground mining alternative would mitigate environmental impacts on wetlands, water quality, aquatic ecosystems, endangered species and emissions of particulates and hazardous air pollutants at the mine site as well as ways in which an underground mining alternative would affect the need for perpetual maintenance and treatment of water quality impacts post-closure.</p>	SE4,PD1,CR1
140	<p>Since the DEIS models minimize the risk of water quality exceedance, the need for additional mitigation of acid drainage and leachates is not readily apparent. However, in light of real world experience with drainage from sulfide mines, a robust and comprehensive range of additional mitigation measures to reduce water quality impairments is required in the EIS. The failure of the PolyMet NorthMet DEIS to consider even mitigation alternatives identified in the Final Scoping Decision undermines both the process and substance of environmental review. The suggestion in the DEIS that basic measures to protect water quality can be eliminated from consideration due to cost is inappropriate under applicable law.</p>	WR1E
141	<p>In the PolyMet NorthMet DEIS, several of the most obvious mitigation measures are rejected out of hand without analysis. Feasible and prudent alternatives that could protect public health and natural resources are prematurely eliminated or never considered.</p>	ALT8
142	<p>The final EIS must analyze in detail a robust and comprehensive range of mitigation measures to prevent waste rock, peat and overburden from contaminating groundwater and surface water and increasing mercury methylation at the mine site, including but not limited to the following: • Construction of a level and compacted platform or pad with no unsealed fractures of underlying rock surfaces prior to placement of either overburden or waste rock; • Treatment of all overburden and waste rock as reactive materials unless a protocol of small batch continuous testing has demonstrated that certain portions are non-reactive; • Use of liners under all waste rock (including Category 1 rock) stockpiles and overburden stockpiles at all times, whether or not some rock may be removed at a future date for subaqueous or off-site disposal. Such liner systems must have compacted soil liners at least three feet thick; • Use of enhanced liner systems with enhanced thicknesses and resistance to tearing and liners with leak detection systems; • Use of non-permeable liners and cover systems, including geomembranes, to prevent water infiltration on overburden and waste rock; • Collection of drainage from all waste rock and over burden facilities, including peat and unsaturated overburden stockpiles and treatment of such drainage at a wastewater treatment facility.</p>	WR1E,WR2D,WR3I

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
143	In the Final Scoping Decision, the Minnesota Department of Natural Resources (MDNR) and the U.S. Army Corps of Engineers (USACE) proposed an alternative to address the potential reactivity of the NorthMet tailings, suggesting that PolyMet develop a lined tailings storage facility at the existing LTVSMC to provide storage for five years of tailings while collecting data to determine if the tailings were reactive. If during this five-year period the tailings were determined to be non-reactive, an unlined tailings basin could be constructed and, if the tailings were ultimately determined to be reactive, Cells 1E and 2E would be lined for the entire life of the operation to prevent reactive runoff from seeping into the ground and surrounding environment, while any discharge would be monitored and, if necessary, directed to a wastewater treatment plant for appropriate treatment prior to release. The DEIS reflects that the January 2007 revised project description, arrived at with no public process or public review, removed the proposed lined tailings storage facility from consideration. (DEIS, p. 2-4). This striking change in scoping behind closed doors is inconsistent with public participation under both NEPA and MEPA.	PRO2
144	The failure to consider mitigation alternatives for the tailings basin or for disposal of hydrometallurgical waste is a fatal flaw in the DEIS. The final EIS must include mitigation of the risk of water pollution and failure of embankments at the tailings basin and the hydrometallurgical waste disposal facility, including at least the following: • Construction of the tailings basin and the hydrometallurgical waste disposal facility on a site or sites that are not already contaminated and seeping pollution into groundwater; • Construction of the tailings basin and the hydrometallurgical waste disposal facility on a site that has a secure geologic foundation, not peat, slimes or bog; • Construction of embankments for the tailings basin and the hydrometallurgical disposal facility out of inert and structurally sound material that will provide no additive sources of solute loadings, rather than LTVSMC coarse tailings; • Use of enhanced liners for the tailings basin, including geomembranes to reduce infiltration of any non-ponded area, if saturation is proposed to reduce acid and leachate formation; • Use of dewatering and thickening of tailings to reduce volume, drainage and stability concerns; • Construction of the hydrometallurgical residue disposal facility to prevent migration of constituents into groundwater or surface water, consistent with best practices for disposal of hazardous wastes, including double liners, a leak detection, collection and removal system, a cover system, a system for control of run-on and runoff, an inspection plan and treatment and disposal of any collected runoff and leachate.	ALT8,WR1E,WR2D
145	The final EIS should discuss mitigation measures for both the east pit and west pit that include the following: • Sealing of major fractures that would result in seepage to groundwater or the surficial aquifer from either pit. • Filling either or both pits with waste rock, overburden and non-reactive materials, capping the pit with a low-permeability cover to reduce infiltration and collecting and treating drainage. (Eliminating the east pit constructed wetland and/or the west pit lake). • In any alternative where a pit lake is constructed, providing specific in-pit water quality treatment and pumping of pit lake water through the wastewater treatment facility to reduce sulfates, mercury and other contaminants.	ALT8,WR3I,WR3L
146	The final EIS must include mitigation measures based on the premise that all water that will be discharged, seep or leak from the mine site or tailings basin should be treated so that it meets both groundwater and surface water quality standards and so that its release does not increase sulfate in wild rice waters. Mitigation alternatives that should be evaluated in the EIS include the following: • Construction of a wastewater treatment facility at the plant site as well as the mine site. • Capture, pumping and treatment in a WWTF of the following additional flows: seeps pumped from the tailing basin before either recycling or discharge to the Partridge River, seepage flowing south from the tailings basin to Second Creek, any overflow or standing waters from the east or west pit, seepage from waste rock stockpiles, including permanent stockpiles of Category 1 rock and overburden. • Providing sufficient WWTF capacity and treatment methodology to reduce sulfate through nanofiltration, filter mercury and achieve targets for all chemicals of concern that meet groundwater and surface water quality standards.	WR1E,WR3A,WR3I

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
147	The final EIS must include alternatives to prevent exceedance of health risk values from air pollution and to reduce emissions, including emissions from fugitive and mobile sources, to accomplish at least the following objectives: • Reduce both cancer and non-cancer inhalation risks to human health at the plant and the mine site below health risk values, including significantly reducing diesel emissions. • Reduce emissions of particulates, fine particulates and nitrogen oxides through analysis of best available control technology in all mining activities, mitigating acid deposition and ensuring compliance with all Air Quality Standards and Class II and Class I prevention of significant deterioration limits. • Reduce cumulative mercury emissions increase from the plant, in light of mercury emissions increases in the minerals processing sector and the local watershed area.	AQ4B
148	The final EIS must evaluate mitigation of these impacts including the following: • Replacement of wetlands directly and indirectly impacted by the project with a) wetlands sufficient to meet legal replacement standards without a deficit; b) wetlands that provide equivalent resources to tribes and are within Ceded Territories; c) wetlands that provide the same functionality within the St. Louis River and Lake Superior Basin watersheds. • Specific steps to preserve endangered plant species, particularly those where project activities may impact a substantial proportion of State populations; • Specific steps to preserve and replace, contemporaneous with any impairment, critical habitat and wildlife corridors for endangered species that will be impacted or disrupted by the NorthMet project and other cumulative foreseeable activities. If mitigation measures cannot be taken to avoid impacts, whether on water quality, air quality, human health, wetlands or plant and animal species, the EIS must identify resulting effects as irretrievable and irreversible commitments of resources. It must be emphasized that the purpose of an EIS under both federal and state law is to identify what mitigation would be needed to prevent a proposed federal or state action in permitting a project from resulting in pollution, impairment or destruction of human health and natural resources. If the economics of extraction of ores from the NorthMet deposit don't permit basic mitigation measures, such as building a lined tailings basin on a solid foundation, treating discharges to remove sulfates and heavy metals, mitigating water and air pollutants that impair human health and violate standards and replacing impacted wetlands, either PolyMet has created overly inflated expectations in its investors or the NorthMet site has an inadequately rich deposit to permit exploitation. Part of the function of a properly written EIS is to assist project proponents in making the calculation of whether they can "do the project right" and protect the environment. If investors cannot reduce their profits or commodity markets cannot support high enough metals prices to justify mining this deposit under environmentally protective conditions, this project should go no further.	WI5,WE3
149	• Cumulative impacts on air quality, water quality, mercury loading, Class I and Class II increments of current and foreseeable actions including but not limited to the Mesaba Energy power plant, Mesabi Nugget Phase II, the Keetac Expansion Project and the Essar Steel Expansion Project;	WR5A,AQ4B
150	• Cumulative impacts of the LTVSMC tailings and other contaminated areas of concern in considering both the instability of NorthMet tailings and hydrometallurgical residues and the impacts on water quality;	PD8
151	• Cumulative impacts to wetlands, tributaries, the Partridge and Embarrass Rivers, to Colby Lake and the Whitewater Reservoir considering current water quality concentrations and exceedances, groundwater drawdown or mounding due to multiple mine projects in aquifers impacted by historical and existing mine projects;	WR5A,WE5
152	• Cumulative impacts on the Partridge, Embarrass and St. Louis Rivers including all flow paths from contaminants and all loadings from nonpoint sources and air deposition;	WR4A,WR5A,AQ4B
153	• Cumulative impacts on St. Louis River and Lake Superior Basin watershed of groundwater and surface water quality degradation, loss of wetlands, deposition of air pollutants, changes in cover and hydrologic changes resulting from historic, current and reasonably foreseeable mining and minerals processing activities;	WR5A,WE5,AQ4B
154	• Cumulative impacts on mercury in fish tissue of mercury point and nonpoint discharge, sulfate discharge, air deposition of mercury and sulfur compounds, hydrologic changes, peat disruption and stockpiling from the NorthMet project and historical, current and reasonably foreseeable actions;	WR5A,WR5C,FM3,AQ4B,

155	• Cumulative impacts to wild rice from sulfate throughout the watershed and from hydrologic changes;	WR5A,WR5C
156	Cumulative impacts of loss of wetlands and wetland functionality throughout the St. Louis River watershed, the Lake Superior basin and the Ceded Territories, as well as in the Partridge River watershed;	WE5,CR1
157	Climate change implications of the proposed project, considering disruption of extensive areas of peat;	WE2
158	Cumulative impacts to plant and animal species that are not listed as threatened or endangered, including species such as moose that are important to tribal and non-tribal members would likely be impacted by mining projects;	WI5,G3,CR1,CR4
159	Cumulative effects on fish and macroinvertebrates, including habitat degradation and local emissions from deposition of mercury, sulfur dioxide, nitrogen oxides and particulates, and discharge to waters of sulfates and metals including mercury, nickel copper and cobalt;	WR5C,FM3,AQ4B
160	Cumulative impacts on wildlife corridors and habitat fragmentation for endangered species including historical, current and reasonably foreseeable development, including mining and minerals processing;	WI5
161	Cumulative impacts on human health, deterioration of air quality and violation of air quality standards of all NorthMet air emissions sources, including mobile source and fugitive air emissions of particulates, fine particulates, criteria pollutants and hazardous air pollutants;	AQ4B
162	Cumulative effects of noise, vibration, and visual impacts on members of the public, including tribal members;	EOO,N3
163	Cumulative environmental justice impacts of loss of usufructuary rights to Ceded Territory in the Superior National Forest, impacts on wetlands in Ceded Territory, mercury increases in fish, impairment of wild rice and wetlands in combination with other projects impacting tribal rights and resources;	SE2,G3,CR1,CR4
164	Cumulative impacts on wetlands, wildlife, water quality and social and economic concerns should be assessed for however long impacts would occur. In the case of wetlands, water quality and wildlife, impacts could occur for hundreds or thousands of years or could be permanent.	WR5A,WR5C,WI5,WE5
165	Prior to the final EIS, in addition to addressing flaws in resource-specific areas, it is strongly recommended that the DEIS reconsider the purpose of cumulative impacts analysis. The DEIS appears to conduct cumulative impacts analysis from the perspective of the project proponent. Cumulative actions are used to justify project pollution and suggest that prior or possible reductions in pollution by other sources could prevent the project from having a significant impact. (See DEIS, p. 4.14-4, discussing SO <sub>2</sub> and NO <sub>2</sub> deposition) or to assert that potential harm to the environment may be someone else's fault, for which another source is "culpable." (See DEIS, p. 4.1-120, 4.1-161, discussing impacts on Embarrass River water quality).	G8C
166	For all the reasons stated previously in these comments, the PolyMet NorthMet draft environmental impact statement is inadequate and insufficient. It appears to have been written to justify and promote the PolyMet NorthMet project, rather than to assess its environmental impacts and the cumulative impacts of this proposed project and other regional mining and minerals processing on the Superior National Forest, the Lake Superior watershed, human health, tribal rights and natural resources. Federal law specifically prohibits the use of an EIS to promote a project, "Environmental impact statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." (40 CF.R. §1502.2 (g))	G10
167	The final EIS for the PolyMet NorthMet project must accurately and objectively apply the law, analyze the data, make appropriate modeling assumptions and assess cumulative impacts to determine the degree to which the project would result in violation of standards and regulations, pollution impairment and destruction of the environment and irreversible commitment and loss of natural resources. Any lesser analysis is legally as well as scientifically and morally insufficient.	G10
353	This letter is submitted on behalf of WaterLegacy, an organization founded to protect Minnesota water resources and the communities who depend on them. WaterLegacy has concerns about the PolyMet copper sulfide-mining project, the adequacy of the draft environmental impact statement DEIS and the adequacy of the current public meeting process.	G10

3794 Mr Arkley, I would like to express my current opposition to the Poly Met copper mining project. The risks involved in non ferrous mining of the type proposed and evaluated by the DEIS are too great. Northeastern Minnesota is unique in its pristine environment. We draw our drinking water from the lakes and aquifers with no fear of chemical contamination. How we move forward with this project will be judged and debated for generations. Has there ever been a sulfide mining project that did not contaminate surrounding watersheds? How can we justify the contribution of more "greenhouse gasses"? How can we answer the generations to come when they ask us how we could have offered the pristine water up for sale? The questions are endless. As long time residents of the the rural Ely area, we are aware of the need for economic stability and growth. The possibility of 400 jobs is enticing to say the least, however, without a guarantee of safety for our drinking water and air quality the price of those jobs is just too high. Provide examples of safe, successful mining operations. Our neighboring state of Wisconsin has determined that the price of sulfide mining is too high and called a moratorium on this type of operation. We need to follow their example. Thank you, Tobi Mackey

741 Wait a minute!! 60 days isn't nearly enough time to adequately review and judge the contents of the this EIS. Please give more time: at least an additional 45 days for review and comments; please add more public meetings to the current schedule so that more people will be able to participate; and please ensure the all public meetings be open, and allow for the public to speak and weigh in on the proposed plan. Discussion is vital to ensuring that all sides of the proposal are examined carefully, and the consequences of this proposal, both intended and unintended, are considered. Thank you, Sarah Madrid

1 The DEIS is premature. The DEIS should not have been released until the required land exchange between U.S. Forest Service and public PolyMet has been completed. The DEIS is required to examine all potential environmental impacts associated with the project. The land exchange may well introduce substantial impacts and these may, in turn, interact with other aspects of the project which should be examined in the DEIS.

2	The DEIS is incomplete. 3(a): The DEIS does not address the need for financial assurance or identify the project components for which financial assurance is necessary. Inadequate financial assurance can have profound environmental impacts extending over centuries. Financial assurance should be addressed in the DEIS rather than postponed to permitting decisions for which different regulations may apply. As quoted by the Tribal Cooperating Agencies, quote, "New national rules for financial assurance are under development by the EPA because, given the history of adverse environmental effects resulting from some hard-rock mines and the expenditure of public funds used in some cases to address environmental problems -- problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS." And this is from the insideEPA.com, Tuesday, August 25th, 2009. The DEIS fails to identify the post-closure treatment, such as wastewater, at the mine site and may have to continue for centuries. Financial assurance for such eventualities must be addressed in the DEIS.	ALT3,PD4,GT2
3	Number 1: The process for securing public comments, including the hearings of December 9th and 10th, is fundamentally flawed. 1(a): The comment period should be extended to at least 120 days as recommended by the EPA, among others. The DEIS is 700-plus pages and supporting documents run to several thousand additional pages. The intent of public comments is to secure widespread citizen input. Citizens' groups such as NMW are fairly limited in submitting comments by the enormous burden on volunteers required to respond to thousands of pages of technical presentation.	ALT3,PRO6,PD3,PD4
4	The process for obtaining public comments at the hearing is contrary to EPA intentions. Comments are intended to be public. Citizens should have the opportunity to hear and to learn from the comments made by others in a public forum and to have their own views challenged by others. The process adopted by DNR/USACE precludes these opportunities. Additional hearings should be scheduled and should include the opportunity to present views in a public forum and to challenge the views of others as part of the process.	PRO6,G9

56	3c. The DEIS fails to adequately address a number of potential environmental impacts. These include the likelihood of structural failure at the tailings facility, the lack of structural integrity information for the proposed stockpiles, and the need for perpetual water treatment to avoid contamination to surface and groundwater resources. Structural stability of the tailings basin has been a serious concern since the Polymet project was first proposed. Three different tailings basin designs that have been presented in various draft documents. Reviews of these designs have expressed serious concerns with both the short-term and the long-term stability of the facility. A comprehensive analysis of the structural integrity of the latest tailings basin design must be included in the DEIS.	PRO3
57	3d. The DEIS fails to address existing environmental problems at the mine and processing sites. Problems at the LTVSMC Tailings Basin must be adequately addressed through PolyMet's assumption of remedial liabilities under the VIC program, and mitigation measures should be included and discussed in the DEIS.	PRO3
58	4) Data for analysis are often insufficient or absent. Analytic techniques are used inappropriately. Models are used inappropriately in the Project and rely on invalid data and assumptions. The MODFLOW model was developed to assess rates of mine pit inflow. Reported results are invalid for areas outside the mine pit footprint. The XP-SWMM model is based on stream gage data that is 17 miles from the proposed project and is 20 years old. DEIS modeling forecasts that the more PolyMet seepage released from the tailings basins, the better the water quality will be for Al, Mn and Fe in the Embarrass R iver. This incongruous result occurs probably because modeling at the basins does not appropriately account for leaching from the LTVSMC tailings when predicting future seepage quality.	PRO3

690	- Analysis of all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources.	WI5,WE8
1147	The existing inadequate showing by PolyMet Company that their waste rock and tailings piles will not collapse and dump uncontrolled pollution into nearby waters, causing potentially catastrophic water pollution.	GT2
2221	The inadequate information in the DEIS regarding the scope and extent of potential pollution, including detailed information regarding water flow from the affected areas.	WR1A
2416	As the U.S. EPA suggested, making sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.	PD4
2417	- absence of a detailed reclamation plan which is tied to the required financial assurances. - unacceptable prediction in the existing DEIS that water pollution from the proposed mine could possibly last 2,000 years	WR3I,PD3
2418	The failure to analyze the land that is going to be exchanged for Superior National Forest land to make this project possible.	PD1
3139	Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, increase air pollution that results in regional haze and create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs.	G2C,G4A,G7A

283	I am writing to you in support of the PolyMet Mining project. I am the Chapter Manger for the Twin Ports Arrowhead Chapter ofNECA which represents union electrical contractors in northern Minnesota who employ union employees. This project will help the Iron Range local economy by providing jobs at a time when they are needed the most. Not only will this project provide jobs for the construction workers on the project but it will hopefully allow people in the Hoyt Lakes and surrounding area's a chance to regain employment lost from the shutdown of LTV. A project to of this size will also provide significant tax dollars on a local and state level. It is my understanding that this project will be done under the strictest of environmental regulations to protect both air, water and land. The PolyMet project will be reusing not only the existing site but the current existing infrastructure as well as minimizing any disturbance of wetlands to help protect the environment. I support the construction of the PolyMet project, and I would hope that DNR would look at supporting this project as well.	EOO
<b>Sender Last Name:</b> Makannak		<b>Submission ID:</b> 1159
1274	PolyMet's plans for sulfide mining in the region from Hoyt Lakes to the edge of the Boundary Waters Canoe Area is a lose-lose situations for this irreplaceable region. Even if PolyMet does guarantee, before the mining begins, enough money for a damage deposit to cover clean-up costs when they are finished, will their financial assurance be sufficient to restore the area to its previous pristine state? My most serious concern is can the area be restored to its pristine state ever again even if the financing is available?	PD3,G4A
<b>Sender Last Name:</b> Maki		<b>Submission ID:</b> 231
238	Give Polymet their Permit. We can go on and on letting people make rules on the fly. They have met the requirements existing on the books. The government agencies have done their job and know way more then "Joe Public" knows about the project. They have followed "due process" and deserve to be given their permits. Thank you,	G6
271	As a resident and business owner in Hibbing, MN, I am writing to express my support for the Polymet Mining Corporation project. As a financial advisor in an area that has been hit hard in the past 18 months by the decline in the steel industry, I would be remiss if I did not reach out at this time to make known the importance of this project to our local region. As a business owner in the financial sector, I continually strive to run my business in a manner that supports the local economy. Without any solicitation whatsoever, my clients have continually requested that portions of their dollars be invested in Polymet Mining Corporation (PLM). It is nothing less than inspirational to see the hope and support that has been generated by this project so far. It is my understanding that Polymet will produce the copper, nickel, platinum, gold and cobalt in an environmentally sound manner and generate significant economic activity in this depressed part of Minnesota. In addition, it will provide millions of dollars in local and state taxes that will, in turn, give a boost to our communities and educational systems. It is my request that you make every effort to see the Polymet Mining Corporation project through to completion.	EOO
290	We are writing, as Iron Range business owners, to support PolyMet's mining and production efforts. The lengthily environmental review process that PolyMet has gone through, with both the Federal and State regulatory agencies has not only been thorough but offers the potential environmental impact and how to mitigate it. PolyMet has proved that they will mine and produce copper, nickel, platinum, palladium, gold and cobalt in an environmentally sound way. Income generation to the potential 400 employees plus hundreds of spinoff jobs will not only lift up the depressed state of the Iron Range but it will provide millions of dollars in local and state taxes. All the affected areas need this type of financial boost in order to support the communities and educations systems. It is very clear that the people of PolyMet are Minnesotans committed to living, playing and protecting our state's environment. We cannot ask for a better business model in our state, at this time, at this place and in our state's future.	EOO

2110	I have written to Senators Klobuchar and Franken expressing my concern, please contact them for additional comment. As a resident of SE MN, which has no lakes, my family cherishes the Boundary Waters and requests that the tourism industry we support not become decimated by the quest to employ a few hundred Minnesotans at the expense of an entire industry, and one of Minnesota's greatest natural resources.	G11,G15
<b>Sender Last Name:</b> Mangold		<b>Submission ID:</b> 3458
765	My opinion is that Polymet should be granted a permit to mine given the following considerations: 1.Adequate monies need to be in a government controlled fund to address any environmental issues that arise during operation that requires clean up and/or correction and any clean up issues that arise after operation. Adequate profits will be made by the corporate owners to fund this fund. 2.Polymet should be held to very high environmental standards. "Raise the bar" by the required application of the current and new technology. 3.The water runoff and any discharge water from operations must be consistently well within acceptable levels that do not impact downstream. It must be essential that the quality of water that comes out must be as good as the quality that went in. 4.The appropriate government agencies must uphold the environmental requirements and not "cave in" to corporate pressure. They have a responsibility to the public. There will be adequate profits made by the corporate owners to fund any issues properly. 5.Any issues with methyl mercury and any water quality discharge issues that are currently present from operations of LTV/Cleveland Cliffs should be dealt with by these entities and they must be held to very high standards and the government agencies must not "cave in" to pressure. Cleveland Cliffs has already made millions of dollars of profit from the purchase of the LTV operation.	EOO,PRO1,PRO3,G4A,G5,

1596 Sheet Metal Workers' Local Union #10 supports the Polmet Project in Northeastern Minnesota because it will create quality jobs and boost the Iron Range economy. The \$600 million project will require 1.5 million hours by 300 construction workers over two years. The economic activity associated with the operation of the plant will create 400 full-time jobs and an additional 500 spin-off jobs in the region as money circulates through our communities. In particular, the ongoing maintenance of the plant will regularly employ many local people in the construction trades. Additionally, the plant will generate significant property tax revenue for the county. Investing billions of private money on the Iron Range will provide big economic benefits for regional households and governments. Rather than outsourcing quality jobs to other states and countries with weak environmental regulations, it is better to construct this plant that will serve Minnesota in Minnesota. Therefore Sheet Metal Workers' Local Union # 10 and other unions in the state support the construction of the Polymet Copper Nickel Mining Project, which will provide significant environmental improvements. With all of the employment and economic benefits associated with the Polymet Project, Sheet Metal Workers' Local Union # 10 strongly supports approval of the Polymet Project.

3818 As you walk through day to day life you see common folks lost and hopeless, many without a job. This is the what has happened thanks to the current economic conditions. Jobs are what this country needs more than anything else, more than stimulus money, more than another unemployment extension, more than a free hand out. Allowing the PolyMet Mining Co. to move forward with their Hoyt Lakes construction project can create 300-400 new full time jobs, 500 spin off jobs in related surrounding industries, and 1000-1500 part time jobs during construction. Most of these union jobs. It are these types of jobs that get an economy moving and revive a families hope. PolyMet Mining Co. is truly a steward of our environment. When this project was first being considered the number one item on their list was taking care of the environment, and hasn't changed today. I have spoken to members of the Polymet team and thier awareness of their place in the environment is keen. They have worked with federal and state regulatory agencies and it was found that they can meet and even exceed all environmental impact issues. Many of the people at Polymet are from the area and live their still, so their commitment to the environment is first hand and tangible. Is this letter self serving in that I am trying to get a contract from this upcoming project.....Yes it is. Yes I am trying to put of few more of my people to work for awhile. Yes I am hoping this will take a 1000 people off the unemployment rolls and onto the taxpaying rolls. Yes I am hoping that my company and the many, many more that will build this facility can make a few dollars to keep our struggling business going a little longer and keep even more on the taxpaying rolls. This is about creating jobs, not killing them. It is about giving people and families hope when they have very little to find. It is about being a steward to the environment right now and in the long term. It is about doing the right thing for many not the few. It is about much more than building this facility, and I hope that powers at be in the state of Minnesota understand that and do the right thing.

3129	Hi, my name is Jeff Mark, and I have the good fortune to have property and a cabin on Wilson Lake. I have done much reading on the mining issue coming up for consideration in order to educate myself on the subject. Situations like this are very “charged” as both sides of the story are discussed. We need to ask ourselves why permits for this type of mining have been declined by our neighbors to the east (Wisconsin), because they felt it would do “hundreds of years worth of environmental damage for a few years worth of profit”. Also, companies like this have a history of leaving the cost for clean up to be borne by the states, once they have extracted their wealth and the mine is no longer profitable. Minnesotans are just as smart as Wisconsinites, after all! I am opposed to issuing a permit for this operation. As I told my fellow Excelsior Park Board members, when a company wanted to construct a private project on public land, “just because a thing “can” be done, does not mean it “should” be done. Thank you for your help on this matter, Jeff	EOO,G4A
<b>Sender Last Name:</b> Markle		<b>Submission ID:</b> 3493
1121	total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area	WI1
1326	tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project. Further, the PolyMet NorthMet project will result in	GT2
3240	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine’s closure, as well as tailing’s basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an existing mine	EOO,WR4B,FM1
3690	Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone.	PD2,PD4
3767	Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. As someone who frequently travels to the arrowhead region of Minnesota for the pristine wilderness and serenity it offers, I will very quickly take my money elsewhere if mining operations lead to widespread water contamination and loud drilling noises in the distance. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Sincerely, Tricia Markle	G11

2527	I support the Polymet project. I believe they have addressed all the environmental problems and have proposed proper solutions to those problems. All the criticism I have read about this project are based on problems that occurred in the past when there was little or no restrictions on mining. Technology and restrictions have improved on everything. I believe that the DNR has installed restrictions to prevent the improper operations of the past. I am reading comments about stopping all mining. A lot of people have very short memories of what was a very significant part the mining played in the winning of the second war. In addition, if we put all our dependence on other countries for our supplies we are in deep trouble. Northeastern Minnesota is dependent on the mining industry for its economy. We have tried other industries and they do not survive. I worked for Erie/LTV Mining companies for 35 years which supported my family and the economy of our town and area. I have a cabin just outside of the BWCA and have not seen any air pollution except for the controlled burns in the BWCA. I was involved in some environmental projects at the Dunka mine to resolve some environmental problems after the mining and stockpiling were done. A lot of work was done and was very effective. The point is that now everyone is aware of the problems before the project begins and the technology and restrictions are in place that will prevent the environmental problems. Let's get this project going. We don't need anymore delays. Everyone had an equal chance to express their opinions. I question whether many of the opposing opinions spent any time reading the EIS or Polymet's plans.	G1
3823	I support the Polymet project. I believe the Polymet has done a good job in addressing all environmental problems. I also believe that the DNR has done a very good job seeing that all environmental problems have been addressed. I also question why people that do not live in this area feel that they have so much say what goes on here. They have employment elsewhere but want to eliminate us from their playground. I am still reading letters to the editors from people that have not studied the Polymet proposal or the DNR regulations. Please bring this long debate to an end and let Polymet get started. Rules, regulations, and science are far better than 50 years ago.	EOO,G10
<b>Sender Last Name:</b> Markwardt <b>Submission ID:</b> 364		
404	I am in favor of Polymet getting their operating permit. I think that Polymet has done an extensive job in assuring that their project can be done in an environmentally safe way. In addition, the DNR has set up extremely tight regulations to see that the project is done environmentally correct. Everyone that had any comment had an opportunity to do so at the schedule meetings and there should not be anymore delays for issuing a decision. The anti-parties trying to delay the process in hopes the company will decide to quit. We need the jobs in this area and the state could really use the tax money that will be made.	EOO
<b>Sender Last Name:</b> Martin <b>Submission ID:</b> 134		
123	My name is Curt Martin, I live, work and play in northeast Minnesota and, you know, our economy really needs the jobs right now. I believe that it would help Minnesota greatly to have a mine like this come into our area and it looks like they did their homework on their environmental process that they've been going through and, like I said, it's going to help the economy and that's what we need right now in Minnesota is the jobs, we're really hurting for that. So that's pretty much what I've got to say and I support the mine wholeheartedly.	EOO,G6
3487	Please vote NO to Polymet Mine There is more than enough info on this subject to know that it will have a large impact on the BWCA This area is great just the way it is. Don't destroy it for the next generation Thanks for your help	EOO
<b>Sender Last Name:</b> Marty <b>Submission ID:</b> 1991		
1582	The question of where the funding will come from for post-closure treatment, monitoring and maintenance has not not been adequately addressed, and Minnesota taxpayers may have to pay millions of dollars for clean up after Polymet has gone.	PD3,PD4

2479	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. Water quality, loss of wetlands, and harmful affects on wildlife are all important to consider. Just as important is the financial assurance that needs to be provided to ensure post-closure reclamation of the PolyMet NorthMet mine and plant. Sulfide mining places huge burdens on taxpayers. These mines often require long-term or perpetual pollution and treatment. PolyMet has few assets or financial history.	G2C,G4A,G7
2480	Our clean water, wildlands, and public health are valuable resources, and all of us must be sure we understand the sacrifice we are being asked to make for a Canadian company's profits. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	G2
<b>Sender Last Name:</b> Masnado		<b>Submission ID:</b> 2546
2184	This example leads to my comment regarding the Draft EIS. I perused the document and did not see any indication on what actual monitoring requirements would be specified in a NPDES discharge permit or a mining permit. Nor did I see any indication that the	WR1A
2185	permits issued should require frequent monitoring for the metals in question. Specifically; arsenic, cobalt, copper, and nickel should be measured regularly from any direct discharge to nearby surface waters. A frequency of weekly would not be out of the question during mine operation. Similarly, groundwater monitoring wells located adjacent to surface water near any seepage pits or tailing containment ponds should be monitored monthly during operation and following closure of the site. As evidenced by the Ladysmith operation described above, these requirements should be continued - albeit at a reduced frequency - well after the mining operation ceases to extract and/or process ore. This is to determine whether or not the chemistry changes that occur over time create any situations where the pollutant concentrations in surface waters may increase above assumed values.	EOO,WR1A
2376	permittee would be required to set aside a specified amount of money to be used in if remediation of an unforeseen environmental issue is discovered at a later date - even after the site may be reclaimed following completion of ore extraction. At a minimum, any	PD4
<b>Sender Last Name:</b> Masucci		<b>Submission ID:</b> 174
165	I am in total support of the Polymet Project, it would boost the economy we need in Northern MN, Polymet has demonstrated it can produce these critical metals while following MN's strict environmental requirements to protect air, water and land. Polymet's planned mine layout minimizes impact to wetlands.	EOO,G5,G7
<b>Sender Last Name:</b> Mathias		<b>Submission ID:</b> 2188
2594	MIKEL MATHIAS: Well, I believe that this is a really good idea. The reason that I think it's a good idea is basically we need to keep our jobs in our country. And if we're not -- we got to start producing more in the United States to help with the economy. And if we don't do that, we're just -- we're spending our money and borrowing against the rest of the world. And if we keep a project like this in the United States, I believe that we can govern the pollution control side of it better than if it's overseas. Everybody knows that the world is just one place; and if it's mined here, overseas, it's going to be mined somewhere. If -- how do I want to say this? If it's mined elsewhere, somebody else is going to be making the money. And there is only so much resource for everybody, and I think that we can manage it better. And as far as the work goes, I know that the boilermakers, most of our work nowadays isn't Blaine Steno Atkinson-Baker pt E just coal burning boilers. It's a lot of pollution control, and it's becoming a very prime target. It's an important topic. And that's about it. That's all I have to say.	G1,G2

2595	BRIAN JOHNSON: My name is Brian Johnson. I'm a pipefitter from Duluth. I think the PolyMet project would be good for economic development in the Iron Range and in the whole state and the country. I think their process is environmentally friendly, and they've done research necessary to -- I had it all in my head. I'm all for protecting the environment just as much as anybody else, and I think that PolyMet has taken the right precautions to do so. I enjoy outdoor activities like hunting, fishing, and snowmobiling. I want to preserve the outdoors, but we need to start getting some good paying jobs in the area for economic development. And it would also be a source of these metals in the U.S. instead of importing them, which would benefit us. I think that's all I have to say.	EOO,G2
<b>Sender Last Name:</b> Mathur		<b>Submission ID:</b> 3698
20004	The baseline data for both the Mine Site and the Tailings Basin are inadequate. The baseline data for both the mine site and the tailings basin are sparse. A comparison of hydrologic data that was collected for two other projects in the region (GLIFWC letter to Jon Ahlness and Stuart Arkley, February 6,2009) demonstrates that the PolyMet project is data-poor in the area of basic hydrology.	WR1E
20004	The economic reality of Northeastern Minnesota clearly shows that the stable source of the economic engine is from non-lining jobs. According to Tom Powers from the University of Montana Economics Department, mining only represents 5% of the total personal income in Minnesota's iron range counties. What attracted me and my wife to the Ely area was the small town atmosphere embodied with clean air and water with abounding wild life, fishing, recreation, and scenic beauty. We invested a significant portion of our life savings into a very nice lake home on White Iron Lake. Even Lake County thinks it is nice. We pay more in taxes than our similarly valued home in Hennepin County, even though we are provided very little services from these taxes. We believe that we can reasonably expect Lake County and other governmental agencies to take all measures that ensure our lake quality remains high and our property values are protected. According to Tom Powers, economic rationality requires that mineral deposits be left in the ground undeveloped. Especially, since according to the Polymet data only 1 to 5 percent of the ore contains the non-ferrous metals, relegating the 95 to 99 percent not used to the tailings area! From my perspective, the environmental risk is one no rational person would take. Please review Comparison of Predicted and Actual Water Quality at Hardrock Mines: The reliability o/predictions in Environmental Impact Statements and Predicting Water Quality at Hardrock Mines: Methods and Models, Uncertainties, and State-of-the-Art, Ann Maest and Jim Kuipers. The results of this study are: • 100 percent of sulfide mines predicted compliance with water quality standards before operations began; 76 percent of mines, studied in detail, exceeded water quality standards due to mining activity; Mitigation measures predicted to prevent water quality exceedances failed at 64 percent of the mines studied in detail. Other environmentally conscious companies embarked upon "safe" sulfide mining projects with every intention of being environmentally friendly. However, the facts are that three out four ended up be polluters. Statistically, that means that the Polymet project has a 75% chance of polluting! That risk is untenable and one that should not be taken. My specific comments on the Polymet DEIS are attached. My education is a Masters of Science in Electrical Engineering and my background is a lifetime in the high-tech industry developing sophisticated products based upon technical standards. I am accustomed to reading technical documents and believe that there some significant shortcomings in the Polymet DEIS which I have included in my comments.	G7B
20004	Given the fact that a favorable disposition of the DEIS Northmet 2009 for the mining industry by decision-makers will have enormous "downstream" implications for human development and hard-rock mining in the Arrowhead of Minnesota and elsewhere, attention must be given to ensuring that the public has full and transparent understanding of the scientific, legal, economic, and social/ethical implications of the proposed project. The present DEIS Northmet does not meet this expectation. In its present form DEIS Northmet 2009 should not be approved.	PRO3
20004	The use of flow data on the Partridge River from a site twenty years and seventeen miles distant from the proposed project does not provide sufficient information to allow a full assessment of the hydrologic and environmental impacts of the project on the Partridge River. Additional data must be collected before the DEIS is deemed adequate.	WR3J

Comment ID	Comment Text	Theme Codes
20004	Thus, the stated goal of 4.14 Cumulative Effects to “summarize the resource-specific cumulative effects analyses and provide an overall, synergistic analysis of the system-level cumulative effects resulting from the combined influence of the resource-specific effects to the regional airshed, watershed, and ecoregion surrounding the Project” has not been accomplished.	G9
20004	Finally, one must ask the question: What are the trends in the Arrowhead of MN for the overall quality of air; water; loss of habitat; threatened species; forest fragmentation? For these data categories, the trends over the past 20 years are as follows: overall worsening air quality; worsening water quality; increase loss of habitat; increase threats to the biota and human health; and increased forest fragmentation. These trends suggest that the process for approving projects in MN (whether power plants; mining operations; industrial development; other human developments) is failing to protect the health of the biota. The trends are not sustainable or consistent with stated federal and state goals of ensuring highly valued public natural and recreational environments for future generations. The trends, if sustained, will have adverse impacts on human health and the economies of health.	G2
20004	Also troubling is the fact that as noted (4.14-4) there is major disagreement with the conclusions of DEIS authors regarding the significance of the above findings. In addition, the legitimacy of the analytical approach to the Cumulative Effects approach is problematic for several reasons: 1. Major data elements are missing e.g. baseline data for the Partridge and Embarrass Rivers. 2. In the watersheds, concentrations of aluminum, iron, copper and mercury exceed MN Water Quality Standards; 3. Analytic methods were not robust, e.g., no dynamical systems analysis of these complex environments. 4. No inclusion of data regarding Climate Change impacts on the ecosystems.	WR5A,G8C,AQ3
20004	1.1: Background... The project is stated to consist of three components: Mine Site; Plant Site; Transportation Corridor. A fourth Project component should be considered: a Regional Site. Both NEPA and the MN Environmental Policy Act require that proposed projects include review of project impacts at the mine and plant sites, transportation corridors, and on regional environments. The scope of this DEIS is inappropriately narrow. Incorporation the fourth component would provide focus for filling in the gaps in data and information regarding direct, indirect, cumulative effects as required by NEPA.	G9
20006	I have spent some time reviewing the Polymet Project and have been convinced that this is a financially viable and environmentally responsible endeavor. There is a demand for the precious metals that will be produced using a proven process. Environmental concerns have been thoroughly researched and addressed. In fact, The Company began the environmental review in 2004 and has spent more than \$20 million to date on just the review process. This project will create jobs for Minnesotans. Considering the current state of our economy and the political platforms of our chosen leaders, it seems prudent that this project is allowed to move forward without any further delay. It is important that we streamline the current permitting process so that in the future businesses may not be so frustrated with the permitting process that they choose to locate in another state. With unemployment rates exceeding 10%, I will be happy to have Polymet’s NorthMet project creating jobs “in our back yard.”	EOO
20006	Page 4.1-33 The extent of existing wild rice beds has not been fully characterized and may be in violation in MN statutes.	WR1E
20007	Page 4.1-46 The standard for wild rice waters, as currently in place, must be enforced. According to the tribal cooperating agencies extensive research in Minnesota has demonstrated that healthy and viable wild rice beds occur in waters with less than 10 mg/l of sulfate and is the standard that must be enforced. This must be addressed in the DEIS.	WR4F
20007	A DNR representative at the public meeting in Aurora flatly stated that all tailings basins leaked! If that is a factual representation of what happens then treatment will NOT terminate in year 34, but can be expected to last into perpetuity. This DEIS needs to reflect the real world and talk about how treatment into perpetuity will be provided.	WR3I
20007	Page 4.1-55 It would appear that the DEIS is using a crystal ball to predict long-term flow. There is no evidence to validate the wetlands treatment process proposed.	WE6

20007	Page 4.1-54 The DEIS admits that its analysis of all the water quality parameters was incomplete. With the importance of getting it right with the Polymet Mine incomplete analysis is not an option. This incomplete analysis makes this analysis suspect and casts doubt on other analysis. It is entirely illogical that adding sulfideminning tailings to the taconite tailings will improve the quality of the seepage water. There is a serious flaw in this analysis.	WR1E
20007	4.1.2.1 Hydrologic Alteration of Streams, Lakes and Aquifers Impact Criteria Page 4.1-50 The listed parameters calculated for the Partridge River have little data to support them and, therefore, cast doubt on the veracity of the data used. The MODFLOW model was developed to assess the rates of mine pit inflow and as such, the results it gives for areas outside the mine pit footprint are unsupported by data. The XP-SWMM is based on stream gage data that is 17 miles and 20 years distant from the proposed project. Field data collection is spotty or non-existent and the numbers used in this DEIS are derived from the MODFLOW groundwater model and XP-SWMM model. This deficiency must be corrected.	WR1E
20009	The leachate is predicted to not meet water quality standards for thousands of years (Table 4.1-45). The DEIS must be updated to reflect processing this condition.	WR3I
20010	Page 4.1-56/57 It is logical to conclude that hydrologic characterization using MODFLOW models provided information for the immediate area of the mine pit and the tailings pile only. Groundwater models designed to characterize the watertables, the potentiometric surface in the aquifers, fluxes to rivers and streams or to predict impacts to the water tables or surface waters are missing. The MODFLOW groundwater model at the tailings area is restricted to the tailings pile and cannot be used to characterize groundwater flow direction, the watertables, the potentiometric surface in the aquifers, fluxes to rivers and streams or to predict mounding impacts to the water tables or surface waters. Data driven models need to be developed and these impacts need to be predicted and evaluated.	WR2A
20010	Financial assurance (damage deposit) for clean restoration is missing in the DEIS. The Contingency Closure Estimate would be provided and updated annually as part of the Permit to Mine and its annual report. The DEIS states that the Contingency Closure Estimate would be the basis for computing financial assurance requirements for the Project. However, this is too late to realistically evaluate the impact of the mine closure and ensure that adequate funds are in place. This must be part of the DEIS and must be addressed.	PD4
20010	Page 4.1-56 The volume of seepage from the Tailings Basin is expected to decrease slowly over time, but, with no proposed dry cap, long-term groundwater seepage would be expected.	EOO
20011	Page 4.1-59 The MOD FLOW model does not provide credible data outside the footprint of the mine pits. The expertise of both local hydrologists and hydrologists with experience in other settings is needed to develop a plan for hydrologic data collection and for formulating the appropriate models to integrate the hydrologic data.	WR2A
20012	Page 4.1-61 The assumption that it is not practical to gather the necessary input data for a MODFLOW model proposes a lack of commitment to get it right. A robust groundwater model must be developed for this project in order to adequately characterize the potential impacts of various project alternatives to natural resources.	WR2A
20013	Even though Mn DNR has monitored several other lakes across the Mesabi Iron Range over the past several decades for effects from mine pit dewatering it has never monitored a sulfide mine. Vegetation data suggest that a significant groundwater-surface water connection exists and a more robust groundwater model must be developed for this project in order to adequately characterize the potential impacts of the various project alternatives to natural resources.	WR2I
20014	Page 4.1-61/62 The data presented is insufficient and must be corrected. The empirical observations in the Adams 2009 email are insufficient to support the conclusions. The evidence presented in the email can be interpreted to indicate substantial impact of the Peter Mitchell Pits on adjacent lakes. Aerial photography, without ground verification or georeference is an exceedingly imprecise method for determining water levels in lakes and wetlands (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009).	WR1E

20015	The DEIS does not draw a firm position based upon good evidence and concludes that the Mine Site peatlands appear to be much more bog-like than fen-like. This confirms the tribal cooperating agencies' position that the referenced email (Adams 2009) used inadequate methods for determining impacts to surface water features.	WR2I,WE1,WE2
20016	Page 4.1-66 The groundwater quality modeling assumes these mitigation measures are successfully implemented with any assurance of proper testing, treatment, feedback, adjustment, and monitoring. What must happen is a control system that guarantees proper outcomes from water treatment. There is sufficient profit in the proposed mining operation to properly treat the water to assure water quality and not leave it to chance by dumping limestone and hoping for the best.	WR1A
20016	Section 4.2 discusses recommended wetland monitoring at the mine. While wetlands monitoring will be required, it is more important to get it right before mining starts rather than initiating a corrective action plan once monitoring detects a problem. After all that is a reason for a DEIS.	WE3
20018	Page 4.1-67 The data does not support the conclusions associated with the proposed mine closure. It is quite clear that perpetual water treatment will be required (or least water treatment for 2000 years). This is why it is necessary for the DEIS to include an estimate of the costs associated with mine closure and reclamation. A fund must be established prior to permitting that is adequate to support perpetual water treatment.	WR3I,PD5
20018	There is no time nor financial quantification to "These Post-Closure and reclamation activities would be expected to be ongoing for many years until such time as the various facility features are deemed environmentally acceptable, in a self-sustaining and stable condition." The amount of time has been estimated to be hundreds or thousands of years. This is perpetual maintenance and does not meet the Minnesota requirement for a maintenance free closure. This must be addressed.	PD3
20018	Page 4.1-94 The DEIS concludes that on the basis of deterministic modeling, the Proposed Action would have relatively little adverse effect on groundwater quality downgradient of the Tailings Basin. However, groundwater contamination from the previous mining activities is still an issue near the L TVSMC tailings basin more than twenty years after operations ceased. Water quality is important and this concern must be acted upon. Because of the limited distribution of monitoring wells, the extent of the contaminant plume is not known. However, recent well data show that the plume extends in some areas at least as far as private wells along the Embarrass River. In the wells that do exist near the tailings basin, pollutants including iron, sulfate, manganese, aluminum, and fluoride exceeded drinking water standards. Recent wells near the northern property line show substantial contamination of the groundwater aquifer (Barr 2009, Memorandum: Results of Tailings Basin Hydrogeological Investigation. June 2, 2009). The baseline data on which to base estimates of the impact of the proposed project on water quality at the mine site and the tailings basins is insufficient. The existing analysis for the PolyMet project calculates the additional constituents that the project will add to groundwater but is unable to realistically estimate what the resulting water quality will be because background water quality has not been incorporated into the estimates. Private domestic wells lie between the tailings basin and the Embarrass River where tailings basin discharge water is expected to ultimately discharge. Some of the sampled private wells have contaminants at levels several times the drinking water standard (Barr 2009, Memorandum: Results of residential well sampling north of TVSMC tailings basin. January 27, 2009) Samples from these wells show that they exceed the manganese standard and close to exceeding the arsenic standard. There must be a groundwater flow model to show the direction and rate of groundwater flow, using that pattern of flow should to plan a groundwater-sampling scheme to map the extent of the existing contaminant plume. This data and analysis should then feed into estimates of how the proposed project would interact with existing contamination. The combination of existing conditions with impacts due to the proposed project would show what groundwater quality can be expected during and post project.	WR1E
20020	Page 4.1-98 Little or no baseline data was collected to develop the modeling described in this document. And, therefore, model results cannot be used with confidence and do not allow an adequate assessment of environmental impacts.	WR1E
20020	Page 4.1-102 The available data does not support the DEIS conclusions. Proper data must be collected and used.	WR1E

20021	Unsupported conclusions have been reached in the DEIS and must be fixed. The available data do not support the conclusions presented in this section. The impacts predicted by technical reports (RS73B) to the Partridge River are primarily reduction in base flow due to mine pit dewatering and those impacts are predicted by the MODFLOW model. MODFLOW modeling in (RS22-Appen.B) forms the foundation for the predicted impacts. The MODFLOW model (RS22 Appen.B) is not calibrated to a data set representative of the area and predicts fluxes to the Partridge River based on a non-unique solution. A differently formulated and calibrated MODFLOW model could predict much higher inflow to the PolyMet pits and therefore, show greater impacts to stream baseflow. The surface water model (SWMM) used for predicting impacts is calibrated to Partridge River flows from 1978 to 1988, seventeen miles downriver of the mine site. During the period of record, the Peter Mitchell pits were dewatered with unknown effects on the river flow data. According to technical documents (RS73A, page 21) the flow record at the Partridge River gage above Colby Lake (USGS #04015475) may have been impacted by mine discharges on the north branch. The monthly average flow recorded at this gauging station during 1978-1988 varied between a minimum of 1.3 cubic feet per second and a maximum of 454 cubic feet per second. The discharges from the Peter Mitchell Pit could account for up to 34 cubic feet per second. Since the timing, duration and location of mining discharges may be different now than during 1978-1988, the present hydrologic regime of the Partridge River may not be well represented by the period of record at USGS #04015475.	WR1E
20021	The DEIS is again weak in its analysis and must be improved. There will be surface water discharge to the Embarrass River. Aerial photography and state Public Waters inventory maps indicate that there is currently a direct surface water connection between the northwest corner of cell 2W and the Embarrass River. Aerial photos show that water discharging from the tailings basin follows a natural channel westward, through existing wetlands and intersects a channel that leads directly to the Embarrass River.	WR3C
20023	Page 4.1-11112 This is another example of analysis that logically shows the need for perpetual water treatment. The current approach from the DEIS results in a polluted pit lake. The WWTF needs to operate for a minimum of 2000 years in order to treat leachate from the stockpiles. The effectiveness of the passive wetland treatment system has not been demonstrated and it is likely that the wetland treatment system would not function as suggested. This water would never meet surface water quality standards. The conclusion is that the DEIS must discuss the implications of leaving a polluted pit lake at this site in perpetuity.	WR3C,WE6
20024	Page 4.1-113 Here the DEIS clearly demonstrates a problem and the logical conclusion is perpetual water treatment: "Constructed wetlands performance, however, is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards. " Based on these uncertainties primary water treatment at the WWTF would need to continue for thousands of years. This does not meet the Minnesota goal for maintenance free closure and highlights the need for an up front determination of all the costs to close and reclaim the mine area.	WR3I,WR3L,WE6
20025	Page 4.1-114 All waters of the state are protected by Minnesota water quality standards and using this unnamed water as a mechanism to dilute mine related contamination is not appropriate. In addition no flow information for this unnamed water is available. This improper method of diluting the mine contamination must be eliminated and the DEIS updated to reflect this change.	WR3I
20026	Page 4.1-115 Section 4.1.3.5 is speculative because of continued inputs from the stockpiles, the tailings basins, and the pit walls; the pit lake could exceed surface water quality standards for thousands of years. 20 feet of pit wall will never be submerged and as such constitute a perpetual source of mine related contaminants, highlighting the need for treatment in perpetuity. This must be properly addressed including its impact on the costs associated with mine closure, reclamation, and perpetual treatment of water.	WR3C,PD3
20027	Page 4.1-117 Contaminants from the project would contribute to exceeding the standards below Colby Lake. Wild rice beds are located on the Partridge River immediately below Colby Lake. Therefore, the State of Minnesota wild rice standard for sulfate of 10 mg/l should apply along all of the Lower Partridge River.	WR3I,WR4F
20028	Page 4.1-120 The Embarrass River already exceeds water quality standards and the State of MN should not permit the addition of additional contamination from new or expanded sources.	WR3A

Comment ID	Comment Text	Theme Codes
20029	There is not an adequate understanding of the composition of the ground water aquifers to understand the impact of the tailing pond and mining operations. Ground water cannot be compromised and the composition of the aquifers must be thoroughly characterized and integrated into the hydrological analysis and operation of the mine.	WR2A
20030	Surface water quality at the project has been poorly characterized or left uncharacterized. The limited data that exist suggest that surface waters are already adversely impacted by mining activity. Mercury, sulfate and specific conductance have exceeded Minnesota surface water criteria in surface water samples collected near the tailings basin proposed for use by PolyMet, at nearby Area Pit 5, and mercury exceeds surface water criteria in the Partridge River downstream of Colby Lake. However, no water samples have been collected from lakes near the tailings basin (Hiekillilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings pile have caused contamination of those water bodies. Contaminant transport modeling suggests that the PolyMet Project will cause manganese, aluminum and sulfate to exceed standards. These problems must be addressed.	WR1E
20031	Page 4.1-124 Again the DEIS shows it's analysis is incomplete by admitting to uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury and recommends additional analysis. In this case we agree with the DEIS. This is too important to not address prior to moving forward.	WR3I
20032	Page 4.1-125/6 We note that the conclusion that there is little opportunity for sulfate wetland interactions is based upon a single email that is suspect in its viability as a scientifically sound document. This needs to be properly analyzed.	EOO
20033	Page 4.1-129, Table 4.1-68 It is more important to prevent exceedances of water quality rather than mitigation. The west pit is predicted to violate surface water standards for all years that predictions were made and this must be addressed.	WR3C
20033	Page 4.1-128 The idea of mercury monitoring in the West Pit is good; however, it is analogous to closing the barn door after the horse has escaped. Determination of the final water quality of the west pit must be included in the DEIS so that potential water quality impacts to Lake Superior can be characterized.	WR3C
20033	Page 4.1-126 There are extensive rice beds in the Lower Partridge River and methylation of mercury may be significant in the Partridge River watershed. This must be addressed before moving forward.	WR1E,WR4F
20035	Page 4.1-131 Data collected in 2009 show that private wells north of the basin have been impacted by historic tailings basin effluent and, therefore, the conclusion that monitoring data does not suggest exceedances of groundwater evaluation criteria is incorrect. Although two additional groundwater samples north of the basins collected in 2009 indicate that exceedances exist at the property boundary, the full extent of the contaminant plume has not been defined and must be.	WR1E
20035	Page 4.1-130, Table 4.1-68 The wild rice standard for sulfate and the Lake Superior standard for mercury would be exceeded. This must be corrected. Groundwater contamination in Table 4.1-68 is seriously flawed. It does not consider existing contamination and must do so.	WR1E,WR3I
20035	The Closure Plan does not propose any remediation of groundwater seepage from the Tailings Basin. <sup>51</sup> There is no up to date closure plan for the proposed project, nor is there is a comprehensive cost estimate. A comprehensive closure plan is needed to evaluate long-term environmental impacts and to inform calculations of financial assurance that would be needed for the project. This financial assurance must be in place prior to permitting.	WR1A,PD3,PD4
20035	Page 4.1-131/2 The available data does not support the claim that the relatively high concentrations of aluminum, iron, and manganese currently found downgradient of the Tailings Basin may reflect natural conditions in this area. In addition, a basic assumption (i.e. plug flow [TB-14, July 2,2009, page 9]) of the contaminant transport modeling at the basin (RS74) assumes that all constituents in the groundwater are the result of past and current seepage from the basins. Even if the claim is true, it is illogical to exacerbate this condition with sulfide mining.	WR1E
20037	This section is full of assumptions that compromise the conclusions regarding flow of ground water. There is no data to substantiate the assumptions of this section and these assumptions must be addressed.	WR2A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
20038	Page 4.1-132 The wild rice standard applies to all waterbodies where wild rice is found to be growing. It is the expectation that the PCA will enforce the standard accordingly. This impact needs to be addressed.	WR1E,WR4F
20039	Page 4.1-135 The effectiveness of lime treatment process is very important in the final water quality of mine effluent. Therefore, the analysis of this process should be conducted prior to the construction of the facility and the results included in the DEIS.	WR1E
20040	The effectiveness of the evapotranspiration caps (i.e., vegetated soil layer) has not been demonstrated. This analysis must be done (GLIFWC Comment letter of June 30, 2008 and GLIFWC comment letter of February 6, 2009).	WR2L
20041	The effectiveness of the wetland treatment system is in doubt and must be remedied.	WE6
20042	The effects on groundwater levels at the mine site are unknown for both the proposed project and the mine site alternative because of insufficient analysis. This must be addressed.	WR2A
20043	Page 4.1-144 All waters of the state are protected by surface water quality standards and using the unnamed water to dilute the contaminants of the West pit is not appropriate. The pit lake is predicted to be in violation of surface water quality standards for hundreds or thousands of years. This condition is not the result desired in a successful DEIS and must be addressed.	WR3C
20044	Page 4.1-146 The DEIS points out that there is uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury and recommends additional analysis. This is too important to pass on and analysis must be included in the DEIS.	WR3I
20045	Table 4.1-77 There is insufficient data to support the claim in table 4.1-77 regarding flow and river morphology. More analysis is needed in the DEIS.	WR3J
20046	The west pit is predicted to exceed standards for all years for which predictions were made and, therefore, preventive measures are required to be added to the DEIS.	WR3C
20047	4.1.3.4 Tailings Basin Alternative Untreated discharge of tailings basin water to the Partridge River will exceed water quality standards. In particular the wild rice standard will be exceeded.	WR3I,WR4F
20048	The DEIS readily states that there is wide variability in the data and, therefore, reliable conclusions cannot be made. Because of the importance of water to the ecology of this area this variability must be understood before moving forward.	WR1E
20049	The effectiveness of the permeable reactive barrier (PRB) must be known and included in the DEIS. If it is ineffective, then pumping could be needed for hundreds or thousands of years. Today, the PRB is untested and has not been demonstrated to work in similar situations. In addition, the PRB would need periodic recharging/replacement, which would need to occur at regular intervals for as long as water treatment is needed (hundreds or thousands of years). This long term maintenance is at odds with Minnesota's goal of maintenance free closure and must be included in the DEIS estimated costs for closure, reclamation, and perpetual maintenance.	WR2D
20050	Page 4.1-155 Wild rice grows on the lower Partridge River and the 10 mg/l standard for sulfate applies. This standard would be exceeded by the PolyMet discharge. Furthermore, there are other projects (Mesabi Nugget Phase II and Laskin Energy) that are discharging water with elevated constituents. Given these existing sources, it is unlikely that PolyMet discharge would be able to discharge their untreated tailings basin effluent without violating the clean water act. This situation must be addressed in the DEIS.	WR3I,WR4F
20051	The DEIS tries to explain away predicted concentrations of dissolved aluminum in TB-15 that exceed water quality standards (see TB-15, page 1). However, it is clear that the total aluminum is dissolved that exceeds standards. This is a very serious condition that must be addressed in the DEIS.	WR3H
20052	Page 4.1-157 The DEIS claim that all parameters are expected to meet surface water standards during all flow conditions for all modeled years is not correct. The wild rice sulfate standard applies (10 mg/l) and would be exceeded. This serious flaw in the DEIS must be addressed.	WR3C

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
20053	Page 4.1-163 The DEIS incorrectly concludes that all parameters are predicted to meet all surface water quality standards in the Embarrass River under all flow conditions for all mine years. The wild rice sulfate standard applies and will be exceeded. TB-15 predicts that dissolved aluminum would exceed surface water standards. These are serious issues that must be addressed.	WR3I,WR4F
20054	Page 4.1-164 Treatment of the tailings basin effluent that is captured by the vertical wells must be an integral part of the tailings basin alternative. This treatment could occur in the WWTF already proposed for this project or in a second facility closer to the discharge point. However, treatment of the tailings basin effluent prior to discharge to the Partridge River is wrong and must be addressed. In addition, there are other existing facilities and mine proposals (Laskin Energy, Mesabi Nugget Phase II) that discharge, or are proposing to discharge water at this same location. Water quality of the discharge would exceed the wild rice sulfate standard that applies to the lower Partridge River.	WR5A
20055	4.1.4.2 Water Quality Page 4.1-187 Again, the DEIS incorrectly concludes that the NorthMet Project is expected to meet all surface water quality standards under all flow conditions for all mine years in the Partridge River. Wild rice grows on the lower Partridge River and the wild rice sulfate standard applies. The PolyMet discharge under the tailings basin alternative would not meet this standard.	WR3I,WR4F
20056	Hydrologic data presented in the DEIS indicates that this aquifer is saturated by tailings discharge water. Therefore, it is not possible for recharge from precipitation to occur.	WR2H
20057	From the data in the DEIS, a logical conclusion is that the existing LTVSMC tailings are contributing substantially to the level of constituents observed in the groundwater. It also true that the modeling of PolyMet contaminants at the basins does not take these or other existing constituents adequately into account. This oversight leads the authors of the DEIS to the illogical conclusion that seepage water from PolyMet, after passing through both LTVSMC and PolyMet tailings, will be cleaner than the existing seepage that is passing only through the L TVSMC tailings. It is not a logical conclusion that the addition of mine waste to the basins would cause seepage water quality to improve.	WR2F
20057	Over the many decades of operations at the tailings basin, thousands of gallons per minute of tailings basin water have been discharged through the bottom of the basin, into the groundwater. This water has then moved down gradient and into surrounding wetlands and as stated in the water quality section, ultimately reaching the Embarrass River. In addition, limited recent groundwater sampling shows groundwater contamination at the property line and at private wells north of the basin. It appears to be clear that the full extent of the contaminant plume and the existing contamination to groundwater has not been defined and that adding sulfide mine deposits will certainly add to the contamination. This situation must be corrected prior to any sulfide mining operations.	WR1E,WE2
20057	I am sending you this e-mail in support of the Polymet Mining Project in Northeastern MN. I have several reasons for supporting this project. First: economic impacts. - This project will contribute to a depressed economy, local, state, and national. - The materials from this project will not only create employment directly and indirectly to the economy, but also the materials needed for today's technology. Renewable energy, electric vehicles, computers, medical and the list can go on. - The careers that could then be available to our younger work force can be in the new technology of this project, in the environmental areas, with the vendors, etc. - These jobs will be supplying the metals needed for today's technology. Second: domestic advantages. - These metals will be domestic source needed and used by all in this country. - For this state and country to keep up with the advancing technologies of other countries, we need these metals. Third: environmental concerns. - The environmental requirements of Minnesota are strict. If we were to get these metals from a foreign source, I would question those environmental guidelines. - This project is going to use an existing site and facility. Lesser disturbance to the environment. - We do need these metals today. Mining and processing here versus in another country, transportation becomes both environmental and cost issues. - The Polymet Draft EIS and those involved with it, shows the issues and concerns of this project have been addressed and will be met. It's time to complete this stage of the project, and move on to the next.	EOO

20058	<p>The Northwest Mining Association (NWMA) appreciates the opportunity to comment on PolyMet Mining’s NorthMet Project Draft Environmental Impact Statement (DEIS). On behalf of our members, NWMA expresses strong support for the NorthMet Project. Based on the extensive documentation as outlined in the DEIS, PolyMet clearly has demonstrated it can produce critical metals for our nation while meeting and exceeding Minnesota’s strict environmental requirements to protect its air, water and land. NWMA is a 115 year old, 1,750 member, non-profit, non-partisan trade association based in Spokane, Washington. NWMA members reside in 40 states, including Minnesota, and are actively involved in exploration and mining operations on public and private lands. Our diverse membership includes every facet of the mining industry including geology, exploration, mining, engineering, equipment manufacturing, technical services, and sales of equipment and supplies. NWMA’s broad membership represents a true cross-section of the American mining community from small miners and exploration geologists to both junior and large mining companies. More than 90% of our members are small businesses or work for small businesses. Most of our members are individual citizens. PolyMet Mining is one of our corporate members. PolyMet’s NorthMet Project will create a domestic supply of critical minerals and metals needed in every aspect of our daily lives, from medical applications to cell phones and computers. The metals that PolyMet will mine also are essential for renewable and clean energy technologies, such as wind turbines and hybrid cars, which will help the U.S. become more energy independent. The U.S. can and should be more self-reliant for the minerals and metals we need. Despite reserves of 78 important mined minerals, the United States currently attracts only seven percent of worldwide exploration dollars. As a result, our nation is becoming more dependent upon foreign sources to meet our metal and minerals requirements, even for minerals with adequate domestic sources. Currently, America is 100 percent dependent on foreign sources for 18 minerals commodities and more than 50 percent import reliant on another 45 commodities (See 2008 USGS Net Import Reliance Chart below). Increased import dependency causes a multitude of negative consequences, including aggravation of the U.S. balance of payments, unpredictable price fluctuations, loss of high paying jobs and vulnerability to possible supply disruptions. We must not trade a dependence on Middle Eastern oil for an equally unhealthy dependence on foreign sources of minerals. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that will benefit Minnesota families and provide a true economic stimulus to the entire region. We urge you to expeditiously approve the permit for the NorthMet Project.</p>	EOO
20059	<p>1.1. The regional and local-scale models: basic setup. In the DEIS, the groundwater flow around the project is assumed to be described by the groundwater equation. That equation, given on page 6 of technical report RS-22, Appendix B, is a second-order partial differential equation with independent variables x,y,z, and t (time). There is no known method to find a closed-form solution {i.e. to give a solution as an actual formula}, so numerical computer simulations are used. In the DEIS, this involves the MODFLOW program, developed by the U.S. Geological Survey. Typically, a 3-dimensional spatial grid is used, along with a series of discrete time intervals. Properties of the cells in the model are based on known or estimated porosity of the subsoil and underlying rocks, and the presence of water sources or sinks. The values of the dependent variable (hydraulic head) are calculated at the grid points at various time intervals, being updated in successive iterations. The local-scale model for the mine site, as described in RS22, Appendix B, is done along the lines of the description above. {But there are some serious calibration issues, which I will discuss later.} The MODFLOW model is first mentioned in the DEIS around page 4.1-56, under the heading Evaluation Methodology. The local model covers an area of 100 square miles (about 10 miles by 10 miles). There were 8 levels, ranging from the surface deposits (about 1500 ft above sea level) down to a bottom level at 65 ft below sea level, estimated to be the bottom of the Biwabik Iron Formation. In the outer parts of the local model, the horizontal gridlines are about 100 to 200 meters apart; closer to the mine site, they are 10 to 30 meters apart. If this model had been correctly calibrated, then it might have been good enough to give valid indications of water flow into the mine pit and of drawdowns to the nearby groundwater.</p>	EOO
20060	<p>Interestingly, there even is some information in the DEIS that contradicts these values. For the hydraulic conductivity, we have Table 4.1-3: Bedrock and Surficial Aquifer Hydraulic Conductivity Estimates at the Mine Site. Here are the hydraulic conductivity values from that</p>	WR2F

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
20061	The points to be observed here are that the values for the various bedrock formations are reasonably comparable to the values in the MODFLOW assumptions, and that the horizontal rates in the MODFLOW for the surficial deposits are near the upper end of the range of the test results; however the tests give no evidence that would support the extremely low values used in the MODFLOW model for the vertical component of hydraulic conductivity.	WR2F
20062	Concerning the recharge rate, we can note that in the MODFLOW model for the Processing Plant and Tailings Basin, a value of 8 inches/year (or .0018 ft/day) has been used elsewhere in the technical memos. This is given in Figure 4-3 of Attachment 6 of RS-13. The figure, presented as a map, shows this value as applying to the entire area around the plant site and tailings basin except for the tailings basin itself and areas designated as bedrock (probably outcrops). {I did not find anything printed, either in the DEIS or the technical memos about the numerical value of this parameter, which obviously is needed in the MODFLOW model of the tailings basin area.} While the values for the two areas (mine pit and tailings basin) may not need to be identical, there is no reason to expect them to be very different. Indeed, the Plant and Tailings Basin are only a few miles apart, and the two areas are very similar in many respects.	EOO
20063	NOTE: The issue of non-unique calibration was already raised some time ago by the tribal cooperating agencies. I refer in particular to footnote 30, at the bottom of page 4.1-103 of the DEIS. As far as can be detected from reading the DEIS, this comment – which looked very significant to me on my very first reading of that part of the DEIS – has been completely ignored by everyone else who was involved in preparing the DEIS. This is very unfortunate, since many of the comments by the tribal cooperating agencies here, and at a number of other places in this DEIS are very insightful and could have led to considerable improvement in the DEIS.	EOO,G15
20064	What size of discrepancy in the model predictions could arise from this mis-calibration? To arrive at somewhat realistic parameter values, we probably would have to (1) adjust the vertical component of the hydraulic conductivity upward by a factor of 1000 for the wetlands and glacial drift, and (2) adjust the recharge rate upward by a factor of 5 for these same surficial features. The first change would bring the vertical component of hydraulic conductivity to a value similar to that of the Duluth complex. This still may be on the low side, but that will not matter very much. The second change would bring the recharge rate to 1.5 inches per year for the wetland deposits and 7.5 inches per year for the glacial drift. This latter figure is comparable to what was used in the technical memos for the Plant/Tailings Basin area.	EOO
20066	Now, what is the significance of the calibration discrepancy for this part of the DEIS? Given the significant increase in water that will flow into the mine pit, more sulfate will be leached out of the rock that is exposed in the pit, and more metallic ions (including arsenic, cobalt, mercury, nickel, and selenium) will be dissolved or suspended in the water also. It is difficult to predict the increased rates for these processes, but they probably will be significant. It also means that more water will have to be pumped out of the pit and treated in the WWTF (wastewater treatment facility). Since large amounts of water will have to be treated, a certain amount of the contaminants likely will be discharged to the Partridge River. In particular, it would be completely unrealistic to assume that the WWTF would be 100% effective in removing pollutants from the water that it discharges. Therefore, we can realistically expect a larger impact on water quality in that river, and also in the St. Louis River below its confluence with the Partridge River. This would include increased methylation of mercury, among other effects.	WR2F
20066	Any further change in the vertical rate of hydraulic conductivity probably would have fairly minor effects because the surficial deposits lie directly on top of the Duluth Complex rocks, which are very impermeable. On the other hand, the 5-fold increase in the recharge rate seems to translate into something approximating a 5-fold increase in the water that would flow into the mine pit. I do not claim that this is an exact calculation; it is only an estimate. Still it is clear that an open mine pit would be by far the easiest place for water in the surficial deposits to flow into, once excavation has begun. Accordingly, it is reasonable to conclude that the water flowing into the mine pit would increase by approximately 5 times as much.	EOO
20068	In both places, PolyMet claims that an exponential decay model should apply instead of the constant production model that was applied. I believe that the constant production is a closer approximation for what would be observed – even extending through a century or more. Accordingly, this point should not be conceded to PolyMet. Moreover, I will explain below why this point has practical	WR2E

Comment ID	Comment Text	Theme Codes
20069	The attempted justification of the exponential decay model is given in Barr Engineering technical memo UA02, from Peter Hinck and Miguel Wong, dated September 19, 2008. There is a fairly lengthy but rather confusing verbal explanation, supplied by Stephen Day of SRK Consulting (a firm in Vancouver, B.C.), leading up to the following graph:	WR1E
20069	Does this represent an exponential decay model, or does it not? Some parts of it resemble graphs of transient phenomena followed by exponential decay, but (1) some parts of the data are in definite contradiction to this and (2) we don't see a sufficiently long run of the data to provide particularly strong empirical evidence. As far as the graph is concerned, the heavy red line (labeled as "brown") is drawn to show a linear model rather than an exponential decay model. A more fundamental flaw is that no clear conceptual reason is given as to why an exponential decay model should apply. Indeed, some reason of this sort would be needed in order to reliably conclude that an exponential decay model holds.	WR1E
20071	NOTE: In RS22, Appendix 2, it says that levels 2 to 7 of the local grid (ranging from 1350 ft above sea level down to 330 ft above sea level) correspond to pit bottoms at various stages of mine development. Level 2 is deeper than what other parts of the DEIS indicate for the mine depth.	WR1E
20071	An exponential decay model can only apply in a dilution problem if there is a fixed amount of solute. (I am very familiar with the exponential decay model because it is a commonly used example in introductory courses in differential equations.) The following assumptions also must apply: • clear water would be continuously poured into a container containing a solution; • the liquid in the container would be mixed with the clear water being added, and • the (diluted and) mixed solution would be continuously poured out from another side of the container. Basically, the exponential decay model applies when the amount of solute being removed at any time is directly proportional to what is present in the container at that time, and new solute is not being added. *	WR1E
20073	Do these assumptions apply to this mine-pit situation? I claim that the assumptions do not apply. The point is that the solute in the mine water will be continuously leached out of the rock on the walls of the mine pit. The rate of oxidation of sulfide ions in the rock, to form sulfate ions, should be proportional to the effective surface area of exposed rock. Similarly, as water flows into the pit over the exposed rock, the rate of leaching of sulfate ions to form dilute sulfuric acid also should be proportional to the effective surface area of exposed rock. Now, what is the effective surface area? At any stage in the excavation of the pit, there might appear to be a fixed amount of exposed rock surface. This does not, however, account for phenomena such as the inevitable cycles of freezing and thawing that occur for about six months of every year in Minnesota. There are inevitably going to be cracks in the rock faces of the pit, from various causes such as blasting. The cycles of freezing and thawing are going to expand the existing cracks and also will create new cracks. As cracks extend deeper into the rock, and as new cracks open, there will be new exposed surfaces where the processes of oxidation and leaching can occur. Therefore, we cannot claim that there is a fixed amount of rock surface available to produce leachate, and this rules out the exponential decay model for production of leachate.	WR2D,WR3A
20073	Does this discussion have any practical consequence for management of environmental effects of the proposed project? Yes, there definitely are such consequences. The point is that it will be a long time after closure of the proposed mine – probably several decades – before any significant decrease will be seen in the rate of leaching of sulfate, or of arsenic, cobalt, copper, nickel, and selenium (as mentioned on page 4.1-113 of the DEIS). In all probability, the rate of decrease probably will be very slow for some decades after that time. The continuation of sulfate leaching will lead to continued methylation of mercury downstream in the St. Louis River, and therefore continuation of fish consumption advisories for many more decades or even for centuries. It also means that very long term, or even effectively perpetual, monitoring of these pollutants, and very long term or perpetual maintenance of the wastewater treatment facility, will be needed. This is consistent with the position of the tribal cooperating agencies, as mentioned in footnote 12 on page 3-47 of the DEIS and in footnote 13 on page 3-49, that long term or perpetual monitoring and maintenance of the corresponding facilities will be needed for the tailings basin.	WR1E,WR3A,WR3I

20075	1.4 Implications for water transfers from the mine site. On page 3-10 of the DEIS it is stated that Mine Site process water will be piped from the WWTF to the plant site and/or used at the Mine Site to supplement flooding of the East Pit while that pit is being backfilled (with waste rock from various pits). As a result, it is claimed that these re-uses of Mine Site process water would eliminate the need to discharge any process water to surface waters. Usually, the term “process water” refers to water that is used in some industrial process. This statement could be confusing, since hardly any water-based processes take place at the mine site. After reading the DEIS and technical reports, however, it becomes clear that this term has been used to refer to almost all types of mine site water. There are several reasons to be skeptical about this claim.	WR2G
20076	(1) If more water is pumped out of the mine pit than what is needed in plant processes, then the surplus mine pit water would have to be disposed of somewhere, thus contaminating some nearby stream or local ground water.	WR1E,WR3A
20077	(2) Since we have seen that the amount of mine pit water is likely to be larger than predicted in the DEIS, the existence of surplus mine water, with resulting discharges, is unfortunately very likely. This is the situation that would be likely to hold during the first 10 years of mine operation, before backfilling of the East Pit is begun.	WR3A
20078	(3) Another problematic era is after closure of the mine, and especially after flooding of the West Pit is complete. We have seen in Section 1.3 that leaching of sulfate and metals likely will continue for many years. In page S-7 of the DEIS it is noted that West Pit overflow likely will be directed to the Partridge River, on page S-8 it is conceded that these overflows will initially exceed water quality standards after closure, and on page S-9 there is an indication of uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard. These statements are accompanied by vague indications about the possibility of mitigation, but there is no mention of concrete measures for wastewater treatment after closure. Given the high likelihood of lingering water quality problems, the project plan and the DEIS really must include such measures and a specific plan for funding those measures.	WR1C
20079	(4) To whatever extent mine pit water is transferred to the plant area and the tailings basin, such a transfer may not be a positive step. While it might reduce the amount of water being discharged into the Partridge River, there could be a corresponding amount of water being added to the tailings basin. We will see later that the tailings basin may be even more problematic than the mine pit area. Thus, it could be a transfer of water from one problem area to another, or perhaps something worse than that.	EOO
20081	In this part, I will make some comments about the modeling of groundwater flow and solute transport. The EIS consultant staff made a moderately ambitious effort to construct a ground water model, but various aspects of the tailings basin design seem to have turned the modeling process into an impossible task. Therefore it seems important to comment on the implications of this design, not only for attempts to model the water and solute flows but also for environmental consequences.	EOO
20082	2.1 Consequences for model validity. Although the relevant sections of the DEIS discuss a tailings “basin”, actual reading of the DEIS will quickly reveal that the tailings disposal actually takes place above the local ground level, with the tailings being confined by dams that are constructed from a combination of waste rock and coarse tailings. PolyMet proposes to deposit tailings from its proposed processing plant directly on top of the former LTV taconite tailings basin. It is usually mentioned in the DEIS as LTVSMC (LTV Steel Mining Company). Indeed, the three existing cells (2E, 1E, and 2W) of the former LTV tailings basin are at respective heights of 60 ft, 125 ft, and 200 ft above ground level.	EOO
20083	In contrast, the regional model has only a single layer, corresponding to 640 ft above sea level, said to be below the bottom of the mine pits. {This would be slightly below level 3 in the local model.} The regional model covers 1000 square miles, roughly 40 miles by 25 miles in Figure 3-1 of RS22, Appendix B. The grid spacing in the regional model is 500 meters (1640 ft).	WR1E

Comment ID	Comment Text	Theme Codes
20084	The tailings, both from the former taconite processing facility and also from the proposed PolyMet project, are a mixture of water and finely ground rock. As explained in the DEIS, the former LTV tailings basin is unlined and was constructed in stages beginning in the 1950's. Since it is unlined, there is nothing to stop water in the tailings basin from flowing into local groundwater or seeping out to ultimately flow into some nearby stream. As explained in technical report RS13, Attachment 6, there still are considerable amounts of water in cells 1E and 2E of the former LTV tailings basin. There are a number of known seeps on the north, west, and south sides of this basin, while RS74B gives estimates of the amount of subsurface seepage. The latter report mentions the following situation: "The bulk of this flow is subsurface seepage. All unrecovered seepage is assumed to reach the Embarrass River as groundwater flow during average and high flow conditions."	EOO
20085	There are two layers in the model of the existing situation. The top layer corresponds to the top of the existing LTV tailings, and the bottom layer corresponds to the surface deposits (peat and glacial drift). Additional layers are added to model future vertical expansion of the tailings basin. There obviously is a speculative element to this, but it seems to reflect the proposed design. It must, however, be noted that the model seems to apply to the original tailings basin design. In technical report RS13B, another design is discussed: Tailings Basin – Mitigation Design. It is not clear whether or not those modifications have been incorporated into the modeling reported in the DEIS.	WR2F
20085	The basic setup for the MODFLOW model is explained in technical report RS13, Attachment 6. The model for the tailings basin covers an area of 18 square miles. This is much smaller than the local scale model at the mine site. Accordingly, there could be some distortion in the water table contours predicted by the model because of boundary effects. The calibration of the model (including hydraulic conductivity and recharge rates) seems more plausible than what was done in the mine site model. The grid size is not explicitly given in the text of RS13, Attachment 6, but is indicated in Figure 4-1 of Attachment 6. The grid line separation appears to be 200 meters in the outer portions of the model area, which is somewhat coarse, but is much finer in the areas of the actual tailings basin.	EOO
20087	The basic setup reported so far seems fairly unremarkable: there are some deficiencies that could be remedied, but in general it seems plausible. Therefore, it was very surprising to find the following remarkable declaration on page 54 of technical report RS74B (Surface Water and Groundwater Quality Modeling: Plant Site): "This modeling was performed using MODFLOW and MODPATH. The transport of dissolved constituents through the Tailings Basin is complicated by many factors, including changing pond elevation, unsaturated flow conditions and numerous source areas with very different seepage travel times from each area. It was difficult to know a priori which of these factors would be important in the predictions that were to be made. Because of this, the first round of modeling (presented in the previously mentioned reports) attempted to simulate many of these complexities. The result was a complicated set of models that were difficult for the EIS contractor to validate and would be nearly impossible for the general public reviewing the EIS to understand. In order to provide for more transparent predictions, a second round of conservative modeling was undertaken for the Tailings Basin-Proposed Action."	EOO
20087	What are we to conclude from this? First of all, it seems that the new model is just as bad as the old one from a viewpoint of transparency. It seems that they should have told us something about what the old one predicted, even if it would have added to the length of this unreasonably long technical report. The most obvious suspicion about why they wouldn't publish it is that they didn't like the results for some reason. The report of the modeling results on pages 59-61 of RS74B mentions (supposedly temporary) exceedances of groundwater standards for sulfate, antimony, arsenic, and nickel, as well as (supposedly temporary) exceedances of surface water standards for silver, antimony, cobalt, and nickel. Thus, it seems likely that the first round of modeling would have produced even larger indications of exceedances of water quality standards.	EOO
20089	A similar withholding of documentation is encountered in Sections 8.1.2 and 8.2.3 of RS74B. The declaration in 8.1.2 is that "SRK Consulting provided mass load terms for each source area for each year of operations. This report is not intended to describe how these loads were computed, that will be done either in a revision to RS54/RS46 or in a separate technical memorandum provided by SRK." (Something very similar is said in 8.2.3.) The most recent draft of RS54/RS46 provided for the public comment process is dated July 20, 2007, which thus predates the technical report where the description is promised.	WR1E,PRO3

20089	In such a poorly documented use of spreadsheets, the formulas can be found only by painstaking inspection of many cells of the spreadsheet. This kind of report writing is a willful obstruction of the public comment process.	WR2K,PRO3
20089	Description of the spreadsheet models is sketchy at best. In particular, there is no narrative about what kinds of formulas were programmed into the spreadsheet cells. This does not seem like a method for presenting information, but rather a method for hiding information.	WR2K
20089	• The DEIS and technical report RS74B give only rather limited information about the methods that were used in the “second round of conservative modeling”. One source is in Section 8 of RS74B (entitled “Geotechnical Mitigation – Groundwater Quality Modeling”), which includes subsections 8.1 and 8.3, entitled “Modeling Methodology – Operations” and “Modeling Methodology – Closure” respectively. These mention using MODFLOW-SURFACT modeling to predict travel times through the basin, combined with a spreadsheet model to predict the concentration of dissolved constituents for water released to the environment.	EOO
20089	The original modeling was based on MODFLOW and MODPATH, which are widely accepted software packages developed by the U.S. Geological Survey. By contrast, we have no independent verification of the (mostly unspecified) methods used in the spreadsheet models.	WR2K
20092	• The DEIS briefly mentions on pages 3-31 and 3-32 that there has been a design change, effective as of June 2009. There is less than a page of description of the design changes. As I will explain in the next section, this design change is not adequately documented in the DEIS.	PD9
20092	Furthermore, to the extent that any mitigated design (or “Mitigation Design” as it is called in various RS documents) actually exists, the DEIS tells us very little about its probable environmental consequences, particularly water quality impacts. Specifically:	PRO3,G8
20092	• The wide spacing in the regional model, and the fact that it is 2-dimensional rather than 3-dimensional, make it effectively useless for predicting anything outside the immediate mine area. You could compare it to looking at a digital photo with extremely poor resolution. Moreover, the fact that the regional model calculates nothing at any levels above the presumed bottom of the mine pits makes this model even weaker for predicting environmentally significant variables. Indeed, the layers most likely to have interaction with surface waters are the layers closer to the surface.	WR3A,G9
20092	The DEIS does not disclose the fact (as mentioned in RS74B) that the EIS contractor was not able to validate the results of the MODFLOW/MODPATH modeling of the flow of dissolved constituents through and out of the tailings basin.	WR2F,PRO3
20092	This severely limits the value of further detailed study of this report, because the report applies to a tailings basin design that probably will not be constructed. And the same conclusion probably applies to sections of the DEIS that relate to this technical report or to RS22. Conceivably, some portions could apply to the new design, but other portions most likely will not apply. It is impossible to tell which is which; this also obstructs the public comment process.	WR2D,PRO3
20092	As surprising as the quoted statement from page 54 of RS74 may seem, an even more surprising statement appeared on page 61 of RS74B during the search for “exceedances”: “Because MDNR has decided that the Tailings Basin-Proposed Action has sufficient geotechnical uncertainty to determine that the Proposed Action should not be pursued further, PolyMet decided to not further refine models and develop mitigations that could be modeled so as to demonstrate no exceedances of standards. It is likely that a combination of refined model and modeled mitigations could demonstrate no exceedances.”	WR1E
20095	If PolyMet is allowed to postpone that documentation until the permitting phase, it would mean that a considerable amount of documentation is therefore unavailable during the EIS process, and in particular not accessible for inspection during the public comment period. Moreover, the DEIS fails to disclose that the design that the PolyMet Company proposes to use (the Tailings Basin - Mitigation Design) has not been documented in any detail and isn't intended to be documented until the permitting process. Since the Tailings Basin - Mitigation Design was formally substituted for the original design in June 2009 – four months before the October 2009 finalization date of the current Draft EIS, there really is no justification for the failure to disclose this important fact.	PRO1,PD8

Comment ID	Comment Text	Theme Codes
20095	• PolyMet claims in the above quotation from page 61 of RS74B that “a combination of refined model and modeled mitigations could demonstrate no exceedances”. First of all, this statement implicitly acknowledges that some of the modeling must have shown exceedances. Most troubling, the language of this statement gives a strong appearance that the PolyMet modeling is designed to demonstrate no exceedances rather than to provide objective scientific information.	PD8
20096	The water quality predictions in Sections 8.2 and 8.3 of RS74B for the Geotechnical Mitigation design are more optimistic than the predictions in Section of RS74B for the original design. You can see this by comparing Figure 6-25 (Predicted Concentration – Cell 2E: Proposed Action – Arsenic) with Figure 8-19 (Predicted Concentration – Cell 2E: Geotechnical Mitigation – Arsenic). These figures are shown in an attachment at the end of my comments. {Both figures are from RS74B.	EOO
20096	In that technical report, the phrase “Proposed Action” refers to the original design, in contrast to the current DEIS where “Proposed Action” refers to the Tailings Basin – Mitigation Design.} A very conspicuous difference is that Figure 8-19 lacks the blue curve labeled “Captured Water”. Clearly, this is because the horizontal drains in the original design have been removed from the mitigation design. There is no reason, however, why there would be less arsenic in the tailings water. It is just that no provision is being made in the mitigation design for capturing seepage, or is it that perhaps some future provision will be made for capturing seepage but that the arsenic in captured seepage was ignored when RS74B was prepared? Whichever case applies, it must be emphasized that the difference between Figure 6-25 and Figure 8-19 does not represent a real improvement, but rather a failure to account for all of the arsenic leaving the tailings basin. I also want to emphasize that these two figures are only samples: the corresponding figures in RS74B that apply to sulfate, antimony, cobalt, copper, and nickel exhibit the same kind of differences with no explanation provided.	WR1A
20096	These results for the original design and for the mitigation design were summarized in the text of section 6.2 and section 8.2 respectively of technical report RS74B. For the original design, exceedances were noted for antimony, arsenic and nickel, while temporary exceedances were noted for silver and cobalt. For the mitigation design, there only is an exceedance for antimony and a temporary exceedance for arsenic. It must be emphasized, however, that this does not represent a real improvement, but only the fact that the modeling of the mitigation design fails to account for solutes in captured seepage.	WR1A
20097	Why does the design of the tailings basin lead to such difficulty in the modeling process, and why does it have so many adverse environmental consequences?	RFI
20097	• There are issues of geotechnical stability, particularly the possibility of catastrophic dam collapse. Such a collapse would have horrendous consequences for the environment, for the safety of people in the area, and for the local economy.	GT2
20097	• Both the regional model and the local area model also suffer from the extreme sparseness of the data input. This is partly due to limited availability of historical stream monitoring in the area, but it could have been partly remedied if PolyMet or one of its sub contractors had taken the trouble to collect environmental data during the mineral exploration phase or as a preliminary to preparing this Draft EIS.	EOO,WR1E
20098	Another reason, which tends to amplify the adverse consequences is the sheer scale of the project: • The mine is expected to produce 91,000 tons of ore per day, or 11,680,000 tons per year. On the other hand, the total metallic content of various outputs will be around 48,000 tons per year. Thus, the metallic content is about 0.4% of the ore production, i.e. four-tenths of one percent. If we note that copper sulfide is about 80% copper, we can estimate that the metallic sulfide content being extracted is about 0.5% of the ore production. Even with an estimate that the concentrated output of the process has as little as 10% to 25% metallic sulfide content, we are still left with an estimate of only 2% to 5% of the mine output leaving the processing plant as finished product. This means that something in the range of 95% to 98% of the ore production is going to end up in the tailings basin. This will be over 11 million tons every year. It will be finely ground and mixed with a large enough amount of water to move this amount of material, and it will contain a considerable quantity of toxic substances such as sulfate, mercury, antimony, arsenic, cobalt, nickel, selenium, and silver. Since the material will be finely ground, the process of dissolving these toxic substances will be accelerated. One conclusion is inescapable here: the solution to an environmental problem of this scale will be complex and difficult.	EOO,WR1E

Comment ID	Comment Text	Theme Codes
20098	• Because the former LTV tailings basin is unlined and the proposed PolyMet tailings basin also would be unlined, large amounts of polluted water will escape by subsurface seepage.	EOO
20099	It is also important to note that the Tailings Basin - Mitigation Design appears to be different from the Tailings Basin Alternative discussed in the DEIS which was first introduced prior to the date of the September 17, 2008 DNR memo.	WR1E,WR2D
20100	• The Tailings Basin Alternative provides for the capture and pumping of the tailings basin seepage but allows for the discharge into the Partridge River (especially after mine closure) with no definite provision for treatment. There should be a definite treatment plan, because any water that comes from the tailings basin is going to contain many toxic substances, such as sulfate, mercury, antimony, arsenic, cobalt, nickel, selenium, and silver.	WR1A
20100	• The PRB is an unproven technology; therefore a backup plan should be provided in case the test is unsuccessful.	WR1A
20100	• The PolyMet Mitigation Design vaguely mentions capture of tailings basin seepage but no definite provision is made regarding what would be done with any captured seepage. If this seepage is not handled properly, it would have serious adverse effects on groundwater in the Embarrass River basin. If seepage is not captured and treated promptly, it will make its way into wells and streams many years into the future, at which time the problem will have become much more difficult to remedy.	WR1A
20102	• Construction of a PRB of sufficient size to mitigate the groundwater problems would be a construction project of significant size. It is not clearly stated who would be responsible for paying for it.	WR1A,PD3
20102	• Although it is mentioned only once in the DEIS, it is true that the PRB would require periodic recharge. This would be analogous to replacing the cartridge in a drinking water filter – except on a much larger scale. So, we should recognize that even the PRB, just like other long-term mitigation measures, will require long-term maintenance.	WR1A
20104	1.2 Calibration issues. Once the basic setup of a MODFLOW model has been done, it must be calibrated before any predictive calculations are done. This means that the values of the parameters or coefficients in the equation must be determined or estimated. Some parameters cannot be determined directly, instead they are estimated by an essentially trial-and-error process. With trial values of the parameters of interest, you do calculations to predict values of things that have already been measured. A difficulty in this approach is that the number of parameters being estimated often exceeds the effective number of data points. The situation of an ambiguous result for this problem is called non-unique parameter estimation. An analogy in geometry is that there is a unique line going through 2 points, but if you only know where one of the two points is, then you don't know very much about the line.	EOO
20105	These provisions must be documented as part of the EIS process. No documentation of remediation of water pollution caused by these overflows and seepages is provided in this DEIS.	EOO
20105	Generally, we have to recognize that the tailings basin seepage, just like the mine pit overflow discussed in Part 1, will continue for many decades – and likely for centuries – after closure of the mine. The water pollution caused by these overflows and seepages will adversely affect future generations unless there are adequate provisions to deal with it ahead of time.	WR1A
20107	3.1 The need for financial assurance. We have seen, in connection with both the mine pit and the tailings basin, that there will be adverse effects to water quality that will continue long after closure of the mine and processing facility. The modeling may not be sufficiently precise to tell us the exact amount by which the various pollutants in the mine pit overflows and tailings basin seepage will exceed water quality standards, but we can conclude with a high degree of certainty that there will be significant exceedances and that these exceedances will continue for many years after closure of the facility. Continuing exceedances can be dealt with effectively only by means of continuous treatment of any contaminated water that leaves the mine site or tailings basin area. Therefore, the only responsible course of action is to make provision in advance for appropriate long-term treatment of contaminated water, long term monitoring of water quality, and long-term maintenance of the necessary facilities. This should include:	WR3I

Comment ID	Comment Text	Theme Codes
20108	• Determination in the EIS process of the appropriate parameters of the necessary treatment facility or facilities.	WR2G
20108	• Determination in the EIS process of the appropriate financial assurances, so that the burden of future cleanup costs is not passed on to Minnesota's taxpayers.	PD4
20109	In the history of mine cleanups in the U.S., a large number are associated with bankruptcies of mining companies. In those cases, the taxpayers have paid and are continuing to pay for expensive cleanups. In the case of PolyMet, the company has no assets other than this mine, and this proposed project is to be funded largely by Canadian and other non-U.S. partners. It is not clear how these sponsors could ever be held accountable by Minnesota state law for massive cleanup efforts.	PD4
20110	3.2 EPA requirements. It is stated in the DEIS that Minnesota regulations require determination of financial assurances during the permitting phase, because the costs will be known more exactly at that time. These regulations been developed during an era when we did not have sulfide mining proposed in Minnesota. On the other hand, the EIS process could include discussion of the basic parameters that would apply to that determination. The experience in states or regions with a history of sulfide mining shows that it is better to discuss financial assurances during the EIS process, and this is now reflected in Federal EPA regulations. The situation is very well summarized in the statement by tribal cooperating agencies in footnote 13 on page 3-49 of the DEIS: "It is the position of the tribal cooperating agencies that financial assurance should be fully explored in the DEIS. This is particularly important given the potential for very long-term/perpetual treatment, maintenance and monitoring that may be needed for the Proposed Action. Because of its experience in expensive cleanups of contamination from many defunct or bankrupt sulfide mines, EPA Region 9 has strongly urged other Regions over the past two years to require financial assurance disclosure in the NEPA process. New national rules for financial assurance are under development by EPA, because "Given the history of adverse environmental effects resulting from some hard rock mines, and the expenditure of public funds used in some cases to address environmental problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS." (from InsideEPA.com, Tuesday, August 25, 2009)." Because of the high probability of environmental contamination documented in my earlier comments, the taxpayers of Minnesota deserve to know during the EIS process what the long-term costs of remediation are going to be and what financial assurances are going to be required of PolyMet.	PRO1,PD4
20111	o The regional model for the area surrounding the mine is based on a grid that is insufficient to provide any useful predictions.	WR1E
20112	o Both the regional model and the local-scale model for the mine area suffer from sparseness of data input.	WR1E
20113	o The hydraulic conductivity values and the recharge rates for the surface deposits (wetlands and glacial drift) were set to implausibly low values during the calibration of the MODFLOW model. This has led to incorrect calculation of the amount of water entering the mine pit – estimated to be off by a factor of 5. This will lead to a significant increase in the leaching of sulfate and of metals such as of arsenic, cobalt, copper, nickel, and selenium.	WR2F
20114	I can make my point about this part of the DEIS without further reference to this article; it is mentioned only to document the fact that this problem has been recognized by others. In the DEIS, the model was calibrated to the water levels of some test wells near the location of the proposed mine pit. The parameters which could be adjusted were the hydraulic conductivity and the recharge rate. Hydraulic conductivity refers to the rate at which water flows through a medium, the recharge rate is the rate at which water in the medium is replenished (for instance by precipitation).	EOO
20115	o The MODFLOW model was calibrated by trial-and-error methods, even though more reliable methods are well documented in the scientific literature.	EOO
20116	o The issue of non-unique calibration was raised some time ago by the tribal cooperating agencies, but has been ignored by the other agencies involved in later stages of preparing the DEIS.	WR2F,PRO3

20117	o Transfers of water from the mine site to other areas such as the tailings basin area will magnify water quality and discharge problems in those areas. Please see items (1) through (4) in the text of section 1.4 for more details.	WR1E
20117	o The production of sulfate through the oxidation of exposed rock, as well as the leaching of sulfate and metals (including mercury, arsenic, cobalt, copper, nickel, and selenium) will continue at a high rate during mine operations and for many decades after mine closure, This will lead to exceedance of water quality standards for most of these solutes, and therefore to the need for long-term continuation of water treatment, water quality monitoring, and related maintenance activities.	WR1E
20119	o Although the setup for the original modeling of the tailings basin generally looks plausible, the underlying technical report RS74B claims that the EIS contractor was unable to validate it. No specific reason is given, and none of the results from the first round are presented, leading to a lack of modeling documentation to review as part of the DEIS public comment process.	WR2F
20122	o The original model for solute transport, based on MODFLOW and MODPATH has been replaced by a less transparent model for which the documentation is sketchy to non-existent.	WR2F
20123	o There is no independent verification of the mostly unspecified methods used in the spreadsheet models that have replaced the MODFLOW-MODPATH modeling of solute transport.	WR2K
20123	o It is stated in the underlying technical report RS74B that the documentation of mass load terms for the various source areas is not being documented in the DEIS or in any of the technical reports that have been made available during the DEIS public comment process.	WR1E,PRO3
20124	o The DEIS does not disclose the fact that the EIS contractor was not able to validate results of the MODFLOW/MODPATH modeling of the flow of dissolved constituents through and out of the tailings basin.	WR2F,PRO3
20125	o In the technical report RS74B, PolyMet says that “a combination of refined model and modeled mitigations could demonstrate no exceedances”. The language of this statement gives a strong appearance that the PolyMet modeling is designed to demonstrate no exceedances rather than to provide objective scientific information.	WR1E
20126	If a low value is used for hydraulic conductivity, then you have to use a low recharge rate in order to accurately match the water level in the test wells. Similarly, a higher value for hydraulic conductivity will have to be matched with a higher recharge rate. If you use low parameters, then the model predicts less water getting into the mine pit. Similarly, high parameter values lead to a prediction of more water in the mine pit. The difference between the two choices could be extremely significant for predictions of environmental interest, as I will explain later. Here are the hydraulic conductivity rates presented in Table 3-3 of RS22, Appendix 2:	EOO
20126	o The DEIS fails to disclose that the design that the PolyMet Company proposes to use (the Tailings Basin - Mitigation Design) has not been documented in any detail and isn't intended to be documented during the EIS process.	WR1E,PRO1
20126	o Water quality results reported in the technical report RS74B for the Mitigation Design are more optimistic than the water quality results reported for the original design. This does not represent a real improvement, but rather the fact that captured seepage water was not analyzed in the modeling for the new design – as had been the case for the original design. Thus, the DEIS fails to report likely exceedances of water quality standards for antimony, arsenic, nickel, silver and cobalt.	WR2E
20128	o The PolyMet Mitigation Design vaguely mentions capture of tailings basin seepage but no definite provision is made regarding what would be done with any captured seepage. If this seepage is not handled properly, it would have serious adverse effects on groundwater quality in the Embarrass River basin. If seepage is not captured and treated promptly, it will make its way into wells and streams many years into the future, at which time the problem will have become much more difficult to remedy.	WR1A
20128	o Because the former LTV tailings basin is unlined and the proposed PolyMet tailings basin also would be unlined, large amounts of polluted water will escape by subsurface seepage.	EOO

Comment ID	Comment Text	Theme Codes
20128	o There are issues of geotechnical stability, particularly the possibility of catastrophic dam collapse. A collapse would have horrendous consequences for the environment, for the safety of people, and for the local economy.	GT2
20130	o The Tailings Basis Alternative includes a possible test of a permeable reactive barrier (PRB) to intercept and treat some of the tailings basin seepage. Concerns about the PRB include the following facts: (1) it is an unproven technology, (2) constructing it on a sufficiently large scale would be an ambitious undertaking, and (3) it requires long-term maintenance in the form of periodic recharge. None of the parameters of the design or required maintenance are discussed in the DEIS.	WR1A
20130	o The Tailings Basin Alternative discussed in the DEIS provides for the capture and pumping of the tailings basin seepage but allows for the discharge into the Partridge River (especially after mine closure) with no definite provision for treatment. There should be a definite treatment plan, because any water that comes from the tailings basin is going to contain many toxic substances, such as sulfate, mercury, antimony, arsenic, cobalt, nickel, selenium, and silver.	WR1A
20131	o Because of the high probability of environmental contamination documented in my earlier comments, the taxpayers of Minnesota deserve to know during the EIS process what the long-term costs of remediation are going to be and what financial assurances are going to be required of PolyMet. Therefore the EIS process should include the following:	PD4
20131	o Because there will be a long-term need for water quality mitigation, continuing for many years after closure of the proposed mine, and because of a long history of mining company bankruptcies which have forced taxpayers to pay for expensive cleanup efforts, there is a definite need for financial assurances to guarantee that PolyMet will pay for continued water quality monitoring and mitigation, as well as maintenance of the necessary facilities.	WR3I,PD3,PD4
20132	<input type="checkbox"/> Determination in the EIS process of the appropriate parameters of the necessary treatment facility or facilities.	PRO1
20133	<input type="checkbox"/> Determination in the EIS process of the appropriate financial assurances, so that the burden of future cleanup costs is not passed on to Minnesota's taxpayers.	PD4
20133	The rates for the various bedrock formations are from previous studies in the scientific literature or from recent testing, but the values for the surface features (wetland deposits and glacial drift) are more ad hoc or arbitrary. The Duluth Complex is known to consist of a particularly impermeable type of bedrock; nonetheless, the estimated value given for the vertical component hydraulic conductivity (0.0000033 ft/day) given for the wetland deposits and glacial drift is fully three orders of magnitude lower than the value of hydraulic conductivity (0.0024 ft/day) of the Duluth Complex. From the viewpoint of a scientifically educated layperson, this is inherently implausible. The supposed rationale is that water percolates very slowly out of the bogs. But it doesn't explain why such a grotesquely low value was chosen. It also doesn't explain why this low value is chosen for the vertical hydraulic conductivity of the glacial drift. Supposedly, this has to do with the high silt content of the glacial drift. It would seem, however, that this silt content also should affect the horizontal conductivity, which happens only to a very minor extent. So, we have to conclude that there is no convincing proof that this hydraulic conductivity value is correct.	WR2A
20134	o Based on the experience of states and regions with a history of sulfide mining, Federal EPA regulations strongly recommend discussion of financial assurances during the EIS process.	PD4
20135	It was a good idea to include the Tribal cooperating agencies' comments as footnotes to the DEIS text; they did a good job of technically evaluating the potential impacts described in the DEIS. As there are several areas of disagreement with the DEIS assumptions and projections, the Tribal comments and recommendations should be carefully considered in subsequent actions that will lead to the final EIS and decisions on whether or not to conduct, and how to conduct, the PolyMet mining operation.	G15

20136	I think the analysis of possible Hg effects did a good job of explaining the complexity of the relationship of Hg sources to its incorporation into fish tissues, and the uncertainties about the role ecosystem factors might play in contributing to its conversion to methylmercury. My concerns about the possibilities of the mining activities causing increased fish tissue accumulations in water bodies as far away from the mining site as the St. Louis River and waters in between were substantially reduced since the amount of elemental Hg produced would be very small. There could also be a sequestering effect on elemental Hg by tailings (as seen previously), and conversion to organic Hg might not be increased by the amounts of sulfate residues produced. However, this must be balanced against the uncertainties; associated with an imperfect understanding of the processes involved and their complexity, the somewhat nebulous estimates of contaminant concentrations (particularly sulfate) that would be present the runoff of seepage or overflow from the tailings basin and mine pits, and thus the ability to predict with confidence what will happen with regard to mercury. Considering the magnitude of the problem already, including fish tissue residues in lakes in the vicinity of the plant any likelihood of events leading to an increase is to be avoided. Therefore, the additional work being done to better define this possibility resulting from the Proposed Action is very important and must be considered at the environmental impact review stage, not after.	WR5A,WE8
20136	In my mind a big problem is the time frame over which the Proposed Action might require water treatment to prevent environmental impacts from surface and ground water contamination. According to the DEIS models, the Proposed Action could result in exceedances of state or USEPA water quality standards or "ground water evaluation criteria" (largely drinking water standards) for sulfates, arsenic, antimony, cobalt, copper, nickel, or selenium in ground or surface water collected onsite or adjacent to the mine or processing plant sites. Removal of these by the Waste Water Treatment Facility would of course be expected during the 20 years or so of plant operation, but is also expected to be needed for the additional 45 years or so "Post Closure?" period until the West Pit overflows into surrounding wetlands. Models indicate that further treatment could also be required for an indefinite period after that (decades to centuries) to prevent pollution of adjacent wetlands or the Partridge or Embarrass Rivers.	WR3I,WE6
20138	I think It is unrealistic that Polymet or the state would be willing to assume financial responsibility for treatment of seepages and leachates for this length of time. Too many domestic or foreign financial or economic factors could interfere with any such long-term funding plans. To further complicate matters, financial assurance figures and instruments can only be determined during the subsequent permitting phase of project review. This is far too unique and beautiful an area to be further degraded by the possibility of creating an uncontrolled, perhaps perpetual, pollution source, especially by a mining type (sulfide mining) with such a bad record for environmental damage.	PD3,PD4
20139	Added to the above uncertainties is the fact that the process for extracting the target metals at the plant site is new and has only been tested on a much smaller pilot scale, so hydrometallurgical residues going into and subsequently out of the tailings basin could be substantially different than the model-projected residues.	WR1E,PD2
20140	Based on the preceding considerations, I would conclude the DEIS provides insufficient information to assure me that water contaminant and Hg residue increases will not occur as a result of the mining, particularly when I have no information on assurances by PolyMet that they will provide treatment to control contaminants for as long as elevated levels are capable of leaving the disturbed area. For these reasons I reject the information in the DEIS as being an adequate basis for proceeding to the permitting stage, with the Proposed Action. As a result of the "Catch-22" related to obtaining information about financial responsibility (not available until the permitting stage), I will probably never be able to agree there is a satisfactory basis for conducting this mining operation (ie. have adequate assurances at the EIS stage that PolyMet will pay whatever is necessary to protect the environment, regardless of how long it might take).	WR4B,PD2
20141	I am writing to you as a citizen of Minnesota concerned about the Polymet NorthMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Please accept these comments on PolyMet's Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO

Comment ID	Comment Text	Theme Codes
20142	Concerning impacts of water quality, I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. this is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time and it is an unfair burden to pass on to future generations in Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care. in fact, a possible “mining moratorium law” such as in Wisconsin should be considered.	PD2,PD4
20143	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine’s closure, as well as tailing’s basin discharges high in sulfates can turn mercury into forms that make fish dangerous to consume. it is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR4B,FM1
20143	It is my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of the basin to hold its contents would result in long-lasting and serious contamination PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project	GT2

1202	The state of Minnesota, after six years of intense scrutiny by an independent engineering company, is finally moving forward on a project that could lead to economic revival in northeastern Minnesota. The proposed development of a new mining facility by PolyMet Mining Company at Hoyt Lakes is important to our region, i.e.m direct jobs, support jobs, local, state and federal taxes. However, the project has positive implications that go far beyond the scope of this one endeavor. The future of mining nad manufacturing in Minnesota is dependent upon bringing the MolyMet mine to production. Without state support, it will be virtually impossible to entice other corporations and entrepreneurs to invest the money, energy, and time of the type that PolyMet has expended if such efforts get thwarted by the hue and cry of a scant number of well intentioned but ill informed people. The PolyMet project offers a variable paradigm for the mining of scarce low-grade nonferrous mineral deposits. ANy modern mine must also conform to the rigorous standards that state, local and federal agencies have in place and will enforce. Taxpaying citizens of our area and state will gain substantially by allowing this project to move forward. A successful modern day and transparent mining operation is needed. At the present, mining in most of the regions of the world are not subject to the strict environmental standards in place in Minnesota. PolyMet should be grandted the opportunity to compete with those offshore polluters. However, PolyMet must operate in an environmentally safe manner, which the company has already demonstrated through corporate culture of compliance. Timing is critical. The United States is a net importer of copper, nickel and cobalt with a thrity billion dollar deficit balance of payment in minerals. This project can move America to self-sufficiency in mineral production. In these dire economic times with near record unemployment, a staggering number of people living below the poverty level and gargantuan state and federal spending deficits, the PolyMet project provides an opportunity for the creation of meaningful jobs crucial to homeland economic prosperity and national security.	EOO

1	Generally, I found the DEIES ominous and foreboding in its language and length and disturbing in its overall tone. It was an enormous challenge to attempt to read and digest the content of this document. Better organization and structure to reduce the redundant discussion would have better served the reviewing public. The sheer volume of the document presents a formidable obstacle to good public review and familiarity with the project and its implications for Minnesota's environment. At times the DEIS became annoyingly apologetic consistently minimizing probable impacts or emphasizing lower impacts when model error was equally predictive of greater impacts. A glaring example of this writer bias is demonstrated in the finding that a single (and possibly outlier) data point was used to speculate that waters receiving discharge of sulfate pollutants from the project were not sulfate limited in the methylation of mercury therefore the pollutant was less likely to be of significant consequence. This type of "minimized impact tone" often is allowed to creep into environmental review documents when the agencies responsible for preparing the document allow the project proposer (usually through its consultants) actually draft portions of the EIS. Whether the project proposers were allowed unwarranted authorship of the language in the DEIS or not the writers of the DEIS should strive to maintain a cynical objectivity that reflects their respective agency's recognition that their clients are the citizens of the state and the natural environment that sustains them rather than the project proposers. These cases of writer bias should be meticulously stripped from revisions of the DEIS and the FEIS	EOO
2	Secondly, the purpose and need statement for the project was inappropriately used to justify premature elimination of an important alternative, the underground mining of the desired ore. It is clearly a violation of the spirit and intent of the National Environmental Policy Act NEPA and the Minnesota Environmental Policy Act MEPA to eliminate an alternative to Polymet's preferred open pit mining project on economic considerations alone. Paraphrasing MEPA on this subject, regulatory agencies shall not permit the pollution, impairment or destruction of the natural environment so long as there is a prudent and feasible alternative. Economics alone shall not justify such actions. The underground mining of the desired minerals has the potential to avoid significant portions of the wetland impacts from the preferred alternative, reduce the oxidation and exposure to surface waters of sulfide containing ore thereby reducing potential for acidic runoff, sulfate and other polluting metals discharge to surface and ground waters, reduce air pollution and minimize wildlife and other impacts. This alternative should be fully developed in a revision of the DEIS or amended to the FEIS. Should this alternative be found to be significantly less polluting and to reduce other wildlife and wetland impacts to below significant thresholds the regulatory agencies would be obligated to entertain permit applications from Polymet for this alternative alone. Should Polymet then determine that mining the desired ore under the conditions imposed by following NEPA and MEPA were not feasible for them economically, the environmental review process would have performed as designed. Moreover, this process would have lead Minnesota to have come to the same conclusion about sulfide ore mining that several other states including Wisconsin have, that is that the mining of high sulfide containing ore is not yet feasible in the state while providing for the reasonable protection of natural resources and the environment. Premature elimination of this underground mining alternative in the environmental review process interfered with the logical and analytical process by which this determination could have been reached.	ALT8
3	Third, the segmentation of environmental, social and economic impacts from the land exchange with the Forest Service for an as yet unidentified parcel of land for separate environmental review is also contrary to NEPA and MEPA. Depending on the site ultimately selected there is the potential for significant environmental effects of the project that are not disclosed in the DEIS. Segmentation of the project to avoid full disclosure of the overall impacts of a proposed action is strictly forbidden by these statutes and supporting rules. The DEIS should be amended to include the impacts of the land exchange and then fully republished and re-noticed for public review. Similar to wetland replacement, only identifying to the extent possible the particular parcel or parcels of land involved in the exchange can the public be made fully aware of the complete impacts of the entire project.	PD1

Comment ID	Comment Text	Theme Codes
4	<p>Fourthly, while the cumulative effects analysis in this DEIS represent a significant improvement from past efforts by the Corps of Engineers and Department of Natural Resources there remain significant errors of analysis made that require revision of the DEIS. The DEIS conducts cumulative impact analysis from within the silos of specific pollutant, impacted resource or project aspect without ever bringing them all into focus together with all other past and foreseeable future impacts. This particularly true of the assessment for cumulative impacts on fish tissue mercury concentrations. Fish tissue mercury is an especially sensitive impact category because the resource (fish) has already been stressed beyond acceptable limits, (fish tissue mercury concentrations have triggered human consumption advisories) and special regulatory efforts are being expended to reduce the problem. Furthermore, the MPCA has found that reductions in air emissions alone will not be sufficient to bring fish tissue mercury back within acceptable limits and therefore other efforts (TMDL's's) regulating other factors contributing to the problem to be scaled back in order to realized desired fish tissue mercury levels. In this setting the significance of past human activities is already significant. This drastically 3 lowers the bar for present and future projects impact significance on fish tissue mercury. Essentially, any project that can be shown to potentially increase fish tissue mercury should be considered as having significant adverse impact on that aspect of the environment. Furthermore, to make this assessment the cumulative impacts assessment should have incorporated discussion of the past atmospheric emissions of mercury to the natural environment and the added cumulative impact of atmospheric emissions on methylation of the ambient mercury as it relates to fish tissue concentrations and the fish tissue impact within the geophysical, aquatic and air shed mercury impact footprint of the project. Other discharges non-atmospheric (i.e. wastewater discharges) of mercury and sulfates from all other past, present and future discharges should then have been added to the impact footprint. Then all hydrologic alterations of the watersheds within the impact footprint that further facilitated methylation of available mercury in the environment should have been assessed including construction of water impoundments, lake level control structures, inundation of or alternate draining and flooding of all wetlands (not limited to riparian wetlands) from watershed alterations etc. should have been taken into account. At least impacts of the Whitewater Reservoir's construction and past operation (water level fluctuations) and the added fluctuations associated with the proposed project's impact on mercury methylation should have been assessed in addition to the several reservoirs downstream from the project on the St. Louis River and elsewhere. The relationship between water impoundments and hydrologic alterations has been well documented in Canadian studies of hydroelectric dams and in the Final Joint State/Federal Environmental Impact Statement on Flood Control Impoundment in the Red River Basin of the North prepared by the Corps of Engineers and the Minnesota Department of Natural Resources. The relationship between riparian and riparian or drained wetlands and mercury methylation is well established in Corps of Engineers work on the Rainy River chain of industrial impoundments and their operational plan involving operational and seasonal fluctuations of water levels in these impoundments. Finally all emission sources and water discharges of mercury and sulfur containing pollutants from the proposed project should then have been added to the past and reasonably foreseeable non-project impacts on fish tissue mercury concentrations in the broader project foot print. Environmental impacts accumulate by various means as described in NEPA guidance documents on the</p>	PD10,CR1
5	<p>And finally, one reasonably foreseeable future action by Polymet itself was casually dismissed in the DIES that may have serious implications for the overall cumulative impacts of the proposed project and the impacts of which should be incorporated into this assessment. Alternative E20 on table 3.2.4 (page 3-67) of the DEIS states that "There are additional mineral resources in the West Pit that would effectively be lost if the pit was used for waste rock and/or tailings disposal." Use of the West pit for waste rock or tailings disposal is thus eliminated from further consideration. The probability of future mining of unspecified mineral deposits in the West Pit making it unavailable as a disposal alternative is clearly established in this decision by Polymet. Environmental impacts of this "reasonably foreseeable future action" by the project proposer must be incorporated into the current DEIS. While this may be an exception to the standard criterion for reasonably foreseeable actions (detailed plans or permit applications) the probability of this future action is strong enough for the company to reject reasonable alternatives to the proposed action and thereby rises to the level of reasonably foreseeable. This future mining should be assessed in the revised DEIS and the final DEIS.</p>	G9

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
6	The summary findings (pages s-8) of the project impacts including Antimony, manganese and nickel concentrations exceeding EPA MCL's and sulfate exceeding groundwater evaluation standards is a significant impact of the proposed project that would favor alternatives including the no action or underground mining alternatives to prevent or minimize them.	ALT8,PD2
7	The discussion and land exchange with the U.S. Forest Service (page1-2) remain unresolved issues the finer points of which should have been developed and detailed in the DEIS. The public should be party to and reviewers of both the arguments for the mineral rights and the environmental impacts of the suggested land exchange. If the U.S. Forest Service is an unwilling partner in the land exchange or the access to the mineral rights within the National Forest Lands this debate should be conducted in full view of the public and documented in the DEIS. Failure to include the associated environmental or public resources at stake in the mineral rights access and the suggested land exchange is a critical omission from the DEIS and should be corrected by having these negotiations carried through to their ultimate outcome before final judgments can be made on the overall environmental impacts of the project.	PD1
8	On page 2-6 the DEIS sets forth an unacceptable rationale for not including estimates of financial assurance until the permitting phase. Since financial assurance issue may heavily influence economic viability, future public liability, financial assurance that future environmental impacts are sufficiently addressed after closure etc. the public must have at least reasonable estimates of needed financial assurance at the point of environmental review. Surely, those values can be estimated for each of the preferred and alternative project designs and projected future impacts using conservative (high values for sake of avoiding serious underestimates) to provide the skeptical reviewing public some measure of assurance that they are not being hoodwinked into receiving and monstrous future environmental and financial liability should the project move forward. The DEIS revisions and re-noticing of the revised final DEIS should be delayed until these numbers can be developed.	PD3,PD4
9	In Section 3.1.3 Proposed transport of ore on page 3-17 and 18 the issue of losses of ore from transport trains either by leakage through gaps in hinged doors or large pieces of ore falling out of rails cars is discussed. The center loading of fines and proper loading and or recovery of lost ore rock is offered as assurance that this spillage will not be of concern. The reviewing public should not be assured by these measures. Significant spillage from leakage and falling off of larger ore rocks may well be a significant source of all the pollutants at issue in this project with groundwater, wetland and surface stream and lake impacts. This source of sulfates, mercury and other metals was not properly 2 estimated in the DIES nor were the additional cumulative effects of this vast non-point source of these pollutants properly assessed in the DEIS. The DEIS should be amended to include this assessment.	PD7
10	The projected post-closure operating time of the proposed WWTF is questionable based on assumptions not well supported in fact or data in the DEIS. This contributes to uncertainty about the future financial assurance needed for the post-closure period of the project increasing the public risk of pollution or unpredicted economic burden on the general public should wastewater treatment be needed beyond the projected time frame. The uncertainty in this prediction should be better quantified and the implications for post closure WWTF operation costs and burden more fully developed in the DEIS.	PD5
11	On page in section3.2.1, No Action Alternative on page 3-51 the DEIS implies that the no action alternative would prevent the realization of the social and economic benefits of the Project. This the kind of project favoring speculative assumption referred to in the cover letter to these detailed comments. It has not been established that there would be, on balance positive social and/or economic benefits from the proposed project. Certainly there would be short-term isolated economic benefits to some but the DIES must remain objective and take the boarder long term view from the general society viewpoint. Long term environmental degradation and economic liability should financial assurance measures be inadequate are profound societal economic and social liabilities. The jury is still out as to which of these scenarios is the more likely. Skeptical objectivity on the part of the writers of the DEIS would avoid such unfounded project-favorable findings. Furthermore, the no action alternative may have cumulative long term benefits to the environmental setting that were not discussed in the DEIS. This discussion should be presented here.	ALT8

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
12	Section 4.1.1.2 Groundwater Resources on page 4.12 presents rather vague and unsupported assertions about the dynamics of existing groundwater systems at and in the vicinity of the proposed project. Many calculations throughout the DIES rely on the accuracy of the exiting groundwater condition yet many uncertainties and unknowns exist that may have major repercussions for predicted surface and groundwater impacts from the project. The lack of groundwater data prevent the full development of reliable models and predictions for impacts of the project. This is unacceptable because it has serious implications for assessing all water quality impacts, both project and resource specific impacts as well as cumulative impacts. The entire DIES is severely weakened for lack of adequate groundwater data. These data should be collected and used to better calibrate the ground and surface water models that were used to predict project related water quality impacts and presented in a future revised draft EIS.	WR2F
13	In the proposed action and project alternative evaluation the underground mine alternative was acknowledged as have benefits addressing the four primary environmental concerns with the proposed tailings basin alternative but was eliminated for economics reasons (in addition to mine safety and deposit geography concerns which in reality are not technical but other forms of economic considerations. The DEIS did not find the underground mine to be technically unfeasible, it simply did not meet the 3 expressed purpose and need of the project proposers. That purpose and need was solely based on economic considerations which, by NEPA and MEPA are not justifications for eliminating feasible alternatives. If alternative mining techniques are available that will prevent the significant adverse environmental impacts of a proposed project these techniques must be presented and assessed. Should the project proposer find that the more adequate environmental protections afforded by this alternative make the mining infeasible from a solely economic perspective the EIS process will have served its purpose. The EIS would have provided strong evidence that economics of mining the sought after minerals at this site cannot be conducted in a manor sufficiently protective of human health and the environment. The DEIS should be revised to include evaluation of the benefits of this alternative and if necessary provide the decisive evidence suggested above should that be the outcome.	ALT8
14	The evaluation of alternative means of ore transport in table 3.2-4 on pages 3-64 through 3-67 rejects evaluation of conveyors rather than rail transport that may have significantly reduced spillage of ore and associated (not well evaluated in the DEIS) environmental impacts. Again, this transportation alternative was rejected primarily for economic reasons. Technical feasibility reasons were also cited but not explanation was provided. For the same reasons referenced above regarding the rejection of the underground mine alternative this transport alternative should have been included for more detailed analysis and its potential for reduced impacts assessed. The DEIS should be revised to include this information.	PD7
15	On this same table the alternative of using the West Pit for waste disposal was eliminated because there were “additional (unspecified) mineral resources in the West Pit area that would be lost if the pit was used for waste disposal. This represents a reasonably foreseeable future impact of the mine project that should be assessed in the cumulative impacts analysis. The DEIS should be revised to conduct the required analysis.	G9

16	The mine site geology and hydrogeology presents a data poor and speculative understanding of ground water flows and groundwater/surface water interaction that make predictions of impacts on the groundwater regime on the site very clouded. Further field collection of groundwater levels and movement should have been gathered for this review. Many of the groundwater and surface water impacts of the proposed project rest on having a clear understanding of the dynamics of the existing groundwater system. To the extent the existing groundwater regime is unknown or uncertain, the future immediate and long term impacts of the proposed project and its alternatives become less and less predictable. The DEIS should be revised with more reliable groundwater data on which more reliable predictions of impacts can be based. The discussion of Effects of Groundwater Quality at the Mine Site on page 4.1-66 is disturbing in that it seems to accept at face value and without questioning (objective skepticism) that the limestone treatment of the exposed high sulfide Virginia Formation High Wall in the East mine pits will be effective in controlling acidity developing on the exposed rock face. This is another example of the authors of the DEIS tilting matters of any doubt in favor of unsupported, speculative assertions by the project proposer. While 4 acknowledging that the successful application of the measure has not been demonstrated the authors proceed to accept the assertion as reliable and proceed to base groundwater modeling of East mine pit through filling with processes wastewater and waste rock. This modeling of groundwater quality becomes totally speculative and unreliable in a DEIS of this importance. Either the groundwater modeling should conservatively assume the full acid production that might be expected to leach from the untreated High Wall or the efficacy of the limestone treatment demonstrated both on lab scale and field scale to assure the assumptions in the groundwater modeling are valid before incorporating them in to conclusions in the DEIS. Either of these alternative corrections in the DEIS require a rewriting of this section and revisions of the DEIS conclusions on this topic accordingly.	WR1E,WR2A
17	The discussion of long term water budget for the closed facility in this section of the DEIS would have the reviewer believe that the facility would contain (not discharge) contaminated wastewater or pit drainage/seepage from twenty years after initial mining in perpetuity. This stretches credibility beyond reason given the poor characterization of the groundwater regime presented in the DEIS. A more conservative prediction tempered by the uncertainty introduced into the groundwater modeling of the site would suggest discharges of the contaminated water from the site for many years after closure and if post closure financial assurance does not anticipate these discharges, the general public will be unreasonably burdened with the long term care and maintenance of this facility. The DEIS should be revised to reflect more conservative projections of long term discharge on contaminated water from the site and consequent need for more extensive post closure measures to adequately provide for treatment of these discharges.	WR3I
18	In discussion of process water treatment in the WWTF on pages 4.1-68 and beyond the DEIS seems to suggest that there are doubts whether the proposed WWTF can actually meeting the required for preventing antimony, arsenic and sulfate contaminants from reaching groundwater through seepage from the tailings basin. While the DEIS offers monitoring to determine if the WWTF is providing the needed reduction in these contaminants it does not provide discussion of any contingency plan should the monitoring demonstrate that the required removal of these important pollutants is not provided by the WWTF. A risk assessment of this situation should be provided with the development of a contingency plan including plant shut down should the necessary treatment levels not be provided by the WWTF. The DEIS should be revised to include this risk assessment and contingency plan.	WR2G
19	The discussion on page 4.1-27 of the DEIS of Effects on Water Levels in Colby Lake and Whitewater Reservoir from the proposed action reveals that the Whitewater Reservoir will experience increased water level fluctuations periodically draining and flooding bays of the reservoir. The consequent increase in mercury methylation from the operation of this reservoir and alternate flooding and draining of bays of the reservoir were not included in the discussion of mercury methylation or cumulative fish tissue concentrations of methyl mercury. The DEIS should be amended to include this impact of the project. This section erroneously concludes that because the Whitewater Reservoir will receive inflows from the Partridge River under high flow conditions the resultant low sulfate levels would limit mercury methylation caused by lake level fluctuation. Mercury and sulfate already residing in the Whitewater Reservoir are more that sufficient to support increased mercury methylation with the predicted water level fluctuations. The DEIS should be revised to correctly reflect this response. Similar assessments of mercury methylation resulting from predicted fluctuations in Colby Lake levels should also be added.	WR3F,WR4B,FM1,FM3

Comment ID	Comment Text	Theme Codes
20	In discussion of nondegradation standards on page 4.1-127 and 128 the DEIS offers little assurance other than monitoring that the ultimate West Pit overflows in year 65 will not exceed nondegradation standards for mercury in the Great Lakes Basin. No contingency plan is provided should monitoring demonstrate that the predicted low mercury levels in the West Pit overflows fail to perform as predicted. The DEIS should be amended to develop possible contingency responses in this event.	WR4C
21	On page 4.1-164 in discussion of mitigation measures it is revealed that the wetting and drying of peat in the unlined overburden and storage area could be expected to accelerate methylation of mercury increasing methyl mercury in the drainage from this area. This prediction should have been a finding in the discussion of mercury impacts elsewhere in the DEIS and this discharge added to the cumulative impacts on fish tissue mercury. This should be corrected in the revised DEIS for the project.	WR1E,WR5A,FM1
22	Discussion of the waiver of Clean Water Act Section 401 Certification by failure of the MPCA to respond to the 2005 Corps of Engineers Section 404 permit on page 4.2-1 is troublesome. Certainly the result of scoping and negotiation of alternative facility designs that preceded the DEIS have altered the project sufficient as to make the Corps 2005 public notice of the project void. The Corps should republish a new notice of the revised project providing the MPCA another opportunity to conduct Section 401 water quality review based on the ample new information provided in the DEIS.	WE4
23	The discussion of wetland impacts on page 4.2-9 of the DEIS reveal that the hydrology and type of wetlands involved in the project are hotly contested. The distinction between bogs and cedar swamps would appear to be a significant one with major ramifications for predicted on-site and off-site impacts. This disagreement between the authors of the DEIS and the tribal cooperating agencies should be resolved in the field and the DEIS revised if necessary based on these findings. The promise of future monitoring to resolve this dispute and determine accuracy of predicted impacts is an unacceptable substitute for pre-project groundwater and wetland studies that would more accurately assess wetland characteristics before the project is permitted. Suggesting future monitoring to correct for possible weaknesses of the DEIS is contrary to the spirit and intent of NEPA and MEPA that require justification beyond economics to pollute, impair or destroy Minnesota's natural environment.	WE1,WE2,WE3
24	Likewise, the plant and tailings basin wetland impacts methodology was contested by the tribal cooperating agencies. More accurate and conventional methods were proposed by the tribal cooperating agencies that would take into account unique differences between Cell 2W and Cell 2E settings. These methods should be applied and results used in preparing a revised DEIS and the FEIS.	WE2
25	The DEIS in Section 4.5.4 addresses mercury bioaccumulation in fish. In section 4.5.4.3 project related effects on mercury are discussed. This section relies on an extremely small data set to propose that the sulfate concentration in the Embarrass River watershed is not the limiting factor in determining methylation rates. The establish MPCA strategy for addressing sulfate effects on mercury methylation cannot and should not be dismissed on the basis of "limited monitoring" that was only "NEAR" the Embarrass River. The increased sulfate loading to the Embarrass River and downstream chain of Lakes may well be significant in triggering mercury methylation. The promise of future monitoring should not be substituted for a finding of significant adverse effect of mercury methylation leading to increase fish tissue mercury levels in fish from the proposed project.	FM1,FM2
26	Likewise, the tailings basin alternative would be expected to result in increased methylation of mercury that would impact the Partridge River and fish tissue mercury levels in the impoundments downstream on the St. Louis River. Each of the alternatives would result in further degradation of streams, lakes and existing fish tissue consumption advisory situations in the impacted areas contrary to provision of the Clean Water Act.	FM1,FM5
27	The potential for increased sulfate loadings to area wetlands, lakes and streams from fugitive dust and particulate matter emissions even after control measures are employed were not evaluated for the DEIS. This should be corrected in the revised DEIS and FEIS.	AQ1

-------------------	---------------------	--------------------

396	On page 4.14-5 Wildlife Corridor Impacts are discussed. Consistent and unjustified minimization of resource specific and cumulative impacts are found throughout the DEIS but this is the most egregious example. Cumulative wildlife corridor losses should be considered significant even if the incremental impacts are attributable to the project are found to be relatively minor. This is an example of the “nibbling” effect at a resource the dismissal of which as insignificant is specifically prohibited in explanation of cumulative impacts in NEPA Guidance Documents. The DEIS should be revised to comply with NEPA guidance on this topic.	WI5

396	I am in support of the PolyMet project. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. Based on the documentation outlined in the DEIS, I am confident that impacts to the air and water will be minimal. As a person who lives, works and plays in Northern Minnesota I understand the need to ensure a safe environment project. Let's get on with a project that will do nothing but enhance the Iron Range.	EOO

--------------------------	---------	---------------------------

176	I am writing in regards to the draft EIS on the NorthMet project in Hoyt Lakes, MN. The environmental review process the Polymet project endured took over five years and cost them approximately \$20 million dollars. This is very likely the most reviewed and scurtanized industrial project in the history of the world. The review produced a nearly 2000 page document addressing every possible enviornmental threat as well as multiple possible remediation processes. The Polymet will produce copper and multiple precious metals from the northmet deposit. Copper metal is utilized in wiring, plumbing, circuit boards, integrated circuits, etc. Cars, computers, electric lighting all are not possible without copper. Nickel can be used in products such as stainless steel, rechargeable batteries and is used in airplane components. Platinum, one of the precious metals, is a necessary component in catalytic convertors. All products are derived from natural resources. Every American relies on products made from these materials everyday. I would rather have the metals we need come from Minnesota than from China or South America. If we produce these products, we know they are being produced in the cleanest and safest possible way. If we do not produce these products here, we will still use these products, but will not have influence over the environmental conditions under which they are produced. If the metals are produced here we know that the people laboring are working for a good wage. We know that we do not have to rely on less stable parts of the world for resources that we require. Polymet, a privately funded operation, has spent five plus years now on its environmental permitting process, meeting all the guidelines laid out. Polymet will create good jobs that harvest resources we all need. If we do not get these materials here on our terms, with our labor, we will need to get them someplace else. My preference, and that of the union I represent, is to permit nonferrous mining in Minnesota to produce the vital metals, and jobs, we need.	EOO,G5

1188	The United States no longer has stockpiles of strategic metals or minerals. We depend(trade) on many countries to supply our needs for metals. Nearly everything we eat or touch originated from some form of Mining. We depend(use) potash and the Nitrogen(Huber Process) as a fertilizer for our food..from a mine or a gas well. In a sense farming and logging are a specialty subset of Mining. In farming we attempt to replace some of the removed minerals, by mining some more. Many of the places we trade(depend) with for metals or minerals are not our friends and do not have are best interest in mind. Countries such as Kazakistan, Russia, Mongolia and China. Many countries are unstable and supplies are questionable, such as Congo, Ecuador, Bolivia, Venezueala, or any Sub Saharan country. There is a continuing trend among countries to use critical resources as a lever to enhance their economy or hold sway over others. Recently China indicated they are considering restricting the export of Rare Earth elements, such as Niobrium and Tantalum. China is a major source of these elements. Very little of these elements occur in the US (or have been found). These as you are aware are used in high tech capacitors and magnets. Bolivia has made ovatures that they will resist 'exploitation' of their Lithium deposits. The US, unless I'm in error, has no Lithium deposits. Lithium of course has found its use for ubiquitous batteries for laptops and all sorts of electronic equipment, not to mention the proposed use for electric vehicles. The very industry, green energy, which this country hopes to exploit. The US imports 40% of the Cu used domestically. Their are no active Ni mines in the US. We depend on a low cost dependable supply fo these for modern society. They are everywhere from aircraft to medical equipment to wind turbines to cell phones. The US is already dependent for 60% of our petroleum needs. History has shown that this has not and is not working out well. We are forced to depend(trade) with countries which have diametrically opposed ideas of human rights and freedom of the individual. This trade supports and enriches their systems and objectives and creates a poorer United States. It is in the strategic interest of the United States economically, and politically to be able to produce or have a domestic supply of Metals and Minerals. Metals and minerals mined find their way into EVERY PRODUCT we use, eat, live in or wear. It would seem counterproductive at best to eliminate from our domestic supply the minerals which are required to advance to an energy indepedent and greener society. The windmills, electric vehicles and alternative energy projects (including laptop batteries) are not possible without Nickel, Copper,Paliadium and the other REE. True these can be produced elsewhere, and will be if this project is not successful, but the consequences are greater dependence on foriegn governments, greater air pollution worldwide, exploitation of workers in third world countries and the opportunity lost to create meaningful employment in Minnesota (that will pay taxes) and a new industry. Lets go forward into a more secure, stable world and help produce the advanced greener industries we need by building this facillty.. Northmet.	EOO
2778	The comments listed below are numerous and urgent. I know you have seen them many times. I would like to add that we have a duty to protect these areas for future generations and not just think of the economy of Minnesota for a few years. A 20 year mine that will make a few people rich and leave behind pollution and damage for hundreds of years is not acceptable. Mining companies cannot 100% prove that they will not injure the environment beyond the mine. Cleaning up afterwards is a poor option. The wealth we have in the land and clean waters cannot be measured in dollars. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO,G2
<b>Sender Last Name:</b> Matyska <b>Submission ID:</b> 26		
24	I'm for the project, and I think we should just quit the monkeying around and go on with it already. I've looked at all the information that I can, and I see no problem with it. That's all. Let's do it.	EOO
25	I support the project, and I believe that all the pollution concerns have been addressed to everyone's satisfaction, and most people are for it, and the only people I feel who remain against the project are environmental zealots who can never be satisfied, and so I just -- I would just say that we support the project.	EOO

3910	Please do not allow our pristine Boundary Waters area to be ruined by mining of any kind! It's a sacred place which should be saved for generations to come.	EOO
<b>Sender Last Name:</b> Maxwell		<b>Submission ID:</b> 3184
725	To Whom It May Concern, I am very concerned about the PolyMet Project. It doesn't seem to have been publicized very well in my part of the state. And yet there could be a major impact on the environment which will affect recreational areas that are used by many of us Minnesotans who don't live on the Range. I respectfully request that there be a time extension for written comments, more public meetings around the state in places other than Aurora/Babbitt and Blaine, and that statements by citizens and a public discussion be allowed during each meeting. Sincerely, Margaret Maxwell	PRO6
3724	I am very concerned by the potential long term effects of the type of mining proposed by PolyMet and other mining companies. The land areas and watersheds will mostly likely be forever altered in ways that are not compatible with current use – for the beauty, peace, and recreational activities. Are the short-term benefits so large that they outweigh the long term problems for the people of Minnesota? Are there studies that show the “new” mining techniques are 100% effective. I want my grandchildren to have the places of refuge as I have.	G2A,G7
<b>Sender Last Name:</b> Mayer		<b>Submission ID:</b> 3456
3735	I would encourage you to not yield to the hysteria surrounding this issue. Further I encourage you to go through the entire process, not to employ any short cuts. This is a delicate issue and all the evidence should be considered. Thank you Steve Mayer	G10
<b>Sender Last Name:</b> McCauley		<b>Submission ID:</b> 1036
1136	Laborers Local 1097 and it's 1 000 members support PolyMet Mining's NorthMet Project. For many years we have known about the precious metals that our area can deliver. Now we need the project to move forward with permitting to create new jobs desperately needed for our area. PolyMet will provide millions of dollars of local and state support. They will employ hundreds of people in the plant with just as many spin off jobs that will provide a huge economic benefit to Minnesota. Thank you for your time and we will look forward to seeing this project move forward.	EOO
<b>Sender Last Name:</b> McClure		<b>Submission ID:</b> 3125
3497	Please keep mining out of this very pristine and unique area. I have traveled in the BWCWA since I was a young boy. It is unlike any other park in the USA. I would like to some day bring my yet unborn grandchild to visit this area, please ,please do not allow mining of this type anywhere near the BWCWA.	EOO
<b>Sender Last Name:</b> McDowny		<b>Submission ID:</b> 3398
3688	What happens to the Northeast MN where the mines have been exhausted? Se we then, clean everything up and begin a new mine to keep up the economic boost? Given the risks and minor benefits our economy would pursue with this operation, I think it to be very absurd that this is even being considered. My only hope is that my great, great grand children can have the same experiences on Birch Lake that I have had.	EOO

1	Mine Baby! MINE!	EOO
1	We need jobs that will support families.	EOO
2	On behalf of the 1,070 members of the Duluth Area Chamber of Commerce, I am writing to support an adequacy decision on the draft Environmental Impact Statement for PolyMet Mining Company. While PolyMet proposes to operate on the Iron Range, many of our local chamber members will serve as vendors and service providers to this new business – spreading the positive economic impact. Minnesota law has established a comprehensive and challenging environmental review process. PolyMet has been in the midst of this process for more than five years. It has invested a considerable amount of time and more than \$20 million in studies and other research to support the development of the Environmental Impact Statement. While this is a significant commitment, it is necessary to demonstrate that the project can move forward without harming our environmental and natural resources. PolyMet has made such a demonstration. In addition to developing mitigation strategies for potential environmental challenges, the company also has done an excellent job developing an environmentally friendly proposal: • The project will manage waste rock aggressively, categorizing it and using special liners and ultimately covers to minimize the amount of water that contacts waste rock and treating water that does contact the rock. • Air emissions will be negligible, in part because PolyMet will use the sulfur contained in the ore to fuel the processing of the ore. • Byproducts of processing will be non-hazardous and managed equally aggressively in specially designed containment cells. • No process water will be discharged. I also am impressed with the financial assurance requirements that will ensure all closure costs will be paid for by the company, even in the unfortunate case of a bankruptcy. Minnesota taxpayers will not end up footing any clean-up bills. State regulatory authorities will ensure that PolyMet will mine minerals in a manner that meets state laws. I do not have the same confidence about mineral mined in countries that might not even have such laws. PolyMet has done an excellent job of following state and federal laws and rules associated with environmental review. It is now time for state and federal entities to follow those same rules. I am confident that an adequacy decision is supported by the facts. Thank you for the opportunity to comment on this exciting and needed proposed project.	EOO,G4A
2	The Duluth Building & Construction Trades Council is a Council of 15 Unions with approximately 6000 members. On behalf of the Duluth Building & Construction Trades Council and our many members we are writing to comment on and support Polymet's EIS. " ". We have worked closely with Polymet for many months and are very knowledgeable about the effort they have made to make sure this project is safe environmentally. They have explained to us a number of times how they will process and operate to ensure an environmentally safe operation. Comparing this mining operation to those in the past that were not environmentally friendly is wrong. Today's technology is far superior to that of the past. It should also be clear that Polymet is not in the BWCA's watershed. As local citizens we are very concerned about anything that would harm the environment; therefore we have made a very concerted effort to educate ourselves on Polymet's project. We understand the need to balance resources and the preservation of our water and air. We feel that this EIS supports Polymet's effort to develop an environmentally and economically sustainable project. This mining location contains the second largest deposit of cobalt in the world. Currently the United States is importing 80% of its copper. Polymet will be a domestic supplier of critical metals and will reduce our dependence on foreign metals and create a large tax base for the area and state. It will bring life back into a mining facility that now sits idle and once employed hundreds. It is estimated that Polymet would create 900 permanent jobs, 400 at the mining facility and 500 spin off jobs. It will create 1.5 million much needed construction man hours. Northeastern Minnesota has one of the highest unemployment rates in the state. The tax base is becoming smaller, schools are being forced to merge, and government agencies are being forced to cut back their services. We are asking that you approve Polymet's EIS.	EOO

3	As the President for the Hibbing Chisholm Breakfast Rotary, I have been directed by my local club inform you of our support of the proposed PolyMet project in Hoyt Lakes, MN. Our club is made of up of business leaders in the community and at this point in time we are painfully aware of the need for quality jobs and a diversity of our business mix. We presently have 1400 miners laid off at the 2 mining companies located in Hibbing. Mining is still the base of the Northeastern Minnesota economy and the PolyMet project will create four hundred living-wage jobs along with several hundred secondary jobs in our region. Even though PolyMet is 45 miles away from Hibbing we will be heavily impacted by the high quality jobs that this new type of mining will create. This, diversity of mining jobs are extremely important to our region if we hope to maintain and expand our economic base over the next 50+ years. All this will be done while using a former mine site, rail and utility infrastructure. According to all the information that I have seen, PolyMet will extract and produce these metals in an environmentally sound way and will generate significant economic activity in a depressed part of our state. The Hibbing Chisholm Breakfast Rotary hopes you will look favorably upon this new business venture.	EOO
4	I don't think there is any safe way to mine copper no matter what this company preaches. We have done enough iron ore mining in northern Minnesota already. We don't need to start mining copper in this area with all the risk to the water in that area. Your welcome to read my letter at the two meetings your holding.	EOO,G7
5	I'm writing to offer my support for the PolyMet Mining & NorthMet Project. As you are well aware, PolyMet Mining has been doing everything in their power to design and minimize environmental impact with this project. I personally think it's high time to award PolyMet the permits needed to move forward. As you must be aware, we as a nation are in need of "JOBS". We must compete with the world market. Not only will PolyMet employ around 400, it will also create spinoff jobs in our area. If I remember right, several years ago when the highway 35 bridge collapsed we didn't spend years worrying about environmental impact studies. We needed action now, not eight years down the road. I'm sure Mr. Arkley, you as an educated man, know what I'm saying. Thank you for your time and effort in this matter.	EOO
5	I support the "NorthMet" project. Our area needs all the economic help it can get and this would definitely help. I hope that the project can move forward with being held up by lengthy court proceedings generated by special interest groups who really have no stake in the future of this area. Thank you for letting me share my thoughts.	EOO
6	It is my understanding that Polymet will be a 0 discharge plant in terms of water and thus there will not be any contamination of the local watershed. It is also my understanding that Polymet has	WR3D
7	There are so few areas like this left in the Country & the state – we hate to see them contaminated & spoiled for future generations!	G2
10	My name is Paul Knuti, I'm from Embarrass, Minnesota. My comments reflect two things: one, overall support for the project and for the Environmental Impact Statement as written, with my only concern that there is sufficient money for monitoring all emissions during the plant construction period and during the operating period of the plants in effect. Secondly, I hope there is sufficient monies in reserve in the event that there is an environmental accident or some other consideration that is not anticipated. So adequate monies for monitoring the process and adequate reserves in the event that there is an environmental accident. Those are my comments.	EOO,G4A

Comment ID	Comment Text	Theme Codes
11	My name is Jim Glowacki, my home address is 7300 Birch Point Road, Britt, Minnesota, 55710. My wife and I are 30-year residents of the area. My wife is a school teacher. I'm a business owner; I own three businesses with the full-time staff of 20 people. In addition, I'm on the Board of Trustees for the Nature Conservancy, and I've taken a great interest in this project both from a jobs creation and environmental standpoint. I think we need to seriously consider making this PolyMet project happen if it meets the environmental requirements of the EIS process. I see this -- this PolyMet model as being a model that can be used throughout the world. If we can demonstrate that new mines can be operated and permitted in an environmentally friendly way, I think we're going to be ahead of other countries and processes and this model can be used and Minnesota can be seen as a model of creating sustainable jobs and mining in an environmentally friendly way. So it also has other residual, you know, economic benefits in terms of perhaps selling the technology and mine development process to other developing countries who have the same kind of mineral base we do. Thank you.	EOO
12	Big Picture: The Range needs this economic boost! With the downfall we have been distressed, among the highest employment rates, we are also paying for these unemployed to go back to school and some are getting oversea comp.. We live here because we love the wilderness and all luxuries of recreational activities. We are not going down to the metro in "Special Interest Groups" proposing they stop infrastructure expansions which are contributing to acres per foot of impervious surface pollution runoff! So why are these special 'interest groups making such an issue? There are ways to follow through with this project in an Eco-friendly manner-such as: Management preventions for pollution control, recycling, water consumptions, using a high effluent treatment process and applying "green" technology ( solar, wind and geothermal). Keep these jobs here so they don't go overseas!!	EOO,G2
13	As an out of state outdoor enthusiast I wish to comment about the behind closed doors aspect of this meeting regarding a permit process of PUBLIC Lands. What is the reason for excluding public comment about mining permits since that industry has a poor history of environmental stewardship. Trusting this industry to take care of public lands during their subsidized rape of public domains is ridiculous. This is how superfund sites get started, and to do this to an area like reeks of shortsighted pursuit of a few jobs at the expense of an area that continues to provide steady employment in the tourism access industry. You have apparently been in the scorched earth chapter of conquest of North America for too long. So the operative question is, Who do you really work for? It doesn't appear to be the general public, perhaps the special interests?	G10
14	I believe that this project poses a serious long-term threat to (1) the wetlands, surface waters, and groundwater of Northeastern Minnesota, (2) the taxpayers of Minnesota, and (3) the long-term economic health of Northeastern Minnesota.	G1,G2
15	The mine will destroy thousands. of acres of wetlands and release massive amounts of greenhouse gases. Allowing this to happen would be, the height of irresponsibility. Minnesota needs responsible, sustainable economic development instead of archaic, outmoded, destructive resource extraction industry.	G2
16	To whom it may concern, HlanQ1 <a href="http://cuffmabzdktf.com/">cuffmabzdktf</a>, [url=http://qdvfamyowlc.com/]qdvfamyowlc[/url], [link=http://iokgtxfqzcrs.com/]iokgtxfqzcrs[/link], http://lmajqqbqmhef.com/	G15
17	While there are many more solid reasons for rejecting the PolyMet proposed mining, I am also quite disturbed that public hearings have been restricted to only two sites, and that at the northern Minnesota site the public was denied the opportunity to speak.	PRO6
18	I urge you to add public meetings on this proposal to Duluth, Ely, and the Fond du Lac Indian Reservation. It is crucial that as many of the public that will be impacted by the proposed mining be heard.	PRO6
18	I have grave concerns about the proposed PolyMet mining in northern Minnesota. Foremost among these concerns is the very likely environmental damage from such mining. You are probably aware of several studies done recently on similar mining projects, such as the Brohm Mine in South Dakota where sulfur in the ore no greater than that of the PolyMet proposed mine site resulted in significant acid mine drainage. A 2006 study of sulfide mining environmental impact appraisals showed that 76% of the mines had significant water pollution, although all the proposals predicted no water pollution at all.	G7A

19	No mine!!!! THE damage it will do is NOT worth it. Mining is a destructive endeavor. We need to protect our lands, not rip them apart.	EOO
19	Regarding PolyMet ..... I say, "No, no, no!" They broke the law in Floodwood, MN regarding the wetland replacement. They have no business being here now.	EOO
20	As a business owner in Minnesota, I support the PolyMet Mining's NorthMet Project. PolyMet's 400 plus employees and hundreds of spin-off jobs are needed during this poor economic period. PolyMet will provide millions of dollars for local and state businesses who support families, as well as, paying taxes which support all government bodies. ThePolyMet project has been designed to minimize environmental impacts, reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands, and utilizing multiple safeguards to protect the environment. With Minnesota's strict environnient requirements to protect air, water, and land this project should go forward and be monitored as with all mining concerns. After reviewing the DEIS it certainly appears that the environmental impacts will be minimal. It is time that we as Americans begin to control our own destiny once and again. We have been turning our industrial base over to foreign concerns long enough. PolyMet has provided ample information, shown extreme patience, and should now be approved for the good of Minnesota and the United States of America.	EOO
21	The White Community Hospital Board of Directors and Administrator strongly support the PolyMet Mining Project. We are a 16 bed critical access hospital with a 55 bed nursing home located in Aurora, MN and excited to see the significant economic benefits that PolyMet will generate. They will contribute to the local and state economy, increase needed employment opportunities and support our area communities. Polymet's EIS has evaluated, in detail, all the elements of potential environmental concern for a new mine. The public can be confident that the draft EIS offers regulators the information they need to issue permits so that PolyMet can operate in a way that protects natural resources. Poly met has also demonstrated it can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. Again, the White Community Hospital supports and recognizes the tremendous benefit the PolyMet Mining Project will provide to this region.	EOO
22	The Iron Range Construction Liaison Committee is made up of local unions and union employers. Our purpose is to promote the construction industry and show the cooperation between labor and management On behalf of the committee and our many members we are writing to comment on and support Polymet's EIS. We have worked closely with Polymet for many months and are very knowledgeable about the effort they have made to make sure this project is safe environmentally. They have explained to us a number of times how they will proceed and operate to ensure an environmentally safe operation. Comparing this mining operation to those in the past that were not environmentally friendly is wrong Today' s technology is far superior to that of the past. It should also be clear that Polymet is not in the BWCA's watershed. As local citizens we are very concerned about anything that would harm the environment; therefore we have made a very concerted effort to educate ourselves on Polymet's project We understand the need to balance resources and the preservation of our water and air. We feel that this EIS supports Polymet's effort to develop and environmentally and economically sustainable project. This mining location contains the second largest deposit of cobalt in the world. Currently the United States is importing 80% of its copper. Polymet will be a domestic supplier of critical metals and will reduce our dependence on foreign metals and create a large tax base for the area and state. It will bring life back into a mining facility that now sits idle and once employed hundreds. It is estimated that Polymet would create 900 permanent jobs, 400 at the mining facility and 500 spin off jobs. It will create 1.5 million much needed construction man hours. Northeastern Minnesota has one of the highest unemployment rates in the state. The tax base is becoming smaller, schools are being forced to merge, and government agencies are being forced to cut back their services. We are asking that you approve Polymers EIS.	EOO

23	<p>I am president and co-owner of Northern Industrial Erectors located in Grand Rapids, Minnesota and want to express my thoughts and opinions to you and the DNR regarding the proposed PolymetProject. It is very clear that Polymet has completed an extensive environmental impact study and is able to demonstrate that they are fully competent to operate the proposed facility in an environmentally friendly atmosphere. Based on the documentation, I am very confident that this mining operation will have minimal impact on our environment. In addition Polymet is proposing to utilize an existing bankrupt taconite facility and create much needed jobs for our north country. Just what good is this facility now to the state of Minnesota and to the local residents? Absolutely nothing - so why not give them the permits to start producing a product that will create real jobs and a steady tax base. We in northern Minnesota cannot survive without having private industry as our main job base. Most of our young leave the area as soon as they finish school to good jobs elsewhere. Our town's and school's populations are dwindling because of the loss of jobs in the industrial sector. Private investors are what we need to rebuild northern Minnesota not government sponsored entities that operate on subsidies. The majority of land in Minnesota is soil. On soil you can grow different commodities that produce a product. Every grower knows and understands that to prosper from your planting you have to fertilize. In my opinion these growers pollute the land and waters way more than a metals plant ever could. In northern Minnesota we have only two commodities - timber and rock. We can and will make an honest living from them if you let us. Mr. Arkley, please stand behind this project during this permitting phase and onto inception. Our people need good jobs and Polymet is willing to provide them.</p>	EOO
23	<p>As commissioners of the Department of Employment and Economic Development (DEED) and Iron Range Resources (IRR), we are writing to offer our institutional and personal support for the NorthMet Project being proposed by PolyMet Mining Corporation. PolyMet seeks to develop Minnesota's first open-pit copper-nickel and precious metals mine, using portions of the former LTV Steel Mining Company taconite facilities located near the Iron Range cities of Aurora, Hoyt Lakes and Babbitt. The company plans to employ environmentally-smart mining and processing techniques to harvest and benefitiate these important resources at a site where such work already has taken place for half a century. Their NorthMet project represents a \$600 million investment in our state that intends to create 300 construction jobs, 400 permanent mining jobs, 650 permanent "spin-off" jobs, \$15 million annually in state and local revenue and \$45 million in federal revenue. These outcomes are critical to our nation, our state and the Iron Range area, especially as we climb out of the deepest economic downturn our country has seen in many years. DEED and IRR are economic development organizations that work with businesses and communities to retain and create quality jobs for Minnesotans. Less than a decade ago, we were dealing with the aftermath of the LTV bankruptcy and the ensuing closure of LTV's taconite plant at the PolyMet site, which put 1,400 people out of work. A state agency team worked with Cleveland-Cliffs and Minnesota Power to bring these valuable mining assets out of bankruptcy, with the hope that this infrastructure, equipment, buildings and land might one day be put back to work producing value-added products such as those contemplated by PolyMet. The NorthMet Project will restore much-needed economic prosperity to many individuals, families and communities of the Iron Range. Copper and nickel are crucial commodities that support housing, infrastructure and industry. Platinum, palladium, gold and other precious metals are used in computers, cell phones and catalytic converters, devices that not only drive our economy but protect our environment. Today's world needs and demands these materials. As Americans, we should mine and process such minerals here in an environmentally sustainable way, rather than let such activity ensue elsewhere on the globe where it may not be so carefully undertaken. It is within this context that we support this project, sincerely believing that it can be undertaken in an environmentally responsible manner, recycling valuable industrial assets to extract. strategic minerals our modem society requires, and is so doing, creating wealth and quality jobs upon which we build sustainable communities. We thank you for allowing us to submit these comments on the PolyMetNorthMet Draft Environmental Impact Statement. DEED and IRR are very supportive of this project. Please feel free to contact us if have any questions about our comments.</p>	EOO

24	<p>This letter is in support of the PolyMet Mining Project. As an educator in the St. Louis County School System, I have watched as enrollment declines due to families having to move from the area to find a job that provides a livable wage. Along with declining enrollment in the K-12 schools, often when our students choose higher education, we face losing them to other areas where they can find a job in their chosen profession. PolyMet Mines will offer an opportunity for up to 400 full-time positions, as well as 500 spin off jobs that will lead to challenging and exciting careers for our experienced and young. PolyMet Mining's contribution to our local and state economic base will be widespread not only by increased employment opportunities, but with a larger tax base, and increased county revenue from property taxes. PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system. I Welcome PolyMet into "my back yard". I have attended both Open Houses that PolyMet Mining made available to anyone who wished to attend. They provided all the information anyone needed to know regarding the project. It was interesting, exciting and I feel very confident that this project is environmentally safe and essential. Minnesota has the precious metals and is very strict in their environmental requirements and PolyMet is committed to protecting our air, water and land. The metals from this mine are needed for so many applications (medical, cell phones, computers, many products we use every day). I also know that that the United States has the Environmental Regulations that other countries do not even consider when looking at mining, manufacturing, or saving our planet, in general. It is time that this mine be permitted and have these metals mined domestically. PolyMet has invested much to make this an environmentally safe project. Move forward. No response needed to this letter.</p>	EOO
24	<p>I am a member of the International Union of Operating Engineers, Local 49. I am writing to comment on the Polymet project and the EIS. The area Polymet intends to use for the precious metals mine and production site are located in an area that was home to LTV, a now non-functional mine in Northeastern Minnesota. Mining on this site has taken place for decades prior to LTV going out of business. Now we, the residents of Northeastern Minnesota, have a chance to see new life injected into an economically depressed area. We are currently dealing with our children growing up, moving away and having very little chance of coming back and making a living here. Our schools are closing and consolidating due to decreased enrollment. We need this project to help sustain a future for the residents of this area. Please don't misunderstand, we will not sacrifice our environment just for jobs. We believe that this project will continue, as has been demonstrated in the EIS to protect and monitor the environmental impacts of this great state and country in which we live. As a 35-year member of the International Union of Operating Engineers, Local #49, I may or may not get an opportunity to work on this project but, I will in any case benefit by the positive impact through hundreds of spin off jobs of this project in our area. Please approve this EIS for Polymet so we can move forward for a change.</p>	EOO
25	<p>I am writing to express my strong support for the PolyMet Mining Co to develop a copper, nickel, platinum, palladium, gold and cobalt mine and process ore at the former LTV Steel Mining Company plant near Hoyt Lakes. As President of Air Liquide Large Industries U.S. LP I have a continuing interest in knowing PolyMet will produce these metals in an environmentally sound way and provide our young people with multiple opportunities for challenging and exciting careers while providing critical metals needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential everyday products. I believe PolyMet's EIS has evaluated, in detail, all the elements of potential environmental concerns for a new mine and the public can be confident the draft EIS offers regulators the information they need to issue permits so that PolyMet can operate in a way that protects our natural resources. In closing, I want to thank you for taking the time to read this letter and I look forward to hearing I have been successful in obtaining support for PolyMet to proceed with the permitting of this mine.</p>	EOO
25	<p>I am writing in support of PolyMet. I am a business agent for the International Union of Engineers, Local 49. We have some 13,000 members in Minnesota, North and South Dakota. It is our members that run the machines needed to build these projects. We, like everyone else are experiencing double digit unemployment. Many of our members continue to live in this area but most commute in many cases hundreds of miles for work. We need this project to help sustain the economics of the area. We believe the safeguards Polymet is proposing for the mining, production, and watershed will have a positive impact on this area and will not add an undue stress to those who live and visit this area. I ask that you approve the EIS and move Polymet forward.</p>	EOO

26	<p>Wells Fargo is a leading employer in Northeastern Minnesota, having 19 offices and over 400 team members who work, live and play in the region. As Senior Vice President and District Manager of business banking for the region, I know first hand the positive impact the PolyMet Mining Co. project could have on our area economy and Wells Fargo's ability to maintain and grow operations in the small communities we serve like Ely, Eveleth, and Hoyt Lakes, to name a few. The impact would likely reach to our Duluth operations. As an Iron Range native, born and raised in Eveleth in a railroad family, I also lived through the 80's, when unemployment was high and the economy struggled. My hometown population dropped, people moved away and eventually my high school, like many others, merged with a neighboring community. I watched as neighborhoods full of well-kept homes fell into disrepair. I still see the signs of that strain, both on the physical assets of the communities across the Iron Range and on families and friends living in the area. The PolyMet project can ease this strain and strengthen the regional economy by creating sustainable economic development. The project being proposed by PolyMet Mining Company would create that sustainable economic development, and I believe it would do so in an environmentally sustainable manner. The 400 jobs that PolyMet will create will lead to the creation of hundreds of other jobs throughout the region; these employers and jobs will be a catalyst to strengthen our base at Wells Fargo.</p>	EOO
27	<p>As a citizen concerned about the economic health of the State of Minnesota and the need to create jobs, I am pleased to support and endorse PolyMet Mining's NorthMet Project. The mining of nickel, copper and other precious metals from this project will clearly add to the vitality and growth of northeastern Minnesota's economy. However, I am equally concerned about the vitality of this state's natural resources. We cannot have increased economic value at the expense of our natural resources. That is why I am confident that our environment will remain safe due to the prudent safeguards the state has in place in order to make our mining industry safe in regards to our natural resources. I continue to have angst at seeing our state and country less competitive with foreign economies. We cannot survive economically if we don't actually produce raw materials that can compete in the global marketplace. This NorthMet project will give our state a good opportunity to compete on a global basis and will also produce complimentary industries which again will add to our economic vitality. This of course leads to more jobs and a healthier tax base. As an investor in the mining industry I believe the PolyMet project stands out in how thoughtful collaboration between state, federal and private parties can produce an outcome that is balanced and good for both the environment and the economy. This collaborative process is a model on how such projects can be done the right way.</p>	EOO
28	<p>As the Executive Director for the Hibbing EDA, my job is to support the development of new businesses with quality jobs and to promote the existing business community. The proposed PolyMet project will accomplish all of the goals. Even though PolyMet is 45 miles away from Hibbing we will be heavily impacted by the direct jobs as well as the secondary support industry jobs that are necessary with a large project of this nature. Hibbing is blessed with a large number of companies that support the existing taconite mining industry and we expect PolyMet will also need our business community to be successful. At this point in time Hibbing is also painfully aware of the need for quality jobs as we presently have 1400 miners laid off at the 2 mining companies located in Hibbing. Last week I was also notified that Internet, Northern Castings was going to be permanently closed, terminated 77 remaining jobs. Mining is still the base of the Northeastern Minnesota economy and the PolyMet project will reuse a former mine site so the environmental impacts will be minimal. According to all the information that I have seen, PolyMet will produce these metals in an environmentally sound way and will generate significant economic activity in a depressed part of our state. It is abundantly clear to me that the PolyMet project is the type of quality economic project that I am continually in search of and the data shows that the environmental impact will be at an acceptable level for those of us who have made the Range our home for generations and hope to remain here for generations to come.</p>	EOO

29	<p>PolyMet Mining Corp. is currently attempting to permit a job-creating project in Northern Minnesota. As long term investors in the state of Minnesota, as shareholders of Poly Met, and as beneficiaries of a strong investment climate, we support PolyMet's NorthMet project. We would like your support in helping this project move forward. As you are aware, PolyMet has submitted a draft Environmental Impact Statement (EIS) to the people of Minnesota. We urge you to take action to help the EIS gain approval and to help make the NorthMet project a reality. The approval of this project will enhance Minnesota's status as a state that welcomes investment. According to Forbes, Minnesota is currently #17 on their list of The Best States for Business, but it is a lowly #30 when it comes to the regulatory environment. By giving approval to the NorthMet project, we believe Minnesota will clearly improve its perception within the investment community. Heartland Advisors is an investment management firm in Milwaukee, Wisconsin. We have been investing globally and in Minnesota-based publicly traded companies for over two decades. As of June 30, Heartland had over \$30 million worth of investments in Minnesota-based companies. Minnesota has generally proven to be a friendly environment for investing, and we hope it can remain so. The NorthMet project has undergone more environmental engineering and review than any company we have ever witnessed, and we are confident it will be a flagship operation for environmentally sustainable minerals extraction. By approving this project, we believe Minnesota will not only demonstrate that the state is open for business, but it will be giving the people of Minnesota a landmark mining operation that will be admired around the world. We believe the approval of North Met will be a positive for Minnesota's business climate. In our opinion, your help in advancing the approval of NorthMet will only lead to a greater level of investor faith in the North Star State going forward.</p>	EOO
30	<p>I have reviewed the Draft EIS for the NorthMet project and want to congratulate you and your staff for your diligence in assembling what I believe is likely the most comprehensive examination of a project to date in Minnesota. As I understand the EIS process, it explores potential impacts and mitigation strategies for those impacts. It is not meant to supply definitive answers to all possible operating scenarios. With that in mind, I believe the project should be allowed to move forward. This project has the ability to significantly improve the economic situation in Minnesota and provide a much needed boost to both construction and permanent jobs. The US is no longer the driver of the world economy and as such we need to have a more strategic position with regard to the metals that the NorthMet deposit holds. I feel that PolyMet has demonstrated it can produce these metals while following the state's strict environmental requirements. There will be opportunities to learn from this project and to understand better the actual conditions that are created. All the work done by the MNDLR on Minnesota sulphide ores over the years has created an understanding of the mechanism and severity of acid rock drainage. We understand it and can safely deal with it. A society that remains static and does not continue to grow and develop is not a society that we can afford to have today in this global economy. Approve this project and continue your diligence on protecting Minnesota's environment while developing her natural resources for the benefit of all.</p>	EOO
31	<p>My name is Mark Mandich. I am a county commissioner in Itasca County. I am a strong supporter of Poly Met Mining's NorthMet Project. The economic impact of this project is huge for northeastern Minnesota. Our unemployment up here is worse than the state average. As a person who lives, works and plays up here, I do understand the environmental issues, and I believe that the EIS lays the proper groundwork for developing an environmentally and economically sustainable project, and I wholeheartedly support it.</p>	EOO

32	The electrical industry in Minnesota has been hit harder than most industries during this current recession. With nearly 50% of our member out of work for up to two (2) years, and no end in sight, electricians throughout the state are looking to support their families any way they can. On a daily basis, I hear about workers going through divorcees, bankruptcies, and losing their homes. The devastation this long and terrible recession is causing our families is terribly troubling. The PolyMet Mining Company proposal to build a copper-nickel-precious metal mine and processing facility near Hoyt Lakes offers our members some hope to wait out this recession. Construction will require about 1.5 million man hours of construction over a two-year period; some of my members are bound to be part of that construction work force. PolyMet has made your job relatively easy by proposing a very environmentally friendly project. Much of the infrastructure for transportation and processing will be recycled from the old LTV plant. Stockpiles will be managed so water infiltration is minimized and so any water that does percolate through the piles is collected and treated. Sulfur in the ore will be used as fuel in the process, and waste streams will be managed. Air emissions will be much less than other facilities in the region – so much less that they are considered a minor source. The draft environmental impact statement for the project has done a very thorough job of looking at all the potential impacts and offering options for mitigation, where appropriate. The draft EIS should be deemed adequate so that permitting can begin quickly, and so our members can start working to build the facility.	EOO
33	My name is David, and I would like to support the Project that is proposed for Polymet. I have looked at what the concerns are, and understand the DNR's desire to do what is the best for the state of Minnesota. It looks as if the Polymet company is going to meet the stringent requirements of the state. I would rather that we have a plant operating in Northern Minnesota than have more jobs go to China or one of the other countries that would be willing to do the same process with less regulation. I feel we need to think not only of what is best for Minnesota, but what is best for the planet.	EOO
34	As the owner of a small business in Northeastern Minnesota, I have followed with keen interest the development of the proposed Northmet Project, otherwise known as Polymet. I believe Polymet and the DNR have gone the extra mile to insure environmental safeguards second to none. Operational and mine closing issues have been addressed as well. The positive economic and positive environmental impact to the local area, State of Minnesota, and the United States will be significant. I strongly support the acceptance of this Draft E.I.S. and urge you to issue the necessary permits to begin construction of the plant and mine sites.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
35	<p>I appreciate the opportunity to participate in the public comment process for the draft environmental impact statement for PolyMet Mining Company and its NorthMet mine proposed near Hoyt Lakes, Minnesota. I am provost of Mesabi Range Community &amp; Technical College, the college that serves the Citizens and businesses and industries of the Iron Range, where Hoyt Lakes is located. The majority of our students are from the Iron Range and are the beneficiaries of generations of iron mining that has built and supported schools of excellence, that has provided jobs for tens of thousands of parents and grandparents, and that has managed to protect our environment and honor our natural resources. Our students understand that if they work hard, meet the requirements of their degrees and work to high standards and expectations, they will be successful in whatever career they may choose. I'd like to think the same advice applies to PolyMet. Additionally, I view PolyMet as an important partner in helping our graduates lead successful, meaningful lives in their hometown communities. The success of Poly Met translates to workforce and community development - factors that also drive the success and sustainability of the college and, most importantly, benefit our learners. PolyMet has worked hard - very hard. The process of developing this draft environmental impact statement has taken nearly five years and has required an investment of more than \$20 million. (This is on top of the years of research and millions of dollars required just to enter the environmental review process.) PolyMet has met the environmental review requirements that the state and federal agencies have established. All of the issues raised in scoping documents have been addressed in the draft environmental impact statement and alternatives, where appropriate, have been offered. The draft impact statement demonstrates that PolyMet will be able to meet permitting requirements. And PolyMet will meet the state's financial assurance requirements, so taxpayers won't have to foot the bill for any clean up that might be required should PolyMet fail to do so. Finally, PolyMet has gone the extra mile - it has exceeded expectations by identifying the worst possible things that could go wrong and then creating safeguards to address that worst imaginable situation. PolyMet will protect our environment, my students' environment. PolyMet will create hundreds of jobs, jobs my students can help fill. Please make my participation in this public process meaningful. Please determine that the draft environmental impact statement is adequate and begin permitting this exciting neW development that is essential to the long term vitality and sustainability of the Iron Range and beyond.</p>	EOO,G4
36	<p>This letter is submitted to provide my comment on the proposed NorthMet mine and processing operations proposed by PolyMet Mining Company near Hoyt Lakes, MN. I have many years experience in the mining industry and specifically in the environmental issues related to the mining industry. I am familiar with the environmental review process through direct experience related to my past responsibilities at a local mine. It is clear to me that the environmental review process for the proposed project has resulted in a thorough and comprehensive draft environmental impact statement (DEIS). I conclude that the DEIS has thoroughly examined the potential environmental impacts of the proposed project. I am aware of the concerns that some citizens have expressed about the project, but these concerns do not support the conclusion that the DEIS has failed to examine the issues. The concerns about the project are properly addressed in the permitting processes. I urge that the DEIS should be declared adequate to enable this project to progress into the environmental permitting phase.</p>	EOO

37	The economy of Minnesota is an ecosystem just like the ecosystems found throughout the State. When one part of the ecosystem is struggling, it has a negative impact on the related parts. The Building Trades in the twin cities metropolitan area are struggling. The economic recession has devastated the industries that have kept our members employed, As many as fifty percent (50%) of our members are sitting on the bench on any given day. The PolyMet Mining Company proposal to build a copper-nickel-precision metal mine and processing facility near Hoyt Lakes offers our members some hope to wait out this recession. Construction will require about 1.5 million man hours of construction over a two-year period. Some of my members are bound to be part of that construction work force, but we don't have time for delays. PolyMet has made your job relatively easy by producing a very environmentally friendly project. Much of the infrastructure for transportation and processing will be recycled from the old LTV Plant. Stockpiles will be managed as water infiltration is minimized and any water that does percolate through the piles is collected and treated. 39	I am writing in response to the EIS. I haven't changed my views on allowing copper mining in Monnesota.	EOO
40	Also why hasn't Poly Met had to put up or sigh a waiver for a potential clean up after the mining is over. It has happened numerous times in the past with copper mining leaving a huge mess of contaminants and not paying for a clean up.	PD4
41	I don't think you can protect our water from being contaminated from the sulfide. Your going to risk our water for 20 years of mining.	WR3A

42	<p>As you may determine from the letterhead, I am a resident of Florence, Kentucky. Also, in the interest of full disclosure, I wish to state that I own stock in the PolyMet Mining Company. I started investing in PolyMet in the late 1990's when I realized that the United States was completely deficient in producing the raw materials (copper, nickel, cobalt, platinum and palladium) required by our industrial base for the production of the goods needed to maintain and enhance our standard of living as well as providing the equipment necessary for the safety of our country. Our country needs copper ore for the construction, plumbing and wiring of new homes and businesses; nickel for the batteries required by the electronics and defense industries; cobalt for hybrid vehicles; and palladium and platinum for the catalytic converters used by the automobile industry. The northeast area of Minnesota is the only area in the United States that contains all of the ore mentioned above, and, currently has the infrastructure already in place to produce this much needed commodity. Furthermore, PolyMet will provide good, safe, well paying jobs to an area that is currently experiencing a very high rate of unemployment. In addition to the advantages previously listed, the PolyMet project has been designed to minimize impacts to the environment by reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. It is also important to note that the draft EIS is a detailed, independent review; federal, state and tribal agencies have shaped the development of the draft EIS, which was written by an independent third party. PolyMet has invested tens of millions of investor dollars in studies to comply with every EIS request and permitting process. As an investor in PolyMet, I have a keen interest in the success of the environmental review and permitting process and have been following it closely. I appreciate the opportunity to express my complete support of both the EIS and the PolyMet project and I look forward to the MDNR issuing the Permit to Mine after the review process is completed.</p>	EOO
43	<p>On November 24, 2009, the Virginia City Council went on record in support of the Environmental Impact Statement for the PolyMet Mining Company's project to develop a copper, nickel, platinum, palladium, gold, and cobalt mine at the former LTV plant near Hoyt Lakes. Enclosed please find a copy of Resolution No. 09140, in support of the PolyMet Project. The City Council encourages the Minnesota Department of Natural Resources to approve the draft Environmental Impact Statement for the PolyMet project, which will provide a huge economic benefit to Minnesota, especially Northeastern Minnesota, and also utilize a former mining plant. If you have any questions, please feel free to contact me at (218)748-7500. Thank you.</p>	EOO
44	<p>Having authored the Minnesota Reclamation Act of 1969, and having participated in the subsequent hearings and process leading to the adoption of the regulations needed to implement the Act, I have every confidence that the DNR has the capability and experience to responsibly oversee and regulate the potential development of non-ferrous mineral projects in our state. Starting with the PolyMet project, which the DNR has been assiduously reviewing for the past three years, I would hope that the EIS process can be completed, allowing PolyMet to move forward with the development of its project. Thousands of jobs and significant economic benefits will flow from the careful and environmentally responsible development of non-ferrous mining projects in Minnesota, Final approval and permitting of the Poly Met undertaking will start this positive resource development for our state.</p>	EOO
45	<p>As a descendant of the Merritt Brothers, who discovered the iron ore deposits on the Mesabi Iron Range, I would like to express my thoughts and feelings to you and the DNR regarding the proposed PolyMet Project. I feel that PolyMet has completed an extensive environmental impact study and is able to demonstrate that they are fully competent to operate the proposed facility in an</p>	EOO

46	The people of Northern Minnesota, specifically the Mesabi Iron Range, have suffered from the boom & bust economy for almost 100 years. PolyMet has proposed using a former bankrupt taconite facility that left nearly 600 employees without jobs, health care, and pensions, as well as the State of Minnesota without the then stable tax base of nearly 50 years. Northern Minnesota cannot survive without private industry. Our schools and cities population are dwindling due to the loss of jobs from the private industry sector. Our children leave the area as soon as they graduate from high school because there is no industry to keep them here with good paying jobs. PolyMet will create 400 full-time jobs with an annual payroll of \$40 million and more than 500 spin-off jobs with a \$242 million payroll in St. Louis County alone. Construction of the \$600 million project will require about 1.5 million construction hours over two years. As a former Executive Board member of Millwright Local 1348 in Virginia, Minnesota, and Millwright Local 548 in St. Paul, Minnesota, I feel that this project will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefit. Let's move forward with the permits to allow this project to begin and to create much needed jobs in the area.	EOO
47	environmentally friendly and safe manner. The EIS should be clearer; PolyMet is not in the Boundary Waters watershed.	WR3B
48	I am writing to express my support for PolyMet Mining Company's permit request to develop a copper, nickel, platinum, palladium, gold and cobalt mine and process ore at the former LTV Steel Mining Company plant near Hoyt Lakes. This project is immensely important to the economic health of Northeast Minnesota, and equally as important, PolyMet has demonstrated that the mining will be done in an environmentally responsible manner. I support the project because I am a native and current resident of Duluth, and the economic health of Duluth is closely linked to the health of the Iron Range. If the economy on the Iron Range is thriving, all of Minnesota benefits as well. We can be confident that the environment will be treated with care because the people that work for PolyMet are from the area. Everyone has a stake in maintaining the environmental health of our area. Please issue PolyMet the necessary permits as soon as possible. This is the right project at the right time, and the mining will be done the right (i.e. responsible) way. Thank you for your time.	EOO
49	I would like to extend my support for the Polymet mining project in Northeastern Minnesota. If we are going to have a modern life style, we are going to have to mine somewhere in the world. I think we will be a lot more environmentally conscious with mining here, than perhaps some of the other countrys of the world would be. And last, but not least we could really use some jobs in Northern Minnesota!	EOO
50	I am in favor of the PolyMet Project. I do not live too far from it, so I would be affect by any mistakes if made. I think the Environmentalists are more interested in eventually shutting everything down up here not just this one operation.	EOO

51	<p>The environmental review process serves a critical function for proposers and for regulatory agencies, identifying potential issues associated with a project and suggesting ways to mitigate them before the first shovel of dirt is turned. The Draft Environmental Impact Statement (DEIS) developed for PolyMet Mining Co.'s NorthMet project has offered a comprehensive review of all potential issues identified in the Scoping Environmental Assessment Worksheet and offered mitigation alternatives, where appropriate. It should be deemed adequate and permits for the project should be developed. If the environmental review process is to fulfill its promise, it must be balanced and reasonable. It must move forward according to established laws and rules and resist attempts to distort its purpose. PolyMet has followed all the laws and rules associated with environmental review, It has invested more than four years and more than \$20 million following those rules. That investment of time and money has provided extraordinarily detailed research and other data that have informed preparation of the DEIS. The DEIS has been developed by an independent contractor with the oversight and direction of no less than two federal agencies, two state agencies and several tribal governments. The PolyMet DEIS documents the following:</p> <ul style="list-style-type: none"><li>• That PolyMet will be a minor source of air emissions.</li><li>• That PolyMet will not discharge process water.</li><li>• That PolyMet will generate non-hazardous waste streams that will be managed appropriately.</li><li>• That Poly Met will ensure waste rock stock piles are managed based on acid-generating potential with a combination of foundation drains, liners, collection systems and covers.</li><li>• That PolyMet will re-use existing processing and transportation infrastructure.</li><li>• That PolyMet will generate very few greenhouse gases because it will use sulfur found in the ore as fuel in its processing.</li><li>• That PolyMet will ensure closure costs are covered because it will set aside resources in advance and according to a plan approved by the Minnesota Department of Natural Resources.</li></ul> <p>Minnesota's environmental review process also considers alternatives to proposed projects, and we suggest also considering this alternative: If the United States does not have a domestic source for the critical metals PolyMet will produce, it must import them from countries that lack Minnesota's strict environmental regulations, generating considerable greenhouse gas emissions transporting the ore for processing and then transporting the metal to the U.S. for consumption. This is not the environmentally sound alternative. PolyMet will produce metals our members - and every single person in this state - use every day. It will produce those metals while meeting or exceeding Minnesota's strict environmental requirements. And it will create significant economic benefits - hundreds of jobs and millions of local, state, and federal taxes. PolyMet has met every test in the environmental review process. The DEIS should be determined to be adequate and permitting based on the information contained in the DEIS should move forward immediately.</p>	EOO

51 The Minnesota Chamber of Commerce, represents more than 2,400 businesses statewide whose vision is to work together to make our state a better place to do business. We work toward that vision not only by encouraging sound economic development but also by preserving the vast natural resources that make Minnesota a unique place in which to live and work. PolyMet Mining Co.'s proposed copper-nickel-precious metal mine proposed for Northeastern Minnesota is an excellent example of an extraordinary economic development opportunity designed with the uppermost in environmental protection. The Draft Environmental Impact Statement (DEIS) for the project demonstrates not only its job-creating potential but also its commitment to an environment. With unemployment of more than seven percent, Minnesota needs jobs. PolyMet will help fill this need by keeping about 300 construction workers on the job for two years. Once fully operational, PolyMet will support 400 families with full-time, stable employment and a payroll of about \$40 million. More than 500 spin-off jobs also will be created as a result of the project; the annual impact of those jobs will be more than \$242 million. PolyMet also will generate tens of millions of dollars annually in royalties and state, local and federal taxes. All that economic activity will be created as PolyMet mines metals that each of us uses every single day and that oftentimes aren't available from domestic mines. Some might prefer the alternative of importing these metals. Some will suggest that they want the convenience of cell phones and computers and hybrid cars and wind turbines and catalytic converters, but they want other countries with little or no environmental protection to produce them. PolyMet offers a much more responsible alternative: Produce these minerals in Minnesota, right under our noses, so we can be certain that they will be mined and processed in ways that meet our tough standards and so we can shrink the carbon footprint from transporting imported metals from mine to processor to the U.S. The United States needs the cobalt, copper, gold, nickel, palladium and platinum that PolyMet will produce. At the Minnesota Chamber, we insist that the metals we use be produced in way that protects the environment, in short, the way that PolyMet proposes. The DEIS demonstrates PolyMet's commitment to the environment on each of its 714 pages. It has adequately addressed each of the issues identified in the Scoping Environmental Assessment Worksheet. It's time to start permitting this exciting project. Thank you for the opportunity to comment.    EOO

52 Being a native of Northern Minnesota and witnessing first hand the major swings in the area economy, I am in full support of the PolyMet Mining NorthMet Project. My support is based on the following reasons: • PolyMet Mining has invested significant resources both in terms of time and money in bringing the Draft EIS to this point and has endured repeated delays to ensure that all questions and concerns are brought to light are being addressed prior to the start of the project. • The tax contributions to all levels of government, the direct jobs at the mine and the spin-off impact are tremendous and are desperately needed to help level the economic swings of the region. • As a person who resides, works, plays, pays taxes and votes in the region I am abundantly aware of environmental impacts. The resources of time and money spent to make sure all environmental issues are addressed prove to me that project is economically viable while working within the current environmental regulations. • The metals that PolyMet will be mining and refining at the NorthMet Project are essential to all of the modern conveniences that Americans desire in their everyday lives. Many of these metals are not produced in the United States, thus requiring importation. The countries that produce these metals in many cases do not have the safe guards in place to protect the environment that will be required of the NorthMet Project. I am more confident of having the metals mined and refined at a permitted site with the ability to mitigate and eliminate the environmental impact, than the environment of another country without any environmental regulations. Thank you for the opportunity to submit a comment on this project that is essential to the State of Minnesota and to the United States of America.    EOO

53	I am writing to encourage you to support the PolyMet Mining project. This is a very important project to Minnesota but more importantly, northern Minnesota. I am a Registered Respiratory Therapist at Grand Itasca Clinic & Hospital and have lived on the Iron Range my entire life. I have felt the benefits of a booming mining industry and the effects of a declining industry. It is extremely important to encourage the growth of a healthy and safe mining industry. Our communities/state depend upon it. PolyMet will help to support our local communities plus also feed into our State economy and in today's state of economic distress we can not afford to discourage new jobs and spin off jobs. My husband and I both have grown up on the Range and would love for our children to have the opportunity to do the same. Without our mining industry this is not possible. Please think long and hard about this opportunity to boosting our local and state economies. I strongly believe that this is a great opportunity for us. This is a company who has invested a lot of time and money into the research of producing a valuable product safely. Please support us here on the range by supporting PolyMet. We need the jobs!	EOO
54	I have been a resident of northern Minnesota most of my life, 4 years in Illinois. My dad worked at Erie mining for 30 yrs and I worked there during the summers while attending college. I am very familiar with the area, as opposed to some, out of the area, whom may want to influence the permitting process. I would very much like to see this mine come to being. It would diversify the manufacturing base and supply our country with a domestic source of strategic minerals. It would also open up the area to several other non-ferrous mining operations in the area. I have read some of the EIS and also some of	EOO
55	the plans that Polymet has to eliminate the possibility of acidified runoff. That is the problem that I feel is the biggest facing this project. You gentlemen at MNDNR had better make sure that this acid runoff problem is sufficiently being handled while the mine is operating and, more so, after the mine has closed. I am a pharmacist and I have had enough chemistry to know the problem that exists here. If you feel that Polymet has not put in place sufficient safeguards, let them and the public know. Ferrous mining caused pits to be formed that I have fished in and swam in as a child in Sparta. I would hate to see acid runoff into any river or lake in northern Minnesota. We are in need of jobs and I support Polymet in their effort. So MNDNR, do your job.	WR3D
56	This letter comes to support the Polymet Northmet project in northeastern Minnesota. After eight years of study and work, I believe that both Polymet and the Minnesota Department of Resources have addressed the issues related to nonferrous mining and taken the steps to handle the by products and to mine responsibly for the environment and the residents of the state of Minnesota. The entire state will benefit from the revenue produced from metals found to be underground at the site of the former LTV mine site outside of Hoyt Lakes MN. Anyone who visits the site will recognize that the large vacant expanses of land are a natural choice for another mining operation. As a resident of Aurora, I know that the Polymet proposed mining operation would bring new life to this area of Minnesota. Our educated and skilled workforce also has concerns for the survival of the environment and the desire to do the right thing for future citizens. For future generations to live and work here, Polymet's Northmet project will make a great difference in the survival and positive growth of this nature-blessed area of Minnesota. The required continual monitoring and response to resulting problems in the mining processes will maintain the quality of our natural resources, waters, and lands. Please register my support for this well-studied and proposed mining operation, Polymet Northmet.	EOO
57	I have watched the EIS review process and although I think that it is very necessary, I do think that it has dragged on way to long. There are very important reasons for the EIS and I do appreciate the fact that DNR has completed at least the draft portion. I do have a vested interest because I live within 5 miles of the proposed site, I do care about the air, water and land. My life will be affected by any ecological mishaps and therefore I do appreciate your thoroughness. There will always be worldwide needs for our natural resources. Thankfully we have the opportunity to provide them in an ecologically safe manner. If this was left up to some other countries to provide it could and probably would be an ecological disaster. I feel that Polymet has crossed all of the T's and dotted all of the I's and it is time that we move on to the permitting phase of this project. We are struggling with a weak economy and high unemployment. Let's move ahead and put this phase behind us.	EOO,G10
58	I support Polymet Mining's NorthMet Project. This project will provide significant economic benefits to the economy of Minnesota, at a very low environmental cost.	EOO

- 58 As a business that has supplied valuable equipment and service support while helping to create and sustain well-paying jobs on the Minnesota Iron Range for well over seven decades, Milwaukee-based P&H Mining Equipment hereby declares our support for the NorthMet Project plan that has been developed by PolyMet Mining for consideration by the Minnesota Department of Natural Resources. Our P&H MinePro Services - Iron Range employees based in Hibbing are most proud of our role as suppliers of highly reliable, productive equipment and efficient, safety-focused service support to mining operations across the Iron Range. Our customers are justifiably proud of their ability to efficiently and safely produce valuable iron ore while applying increasingly sophisticated and effective technology that safeguards and minimizes the impact of their mining operations upon the ecosystem that encompasses the Minnesota Iron Range. We have invested in valuable service support and logistics management facilities in the Hibbing and Virginia, Minnesota communities. Above all, we have recruited, trained and developed a solid team of mechanics, electricians, welders and service support administrative employees from the region, and they are very highly regarded by our customers on the Iron Range for their devotion to quality, service and safety management excellence. In so doing, we have helped strengthen the communities in which we are based through positive generation of wages and tax revenues as well as numerous charitable community involvement contributions. For these reasons and more, we urge the Minnesota Department of Natural Resources to consider the merits and the overall social and economic good that can result from allowing the PolyMet NorthMet Project to move forward to the development and operations phases. We believe the PolyMet organization has the necessary capital, technology and above all people resources that will ensure valuable outcomes for Minnesota. They include ... • Investment in operations, infrastructure - and above all, well-paying, long-range jobs and careers for the residents of the Iron Range region and their families. • Beyond an estimated 400 jobs created within the PolyMet NorthMet operations, many more jobs will result as firms including P&H MinePro Services -Iron Range invest in expanded facilities and equipment on behalf of what will be a world-class, state-of-the-art mining operation. • Investment in businesses and jobs will result in a strengthened tax revenues base for both the regional economy as well as the State of Minnesota going forward. • PolyMet has access to the most advanced environmental protection technology and strategies available in the world today, and they can be counted upon to carefully apply that valuable know-how to help responsibly safeguard the Minnesota Iron Range regional ecosystem. • As our global civilization transforms itself with regard to application of renewable energy sources, the important minerals that can be extracted by the PolyMet operations can help in that transformation as they will be applied to wind turbines, hybrid transportation vehicles and other "green" technology as demand will continue to increase. In a world that sometimes undergoes volatile economic, social and political transformations, it will be vital for our United States of America to have a safe and reliable source for the kinds of metals that are so abundant within the PolyMet ore body. The PolyMet project would contribute in many ways to the necessary strengthening of our communities on the Iron Range while safeguarding our environment and helping to strengthen our nation's economy. PolyMet employees can and will be counted upon to be environmentally responsible partners within the Minnesota economy. We are grateful to the Minnesota Department of Natural Resources for considering our position with regard to the PolyMet
- 59 spent over 20 million dollars for the EIS in order to provide an environmentally sound project. I have reviewed the summary and conclude that the extensive EIS document and the rigorous review that the current regulating agencies have done would suggest that Polymet and the regulating agencies have done their due diligence. This plant will be environmentally safe. My cabin is within 15 miles of the plant. I have no concerns about the effect that Polymet will have on the environment or wildlife in Northern Minnesota. Jobs: Polymet alone is projecting over 350 jobs excluding the spin-off jobs. In an area that currently has an unemployment rate of over 10%, these jobs would be a welcome relief to the unemployed. The impact to the local school districts would also be significant through the school trust fund. Given the current state of the Iron Ore industry, we need this new industry to insure jobs now and for our children. In closing, we all have to weigh the risks of projects with the rewards. Due to the current rigorous environmental regulations in the State of Minnesota, the environmental risk is very small yet the reward to the state is very large. I strongly encourage you to grant Polymet the permits required to make this project a reality.

60	The economy of Minnesota is an ecosystem - just like the ecosystems found throughout the state. When one part of the ecosystem is struggling, it has a negative impact on the related parts. The Construction Industry throughout the state of Minnesota is struggling; the economic recession has devastated the industries that have kept Skilled Construction Laborers employed. Too many of our members are sitting on the bench on any given day. The PolyMet Mining Company proposal to build a copper-nickel-precious metal mine and processing facility near Hoyt Lakes offers our members some hope to wait out this recession. Construction will require about 1.5 million man hours of construction over a two-year period; many of our members will find work as a part of that construction work force. But we don't have time for delays. PolyMet has made your job relatively easy by proposing a very environmentally friendly project. Much of the infrastructure for transportation and processing will be recycled from the old LTV plant. Stockpiles will be managed so water infiltration is minimized and so any water that does percolate through the piles is collected and treated. Sulfur in the ore will be used as fuel in the process, and waste streams will be managed. Air emissions will be much less than other facilities in the region - so much less they're considered a minor source. The draft environmental impact statement for the project has done a very thorough job of looking at all the potential impacts and offering options for mitigation, where appropriate. The draft EIS should be deemed adequate so that permitting can begin quickly - and so our members can start working and paying income tax again to build the facility and help to strengthen Minnesota's economy. Thank you for the opportunity to comment.	EOO
61	I support PolyMet Mining's NorthMet Project. There are many reasons for this project to be approved such as; by allowing the mining it will provide many jobs to support our economy and the metals that will be mined are necessary to environmental friendly technology. With the jobs that will be offered by PolyMet it will provide millions of dollars for local and state taxes that provide for the communities and educational systems. Now is the time to say yes and allow there to be more jobs available that will stimulate our economy, which will only be beneficial. The research that has been done on mining these precious metals it has provided nothing but positive feed back that our environment will be barely harmed, if at all because of following Minnesota's strict environmental requirements to protect air, water and land. PolyMet is also limiting its impact on the environment by reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. As a person who works in Northeast Minnesota, I understand the need to balance the use of resources like minerals and preservation of resources such as water and air. I wholeheartedly support PolyMet Mining's NorthMet Project and hope this letter has persuaded you in supporting the project as well.	EOO
62	I am in support of the PolyMet Mining project. PolyMet will significantly contribute to the state and to our local economy. Employing approximately 400 men and women along with all the extrapolating jobs is crucial to the future of the Iron Range.	EOO
63	Please note that this project is NOT in the Boundary Waters watershed. I am confident that the DEIS	WR3B
63	documentation will show that the impact to the air and water will be minimal as our State has strict environmental requirements. Last but certainly not least, this project is critical for the production of Domestic Production. The United States must stop getting our metals from foreign suppliers that may or may not make sound environmental practices. Thank you for your cooperation.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
64	IBEW Local Union 949 represents some 2,100 working men and women in the state of Minnesota. Many of them live, work and/or play in the Arrowhead region of Minnesota. The economic devastation to that area in recent years is horrific. The current recession has reduced the already scarce job market. The lack of jobs directly relates to bankruptcies, divorces, mortgage foreclosures and even suicides. The PolyMet Mining Company's proposal to build a copper-nickel-precious metal mine and processing facility near Hoyt Lakes offers the hope of relief for the working men and women in that area. Construction will require about 1.5 million man hours of construction over a two year period. PolyMet's 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region through wages, taxes and an increase in disposable income. PplyMet's proposed mine will domestically produce critical metals while following Minnesota's' strict environmental requirements to protect air, water and land. I believe their proposal is environmentally responsible. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air and water will be minimal. The environmental review process has been lengthy and thorough; the draft EIS addresses potential environmental impacts and how to mitigate them, and lays the proper groundwork for developing an environmentally and economically sustainable project. On behalf of the membership, Officers and staff of IBEW Local Union 949, I am asking that permitting move forward quickly. This project is responsible, safe and necessary. I fully support the project, and ask that you do too.	EOO
65	I'm writing this letter to encourage support for the proposed Polymet mine in Hoyt Lakes, MN. I work for Road Machinery & Supplies Co. We support the taconite mines, the paper mills, road and bridge contractors, and timber harvesters in Northern Minnesota via three branches in Duluth, Virginia, and Grand Rapids. Our economy depends on projects like Polymet, and I think the State of Minnesota and its residents should be as supportive and accommodating as possible to an opportunity like Polymet. I have met some of the Polymet senior management and its equity partners. They have invested their entire careers in the mining industry and understand what it takes to run a safe, efficient and successful mining operation. The depth of review they have performed to satisfy the public that the project will be environmentally sensitive is impressive. And I am encouraged by the prospects for good paying jobs and relative prosperity that this project will offer to the residents of Northern Minnesota. I have worked in the construction and mining industry for over twenty years, and during that entire time, we have not seen the range of growth opportunities that we have before us now. Polymetis one -great quality opportunity that we need to embrace now and we will see positive impact on many fronts for many years to come.	EOO
66	In fact, a possible "mining moratorium law" such as in Wisconsin should be considered.	EOO
67	I had trouble with your email address. Kept coming back undeliverable. This project must go forward. It's time we take better advantage of our natural resources. This project will benefit the State and our Country. If, for some reason, people stop the project, it will be a shame. Go-Go-Go	EOO

67	I am proud to offer these comments in support of the finding that the draft Environmental Impact Statement (EIS) prepared for PolyMet Mining Company adequately assess all impacts associated with the proposal and that permitting for this important project should begin immediately. As a St. Louis County Commissioner, I also would be proud to have PolyMet operating not only in my county, but also just south of my home. PolyMet has demonstrated that it puts the environment first, and that's just the kind of neighbor I want to have. The draft EIS is voluminous, and contained within its more than 700 pages are the kinds of details that tell me that PolyMet will be able to operate safely, protect our environment and put people to work producing metals that each of us uses every single day. As a neighbor of the PolyMet project, I was impressed by a number of the details, including: PolyMet will emit very little air pollution. In fact, it will be considered a minor source. PolyMet will not discharge any process water into the environment. PolyMet will use the sulfur contained in the ore itself as a source of fuel for processing instead of relying on coal, gas or electricity. PolyMet will re-use the shuttered Erie Plant - ensuring that this incredible industrial infrastructure is put to good use instead of turned into scrap. PolyMet will have a comprehensive plan for managing waste rock. As a St. Louis County Commissioner, I also was impressed by the other details in the draft EIS. Constructing the facility will keep construction workers busy for 1.5 million hours over three years, meaning they won't have to sit on the bench looking for work. PolyMet will create full-time jobs for 400 people in my county, at a good wage that can support a family. In addition, more than 500 spin-off jobs are expected in my county alone, with an economic impact of more than \$250 million each year. PolyMet will pay considerable local, state and federal taxes - dollars governments like the county can use to provide essential services. In addition to being a local elected official, I have worked an entire career in the mining industry. I am proud of this industry and the contributions it has made to individual families, to communities, to our region and to the state. While I realize not everyone in Minnesota appreciates the contributions that mining makes, I know that everyone still wants the products made from the minerals we work hard to produce in an environmentally sound manner. People in St. Louis County know that we rely on the minerals that PolyMet will mine for our computers and cell phones, for our electrical wiring and our artificial hips. And people in St. Louis County know that, in order to get permitted in Minnesota, PolyMet will have to do it right and to protect our environment. That's what we expect of our neighbors. Please issue a determination that the draft EIS is adequate and issue the permits for PolyMet Mining Company.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
68	<p>As a retired taconite miner, school board member, and lifelong 61 year old resident of Ely, born and raised here, who has raised a family here, I do support the PolyMet - NorthMet Project that is proposed for operation between Babbitt and Hoyt Lakes, MN. The reason I live here is because of our quality of life in Northern Minnesota. At one time, it used to be a much more thriving area when we had our logging, mining operations, and former resort industry operating on a larger scale. Those industries using our Natural Resources provided living wage jobs to the various local communities and a much-needed tax base for our schools and government entities. Now that the majority of resorts have disappeared (1960's-70's), the lumber mills have closed (1970's) and mining employment has diminished, this would be a needed shot in the arm. This is an opportunity to revitalize our economy and keep our children in the area, and possibly draw some of those that have left, back to the area, their hometowns. It is estimated that the royalties from these minerals in the Duluth Complex will be in the area of \$1.4 Billion for the Permanent School Trust Fund. These funds are sorely needed to address the inadequate funding of our schools in Minnesota and the loss of 150,000 Minnesota jobs in the last decade. Ely, at one time had 1,771 children in our local schools in the mid 1970's, a city population of over 6,000 due to the resort, logging and mining industries. Today, Ely has 538 children in school and a population of around 3,500. We cannot survive solely on a tourist-based economy as some have said. I believe that after hearing presentations by PolyMet, and also touching on reviewing the Draft EIS on-line, it appears that the NorthMet Operation, following State and Federal EPA laws, (and MSHA and County Mine regulations for miners) will protect our air, land, and waters here in NE Minnesota. We know that our air and waters are also precious Natural Resources and we would not want to damage them. So, it is important to do all that is necessary to protect them as this project and any future developments move on with adequate safe-guards and assurances for mine operation and closure in the future. This project is important to our local, state and national economies in that we would be employing Minnesotans using our Natural Resources, and more broadly U.S. industries. The materials mined and produced here would be able to be refined and used in wind generators, motors for hybrid cars, copper wiring, nickel for stainless steels such as in bearings, heart stents, and surgical tools. Platinum would be used in catalytic converters for automobiles, and many of the other PGM's for use in multitudes of electronic devices and other products. This would make us able to promote our U.S. Industries instead of importing from countries that do not address environmental standards as we do and we end up with the pollution from those countries eventually in one form or another anyway. Take, for example, Beijing's air pollution at the Summer Olympics. We need to support this operation, here in the U.S., and promote our own economy with proper environmental and worker safeguards. We should make it happen here. Thank you for the opportunity to</p>	EOO
69	<p>I have reviewed the Draft EIS for the Polymet project and am in support of the project. The information provided in the EIS details how the project will minimize the impact to the wetlands and other existing natural resources. Polymet will be required to meet applicable environmental requirements/standards for emissions. Meeting these requirements will assure the natural resources are protected. The project will provide much needed employment and economic benefits to the region. Please include my comments in support of the project.</p>	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
70	The purpose of this correspondence is to indicate my support for the PolyMet Mining project near Hoyt Lakes, Minnesota. I am strongly in favor of a reasonable and thorough environmental study that analyzes the present and future impact of the proposed PolyMet Mining operations on our natural resources, including water and air. Although I have not reviewed the draft EIS, I am satisfied that the DNR has completed a very comprehensive review of the project, and that PolyMet has taken extreme precautions to minimize any detrimental effect upon the environment. As a result, I recommend that Permitting be approved, so that the project may proceed. Of course, any activity could be objected to on the basis of the activity's potential effect upon our environment. Mining operations will have some effect, including the fact that employees will consume gas to drive to their places of employment. However, even tourists who wish to enjoy our beautiful lakes, streams, and woods, affect the environment, as they also consume gasoline to arrive at their destination, restaurants that cater to the tourists use paper and plastic products, canoes and boats are made of steel, aluminum, plastic, etc. My point is that there should be a balancing of the need for productive jobs in our Region, State, and Nation, with the minimal effect upon the environment. Consideration should also be given to the fact that the minerals that PolyMet is proposing to provide by this project, are necessary for the world population. If the PolyMet project does not proceed, the minerals will be provided by a foreign company, possibly supported by a foreign government, and possibly subject to much less scrutiny with respect to its mining operations. It is likely that our local environment, as well as the world's environment, will be protected more by permitting this project, rather than by encouraging foreign mining operations. Should there be any questions concerning this letter, please feel free to contact me.	EOO
71	The economy of Minnesota is an ecosystem - just like the ecosystems found throughout the state. When part of the ecosystem is struggling, it was a negative impact on the related parts. The Building Trades in the Twin Cities Metropolitan Area are struggling! the economic recession has devastated the industries that have kept our members employed. As many as 50% of our members are sitting on the bench on any given day. The PloyMet Mining Company proposal to build a copper-nickel precious metal mine and processing facility near Hoyt Lakes offers our members some hope to wait out this recession. Construction will require about 1.5 million man-hours of construction over a two-year period; some of my members are bound to be part of that construction work force. But we don't have time for delays. PolyMet has made your job relatively easy by proposing a very environmentally friendly project. Much of the infrastructure for transportation and processing will be recycled and so any water that does percolate through the piles is collected and treated. Sulfur in the ore will be used as fuel in the process, and waste streams will be managed. Air emissions will be much less than other facilities in the region - so much less they're considered a minor source. The draft environmental impact statement for the project has done a very thorough job of looking at all the potential impacts and offering options for mitigation, where appropriate. The dtaft EIS should be deemed adequate so that permitting can begin quickly - and so our members can start working to build the facility.	EOO
72	This project is strongly needed in Minnesota. If not for the tac money that the man on the jroject can produce, then for all of the construction people on unemployment who are get off the unemployment rolls but for the people who live in the range that need jobs and better way of life	EOO
100	I support mining in Minnesota. I think we have a very good record here. A lot of the materials that this PolyMet project is working with are basically the same materials that we've been digging up in the past. I mean it's adjoining mineralization. We need -- we need to have jobs that provide for the economy of our nation, to build the infrastructure that we need, the equipment that we need, supply the metals that we need to make equipment actually function. Any complex piece of equipment, including such things as solar-powered units or electric-powered units, require a great amount of different types of metals, and this particular project is going to be a real asset in providing some of the metals that we have not been able to produce in this country in the quantities that we need them in. And that's all I have to say for now, thanks.	EOO

100	I'm Walt Hautala, and I'm the Chairman of Biwabik Township and I'm also on the Mesabi East School Board, and I also manage a business in this area and own a business, so new jobs are very important to me. And as I watch the TV, I see the government giving money away, spending billions on stimulus. Well, I thought wow, here they're giving money like that and here's this business trying to get a start without asking for money. That's why I think it's really important to support this. Also, being a business person, I have gone through permitting with DNR, Army Corps, etcetera and, I know they do an excellent job and very thorough, so if they're okaying this or agreeing to it, it's got to be good. The local residents, some people say we're going to pollute the area, the waters. Well, we have our kids living here, we have our grandchildren here, we're not going to allow them to do something that would hurt our own family. And also, there's a lot of talk by the environmental people, and I'm not sure, I'm not really up on that, but it seems like there would be issues like the smoke coming from China or the lead in toys, that if they -- if they are interested in something like that, why don't they check into that? Then I see other businesses locating outside of the United States. Well, here again, we've got somebody that's trying to do something within our boundaries. So that's another reason to support it. Of course one very important reason, we certainly need the jobs in this area and also in Minnesota and throughout the country. Thank you.	EOO
101	Exxon wanted a sulfide mine in the Crandon, Wisconsin area. Many folks did their homework, could not find a single example of a "clean" mine. Fortunatly, after many years of fighting a Wisconsin tribe bought the land. End of discussion. There is NO number of jobs woth jeopardizing the whole Lake Superior watershed region. Do the right thing- for the sake of our children and their children.	G2
103	My name is John Malevich. I'm a retired purchasing manager at Arcelor Mittal Steel in Virginia, Minnesota. I'm totally supportive of the PolyMet project. I would do anything to get this to move ahead, to help PolyMet, including writing any letters beyond this point, politically or otherwise. That's it.	EOO
104	I just basically want to say that I think this is a project we need. Jobs up here are true and hard to difficult -- hard to find, everybody knows. I've checked some of the data, I think the environmental impact will be low and I'm looking forward to it taking off.	EOO
105	I didn't prepare anything to tell anybody anything except I know a lot of stuff that they should do because I worked there for 41-and-a-half years and I worked on almost everything in the plant, and I know a lot of things that should be done before start-up because a lot of the things were froze and there was a lot of water supply systems that weren't fixed right because they were all broken. And I know many different things on everything in the plant, so if they wanted to know anything, call me up. That's short and sweet.	EOO
106	I just wanted to stay that I'm in favor of this new construction out here. I'm a boilermaker and my trade depends on this. I was working out at the original LTV site when it closed. I was there when the workers there got their pinks slips and I saw the looks on their faces. I'll never forget that, ever. And I'd like to see it open back up, not only for me, I don't even know if I'd be able to work there, but just the jobs that it will create. I used to live in the Twin Cities, now I live in northern Minnesota and I know that northern Minnesota is a place that's here all the time, it's not just here on weekends, it's 24/7 up here. So the people who live up here support the town and build the town and build the area. So that's really all I have to say.	EOO

107	<p>My name is Dan Harp, I live in Aurora, Minnesota. And I guess I'm not necessarily a supporter of the mine or the environmentalists. I'm a supporter of doing what I think is the right thing to do, and I'm a supporter of reasonableness. And I'm hoping that this project does not get forced to a 100 percent guarantee on anything because I don't think that's reasonable and it can get in the way of progress and an opportunity to try out new technologies. We need a place to try out things and this particular location has been a mining location for decades and the infrastructure is in place. I think if you're looking for a place that would have minimal impact, this is a great spot to try. And no one is asking to do things the way that they were before, so I think the environmentalists haven't been reasonable in their arguments when they talk about doing things the way that they were 50 years ago; that should not be applicable. Therefore, I'm hoping that we can try a new technology, monitor it to see how it's working, and perhaps it could be a stepping stone to furthering this technology or other technologies that might work better than this. At least maybe this one would work. But expecting 100 guarantee I think impedes all entities in this case. So I'm hoping that there has been more than enough study. I know that it has gone on for some time, I'm told, but I do not know for sure, that the study has gone on far greater than was ever expected in the typical environmental study process, and I haven't heard of negative results. So in light of that, I'm hoping that they will vote to proceed with the permitting. The second concern I have is even though you permit something, that they don't put things on it that make it something that you can't do. For example, a recent commercial where they have a little child on a bike surrounded by a square, you can ride the bike but you can't go out of the square. In other words, you let them ride but you don't let them ride anyplace. So I'm hoping that we permit this, but we don't put so many things on it that they still can't do anything with it. See what happens when I get a captive audience? Let's see, what else do I have? In terms of jobs, I think it's very relevant, but I don't think it should be the argument in terms of the permitting process. I think all parties are diminished by using the economic side of the argument because that's not what the environmental process is about; it's about can it be done and can it be done safely. So I'm not a miner, I'm not an environmentalist, but I'm an advocate of being reasonable and reasonable expectations. Thank you.</p>	EOO
108	<p>Brian Nelson, Cloquet. I strongly support the PolyMet project. I believe that -- that that mining operation and the balance of nature works together. They have a process for, I talked with the people out there, taking care of the waste, managing the waste. I grew up here, I -- I use all of Minnesota's natural resources. I hunt, fish, camp, hike, bike. I have -- I'm married, two boys, we enjoy it all. And we need the work, we need the jobs. Our economy could be stimulated with this project. 400 permanent jobs for 20 years, the construction jobs that would be created, it -- the tax dollars, the revenue, the schools. We don't want to close the doors to the northland, we want to keep as many people up here working and living and enjoying the environment. And I just strongly support this project. Thank you.</p>	EOO
109	<p>My name is James P. Glowacki. I live at 7300 Birch Point Road, Britt, Minnesota, 55710. I'd like to record these comments regarding the PolyMet project: I'm a business owner in northeastern Minnesota. I own three businesses. I have a staff of 20 full-time people. And in addition to being a business owner up here, I'm on the Board of Trustees for the Nature Conservancy, so environmental concerns are important to me and making sure that the PolyMet permitting process, you know, assures that the environmental needs of our residents are met. Having said that, it's equally important that we make this project happen, that we use the PolyMet project as a -- as our effort to show the rest of the world that we do mining right and we've set the example on how mining and the environment can co-exist. And, again, I'd be available for any further, you know, comment. And that concludes my remarks.</p>	EOO
110	<p>I'm Marlene Pospeck of the City of Hoyt Lakes. And my comment is that because I know that the socioeconomic benefits of a project are weighed equally with the environmental impacts of a project in the EIS, it would behoove the presenters to talk about the socioeconomic benefits or impacts of the project as well as the environmental impact. That way the people would be able to weigh the environmental impacts with the socioeconomic benefits and make better decisions, I believe. Thank you.</p>	PRO6
111	<p>Secondly, having read a portion of the DEIS and having discussed the issue with individuals and groups, I would not like to see this mine proposal go ahead. Considering what has happened with similar mines, environmental degradation as a result is inevitable. The land, water, and air are the bedrock upon which every human endeavor is built; should we compromise these, through actions such as the PolyMet mining operation, we compromise our future.</p>	EOO

112	Firstly, I believe that there should be open public forums for public comment held in both Duluth and Ely, in addition to the locations already scheduled.	PRO6
113	Also, because of the difficult time of year (holiday season and restricted travel due to inclement weather), the comment period ought to be extended. The majority of the public is as yet *uninformed* about the reality of the project; there has by no means been enough time for the public to understand the Draft EIS and form a response to it.	PRO6
114	My family has lived on Birch Lake for four generations. My great grandmother-purchased o'ur property on the lake in 1928 and my family and t live there permanently ,to this day. To be honest, the mining industry has employed members of my family over the years. However, I cannot support the current proposal for sulfide mining under and -around Birch Lake.	EOO
114	In addition, the DEIS predicts contaminated waters will be discharged from the mine site into the Partridge River after the mine's closure, along with tailing's basin discharges high in sulfate concentrations. Here too, the anticipated pollution should be unacceptable to all Minnesotans responsible for maintaining a healthy environment in our State's natural and Wilderness areas.	WR3A,FM1
114	I understand that Polymet's project will result in Water leaching from waste rock piles that is expected to exceed water quality standards for up to 2,000 years. This is unacceptable to me, and should be unacceptable to every Minnesotan concerned for the quality of life they pass on to future generations. There is no way to assure that mining companies can or will be able to maintain water treatment facilities for two millennia. It is simply absurd to expect that a calculus can be devised which accurately derives the economic, technological, and cultural exegencies affecting a mining operation over two thousand years!	PD2
115	If these issues cannot be resolved in a manner that preserves and protects our wilderness and natural areas for posterity the project should not be allowed to proceed.	EOO,G2
115	As a property owner on the east side of Sand Lake in Lake Co., MN, I have serious concerns about the safety of this project and its potential impacts on the Sand Lake Peatland SNA.	G2
116	My name is Leslie Zamzow. I grew up in Solon Springs; WI., but am currently going to the University of Minnesota. I really miss being home, and have a lot of fond memories from when I was little that-are surrounded by the little lake that we have in town. I hope that you don't put in that mine because, that little lake means A LOT to me. It is where my brothers, and I go fishing, tubing, and swimming in the summer. If the lake becomes polluted by the Brule River then there will be no way to enjoy it as I used to. I am also concerned about the Brule River. Canoeing and Kayaking down the river is a great summer activity that my family, and I take part in every year when my Uncle comes back to Wisconsin from Washington. So please don't put in that copper mine, because I know that I am not the only one who truly enjoys the Boundary Waters in Northern Wisconsin, and Minnesota.	EOO
117	I believe that most of the support for this project is coming from the cry that it will "create jobs." However clean water. air, future existence, all of these will surely be polluted and or lost. Certainty these costs are too high to consider proceeding with the project.	G2
117	I personally know that MN fish is considered dangerous for consumption by children due to mercury and dioxins by CleanWater Action which derive this info from scientific testing. I would like to be able to tae my child fishing and actully eat the fish without endangering her. We need to decrease or at least slow down our pollution burden in MN. Many of our lives freedoms and chance to participate in outdoor activities arebeing encroached as it is.	EOO,WR4B

1318	Please think of future generations – keep them in consideration. I understand the historical XXX Northern Minnesota has with mining, and yes it is easy to understand why families support mining for short-term economical gains, but keep in mind the longevity of some of the most beautiful land this country has to offer, and everything it offers.	G11
<b>Sender Last Name:</b>	McGilligan	<b>Submission ID:</b> 206
205	I am responding to the draft EIS for the Polymet Mining North Met project. Because of the heavy metals and sulfide acid that is produced by these mining methods, there is no safe way to protect our northern Minnesota environment from the effects of this mining. No one anywhere has devised a method of mining that mitigates these effects. No amount of assurances by the mining companies can change that fact. This project and others like it should be stopped.	EOO,G7A
<b>Sender Last Name:</b>	McGillivray	<b>Submission ID:</b> 1040
1141	I am a home owner in MT.Iron I Virginia MN and a land o\yner in Elisberg township and on Sabin lake near Biwabik. In the commlng years we will build our retirement home on Sabin- Lake. As you may know Sabin Lake is. part of the Embarrass River system which is specifically named in the DEIS. I am convinced the project and mining will be the safest and most envimmentally freindly mining operation in the State if- not in the World. The DEIS isan amazing document. Nice work. I fully support 'PolyMet Mining and the NorthMet Project.	EOO

3664	It seems that corporations will promise anything to be able to do what they need to increase their profits. When they say that they are confident there will be no pollution, history shows that ¾ of all operations have caused pollution and damage to the environment. Damaging Minnesota's environment for temporary economic gain is not worth the risk. The long-term affects of mining pollution are apparent in past operations and to reverse the affects of this proposed operation would probably exceed the small economic gain provided in the short-term.	EOO,G2

3123	I am deeply concerned about the proposed sulfide ore mine by North Met. The environmental impact study includes no provisions for clean-up, reserve funds for accidents or other compensation for the potentially significant environmental damage that could be caused by these mines. I urge you to require a more rigorous study of the impact of this substantial operation before granting approval to the impact study. It is discouraging that the taxpayers of Minnesota would vote to increase their own taxes in order to preserve clean water and wetlands, only to be undermined by mining operations such as this one.	G1,G4A,G6
<b>Sender Last Name:</b> McMillan		<b>Submission ID:</b> 2201
999	We have learned a lot about the autoclave and the hydrometallurgical processes they're going to employ. We think it's excellent they're going to utilize a large number of the existing assets from the old LTV in Cleveland-Cliff's facility. Most importantly, we don't feel that this is an either/or situation. We feel that PolyMet can both benefit the environment and the economy at the same time. Minnesota Power stands ready to supply PolyMet with electricity from an increasingly cleaner fleet of assets that include new wind generation, hydroelectric generation, biomass generation and a fleet of retrofitted coal generation, so we have a power supply that we think is cleaner and that matches the processes that PolyMet is going to employ. The economic benefits of this project are undeniable. The Iron Range badly needs to diversify the industries it depends on. Copper-nickel provides one such opportunity to diversify. Northeastern Minnesota badly needs the jobs, not only to diversify its economy from dependence on taconite, but also	EOO
1000	KIRBY A. KENNEDY & ASSOCIATES (952)922-1955 awful lot of unemployed people up there. This project would employ at least 400 people directly and countless more indirectly. The University of Minnesota at Duluth has determined that there's about a 1.6 multiplier, so every direct job that's created, there's 1.6 additional indirect jobs that are created, and the economic effect of that, benefit of that is exactly what northern Minnesota needs. Speaking from the state of Minnesota's perspective, the state also needs new revenues to address a structural and ongoing deficit problem, and this project, with potential for additional copper-nickel mining elsewhere on the Iron Range, would provide much-needed revenues to the state to support K-12 education and to support general funds' pending needs. These are high-valued minerals that would result in a tremendous influx of revenue for the state. In closing, I strongly believe that PolyMet can do right by the environment, do right by the region and do right by the economy and mine these minerals that are so vital to our development. (Oral comment concluded.)	EOO
2609	My name is David McMillan, and I live in Duluth, Minnesota. I am the senior vice president of Elite and executive vice president of its largest business, Minnesota Power, and I'm here to make sure people understand Minnesota Power supports the NorthMet project as described in the draft environmental impact statement. I want to explain why we're supportive of this. The company and myself are very familiar with PolyMet, very familiar with its officers, the assets that it will use to mine and process this ore and the processes that it will employ to make sure that the environment's treated properly. We're very confident that PolyMet can and will protect the environment and the natural resources we all depend on in northeastern Minnesota. We're equally confident that the State of Minnesota and its regulatory processes are capable of assuring that the environment will be protected, and we believe this is reflected in the draft environmental impact statement.	EOO
<b>Sender Last Name:</b> McMillen		<b>Submission ID:</b> 2331
2792	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. PLEASE take NO chances on defiling the waters of Minnesota. As a native Minnesotan who has canoed the Boundary Waters, I want NOTHING negative to impact that entire area. Mining of any kind simply isn't compatible with pristine waters and country.	G7

304	<p>Conservationists with Common Sense (eWCS), an organization with over 4,000 members all across the United States, works to preserve recreational access to and multiple uses of public lands and waters. We submit the following comments on the PolyMet EIS. In regards to economic development, CWCS supports the use of common sense, the best available scientific data, objective analysis, and broad public input on the part of government agencies and elected officials when making and implementing land management and environmental policies. We believe a healthy natural environment, including clean air, water and soil is essential to present and future generations. But, along with being environmentally, economically and socially responsible, the human factor must be put back into land management policies. The needs of local communities and all users can and must be balanced with the conservation of sensitive natural environments. Common sense is needed in addressing economic development for the betterment of all. In this present depressed economy, jobs are very much needed all across the country and especially in northern Minnesota. The proposed NorthMet project at the former LTV Plant in Hoyt Lakes, a non-ferrous mining project of PolyMet Mining, would create 400-450 new, highquality permanent jobs with additional spin-off jobs. PolyMet's patented hydrometallurgical processing technology - PLA TSOL - makes recovery of both base and precious metals possible with high levels of recovery. This is a clean technology with no smelting involved and is the only process that can recover the platinum, palladium, gold and silver without using cyanide. This process is new to Minnesota but is used in Ontario, Laos, New Zealand, and even in southwestern U.S. With forever increasing use of computers, cell phones, iPods, medical eqUipment, appliances, catalytic converts in cars, and numerous other products, the need for these precious metals is in great demand. It would be far better to mine these metals here in Minnesota where we have strict environmental protection laws and regulations rather than continuing to get these metals from the polluting mines of China and Russia where they have no environmental protection laws. It is the acid rain from these overseas mines that is polluting our north country!The Friends of the Boundary Waters, Northeastern Minnesotans for Wilderness, the Sierra Club, and Ely business Piragis Northwoods Company have supported the production of a propaganda film opposing the PolyMet project. Even though PolyMet's process uses clean, energy efficient technology for low grade sulfide ore, the film shows polluted areas from other mining sites of a higher grade sulfide ore. The film states concern for the precious waters of the Boundary Waters, but the PolyMet project is not within the Boundary Waters watershed. Much of the propaganda film is aimed not at PolyMet, but at other proposed mining projects. All of these projects are outside of the Boundary Waters and there is no buffer zone to the Boundary Waters. And, if there were any impacts to the Boundary Waters you can bet that cwes and the people living and making a living near the Boundary Waters would be the first to get after the mining companies. PolyMet has set aside \$600 million to correct any possible problems and to address reclamation of the area at the mine's closure. This amount is to be adjusted yearly. It's interesting to note, that in the 1978 BWCA Wilderness Act if the President declares a national emergency mining could take place within the Boundary Waters, but no one wants to do this. Energy usage required for the hydrometallurgical process would be about half compared to a traditional smelter. The opportunity to "recycle" the former LTV site (an already big hole in the ground) also makes the project more viable in the current global marketplace for base and precious metals. The concern about the huge footprint of mining is unjustified as other developments ha</p>	EOO,G4
2639	<p>My name is Nancy McReady. I was born and raised in Ely, Minnesota. I still live thereon Fall Lake, one of the lakes that is in the Kawishiwi watershed. My husband works at Northshore Mining Company in Babbitt, and it's been a good job that provided a good income for our family and also allowed me to be a stay-at- home mom. The importance of this mine is pretty personal. I have two replaced knees; one is titanium; one is cobalt, and those are some of the minerals that may be mined in this project. And our towns just need jobs. We need young families moving back to town to help enrollment at our schools, and tourism is a big part of our economy, but it doesn't provide a livable wage to support a family, and these mining jobs will. And that's about all I have to say.</p>	EOO

3563	Our family owns private property along the Dunka River, South of Babbitt and East of Hoyt Lakes and are very concerned with the overall impact on our natural resources that Polymet will bring to the environment with there proposed mining project. Our natural resources are currently in a fragile state and it is in the best interest of all of us to protect them and by letting this project go through for financial gains sends a bad message to all. The DNR is an agency that promotes sustainability for our resources not working along side companies that look to destroy such commodities like wetlands, forest re-generation, wildlife habitat, etc. I am against this project and any others like it. Please do not let my faith in your organization dwindle with the authorization of this project.	EOO,G2C
<b>Sender Last Name:</b> Mehrman		<b>Submission ID:</b> 227
233	We are writing this communication to indicate our very strong support for the PolyMet Mining NorthMet Project. Along with the extensive economic benefits to our depressed Arrowhead Region it is clearly evident that PolyMet is committed and capable to mine and process these critical metals in an environmentally safe, sound and conscientious manner. The mining and processing of natural resources such as these are key to keeping our national economy strong and viable. American cannot blindly continue down the path of becoming a largely Service based economy, dependent entirely upon other nations for the supply of much needed goods and natural resources. PolyMet and their many local employees will provide the metals along with sustainable, good paying, jobs needed to keep us a strong global leader. Please do not be unduly swayed by those elements of our great state that would prefer that the residents of the Arrowhead Region attempt to provide for our families on the subsistence wages provided by low income, tourism based service jobs. We are confident that the rules, regulations, processes and procedures that are currently enforced by the State of Minnesota will ensure strict environmental compliance by PolyMet yet allow this dynamic and important project to come to fruition and provide the economic boost so badly needed during these trying times and for many years to come.	EOO
<b>Sender Last Name:</b> Meier		<b>Submission ID:</b> 3204
3540	I respectfully ask. How can this project not go through? The jobs created from this extensively researched and properly prepared mining project would be a savior to not only the citizens of Northern Minnesota but to people of neighboring states as well. The EIS for this project has been in development for more than 4 years at a cost of nearly \$20 million dollars under the watchful, scrutinizing eyes of the MNDNR. Do the right thing for the good of the people, pass this draft EIS and help our Country be great once again. Sincerely, Dale Meier Below is from PolyMet Mining Corp. news letter	EOO
<b>Sender Last Name:</b> Meineke		<b>Submission ID:</b> 167
157	Many of the metals to be produced by the PolyMet project are sourced outside the US. The PolyMet development will enable strict control of air and water emissions, and worker safety not required by most foreign sources. Minnesota has air and water regulations among the most stringent in the US and the world. Because of continued demand, these metals will be produced somewhere and Minnesota is the source of choice, where we can regulate the development. The US has and continues to lose manufacturing jobs to foreign countries, which restricts our economy and erodes the US currency. Development of natural resources is the foundation of any countries economy. The PolyMet project is the type of stimulus the US economy needs, an opportunity for Minnesota. This project will produce many high paying jobs and tax revenue, plus reduce the US reliance on foreign sources of the metals PolyMet will produce and improve the US balance of payments. These are the building blocks necessary to restore the US economy. As an engineer and business person, I find no reasons to expect this new metals industry in Minnesota will not be regulated to protect and safe guard the environment. The economic stimulus of the PolyMet project is an opportunity for Minnesota. Therefore, I support PolyMet's NorthMet project.	EOO,G5

331	The economy of Minnesota is an ecosystem - just like the ecosystems found throughout the state. When one part of the ecosystem is struggling, it has a negative impact on the related parts. The Building Trades in Minnesota are struggling; the economic recession has devastated the industries that have kept our members employed. As many as 50% of our members are sitting on the bench on any given day. The PolyMet Mining Company proposal to build a copper-nickel-precious metal mine and processing facility near Hoyt Lakes offers our members some hope to wait out this recession. Construction will require about 1.5 million man hours of construction over a two-year period; some of our members are bound to be part of that construction work force. But we don't have time for delays. PolyMet has made your job relatively easy by proposing a very environmentally friendly project. The draft environmental impact statement for the project has done a very thorough job of looking at all the potential impacts and offering options for mitigation, where appropriate. The draft EIS should be deemed adequate so that permitting can begin quickly-and so our members can start working to build the facility.	EOO

1225	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. My name is Tim Melby. My wife and I have resided at Finland, Minnesota on 40 acres for over 25 years where we have raised 3 children. We are both university graduates and our children are pursuing higher education of which our eldest graduated from the University of Minnesota. We all have concerns with Sulfide mining in Minnesota and particularly on the 6700 acres in Superior National Forest and public land. One concern is the water quality in locations that have sulfide mines and upon investigation we find no clean sulfide mines. Apparently the DEIS has not found any clean Sulfide mining operation anywhere.	G7B

3859 Krech Ojard & Associates, P.A. is a member of the Area Partnership for Economic Expansion (APEX), a business development organization led by top executives and senior managers from many of Northeastern Minnesota’s largest, most successful companies. The goal of APEX is to strengthen the regional economy by creating sustainable economic development. On behalf of both Krech Ojard and APEX, I want to state that I strongly support the NorthMet project being proposed by PolyMet Mining Company in Northeastern Minnesota. Through this project, PolyMet will significantly contribute to the state and local economy at a time when both the resulting jobs and related economic benefit are sorely needed. Not only will PolyMet’s 400 employees and the hundreds of spin-off jobs provide a huge economic benefit to both the Arrowhead region and Minnesota, but PolyMet will also provide millions of dollars in local and state taxes to support our communities and educational systems. More importantly, these economic benefits will not accrue at the expense of environmental protection, for as the comprehensive and detailed Environmental Impact Statement demonstrates, PolyMet will generate this economic activity while it is protecting our air, water and land. In addition to the economic benefits note above, PolyMet’s NorthMet project will provide a domestic supply of critical metals needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential products – products that are used by APEX members and others on a daily basis. Under current production, these metals are mined in one country, processed in another, and then transported to the United States. Not only does this create unnecessary greenhouse gas emissions associate with the transportation of these metals, foreign suppliers of these metals do not necessarily follow sound environmental practices, creating an even greater global environmental impact. In summary, the draft Environmental Impact Statement outlines the many choices PolyMet has made to protect our environment, and has documented that PolyMet can mine these critical metals, create these jobs and contribute to our regional, state and national economy while at the same time protecting our environment. Consequently, the draft EIS should be deemed to be adequate, which would then allow for the appropriate permits to be issued and this long-awaited project to begin.

3640	Considering the reality of water shortages in the South Western United States, its very shortsighted to underestimate the value of clean, healthy water. Aside from the impact of tourism, for our own survival; we must fight to protect sources of quality water. We can live without the minerals, but there is no substitute for water. Building this mine will go against any benefit the economies of the area or company may gain for the people of the Midwest; potentially the whole country. For the safety + well-being of people + ecosystems we cannot do this.	EOO,G7B
<b>Sender Last Name:</b> Midderdorf		<b>Submission ID:</b> 3337
3630	This project idea is disgusting. If those metals are so necessary, why can't recycling efforts for used electronics be improved? With the uncertainty of water sources with shrinking aquifers, water shortages are going to be, and already are, a dire issue in this country. We cannot live without electronics if need be, but we will not make it without quality water sources. I strongly urge you, please consider the well-being of your constituents. As for the jobs, we can survive by other means, but that will be compromised with this project.	EOO,G7B

1	C. Human Health Fish consumption advisories already occur for fish caught from many of the water bodies into which the project would drain. The risks of methylmercury contamination are examined in Comments II.N. Minnesota's fish tissue water quality standard for mercury is 0.2 mg/kg. At this level of mercury contamination, it is recommended that people not consume more than one fish per week. More than that is not considered safe. But for many people, fish constitutes an important nutritional and/or cultural part of their diet. People consuming more than one fish a week from impaired waters, or fish with higher levels of mercury than 0.2 mg/kg, are at risk of harming their health. The NorthMet project with its potential for increasing the mobilization of mercury, poses a human health risk to people who consume fish. The problems of geotechnical stability of the tailings basin (discussed in Comments II.K.), poses another serious risk to human health. The contents of the hydrometallurgical residue cells in particular will be extremely hazardous. Should the tailings dams fail (with an acknowledged "low margin of safety"), toxic materials would drain into water bodies from which human communities obtain drinking water. In addition, the DEIS also reviews the potential for mining to release amphibole mineral fibers to air and water. Exposure to these fibers has been connected to cancer and other health problems. The PolyMet project is in proximity to the Peter Mitchell Mine and Silver Bay Processing Plant, which has been associated with releases of amphibole fibers. "...amphibole minerals are present in the Duluth Complex and in close proximity to the NorthMet deposit. Thus, there remains an uncertain level of potential health risk from airborne amphibole fibers for the Project" (DEIS pg. 4.6-60). Recommendation: The EIS must fully examine the potential impacts from mercury contamination in fish and the resulting impacts on human health from fish consumption. It must include a new tailings basin design that has a reliable degree of stability. And it must more thoroughly examine the risks of amphibole mineral fibers in the project's ore and its impact on human health.	FM1

1	B. Socioeconomic Impacts The DEIS presents a one-sided evaluation of impacts to communities and economies in the region. The only potential negative impacts from the project cited in the DEIS are that “the Project would further reduce access to the site for hiking, fishing and hunting” and “generate some noise and light which may impact the recreational experience,” and “some impacts may experienced by recreational users of Whitewater Reservoir due to water fluctuations” (DEIS pg. 4.10-21). Absent from the DEIS is a meaningful assessment of other potentially negative impacts. Missing, for example, is any analysis of impacts to tourism and recreation, impacts on real estate values and sales, impacts to commercial fisheries if mercury contamination occurs. The Superior National Forest estimates that these public lands bring over \$200 million in tourism and recreation to the region annually (personal communication, Jim Sanders, Supervisor, SNF). But the DEIS provides no evaluation of this project’s potential impacts on this sustainable, important industry. The DEIS is devoid of any evaluation of reasonably foreseeable negative impacts, such as the impacts to communities from potentially contaminated drinking water, and impacts on fisheries from mercury contamination. There is not even an analysis of the impact on communities, schools, and the tax base when the mine closes in Year 20. This biased representation of impacts is not fair to those communities most directly affected by the mine’s closure. Particularly disturbing is that the DEIS describes the “No Action Alternative” as the option that entails on-going population and employment decline. No data are provided to support the conclusion that not building the mine will lead to ever declining jobs and dwindling population. And no evaluation is provided to show how the Proposed Action won’t lead to those same outcomes when the mine closes. Recommendation: The EIS must do a complete analysis of the potential negative impacts to communities, employment, and the economies of the area from this project. It must evaluate the region’s reliance on environmental amenities such as tourism and recreation. The EIS should include an analysis of the impacts to the region when the mine closes. And it must assess the potential impacts from scenarios that include water contamination.	SE4,G1,CR1
2	-Inadequate assessment of the potential for contaminants to leak from the tailings basin, despite the presence of the existing tailings basin from which existing seepage could have been measured.	WR2E
3	-Failure to assess mercury exposure through the collection of biotic samples such as fish, as most mercury monitoring programs today include.	WR1E,FM2
3	-Inadequate sampling of water chemistry of area lakes and streams affected by past iron mining activity as a method of comparison and prediction for the methylation effects of additional sulfate discharges	WR1E
3	-A lack of useful data or supporting information on which to base predictions of methylation risk due to field sampling that was too little and of poor data quality.	WR1E
3	Dr. Engstrom notes many similar issues with insufficient data, overdependence on modelling, and inadequate sampling regarding the analyses for potential mercury methylation and sulfate contamination.	WR1E
4	Recommendation: Additional data collection must be conducted, and the results of this disclosed in the EIS. The technical experts repeatedly indicate that real world data is far more reliable and predictive than models with potentially faulty and layered assumptions. In nearly all cases, the data needed can easily be collected. See Dr. Siegel’s and Dr. Engstrom’s reports for complete recommendations for additional information and collection methods.	WR1E
5	-Lack of a detailed reclamation plan (that should be tied to a financial assurance analysis) for necessary closure activities.	PD4
6	-Providing additional documentation about groundwater modeling, including water table maps and model assumptions	WR2F
7	-Installing a series of shallow piezometer nests and water table monitoring well along appropriate transects from the existing tailings pond to determine such things as flow direction	WR2A
7	-Installing approximately 6 additional monitoring wells in bedrock south of the proposed mine area to determine how groundwater in bedrock moves across the site.	WR2A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
8	-Installing several piezometer nests south of the mine and adjacent to the Embarrass and Partridge Rivers to better understand groundwater interactions with the rivers.	WR2A
8	-Obtain direct measurements of head and water chemistry downgradient and perpendicular from the existing tailings basin to assess leakage and solute transport.	WR2A
9	-Collect biotic samples and analyze for mercury contamination	WR1E
9	-Design a well constructed sampling program to assess methylmercury production that includes more and strategic sampling sites	WR1E
10	B. Problematic DNR Public Meetings The DNR held two public forums for providing information and opportunities for comment on the DEIS. One forum was in Aurora, MN, the other in Blaine, MN. Despite requests from the environmental community that additional forums in other more accessible locations be organized, the DNR refused to do so. Forums in Duluth and Minneapolis or St. Paul at a minimum should have been held, for these are centers of populations in the state. The DNR and USACE organized the forums in a manner that did not allow for oral public conversation, questions, or comments. Stenographers were available to take oral comments in a private space, but the public gathered at the event was prevented from hearing questions, answers and remarks from others. However, several politicians were given a formal platform during the presentation part of the gathering, to support the project. In some cases, the information these political leaders provided was inaccurate. The forums were biased events, in which only supporting comments were publicly heard, and no negative remarks were permitted in a public forum. This was an unbalanced event that deteriorated into a political rally in favor of the project. The fundamental purpose of the public forums – to provide a public space for citizens to learn, ask questions, and comment on the proposed project – was not achieved.	PRO6
10	2.) By not calculating the financial assurance, the DEIS fails to provide a full understanding of needed closure activities and closure costs. Water treatment actions are “one of the most important components of closure, especially from a financial standpoint...” (Chambers 2010). The DEIS acknowledges a need for water treatment for at least 45 years after mine closure. Given the predicted water contamination that may last for 2,000 years, it is obvious water treatment will be needed for a long time, if not in perpetuity. The DEIS does not clearly outline what the water treatment plan will be, and provides no cost analysis. Dr. Chambers provides a way of estimating these costs, something the DEIS did not do: “Again, as a rough estimate, the net present value of a chemical precipitation only system for the mine is \$27 million, and for a nanofiltration only system for the mine \$37 million. These costs include 20 years of operating costs... The closure water treatment systems will need to operate for at least 45 years, and the existing treatment systems will be 20 years old when closure begins. Given that the closure operating period is over twice as long as the 20 year mine operating period for which the cost estimates were made, and that the treatment systems will quite likely need to be replaced and upgraded during this 45 year period, using a figure of twice the cost estimate for the operating mine would seem to be a reasonable estimate. That would place the net present value of the Closure water treatment in the range of \$54 million to \$74 million for financial surety purposes” (Chambers 2010). This is a very large amount of money. The public will be liable for this cost or be forced to accept the water contamination if financial assurance is not properly calculated or if the mine operator goes bankrupt. As a result, the public has a right to be provided with thorough estimates as early as possible to properly understand the risks associated with this project. It is alarming that the only financial estimate provided in the DEIS, the Project Preliminary Closure Cost Estimate Summary (DEIS pg. 3-48), does not appear to contain water treatment operating and capital costs. If water treatment is not a component of financial assurance calculations, Minnesota taxpayers and human and natural resource health will be placed at unacceptable risk by this project. Recommendation: Financial assurance calculations must be included in the EIS. Water treatment operating and capital costs must be a component of financial assurance calculations. Dr. Chambers believes closure costs will likely require a financial surety of about \$100 million. The agencies overseeing the development of the EIS have an obligation to inform the public of this risk and to protect the public from unacceptable risk through full disclosure. The DEIS must also provide a rationale for why water treatment may only be needed for 45 years when pollution is expected to continue for much longer. Any longer treatment estimates must be included in closure costs and analyses.	PD3,PD4

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
10	<p>B. Reclamation Plan 1.) The DEIS presents an incomplete plan for reclamation activities that will be needed to responsibly close the mine. Dr. Chambers notes: “Lack of a viable reclamation plan and cost closure estimate is a major flaw in the EIS...It does not go far enough to present these details as a complete reclamation package that can be assessed in terms of what the overall reclamation goals are and how they will be met, whether the closure technologies that are proposed are viable, and how much implementing these closure and post-closure technologies will cost” (Chambers 2010). Elements missing in the reclamation plan include: assessments of the technologies available to close the mine, estimates of the costs of these technologies, and articulation of overall reclamation goals and how they will be achieved. Central to this plan must be the calculations of financial assurance detailed within the EIS. Recommendation: Dr. Chambers notes, “Mine reclamation should not be developed based on future technologies, or future resources. The pre-mining reclamation plan needs to lay out a basic approach to reclamation using technologies that are proven and have measurable costs, and with enough detail to provide a conservative but reasonable estimate of what these closure costs will be” (Chambers 2010). Elements to include in a more detailed reclamation plan in the EIS are: assessments of the technologies available to close the mine, estimates of the costs of these technologies, and articulation of overall reclamation goals and how they will be achieved. Central to this plan must be the calculations of financial assurance detailed within the EIS. As Dr. Chambers highlights in his comments, most modern EISs analyze the reclamation plan as part of the EIS process. He recommends that the PolyMet EIS do the same, and show the reclamation liability on a year-by-year basis. His attached comments provide an example of a reclamation plan with an appropriate level of detail and cost estimates (Pogo Project Reclamation and Closure Plan, Dec. 2002). This template should be used to develop an appropriate reclamation plan for the PolyMet project.</p>	PD3,PD4

- 10 A. Length of Comment Period The Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers provided a 90-day public review and comment period for the DEIS. This was despite the urgings of the U.S. EPA to allocate a 120-day comment period. “The complexity and potential impacts of this project warrant a longer public review period than the 45-minimum for a DEIS published in the Federal Register. Recent similar projects elsewhere in the country that were submitted for public review under NEPA have had 120-day review periods, either initially or through one or more extensions. We observe that public interest in copper mines in the Upper Midwest is high. Decisions made for this project may be precedent-setting, as it is the first large-scale copper mine in Minnesota. We have consistently urged the USACE to adopt a realistic comment period over the past few years and will address this concern regarding the comment period with the USACE St. Paul District Colonel separately” (U.S. EPA August 2009). On October 7, 2009, The Friends of the Boundary Waters Wilderness joined ten other organizations through the Minnesota Environmental Partnership (MEP), a statewide coalition of more than 80 environmental, conservation, and non-profit organizations, to request a 120-day comment period. That request was rejected in favor of the 90-day period. With the release of the DEIS and a more full realization of the scope and complexity of the DEIS, MEP in December 2009 requested an extension that would provide a total of 180-day comment period. “As you are aware, November 2nd marked the start of the scheduled 90 day public comment period for the DEIS. We do not believe that the length of the comment period is adequate to meet the need for a credible and accessible public review process. We request that the time period for submitting comments be extended to 180 days. . . This DEIS was years in development and totals three volumes of material. It is unreasonable to expect citizens and concerned stakeholders to be able to fully review, analyze and prepare adequate comments in this relatively brief 90 day period. An extension to 180 days is necessary to provide time for adequate review and preparation of comments” (MEP letter to the DNR, USACE December 2009). This request was rejected. “The MnDNR has determined that no additional public meetings will be held and that the DEIS public comment period will not be extended” (Mn DNR letter to MEP January 15, 2010). The complexity and length of the DEIS warranted the 120-day period to enable the public to thoroughly examine and respond to it. The Friends worked with technical experts to solicit their analysis of the project, and the 90-day comment period proved very challenging for providing them the review and response time they needed. The Friends is an organization that works directly with the public, providing information to citizens on projects like the NorthMet project. The short timeframe was an extremely difficult one for us to both receive the technical comments from experts, and to summarize and distribute these findings to members of the public. We were prevented from adequately communicating these findings with our members and other members of the public due to this short timeframe for comments. The DEIS is 1,800 pages, three volumes, and hundreds of supporting documents in length. This is a sufficiently long and technical project to warrant the recommended 120-day comment period. In addition, the comment period included the Thanksgiving, Christmas and New Year’s holidays, periods of time for which many organizations are closed for business, and for which members of the public are engaged in travel and activities that likely limit their time for review and comment on the DEIS. It was reasonable for the agencies to provide extra time given the overlap with this busy holiday period. In early December, 2009, the DNR’s email address for public comments on the DNR website malfunctioned. In a
- 11 2.) The DEIS describes general maintenance activities that would need to continue through post-closure, including: “repair of stockpile and tailings dike slope erosion, wetland outflow structure up-keep to ensure they are functioning properly, woody species and tree removal on stockpiles and hydrometallurgical cells with membranes, tailings pond maintenance, and seepage collection from the Tailings Basin” (DEIS pg. 3-49). These are all maintenance activities that will be required in perpetuity. Given this perpetual maintenance requirement, this project cannot ever be deemed “reclaimed.” Minnesota Nonferrous Metallic Mineral Mining Rules (Chapter 6132) clearly indicate that reclamation goals are for post-closure maintenance to cease. The rules also state: “No release from a permit to mine shall be approved for a portion of the mining area requiring post-closure maintenance until the necessity for the maintenance ceases” (MN Rules 6132.4800 Subp. 3). Given these requirements, both the mine site and the tailings basin will fail to qualify, ever, as reclaimed. In addition, the responsible mining entity will never be released from their permit obligations. This is a failure to reach reclamation goals to achieve maintenance-free conditions and a final release from the permit conditions. Recommendation: The EIS must incorporate designs that achieve Minnesota State reclamation goals for an eventual maintenance-free site.

- 11 C. Land Exchange and the Mine Site 1.) While PolyMet has leased the privately held mineral rights at the mine site, the surface rights are in public ownership, managed by the U.S. Forest Service. The DEIS notes: “It is the position of the United States that the mineral rights leased by PolyMet do not include the right to open pit mine the National Forest System land” (DEIS S-1). PolyMet and the Forest Service are exploring a possible land exchange to trade to PolyMet the mine site in exchange for new land to put into public ownership. The DEIS indicates that a separate EIS will evaluate this proposed land exchange. The PolyMet DEIS does not examine the potential environmental impacts of this land exchange even though it is an integral component of this project. The U.S. EPA in an August 2009 letter to the U.S. Army Corps of Engineers regarding the PolyMet project identifies as a “red flag issue,” the failure to analyze impacts related to the potential land exchange with the U.S. Forest Service: “We are concerned that some impacts related to the potential land exchange between the U.S. Forest Service are not covered in the PDEIS. We question whether the discussion of the land exchange can be deferred to a separate EIS, as it is a connected action which is clearly related to the NorthMet project” (U.S. EPA August 2009). Recommendation: The EIS must include a complete analysis of the proposed land exchange. This is obviously a related and connected action to this project with the potential for environmental impacts.
- 12 2.) The DEIS fails to provide important information about the value of the site proposed for the land exchange, land that would be significantly and irrevocably altered during the mining operation. The proposed mine site was identified in the late 1990s as special habitat worthy of protection in two assessments, one conducted by the U.S. Forest Service and another by the MN DNR. In these evaluations, the scientists concluded that the mine site, part of what is called the “100 Mile Swamp,” represents some of the highest quality habitat remaining in the landscape. In January 1997, as part of its preparation for the Forest Plan Revision, the Superior National Forest released a report titled, “Identification of Potential Natural Areas, Including Representative Ecosystems, on the Superior National Forest” by forest biologist Robin Vora. The report summarized a process to identify natural areas on the forest that might qualify for permanent protection. The focus was to develop a list and general description of the highest quality remaining examples of common ecosystems present in each Landtype Association (“LTA” or “landscape”). The report notes, “A network of natural areas helps to protect biological diversity at the genetic, species, ecosystem, and landscape scales. Natural areas representative of common ecosystems in natural conditions serve as baseline or reference” (Vora 1997). The PolyMet potential mine site was identified in this report as part of the “100 Mile Swamp.” It sits within LTA 8A, and was considered one of those “ecosystems in natural condition” that was representative of its landscape, and a good candidate for protected status. The site is especially important as LTA 8A was noted as lacking ecosystem representation in protected areas. Features that gave this area a high ranking were its watershed integrity, the size of its wetlands, the presence of riverine ecosystems, and the large amount of interior forest present. In December 1997, the Minnesota DNR released a report called, “Evaluation of Selected Potential Candidate Research and Natural Areas as Representative Ecological Landtype Associations on the Superior National Forest, Minnesota.” This study was conducted by plant ecologist Chel Anderson. The purpose of this assessment was to continue the evaluations begun by Robin Vora. The assessment was to further assist the Superior National Forest in evaluating areas for protection for the Forest Plan Revision process. The study analyzed the 93 sites identified by Vora and developed a shorter list of 45 sites worthy of consideration as protected natural areas. The assessment notes that these sites represent the highest-quality remaining examples of characteristic ecosystems in each ecological Landtype Association on the Superior National Forest. Again, the “100 Mile Swamp” appears on this list of worthy candidates. The report notes, “Inclusion of the 100 Mile Swamp site would very likely complete representation of the prominent ELTs [ecological landtypes], and provide some additional upland diversity” (Anderson 1997). Representative ecological systems within the Laurentian Highlands, the ecological subsection in which the PolyMet mine site is located, include forested communities dominated by aspen-birch, jack pine barrens, red and white pine on uplands, and conifer bogs and swamps in the lowlands. The PolyMet mine site sits on a conifer bog and lowland swamp. Within the Laurentian Highlands are 58 species identified as Species in Greatest Conservation Need, including 12 species that are federal or state endangered, threatened or of special concern. Habitat loss, habitat degradation and pollution represent some of the most pressing threats to these species. Lowland conifer forests have been identified by the MN DNR as key habitats for Species of Greatest Conservation Need in this subsection. Within the Laurentian Highlands, 22 Species of Greatest Conservation Need are typically associated with lowland conifer fores

12	D. Geographic Scope of Evaluation The DEIS evaluates the potential environmental impacts from the proposed project, but the scope of the evaluation was largely limited to a five mile radius around the mine site, the plant site, and the transportation corridor. Given predicted water quality violations, the acknowledgement that drainage from the project will enter both surface and groundwater, the geotechnical instability of the tailings basin, admitted global warming impacts, and the many uncertainties in data and modeling, this project is certain to have impacts broader than a five mile radius around the project's core. Recommendation: The EIS must provide evaluation of the potential impacts within a much larger zone, including likely impacts to the entire St. Louis River watershed and Lake Superior. Statewide impacts, such as those from increases in carbon emissions from the project, must be included. (See Comments III.B.2.)	WR3B,AQ4E
13	E. Mitigation Measures In the DEIS, mitigation measures for the proposed project are almost exclusively presented as recommendations vs. requirements. As Dr. Chambers notes, "the description of the mitigation measures end with statements like: the measure 'warrants further consideration;' or 'it is recommended that...;' or the measure 'should...;' or, could..., or would..." (Chambers 2010). It is unclear and unstated which, if any, of the mitigation measures the responsible agencies will find significant enough to make requirements in the permit. It is unclear and unstated which measures will be considered voluntary. Dr. Chambers comments: "Since the EIS is a document that is tied directly to the state and federal agencies that will be issuing the permits necessary for the mine to operate, it would be reasonable for the public to assume that the agencies can and would require some or most of the mitigation measures described in the EIS when they issue the permits for the mine. But the way the mitigation measures are described in the DEIS all of the mitigation measures would be voluntary. That leaves this reviewer, and the public, unsure what the final project will look like and what effects it will actually have" (Chambers 2010). Recommendation: The EIS should specify what mitigation measures will be required of the mine operators. Voluntary measures should be stated, enabling the public to "comment on the relevance and importance of the voluntary mitigation measures" (Chambers 2010). Voluntary mitigation measure must be assumed, for impact analysis, as not occurring.	G2D
14	F. Data Collection and Disclosure A full understanding of significant environmental impacts can only be realized with the appropriate gathering of data and analysis. Repeatedly throughout the DEIS, however, it is clear that opportunities to gather relevant, available information were not taken. Models were created, with assumptions that may be inaccurate, to assess issues such as groundwater flow, when real world information could have easily been gathered for analysis. Details of models and assumptions are often not disclosed, making a review of these methods difficult. So often are necessary data missing, that an accurate portrayal of this project's impacts is potentially not reflected in the DEIS.	G8B
15	-Lack of any financial assurance calculations that would enable understanding the long-term environmental impacts of the project.	PD4
15	-Insufficiently documented groundwater modeling approaches. "These models may, in fact, be inappropriate to address the problems considered; (a) dewatering caused by the mine and (b) how rapidly potentially contaminated water might move from the closed mine to the Partridge and Embarrass Rivers" (Siegel 2010).	WR2F
16	-Installation of insufficient ground water monitoring wells and piezometers in bedrock to either characterize where and how ground water in bedrock moves across the site, or how it interacts with the Partridge River.	WR2A
17	-Insufficient characterization of how water leaking from the present and future tailings pond may carry potential contaminants north to the Embarrass River. "The hydrologic conditions caused by tailings ponds present for many years offered a unique opportunity to directly evaluate important contaminant transport properties at the proper distance (scale) along subsurface pathways to the river prior to mine opening. PolyMet chose not to do this, but to develop models and other methods to infer what might happen" (Siegel 2010).	WR5A
17	-Inappropriate assumption for the modeled area that the rock properties of the hydrostratigraphic bedrock aquifers in the mine site are uniform in all directions. There was little effort to characterize the distribution of fractures in the bedrock either by analogy with other sites in the Iron Range, or by direct measurement. "Without this characterization, no conclusion can be clearly made as to where potentially contaminated water might move in bedrock..." (Siegel 2010).	WR2F

|---|---|----------|
| 4 | <p>G. Cumulative Impacts The DEIS fails to include in its examination of cumulative effects on water resources, known mining projects that are currently in development. Dr. Chambers notes, “For example, there are several mining projects in the advanced stages of exploration that should be considered as reasonably foreseeable. These projects include the Duluth Metals Ltd – Nokomis deposit and the Franconia Minerals Corp – Birch Lake deposit. Ignoring the potential for these developments understates the cumulative impacts to the region” (Chambers 2010). In an October 29, 2008 tour of the PolyMet processing plant, the existing LTVSMC plant, Friends staff member Greg Seitz was told by PolyMet that 8 of the 24 crushers would be operating for processing ore from the NorthMet project. The Friends is concerned that if permitted, PolyMet is likely to use the un-used portions of its plant to process ore from other nonferrous mining operations. If this is the intent, it must be outlined in this EIS. There are obvious potential cumulative impacts to the tailings basin, wetlands and water resources from increased activities resulting from handling ore from other mining operations. Recommendation: Mining projects in the advanced stages of exploration should be included as reasonably foreseeable impacts for analysis of the NorthMet project’s cumulative impacts. Any anticipated use of the processing plant, tailings basin, project lands, and transportation corridors to handle ore from other mining operations must be included in this EIS’s cumulative effects analysis.</p>  | WR5A,WE5 |
| 4 | <p>It is disturbing that, after years of preparation, the DEIS contains so many omissions and data gaps, and that opportunities to examine existing conditions that would obviously be helpful, were not taken. This lack of information must be resolved for the EIS to be complete.</p>   | G8       |
| 5 | <p>H. Underground Mine Alternative The option of developing an underground mine rather than the open pit mines of the Proposed Action was rejected by PolyMet as: “Not economically viable. The rate of ore production of an underground mine would not support the processing rate necessary to economically process the low-grade ore...Additionally, the ore deposit is shallow and broadly distributed throughout the Mine Site...” (DEIS pg. 3-64). But in Dr. Chambers’ review of support document “ALT11High Level Underground Costs,” from PEG Consultants Inc, July 30, 2009, he found only a limited economic analysis of an underground option. “This was not a detailed analysis of the costs of underground mining at the NorthMet site. The document is only 2+ pages in length, and lays out what must be rough estimates of the costs of underground mining compared to open pit mining. The scope and depth of analysis presented in ALT11 is not enough to state conclusively that underground mining is not economical at this site” (Chambers 2010). The tribal cooperating agencies provide additional information to suggest more consideration should be given to the underground alternative: “A study of this particular deposit was performed by U.S. Steel that recommended underground mining. By examining cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative” (Tribal Cooperating Agencies, DEIS pg 3-64). Recommendation: The EIS should provide a thorough analysis of the underground mine alternative, examining ore distribution, the economic viability of this option and the potential environmental impacts of an underground mine.</p> | PD1      |
| 6 | <p>-A dangerously unstable tailings basin design that the DEIS acknowledges has a low margin of safety, and which would contain hazardous wastes.</p>   | GT2      |

6 A. Reactive Waste Rock and Material 1.) Waste rock disposal plans under both the Proposed Action and the Mine Site Alternative raise water pollution concerns. Proposed Action Storage of reactive waste rock permanently above ground the acknowledged potential to generate Acid Mine Drainage (AMD) and to leach metal contaminants. The Proposed Action calls for placing only a portion of Category 1 and 2 waste rock, the least reactive material, into the East Pit for subaqueous disposal before converting the pit to a created wetland. Category 1 and 2 waste rock are predicted to contain less than 0.3% sulfur. Meanwhile, the Proposed Action would permanently leave on the surface all of the Category 3 and 4 waste rock, with sulfur contents between 0.3 and 0.6%. The DEIS indicates that Category 3 is medium reactive waste rock that may generate acid mine drainage and is predicted to leach heavy metals resulting in drainage with heavy metal concentrations in excess of water quality compliance levels. Category 4 waste rock is labeled highly reactive. “This material would generate ARD and leach heavy metals resulting in drainage with heavy metal concentrations in excess of anticipated water quality compliance levels” (DEIS pg. 3-14). Indeed, modeling described in the DEIS indicates significant potential pollution problems from storing reactive waste rock above ground. Table 4.1-44 shows results of modeling showing potential groundwater exceedances from the waste rock stockpiles. The Category 3 Lean Ore stockpile shows potential exceedances of copper, iron, manganese, nickel, aluminum, beryllium and thallium. The Category 3 waste rock stockpile shows potential exceedances for antimony, arsenic, copper, iron, manganese, nickel, sulfate, aluminum, beryllium, and thallium. The Category 4 waste rock stockpile shows potential exceedances for antimony, iron, manganese, nickel, aluminum, beryllium, and thallium. Additional modeling shown in Table 4.1-45 in the DEIS shows predicted groundwater exceedances into the Partridge River for nickel from the Category 3 Lean Ore stockpile lasting 50 to 2,000 years. Category 3 waste rock stockpile is predicted to exceed groundwater criteria for antimony, manganese, nickel, and sulfate from 50 to 2,000 years. Contamination exceeding groundwater criteria from the Category 4 waste rock stockpile is predicted for antimony lasting 90 to 250 years. Storing medium to highly reactive waste rock permanently above ground presents acknowledged and unacceptable pollution risks for unacceptable durations. Under the Proposed Action, some Category 1 and 2 waste rock will also be stockpiled on the surface, also with pollution risks associated with it. In one DEIS model, Category 1 and 2 waste rock are predicted to exceed groundwater evaluation criteria for arsenic, antimony, sulfate, aluminum, iron, manganese, beryllium and thallium. In a second model, antimony, arsenic and sulfate are predicted to exceed groundwater evaluation criteria for 100 to 2,000 years. Mine Site Alternative The DEIS also presents a Mine Site Alternative to the Proposed Action that would place all the Category 3 and 4, as well as Category 2, waste rock into the East Pit for subaqueous disposal. The only permanent stockpiles would be for Category 1 waste rock and overburden. This is a preferable plan to the Proposed Action. Dr. David Chambers notes: “Backfilling Category 2, 3 and 4 waste rock into the mined-out East Pit would probably be the most protective of water resources in the long-term” (Chambers 2010). Nevertheless, although the Mine Site Alternative is preferable, modeling in the DEIS shows significant ground water pollution risks from this alternative action. A concern is the “dissolution of oxidation products formed prior to inundation with water in the East Pit (i.e. during temporary surface stockpiling) and continued reaction of the rock once submerged” (DEIS pg. 4.1-136). Modeling in the DEIS assumed oxidized solutes would be leached durin

WR1E

7 2.) The Proposed Action also calls for storing peat and unsaturated overburden in an unlined area called the Overburden Storage and Laydown Area. “Peat, in particular, is a sink for mercury. The wetting and drying of the peat that would occur in this storage area would promote the methylation of mercury” (DEIS pg. 4.1-166). The DEIS recommends that drainage from this area be collected and treated at the WWTF. Recommendation: Collecting and treating drainage from the Overburden Storage and Laydown Area must be a requirement in the EIS, rather than a recommendation.

118	I just want to say PolyMet -- I believe the leaders, the officials that are running it, come from a very experienced mining background and they will set a benchmark, set the standards for projects to come. I think they will set a high bar as far as having a project that has very little impact on the environment, and I believe there will be more mines like it that will start up as a result. Northeastern rural Minnesota is an important part of the state with lots of communities, families, people raising their families, and we need the jobs. It's a depressed area, economically, and we tend to lose a lot of our young people because we don't have a lot of good-paying jobs. And it would produce lots of tax dollars for the state. That's about it.	EOO,G6
166	I want to take this time to express my full support of the proposed Polymet project in Northeastern Minnesota. This project is badly needed in our part of the state. We have been blessed with an abundance of natural resources here. Developing those resources in a safe and environmentally stable way has been, and will continue to be, our major means of economic viability. These 400 potential jobs and the many indirect jobs that would result are critical to our communities' well-being. The spin-off from this kind of major economic activity makes most other jobs in our area possible, and directly affects the well-being of our related businesses, communities, schools, and institutions. We live in an incredibly beautiful part of the state, but our geographic remoteness from major U.S. markets severely limits other manufacturing-related entities to consider locating here. We in Northeastern Minnesota have closely followed the progress of this project, with high hopes for its viability. The environmental review process has been both lengthy and thorough. It is my opinion, in reviewing the draft EIS, that the proposed project more than adequately addresses the environmental concerns. I believe that this project will benefit not only our region and Minnesota in general, but will also benefit the U.S. as a nation, as these precious metals are not mined anywhere else in our country. Relying on foreign sources for these metals takes control of how they are mined and refined out of our hands. This makes it more likely that environmental concerns are not being met, and results in a much more inefficient and resource-wasting route to get them to our market. Mining and producing them here in Minnesota, where strict environmental oversight takes place, greatly reduces these concerns and directly impacts our own economy in a positive fashion. State of Minnesota and our local governmental bodies will also benefit not only from the boost to our economy, but also from millions of dollars in additional revenue collected in local and state taxes. These additional revenues will be timely in bringing some relief to our presently tax-strapped local and state governmental bodies. I cannot stress enough what this project means to our region. We have seen the taconite industry, our economic mainstay, go through bankruptcies (LTV) and painful downsizing that has resulted in the shrinking of our communities and the exodus of our high-school-educated children and young families out of our region to seek meaningful employment elsewhere. I would like to see my own children be able to remain working here in Northeastern Minnesota, the area in which they grew up and for which they love and want to stay. There are many others who have left the area and would love to return if there were adequate means of employment here for their families. This decision will directly affect the well-being of our small business here in Hibbing and many others across our region, and the families that they employ. Please give this project your strongest consideration. I am thoroughly convinced that it will impact our region, state, and nation in a positive and environmentally friendly way.	EOO
1233	I oppose the Polymet/Northmet project due too high risk of serious environmental damage that may be impossible to control.	EOO
1974	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. We here in Minnesota are so fortunate to have abundant water resources. Lake Superior is the largest lake in the United States and there is no area comparable to the BWCA in the United States. An article in the Star Tribune on December 8, 2009 carried the headline "Millions in U.S. drink contaminated water, records show." Experts predict that in the near future, clean water will be many times more precious than it already is. Please protect our water resources from pollution. If we pollute every source of fresh water on this planet, there is no where else to get it.	G9

3493	<p>I'm originally a Minnesotan but now live in Wisconsin. I still have family in Minnesota but besides visiting them I count on two to three BWCA trips a year and each trip I spend money "back home". I've always been proud of my home state but boy will I be disappointed if I learn that the principle watch dog group for Minnesota natural spaces and resources let's down America by turning a blind eye to additional mining operations for Polymet. Please plan for the future and make sure that there are provisions to hold Polymet fully responsible for environmental degradation over the long haul as a result of their business practices. There's a concept called Solastalgia that is currently being given more and more credence in psychology and this concept relates to the deeply disturbing psychological affect that destruction of ones homeland has on people's mental health. You risk more than destruction of Minnesota's natural resources that can benefit many for years and years by allowing the few to gain money in the short term and destroy the future prospects for sustainable resources. Please be both cautious and responsible as you cut deals to allow the exploitation of Minnesota Natural Resources. Trying to go after Polymet later will be incredibly more expensive than setting up responsible limitations now. I'm writing this assuming this is a done deal despite the terrible environmental practices of mining companies over time.</p>	PD4,PD10,G6,G8
<b>Sender Last Name:</b>	Mills	<b>Submission ID:</b> 3309
3602	<p>Please consider my sincere opposition to the NorthMet Project. Its merits to boost economy pales in comparison to the potential environmental degradation &amp; long-term damage to one of the most beautiful resources in North America, and more importantly an area that many Americans &amp; Canadians view as the last region to leave unpolluted to future generations. I will not travel to that area if the proposed mine were to arrive, it would be a sad day. Please forward this to decision making bodies.</p>	EOO,G2
<b>Sender Last Name:</b>	Mirindas	<b>Submission ID:</b> 2111
2498	<p>It is with great dissapointment That I find the DNR guilty of selling out the residents of this nation. It is no doubt that you and your agency are nothing but a tool for corporate interests. The many people I talk to are shocked that the DNR is working toward exploitation of Indian and national interests in what little remains of our National Forests. My organization and others will make it known to the country what your agency, Franken, Klobouchar, and Oberstar are trying to slip under the citizens of this state and country. Your intentional shutting out of public opinion of the environmentally concerned is so obvious to what your intentions are its a joke and so were your public hearings. It dosen't bother me that your closing out early of the hearings because they were a waste of time anyway for the people who wanted to express their environmental concerns. We will fight you every inch of the way I suggest you keep your eyes and ears open to the people and voices of the people you think are already defeated by your decision, for we don't intend to blindside you like you have done to Minnesota and the country. The fight you've asked for has only begun.</p>	EOO
<b>Sender Last Name:</b>	Mismash	<b>Submission ID:</b> 185
177	<p>I fully support the Polymet project and feel that they have followed all of the necessary guidelines in appropriating their permits and environmental requirements. They have shown genuine concerns about water and air safety and are willing to constantly look at new and improved ideas for the care and safety pertaining to these area. The Polymet operation will provide much needed jobs in the Northeast Minnesota area and will provide good usable products that are a USA produced material rather than importing. What they will do for the overall business communities in this area will be measured as a huge success and enable everyone in the area to raise families and grow with the success of Polymet. It will truly be a win/win situation for everyone. I firmly believe that Polymet will be a leader in the new area of mining in Northeast Minnesota and will convince others that it can be done in an environmentally sound manner. I feel that they will constantly exercise concerns to be as up to date with environmental issues as possible.</p>	EOO

1284	Like many Minnesotans I am very concerned about the long term environmental consequences of non-ferrous mining. Until it can be proved to not be destructive to our lakes, rivers and streams I am against mining in our wetlands. Minnesota is not the right choice for a site for mining of this kind.	G7B,G7C
<b>Sender Last Name:</b> Moates <span style="float: right;"><b>Submission ID:</b> 2883</span>		
2763	The mine would likely significantly raise methyl-mercury levels in the Partridge and Embarrass Rivers, due to leaching of sulfates which increase mercury methylation. Raising the levels of methyl-mercury in the Partridge River and the downstream St. Louis River, which are already impaired by the unsafe levels of mercury, is contrary to Minnesota State Law. Yet the DEIS does not adequately address this impact, even though Tribal Agencies have raised serious concerns about it. The impact of sulfate pollution on wild rice is similarly inadequately addressed, even though there is a Minnesota law governing wild rice water quality. The DEIS also fails to adequately address environmental justice impacts related to increased mercury and the loss of wild rice. The Fond du Lac Band of Lake Superior Chippewa live down stream, have treaty rights in this area, and have lower per capita and median incomes than the rest of Minnesota. Consequently, the DEIS should include analysis of environmental justice impacts to Fond du Lac tribal members such as loss of subsistence, loss of income, and loss of traditional cultural property from decreased water quality, toxic fish, and destroyed wild rice. Many non-native residents also rely on fish, wild-rice, and game to supplement their subsistence and/or incomes. The DEIS should also include analysis of environmental justice impacts on non-native rural residents of St. Louis County, particularly those who may need to subsist on fishing and gathering.	WR4B,WR4F,WR5C,G3,F

30	If this is all about jobs, we need to consider the jobs that will be lost in the tourism industry if our pristine waters that draw visitors from around the nation and from other countries become polluted. In Northeastern Minnesota, tourism brings in \$1.6 billion per year, \$250 million in local and state taxes, and 35,500 full-time equivalent jobs. How can we even consider putting all this at risk?	SE4
3501	I am very concerned about the request by PolyMet to construct and operate an open pit mine to extract metals from sulfide ores. The process they will be using is known to create water pollution, which can affect the viability of our strong tourist industry in Northern Minnesota -- both inland and on the North Shore -- as well as threatening the safety of the ground water for residents of the area. The effects of this type of pollution can require treatment of waters for thousands of years. Why are we even considering giving a permit to such an operation, which puts our beautiful lakes and forests at risk?	G7A,G11
3502	How shortsighted are we? Do we not consider the generations to come after us? Let us focus on creating green jobs to help our economy -- not jobs whose end result will be pollution of our beautiful land and waters and harm to our vital tourism industry.	G1,G7,G11
<b>Sender Last Name:</b> Moe <span style="float: right;"><b>Submission ID:</b> 263</span>

276	As a resident of Hibbing, Minnesota, I am writing to express my support for the Polymet Mining Corporation project. I am a proud member of my community. I have built my career here and I am in the process of raising a family in this area that has been hit so hard economically in the past 18 months. I would be remiss if I did not reach out at this time to make known the importance of this project to our local region. As a part of a community that has survived the rise and fall of the steel industry many times, I strive to support my local community whenever possible. With that in mind, I have invested my own dollars in the Polymet Mining Corporation, and have encouraged my family, friends and neighbors to do the same. It is my understanding that Polymet will produce the copper, nickel, platinum, gold and cobalt in an environmentally sound manner and generate significant economic activity in this depressed part of Minnesota. In addition, it will provide millions of dollars in local and state taxes that will, in tum, give a boost to our communities and educational systems. It is my request that you make every effort to see the Polymet Mining Corporation project through to completion.	EOO
2012	If the worst happens. The DEIS does not adequately address the scenario of what steps or measures will be employed if the "worst case" happens, such as the "waste" or rubbish piles were not adequately "sealed" and result in sulphuric acid polluting the ground water, lakes and streams? The projected life of the mine is 20 years of operation and then left to nature to cope with. Much of the effects of 20 years operation will not be evidenced for 50 to 100 years afterward and then who is responsible for the cleanup? Our thinking is that without strict supervision of the Polymet Mining Operation, it will never be "cleaned up" adequately in 20 years and you must think 100 years ahead!	PD3
<b>Sender Last Name:</b> Moehlenbrock		<b>Submission ID:</b> 3591
1983	The last problem I would like to address involves polluted groundwater upwelling from the tailings basin during the time period when the mine is in operation. The following is a quote from page 4.1-129. "The groundwater seepage rate from the Tailings Basin during mine operations would greatly exceed the groundwater flux capacity of the aquifer, which would result in significant upwelling of groundwater with elevated sulfate concentrations. This upwelling would inundate portions of the wetlands found north of the Tailings Basin, introduce relatively high sulfate concentrations to the wetlands and downstream lakes on the Embarrass River that represent high risk situations for mercury methylation, and could affect sulfate concentrations in downstream waters ... " The Embarrass River watershed already has elevated mercury levels in its fish. Further methylation of mercury within the river system could render the fish very dangerous to eat. Considering that the area is currently experiencing a boom in development due to the recreational potential of the lakes within this watershed, word of increased contamination could slow down development and the local economy. The tailings basin alternative plan seems to improve upon the proposed action, but still has some inadequacies. Specifically, page 4.1-148 which states, "If determined to be necessary based on actual seepage water quality, the treatment plant would be required. " The quote from page 4.1-129 already stated that the leakage from the tailings basin would have elevated sulfate levels. This water would definitely require water treatment unless 100% of the leakage is recycled as make up water at the plant site. Whether the water is discharged into the Embarrass River or the Partridge River should have no bearing on what level of contamination is acceptable.	FM1
3301	The first problem I would like to mention refers to water leaching from permanent waste rock stockpiles after mine closure: On page 4.1-56, it states that, "PolyMet would continue to collect and treat leachate from the permanent waste rock stockpiles at the WWTF [waste water treatment facility] until monitoring shows that treatment is no longer necessary to meet water quality standards." That sounds acceptable at first glance, but what worries me is the table on page 4.1-80 (Table 4.1-45) that clearly states that water quality standards of the stock pile leachate will not be met for 2000 years. The idea that Polymet would operate a waste water treatment facility for 2000 years is absurd.	EOO,WR3I
3302	Pages 4.1-111 & 112 discuss another part of Polymet's plan for long term water treatment. " ... constructed wetlands would indefinitely provide the primary treatment of waste rock stockpile leachate." However, as you read on, pages 4.1-112 & 113 state that because of the way wetlands have been used for water treatment in the past and the variability in success that has been experienced ... "Constructed wetlands petiormance, however, is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards. "	WR3L

Comment ID	Comment Text	Theme Codes
3303	To summarize my first point, according to the EIS, the mine's plan for long term, post closure water treatment is not expected to work, meaning that to comply with their statement on page 4.1-56 and consistently meet standards, by Polymet's own calculations, they would have to operate the waste water treatment facility for a period of at least 2000 years. This is not a tenable long term solution. How can a project be approved when the EIS clearly states that discharges will exceed standards, and that the proposed mitigation measures will probably not work?	EOO
3304	My next concern is in regard to acid rock drainage. The mine's plan to neutralize acid rock drainage is to treat it with limestone, but on page 4.1-66, it states that, " ... successful application of this measure has not been demonstrated." I do not believe it is prudent to use an unproven technique when the consequences of acid rock drainage have proven to be very serious in other parts of the country and around the world. Doesn't Polymet have to provide some proof, or at least some strong evidence founded on empirical research that this method will work before the project is approved? The mine site alternative described on pages 4.1-134 & 135 does not appear to solve this problem. "PolyMet proposes to add limestone to the temporary stockpiles (Category 2 and 3 waste rock, Category 3 lean ore, and Category 4 waste rock) using multiple dosing stages and several mixing methods to neutralize acid formation until the rock can be backfilled into the East Pit beginning in Year 12. A key assumption is that the addition of limestone would be effective in maintaining a relatively high pH of 8 in order to limit metal solubility. This can be done, but close monitoring of the pH and water quality of collected leachate from these stockpiles is recommended to ensure the effectiveness of the lime treatment." It is clear that Polymet has not done enough research to be able to predict the result of this technique. If they can research the exact size, shape, and depth of the ore body, know the exact amount of the target minerals they expect to acquire, know the amount of waste rock and overburden, and know the chemical composition of the ores and surrounding minerals, then why can't they be expected to do the necessary research to provide us with adequate empirical data to prove that their contamination mitigation measures will work?	WR1E
3305	The last problem I would like to address involves polluted groundwater upwelling from the tailings basin during the time period when the mine is in operation. The following is a quote from page 4.1-129. "The groundwater seepage rate from the Tailings Basin during mine operations would greatly exceed the groundwater flux capacity of the aquifer, which would result in significant upwelling of groundwater with elevated sulfate concentrations. This upwelling would inundate portions of the wetlands found north of the Tailings Basin, introduce relatively high sulfate concentrations to the wetlands and downstream lakes on the Embarrass River that represent high risk situations for mercury methylation, and could affect sulfate concentrations in downstream waters ... " The Embarrass River watershed already has elevated mercury levels in its fish. Further methylation of mercury within the river system could render the fish very dangerous to eat. Considering that the area is currently experiencing a boom in development due to the recreational potential of the lakes within this watershed, word of increased contamination could slow down development and the local economy. The tailings basin alternative plan seems to improve upon the proposed action, but still has some inadequacies. Specifically, page 4.1-148 which states, "If determined to be necessary based on actual seepage water quality, the treatment plant would be required. " The quote from page 4.1-129 already stated that the leakage from the tailings basin would have elevated sulfate levels. This water would definitely require water treatment unless 100% of the leakage is recycled as make up water at the plant site. Whether the water is discharged into the Embarrass River or the Partridge River should have no bearing on what level of contamination is acceptable.	EOO,WR2D,WR3A,G1,G7
<b>Sender Last Name:</b> Moisio		<b>Submission ID:</b> 1060
1165	I am writing to you to express my views on the proposed Potymet Mine. After attending two informational meetings of the proposed mine I give my full support to proceed with the construction of this project. Upon full review of the fact' and figures I believe this pompany h'as gone far and well beyond the requireme.nts of state, federal and regulatory guidelines. The benefits of this business would not only bring In much needed jobs to our community but would be a driver in the fact that projects of this nature can be done while achieving environmdntal compliance. I would not approve, of a business coming into our state or community just for the sake of employment while disregarding the possibilities of environmental destruction. Read the facts, get answers, ask questions and by all means don't just believe what rumors you hear to say this business is good or bad.	EOO

2811 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. As a Minnesota citizen who frequents the area that is under consideration for mining, I have very serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I have encouraged many out of state visitors to join me in the Ely area to enjoy the bounty the Boundary Waters Canoe Area affords.

G2,G11

**Sender Last Name:**    Moogk

**Submission ID:** 3135

3505 For 43 years I have been canoeing in Boundary Waters/Quetico and now my son is as well. Our world of pristine areas are dwindling with big business on a daily basis. It pains me to think the waters will be extremely tainted. This is not an "if". This is the real deal. I remember seeing the bottom of lakes, dipping our cups in the water when thirsty smelling fumes from a small outboard which was 2 hours away. Ahhhh...the old days, well time has taken a small toll but in your heart you know this could be devastating to the area. Will the world really be a better place if this mine opens? I think not. Please step back and demand a LEAST a much more thorough scientific long term data report other than the one the mining company is offering. We will be trading money in someone's already deep pockets for one of the most beautiful places on this planet. Please don't let this happen. Our souls need places like this.

**Submission ID:** 2870

3217 I love the Boundary Waters. It is a big part of my family and our tradition. It is hard for me to think about people destroying my family's tradition just for copper and nickel. The Boundary Waters are not just a big part of my family tradition, they are a huge part in many people's lives. This mining process will hurt the environment of the Boundary Waters hugely. Sulfates in the water impact our health and aquatic vegetation. Sulfates and elemental mercury react to each other in a process called Mercury methylation. Methylmercury is the form that bio-accumulates in fish in which humans eat. I will never understand why people would want to harm this great natural boundary. It is a hard concept for me to comprehend. There are a million reasons why this mining process is bad. I only named a couple. Please think about what you are about to do and think about how it could affect so many animals' and people's lives. Think about the right thing to do and how you would feel if you lost something close to you. Just think about it.

**Submission ID:** 2572

2209 I am writing my comments on the PolyMet draft EIS out of concern for the Lake Superior watershed, in particular the St. Louis River and it's watershed. I will focus primarily on the threat of increased fish tissue mercury. Methyl mercury is presently the greatest threat to this water body. (The St. Louis River has been listed as impaired for mercury because of fish tissue consumption advisories.) Methyl mercury is the greatest threat from the PolyMet proposal. I believe all land and fish should be protected from this contamination. As a land owner in northern Minnesota I am personally affected by the threat of short and long term effects of increased mercury. As stewards of the land we have been given as citizens of Minnesota I consider it my responsibility to oppose projects and activities which contribute to environmental pollution. I also believe strongly that any damage to water and soil as a consequence of industrial action needs to be legally linked to financial responsibility by the polluting company. I am a member of the Sierra Club and the Nature Conservancy. I am pediatric nurse who works with children with cancer. Environmental decisions impact health on many levels. An increasingly toxic environment puts all of us at risk for significant health problems, including cancer.

1883 I am writing to let you know that I think the PolyMet will severely jeopardize the one of kind natural heritage of Minnesota's North Woods. This ecosystem is one of a kind. Although I am not currently a Minnesota citizen I used to be and I have spent much time canoeing on the lakes and rivers in the area and know that these ecosystems are worth protecting. Every other state that has allowed these types of mining projects have banned them as they are so destructive to the health of the environment as well as the health of the people that live down stream. It is unrealistic to think that the mining company will be able to maintain a high standard of water quality and preserve the human and ecological health that will be exposed to this highly toxic form of pollution. Allowing this mine would be a poor choice if one values the health of the state and the people that live therein.

2784 I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. Simply put, NO mine like this has EVER been safe for the environment; every one has eventually leaked toxic chemicals into the environment with horrific and long-lasting effects. The BWCA and surrounding are not just pristine, but UNIQUE in the world. Their despoilation would be tragic, irretrievable, and criminal. In the 70s, through YMCA Camp Menogyn, based on West Bearskin Lake, I guided many teens through that priceless land. These young guys and girls had life changing experiences there, as did I. To even risk that this incredible area be poisoned for future generations is unthinkable. This project must NOT be approved. All issues should be completely aired in public, with public involvement, and then resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.

194 To Whom it May Concern, I live in Aurora - was raised in Aurora and have seen Aurora in good and bad times. PolyMet would be a Godsend for residents of the area. Please don't let us down. WE NEED THESE JOBS. I feel that there is a responsible way of mining for these precious metals and WE NEED THESE JOBS.

EOO

2361 The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Although I did not personally write the bulk of this letter, please do not consider it to be a superficial contribution to an effort to which I hold no personal connection. The BWCAW watershed is of unique cultural significance to Minnesotans, representing the epitome of preserved, appreciated, and thereby invaluable moving wilderness.

G3,G8

2474 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. Will it really be worth the money to take the chance of environmental damage? Once our wetlands, rivers, lakes and land are spoiled there is no 'getting it back'. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.

G6,G7

3475 I live on Wilson Lake with the Bountry Waters almost in our back yard. We moved here from Chicago a year ago to get away from pollution and be in such a wonderful, clean state. It is so sad to think that you would put in this mine, that in the end would pollute the pristine waters of Minnesota. Please do not put in mine.

2493 Lets follow Wisconsin's lead in banning this type of harmful mining. G14

**Sender Last Name:**    Morse **Submission ID:** 334

39 As you are aware, November 2nd marked the start of the scheduled 90 day public comment period for the DEIS. We do not believe that the length of the comment period is adequate to meet the need for a credible and accessible public review process. We request that the time period for submitting comments be extended to 180 days. We are aware that a minimum comment period of 120 days was requested in a letter sent October 7, 2009 to Ms. Cameron and copied to Mr. Arkley. The letter was signed by ten MEP member organizations. In August, the U.S. Environmental Protection Agency also recommended a minimum 120 day comment period for a project of this scope. The current comment period was subsequently scheduled for 90 days that span the Thanksgiving, Christmas, Hanukah and New Year's holidays. This DEIS was years in development and totals three volumes of material. It is unreasonable to expect citizens and concerned stakeholders to be able to fully review, analyze and prepare adequate comments in this relatively brief 90 day period. An extension to 180 days is necessary to provide time for adequate review and preparation of comments. PRO6

40 This need is compounded by several developments that have come to our attention in the past week. The DNR's advertised electronic site for receiving e-mailed public comments went down last week and to our knowledge is still not functioning PRO6

41 Additional paper copies of the DEIS that had been requested for placement at regional libraries in greater Minnesota have not yet been distributed. PRO6

354 The PolyMet proposal is the first of haifa dozen non-ferrous mining proposals being discussed for the Duluth Complex and possibly other locations in the state. Polymet's is the first project of this type in Minnesota and the public comment period is the first real opportunity residents have to learn about the impacts and weigh in with state agencies. Decisions made now will have serious and far reaching impacts for special places treasured by all Minnesotans, including the Boundary Waters Canoe Area Wilderness, Superior National Forest, and Lake Superior. Public involvement is critical to this process. This is especially true given the history of serious pollution this type of mining has created in other states, including damage to water resources and taxpayer liability for expensive clean-ups. G4A,G7

**Sender Last Name:**    Moses **Submission ID:** 2851

3143 The plan appears to be poor, as it does not even include any monitoring those who would engage in this activity. Neither is there a plan for reclamation. There was no field sampling. There is wildlife that would be disrupted ,right along the place where this mine would be. PD3

3207 I am writing in opposition to allowing Polymet to mine copper in Duluth gabbro complex. Environmental concerns run high when it comes to sulfide ore minerals as they have caused massive damage to streams and lakes around the world when acid leaches from ore and waste piles into the ground and surface waters. I can't believe we are really considering opening our beautiful Minnesota up to such a harmful activity. EOO,G7A

**Sender Last Name:**    Moses and Haller **Submission ID:** 3669

1 We are sympathetic with the economic needs in the area - we know the financial struggles of area school districts as enrollment declines when families don't have work. However, the AITowhead region of this state is a treasure of precious natural resources and beauty that must be preserved and that will continue to benefit the area economically, if it is not forever damaged by the NorthMet and other sulfide mining projects. NorthMet Project threatens the ecosystem of the area and may well put the people of Minnesota in a financial bind for unending cleanup costs that could never truly restore the land and water. The project and others in the works would favor twenty years of extraction of copper, nickel and other minerals over the protection of our precious and irreplaceable natural environment. As taxpayers we object strongly. The DEIS itself raises grave concerns with no apparent answers and is otherwise inadequate in the following specific areas. EOO,G2,G8

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
2	Sulfide ore will interact with air or moisture to produce sulfuric acid. Any leakage of such acid into the surface water, groundwater or air will damage the environment.	WR1E,AQ4
3	Water from waste rock piles will be polluted for two thousand years. It is incomprehensible that either the mining company or the state realistically will maintain treatment facilities that far into the future. Who would pay the cost? Even if the mining company were required to put up substantial financing in advance, it would not be sufficient to cover centuries' worth of restoration that almost certainly would not be successful.	WR3I,PD2,PD4
4	The DEIS indicates that the West Pit will begin to discharge polluted water in 65 years. Adequate protection against leakage or overflow must be required. Although the DEIS indicates that overflow could be mitigated, it is unclear how - once the contaminated substance is flowing through wetlands, streams, rivers and lakes - in this case into Lake Superior?	WR3C
5	Further, per the DEIS summary, "relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream ... that represent high risk situations for mercury methylation." The mercury level in fish in the lakes and rivers in the area is already a health concern and yet this proposal would almost certainly increase the health and safety risks posed by mercury concentrations. The EIS should include detailed and cumulative impacts of potential mercury increases in fish as related to the NorthMet project and other nearby pollution sources, including mercury methylation as well as discharge and emissions.	WR5A,WR5C,FM1,FM3
6	The DEIS acknowledges a potential for the proposed tailings basin to fail due to fines and underlying soils in the existing L TVSMC Tailings Basin. Poly Met has not adequately addressed the safety issues -leaving the problem to further design and analysis during the permitting process. This is totally inadequate and should not be allowed. Proven solutions must be proposed in advance. Minimally, PolyMet should be required to resolve tailings basin geotechnical stability and seepage issues identified by the Tribes and the U.S. Environmental Protection Agency.	GT2
7	The proposal to construct a wetland to treat contaminated waters is inadequate in that effectiveness of such a system has not been proven and cannot be relied on, as it likely would result in pollution of rivers and lakes downstream.	WE6
8	In general, the proposed solutions to handle toxic contaminants have not been tested or proven to protect water quality, human health and wildlife. Considering the extreme risks, PolyMet's projections are inadequate both in the protection of water quality initially and in the proposed remediation. Once sulfuric acid is released, the damage is done.	EOO,WR1E,WI5
9	The NorthMet project would directly or indirectly affect over 1,500 acres of wetlands, including peatlands. Over 1,000 acres of peatlands would be destroyed. Because peatlands effectively sequester carbon, the DEIS correctly acknowledges that the project would result in additional greenhouse gas emissions in the Arrowhead. In fact, the emissions would result in a two percent increase in the state's overall carbon dioxide emissions. This is unacceptable.	AQ3
10	Peatlands develop over thousands of years and are known to be a highly effective and natural way of containing dangerous carbon. Their destruction cannot be undone. Peatlands have repeatedly been identified as extremely valuable in federal and state inventories and other reports commissioned by the legislature and governor call for the protection of peatlands because they securely contain carbon. Peatlands should be protected, not destroyed for short term gain.	WE2
11	Given the grave risks to the environment, the water quality monitoring, treatment and remediation that may be needed for centuries, PolyMet should be required to provide financial assurances in the EIS before any permitting process gets underway (This is the U.S. EPA position). Sulfide mining pollution in other states where mining companies closed or became bankrupt is a nightmare of cleanup costs that are borne by the taxpayer. It should be a cost of doing business for PolyMet and should be a standard set now for the other mining projects that will be proposed in the Arrowhead. Otherwise, we the taxpayers are left with the bill.	PD4

Comment ID	Comment Text	Theme Codes
12	The EIS should include cumulative air and water quality effects on lakes and rivers from all sources, including other mines and mine proposals in the works. This EIS may set the standard for all water quality impacts analysis. Good cumulative impacts analysis is critical to protect water quality in the entire area and it is irresponsible to view this project in isolation.	WR5A,AQ4B
13	Similarly, the EIS should include future development of sulfide-mining by companies that are already doing exploratory drilling in the analysis of cumulative effects. This is the Tribal position and we agree.	G9
14	There has been inadequate analysis of socioeconomic effects of the project. Specifically, the economic impacts should take the longer view, keeping in mind that the mine will last only twenty years. The analysis should include the effects of the mine's closure when job loss inevitably will occur, as it has repeatedly in historic mining cycles on the Iron 3	SE3
15	All the concerns raised by the Environmental Protection Agency and the Bois Forte and Fond du Lac Tribes must be fully addressed.	G15
<b>Sender Last Name:</b> Muelken		<b>Submission ID:</b> 238
248	Give Polymet their Permit. We can go on and on letting people make rules on the fly. They have met the requirements existing on the books. The government agencies have done their job and know way more then "Joe Public" knows about the project. They have followed "due process" and deserve to be given their permits.	G6
<b>Sender Last Name:</b> Mueller		<b>Submission ID:</b> 3490
1120	loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area	WI1
1325	basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project. Further, the PolyMet NorthMet project will result in total	GT2
3239	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an existing mine tailings	EOO,WR4B,FM1
3689	Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone.	PD2,PD4
3764	Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of	G2

273	We are writing, as Iron Range business owners, to support PolyMet's mining and production efforts. The lengthily environmental review process that PolyMet has gone through, with both the Federal and State regulatory agencies has not only been thorough but offers the potential environmental impact and how to mitigate it. PolyMet has proved that they will mine and produce copper, nickel, platinum, palladium, gold and cobalt in an environmentally sound way. Income generation to the potential 400 employees plus hundreds of spinoff jobs will not only lift up the depressed state of the Iron Range but it will provide millions of dollars in local and state taxes. All the affected areas need this type of financial boost in order to support the communities and education systems. It is very clear that the people of PolyMet are Minnesotans committed to living, playing and protecting our state's environment. We cannot ask for a better business model in our state, at this time, at this place and in our state's future.	EOO
<b>Sender Last Name:</b> Munger		<b>Submission ID:</b> 3246
3143	The PolyMet Sulfide mining proposal will, without any reasonable doubt, have a serious impact upon our environment that will destroy many acres of our Northern Minnesota Wetlands. At the same time there is no proven way possible to guarantee that significant impact will not be made on water quality in Northern Minnesota rivers and streams. There is, as a result, a reasonably strong chance that underground water supplies and the lowering of the water quality of water sheds that feed Lake Superior could very well effect this, the world's largest fresh water lake, as well.	EOO,WR3B
3595	it is my belief that the DNR should deny this permit unless the permitting process spells out an iron clad guarantee that minimizes the damage that will be made to the environment and guarantees that unforeseen clean-up costs will be paid by the industry and responsible parties.	PD2,PD4
<b>Sender Last Name:</b> Murphy		<b>Submission ID:</b> 3705
1	Furthermore, in the DEIS, there is no reliable groundwater model for groundwater drawdown impacts associated with the mine pit dewatering. The estimates of groundwater drawdown are currently based on anecdotal observations and analysis of historical aerial photography.105 Aerial photos are a very imprecise measure of surface water level. As such, some changes in groundwater hydrology cannot be detected by aerial photography. The historical aerial photographs used to demonstrate that there would be no impacts as a result of drawdown show that the nearby Peter Mitchell Mine Pits are mostly flooded.106 Therefore, at the moment, there is little or no stress on surrounding wetlands at this time, but the company's plans demonstrate that there will be profound changes to the relevant conditions. The wetland soil conductivity values that were used to determine flow rates in the surficial aquifer are extremely low, and the supporting source citation in professional literature has not been provided.107 Additionally, the topographic relationship of the landscape features, including the depth of the Peter Mitchell Pits, which are only about 80 feet deep, and the proposed PolyMet Pits, which are approximately 800 feet deep, are very different and therefore head pressure resulting in groundwater drawdown into the pits would be expected to be substantially greater in the PolyMet Pits. With no quantitative assessment of the mine-related drawdown of the regional water table, there has been no mechanism to develop an adequate indirect impact assessment for wetlands. Based on the vegetation data collected from wetland delineations it appears that groundwater supported wetlands are common in the Project area.108 The workplan to identify indirect wetland impacts has not been finalized by the US ACE Wetlands Workgroup and consequently the results of those investigations were not included in the DEIS to allow a full public review. Unquestionably, the DEIS must be supplemented with this information.	WE1,WE2
158	I feel the DEIS for the Polymet project is very accurate and detailed. After reading the DEIS I am 100% for the project and I'm confident that Polymet will take care of our area while mining. This is 2009, not 1899. We have the technology to mine in an environmentally safe manner. I spend a lot of times in our forests hunting and hiking, fishing the rivers and lakes. If I had any doubt the mining couldn't be done in an environmentally safe manner I would be opposed to the project. Most everyone I talk to on the East Range is for this project, we want this mine to happen. Please don't let some out of area extremists ruin it for us. Thank you,	EOO

3861	I am sending you this e-mail in support of the Polymet Mining Project in Northeastern MN. I have several reasons for supporting this project. First: economic impacts. - This project will contribute to a depressed economy, local, state, and national. - The materials from this project will not only create employment directly and indirectly to the economy, but also the materials needed for today's technology. Renewable energy, electric vehicles, computers, medical and the list can go on. - The careers that could then be available to our younger work force can be in the new technology of this project, in the environmental areas, with the vendors, etc. - These jobs will be supplying the metals needed for today's technology. Second: domestic advantages. - These metals will be domestic source needed and used by all in this country. - For this state and country to keep up with the advancing technologies of other countries, we need these metals. Third: environmental concerns. - The environmental requirements of Minnesota are strict. If we were to get these metals from a foreign source, I would question those environmental guidelines. - This project is going to use an existing site and facility. Lesser disturbance to the environment. - We do need these metals today. Mining and processing here versus in another country, transportation becomes both environmental and cost issues. - The Polymet Draft EIS and those involved with it, shows the issues and concerns of this project have been addressed and will be met.	EOO
<b>Sender Last Name:</b>	Musich	<b>Submission ID:</b> 3521
3787	I grew up under the "beauty" of glorious "dumps" of the Hull rust open pit mine. This latest scheme from the mining companies is incredibly dangerous and untested. Only the pockets of a very few will be lined with the benefits. Better to put the energy into rare mineral recovery. Better to pay directly people who need jobs. The natural state of the land has more to offer for both employment and to our health than mining. To move forward with the mining will only bring regret.	EOO
<b>Sender Last Name:</b>	Muzzi	<b>Submission ID:</b> 1815
2407	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. As a lifelong Minnesotan and lover of the BWCAW, I would hate to see these ecosystems damaged. I spend my summers guiding trips comprised of young adults from all over the country. All leave awed by the beauty of northern Minnesota, and with a respect for natural places and a desire to protect and preserve them. Please do not allow this permit; it would jeopardize a place that hold both sentimental value for me, economic value for the regions it serves, and educational value for children (and adults) from all over the world.	G3,G11
<b>Sender Last Name:</b>	Myers	<b>Submission ID:</b> 3670
1	LWVMN believes that it is important to protect the citizens' right to know what the government is doing and to facilitate the participation of citizens in government decision-making. While an extension would have been useful, we are pleased that the public had at least the 90 days.	G10
2	LWVMN has major concerns about this project because its environmental impact, as revealed in the DEIS, will be felt for many generations, long after the minerals have been removed and the mining company has left the area. We believe that natural resources should be managed as interrelated parts of life-supporting ecosystems; pollution of these resources should be controlled to preserve the physical, chemical and biological integrity of ecosystems and to protect public health. The DEIS documents the long-term pollution of the waters surrounding the mining site and flowing throughout the watershed, the destruction of over a thousand acres of wetlands and the loss of habitat for wildlife, including fish and birds.	EOO
3	Waste rock disposal plans under both the Proposed Action and the Mine Site Alternative raise water pollution concerns. Storage of reactive waste rock permanently above ground has an acknowledged potential to generate Acid Mine Drainage (AMD) and to leach metal contaminants. We will mention a few specific issues of concern.	WR1E

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
4	The Proposed Action would permanently leave on the surface all of the Category 3 and 4 waste rock, with sulfur contents between 0.3 and 0.6%. The DEIS indicates that Category 3 is medium reactive waste rock that may generate AMD; it is predicted to leach heavy metals resulting in drainage with heavy metal concentrations in excess of water quality compliance levels. Category 4 waste rock is labeled highly reactive; it would generate AMD and leach heavy metals resulting in drainage with heavy metal concentrations in excess of anticipated water quality compliance levels. In fact, storing reactive waste rock permanently above ground presents acknowledged and unacceptable pollution risks for unacceptable durations. In one DEIS model, Category 1 and 2 waste rock are predicted to exceed groundwater evaluation criteria for antimony, arsenic and sulfate for 100 to 2,000 years. The Category 3 waste rock stockpile is predicted to exceed groundwater criteria for antimony, manganese, nickel, and sulfate from 50 to 2,000 years. Contamination exceeding groundwater criteria from the Category 4 waste rock stockpile is predicted for antimony lasting 90 to 250 years. Antimony, arsenic and sulfate are predicted in another model to exceed groundwater evaluation criteria for 100 to 2,000 years, according to the DEIS.	WR2C
5	The Mine Site Alternative is an improvement and should be adopted, placing, as it does, Category 2, 3 and 4 waste rock into the East Pit for subaqueous disposal. However, modeling in the DEIS shows significant ground water pollution risks even from this alternative action. Among other things, an on-going monitoring plan should be included in the EIS, designed to check for the generation of Acid Mine Drainage within the mine pits and its seepage into surrounding areas.	WR1B,PD10
5	Another water pollution issue is the predicted natural flooding of the West Pit with groundwater and precipitation, leading eventually to the overflow of the pit into the Partridge River in about 65 years. The DEIS indicates that water quality standards for mercury could be exceeded in the long-term discharge from the West Pit. In fact, the predicted pollution from the overflow of the West Pit violates the Clean Water Act. The EIS must present alternative designs and methods to prevent contamination that exceeds water quality standards. Since neither primary method of water treatment is expected to be effective at removing mercury, the EIS must present an alternative method that is.	WR3I,CR1
6	The problems which flow from water contaminated with sulfate and heavy metal are too numerous to list here. To note just a few: Sulfate turns mercury into “mentholated” mercury which can bioaccumulate in fish, endangering humans, birds and wildlife by making the fish unsafe to eat. Since this project is in the St. Louis River watershed and will affect both water quantity and quality, there is the potential to negatively impact the valuable wild rice areas along that river. There are direct and indirect wetland impacts which have not been mentioned, including the potential connectivity between groundwater and wetlands.	WR1E,WR3N,WR5A
6	The failure of the DEIS to provide information about the amount of financial assurance that will be required for the project is the last concern we will include. In order to assess the potential effectiveness of reclamation and closure activities, the public must have this information. As you know, the EPA recommends including financial assurance information in EISs because a major factor in determining the environmental impact of a mine is the effectiveness of reclamation and closure activities. Since the public is ultimately responsible, should the mine operators declare bankruptcy, the public has a right to have this information long before the permitting process begins.	PD2,PD8
7	I live in the twin cities and care deeply about northern Minnesota, the wildlife and wild habitats. My use of the arrowhead region of Minnesota consists of hiking, camping, birding, and other wildlife watching, weighing in on Forest Service timber projects and other impacts to our public land forests. I believe that the Boundary Waters Canoe Area Wilderness (BWCA) and the Superior National Forest (SNF) are valuable natural heritage assets for the State of Minnesota – what is above the ground is far more valuable than what is buried beneath.	G11
7	LWVMN believes that the “No Action” alternative should be the selected outcome at this time. Given the risks to our ecosystem and the the DEIS statement that “the amount of financial assurance associated with reclamation actions cannot be estimated until these actions are understood at a deeper level of design detail,” we recommend that the DNR and the Army Corps of Engineers seek the information necessary to understand the PolyMet project at the deepest possible level before going forward.	PD3,PD4

2366	In addition to the note below, I'd like to say that I am not in support of this mining project and I hope that a decision will be made that will prevent any mining to take place that will cause any environmental damage. Thank you. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota’s natural resources	EOO,G2
<b>Sender Last Name:</b> Nankivell		<b>Submission ID:</b> 1577
1947	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. As a Minnesotan, I value the rich natural resources of this state and will not stand idly by while it is threatened. The stakes are too high.	EOO
<b>Sender Last Name:</b> Natzel		<b>Submission ID:</b> 3058
1021	Also wildlife would be at risk from the mining activities discharging poisons.	WI5
<b>Sender Last Name:</b> Naughton		<b>Submission ID:</b> 239
249	Give Polymet their Permit. We can go on and on letting people make rules on the fly. They have met the requirements existing on the books. The government agencies have done their job and know way more then "Joe Public" knows about the project. Polymet has followed "due process" and deserves to be given their permits.	G6
<b>Sender Last Name:</b> Neff		<b>Submission ID:</b> 2441
2934	Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State OTHER THAN THE JOBS IT WILL BRING! Please look farther ahead than our current employment status. Is this a sustainable decision? Take the iron ore mines for example. Each year they struggle to keep their doors open and they've been around for nearly a century. Given the amount of copper in the earth to be mined, will this allow a company like PolyMet to keep a plant open for even a decade? If so, at what costs to surrounding residents including wildlife? The risks sure don't seem to outweigh the benefits in this situation. Remember, "Where conflicting interests must be reconciled, the question shall always be answered from the standpoint of the greatest good of the greatest number in the long run."	EOO,G2C

1 3.) Saturated Overburden would be stored in the Category 1 and 2 waste rock stockpiles. The DEIS describes analysis that indicates this overburden is likely to be high in sulfur content, sometimes equivalent to Category 4 waste rock. There is a risk of it acidifying and releasing metals and sulfate. “There is a concern that placement of this material in the Category 1 and 2 waste rock stockpile could result in acidification and release of various metals and sulfate on a liner system that was not designed for this level of reactivity” (DEIS pg. 4.1-165).  
Recommendation: The EIS should require that qualifying overburden be placed in the appropriate stockpile for its reactivity. An effective method for characterizing the reactivity of material in the field must be developed and required.

WR2D

1 B. West Pit Flooding and Drainage After Closure 1.) After mining operations cease, the Proposed Action calls for the West Pit to naturally flood with groundwater, precipitation, and surface runoff, eventually leading to overflow into the Partridge River around Year 65 (about 45 years after mine closure). The DEIS indicates that water quality standards for mercury could be exceeded in the long-term discharge from the West Pit, as neither the WWTF nor the East Pit constructed wetlands are “expected to be consistently effective in mercury removal” (DEIS pg. 4.1-123). Antimony from the West Pit drainage is predicted to exceed groundwater criteria for 550 to 2,000 years (DEIS Table 4.1-45). Additional exceedances may occur for nickel and sulfate. The deterministic model used to analyze West Pit overflow water quality predicts arsenic, cobalt and selenium would exceed surface water quality standards. An additional analysis, “uncertainty analysis,” predicts exceedances of surface water quality standards for cobalt, copper and nickel (DEIS pg. 4.1-113, Table 4.1-64). Sulfate concentrations are also predicted to be high. The DEIS notes: “There is the potential that this overflow could result in a short reach (approximately 1,000 feet) of the Upper Partridge River between the confluence with the unnamed tributary and the South Branch Partridge River exceeding some surface water standards. The water quality of the West Pit overflow, however, is not predicted to result in exceedances of surface water standards in the Partridge River at SW-004a (located approximately 1,000 feet downstream from where the West Pit overflow would reach the Partridge River and downstream of the confluence of the South Branch Partridge River)” (DEIS pg. 4.1-113, 114). But the DEIS does not provide flow information for this unnamed water body or explanation of why it is expected to sufficiently dilute contamination. This water body is a protected water of the State of Minnesota, and sacrificing it to potential contamination is not acceptable. The DEIS also fails to explain why contamination in the Upper Partridge River will be limited to 1,000 feet. Recommendation: The predicted pollution from the overflow of the West Pit violates the Clean Water Act. The EIS must present alternative designs and methods to prevent contamination that exceeds water quality standards. Given that neither primary method of water treatment is expected to be effective at removing mercury, the EIS must present an alternative method that is. Additional information must be presented to explain the expected geographic extent of contamination. No water bodies of the State of Minnesota should be sacrificed to pollution.

WR3A

504 This project must have "backup" safeguards in place and must have financial guarantees to fix problems as they occur. Realtime monitoring of water and air quality all around the area as well as in the immediate area must be a part of this project.

AQ5,WR1A,WR3I

728 I'd like to request: 1) a time extension of 30 to 45 days for review of the EIS. 2) more public meetings in more places to gather input. The current schedule is too limited. 3) that public meetings include the option for citizen statements and discussion in the open meeting.

PRO6

1160	I humbly request you consider, the following during your public comment review of the proposed NorthMet and other copper nickel mining operation in Minnesota. We must be loyal stewards of our environment while we are juggling the economic needs of our citizens and businesses. We encourage good paying jobs but they must not be at the expense of polluting our air and water. Iron Mining on the Iron Range has for the most part been good for Minnesota and our country, our challenge is to make copper nickel mining also good for Minnesotans. We cannot allow "any more" pollution into Lake Superior or its tributaries. The citizens of this great state are already greatly restricted in consuming fish from our precious lakes and waters. We must be striving to improve environmental conditions, not worsen them. Some of the air born problems are not of our own doings but we must not contribute to them. The citizens of this great state voted to tax themselves so that their dollars could go towards improvement in water quality, Please do not let them down so that these dollars are instead used in cleanup of failed water containment projects associated with copper nickel mining operations. I don't believe anyone intends to pollute our waters but accidents happen and we learn sometimes the hard way when we are exploring new horizons. Historic examples sometimes better illustrate my point such as: The use of agent orange to defoliate the jungle landed up causing our own troops irreparable harm - my own friend is currently suffering. Surely our own military did not intend to harm our own troops but it did. And we must learn from these experiences and not "repeat" them. Copper nickel mining likewise has not had a clean track record to date, so we must learn from these failures and not go down the same path.	EOO,G7
1161	I submit these comments as a land owner within 15 miles of the proposed mine and as a fisherman who enjoys drinking our local water and eating fish from our waters. I also want my grandson and your grandchildren to have these same opportunities.	EOO
2170	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. It is beyond my comprehension why MN would allow something so environmentally detrimental for generations to come- which the DEIS itself admits- to happen in one of its most pristine areas. And then to further show how anxious we are to accept this payout, we are not requiring Polymet to set up an escrow account to clean up the inevitable destruction. It is my understanding that there has never been one sulfide mine in this country which has not caused environmental damage. And Polymet won't be the only one. Other mining companies have said they are just waiting for PolyMet to get approval and then they will also be coming. Once again, big money is winning because our natural areas can not compete against the enticements of greed. Instead of supporting the existing northern tourism industry, we are willing to endanger that economy for a quick but relatively short cash infusion. Support longterm economic and environmental sustainability or shortterm profits? It appears the decision makers in MN are no different than the Wall Street bankers.	EOO,G4A,G11
2528	I am not in favor of granting mining, processing, and waste storage permits for the proposed Polymet project. At the informational meeting in Blaine, I listened carefully as politicians from northern Minnesota spoke enthusiastically that Polymet had a different business model and would do metal sulfide mining in a cleaner way than is done by others. We were given no more information than that they would attempt better containment of sulfur waste. The politicians' focus was primarily on a desperate hope for 20 years of jobs, an issue that is popular with the northern citizens who traveled far to pack the meeting. They want work that will provide income to allow them to continue to live in and enjoy this beautiful, mostly unspoiled wilderness area. I don't blame them for their enthusiasm. However, the Army Corp of Engineers, the Minnesota Department of Natural Resources and the Pollution Control Agency are charged with the responsibility of either granting or denying permits on the basis of evidence relating to possible harm to the natural environment. I ask that: the Army Corp carefully evaluate the long term risks to wetlands and waterways. the DNR consider the dangers that are posed to the natural environment from sulfur pollution. To get a clear understanding, DNR officials should visit Sudbury, Canada. the PCA evaluate the contention that Polymet can contain hazardous wastes over the very long term. Any permit that is granted would be contingent on the establishment by Polymet of an escrow fund of money dedicated, over the very long term, to the cleanups that would be needed in the event of an accidental release of toxins.	G4A,G14

316	As a taxpayer and resident of Minnesota I feel strongly in value add manufacturing moving forward in Minnesota. I also feel strongly about environmental stewardship. I believe Polymet meets both of these criteria and I support this project moving forward. Polymet is taking measures to ensure proper closure of the mine after 20 year life as well as making investments for mine closure. Polymet will be using an existing brownfield site which is currently not being used and there are benefits to putting this site to use.	EOO
<b>Sender Last Name:</b> Nevins		<b>Submission ID:</b> 2475
2991	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. This project should not even be on the table, it is completely unacceptable, citizens will never allow this to happen! This is a proposal to TRASH the most pristeen watershed in the country, not to mention all the watersheds connected to it. REALITY and ECOLOGY MUST BE CONSIDERED BEFORE DOLLARS!!! Who is going to explain to our children why they cannot swim, or fish, or drink?! If policy makers cannot or will not make the LOGICAL decision, the community will come together to stop this project!	EOO,G2
2992	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues cannot be resolved and so the project MUST NOT be approved by the MINNESOTA DEPARTMENT OF NATURAL RESOURCES (this IS your job!!!!) and the U.S. Army Corps of Engineers.	EOO,G2
<b>Sender Last Name:</b> Nguyen		<b>Submission ID:</b> 3504
3774	No mining should be in our state. It gonna hurt our land and be no good with mining. It shouldn't happen at all, throwing away nature, throwing away people love to do outside and enjoy the environment. If there is mining, think about the land is being destroyed for a single little piece of ore, go to a different state and look for that kind of crap. Also our clean water will be ruin if we did have mining in our state. Taking big fields like 500 football fields for mining is a waste of time, and using our tax money on something we don't need and don't need to destroy Minnesota at all. Minnesota is a great place, bringing mining to our state would be a place with bad pollution, bad clean water, and destroying land. Tell the company PolyMet to go some where with their plan some where else, we don't need them and they don't need our land. Our land is precious more than them and their ore.	EOO,G2

263	I have been a Minnesota resident all my life and am still amazed that we say we want business in Minnesota but turn and do everything we can to keep business out. We make so many stipulations (roadblocks), tax the heck out of them, or a minority of residents who want their name in the paper, cause enough problems that the Company say "forget if" and moves on to another state or out of the country, to a place that wants them. We need jobs in this area to keep people in the northland. PolyMet will comply with all the governmental regulations. Most mining companies employ environmental engineers passionate with their job, that work to make sure the company is in compliance with what is expected. Let's recycle the old LTV Steel Mine, create jobs here in America, provide millions of dollars in local and state taxes, and use the resources that God placed here for us.	EOO
396	Require the PolyMet Company to show that their waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for hundreds or thousands of years.	GT2
399	Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	FM1
658	Analyze the land that is going to be exchanged for Superior National Forest land to make this project possible. Make sure that the land swap would protect wetlands, endangered species, hydrology, tribal rights and taxpayers' interests.	PD1
659	As the U.S. EPA suggested, make sure that financial assurances for the public are included in the EIS long before any permitting process gets underway.	PD4
701	Analyze all of the impacts (air and water) of increased mercury in fish from the PolyMet project and other nearby pollution sources. Mercury in fish causes brain damage to children and to the fetus.	WR4B

1589	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota could degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, interfere with tribal rights guaranteed by Treaty and with tribal resources, like wild rice, increase air pollution that results in regional haze and create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs. The Indian tribes working on the EIS and the United States Environmental Protection Agency have provided helpful information on the inadequacy of the PolyMet draft EIS. Before this sulfide mining project is even considered for permits, please fill these gaps:	EOO,G2B,G2C,G3A,G4A,G
1590	Please bring this to your biggest constituency- the earth herself. We cannot do these things as projects w/o thinking 7 generations ahead. Its ethically irresponsible.	EOO
3236	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an	EOO,WR4B,FM1
3684	natural resources and public health. Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone.	PD2,PD4
3758	Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the	G2

<b>Sender Last Name:</b> Nitzsche & Fahey		<b>Submission ID:</b> 3593
51	SECTION 4.10 SOCIOECONOMICS "Add the following to Section 4.10" NATIONAL SECURITY The minerals proposed to be mined and processed are Copper, Nickel, Cobalt, and the Platinum Group Metals; these minerals are strategic to National Security and a key component to the National Debt and Balance of Trade. The United States imports over 87% of Platinum. Palladium & Gold : imports in excess of 40% if the Cooper requirements: and 100% of Nickel and Cobalt except for the recycled Nickel. Therefore the United States must find suppliers of these valuable minerals within our County or face growing Trade Deficits. The sources for these minerals are from vast deposits in Russia, China, and to a smaller degree Canada. China and Russia can hardly be defined as friendly nations and nations that use the same environmentally responsible mineral development that is represented in this DEIS. In fact we know how careless these Countries are and we also know the carelessness does not stay within the host nation. THE UNITED STATES CONGRESS HAS ADOPTED THE MINING AND MINERAL POLICY ACT OF 1976 THAT REPRESENTS THE POLICY OF THE U S GOVERNMENT REGARDING GUIDENCE OF AGENCIES FOR REVIEW OF PROPOSALS LIKE POLYMET. THE CONGRESS, IN THE ACT OF 1976 STATED - TO "FOSTER. AND ENCOURAGE PRIVATE ENTERPRISE IN THE DEVELOPMENT OF ECONOMICALLY SOUND AND STABLE INDUSTRIES AND IN THE ORDERLY AND ECONOMIC DEVELOPMENT OF DOMESTIC (MINERAL) RESOURCES TO HELP ASSURE SATISFACTION OF INDUSTRIAL, SECURITY, AND ENVIRONMENTAL NEEDS OF THE UNITED STATES OF AMERICA". Congressional direction is clear and applies directly to this Proposal by PolyMet Mining, Inc. for development of Cooper, Nickel, Cobalt, Platinum , Palladium, and Gold. All the minerals are critical to industrial process in the United States and will provide a ready domestic source of product. The United States of America will have a reduced Trade Deficit, & will not be shipping dollars to unfriendly Countries that do not play by the same rules as outlined in The Mining & Mineral Policy Act of 1976 or as detailed in this DEIS. Cobalt is a strategic and critical metal used in many industrial and military applications. The largest use of cobalt is superalloys, which are used to make parts for gas turbine engines. However, Cobalt is used to make magnets; corrosion and wear-resistant alloys; high-speed steels; cemented carbides; steel-belted tires; radial tires; and air bags for the auto industry. Cooper will be used in the electric motors in the Power Plant that provides the energy and electric power that will be transmitted over existing transmission and distributions lines; Minnesota Power will generate electric energy in the power plants that utilize every metal that will be mined the PolyMet's NorthMet Mine. Therefore the impact on Minnesota and the Iron Range is critical.	EOO
52	SECTION 4.10.1 .4 PUBLIC FINANCE We request that certain pages from the Mining Guide, published by the MN Department of Revenue, be added to fully reflect the economic impact". See below TAXES IMPOSED ON Base Metals, Precious Metals, and Energy Minerals In the second paragraph there is a short sentence regarding 'Ad Valorem Taxes'; This should be corrected to read - "Ad Valorem Taxes are the result of the financial dollar requirements of the Townships, Cities, School Districts, Counties and any other Agency with Taxing Authority". In addition, the State of Minnesota levies a property tax (Ad Valorem) on Commercial and Industrial Properties. The property tax imposed by the State of Minnesota may be adjusted to assist the State with financing Revenue Shortfalls and Education Costs. A listing of the specific taxes may be found in Labovitz School of Business and Economics 'Economic Impact of Ferrous and Non-Ferrous Mining' or in the 'Mining Guide of 2009', on Pages 52, 53, 54, 50, and 29, 41, 38 published by the Minnesota Department of Revenue. We don't have an independent projection of the tax yield; however, the Labovitz School of Business has provided a projection on pages A-13. The projections clearly demonstrate the positive impact of non-ferrous Mining. Non-Ferrous Mining may produce taxes at a level of two times Iron Ore mining. The addition of non-ferrous mining tax yields will strengthen the financial structure of Cities, Counties, and School Districts. Hospitals, Assisted Living Facilities, Memory Care Facilities will be able to prosper. Other community and Non-Profit agencies will also benefit significantly.	EOO

53	SECTION 4.10.1 .6-4.10.1 .7 The additional employment of 450 for operations will be a major economic impact for the School Districts, Medical Facilities, and Municipal Services. Each of the impacted communities has sustained a devastating loss of employment with the closing of LTV. The loss of LTV also meant the loss of hundreds of families, decrease in enrollment, higher cost per family for municipal services, and the loss of commercial enterprises. During construction, the permanent employees will begin to phase into start-up operations creating an easy transition for all the families and the communities.	EOO
3862	Let there be no mistake in Northland Securities, Inc. position on the PolyMet Mining, Inc. proposal to create NorthMet Mining Project. Northland Securities firmly supports the proposal for development of mining for Copper, Nickel, Cobalt, Platinum, Palladium, and Gold. As an active Broker Dealer in the area we have a responsibility to our Customers and Clients to support the project; and as a citizen of the State of Minnesota we must support the project to enhance the financial stability of the State. We must support this project because we know the positive impact on the residents and families of Northeastern Minnesota.	EOO,G1
3863	SECTION 4.10.3 SOCIOECONOMIC CONEQUENCES This section is covered in our comments in Section 4.10 Public Finance and in the Labovitz School of Business and Economics Report on the "Impact of Ferrous and Non-Ferrous Mining". SECTION 4.10.3. 1 We generally concur with the statements for purposes of the DEIS. SECTION 4.10-13 PUBLIC FINANCE We have commented on the public finance section above and have included in our comments the entire Labovitz Impact Study. However the total Public Finance exceeds our prior comments. Each job that is created will generate the following: 1. Federal Income Tax Obligation 2. Federal Social Security Contribution 3. Federal Medicare Contribution 4. State of Minnesota Income Tax Obligation 5. State of Minnesota - State Property tax on Comm.-Industrial 6. State of Minnesota - Contributions to State Retirement Plans. There are other benefits from the expansion of the region and stabilization of organizations within the region. SECTION 4.10-16 TOTAL IMPACTS FROM JOINT OPERATIONS, BY PROJECT, BY MEASURE, BY YEAR We concur with the impacts and project phasing and Conclusion.	EOO

1312	As someone who's never gone (yet!) to the boundaries waters, I am not only convinced that we must work to stop mining, but also, I must go on a trip this summer. How sad to think the opportunity to visit these waters might be gone in a moment.	EOO,G11
1314	Please protect wolf and lynx habitats.	G2C
1317	I trust that with technology and the process, any permit that would be granted, will protect the environment.	EOO
3594	Sulfide mining will damage Minnesota's unique wilderness areas for centuries to come; the bulk of the profits from the mining will go to private interests outside the state, and the public will be left inevitably with tremendous cleanup costs which still are unlikely to prevent all damage. Arsenic and selenium poisoning are not problems I want to be associated with Minnesota's waters; now or at any point in the future, and sulfide mining which could compromise our waters should not be permitted.	EOO,G4A,G7B
3605	As an avid outdoorsman & Minnesotan I feel like the BWCA is more than precious to our state & should not be taken for granted nor put at any risk. I feel the PolyMet Mining, Inc. should not be allowed. I firmly disagree with open pit mining but would consider waying options of drilling circumstances. Also if passed, the incorporations must be held to an extremely high standard as well as very high pollutant insurance. Heritage, cultural, precious water. Will to give this up???	EOO,G2,G4
3608	As a resident of Minnesota I am all about economic impart and growing our economy. I don't think this is going to be good for our economy over the next 200 years.	EOO,G1

Comment ID	Comment Text	Theme Codes
3609	It's a bad idea! It's not worth any gain made. It needs to be about the long term impact instead of a short tem economic gain. You can't guarantee that nothing will happen.	EOO
3611	I think that the fact that people are willing to sacrifice our environment for a short term economic gain is completely crazy. In the long run it will only cause problems. We need to think into the future and this will not benefit the environment of the boundary waters at all. I go to the Boundary Waters every summer and most people go there for peace and quite and to escape society. If it is destroyed we will have nothing.	EOO
3613	We need to protect our waters and our enviornment. Here in Minnesota our water is everything. We can't afford to destroy what our state is. These mines are not worth the destruction of Minnesotan's way of life.	EOO,G7
3614	I would like to keep the boundary waters area untouched by man. Keeping it untouched for generations to come is key to this wonderful State. Please keep this from happening so my kids will be able to enjoy the boundary waters just like I am able to enjoy in the years to come.	EOO,G2
3616	It would be nice to see the enviroment unchanged. To me the gain from mining it isn't worth damaging the environment.	EOO,G2
3617	Really, I mean yes and no there are pros + cons about the whole minning controversy. But really as individuals/users/[illegible] of the boundry waters we have to understand why they want to do this. I personal don't agree with it because economilly there are loads of people who who depend on people going/ making trips to see and use the boundry waters. But we always say that we need to boost the economy,	G1,G11
3618	I think it's not worth the money. It may be good economically now but will not be in the future. It's too expensive to clean up after. Go drill somewhere else. Minnesota loves their state's geography. Minnesota deserves to keep their image of pristine wilderness. Minnesota's economy really depends on tourism income, especially during warm months.	EOO,G1,G11
3619	I don't think that there should be drilling in MN Boundry Waters. Obviously that's where people go to get away from the City to the wilderness and to do out doors activity it might be hard to breath with all that crap in the air.	EOO
3620	I don't want people to mine up there. Especially Canadians. I think the economics of the situation are better served by not mining.	EOO
3621	I think it is wrong for the mining companies to rape the land that we love and cherish. They promise jobs, but mines don't last forever. I am completely opposed to mining by the boundry waters.	EOO
3622	We should not mine! I live + grow up on the lake so I can't imagine if my lake got ruined.	EOO,G7
3623	This video has opened my eyes on this topic, and I think that they should not mine around the boundry waters at all. by minning around that area it will atleast move things their it will do them good. It will hurt Minnesota's fresh water, and the tourist people coming over every summer.	EOO,G7,G11
3625	I discourage the mining because its not looking at the long term effect. Noting the statistics that was given in the video the mining doesn't even seem to pay off in any way. Noting the distruction of summer rec. and wilderness than the cleaning up process and if it happens.	EOO,G2C,G11
3627	This is not going to help our State's economy, it will destroy it! The sulfuric acid that will be leached into our wetlands, will destroy our State's tourism. Poepel came to the boundary waters and the Lake Superior for it's prestine wilderness. If it's gone, Minnesota's economy is gone! Tourism is our State income! Please Stop This!	EOO,G7A,G11
3632	I don't think that the mine is worth it, sure the economy is suffering, but the net profit of such an operation is not guaranteed to be worth the years of clean up. I think it is not worth the risk of the effort. We should be looking for better ways to provide jobs in that region. Minnesota is not historically known for having rich sulfides, they are wasting their time looking for precious metal in the wrong place. Towns like Ely thrive off tourism if the BWCA is damaged JOBS WILL BE DESTROYED!	G1,G11
3633	The short term benefits of the mining are not worth the long term environmental consequences.	EOO
3635	I don't think that this project would be worth the risk. It has long terms effects that would be bad for the surrounding environment and economy. For example resrts in the area would lose a lot of business and it would also hurt the fish and animals in the surrounding area.	G2C,G11

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3637	To disrupt a sector of Wilderness to such magnitude would be genuinely disheartening. Creating short term jobs and profit from mining is economically beneficial 4 some but long term negatively impacting for the local and regional mass. Canoeing, fishing, boating, camping, etc is a trademark of northern MN, and this would definitely suffer on the spectrum of those who visit here and those who provide those services.	G11
3638	The impact of the sulfide mine won't just effect the wetlands ecosystem. It will ultimately destroy the wildlife around those waters, and also the waterfowl population as well. The short term gain will not outlast the devastation and the generations to come.	G2C,G7C
3639	Fishing and canoeing is way to important to sacrifice to mining. Piece would not be their anymore for people to get away from their heptic life. We need to preserve the boundary waters for us and our children.	G11
3643	I have been going up to northern Minnesota since I had been a little kid. The main reason my family loves it is because the beauty of the nature. I come from Chicago and the industry is not good looking in any regards. I can't inage seeing mines on my like. It would take the joy out of my familie's summer hunting and fishing.	G11
3644	I think that the mining should not go on because we would loose so much land and wild life we would loose everything Minnesota is known for.	G2A,G2C
3645	interesting, seems ridiculous that they would do something to a sanctuary place like the Boundary Waters.	EOO
3653	I think that is pointless to wreck such a beautiful place for a few minerals!	EOO
3654	I think it dumb to start mining by the boundary waters when we already know how much damage has been done by past sulfur mining. Also I think it is impossible to believe the things they say when they talk about no pollution when looking at the past. It is a dumb idea and the mining should not be done, it will ruin the boundary waters.	EOO
3655	I feel that mining would ruin what we have today. We need to preserve the environment. It's worth way more than any copper or metal that we can get. It is disturbing that people would want to pollute our lakes by choice. I just don't think it would be a smart decision.	EOO
3659	This industry is not what northern Minnesotans want. Wilderness areas such as the boundary waters is who we are. Its our identity. People travel from many places to experience this. Along with this and the obvious pollution problems that will be caused by this I'm just not sure if it [illegible] of a question to go through with this.	G2,G11
3661	but before they start minning they need to put/install a plan to restore the area after the mining has done. And most of all the need to follow through with it. What is our problem today will carry over to our children and their children and so on.	PD4
3667	I believe they should not mine. Our sacred Minnesotan lands needs us to protect them and keep things natural. I don't believe what they would be mining is absolutely necessary for humans to continue living so its not worth to mine and ruin what is so special and beautiful about Minnesota.	EOO
3668	I think they should not be able to mine in the Boundary Waters. We need to save our environment.	EOO
3673	I've just heard about this and I'm shocked that it would even be considered! Not only is the harm not worth the cost, it also endangers beautiful wildland habitats and ecology.	G2A,G2C
3676	If Poly-Met mining were to invade the Boundary Waters, I think it would decrease tourism to the area. The Boundary Waters define a pure, natural area and a mining complex would disrupt this image. Damage from mining would cost the state more money.	G11
3678	They should not touch the Boundary Waters. Because if they do it and as happes pollution will happen. The not just we lose, but the generations to come. Its not about you, its not about your kids. Its about 2 generations from now.	EOO,G2
3679	As the areas on this plants that include no trace of human life decrease, where or when do we draw the line on the precious areas? It is so rare to find a piece of wilderness in which there are no drones of far off machinery or vehicles, and using this land for short-term profit is insane. *76% of companies failed their "quota" of zero damage to nature.	EOO,G2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3680	The small economic boost it would provide is not worth the long term effects it will do to air environment. The boundry waters are beautiful, and have been for many generations, destroying or even cometimes tainting it would be extremely wrong.	EOO,G2B
3681	The video really opened my eyes to what Minnesota may be facing in the near future. Being a pro nature and wildlife person it maddens me to see that people are willing to put the enviornment at huge risk for their own benefits.	G2C
3682	I think that they should not mine it would ruin a lot of things in the community and also the enviornment	EOO
3683	Also, I think our lakes, rivers & land is polluted enough as it is. Why not fix those problems or at least tame them first, before thinking about mining again. Why is the sulfide mining so important? I think we have more important concerns to worry about with our land, or at least a better way.	G7
3686	A sulfide oar body like the one proposed to be mined by Polymet in Northern Minnesota is a serious concern to Minnesota citizens. The economic and ecological impacts are very serious. Sulfide mining operations have a bad track record all over the United States, especially when they are located near water. Lake Superior is one of Minnesota's greatest assets and is the cleannest of the Great Lakes. We cannot sacrifice this. Don't let Polymet mine in Minnesota.	EOO,G7A
3689	Don't do it Kill the environment and the workers	EOO
3690	Like the title of this video, "Precious Waters' water is in fact precious. Don't consider this safe at all since our water is at risk such as everything else such as the wildlife.	G2C,G7A
3691	I think it's awful that there are mines so close to rivers and lakes. This was a good video & it helped educate me	EOO
3692	To me, it is very important to save and preserve the Boundary Waters. Here, one is able to experience the true wilderness, which is very important. It represents who we are as Minnesotans and should be saved - We are very lucky to have this and it is out job to save it.	EOO
3693	I don't think they should do it. The boundry waters look like a very nice place to go. I've never been there before but it looks like somewhere I'd enjoy going.	EOO
3694	I have never been to the boundry waters. It would be sad to see so much beauty destroyed for the mining industry. Who would be paying for the cleanup if the mining went through? If there is no guarantee that the public won't be paying for it, it should not go through. It is very permanant for a short term gain. We are lucky to have preserved the boundry waters before & this will wreck it forever.	G4A,G7A
3695	The NorthMet Project will contaminate the boundary waters from pits and waste. The high sulfate discharge will form sulfuric acid and destroy the peatland. It will also damage aquatic life from drainage and put at risk the critical habitat in the boundary waters. This area holds special meaning and memories to my family and I and I would be devastated to see it ruined by mineral mining.	G2C,G7C
3696	The pollution from the kind of sulfide mining does not seem to be worth the risk of mining. I think our lakes/rivers/streams are polluted enough and the mining will make everything worse, especially in the long run. The mining should not be done unless the new technology will 100% be able to mine without pollution.	EOO,G7A
3697	Great movie. I didn't know how much mining really destroys the environment. I personally love to hunt and fish so the outdoors is a big part of my life.	EOO
3698	How can they drill in the BWCA when they don't even want you to wash your hair within like 200 ft of the water.	EOO
3699	I trust our federal government to handle this problem effectively. None of us (students) are experts or scientists. A half hour movie does not allow me to weigh in my opinion. Yes the Boundary Waters are great but even the Minnesota representative stated 76% of the mining companies harmed the environment. That other 25% still exists. The geologist also cited only 20 out of 200 sulfur mines as hurting the surrounding area. As far as job outsourcing goes, those are still American workers being employed and anything can help today's economy.	EOO

3700	Would mining create jobs, yes, but what price are we willing to pay? Personally I think losing nature and water is too high a price. I want kids of all generations to see nature and to swim in natural lakes. Not only are there environmental problems, but health problems too. Basically, you'd create jobs to put money into the economy, just to take all the money back to try to get a fraction of what we had in the first place. On top of that, you have more sickness and angry people to deal with. I like camping and fishing, so if mining is allowed consider me an angry person.	EOO
3701	I think that the people deciding on this issue need to weigh what values more, precious metals, or the environment we live in. I love to camp, hunt, and fish like many other people. They take us back to our roots. Our roots are the environment and if we keep mining and destroying it we will have no connection to where we come from. Not to mention we will be ruining the most beautiful things on Earth.	G11
3702	I think all the chemicals and metals in the water is super sad. Being the Boundary Waters has no cell phone towers and other things, it's for a reason; to get away for peace and quiet. Why make something it wasn't meant to be?	EOO
3703	I think this video will open people's eyes. They have to realize that this beautiful, natural environment will be destroyed.	EOO,G2
3704	Kennecott is putting a mine in near my house and I was wondering about the effects of an underground sulfide mine? The mine would be in Tamarack, MN.	RFI
3705	Good video, showed the importance of our wilderness and exactly what open pit mining can do to an area.	EOO
3706	This was a good video. I can't believe that people would even consider risking our natural resources for money. Minnesota has always been known for its forests and lakes and destroying those would be devastating. I believe that if MN decides to go through with this mine, they will lose many supporters. Not only will we lose MN support, but also those who vacation here. It will no longer be the clean, quiet area that it is. MN will lose all profits of tourists. This would be a stupid decision.	EOO,G11
3707	As a young college student, a young adult that will someday be raising a family in this area I feel like the mining shouldn't be allowed. The Boundary Waters is a very beautiful place and the potential for great water pollution in the future greatly affects all Minnesotans. The pollution can cause great health problems for ppl. in the area and surrounding areas. The water quality is very important and not to mention how the ppl. who have to pay more taxes to clean it up is worse. Also the effect it will have on ppl. living here (economy, pollution, jobs, way of life).	EOO,G4A,G7B
3708	As a Minnesotan I have great appreciation for our lakes and wetlands. The preservation of our waters is vital to who we are morally and economically. The mining that would take place would slowly deteriorate our most precious resource and destroy our way of life.	G7C
3709	The film was well done and very informative. I think the mining near the Boundary Waters should not take place. The risks for the environment, individuals, and habitat are too much. By doing this mining it puts too many things at risk. The Boundary Waters should be preserved as-is for generations to come...	EOO
3710	I think mining northern Minnesota would be a huge mistake. It would remove any value that part of the world has. The effects this would have would affect so much more than just Minnesota. The Great Lakes are tied in along with tons of smaller bodies of water/land that would be ruined. It may create jobs but many jobs will be lost because the area's income comes from the wilderness and the fact that it is so secluded is the reason people spend so much money for that.	EOO,G11
3711	I agree with many of the points against the mining. What has to be done is weigh and compare the consequences economically and environmentally past present and future.	G8C
3712	I believe we need to protect this area and not let them mine it. Minnesota's wilderness is beautiful and we should take care of it. I am also an angler and I would be very frustrated and angry if the fish were killed off in the lakes.	EOO,G2C
3713	I think it will ruin all my favorite Boundary Water Lakes walleye fishing and if it happens I might start a war against them because I live for the outdoors in this beautiful state and will not let this stand.	EOO,G11

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3714	The PolyMet Mining should not take place near the MN Boundary Waters since it will disrupt the natural habitat of not only the organisms there but also everyone that goes there for the real experiences of wilderness. Additionally, the long-term effects are what we should focus on rather than any short term. We need to continually cherish the uniqueness of MN's land and waters! Our wilderness is what brings non-Minnesotans here. I say NO to PolyMet Mining!	EOO,G2C,G11
3715	As a lifelong Northern Minnesota outdoorswoman, to allow a few companies to exploit our natural resources is unbelievable. Not only would mining destroy an area of my home state that I personally utilize, but also the flora and fauna that call it home. To think money is more important than an overwhelmingly large number of species (human, animal, and plant life) is disgusting. Also, hydrology is a relatively new science, so should mining companies be allowed to tell us they certainly know what could happen to our water resources? PROBABLY NOT!	G2C,G8B
3716	This project makes me feel very sad. To put the boundary waters at risk for short term economic reasons is a bad idea. To put the fish at risk, the waters at risk is not good. I myself love the boundary waters and would hate to see something like this happen to it.	EOO,G2C,G7A
3717	Given just the effects of this type of mining that have been recorded, is it even ethically permissible to allow this? Is human life to be measured as a lesser quantity vis-à-vis precious metals? And it, as in human life, will be affected negatively, history has shown a precedent; how much is the only question.	EOO,G2
3718	For the amount of damage that minning will do to Minnesota is not equal to the amount of profit minning people/companies/ect. will make. Nature is not to be messed with. Why destroy natural beauty?! What will happen to people who live around the boundary waters and the amount of money they will suffer for damage? What does minning offer our community besides a small job and a bigger damage?! Think about it!	EOO,G4A
3719	I live on a lake in northern MN. If my "home" got polluted like the video says is possible, I'd be so sad. The earth is pure, and man keeps messing it up. We need to give back to the environment, not take from it.	EOO
3720	I think that it's crazy that people are willing to let that happen to our lakes! It's gross and nasty but I guess big corporations and some people will do anything for a dollar these days. I understand that they want to provide jobs but can't they come up with a positive source of income and job that doesn't damage our environment?	EOO
3722	Minnesota is all about our water. The Boundry Waters is the heart of this state. It is so precious. It makes me sick thinking that it could so easily be destroyed. I want my future children and grand-children to go to the Boundry Waters and enjoy it's purity and serenity. With a lot of national forests and wilderness areas disappearing, we need to keep this as pristine as possible.	G7
3723	This sort of mining would not outway the harm that it does to our environment. The short term financial gain from this type of mining does not make the long term effects/harming the natural resources and water right. I believe that preservation is key and there is absolutly no need for the mining.	EOO
3727	I think that there should be a vote in each county that would be effected immediately by water pH levels, business, noise levels, etc. The rest of Minnesota and the country will not have a realistic opinion on this matter. Outsourcing jobs and materials will not help the areas. We need to tell people about immediate effects because they will not care about the seventh generation, or rather comprehend that far out.	G10
<b>Sender Last Name:</b> no name-		<b>Submission ID:</b> 3431
3721	I understand the need for jobs in Northern Minnesota, especially on the Iron Range, but the effects of putting more mines in the area is dangerous. We house 100s of thousands of tourists each summer, we would lose that much money per year. People come to northern Minnesota to get away from honking cars, cell phones, and work, to just plain escape. So I honestly don't understand why they would disrupt such a peaceful place. Not to mention the mess that would be left for how many generations to clean up. So I think we should find a more safe way to create jobs.	EOO,G4A,G11

3642	I think it is true what she said about the ripple effect the money coming from the mining would boost the economy but it also will lose money for all the local businesses + create a mess that will be even more of a burden then worth.	G1
<b>Sender Last Name:</b> Noble		<b>Submission ID:</b> 3594
3864	The email , below, which follows this (my) message is self-explanatory. I am a member of the League of Women Voters in Minnesota (LWVMN) and wish to express my sincere concern regarding the Poly-Met proposals for sulfide mining in the Arrowhead. In fact, it seems incredible to me that the Minnesota's DNR would even entertain such a proposal, along with the Corp of Engineers, considering the potential humungus risk to water quality, potentially destructive impacts on our wildlife, wetlands and global warming. I am objecting to Poly-Met's proposals and to any other sulfide mining proposas in the pristine wilderness of our state - no matter the promises of these mining companies that there will be minimum damage and that they will put the monies up front to clean up their mess. I do not want to see the tragic losses which have occurred in other states, e.g. Colorada, become Minnesota's. The Arrowhead and BWCA and surrounding area are much too precious to take a chance on losing. Please take a few minutes of your time to view the video at <a href="http://www.preciouswaters.org">www.preciouswaters.org</a> if you have not seen it. Thank you for your attention to this expression of my concern.	G2C
<b>Sender Last Name:</b> Nord		<b>Submission ID:</b> 2452
2282	In order to protect the citizens of Minnesota financially from the long tail of water quality degradation from sulfide mining, I believe the state must require the mining companies to post a significant bond that will assure funds are available in the future for mitigating environmental impacts from the mines. If the mining companies respond that this will make the mines unprofitable and that they will not develop them, I believe that should be taken as a signal that the value of the metal that can be produced by the mines in Northeast Minnesota is not sufficient to undertake the risk to the environment that the mines pose. If because of superior design and operation the mine does not result in water quality degradation, the bond could be repayed to the mining companies at some point in the future with suitable interest. This seems to me the only way to equitably share the risks and benefits of the project between the citizens of Minnesota and the mining companies.	PD4
1948	To the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers: I am deeply concerned about the impacts on water quality in Northeast Minnesota due to the proposed PolyMet mine and other potential mines that are not as far along in the permitting process. The watershed for the PolyMet mine flows into Lake Superior. The watersheds for other proposed mines flow into the Boundary Waters Canoe Area. Both of these resources are among the "crown jewels" of Minnesota. They are fundamental resources in making Minnesota a very livable state. They also bring significant tourist dollars into the state. The BWCA is the most used wilderness area in the United States east of the Mississippi River. The cultural and economic value of both of these resources depends on their water quality. This is my primary concern with the proposed mines. The history of mining sulfide rock bodies in the U.S. is a history of creating acid mine drainage. Streams and rivers in Wisconsin, Michigan, Colorado, Montana and other states have been impacted, and in some cases rendered biologically unfit to support life, by acid mine drainage from sulfide mines. The history of sulfide mines is also a history of mining companies going bankrupt or just leaving, and leaving the people of the state to pay the bills for cleanup or having to live with the impacts of the degraded resource. The mining companies trying to get the PolyMet mine permitted have assured us that this won't happen this time. That they know how to do it right environmentally. This runs contrary however, to the whole history of sulfide mining, and should be taken with a significant degree of skepticism. Particularly because the life of the active mine is fairly short, but the duration of polluted water and a degraded environment is measured in geological time.	G4A,G7A,G8C

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2949	My final statement is that while technically the permitting action on the PolyMet mine does not impact directly on a watershed leading to the BWCA, I think that the MNDNR must consider that the actions taken will be a direct precedent for future sulfide mining permits in Northeast Minnesota. I think that rather than considering this as one isolated project, we must consider the potential impact of additional mines on water quality in Northeast Minnesota. This should be an important consideration in determining the amount and how a performance bond is structured. Once the precedent is set for allowing a mine, it will be extremely difficult to change the precedent for future permitting actions. There are many considerations in the permitting process. I am not a geologist or mining expert, but I am a citizen of Minnesota who loves our precious waters. I hope the potential for our future generations to recreate in our precious waters will also be taken into account in the decisionmaking.	G7A,G8C
<b>Sender Last Name:</b> Nordin		<b>Submission ID:</b> 270
284	We support PolyMet Mining's NorthMet Project. It's time to get on with permitting this mine. We want JOBS! PolyMet will provide millions, of dollars in local and state taxes to support our communities and educational system. They will employ 400 people; with hundreds of spin off jobs that will provide a huge economic benefit to Minnesota and the Arrowhead region including construction of the \$600 million project that will require about 1.5 million construction hours over two years. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families; keeping them in northern Minnesota will help the economy and the educational system. Thank you for your time in reading this letter and we'll look forward to seeing this project move forward. We need to put our members to work!	EOO
1289	Minnesota's water is certainly one of our most precious resources and to jeopardize the quality of that for some possible short term advantage is not a wise decision. I am opposed to any non-ferrous mining operations.	EOO,G7B
1291	Non-ferrous mines or sulfide mines should not be allowed as extracting minerals like copper and nickel from sulfide ores would pollute our lakes, rivers and streams and would be very costly to clean up. I am against sulfide mining. It is my understanding that sulfate turns mercury into forms that make fish dangerous to eat.	G3B,G7B
<b>Sender Last Name:</b> Norrgard		<b>Submission ID:</b> 3671
1	e. Inadequate analysis of the toxics – numerous metals leaching, acid mine drainage, methyl mercury, sulfates in waters etc. The DEIS has done an inadequate analysis of the impacts of the PolyMet project on mercury releases, mercury methylation, delisting of water bodies, wild rice and aquatic species.	WR1E,WR4B,FM1
2	Sulfide mining is new to Minnesota. It has been responsible for extensive acid mine drainage and water pollution in mines all over the United States, resulting in hundreds of millions of dollars of costs to taxpayers. The Polymet Project would impact 6,700 acres of public lands in the Superior National Forest, including high quality wetlands and forests. It would release mercury, sulfates and heavy metals into the Lake Superior Watershed and rivers already impaired due to overly high concentrations of pollutants.	PD10
3	3-33—Explain why, if the gypsum filter cake is so high quality, that it must be placed within a hydrometallurgical cell that has a geosynthetic liner. Explain the chemical breakdown components of gypsum filter cakes within the residue tailings.	PD9
4	Figure 3.1-42—Explain how the pumps and pipes on the sheet of paper will withstand drilling, blasting, and ground vibrations caused by 240 ton trucks, locomotives, and other equipment.	PD9
5	3-43-Explain where the removal of storm sedimentation goes.	PD9
6	3-43—“...discharges from these outlet control structures would be monitored as necessary to ensure the runoff to the Partridge River would meet water quality discharge limits.” The EIS process needs to include a plan explaining who would monitor, when the monitoring would take place, and what mitigation procedures could bring the discharge under control.	PD8

Comment ID	Comment Text	Theme Codes
7	3-45—The DEIS does not explain an inspection program or a mitigation program. There is nothing in place to adequately address the problems associated with acid mine drainage and leaching of toxic heavy metals. PolyMet advertises that it is following Minnesota’s strict rules. If this is true, the rules need to be stated and the plan to prevent contamination clearly spelled out. The DEIS is inadequate in not addressing this problem. Monitoring for possible pollutants is not the answer to acid mine drainage. Monitoring simply perpetuates the current system whereby the mining company is fined, and the IRR promptly reimburses the mining company for the cost of the fine. Since the problem is never addressed, the agencies then grant the mining company a variance, so that pollution can continue.	PD8
8	The purpose of this DEIS is to assure the public that pollution will be prevented and/or treated. This is not adequately addressed in the DEIS.	PD2
9	3-47—“The cover used at Closure would consist of a layer of NorthMet flotation tailings or LTVSMC tailings.” The EIS process needs to analyze the contaminants that would be found in these tailings as part of a surface water control plan. LTV tailings contain coal ash from the Highway 61 coal ash spill, and dredging from the contaminated Dunka mine site.	PD2
9	There is no justifiable reason for turning the Arrowhead Region of Minnesota into a sulfide mining district. The footprint left by taconite mining on the Iron Range, by mining rock that has 25% metal, will seem small in comparison to mining sulfide bearing rock that contains less than 1% metal. The acid mine drainage legacy of sulfide mining will destroy our last remaining clean waters. Forests and wetlands will be replaced by open pits, waste rock piles, and tailings basins. I am commenting on this DEIS because of my concern about the legacy that the permitting of metallic sulfide mining would leave behind. People of my generation, with our experiences and our knowledge, bear a responsibility toward future generations. What is it that we most value, that we most want to leave behind for those who will come after us? We do not inherit the Earth from our Ancestors, we borrow it from our Children.	EOO,G2
10	g. Complete lack of analysis to assure the taxpayer does not get stuck with the clean up costs (which reach into the future so far, 2000 years according to documents, as to be perpetual)	PD4
10	f. Inadequate analysis of climate change and the increase to impacts that this project will bring	AQ3
11	h. Inadequate explanation of how the technical and mechanical processes will protect the public and public values such as clean air and water and healthy wildlife and habitat – or how the DNR, USACE and Polymet can guarantee this project will meet the laws of this state. Altern	PD3
12	Alternatives Analysis This EIS is prepared to accomplish the purposes of NEPA. To accomplish these purposes, NEPA requires all agencies of the federal government to prepare a “detailed statement” that discusses the environmental impacts of, and reasonable alternatives to, all “major Federal actions significantly affecting the quality of the human environment.” The EIS must “provide full and fair discussion of significant environmental impacts and shall inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment.” This discussion must include an analysis of “direct effects,” which are “caused by the action and occur at the same time and place,” as well as “indirect effects which are later in time or farther removed in distance, but are still reasonably foreseeable.” An EIS must also consider the cumulative impacts of the proposed federal agency action together with past, present and reasonably foreseeable future actions, including all federal and non-federal activities, and an EIS must “rigorously explore and objectively evaluate all reasonable alternatives” to the proposed project. Due to these requirements the DEIS is inadequate in both not exploring an underground mining option to see what the difference in impacts to the environment and local communities and well as human health might be. Using expense is not an adequate excuse for not taking a “hard look” at this very viable alternative. Other mining in the area is done in this way, a recent study was done that shows that this may be a viable alternative to this particular project (study by U.S. Steel of this mineral deposit, which recommended underground mining because the ore depths were so great that open pit mining would not reach them), and this type of mine may eliminate a whole host of human and environmental impacts from this new type of non ferrous mining in Minnesota. Before this Project should move forward it should be required to take a hard look at the alternative of underground mining.	ALT8,PD3,CR1

13	Creating 394 million tons of waste rock, 91,200 tons per day, that contain multiple toxins, create acid mine drainage, and impacts to air quality and human health due to particulates and high mercury accumulations. Plus the loss of threatened and endangered plant species, loss of high quality wildlife habitat and wildlife travel corridors and critically important wetlands ecosystems, while also polluting the surrounding watersheds all the way to Lake Superior (and in future the BWCAW), is not a good future for Minnesota – we should create jobs, but jobs that do not destroy the landscape, waters, and the health of the communities that rely on them.	PD10
13	The one thing I really want to say is the DEIS is huge and it's going to take a while to really be able to read through it and see what this project is all about, the impacts that it has, and so I'm hoping that we can ask for extended time. We need a lot more time to be able to review this project. And I just wanted to make	PRO6
14	The No Action Alternative was not given full consideration and should be analyzed to the full extent of the Proposed Alternative. A full hard look analysis of the no action alternative would show the benefits of protecting the wetlands, forests, and wildlife values for the economic, health, and viability of the local communities. Sometimes it is far better to realize the value of what we have existing – and consider the dollar value of the ecosystem services that are already in place, than to destroy this valuable resource and realize the tremendous loss after it is too late.	ALT8
15	The No Action Alternative analysis should take into consideration the growth in the local economy that has happened since the last “bust” of mining – in social services, tourism and hunting. Metal mining has major negative aspects, disturbed and degraded land which in many cases will never fully recover, and water and air pollution continuing indefinitely. This industry also has a history of boom and bust cycles that can be devastating to local economies – jobs tend to be volatile and lead to community instability. Metal mining also leads to the social cost of “attractiveness” loss – the relatively permanent environmental damage, huge open pits, massive waste piles, extensive settling ponds, heavy metal pollution and mine drainage make it difficult for an area to attract new residents and businesses – who would want to live near this? Even the miners themselves tend to choose to live some distance from the mines to protect home values from these losses. (from the report <i>The Economic Role of Metal Mining in Minnesota: Past, Present, and Future</i> ). According to the above mentioned report this project would only add less than one percent employment (using the multiplier impacts) and represent only three months of the earnings growth seen in recent years in St. Louis County. The State of Minnesota could do much better to focus on jobs that are truly “green” jobs. Green jobs do not destroy the environment upon which they are based.	ALT8
15	The attractiveness of a place, especially the environmental characteristics has become an important source of local economic vitality – an analysis of this in the arrowhead region should be a part of the DEIS. The analysis should also take into consideration the value of ecosystem services such as clean water, clear air, carbon sequestration, wildlife, soil stabilization, rainfall storage, and many others.	PD1
15	A discussion of the cumulative environmental effects of a proposed action is an essential part of the environmental review process, for otherwise the agency cannot evaluate the combined environmental effect of related actions. Cumulative impact is defined in NEPA’s implementing regulations as “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions . . . . Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.”	CR1
16	1. Discharge and seeps from the mine, pit lake, tailings and waste rock piles of the PolyMet project are likely to pollute water for decades, even thousands of years. Yet there is no showing that the PolyMet corporation can or will provide financial assurance to protect taxpayers from long-term pollution.	WR3I
17	The PolyMet Project would significantly increase mercury levels in local fish, creating human health and ecological risks. Sulfates would impair wild rice. The DEIS studies are inadequate to prevent degradation of water quality. The DEIS studies are inadequate for the public to be knowledgeable about the true risks of the project to health and the environment.	WR1E,WR4B,WR4F,FM1,F
18	There is no inspection program or mitigation program outlined within the DEIS as to the acid mine drainage that will be created.	WR1B,WR4C

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19	Technologies upon which PolyMet relies to treat contaminated water, prevent release of contaminants, including sulfuric acid compounds, are untested or unreliable.	WR1E
19	There is no way to logically categorize whether waste rock is a 1, 2, 3, or 4 category waste – there is absolutely no way to ensure the more toxic waste rocks are safe from leaching toxins into the environment, all waste rock has the potential pollute waterways, even category 1, but there is no way to test each stone as to its category. Polymet’s plan for storage of waste rock is inadequate to protect the environment – the DEIS should provide full public disclosure of this inadequacy.	WR1A
19	The Tailings Basin design does not meet minimum safety standards to prevent catastrophic failure and uncontrolled release of tailings to the Embarrass River. Waste rock piles, mine pits and liners will leak and seep pollution into groundwater.	WR2C,GT2
20	The PolyMet project would take over 6,700 acres of public land in the Superior National Forest. Yet, the DEIS has done no analysis of a land exchange to protect the environment, tribal rights and public taxpayer assets.	PD1
21	an assessment of the impacts of all of the pending sulfide mining projects within the arrowhead region, especially including the Duluth Metals Ltd (Nokomis deposit) and the Franconia Minerals Corp (Birch Lake deposit).	G9
22	additional capacity within the Northmet processing plant beyond what the Polymet project will use, it is a good probability that a reasonably foreseen future is greater – up to 100% - capacity use.	G9
23	additional “areas of interest” in the analysis of sulfates. And evaluate geographic boundaries to fully consider the distance sulfates can travel. The current documents consider the area of interest to be limited to the Partridge and Embarrass River sub-watersheds. The area of interest for direct, indirect and cumulative impacts of sulfates on the aquatic resources in this watershed should be the St Louis River from river mile 179 and downstream to its mouth.	WR3B
24	This project is on the Superior National Forest and within Forest Service lands which precludes this type of project – this should be addressed in the DEIS, and any actions in regard to this should be addressed within this Study. The project footprint is within very important ecological features, the impacts are of great concern. Due to the location of the Project on federal public lands there is a requirement to protect the public values of these lands. Forest Service Regulations state “Habitats for all existing native and desired non-native plants, fish, and wildlife species will be managed to maintain at least viable populations of such species.”	PD1
25	MiningMinnesota strongly supports PolyMet Mining’s NorthMet project. The project will bring much needed jobs and significant economic benefit to both the state and regional economy. These new jobs will support thousands of people in hundreds of families in our rural communities in Northeastern Minnesota, and the millions of dollars in annual tax revenue will benefit the schools, cities, and State tremendously. MiningMinnesota believes that the draft EIS is a thorough effort and reflects the extensive work behind its preparation. The draft EIS covers all potential impacts identified in the Scoping EAW and some additional issues of concern as well. The EIS identifies alternatives and mitigation to reduce or eliminate these impacts, and can and should lead the way to a Final EIS and a decision of Adequacy as soon as possible. PolyMet can produce the critical metals we need and use in our country on a daily basis and do so in an environmentally sound manner. The demand for these metals continues to grow. In the U.S. we are import dependent for all of the metals that PolyMet will mine and process including copper, nickel, platinum, palladium, and cobalt. This reliance on imports negatively impacts our domestic trade imbalance, creates limitations on availability and access to metals, adds cost, and results in the exportation of jobs and further loss of job creation opportunities. Many of these metals are also essential to green technology such as wind turbines, catalytic converters, hybrid cars, and solar. In fact, PolyMet will produce several metals that are not currently mined anywhere in the United States. By mining and processing these metals here in Minnesota under our strict environmental standard we will lead the way in global carbon responsibility. Mining these metals in one country, processing them in another and then transporting them to the U.S. for consumption creates unnecessary greenhouse gas emissions. Finally, PolyMet’s NorthMet project has been designed to minimize environmental impacts. It will reuse a brown field site, reuse existing infrastructure, minimize wetland disturbance, and utilize multiple safeguards to assure air and water quality standards are met.	EOO

Comment ID	Comment Text	Theme Codes
25	Critical habitat for the endangered Canada Lynx. The lynx in Minnesota requires large unfragmented tracts of quality forest area – which is what the mine site proposes to destroy. Due to development, existing mining, and other human encroachment to the natural environment we are increasingly losing larger contiguous areas of habitat for our wildlife, especially those species that require mature and interior forest areas. Large unfragmented tracts of habitat are a rare and valuable resource for Minnesota.	WI1
25	The High Biodiversity Significance rating that the mine site footprint has requires a critical look at what is most important for this area of forest. If Polymet is permitted it will be a permanent and irretrievable loss to the Superior National Forest and Minnesota. What we would lose is over 3,000 acres of high quality native habitat containing some of the rarest species. Two of the vegetation communities (black spruce-Jack pine and rich black spruce swamp - DEIS 4.3-2) are considered imperiled/rare and rare/uncommon by the Minnesota County Biological Survey. It is far past time that Minnesota consider the importance of our rare ecosystems – if we are to protect our native species from extirpation and extinction. It is also unacceptable that diverse and at risk forest types will be replaced with a red pine plantation upon closure of the mine. This again points out the irretrievable loss to Minnesota this project creates.	IR2
25	The Polymet project will also impact 2 of the 13 wildlife travel corridors, (9 of which may be impacted by the additional mining projects). The impact of this loss for the movement and dispersal, foraging and hunting, and other activities of our wildlife is not addressed. The DEIS should analyze the cumulative impacts this will bring to northern MN species. What will happen to the movement of wildlife if access is prevented by the Project to Corridor 11 and 12? What will this mean to wildlife with the additional impacts from the future mining projects if they come on line? “Cumulative impact” means the impacts of this Project added to existing and future impacts (hence “cumulative”). All of the classification of impacts - 1. direct loss, 2. fragmentation of habitat in corridor 3. isolation of corridor by a barrier (DEIS 4.4-31) – are significant and should be further explained as well as mitigation measures discussed to better inform the public about cost to our wildlife from these impacts.	WI5
25	The loss of high quality wetlands and peat areas will exacerbate impacts of climate change. One of the most important things we can do to mitigate and address climate change is protect forests and wetlands as sinks for sequestering CO2. By protecting these areas from development, the carbon in above-ground biomass and belowground soil organic carbon can be maintained and additional emissions of CO2e to the atmosphere can be avoided. Peatlands and wetlands are recognized to have large stores of soil carbon. Studies to gain a full understanding of overall carbon dynamics show that peatland/wetland protection and enhancement programs should be initiated to protect this stored carbon and to sequester additional carbon in the future.	WE2,AQ3
25	The DEIS should analyze the impacts of introducing invasive species as a part of the mine closure plan. We should not allow the introduction and use of invasive species into the Superior National Forest. The United States is under attack from a diverse army of invasive plants and animals that are threatening to transform the country's natural ecosystems and obliterate regional economies. Exotic species cause billions in environmental losses and damages each year, out compete native species. Non-native plant species are nearly invisible to native birds and other wildlife as a food source.	WI4
26	See maps included in comment document.	EOO
26	The permitting of PolyMet would be an irresponsible decision, and this should be stated as such under IRREVERSIBLE AND IRRETRIEVABLE COMMITMENT OF RESOURCES. The Army Corps of Engineers should most notably understand the impact of sulfide mining on our waterways, and the irreversible and irretrievable loss of wetlands. I support a No Action Alternative.	EOO

27	I am a citizen of the State of Minnesota and I incorporate by reference the Tribal cooperating agencies' findings and the Water Legacy comments: "The EIS Must Include Detailed Information on the Potential for Failure of Containment and Treatment of Wastes, Including Impacts on Water and Air Quality." There seem to me to be so very many areas of uncertainty regarding most, if not all, aspects of the proposed PolyMet mine project. Among other issues is that of the liners to be used. On page 4.1-164 of the DEIS it states that, "All liners leak to some extent." Then, on page 4.1-136 the DEIS states that, "Concerns still exist regarding the adequacy of the proposed overliner buffer thickness to protect the liner from accidental tears or rips during waste rock placement or removal given both the size of the waste rock and the equipment necessary to place or remove it properly." These are just two examples of legitimate concerns about how the liners will be able to do their job given the fact that they all leak to varying degrees and then given the fact that OVER 99% OF WHAT'S MINED WILL IN FACT BE TOXIC WASTE is the concern that the overlayers have not been ensured. If this project were in your backyard, would you feel that the odds were good enough for you to continue living safely in that place??? Would you still drink the water???	EOO,WR2D,GT2,AQ5,AQ6
28	Yet another particularly problematic issue is the perfection of the seal at the seams. With so many unresolved questions and so much inherent risk, how can this project be permitted at this point?	G8
28	We have a unique and priceless ecosystem in the vicinity of the proposed PolyMet mine. Should PolyMet be given the green light when there are questions regarding the integrity of the material they propose to use for the liners in terms of the pressure they will be exposed to under jagged rocks? Also, a related issue of concern regarding the liners is the question of the skill and thoroughness of installation.	GT1
29	First comments are maps: see comment document.	G14
30	3-34—"LTVSMC coarse tailings layer would be placed to create the covered surface on which vegetation could be sustained." How stable are coarse tailings as a foundation? Is this designed for use on 320 foot high waste rock piles? Are the coarse tailings from taconite? Are they inert?	PD10
31	3-37—The EIS process needs to explain where the money is coming from for closure: demolition, special material demolition, etc., as well as for "long-term" water treatment.	PD4
32	3-38, 3-39—The EIS process needs to define reclamation, and explain what reclamation means in terms of further use of the mined land. If the mine cannot be used for other purposes, and if the land is unusable because of potential toxic leaching, then this needs to be explained, and this also needs to be included in the socio-economic impacts, and under Irretrievable Commitment of Resources.	PD3
33	3-40—An estimate for total amounts of limestone needs to be included in the EIS process. Due to the large amount of limestone needed, cost and availability of limestone needs to be included somewhere in the EIS, possibly as a liability under socio-economic impacts.	PD2
152	I just want to make a statement that I'm very concerned about this mine going in place for a number of wildlife issues. I think what's above the ground is much more valuable than what's under the ground. And habitat, we are losing it every day with new development. This is going to be a huge impact to our Superior National Forest forested habitats.	G2A
<b>Sender Last Name:</b> Norton		<b>Submission ID:</b> 162
14	I wanted to say that it is important in a public meeting to provide a chance for a dialogue in that it is not sufficient to have an opportunity for individual people to speak their thoughts on the record. That is not dialogue. That is a statement from the agency, or in this case agency, Environmental Consulting Company, and representatives and senators from the state, followed by a response by a single citizen. And with that set up, you lose the opportunity for citizens to hear the thoughts and reactions of other citizens, and then responses to those thoughts, and counter-responses, and replies to those responses. That's dialogue. We	PRO6

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
15	Second. The meeting tonight is too early in the comment period to afford citizens a chance to first read and understand the Draft Environmental Impact Statement (DEIS) which is, even without the supporting documents, nearly 2,000 pages long. More time is required for citizens to read, comprehend, formulate comments and questions, and then put those down in writing, than the 90 days that the Department has offered or afforded. The Department of Natural Resources many times in the last four years extended the time allowed for it and the consulting companies to prepare this Draft Environmental Impact Statement because it is a very complex proposition to carry out this project. If the Department does not extend the time allowed for citizens to understand and comment on the DEIS, then I believe that shows that the Department sees the process of preparing a Draft Environmental Impact Statement as an opportunity to determine the proper course of action, rather than to present to the public a proposal for environmental review and comment.	PRO6
16	I would also like to say that from what I heard tonight, it was not a particularly balanced public meeting in that the only people permitted to speak, including at the outset Senator Tomassoni, Senator Bach and Representative Rukavina were hardly neutral in their comments. They were not brief, welcoming comments; but	PRO6
17	rather a pep rally for the mine. Another round of public meetings is necessary to afford the public, whatever their opinions about the mine, a chance to have a proper dialogue. Those meetings should come after the comment period has been extended from 90 days to at least 120 days and that extension should be decided and announced sooner rather than later.	PRO6
34	I am writing to request an extension by at least 30 days of the comment period deadline for the Northmet (hereinafter, "Project") Draft Environmental Impact Statement (hereinafter "DEIS"). I am a staff attorney for the Minnesota Center for Environmental Advocacy (MCEA)." MCEA is a non-profit, non-governmental organization whose mission is to protect and defend Minnesota's environment and public health, using legal and scientific research, and various forms of advocacy. MCEA works with governmental agencies, in the courts, and at the legislature. MCEA, takes strong interest in the Project because of it's location, size, and nature. The Project DEIS was first released for public review on November 2, 2009, with public comments accepted until 4:30 p.m. on February 3, 2010. This results in a 90-day comment period. For several reasons, 90 days is an insufficient period of time within which to read, comprehend, and draft helpful comments on the Project.	PRO6
35	First, the Project DEIS includes scores of documents, and the total size of the entire Project file is enormous. The sheer. volume of pages surpasses the ability of most individuals to read and formulate comments upon the DEIS within 90 days.	PRO6
36	Second, the Project DEIS contains scores of highly technical documents. It will require more time to read, comprehend, and respond to the technical material than would be required for non-technical information.	PRO6
37	Third, this DEIS comment period overlaps several holidays. It is a time of the year during which many people travel and/or spend vacation time with family. In other words, the timing of the DEIS release and the resulting comment period deadline further reduce the amount of time likely to be available to most people for reviewing and commenting on the DEIS.	PRO6
38	Fourth, this Project and its proper environmental review are exceedingly important, and not just because the land upon which the Project is proposed is owned in common by the public. This is the first project of its kind to reach the point of DEIS issuance in Minnesota, but many more are anticipated in the event this Project proceeds. Mining of sulfide-metal ore has never been accomplished without causing eventual acid metal leachate pollution of groundwater or surface water in the vicinity of the mine site. This is true even in arid environments. Minnesota is lake and wetland country, and presents even greater danger of such pollution coming to pass. In short, this is a new and potentially very dangerous type of project in an extremely sensitive area, and is likely to lead to a cluster of additional such project proposals.	PRO4,PRO6

2610	<p>My name is Kevin Norton, and I am a pastor in northern Minnesota. I grew up in Minnesota, born and raised in this state, and I've spent the last 28 years in the north, even though I graduated out of the Twin Cities, and what I've recognized in seeing many different people all over the state is that 11 they're hard-working, industrial people. Right now with the things -- the way things are going everyone needs work, and PolyMet would certainly assist in helping many people with finances, which helps them build self-respect and self-esteem because they're providing for their families. It would be good for the environment, I think, also, because of the fact that I think the United States is probably the leader, a model for the rest of the world to follow in terms of environmental issues and policies, and Minnesota statewide I think is probably the top of that league. And so if PolyMet decided to go somewhere else, I think that instead of being in a place that there would be the proper safeguards and so forth, we would see maybe a state or another country that isn't as interested in the safeguards as they are in making a profit would just let some of those things slide, and therefore we'd be culpable by omission by allowing it to go somewhere else, where here we do care about our environment. I have people in our congregation that have 80 acres of land that they feed the deer during the year, and then when they harvest the deer they self-impose restrictions and even fines on themselves and make sure that the deer are not overharvested and that they get to grow to a proper amount of age. That happening on a personal level, then what that says is that Minnesotans do care about the environment and they do care about the surroundings, they're responsible. And I think that all the work that's necessary to protect our environment has gone into the research and the studies, and we just can't -- we can't avoid the fact that we need to provide jobs and security and self-esteem and health insurance and all these things that come with this job. Therefore, I'm just very strongly encouraging whoever hears this thing that they would not get in the way of this, but rather they would endorse this and say this is good, because our state can handle it and will handle it well and with the kind of respect and dignity that it's supposed to. That's it.</p>	EOO,G1,G4

<b>Sender Last Name:</b>	Nurmi	<b>Submission ID:</b> 3236
3561	<p>I really hope the Polymet Project actually becomes a reality. I believe they have spent enough money jumping through hoops to satisfy even the "greenies". I love the lakes up here and surely do not want to see anything happen to our waters or land for that matter. I also look at the benefits for the people who actually live up here, paying taxes and trying to make a living. I think we should let our governing agencies do their jobs. It is past time to start moving dirt. I also expect the government agencies, local people, and even the "greenies" to make sure they use the best, modern processes available. Now if Polymet does not meet these expectations, I would expect to see them closed down immediately. I think this is more of a local issue. I do not know anyone who goes to Minneapolis trying to tell those people how to not ruin their lakes. It is past time for that. I do not subscribe to the theory, they know what is better for us, since they have ruined their lakes. We are the ones that live up here in the -40 degree winters, fight the bugs, and have to put up with them coming up here with one pair of jeans and a twenty dollar bill, changing neither one. We need these jobs. I am still working and have been in mining since April 1968 when I first started at Erie Mining Company. I now have over 33 years at the Minorca Mine near Virginia. I hate to see our young people leaving to find jobs in the crowded cities.</p>	EOO

3231	Long-term water contamination from waste rock – Modeling in the DEIS predicts that water leaching from waste rock piles will exceed Minnesota's water quality standards for multiple metals and compounds for up to 2,000 years. (Page 16) Contaminated overflow from mine pit – Approximately 45 years after mine closure, the DEIS predicts that the West Pit will overflow and spill into the Partridge River. Water from the pit is expected to exceed water quality standards and contamination of the river will violate the Clean Water Act. (Page 16-17) Unsafe tailings basins – The DEIS acknowledges that the tailings basins will have a “low margin of safety” because the underlying material—fine tailings from the LTV taconite mine—is unstable and poorly-constructed. Failure of the tailings basin would result in the release of a catastrophic amount of toxic waste from ore processing. (Pages 25-26) Sulfate contamination and mercury methylation – High levels of sulfates discharged into surface and groundwater will increase the methylation of mercury, a biological process which can result in the bioaccumulation of mercury in fish, wildlife and humans. Increased sulfate levels will also have negative impacts on wild rice beds in lakes and rivers downstream from the mine, seriously harming an important cultural resource of Native Americans in the region. (Pages 30-35). This is one of my main concerns for the fish and health of people downstream of this mine. Inadequate data collection and disclosure – The DEIS is overly dependent on modeling when real-world data could have been easily obtained and would have provided far more useful and predictive information. (Page 9) I cannot subscribe to risking our rivers and streams to this type of conjecture.	EOO,WR1E,GT2,FM2,FM5
3678	I am very concerned about risking our water quality with this project. Here are my issues with the PolyMet Northmet project DEIS. Lack of financial assurance – Delaying such an important component until the permitting stage is a serious omission, makes it impossible to fully assess the project’s potential environmental impacts, and puts Minnesota’s taxpayers and natural resources at risk. In his report, Dr. Chambers suggested that mine clean-up, closure and long-term water treatment could cost \$100 million. If PolyMet goes bankrupt or otherwise abandons the mine, it will fall to the people of Minnesota to either live with the pollution or foot that bill. (Page 3)	PD4

1116	I am very pleased to express my strong support of an adequacy determination for the draft Environmental Impact Statement (DEIS) for PolyMet Mining Co. The environmental review process for what will be Minnesota's first nonferrous metal mine has been long and arduous, but the resulting draft demonstrates that PolyMet will help meet our nation's domestic demand for copper, nickel, platinum, cobalt, gold and palladium, put Northeastern Minnesota citizen back to work and ensure the protection of our precious natural resources. PolyMet has earned my support from the outset because of its responsible, innovative approach to nonferrous mining and processing; the DEIS does an excellent job of describing the many steps PolyMet will take to minimize environmental impacts. PolyMet proposes to utilize superior processing technology to use the sulfur in the ore as fuel and minimizing the emission of greenhouse gases. PolyMet will re-use the exceptional infrastructure from the former LTV Steel Milling Company and proposes to mine within an already well established mining district. I am pleased in particular to see the redevelopment of this LTV brownfield site-the reuse of the facility will decrease the amount of undisturbed lands needed for the project and helps decrease capital costs for the project thus making the mine more competitive globally. PolyMet plans to carefully manage waste rock and will not discharge process water. And the company will follow state law by setting aside appropriate levels of financial resources to cover any and all closure costs. PolyMet will help our nation meet the demand for the metals already in widespread, daily use. Many of these metals are essential for our national security. PolyMet will also proceed with this vital project in an environmentally responsible fashion not necessarily found in foreign mining and processing facilities. In addition, PolyMet will help diversify the economy of the iron ore-dependent Range, creating hundreds of jobs in the process. More than 300 construction workers will put in 1.5 million hours of labor constructing the \$600 million facility over two years. At full operations, PolyMet will employ 400 people earning an annual payroll of about \$40 million. Spin-off jobs in St. Louis County alone will amount to more than 500 and generate an economic impact of \$242 million. Over 100 years ago, Minnesotans began mining natural ore and then used ingenuity and determination to extend our mining and processing capabilities to include taconite. Responsible, non-ferrous mining represents the next chapter in the evolution of the Iron Range; it is time to begin this new era. Thank you for your consideration of these remarks. More than 300 construction workers will put in 1.5 million hours of labor constructing the \$600 million facility over two years. 257	As our country struggles to get out of this current economic recession it is exciting to hear about the new PolyMet facility. What does our economy need the most now - Jobs!. The new PolyMet facility will provide jobs and support for the local communities. My understanding is that PolyMet has addressed the issues of contaminations as well as what to do with the bi-products it develops. It sounds to me that Polymet is being a responsible corporate citizen. In good economic times as well as difficult economic times, corporation willing to invest in the US should be encouraged and supported. The sooner this plant is up and running the sooner people can get back to work to support their families and support their local communities.	EOO
3711	venture on the global market, rather than providing a steady supply of jobs. +PolyMet purchased the former LTV taconite crushing plant and tailings basin for its plant site, but the open pit strip mine would be located within 6,700 acres of public Superior National Forest land which is designated to be sold to PolyMet without environmental review. It is not appropriate to sell off a portion of the Superior National Forest for a marginal mining operation that has a high potential to cause long lasting damage to the environment. I am under the impression that our national forests are to be held in perpetuity on behalf of all the citizens of the United States. +Excess capacity at the	PD1

3797	Proposed sulfide mining in northern Minnesota in the Superior National Forest adjoining the Boundary Waters Canoe Area should be prohibited for the following reasons. +PolyMet is a Canadian company, so this mining project will not provide a domestic source of copper, nickel, cobalt, platinum, palladium, and gold. The metals will be further processed in Canada and sold on the global market. +The mineralization of northeast Minnesota is very low grade, containing approximately 8 pounds of copper and .01 ounces of precious metals per ton of waste rock. This will require energy and electricity to create enormous amounts of waste, making this a marginal mining	EOO,G1
3798	PolyMet processing facility would open the door for a sulfide mining district between the PolyMet site and the Boundary Waters Canoe Area Wilderness (BWCAW). +Acid mine drainage and toxic heavy metal leaching are byproducts of mining sulfide ores, requiring water treatment for centuries. PolyMet admits the mine would pollute ground water, but claims that any pollution would meet water quality drinking standards. Mining pollution also adds sulfates to watersheds, triggering the chemical reaction by which mercury becomes methylated, and bio-accumulates in fish tissues. +Since PolyMet's open pit would be within 20 miles of the BWCAW, haze and noise pollution would impact the wilderness.	G2C,G5,G7B
<b>Sender Last Name:</b> OConnell		<b>Submission ID:</b> 2860
10	ALTERNATIVES: In light of the possible millennial scale of acid mine drainage impacts, and the failure of previous mines to achieve adequate treatment (for example, 5,000 years of acidity and toxic dissolved metals in the Rio Tinto district in Spain where the river pH reaches as low as 2-2.5; the 2.37-2.57 pH and toxic dissolved metals in the abandoned open-pit mine called the Berkeley Pit in Butte, Montana; and the Wisconsin “ban” on future sulfide rock mines until they’re PROVEN safe), I find it hard to believe that Minnesota would even consider allowing any but the most stringent management and treatment of the reactive waste rock stockpiles and tailings basins. Those most environmentally protective options shouldn’t be “alternatives”, but part of the “proposed action”, including the “alternatives incorporating reasonable mitigation measures identified through comments received during the EIS scoping the DEIS comment periods”.	ALT9
11	“REASONABLE MITIGATION MEASURES”: Again, these shouldn’t be alternatives, but part of the “proposed action”. In fact, these seem barely adequate, if not actually inadequate. For example, it’s stated that if the tailings are “reactive”, then the storage cells “would possibly be lined”. Possibly? Even if they were lined, that wouldn’t guarantee no leakage if the linings are designed to standards such as the Minnesota Pollution Control Agency allows for some waste facilities, which may leak 500 gallons per acre per day. That’s a lot of leakage from a “lined” facility!	ALT9
12	Page 3-51 NO ACTION ALTERNATIVE: again, I agree with the Tribal comments – there are major environmental, social, and economic costs that would be avoided by NOT doing the project. The problem that I see is that the timescale for the benefits is short-term (20 years), while the costs are long-term (potentially thousands of years). Section 3.2 ALTERNATIVES: I’ve already stated that I believe that the MOST protective measures are what should be required.	ALT1
935	FOREST FRAGMENTATION: Open pit mining on formerly NFS land leads to further fragmentation of the forested lands and wetlands, causing changes such as: 1. Increases in the already extensive “edges” of forest habitat, and loss of deep forest habitats required by many species 2. Further interruptions in the limited north-south wildlife corridors within the Iron Range mining region	WI5,WE7
2732	MINE SITE PROCESS WATER (precipitation runoff & groundwater which has contacted disturbed surfaces) “Would be treated using a combination of membrane separation and chemical precipitation technologies at the WWTF”. Then details follow, including “Reuse...would eliminate the need to discharge any process water to surface waters.” That seems reasonable during the 20 years of operation, but what about the centuries after closure?	WR1A
2733	BASELINE ALUMINUM IN SURFACE WATERS: Yes, aluminum is already exceeding standards in the Partridge River. Do we want it to increase even more and interfere with fish gill functioning, etc,	WR3H

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
2734	TREATMENT OF STOCKPILE DRAINAGE: What if acidity is slow to develop and the WWTF is shut down too soon? Be sure to keep it operable and be sure water quality acidity and metal levels are acceptable at “compliance locations” for DECADES before eliminating the need for the WWTF (EPA’s 1994 study shows that pH decreased with time).	WR1C
2735	Page 4.1-5 and following pages GROUNDWATER: It is notoriously difficult to characterize the flow patterns and interconnectivity of groundwater, both between individual aquifers and with surface waters. The tribal comments raise significant issues that need to be addressed. Page 4.1-14 and following GROUNDWATER QUALITY & TAILINGS: Again, the Tribal comments raise pertinent issues, including limited monitoring not identifying a tailings basin groundwater plume, and difficulties drawing conclusions from very limited monitoring. Page 4.1-55 GROUND WATER AND TAILINGS AND RESIDUE CELL DRAINAGE: As described in the Tribal comments and as officially recognized in MPCA standards for liners: all liners leak. There will be seepage, yes, but will its chemical nature change with time? Yes, very likely, and not for the better. And will drainage end by year 34? What will happen if it continues longer – especially if long-term maintenance includes a pond on top? Page 4.1-67 WWTF, STOCKPILES, AND WEST PIT OVERFLOW: I’m happy to see that the WWTF is projected to operate at least until West Pit is projected to overflow in Year 65. But I wonder if West Pit might not end up like Berkeley Pit in Butte, Montana, where the pit water is extremely acidic, and part of the Superfund remedy there is a WWTF and a plan to keep the pit water level BELOW the overflow level, because it serves as the local ground water sink, keeping the contamination from spreading into the nearby river. Page 4.1-79 – 4.1-80 As the Tribal comment also points out (page 4.1-67), Table 4.1-45 predicts exceedances of some ground water evaluation criteria for up to 2,000 years (or perhaps more?), including antimony, sulfate, nickel, and manganese. Is this something Minnesota is happy to allow for 20 years worth of jobs? I’m also not happy to see that modeling does not include the metals which already exceed “Groundwater Evaluation Criteria” (as shown in Table 4.1-44). Although they already exceed the standards, what’s the future likely to hold? I would also like to see pH measurements included in your projections. While they are currently nearneutral or basic, will they stay that way? Page 4.1-90 This table only shows groundwater impact predictions to closure, not post-closure. This seems too limited a timeline, since acidity from oxidation will continue for many years post-closure. What are the predictions for year 34, 65, 2000? Page 4.1-95 TAILING SULFUR CONTENT: If the average tailings sulfur content is 0.13%, then some, as you say, will exceed the 0.14% threshold when acidic leachate production and increased metal mobility occurs. Your data, then, support that some acidification is likely to occur, and continue to occur for an extended period of time. Page 4.1-111 SURFACE WATER IMPACTS TO UPPER PARTRIDGE RIVER: Table 4.1-62 is misleading – it doesn’t state that this table is for impacts “for all mine years” (as mentioned on the previous page). What about post-closure years? Also, I would like to see pH predictions, in light of acid mine drainage. Page 4.1-114 WEST PIT WATER QUALITY, POST-CLOSURE: Those are high sulfate levels. What’s the projected pH of this pit’s water? Also, some of the exceedances could be a problem downstream if the water is used for drinking water (e.g., arsenic, shown at 198 ug/l, which has a drinking water standard of 10 ug/l). This may not be a problem now, but if the high levels continue for centuries and if more similar mines are permitted in the future, can we restrict drinking water use, or will communities need to pay the cost of future water treatment facilities which must treat for the arsenic levels caused by today’s business making a profit for 20 years? Page 4.1-128 MERCURY METHYLATION AND WEST PIT OVERFLOW: Another concern that may continue for millennia. Page 4.1-129 (and elsewhere) “ALL MINE YEARS”: I interpret “all mine years”, as found twice in Table 4.1-68, to mean that you only predicted for the 20 years of the mine’s life. That’s certain	EOO,RFI,WR1A,WR1E,WR
3161	SEVERED MINING RIGHTS & OPEN PIT MINING: I’m very concerned about the severed mining rights on private and federal lands, especially if that mining right allows open pit mining which permanently changes the character of the land – regardless of revegetation and restoration efforts after the completion of ore removal. The resulting hydrological changes in groundwater and surface water flows and impacts on the water quality are highly likely to cause significant impacts for wildlife and vegetation, especially in an area of sulfide ores which results in acidic mine drainage.	PD1,PD8,CR1

Comment ID	Comment Text	Theme Codes
3162	LAND EXCHANGE: Allowing a land exchange of private land for National Forest Service (NFS) land is a very bad precedent which threatens protection of all federally protected lands here and elsewhere, both now AND when future mining operations request the same opportunity. This is especially a concern for sites in close proximity to the Boundary Waters Canoe Area Wilderness. What's being requested here is like letting the "camel's nose into the tent". Can you stop it once you start it?	PD1,G9
3163	My question is – could treatment options such as those attempted at Dunka effectively operate at NorthMet (and potential future nonferrous mines) over a timeframe that could approach perpetuity? This is especially a concern when the company predicts a 20-year lifespan for the project, yet the environmental consequences may need to be prevented for orders of magnitude more years than that. Who will pay for those costs – a company that's no longer in business; a state that may have many other economic priorities; the NE Minnesota citizens who may or will lose the quality of their environment, the recreational options, and jobs; and/or the nonhuman organisms who no longer have viable habitats?	PD3,PD4,G1
3164	ORE vs. WASTE ROCK: Based on my rough-and-dirty calculations (below), apparently the final production of metals will be approximately 0.001% of the mined materials (based on calculations from the data reported here). Since the waste rock and tailings will be converted from its original solid material to fragments that take up more volume, that will be a huge amount of waste that will need to be stored, and much of it will be impacting the water quality in almost perpetuity.  • My calculations from information on this page of the DEIS:  o 228 Million tons over 20 years  o 91,200 tons/day of "rock"  o ~ 48,263 tons per year of metals = 132 tons/day  □ = 0.001% produced ore  o = 99.9% waste & tailings	PD2
3165	WASTE ROCK CATEGORIES: I understand the categories, and hope that they are indeed predictive of their chemical reactivity. I do notice, however, that, although not all categories are likely to generate acid mine drainage, all categories are predicted to leach "metal concentrations in excess of anticipated water quality compliance levels" (pages 3-13 – 3-14). Will treatment and maintenance practices ensure that all surface and groundwater "compliance levels" will be met before leaving the property boundary - for perpetuity?	PD2,PD11
3166	ACID-PRODUCING SATURATED OVERBURDEN: It's stated that saturated overburden can be the equivalent of Category 4 waste rock. The treatment option (bottom of page) sounds like a "guess" and not a good alternative, and "process water...would be sent to the WWTF". Maybe that's fine while the WWTF is operating, but how long will that be happening? 65 years or potentially hundreds of years?	PD5,PD11
3167	WASTE ROCK STOCKPILES: The Category 1, Category 2, and Overburden stockpile doesn't have a geomembrane covering, meaning that infiltration will not be prevented – and all of those categories may leach metals and/or the overburden may also leach acids. Again, if the WWTF is to treat the collected leachate, how long will that continue – in perpetuity at the cost of the company?	PD5,PD11
3168	The "clear water" from the tailings basin which "would be re-circulated" – but likely some would remain; is it really just water? Also, the tailings are in the <120 micron size – great dust storm material if they should dry out, before or after closure.	G2B
3169	TAILINGS POND DAMS: Somehow, building tailings pond dams out of old tailings sounds like a recipe for subsequent failure, especially as the walls rise higher.	PD8

3170	LIMESTONE ON CATEGORY 4 SIDEWALLS: Are 4 inches of limestone enough to prevent oxidation in perpetuity? And how likely is it to stay put on a 3.5:1 slope?	PD2
3171	CLOSURE and "RECLAMATION": I agree with all of the tribal cooperating agency comments, especially regarding the need for full disclosure of financial assurance for post-closure costs and the need to recognize that full reclamation may be unachievable, since possibly perpetual maintenance may be required.	PD3,PD4
3209	I'm pleased to see that the MDNR has done quite a bit of research on the topic of treating acid waste (as I see cited on p 15-20 of <a href="http://files.dnr.state.mn.us/lands_minerals/reclamation/reclamation_publication_list.pdf">http://files.dnr.state.mn.us/lands_minerals/reclamation/reclamation_publication_list.pdf</a> , but I don't have the time to obtain and read these documents) including dry covers, subaqueous disposal/wetlands on tailings, mixing alkaline solids and limestone beds (even more materials stored on site and very costly to import those huge amounts), microencapsulation, sulfate reduction (all using sulfate-reducing bacteria?), trace metal sequestration/removal by peat etc. I particularly found the title of P. Eger's 2007 paper interesting but disturbing – "Solving Mine Drainage Problems at Soudan State Park – One Step Forward, Two Steps Back", a location which I hadn't realized even had acid mine drainage – but its title and recent date implies that the DNR doesn't yet have a solution to the problem of acid mine drainage. That doesn't bode well for approving this project, which is just the tip of the future iceberg of nonferrous mines in Minnesota? Although I wasn't aware of the Soudan Mine issues, I was aware that the Dunka Mine had acid mine drainage problems, and that the latter has received attention from both the MDNR and the U.S. EPA (see EPA's Office of Solid Waste's "Technical Document: Acid Mine Drainage Prediction", EPA539-R-94-036, NTIS PB94-201829, December 1994, at <a href="http://www.epa.gov/waste/nonhaz/industrial/special/mining/techdocs/amd.pdf">http://www.epa.gov/waste/nonhaz/industrial/special/mining/techdocs/amd.pdf</a> ). The EPA reports states that "Since these waste rock stockpiles were constructed in 1976, monitoring of drainage from the piles has revealed a decrease in pH levels, as well as an increase in trace metal concentrations...during sampling...pH values as low as 5.0 in Seep 1 were reported." Laboratory studies found that "drainage pH decreased as the sulfur content of the sample increased. Drainage pH also decreased as the experiment time increased." And "concluded that small particles (<2.0 mm) have a large influence on field stockpile drainage quality." Sampling of a receiving water of the mine's waste rock pile seepage (Bob Bay of Birch Lake) found elevated levels of copper, nickel, cobalt, and zinc. Treatment methods to be studied included "pile capping/channeling to limit infiltration, active treatment in a neutralization pond to lower pH and remove metals, and use of artificial wetlands to remove metals. The ultimate goal was a passive treatment system that would require little or no maintenance (U.S. EPA 1992d)."	G7A
3210	I agree with the footnote comments of the tribal cooperating agencies.	G14

1278	I'm sorry to say that any mining in any shape or form causes problems to land, water, environment, people and our future way of life.	EOO
<b>Sender Last Name:</b> Odendahl		<b>Submission ID:</b> 3527
3256	the potential harm to water quality and harm to and loss of wetlands. More and more, we are beginning to recognize the precious value of our water resource here in Minnesota. The DEIS addresses this issue, but does not provide adequate assurances that our water resources will be protected. The loss of wetlands is also problematic. Wetlands are a tremendously undervalued resource. Again, the DEIS addresses this issue, but doesn't provide an adequate offsetting mitigating value. Among other concerns, my most significant concern relates to the potential economic impact on taxpayers of Minnesota should environmental damage occur and Polymet be unable to take adequate corrective measures, whether because of the extent of the damage or the inadequacy of the company's finances. In summary, the DEIS is disappointingly inadequate for a project with so much potential for environmental degradation.	WR3I,WR3N,WE3,PD2

1121	The DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. Ultimately this will end up in Lake Superior. As a major source of fresh water for Minnesota and the other states surrounding it, Lake Superior should be protected from sulfide pollution.	WR3A,FM1
2278	The blasting particles from the open pit mining, the dust from the trucks transporting rock to the processing area, and the waste rock will all contain high sulfate concentrations. Rain and snow will cause the sulfate to enter and pollute the ground water, and eventually reach the Embarrass River	G2B,G7A
<b>Sender Last Name:</b> OHara		<b>Submission ID:</b> 1089
1193	This is a well planned and scutinized project that should go forward. It will be good for Northeastern Minnesota and allow us to provide these minerals sourced in-the US instead of importing more goods. It will not only provide jobs lo'cally but the number of suppliers will multiply the economic benifitsthroughout the state and more. Lets not, let foreign countries have the upperhand anymore.	EOO
<b>Sender Last Name:</b> Oja		<b>Submission ID:</b> 2238
2644	I have lived in northern Minnesota most of my life and enjoy the outdoors and also the ability to live here because I have been able to find employment. I am concerned about the area I live in from both an economic and environmental standpoint. The Polymet project will contribute to the state and local economy when northern MN as well as the United States need the jobs and the economic benefit. As a person who lives in northern Minnesota, I understand the need to balance the use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project. I work for a company that relies on the northern Minnesota mining industry and this project will help our company to survive and hopefully grow which will mean we will be able to hire additional employees. With this I wholeheartedly support the Polymet project.	EOO
<b>Sender Last Name:</b> Ojard		<b>Submission ID:</b> 292
306	I am writing this letter in support ofPolymet Mining and their proposed project in Northern Minnesota. As a Minnesota resident the environment is of great concern to me as it is to all residents. I am convinced that this project will not only provide a great boost to our northern economy, but will do so in an environmentally safe manner. The conclusions of the Draft EIS confirm that this project has been designed to minimize environmental effects, not only through our designs but through the reuse of a brownfield site and the reuse of existing processing facilities. As part of the design team that has assisted Polymet in the evaluation and design of the proposed mine and processing facilities, I can honestly say that Polymet has always had environmental stewardship as the guiding principal for our designs. We were always directed to make design choices that limited the impact on the environment even if the choice resulted in significant increases in cost. Thank you for the opportunity to express my support ofPolymet Mining and for this well done and thorough EIS.	EOO

318	I am writing in support of the Polymet project planned for Hoyt Lakes. The Polymet project will provide a positive impact on the entire region and provides benefit to the entire state and national economy. Additionally, by utilizing a former mining property and state-of-the art process and environmental controls, the ecological impacts will be significantly better than the development of a similar project on any site, anywhere. The United States and World require metals to manufacture virtually every product that society uses. If we in Minnesota cannot support and develop this project, the resources will be provided in other areas without the controls and protection measures our regulations require. As a community we have asked that Polymet follow the regulatory process, study their resource development and implement controls to minimize environmental impacts from the start of production through the mine closure. This process has taken years and has been thoroughly reviewed by experts in Professional practice and the Regulatory agencies. It is time to approve this project and move forward toward the future of the Iron Range. The Northland wants and needs this project. As a business professional and resident of Northern Minnesota, I offer my support for the approval of Polymet's development and hope to see a rapid resolution to the review process.	EOO,G1
326	On behalf of the Duluth Seaway Port Authority, I am pleased to write in support of Poly Met Mining's non-ferrous mining and processing facility proposed for Hoyt Lakes. The draft Environmental Impact Statement clearly reflects the years of study and research behind the project and equally clearly demonstrates the reasons why the project should move forward. The Duluth Port is a hub of transportation activity - receiving cargoes from other states and countries and sending cargoes off to other destinations. Because shipping can move large amounts of freight with the minimum of energy required, the port also serves as a model for environmental sustainability; shipping sends far fewer greenhouse gas emissions into the global pool than many other modes of transportation. The PolyMet project offers similar benefits to the environment. Metals critical for our domestic consumption and security will be mined locally-. following very strict regulations that will protect not only our water, land and air but also the air of other locales. PolyMet will mine and process this material with a bare minimum of greenhouse gas emissions and will save greenhouse gas emissions because it will be closer to ultimate domestic consumers. PolyMet's model is a vast improvement over current practices for obtaining these metals for domestic use-mine the ore in a country that may not have any environmental egulations, transport it to yet another country for processing that might not be regulated strictly and then transport it-once again-as a finished product to U.S. manufacturers. PolyMet offers a better way. Finally, the Duluth Seaway Port Authority is charged to support and enhance the economic development of Northeastern Minnesota. The PolyMet project offers us the opportunity to help meet our mission - sound economic development - while protecting the environment. Thank you for the opportunity to support the PolyMet project and to support an adequacy determination for the draft EIS.	EOO,G2

21	My name is Hans Olsen, I'm from Ely, Minnesota, and I read the summary EIS and in there it says that there's considerable uncertainty about the water impact, and then there was some discussion about various ways to mitigate the impact. And that caused me to think that since there is some uncertainty about the environmental impact of this project, perhaps there should be some uncertainty about the executive bonus compensation for the folks who run PolyMet. And so I'll offer this specific suggestion: The executives, the top five executives at PolyMet, agree to escrow their entire bonuses for the first five years of the project, with the understanding that if all of their rosy environmental assessments turn out to be true, the State of Minnesota will match their bonuses, essentially doubling their compensation and giving them a big reward for being right. But on the other hand, if it turns out that they're wrong and the environmental impact, in fact, is severely adverse and there's a lot of cleanup that has to be done, that they agree to forego their bonuses. That's my suggestion. I think it's actually a pretty reasonable one, and if you don't like that one, I think I ask that everyone involved here, Governor Pawlenty and so on, all consider how they can incent the industry to do this in an environmentally friendly way. They're going to get plenty of incentive compensation for selling the end product of the mine. It would be nice if they could also get some incentive compensation for doing it in a way that's severely adverse and there's a lot of cleanup that has to be done, that they agree to forego their bonuses. That's my suggestion. I think it's actually a pretty reasonable one, and if you don't like that one, I think I ask that everyone involved here, Governor Pawlenty and so on, all consider how they can incent the industry to do this in an environmentally friendly way. They're going to get plenty of incentive compensation for selling the end product of the mine. It would be nice if they could also get some incentive compensation for doing it in a way that's friendly to the environment. And that's my suggestion. Thank you very much.	EOO

2458	The value to the economy of sulfide mining is not sufficient to cover the environmental risks.	G2
2571	I am writing to you about the proposed PolyMet sulfide mining project. In other locations, sulfide mining has resulted in acid mine drainage, causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. The PolyMet project in Minnesota is predicted to degrade water quality, increase mercury in fish, destroy wetlands and peat bogs, fragment the habitat of endangered species, and interfere with tribal treaty rights and tribal resources, like wild rice. The project also could increase air pollution that results in regional haze and could create a risk of perpetual pollution without adequate financial assurance that the public won't end up paying the costs. Both, the Tribal agencies and the United States Environmental Protection Agency have pointed out serious inadequacies in the PolyMet/NorthMet Draft environmental impact statement (EIS). I am very concerned about the possible irreversible damage this type of mining may cause in this sensitive area. From what I understand mines of this nature have in the past been given the go ahead with assurances from the mine operators that no damage will be done only to discover after the fact that safety measures were inadequate. This area deserves an absolute guarantee that the impacts will be what the mining industry says and assurances that funds for cleanup are in place when things go wrong. Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State the Lake Superior basin.	G2B,G2C,G3A,G4A,G7A,G
2997	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. Prove that it is safe before going forward.	G2,G6
3646	Honestly the average person does not really care about the Environment. So think of it from an Economic perspective. The mine's will produce \$x in 20 years but then think of the amount of money lost in the local economies during + after the mine closes x the amount We, the tax payers, will have to pay to clean up the pollution over 60 years (not an actual statistic just a guess). Is it really economically beneficial?	G1

42	Further, the PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district.	WI1,SE4
1315	It is also my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in longlasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	WR2D,GT2
1943	Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for postclosure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone. In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents.	EOO,WR3I,PD4,FM1,FM4

2760	I have spent a lot of time over the past 40 years trying to improve the water quality of Lake Superior. The Polymet project, I believe, presents a definite threat to our great lake. The headwaters of the St. Louis River are currently being contaminated by leakage from the old Erie Mining tailings disposal area. Additional runoff from sulfide mining operations into public waters will create additional problems. Is there a sulfide mining operation anywhere that has not caused environmental degradation? Please do not let economic concerns override environmental protection. For our sake, as well as future generations, I sincerely request that a MPCA to Polymet, if offered, be the most restrictive, comprehensive, and environmentally sound possible.	EOO

1914	The mine's tailings basin will also produce discharges high in sulfate concentrations, which will turn mercury into methylmercury, making fish dangerous to consume.	WR4B,FM1
3158	Water quality concerns have not been adequately addressed in the PolyMet project's DEIS. Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years.	EOO
3577	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. I am adamantly opposed to this type of mining in the state of Minnesota. We Minnesotans recently passed the Legacy Amendment which provides funding for clean water programs and the preservation of our natural landscape. It would be a crime to allow this kind of mining in our state and then have to use these funds to clean up its resulting contamination. Consider the state of Montana and how much it has had to spend cleaning up after the mining operations there. Montana taxpayer had to pay millions of dollars (and are still doing so) to clean up the messes that mining companies like PolyMet made. These companies extract and profit from our resources and then leave the burden of cleanup on the state. Although this mine may give short-term economic benefit to the region, its likely long-term environmental and economic harm is not worth those short-term benefits.	EOO,G2,G4A,G7
3614	What's more, PolyMet has not provided proof of adequate financial resources for post-mining cleanup. As I taxpayer, I DO NOT want to pay for the damage that this company will likely do to my state.	PD4
<b>Sender Last Name:</b>	Palcich	<b>Submission ID:</b> 3675
1	4.4-136—"Reservations existed about relying on just the low and average liner leakage rates for groundwater quality predictions, as it may not fully account for the essentially permanent use of the liner (e.g., liner degradation over time, differential settlement, and accidental tears during waste rock placement)." Explain which liners would be able to be replaced in five years time, or as needed.	WR2D
1	4.1-3—"The deposit consists of disseminated copper-nickel-iron sulfides, with minor local massive sulfides..." Based upon this and PolyMet investor reports, there is potential for further or deeper mining at the site. This information needs to be explained to the public, not buried in agency terminology. The potential for expansion of mining at the PolyMet site needs to be addressed as a potential further impact on the environment.	WR1E
2	4.1.4-4.18—What conclusions are drawn from all of these numbers? What are the cumulative impacts on our health? How do the concentrations of these metals and parameters affect fish populations, wild rice, birds, and wildlife? Some statements from the DEIS that concern me: "Limited water quality data are available from these four new wells." (4.1-11) "It is difficult to discern to what extent these reductions are simply attributable to the effects of dilution." (4.1-14) My conclusion is that water in the Embarrass and Partridge Rivers is already contaminated with mining pollution. PolyMet mining would obviously add to this load. The full impacts of this are not addressed in the DEIS. This study is incomplete. Production at the Mesabi Nugget plant must also be factored in to any of these numbers.	WR5C

6	<p>As discussed on Page 4.2-28 of the DEIS, the wetland mitigation planning process relied on the WCA wetland replacement siting rules (Minnesota Rules part 8420.0522), state compensatory mitigation requirements under state water quality standards (Minnesota Rules part 7050.0186), and the USACE St. Paul District Policy for Wetland Compensatory Mitigation in Minnesota (2009), which prioritizes the location of project specific compensation to first replace lost wetlands on-site, then within the same watershed or county, and finally within adjacent watersheds. The primary goal of wetland mitigation is to restore high quality wetland communities of the same type, quality, function, and value as those to be impacted to the extent practicable. The purpose of the passive wetland system that may need to be created between the West Pit outlet and the Dunka Road is to remove metals from discharge water. Because this wetland system is a treatment system it will not officially count toward the wetland mitigation required for the NorthMet Project. However, this passive wetland system would still be a functioning wetland created on the Project property, a highly preferred location for wetland restoration. Natural wetlands produce methylmercury and a constructed wetland will also produce methylmercury. The DEIS text suggests that a passive wetland treatment system “could promote mercury methylation, depending on the mercury and sulfate concentrations in the effluent”. It is not clear whether the word “promote” means that methylation of mercury will occur, or if mercury methylation will be elevated above some background level. If there is a concern that a constructed wetland have enhanced or elevated mercury methylation compared to the functioning of a natural wetland in a non-mining area (i.e., a background wetland), the available field research data indicates that it is unlikely for this to occur. Monson (2007) evaluated a number of constructed stormwater wetlands in an urban area and found that the combined results for all sites indicated that constructed wetlands have methylmercury concentrations similar to natural wetlands receiving agricultural runoff. Monson (2007) also found that the stormwater wetlands were similar to biomonitoring wetlands in regard to methylation efficiency (as measured by %MeHg). Sulfate concentrations in the constructed wetlands ranged from a low of 0.5 mg/L (similar to current background concentrations) to as high as 87 mg/L (considered to be elevated concentrations), but sulfate was not correlated with methylmercury concentrations or methylation efficiency (the percent of mercury that is methylmercury, %MeHg). Preliminary data from PolyMet’s 2009 Sulfate and Methylmercury Investigation indicates that elevated sulfate in water that seeps into wetlands north/northwest of the Tailings Basin does not result in elevated methylmercury concentrations in the streams that drain those wetlands. In other words, methylmercury concentrations in streams draining wetlands that receive elevated sulfate from the Tailings Basin are similar to methylmercury concentrations in streams draining background wetlands with low sulfate concentrations. Similar to the findings of Berndt and Bavin (2009) for the St. Louis River and its tributaries and to a previous review of sulfate and methylmercury data for a number of streams on or near the Iron Range (Barr Engineering Technical Memorandum, 2008), the preliminary results from PolyMet’s 2009 Investigation indicate that sulfate concentration is not correlated with methylmercury concentration and some of the highest methylmercury concentrations were found in streams that drain background wetlands. Based on the available field research data it is unlikely that a passive wetland treatment system would have higher methylmercury concentrations or a greater efficiency of methylation (expressed as %MeHg) than a background wetland or a stormwater wetland in an urban area. Therefore, any decision regard</p>	EOO,WR4B

7	<p>Exceedence of a Guideline Risk Value The Tribal cooperating agencies state that they want all of the estimated potential human health risks to be below the MDH guidelines at the time an air permit is issued to PolyMet. This stated preference is inconsistent with state and federal risk assessment guidance and misinterprets the incremental risk estimates. Incremental risk guideline values are not “standards” and are not applied in the same manner as ambient air standards. The exceedence of incremental risk guideline values (cancer, 1E-05; noncancer, 1.0) does not indicate that adverse impacts are expected to occur. Rather, the real consequence of an exceedence of a guideline value is to focus attention on risk driver pollutants with regard to the factors that are contributing to the risk estimates (e.g., data used to estimate air emissions, variability in toxicity values) and identifying the conservatism in the analysis. A discussion on the conservatism in the risk estimates is provided in RS38B (AERA – Mine Site, Sections 3, 4.2, 4.4). For example, a primary source of conservatism in the risk analysis is the Maximum Exposed Individual concept that assumes continuous outdoor exposure (24 hours per day, 365 days per year) for a 70-year lifetime. Potential actual exposure would be a factor of 10 or more lower than that assumed for the MEI receptors. As another example, discussed in RS38B, the cancer risk drivers (dioxin/furan and PAH emissions) are associated with diesel truck emissions, and as the Mine Site AERA stated, “[t]he emission factors were developed on diesel fuel formulations in the mid-1990s. Diesel fuel formulations have changed since that time period to make the fuel burn cleaner. The available emission factors are considered conservative and do not reflect the current cleaner burning diesel fuel formulations.” More recent data from the European Union (UNEP Standardized Toolkit for Identification and Quantification of Dioxin and Furan Releases, 2005) reports an emission factor for dioxins that is 18.5 times lower than the one used in these calculations (UNEP factor = <math>7.13 \times 10^{-13}</math> lb/gal; factor from U.S. studies = <math>1.32 \times 10^{-11}</math> lb/gal). An alternative emission factor that is 18.5 times lower than the factor used in the initial emission estimates and risk estimates would result in much lower estimates of potential dioxin/furan risks. Additionally, the risk estimates reported in RS38B were calculated using the toxicity values preferred by the MPCA and MDH. An alternative toxicity value for dioxins/furans is available from the California EPA that is an order of magnitude lower (i.e., less toxic) than the value preferred by the MDH. When this alternative toxicity value is used to estimate potential risks from dioxins/furans, the incremental cancer risk for a farmer receptor decreases proportionally. In the case of the farmer receptor evaluated at the Mining/Industrial District boundary, the use of the California EPA toxicity value for dioxins/furans would decrease risk below 1E-05. In summary, risk guidelines are not bright lines that indicate a health risk problem if they are exceeded. Rather, risk guidelines indicate the need for further evaluation of the inputs to the risk assessment (e.g., emissions estimates, toxicity values, exposure assumptions, etc.). When the conservatism in the risk estimates is taken into account (e.g., MEI concept), adverse impacts to human health are not expected to be associated with emissions from the Mine Site. Therefore, even when the maximum hypothetical farmer incremental cancer risk is estimated to be slightly above the MDH guideline value of 1E-05, the conservatism in the analysis and the knowledge that the use of acceptable alternative values results in much lower risk allows for a reasonable conclusion that risks are acceptable.</p>	EOO

7 Potential Farmer Risk The Mine Site Air Emissions Risk Analysis (AERA) (RS38B) is a screening-level risk analysis conducted with conservative parameters that estimate an upper bound on the level of potential risk at a particular location. The emphasis of an AERA is to estimate potential risk for hypothetical receptors and to be conservative and protective of public health. It is also recognized by federal and state agencies that actual risk to actual receptors can be many times lower (i.e., one to several orders of magnitude lower) than the potential risks estimated for a Maximum Exposed Individual (MEI). The Minnesota Department of Health (MDH) policy is that an incremental cancer risk guideline value of  $1 \text{ E-}5$  be used as a point of comparison to incremental cancer risks estimated for human health risk assessments conducted in Minnesota. As stated in the DEIS, the estimated potential incremental cancer risk for a hypothetical farmer receptor at the Mining/Industrial District Boundary is  $3\text{E-}05$  and exceeds the MDH guideline of  $1\text{E-}05$ . This hypothetical farmer receptor is approximately 2.5 kilometers southeast of the Mine Site emission sources (RS38B; Figure 3-1, Receptor Grid; Figure 3-2, Zoning Districts Boundary). Dispersion modeling conducted for the NorthMet Project Mine Site and for numerous other facilities in “flat terrain” and rural locations indicates that air concentrations decrease with distance from emission sources. As an example, the maximum modeled annual average PM10 concentration in the city of Babbitt (~ 8 kilometers north of the Mine Site property boundary) is two orders of magnitude lower than the maximum concentrations modeled at the PolyMet ownership boundary (near the northeastern corner of the site). Therefore, a receptor that is 6.5 miles (10.8 kilometers) to the north of the Mine Site sources will have lower modeled air concentrations and lower potential human health risks than a receptor located closer to the Mine Site emission sources. The probability that a farmer receptor located 10.8 kilometers from the facility would have higher modeled air concentrations and a higher potential risk than a farmer receptor located 2.5 kilometers to the southeast the Mine Site sources is essentially zero. Because air concentrations decrease with distance from the Mine Site, and because potential risk estimates for the hypothetical farmer are based on maximum modeled air concentrations at the Mining/Industrial District Boundary (a distance of about 2.5 kilometers from the Mine Site sources), scaling of risk with distance can be used to estimate potential farmer risks at some other distance. In this case, using the estimated risk of  $3\text{E-}05$  for a hypothetical farmer receptor 2.5 kilometers from the Mine Site sources, the potential incremental farmer cancer risk at 10.8 kilometers from the facility is estimated to be a factor of 4 lower, approximately  $7\text{E-}06$ . This potential incremental farmer cancer risk of  $7\text{E-}06$  at 10.8 kilometers from the Mine Site is below the MDH guideline value of  $1\text{E-}05$ . Based on the PM10 modeling results that show the concentrations in Babbitt to be 2 orders of magnitude lower than at the Mine Site ownership boundary, it is likely that potential cancer risk to a farmer located 10.8 kilometers north of the Mine Site would be lower than  $7\text{E-}06$ , possibly one to two orders of magnitude lower. However, the potential incremental farmer cancer risk for a receptor 10.8 kilometers to the north of the facility cannot be any higher than that estimated for the farmer receptor 2.5 kilometers from the facility,  $3\text{E-}05$ .

8	Some portion of future emissions from this project may be impacted by greenhouse gas (GHG) emission caps and rules implemented under the Midwest Greenhouse Gas Reduction Accord (the Accord). The Project emissions, however, do not influence baseline emission levels or greenhouse gas emissions reduction recommendations proposed under the Accord. The Accord, as the Advisory Group Draft Final Recommendations outline, is based on reductions normalized to a 2005 emissions baseline. As an example, the 2020 target aims to attain carbon dioxide emission reductions of 20% below the 2005 emissions baseline. Because the Project is not part of this baseline, it should not directly or indirectly affect reduction goals defined in reference to this baseline. The mechanism of emission reduction rests on annual allowance distributions (part-auction, part-allocation based on present industry sector emissions), coupled with a cap-and-trade system. As such, this Project has little effect on the Accord other than to potentially increase the industrial sector emissions in the near future, possibly creating an incentive for more allocated allowances to this sector than would happen in the absence of the project. (This increase would only happen if the absolute number of allocations were determined in the time period when the Project was operational, which is not certain.) As time goes on, the number of GHG emission allowances given out and auctioned off will decrease in line with the reduction goal. This goal will not be directly impacted by the Project but will be decided through a negotiated inter-state political process. In the case that the system described in the Accord comes to be the mechanism for GHG emission reduction, PolyMet will have to pay for allowances like every other covered business. In summary, the Project (1) will not affect the emissions baseline; (2) may have a minor effect on the proportion of allowances given to the industrial sector; (3) will not affect the setting of emission goals; and (4) PolyMet will have to obtain allowances like every other covered business.	EOO
9	This footnote does not accurately reflect information provided by PolyMet as stated in PolyMet’s Supplemental NorthMet Project Description – Summary dated July 13, 2007. That document clearly states that this mode of operation would provide significant operating flexibility during changing market conditions and during periods of mandated power usage reductions (as well as during construction/commissioning and maintenance of the Hydrometallurgical Plant). Please see page 2 Of 6 of Supplemental Project Description Summary which describes the benefits of the concentrate mode including: More options will be available to deal with changing market conditions. At metal prices in the expected range, producing the higher value Hydrometallurgical Plant products is more desirable. But unexpected combinations of metal prices, shipping costs or customer situations could result in a circumstance wherein producing a ‘copper’ and ‘nickel’ concentrate may be more desirable. The option to reduce total electrical power load and still produce the ‘copper’ and ‘nickel’ concentrate product will provide the flexibility in managing product mix and power consumption during extended peak power situations and periods of mandated power usage reductions.	EOO
10	4.1-137—“It should be noted that aluminum, beryllium, iron, manganese, and thallium exceeded the groundwater evaluation criteria in the model; however, this was due to high baseline concentrations that were not attributable to the Project and these solutes were not carried forward for detailed transient flow modeling.” If the modeling was not attributable to the Project, what is the significance of the modeling? Explain where these pollutants come from—naturally occurring, from the LTVSMC tailings basin, or from other what other source—and what studies were used to make this determination. Does this statement mean that PolyMet’s mining proposal would add to contaminants that already have high concentrations in the water?	WR4C
11	4.1-143—“The deterministic modeling results suggest that three parameters (i.e., arsenic, cobalt, and selenium) could exceed surface water standards, in addition to relatively high sulfate concentrations. The Uncertainty Analysis for the Proposed Action suggests that copper and nickel could be underestimated by the deterministic modeling.” What are the cumulative effects of these water quality exceedances? How is the uncertainty going to be addressed? The EIS process must include the cumulative impacts of the metals and parameters that are listed within the DEIS.	WR5A

Comment ID	Comment Text	Theme Codes
12	4.1-143—"The deterministic modeling results suggest that three parameters (i.e., arsenic, cobalt, and selenium) could exceed surface water standards, in addition to relatively high sulfate concentrations. The Uncertainty Analysis for the Proposed Action suggests that copper and nickel could be underestimated by the deterministic modeling." What are the cumulative effects of these water quality exceedances? How is the uncertainty going to be addressed? The EIS process must include the cumulative impacts of the metals and parameters that are listed within the DEIS.	WR5A
13	4.4-9—"Consultation between the USACE and the USFS regarding the potential effects on federally – listed species is currently ongoing." Will this go on until those species are extinct? Explain the parameters of ongoing.	AQ6
14	4.4-10—"The Project would generate approximately 970 (948 vehicle and 22 rail) trips per day, totaling about 3,989 miles, between the Mine and Plant Sites. ..An additional 3,930 miles per day of vehicular traffic are expected within the Mine Site itself, primarily to haul ore to rail siding and waste rock to the stockpiles." Are these miles included in both carbon and particulate emissions for the mining operation? What is the economic liability of so heavily relying on equipment that uses expensive fuels while emitting pollutants that contribute to global warming and haze? These issues need to be addressed. The weather patterns being exhibited while this DEIS is going through the comment process indicate that global warming (rain and ice in northern Minnesota in January) or some large kind of global change 9 is in progress. The mining of low grade ores (less than 1%) as assayed by PolyMet exploratory drilling, which literally means mining 99% waste rock, puts this project at particularly high risk to fail in the economic market place. The use of large amounts of expensive, carbon producing fuels will be another liability. Please address this under socioeconomic impacts.	AQ3,AQ4,EOO,AQ4
15	4.6-7—"Due to the remote location of the Project, compliance can be demonstrated with a pollution control equipment efficiency of 85%." Ouch! Because metallic sulfide mining would take place in a fairly remote area, we can pollute that area to be in compliance with the rest of our polluted air (Minnesota rules 7011.0710)? The PolyMet EIS process must explain who is responsible for the above rule, and why those who live in northeast Minnesota should accept the logic behind this rule.	EOO,AQ4
16	4.6-7—"Various state and federal air quality standards and emissions standards have been established to minimize degradation of air quality." The PolyMet EIS process must justify why it is worth degrading the air quality of the Arrowhead Region.	AQ4
17	4.6-10—"Small amounts of toxic emissions known as Hazardous Air Pollutants (HAP) are expected to occur throughout the Project." The PolyMet EIS process must spell out the health hazards of the cumulative impacts of HAP.	AQ6
18	The PolyMet DEIS begins with a quandary. The DEIS does not state where the third party processing would take place. However, the DEIS jumps to the conclusion that the "processed resources" would help meet domestic demand by sale to domestic markets. At the Aurora DEIS hearing, a company rep stated that all of the inquiries that he was receiving in regard to the metals were for possible shipment to China. Therefore the DEIS statement "The processed resources would help meet domestic and global demand by sale of these products to domestic and world markets" should read "The processed resources would help meet global demand by sale of these products to world markets, and domestic demand by the purchase of these metals in the world marketplace." This would mean that Minnesota metals which are mined by a Canadian company which has an agreement with an international company headquartered in Switzerland (Glencore) will become a domestic source only if someone in the U.S. buys that metal, or a product containing that metal , back from Canada or some other country. The use of the word "domestic" in the PolyMet DEIS creates a false need for the mining of these metals. This falsity needs to be corrected as above.	G9
19	4.6-11—"Ozone emissions were not modeled or analyzed for NAAQS due to the regional nature of ozone formation involving complex interaction of multi-pollutants." The PolyMet EIS must specify which pollutants are interacting within the region, and the possible health damages of a sulfide mining district, including PolyMet.	AQ4,AQ6

20	4.6-20—Sulfur and nitrogen deposition was analyzed for its impacts on the wilderness. This analysis is not complete by taking PolyMet as an isolated case. This analysis is totally without merit unless taken as part of a cumulative impact with Mesabi Nugget and the Peter Mitchell mine. The PolyMet DEIS is inadequate in portraying PolyMet as an isolated mine project. PolyMet is the first in line to get permitted for metallic sulfide mining, shares former taconite property with Mesabi Nugget, and borders the taconite mining band of minerals. To present this DEIS analysis in a way that narrows the potential impact of metallic sulfide mining in order to appease political appetite for industry and perceived economic benefit, discredits the entire regulatory process of the state of Minnesota.	AQ4B
21	4.6-27—“The MEI multi-pathway cancer risk estimated was estimated to be 3 E-5 for farmers using the Mining/Industrial District Boundary. This is above the MDH additional lifetime cancer risk guidance level of 1 E-5.” The PolyMet EIS process needs to explain how it would educate farmers about these risks. Who else might be exposed to carcinogenic pollutants as part of this mining project?	AQ6A
22	4.6-31—The EIS process must explain how the Barr Engineering CO2 sequestration loss figures were calculated.	AQ3
23	4.6-32—“However, while energy use is reduced by one-half, greenhouse gas emissions do not decline per unit of production from what would be expected...principally because of the large load of nonenergy process emissions associated with hydro processing.” How could a cap and trade policy or carbon tax affect the economic viability of this plant? Since this process is based upon a small pilot study done in Canada, what is the economic liability of this plant not operating in an economically efficient of a way as proposed? Give details. Consult with an independent economic analysis agency. Place these studies under socioeconomic impacts. The hydrometallurgical plant will take approximately two years to construct, once PolyMet or the company that buys PolyMet attracts enough investment money to begin such construction. PolyMet earlier asked for the option of hauling a bulk concentrate from the site, prior to plant construction. Where is this addressed in the DEIS? According to NEPA, all options need to be addressed. What is the economic liability of transporting bulk concentrate rather than semi-processed metals in hydroxide form? Why isn't the cost comparative stated in this DEIS? Give details. Would copper be able to be electroplated on site without going through the autoclave process? Explain. How would the acid mine drainage trail of railing and shipping bulk concentrate be addressed? Explain.	AQ3,AQ4
24	.6-33—What is the cost of using electric drills in comparison to diesel drills? How expensive are Gen- Set locomotives? How has access to the amount of electricity and natural gas required been determined and spelled out for the public, who will be impacted by increased costs of these sources of energy as the 11 demand for these sources of energy is multiplied exponentially if a new mining industry is allowed to start up? What guarantee is there that PolyMet would buy this more expensive electric equipment once the project has been permitted? Explain how the agencies can enforce using technology that emits the least amount of green house gases. Explain how the electric company would then absorb that portion of PolyMet's carbon impact.	AQ3
25	4.6-33—“This additional mitigation of wetland types other than Type 8 (open and coniferous bog) would contribute to compensating for the Project's impacts on Type 8 wetlands.” Which agency, and under what laws and rules was it determined that it is ok to lose open and coniferous bogs as long as they are replaced by other types of wetlands? How was it determined that wetland replacement for PolyMet could be made out of the county and out of the watershed? How will wetland mitigation in a different county compensate for carbon sequestration loss in St. Louis County? The PolyMet EIS process must explain how Minnesota laws are being followed, and how the mitigation plans will be of benefit to St. Louis County, especially in regard to climate change.	AQ3
26	4.7-1—“The region has traditionally supported various mining activities as well as logging on federal, state, county, industrial, and private forest lands..Review of aerial photography and public records indicate that there are few noise sensitive areas or receptors such as residences, campgrounds, and national wilderness areas within the Project vicinity.” What tests determined that noise won't be heard in the Boundary Waters 20 miles away? How do you determine effects of noise by sight rather than by sound (aerial photographs)? Show other studies that have used aerial photography to determine the effects of noise pollution and show data that indicates whether or not these studies were accurate indicators of the effects of noise on wilderness, tourism, workers, and wildlife. Was it determined that more noise is ok because there has traditionally been noise in the area? How does 24 hour a day noise affect the character of the land?	N1,N4,AQ4

26	S-9—"There is some uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard, but this impact could be mitigated if it would occur." The EIS process requires a plan that will allow the St. Louis River watershed to achieve mercury TMDL standards.	WR3I
26	4.10-2-4.10-4—Explain why the East Range cities are compared to the county and the state, rather than to the other Range cities. Comparing the Range to the State is comparing apples to oranges. When the whole county is included, that includes Duluth. Former mining towns should be compared with remaining mining towns in order to get a true comparison.	SE8
27	4.10-18—Public Finance Tax figures are misleading, because they don't account for swings in metal production. During the 34 years of my teaching career, the taconite industry suffered a major downturn in the 1980's, followed by major downsizing of the workforce. This was followed by a boom period during the 1st decade of 2000, culminating in the depression of 2008-9. School population continued to decline during the 34 years of my teaching career, even though the Virginia school district was surrounded by mining on 3 sides. Iron Range school districts continue to consolidate, even though taconite mining was at 90% full production prior to 2008. Mining has become machinery intensive. As the workforce declined, the socioeconomic gap among student families widened. My own experience as a classroom teacher confirms the conclusions of "Mining the Data: Analyzing the Economic Implications of Mining for Nonmetropolitan Regions" by William R. Freudenburg and Lisa J. Wilson: "...even when higher incomes are associated with mining, those incomes do not prove sufficient to alleviate the problems of poverty and unemployment so often associated with mining-dependent regions." ( <a href="http://f1.grp.yahooofs.com/v1/ENZkSxa3NFFHTojilcbN4n44UA58lcGsURC_p3AujquU40qIHZFjc7hqOYoi0nkIr3QSj_k-FyAj70YhttowcloYXFmy-6jbA/Freudenberg%20article.pdf">http://f1.grp.yahooofs.com/v1/ENZkSxa3NFFHTojilcbN4n44UA58lcGsURC_p3AujquU40qIHZFjc7hqOYoi0nkIr3QSj_k-FyAj70YhttowcloYXFmy-6jbA/Freudenberg%20article.pdf</a> ) (Paper copy included with mailed-in comments.)	SE3
28	4.10-27—"The beneficial effects include increased employment opportunities, a larger tax base, and increased county revenue from property taxes." County and state government continues to push for mining because of tax revenues and a tax base. From my experience as a classroom teacher, I would argue that the current mining economy of the Iron Range has created an entire layer of people receiving public assistance who choose to live here because the cost of living, especially housing, is cheaper. Fewer mine workers, due to more machinery, have left older housing on the market that is used for rental property. In the meantime, Range towns continue to dwindle in size and services, while local leaders have promoted big box stores and other highway sprawl marketing. Agency personnel who complete this part of the DEIS are no doubt isolated from the full view of the Iron Range socioeconomic structure. As a former classroom teacher, I am well aware of the Iron Range gap between the higher and lower income levels. I am well aware of this because during my own school days on the Iron Range, the majority of us were in the middle of a blue collar working class society. The middle no longer exists. In its place is a narrow top income layer and a wide bottom income layer. The opening of a metallic sulfide mining district is not the answer to economic woes. This is explained in the entry below: From Wikipedia, the free encyclopedia "The resource curse (also known as the paradox of plenty) refers to the paradox that countries and regions with an abundance of natural resources, specifically point-source non-renewable resources like minerals and fuels, tend to have less economic growth and worse development outcomes than countries with fewer natural resources. This is hypothesized to happen for many different reasons, including a decline in the competitiveness of other economic sectors (caused by appreciation of the real exchange rate as resource revenues enter an economy), volatility of revenues from the natural resource sector due to exposure to global commodity market swings, government mismanagement of resources, or weak, ineffectual, unstable or corrupt institutions (possibly due to the easily diverted actual or anticipated revenue stream from extractive activities)." The socioeconomic chapter must include an independent cost-benefit analysis that includes environmental, social, and governmental impact of metallic sulfide mining.	SE3

29	4.11-3—Explain how waste rock stockpiles (maximum height 320 feet) will not have a visual effect upon the project area. Explain how replacing 6,700 acres of Superior National Forest with open pits and waste rock piles will not impact the visual character of the Project Area. “The project would increase the scale of disturbance in the region; however, mining activity is a longestablished aspect of the Iron Range landscape and the addition of the proposed mining facilities would not introduce visual elements to surrounding viewpoints that are in stark contrast to the regional visual character.” The above statement is incorrect, and needs to be corrected. The sulfide mining district is not within the Iron Range. It borders the Iron Range, and PolyMet’s proposed mine would be situated within what is now Superior National Forest. The mine site would be situated approximately 20 miles from the BWCAW.	EOO
30	Any of the impacts stated within the DEIS are meaningless because of continued exploratory leasing, which would open up the entire Arrowhead to become a sulfide mining district. Exploration itself is playing havoc with wildlife habitat and water quality. An EIS must be completed on the mineralization of the entire Duluth Complex prior to the permitting of any one project. The agencies are knowingly misrepresenting metallic sulfide mining as individual operations rather than one complete district because that is the only way that sulfide mining can get permitted in the state. The overall impact of metallic sulfide mining would greatly exceed water and air quality standards and would not be acceptable due to its impact upon the Boundary Waters Canoe Area Wilderness. This is a travesty to the general public and to the integrity of this area for future generations	G8C
30	Chapter 5—Explain the rationale behind choosing to pollute the Partridge River rather than the Embarrass River.	RFI
31	Details of all sulfide mining exploration and findings must be presented to the public for comment as a complete sulfide mining district. Since the DNR Lands and Minerals Division has complete access to all records, the scope of mining exploration and the potential for opening other mines must be presented to the taxpayers who fund the DNR Lands and Minerals Divisions. The potential degradation of the Arrowhead Region, its waters, land, and air, and the extent of the Duluth Complex as it is being advertised as the largest body of mineralization in North America must be made known to the public. The public must be informed that 99% of this body of mineralization would be waste rock. The amount of waste rock that would be generated must be presented to the public in a way that they can comprehend, because it would be enormous. The demand for these metals must be put in the context of worldwide demand, as none of these companies are American companies and none of the metals mined would be considered a domestic source or supply. This must be clearly stated within the EIS process under socioeconomic impacts. It must be made known to the public that the profit figures advertised in regard to mining the entire Duluth Complex are figures that would go to foreign companies and whomever their investors might be, ultimately leaving the Arrowhead Region devoid of minerals, forests, wetlands, wildlife, clean water, and jobs.	G8
32	The USFS must also explain the land exchange process that is taking place in order to comply with PolyMet’s request to mine in Superior National Forest. This is public land, and the land exchange process requires public input according to law. Since the USFS was remiss in completing an EIS on lands within the mining exploration zone, then the PolyMet DEIS must incorporate this environmental review into its process. This process cannot rely on legislation that the USFS and PolyMet have requested U.S. Rep. James Oberstar and U.S. Senator Amy Klobuchar to introduce. Such legislation would bypass public input on public lands, would exclude federal laws protecting threatened and endangered species, would bypass 100 years of federal law by which land was added to Superior National Forest with the intention of protecting the watersheds, and would exclude tribal rights. It is unfair of our state and federal agencies to ask our federal legislators to introduce legislation that is highly unethical.	PD1
33	S-11 under Cumulative Effects—“General increase in air emissions, however, no significant effect on regional air quality.” The EIS process needs to give a qualitative definition for significant and a description of air without emissions.	AQ4
34	This mine plan is based upon the plans of current taconite mines, which we know are leaching metals and contaminants into our groundwater, and polluting our air. This DEIS does not explain how PolyMet’s new, cutting edge, next generation technology, as advertised on radio, protects our environment.	PD8

Comment ID	Comment Text	Theme Codes
35	This DEIS does not address health concerns of cumulative impacts regarding the following: flocculent chemicals, hydrometallurgical chemicals, water treatment chemicals, and toxic heavy metals. The cumulative effects need to include contaminants already in the Partridge and Embarrass Rivers, along with potential new contaminants from PolyMet, and from Mesabi Nugget which shares the LTV site with PolyMet. Synergistic effects must be included. Any hormone disrupters must also be singled out.	CR1
36	The DEIS lacks a separate chapter for politicians, who have backed the opening of a metallic sulfide mining district in Minnesota without knowledge of the science behind the mining and the pollution. Politicians, as well as average citizens, do not have the time to make their way through the PolyMet DEIS. Our local politicians have stated over and over again that they are relying on the agency process to make sure that this mining is done right. The agencies, assisted by independent, non-conflicted review, need to spell out for the politicians the pros and cons of mining low grade sulfide ores in northeast Minnesota's water rich environment and also where the responsibility for polluting the Arrowhead Region of Minnesota will lie.	EOO
36	The PolyMet DEIS shows that PolyMet will pollute the watershed, we just don't know exactly how much. There is nothing in this DEIS that shows how that pollution can be stopped—only mitigated to some extent. There is no way to enforce any treatment. The process is open ended, especially closure plans, depending on what actually happens on the ground rather than on charts. The DEIS is inadequate without a chapter that summarizes the extent and kinds of pollution that can be expected and how to address them.	WR1E
37	This DEIS is neither adequate nor complete. This DEIS process needs to be halted for the public good, based upon the fact that the permitting of PolyMet would indicate regulatory agency approval for the opening of a sulfide mining district in the Arrowhead Region of northeast Minnesota.	G8
37	There is little evidence that PolyMet has the finances to actually complete its mining plan, let alone clean up the pollution that the DEIS suggests will occur. This DEIS does not set forth responsibility for clean-up of acid mine drainage that would be passed from company to company, from agency to agency, from generation to generation.	G4A
38	S-11—"If water quality monitoring demonstrated the need, treatment of the pumped seepage could be provided prior to discharge to the Partridge River." What would the treatment consist of and what impacts might the treatment itself have upon the water quality? Who does the monitoring, how often would the monitoring be done, and how would treatment be monitored? How would clean-up be enforced? Explain.	WR1A,WR3C
39	3.2-1--Explain who made the decision, as stated at the PolyMet DEIS hearing in Aurora, that the No Action Alternative was only being used as a point of comparison. If the No Action Alternative will receive no action, then the EIS process must define the purpose of an EIS and state which laws it is following.	ALT8
40	We ask that the No Action Alternative be chosen after evaluation of the Northmet Project Draft Environmental Impact Statement. The basic assumption in the DEIS that the land involved will be exchanged with the US Forest Service and the fact that the analysis in this DEIS assumes that to be a fact is misleading and irresponsible and seems to side-step the issues involved in use of public land and mineral ownership.	PRO8
40	As residents of northern Minnesota for over 34 years and as active citizens who have spent the majority of our work lives here and pay taxes and contribute to the economy, we are concerned about the safety of this project and its potential impacts on Minnesota's natural resources and the quality of life for residents of this area.	G2
41	The PolyMet DEIS describes significant environmental issues associated with this proposed mine including water quality, heavy metals, invasive species, and major landscape changes that will last far beyond the 20 year life span of this operation. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	EOO

41	We understand that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project. The analysis cannot assure water quality protection. A sample of statements implies that problems are inherent in the mining process. Page 3-4 states waste rock must be kept in a subaqueous environment to reduce environmental impact associated with oxidation and decomposition of sulfide mineals. Page 3-39 states that the West Pit will flood in 65 years with overflow to the Partridge River. Page 3-14 states there will be leaching of heavy metals in all categories of waste rock. Page 4.1-21 admits that tribal entities have issues with wetland assumptions made in this document. The PolyMet project is “data-poor in the areas of basic hydrology” (pg 4.1-21).	WR1E,WR2D,GT2
42	While PolyMet continues to pursue a land exchange with the USFS to acquire the surface ownership of approximately 6,700 acres of national forest land, it should be specifically noted that PolyMet is of the opinion that, pursuant to the mineral reservations on the lands which they have obtained mining leases, PolyMet has an absolute right to conduct mining operations including open pit or surface mining without acquiring surface ownership to the USFS lands. The mining reservation contained in the “Duluth” deed in Vol. 640 of Deeds, page 39, which deed encompasses all but three 40-acre tracts within the proposed mine site, specifically provide that the mineral owner has the right “. . . to cave, disturb or remove the soil or surface of said lands or any part thereof, and do any other matter or thing which may be necessary or convenient for carrying on an oil, natural gas, or a mining business upon, in, and under said premises, . . .” Applicable case law relating to the interpretation of mineral reservations supports PolyMet’s position that it has the right to conduct surface operations without acquisition of the USFS surface rights. PolyMet is of the further opinion that on the three 40-acre tracts which are subject to the “Longyear” deed, the deed to the United States being recorded in Vol. 639 of Deeds, page 353, PolyMet has the right to conduct surface mining on said tracts without acquiring the surface ownership. PolyMet retains the option to seek declaratory relief in Federal District Court to have the Court determine it has the right to mine the surface of the USFS lands without the necessity of acquiring said surface rights. A court decision in favor of PolyMet would not only affect the lands currently under lease to PolyMet but would affect a large number of other lands located within the Superior National Forest. In fact, a decision in favor of PolyMet could affect important forest lands throughout the national forest system which have mineral reservations with language identical or similar to that of the PolyMet mineral reservations. PolyMet remains confident that if such an action were commenced by PolyMet that they would prevail in such an action.	EOO

42 PolyMet strongly disagrees with the Tribal cooperating agencies' position that the results from the MODFLOW model outside the mine pit footprint are unsupported by data because the model was developed to assess the rates of mine pit inflow. The modeling objective of determining groundwater inflow rates to the pits does not mean that model results outside of the footprint of the pits are not supported by data. The hydrologic data and associated hydrologic/hydraulic modeling used to assess baseline conditions and impacts of the NorthMet Project on the Partridge River flows is comparable or superior to that used in the EIS of two other sulfide ore mining projects in the Upper Midwest (i.e., the Crandon and Eagle projects):

- It is important to make a clear distinction between data available and data actually used to predict hydrologic impacts. Some of the hydrologic
- If the goal of the impact assessment is to predict changes data available for the environmental evaluation of the Eagle and Crandon projects (per John Coleman, GLIFWC email communication to Stuart Arkley, MDNR dated October 30, 2008) was not actually used in predicting hydrologic impacts of these two projects; the data was simply listed as available.

in flow statistics, there is no doubt that it is more appropriate to do such assessment based on a 10-year continuous record of flows in the study watershed than based on scattered instantaneous flow measurements. The first reason is that a larger sample size will produce more robust estimates of the statistics characterizing a process (e.g., mean, standard deviation). A second reason is that a continuous record eliminates the potential bias of instantaneous ("spotty") weekly or monthly measurements being assumed as representative of mean values over a week or a month. Even more critical, these instantaneous measurements do not help to represent the intrinsic temporal variability of the flow hydrograph at a given study location. More specifically regarding the data for the Crandon and Eagle projects:

- o Data used for predicting impacts of the Crandon project consisted of at most 3 years of weekly instantaneous flow measurements at 7 locations (in some locations, flow measurements were over a period of 3 months only) and 3.5 years of continuous flow data at one location (versus 10 years of continuous flow data at one location for the NorthMet Project EIS).
- o Data used for predicting impacts of the Eagle project consisted of one year of continuous flow measurements at 4 locations (versus 10 years of continuous flow data at one location for the NorthMet Project EIS).
- Flow data collected by the USGS is generally considered more reliable than that from other parties because of the strict stream flow measurement protocols used by the USGS to develop accurate continuous flow measurements. The data used for the NorthMet Project EIS is exclusively from the USGS, whereas the source of the data used for the Crandon and Eagle projects is not the USGS in any cases except for one monitoring location.
- The 10-year continuous record of flows in the Partridge River from the USGS Station above Colby Lake represents a good record of hydrologic conditions that span a range of climatic conditions. As discussed in RS73B and also in the NorthMet Project EIS, this period of record includes wet, average and dry years. The average precipitation for the Mine Site over this 10-year period was nearly identical to the 30-year climate normal precipitation, and the period included the second-wettest and fifth-driest years from the climate normal period. The shorter records and/or instantaneous flows measurements used to evaluate impacts of the Crandon and Eagle projects do not capture the same degree of climatic and stream flow variability. The stated goal for the streamflow modeling in the Final Scoping Decision Document is for a model period (extended if necessary) that is "long enough to include both wet and dry climatic conditions." The 10-year p

43	<p>Treatment wetlands, sometimes referred to as constructed wetlands, have been studied and used extensively for the treatment of many types of water. The U.S. EPA estimates that over 1,000 constructed wetland treatment systems are currently in operation in the U.S., treating a wide range of waters. Given this broad range of experience with treatment wetlands, it is highly likely that a wetland treatment system can be designed that would be capable of providing any additional treatment capacity that may be needed for the water that will eventually discharge from the West Pit to the Partridge River during post-closure. The water quality of the West Pit after filling has been calculated for two different mining scenarios using two different calculation methods. The results of these efforts suggest that the water quality of the West Pit will meet, or approach the potential applicable water quality discharge limits that would apply to the West Pit overflow. Several mitigation techniques have been described in the DEIS to help achieve the goal of meeting water quality discharge limit in the West Pit prior to overflowing. In addition, several other methods of further mitigating any potential impacts associated with discharging this stream to the Partridge River were considered in the DEIS. One mitigation method would be to construct a treatment wetland along the proposed flow path from the West Pit to the Partridge River. Current modeling suggests that this water would be relatively low in organic matter (unless it is augmented during filling) but may contain low concentrations of some dissolved inorganics such as arsenic, antimony, or cobalt. At low concentrations, these compounds are readily transformed to insoluble components or adsorbed to the organic matter created in wetlands, thus improving water quality. Because wetland systems are natural, growing systems, they replenish themselves and can operate with little or no maintenance. If they are designed properly (i.e. not overloaded) they can operate indefinitely. However, some minimal monitoring or maintenance is suggested, primarily to monitor changes in other natural factors, for example long-term changes in climate or the influence of beavers. In summary, if necessary, a constructed/treatment wetland would be a viable option for a final treatment of the overflow water from the West Pit as it flows toward the Partridge River.</p>	EOO
44	<p>During development of the preliminary design for the Hydrometallurgical Residue Facility, the MDNR and PolyMet specifically discussed the design of the cell cover system and the potential need for long term management or potentially management in perpetuity of liquid recovered from the cell drainage collection system. This drainage would result from the small amount of infiltration that could occur through the single geomembrane barrier component of the cell cover system that was initially proposed, while being prevented from escaping the cell by the composite liner system. To minimize the infiltration to the maximum extent practicable, PolyMet subsequently proposed supplementing the cover systems' geomembrane barrier layer with an underlying geosynthetic clay layer. This composite cover system design is the basis for the hydraulic flow modeling on which the 34 year timeframe estimate is based. Furthermore, this composite cover system design, which exceeds regulatory design requirements for industrial solid waste management facilities and designs normally implemented in the State of Minnesota, will minimize the potential for future infiltration by providing a final cover system with performance matching or exceeding the performance of the liner system, and will thereby minimize and likely eliminate long term drainage management requirements after operating water is collected from the cell.</p>	EOO

45	<p>The existing groundwater quality at the Mine Site already shows that the groundwater in this area of the State does not meet water quality standards for parameters such as iron, manganese, and aluminum. The results presented in Table 4.1-45 show that the existing parameters that do not meet groundwater quality standards at the Mine Site will continue to not meet those standards. In addition, the results presented in Table 4.1-45 represent one method of calculation (deterministic) for one of the alternatives (Proposed Action) considered in the DEIS. The deterministic method used to calculate these values was based on several conservative assumptions for the leakage through the cover of proposed waste rock stockpiles and conservative assumptions for the load that would be generated from the waste rock. Additional calculations, using the uncertainty analysis method and included in the DEIS demonstrated that for several of these parameters the values calculated using the deterministic method were overly conservative, even for the Proposed Action. Moreover, the results of these calculations helped to guide the development of the Mine Site Alternative, in which the Category 2, Category 3, and Category 4 waste rock would be placed in the East Pit during backfilling, rather than being left in above ground stockpiles. The development of this alternative eliminates the Category 2, Category 3, and Category 4 waste rock stockpile leakage. Thus, while the results of the calculations presented in Table 4.1-45 suggest that potentially adverse impacts to groundwater quality could be possible, given very conservative assumptions, even these limited impacts were enough of a concern to PolyMet and the permitting agencies to consider and ultimately develop a Mine Site Alternative that significantly reduces the potential for even these marginal impacts to occur.</p>	EOO
46	<p>The MODFLOW models used in the evaluation of impacts from the NorthMet project are more than adequate for making the predictions they were designed to evaluate, specifically groundwater inflow rates to the mine pits and base flow reduction in the Partridge River as a result of pit dewatering. The position statement represented in this footnote incorrectly implies that there were “conclusions” from the USGS report and the subsequent meeting (February 26, 2009) that could be implemented. This was not the case. The USGS report suggests ways in which uncertainty could be evaluated using the MODFLOW model and the suitability of the existing model for use in an uncertainty analysis. Further, the referenced meeting did not have participation by all necessary parties for decisions or conclusions to be made; notably no state agencies were represented. The meeting discussed ways in which wetland impacts could be evaluated for future mining projects, and used the NorthMet project as an example, but was not focused on additional work that could or should be done on the NorthMet project, as the footnote implies.</p>	EOO
46	<p>The MODFLOW model provides credible predictions for the type of analyses it was designed to perform, specifically the prediction of groundwater inflow rates to the mine pits and the reduction in baseflow within the Partridge River as a result of pit dewatering. The presence of ammonia in the bedrock well is discussed on page 4.1-11. As stated there, the presence of ammonia is attributed to either collection or laboratory error as the only two samples with hits of ammonia were collected on the same day and both were from 6-inch diameter boreholes that had collection difficulties. Further, there was no nitrite or nitrate found in these samples (these are the forms of nitrogen to which ammonia quickly converts). The lack of nitrite or nitrate indicates the ammonia was recently introduced and there is no on-going source of ammonia.</p>	WR4C
47	<p>The vast majority of the Virginia Formation wall that will be exposed during mining operations will be inundated during the backfilling and flooding of the East Pit. Lime will be included with the water that is used to flood the East Pit and will be directed to the Virginia Formation wall. This process will flush any salts from oxidation of the pit wall into solution where it will be neutralized. The neutralization of these salts in solution is a well understood and well documented chemical process that can be both monitored and controlled during the East Pit backfilling operations and during closure operations. In addition, sub-aqueous disposal of potentially reactive rock is also well documented. Thus, the effectiveness of this proposed operation is well documented and understood. Moreover, as noted, water quality predictions for both the Proposed Action and the Mine Site Alternative were calculated using two different methods – the deterministic method and the uncertainty analysis – which provided a very conservative range of water quality predictions. The basis for establishing both of these calculation methods were developed in cooperation with the permitting agencies and provide a more than adequate range of potential results for consideration of this project.</p>	EOO

Comment ID	Comment Text	Theme Codes
48	<p>DEIS text is misleading in Section titled "Virginia Formation High Wall" when it states that the method for reducing oxidation and metal leaching from overburden has not been demonstrated. As commented in PolyMet's review of the July 31, 2009 PDEIS, it is not clear from this statement which part of this mitigation measure has not been demonstrated. The geomembrane cover will protected the area from the top of the bedrock wall down to the water table from further exposure to precipitation and erosion, thus limiting oxidation and solute leaching in this area. The wall rock below the water table will be subaqueous, thus limiting oxidation and solute leaching. Both of these methods are proven methods of limiting oxidation and further leaching; each of these methods is described in more detail below. The mitigation measure is depicted on DEIS Figure 3.1-41 and described in Section 3.1.7.2 (Reclamation of Mine Site, Mine Pit – East Pit Category 4 Foot-Wall Cover). It includes the use of a limestone layer applied directly to the face of the Virginia Formation, an overburden core, and capping with a geomembrane cover that extends from the overburden above bedrock to the waste rock four to eight feet below the water table. Geomembrane cover The application of a geomembrane cover for reducing oxidation and solute leaching from precipitation on waste rock stockpiles has been well demonstrated and documented at other mines by several researchers including the EPA, the Corps of Engineers, and the MDNR. The MDNR research at the Dunka Mine shows that, even with improper installation, geomembrane caps significantly reduce solute leaching (Eger, Antonson, and Udoh, 1990). Capping with a geomembrane is also the traditional approach to reduction of oxidation and solute leaching at landfills and other solid waste disposal facilities. Subaqueous Disposal The wall rock that is below the design elevation of the wetland would be subaqueous and therefore not exposed to oxidizing conditions. This is a thoroughly demonstrated method of limiting oxidation and solute leaching. Exposed Area The design elevation of the East Pit wetland is based on the estimated elevation of the long-term groundwater levels, which is estimated to be approximately 10 feet below the existing groundwater levels, as described in the DEIS (Sec. 4.1.3.1 Proposed Action, Groundwater Resources, Mine Closure and Post-Closure, page 4.1-63). The water level in the East Pit will be relatively stable, because it will be controlled by the long-term groundwater level and the East Pit outlet structure. As shown in Figure 3.1-41 from the DEIS, there will be an estimated four feet of bounce within this wetland. In order to maintain the East Pit as a viable wetland, this bounce may need to be reduced to a few feet. The East Pit wetland will be optimized during detailed design prior to closure to minimize the bounce in this wetland, based on a better estimate of the long-term water table elevation. Therefore, the wall rock exposed to this 2-4 foot water level fluctuation will be the only area exposed to oxidation and solute leaching. Summary The area above the water table would be protected from further exposure to precipitation and erosion by the geomembrane cap, which has been thoroughly demonstrated, and the area below the water table would be subaqueous, which has also been thoroughly demonstrated as effective. Therefore, this mitigation measure provides thoroughly demonstrated methods of limiting long-term oxidation and solute leaching from the pit wall rock to the area exposed to the water level fluctuation of the East Pit wetland. Reference: Eger, Paul, Dave Antonson, and Francis Udoh. 1990. Stockpile Capping Report. Minnesota Department of Natural Resources: Division of Minerals. February 1990</p>	EOO
49	<p>As noted previously, the results presented in Table 4.1-45 represent a small portion of the water quality calculations prepared for the consideration of this project. As provided in the comment on Footnote 14 in Section 4.1, during development of the preliminary design for the Hydrometallurgical Residue Facility, the MDNR and PolyMet specifically discussed the design of the hydrometallurgical residue cell cover system and the potential need for long term management of liquid recovered from the cell drainage collection system; just like what already occurs as standard operating procedure at scores of existing landfills in the State of Minnesota. This drainage would result from the small amount of infiltration that could occur through the single geomembrane barrier component of the cell cover system that was initially proposed, while being prevented from escaping the cell by the composite liner system. To minimize the infiltration to the maximum extent practicable, PolyMet subsequently proposed supplementing the cover systems' geomembrane barrier layer with an underlying geosynthetic clay layer. This composite cover system design exceeds regulatory design requirements for industrial solid waste management facilities and designs normally implemented in the State of Minnesota, will minimize the potential for future infiltration by providing a final cover system with performance matching or exceeding the performance of the liner system, and will thereby negate any requirement for an on-site treatment operation beyond the anticipated period of site closure operations.</p>	EOO

49	In PolyMet's review of the July 31, 2009 PDEIS it was suggested clarifying that steady state modeling used highest predicted liner leakage rates (corresponding to an open stockpile) paired with highest predicted seepage concentrations (typically corresponding to a closed stockpile). This combination results in an impossibly high mass release of constituents to the environment. This change was not incorporated into the published DEIS.	WR2E
49	In summary, it is clear that both PolyMet and the permitting agencies recognized that the potential need for long-term water treatment at the Mine Site was undesirable. As a result of this concern, both PolyMet and the permitting agencies expended significant additional time and effort to develop a Mine Site Alternative and additional mitigation and monitoring activities for the express purpose of developing a project 'with the end in mind' of not needing long-term water treatment.	EOO
50	In PolyMet's review of the July 31, 2009 PDEIS it was noted that PolyMet does not agree with the approach used to define the pH range in the uncertainty analysis for the Category 1 and 2 waste rock stockpile. For the Category 1 Waste Rock Stockpile it is unlikely that the leachate pH will fall below 8.0. As reported in RS82 Draft-02 (February 2009), the humidity cell leachate pH observed for this type of waste rock stabilized for all samples between 6.5 and 7.5. When these results are scaled to the waste rock size (larger rock) and liquid to solid ratio (less liquid) expected for the stockpile, the corresponding pH of the stockpile leachate will be above 8.0 (see RS53/42 pg. 57, March 2007). The pH will be buffered by weathering of silicate minerals to produce carbonate alkalinity. However, PolyMet used the pH range of 6.6 to 8.0 in the uncertainty analysis because MDNR Division of Lands and Minerals requested this range for the analysis. PolyMet believes that the use of an uncertainty multiplier for the concentration caps, as applied in the analysis of the Category 3 Lean Ore stockpile, is more appropriate.	WR1E

52	<p>The model was calibrated to water levels measured in the bedrock and the surficial deposits, as well as a base flow target for the Partridge River. The fact that the model was calibrated to both head and flux targets helps to minimize the non-uniqueness issue that is often the problem with groundwater models that are calibrated to head targets alone. Please see response above to Page 4.1-50, Footnote 11 regarding the appropriateness of the XP-SWMM model for existing climatic and stream flow conditions in the Partridge River near the PolyMet Mine Site. Regarding dewatering discharges from the Peter Mitchell pits, the Final Scoping Decision Document (FSDD) states that during the 1978-1988 period of stream flow data the Reserve Mining Company (then-operator of the Peter Mitchell Pits) “was not pumping to the Partridge River so [the USGS gauge data] will probably be usable for calibration. This assumption needs to be verified, especially with respect to the impacts of any overflows that may have occurred from Reserve Mining Company pits.” Peter Mitchell dewatering data was not available at the time that the surface water modeling for the Partridge River was completed in October 2007, and later updated in September 2008 (detailed in RS73A and RS73B). Contributions from the Peter Mitchell Pit watersheds to the Partridge River were included in the calibrated XP-SWMM model. This is akin to the assumption that any pit dewatering was for water level maintenance only and any excess runoff was delivered to the Partridge River, but it excludes any significant groundwater inflow to the Peter Mitchell Pit originating outside the Peter Mitchell (surface) catchment area. It is also important to highlight that the 30-day low flows developed from the XPSWMM model (and used in subsequent water quality modeling for the Partridge River) are less than 1.0 cfs for all monitoring locations upstream of the South Branch of the Partridge River (i.e. SW-001 through SW-004). Flows of this magnitude are extremely difficult to measure accurately, especially since they typically occur during winter when streams may be frozen. Monthly discharge data for the Peter Mitchell Pits from 1976-1986 was provided to Barr in an email from Nancy Smith (Northshore Mining) on October 7, 2008 (i.e., after publication of RS73A and RS73B). The data has several significant characteristics with regards to the Partridge River flow record:</p> <ul style="list-style-type: none"><li>• Only monthly total flow data is available because it corresponds to data required as part of an NPDES Permit. Since 30-day low flow periods do not necessarily correspond to calendar months, it is not clear how the dewatering discharges affect all low flow periods.</li><li>• The available data includes discharges from different locations in the Peter Mitchell Pits to different rivers and streams (one of them is the Partridge River). More specifically, the Peter Mitchell Pits discharge from up to 9 points in the Partridge River watershed (see Figure 19, RS73A). Several of these locations discharge directly to the Partridge River or its tributaries, and the flow would be expected to pass downstream relatively quickly (depending on flow rates and velocities). Other discharge locations are on the boundaries of Hundred Mile Swamp or other wetlands, where flow would pass through large saturated areas before reaching surface water streams. Depending on the magnitude of the Peter Mitchell Pits discharge, it is possible that flow through these wetland complexes would not immediately report to the Partridge River during dry periods or periods of replenishment of soil water storage.</li><li>• Discharge from the Peter Mitchell Pits is generally highest during periods of high flow in the Partridge River, and lowest (occasionally zero) during winter low-flow periods. This is consistent with the assumption that dewatering during the majority of this period was primarily for water level maintenance in response to snowmelt and other storm events, and not for significant water</li></ul>	WR3J

53	<p>As noted in previous comments, the calculations presented in Table 4.1-45 concerning stockpile leachate quality represent one method of calculation (deterministic method) of water quality impacts considered in the EIS process. The deterministic method resulted in conservative calculations of potential impacts. Even though these values were known to be conservative, PolyMet and the permitting agencies considered a Mine Site Alternative that would significantly reduce these potential impacts. Thus, Table 4.1-71 shows that when Agency-accepted sorption values are used, the only exceedances of groundwater standards correspond to antimony. Furthermore, Note 5 of Table 4.1-71 indicates that “The predicted antimony concentrations rely on the concentration cap developed from the contaminated humidity cell testing (80 <math>\mu</math>g/L) rather than MDNR reactor data (3 <math>\mu</math>g/L), which probably results in overestimated of antimony concentrations in groundwater at the Mine Site.” It is worthwhile clarifying that under the Mine Site Alternative, Category 2, Category 3, and Category 4 waste rock will be temporarily placed in geomembrane-lined stockpiles and subsequently used to backfill the East Pit as part of the Closure Plan. Part of the Category 1 waste rock produced in the later years of the mining operation would be permanently placed in these geomembrane-lined stockpiles. The other permanent waste rock feature would be the Category 1 stockpile, which primarily drains toward the East Pit and West Pit. Consistent with the discussion in the previous paragraph, the West Pit does not drive exceedances of groundwater standards at the Property Boundary or Partridge River. The proposed water management under the Mine Site Alternative includes treating waters for part of the period of West Pit filling, not for 2000 years. In addition, pages 4.1-166 and 4.1-167 of the EIS discuss mitigation measures to implement while the West Pit is being filled, with the goal of meeting water quality standards in the West Pit at the time of overflow. In addition, while the results of wetland treatment systems are equivocal it is well understood that wetland systems generally provide a benefit to surface water quality.</p>	WR2E
54	<p>In order to help evaluate potential groundwater quality impacts, four additional monitoring wells were installed north of the Tailings Basin (these wells supplement the previously existing eight monitoring wells). In addition, 15 private wells north of the Tailings Basin were sampled. Analytical samples collected from the monitoring wells and the private wells provide the data necessary for the characterization of existing conditions for the purposes of the EIS. The water quality samples collected at private wells do not have exceedances of groundwater quality standards caused by seepage from the Tailings Basin. As is indicated in Chapter 4.1.1.2 and Table 4.1-6, regional baseline groundwater has concentrations of aluminum, iron and manganese that are over the drinking water standards. The concentrations of these constituents measured in the private wells are within the range of the natural baseline concentrations and reflect baseline conditions and not impacts from the Tailings Basin.</p>	WR4C
55	<p>The available data supports the statement in the EIS that elevated concentrations of aluminum, iron and manganese down gradient of the Tailings Basin may reflect natural conditions in this area. As is shown in Table 4.1-6, regional and background concentrations of these constituents are similar to the concentrations found down gradient of the Tailings Basin. The modeling methodology used to predict down gradient groundwater concentrations does not assume that all constituents in the groundwater are the result of past and current seepage from the basin as the footnote states. Mixing of seepage water and precipitation derived recharge is simulated in the modeling.</p>	WR4C
56	<p>This comment describes the use of lime or limestone to treat the temporary stockpiles of Category 2, Category 3, and Category 4 waste rock prior to being placed in the East Pit during backfilling operations. While it is likely that this operation could have reduced the rate of oxidation of these materials and the resulting load of dissolved solids to the East Pit during filling, the MDNR questions concerning effectiveness of this operation resulted in modeling of this operation using zero percent effectiveness. Because of the conservative use of zero percent effectiveness regarding the use of lime or limestone to treat the temporary stockpiles, this was not a key assumption in the modeling of the waste rock piles for the Mine Site Alternative.</p>	EOO

57	<p>Evapotranspiration (ET) covers have been used successfully for over the last few decades to reduce infiltration into landfills, stockpiles, and other solid waste disposal applications. EPA has a fact sheet (EPA 542-F-03-015, Sept. 2003) about ET cover use and application on landfills and hazardous waste sites. Engineered multi-layer soil covers to control acid rock drainage became more popular in the 1990s with the development of modeling tools, such as the SoilCover Model, that could predict the evaporation from the soil cover (GARD, 2009). Upon review of 10 to 15 years of cover performance data, Wilson et al (2003, 2008) have determined that these covers are successful in significantly reducing infiltration and oxidation within stockpiles. These covers are not meant to stop all infiltration into the stockpile from occurring; however, it has been successfully demonstrated that these covers significantly reduce the amount of infiltration into the stockpile, thus limiting the leachate collection from the liner of the stockpile. Wilson et al (2003, 2008), for example, goes into detail on the mechanisms of failure and success of these systems. Their study examined covers in a variety of climates, including temperate rainforests of British Columbia, Canada, humid alpine climate of north central British Columbia, and semi-arid regions of Saskatchewan, Canada and North Queensland, Australia. They have been used successful in either climate type, although the design is different based on the climate. For example, in semi-arid to humid regions, a store and release type system, comparable to what is planned at PolyMet, is recommended. In temperate rainforests, a barrier-type system is recommended. Typical mechanisms of failure in a store and release type system include lack of storage capacity in the soil (a factor associated with soil depth and soil type), vitality and sustainability of the vegetation (a factor related to the vegetation type), and erosion (associated with slopes and stability of the design). One mine, Equity Silver Mine, in north central British Columbia has an ET cover very similar to what is planned at PolyMet. They also have a very similar climate with similar glacial till construction materials for their covers. SoilCover modeling for this mine predicted reductions in infiltration from 60 to 80 percent down to about five percent. Actual field measurements by lysimeters confirmed this drop in infiltration rates and success of these covers (Wilson, 2003). ET covers are also a standard cover for landfills as well as stockpiles. Several researchers have studied the performance of ET covers on landfills, comparing them to other conventional covers. Hauser (2002) reviewed long-term field data that measure the water balance at sites ranging up to 31 years that demonstrated that the ET cover can successfully control water movement. Hauser (2002) did note that improper soil depth was the leading cause of failure. Soil models, such as SoilCover and USAT-H, allow designers to determine what the proper depth of soil is based on areas specific climatic information. Overall, there are numerous researchers, from Federal, State and municipal agencies to private entities that have studied the performance of ET covers for use at mines and at solid and hazardous waste disposal sites. ET covers are not a new technology, but have been used for decades to successfully reduce infiltration. The cover system utilizes natural processes for long term success. Additional research on the cover type should not be necessary. The details of the ET cover design (soil properties, soil thickness, vegetation types, etc.) will be finalized in permitting.</p>	EOO
58	<p>The text is unclear as the section apparently refers to the West Pit Lake, but reference is made to seepage water. In PolyMet's review of the July 31, 2009 PDEIS, it was noted that the pit water is not predicted to have strong acidity; however, limestone could be used to make modest upward adjustments to pH if needed.</p>	WR3C
59	<p>The Central Pumping Station (CPS) will be used during the operation of the Mine Site to transfer treated water to the Plant Site for reuse. This operation will cease when the mining and processing operations are completed. No water will be pumped from the Mine Site to the Plant Site during closure or post-closure. Alternatives that have been considered to accelerate the filling of the West Pit, using water from the tailings basin or Colby Lake, however, could potentially use the CPS pipeline to carry water to the Mine Site (opposite direction of flow in closure).</p>	EOO
60	<p>The DEIS does not state that differentiation of the wetlands was based solely on canopy cover; field work was carried out as stated in the DEIS that, "Based on the habitat mapping, wetland field delineation/mapping was performed in 2004, and supplemented in 2005, 2006, 2007, and 2008 ...". (DEIS, p. 4.2-4).</p>	EOO

61	<p>1. The Adams 2009 email (Adams and Liljegren 2009) refers to aerial photographs of lakes that are located very near the Peter Mitchell mine, which clearly show that the nearby lakes (Mud, Iron, and Argo) did not drain over a nearly fivedecade period while mining operations continued at the mine. Adams and Liljegren (2009) did not suggest, nor can the photographs show, small changes in lake water elevation, however it is clear that lakes immediately adjacent to the pit do not show any evidence of lowered water levels during mining activities. The Adams 2009 email (Adams and Liljegren 2009) also presents graphs showing water surface elevations for Argo and Iron Lakes over the period 1946 to 1981 in fractions of a foot. The graphs show lake level fluctuations and a gradual increase in lake surface elevation over the time period, which is also a period of active mining in the vicinity of the lakes. The lake level fluctuations shown on the graphs are presumably weather and seasonally-related, such as the drop in lake levels from 1976 to 1977 due to the drought of 1976 (with only 17 inches of precipitation at Babbitt compared to the average of 28.5 inches over the 1946- 1978 period). These graphs do not depend on "...aerial photos [as an] imprecise measure of surface water level", but are based on detailed measurements of water surface elevations for the lakes. 2. The photographs provided in the Adams 2009 email (Adams and Liljegren 2009) do not show that the pits are "mostly flooded." Only in the photograph sequence for Mud Lake do nearby parts of the pits appear flooded in recent photographs (July 1981 and July 2008). There is no flooding of the pits in the 1972 photograph of Mud Lake, when mining operations were ongoing near the lake with no apparent effect on its water level. 3. The footnote infers that because the NorthMet pits will be deeper than the Peter Mitchell pits, they would somehow be more effective at draining the lakes in question. In fact, water flows downhill, and if water levels in the pit and lake were closely linked via high conductivity strata, then even an 80-foot deep pit would be sufficient to drain the lakes. Only if the lakes were greater than 80 feet deep (which is doubtful) would they retain water. 4. The footnote point about the "lack of recognition that some changes in groundwater hydrology would not be detected by the large changes in surface water level that could be detected by aerial photography" is valid. But the point here is "some changes." The photographs and graphs do not show any change; therefore any change would have to be very subtle. The graphs also indicate that it would be difficult to separate changes induced from mining from changes caused by natural factors, such as weather. 5. The tribal cooperating agencies state that the arguments within the Adams 2009 email (Adams and Liljegren 2009) depend on "... wetland soil conductivity values that are extremely low and for which supporting source citation in the professional literature cannot be found." In fact, the email (Adams and Liljegren 2009) stated that hydraulic conductivity of peat is strongly controlled by its degree of decomposition (Rycroft et al. 1975, Ingram 1983, Boelter and Verry 1977). The generally accepted view of water flow in peatlands can be summarized by this quote from an overview of peatlands (Rydin and Jeglum 2006, p. 143): "Water on the surface may sometimes flow slowly in pools or channels, or as sheet surface flow in water tracks. Below the surface the flow rate will decrease drastically - even weakly decomposed material offers considerable resistance to water movement. The highest saturated conductivities, for example 10<sup>-4</sup> – 10<sup>-6</sup> m s<sup>-1</sup>, are for poorly decomposed fibric peats and undecomposed Sphagnum. Conductivities of 10<sup>-6</sup> or 10<sup>-8</sup> have been reported for moderately decomposed mesic peats and the lowest values, 10<sup>-7</sup> – 10<sup>-10</sup> for highly decomposed humic peats with very fine pores." In addition, two research papers cont</p>	EOO

Comment ID	Comment Text	Theme Codes
62	<p>This footnote is addressing two related issues, 1) subsurface flow through upland soils to peatlands and 2) identification of wetland plant communities as described in the DEIS. Both points are relevant to the tribal cooperating agencies comments in the WETLAND and WATER RESOURCES portions of the DEIS as related to groundwater flow and the use of wetland vegetation as an indicator of that flow. The comments can be summarized by the statement on p. 5-2 of the DEIS, "It is not possible to completely evaluate the environmental impacts of this alternative to surface water, groundwater, or wetlands due to ... the lack of knowledge on groundwater flow and the lack of understanding of the interconnections of groundwater and the extensive wetland complexes in the area." #1-Subsurface flow through upland soils to peatlands: A commonly accepted misconception is that peatlands directly reflect surface exposures of the regional groundwater system. Two examples show that the link between peatlands and the regional groundwater table is tenuous. In the first example, in the sandy soils of the Anoka Sand Plain in east-central Minnesota, Reuter and Bell (2001) reported that water table behavior differed between the peatland and the surrounding upland. They hypothesized that this difference was because, in the wetland, there was a hydraulic barrier of much lower conductivity between the peat and sand, a highly-decomposed layer of peat or lake-laid sediments, which have very low hydraulic conductivity. The second example is from peatland basins formed by lake filling in north central Minnesota (Boelter and Verry 1977). Monitoring indicated that two kinds of peatlands exist in this landscape, 1) bogs whose water table is perched above the regional groundwater table and 2) fens whose basin lies within the regional groundwater. The bogs are separated from the regional ground water system by very slowly permeable peat or lacustrine deposits, while the water tables in the fens are simply exposures of the regional groundwater table. While neither example is from bedrock-dominated terrains, the peatlands in these examples are isolated to a greater or lesser degree from the regional groundwater table by low-permeability substrates. In these two examples, water does not necessarily run downhill but instead runs from a point of higher potential to one of lower potential. Toth (1963) theorized three types or scales of ground-water flow; local, intermediate, and regional. A local system of groundwater flow has its recharge area at a topographic high and its discharge area at an adjacent topographic low. An intermediate system has one or more topographic highs and lows located between the recharge and discharge areas. A flow system can be considered regional if its recharge area occupies the water divide and its discharge area lies at the bottom of the basin. Water levels in local systems at shallow depths are most affected by seasonal recharge and discharge. Different recharge areas and flow path lengths contribute to differences in the chemical composition of water in different systems. The work on groundwater flow shows that wetlands (peatlands) can have varying degrees of groundwater influence, leading to varying degrees of minerotrophy and variations in vegetation. #2 - Identification of wetland plant communities: Wetlands described in the DEIS were classified using Eggers and Reed (1997) wetland community types as required by the U.S Army Corps of Engineers. As part of additional wetland work requested by the Wetlands Working Group (September 10, 2009), the classification of wetlands on the NorthMet Site included coniferous bogs (47%), shrub swamps (alder thickets and shrub-carr, 28%), coniferous swamps (16%), open bogs (3%), shallow marsh (2 %), open water (0.8 %), sedge/wet meadow (0.5 %), and hardwood swamps (0.4 %). Using the the MDNR (2003, p. 221) classification system, many of the wetlands complexes on the mine site are likely APn81, Northern Poor</p>	EOO
63	<p>The Tribal cooperating agencies correctly point out that there is some difference in the topography north of Cell 2W and Cell 2E. However, PolyMet disagrees with the interpretation of the effects the difference in topography would have on wetland impacts. North of Cell 2W, the upland areas would funnel flow into the low-lying areas. This would cause impacts in the wetland areas to extend further from the basin (more water spread out over a narrower area) than if there were no or fewer upland areas, such as the area north of Cell 2E. Thus, using the distance of observed impacts north of Cell 2W to predict the distance of impacts north of Cell 2E provides a conservative estimate of potential indirect wetland impacts.</p>	EOO

Comment ID	Comment Text	Theme Codes
64	<p>PolyMet disagrees that there is an inconsistency between Section 4.1.3.1 and Section 4.2 or that the latest information developed for the water resources section (4.1) has not been incorporated into the wetland impact section (4.2) as suggested by the Tribal cooperating agencies comment. Section 4.1 quantifies the amount of seepage from the basin under historic and future conditions. Section 4.2 discusses the distance from the tailings basin where this seepage water likely discharges. Rather than being inconsistent, these two evaluations complement each other. The Barr memo (Lined Tailings Basin Alternative – EIS Data Request, April 8, 2008) describes the basis for the conclusion that wetlands will not become further impacted north of the Tailings Basin.</p>	EOO
65	<p>A screening analysis was conducted by PolyMet to assess the potential deposition of sulfur from fugitive dust emissions to wetlands within 2 kilometers of the Mine Site, including wetlands within the Mine Site property boundary that are expected to be present during mining. The major components of the analysis included: 1) estimating potential fugitive particulate dust emissions (as PM, includes fine fraction and coarse fraction up to 30 microns) from activities that handle sulfide rock (e.g., truck loading in the pit, waste rock dumping in stockpile areas, ore loading); 2) assigning a maximum potential sulfur content, as a percent, to each category of waste rock and ore and estimating potential sulfur emissions for each source; 3) estimating maximum potential total (wet + dry) sulfur deposition rates with the AERMOD model for delineated wetlands within and outside of the Mine Site property boundary; 4) comparing modeled sulfur deposition rates to an estimated average annual background total (wet + dry) sulfur deposition rate of 0.206 grams per square meter per year; g/m<sup>2</sup>/yr; 2004-2008 data (estimated from current background wet sulfate deposition of ~ 4.8 kilograms per hectare per year (kg/ha/yr), historically &gt; 10 kg/ha/yr, National Atmospheric Deposition Program, Fernberg site, MN18; background dry deposition data from Clean Air Status and Trends Network, Voyageurs National Park site, VOY413). Initial results from this screening analysis indicate that the highest modeled deposition rates are estimated to occur immediately adjacent to the pits, stockpiles and rail transfer hopper. A very small number of receptors (~11, representing about 108 acres of wetlands; ~ 10% of wetland area within the Mine Site boundary) are estimated to have deposition greater than 20% of background. Because air concentrations and deposition become smaller as the distance from the emission source increases, most of the wetland areas within the Mine Site boundary and essentially all of the wetland areas outside of the Mine Site boundary are estimated to receive potential deposition that is less than 5% of background. Potential deposition increases that are 5% or less of background are small and the potential impact from fugitive dust associated with sulfide rock handling is not likely to be measurable and is considered to be insignificant. Therefore, for almost all of the wetland acreage included in this screening analysis, the potential increase in sulfur deposition due to fugitive dust from sulfide rock handling is considered to be insignificant. An additional evaluation was conducted for the small acreage of wetlands within the Mine Site boundary that might receive some measurable increase in sulfur deposition. The maximum modeled deposition rate occurred near the rail transfer hopper (0.148 g/m<sup>2</sup>/yr; ~ 72% of background deposition). Adding background to maximum modeled deposition = 0.206 g/m<sup>2</sup>/yr + 0.148 g/m<sup>2</sup>/yr = 0.354 g/m<sup>2</sup>/yr (= 3.54 kg/ha/yr). A very conservative assumption is that all of the estimated sulfur deposition (3.54 kg/ha/yr) converts to sulfate; ~ 10.6 kg/ha/yr as sulfate (wet + dry; model + background) and is within the historic total (wet + dry) deposition levels estimated for the Fernberg site. For the small acreage of wetlands within the Mine Site that might receive some additional sulfate deposition associated with sulfide rock handling, the potential for this additional sulfate to increase mercury methylation rates is uncertain. However, the available data indicate it is unlikely to occur. For example, field data indicate that an increase in sulfate concentration does not necessarily result in increased methyl mercury formation even when wet sulfate dosing was 4 times greater than background (~ 28 kg/ha/yr) (Jeremiason et al., 2006; Mitchell et al., 2008). In most cases there is no relationship between sulfate concentration and methyl mercury concentration in surface waters or fish because both Porcella (1994; Wisconsin lakes) a</p>	EOO

159	I received the paper copy of the PolyMet DEIS in its 3 plastic binder. Seeing the beautiful water scene on the cover of this DEIS feels like a knife cutting into my heart. This mining project is the very antithesis of an environment featuring water, wetlands, and wildlife habitat. The PolyMet project would destroy at least 6500 acres of such land, and even PolyMet admits that its mining will contaminate the ground water. Into perpetuity. The cover design of this binder shows me that the agencies have lost touch with the organic living and breathing environment, and have become lost instead within the the virtual reality of pages of statistics, maps, charts, and documents. Throughout this process, I have tried to maintain a sense of respect and purpose for the agencies and their role in protecting our environment. In one painful swoop, the eagle on the binder cover shattered any belief that I had in this process. Why are you offering up an American symbol to Canadian companies, while denying American citizens the real truth about the impacts of this project on their land and water?	EOO,G2A,G7B

2786	<p>I would like to submit my comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. As a resident of this area I can appreciate the short term economic benefit of mining up here, but as a lover and protector of the Wilderness, and as an outfitter, who is dependent on the wilderness for my living, I have very serious concerns about the environmental impact of the proposed mining operation. I have been studying this issue and I simply do not believe that this operation can be done without unacceptable damage to the environment. This type of mining has never been done in Minnesota and has never been done without damage to the environment anywhere. Minnesota should follow Wisconsin's lead and effectively ban this type of mining. What makes this area so special is that it is one of the few remaining reasonably intact wildernesses left. To put our wilderness in peril is simply unreasonable. Please block PolyMet and all other operations that would put our wilderness at risk.</p>	EOO,G2C,G12
<b>Sender Last Name:</b>	Patnoe	<b>Submission ID:</b> 293
307	<p>I support PolyMet Mining's NorthMet Project and I am convinced that PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. Not only has PolyMet's \$20 million environmental review demonstrated that it can produce these metals while following Minnesota's strict environmental requirements to protect air, water and land, the metals that Polymet will mine are essential to green technology such as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters. The PolyMet project has been designed to minimize environmental impacts especially through reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. I am particularly impressed that they plan to use the sulfur in the ore as a fuel for processing instead of greenhouse gascreating fossil fuels. PolyMet's 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region as well as providing millions of dollars in local and state taxes to support our communities and educational system. The minimal environmental impact this project will have on our region is more than offset by this huge positive financial impact. PolyMet's 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region as well as providing millions of dollars in local and state taxes to support our communities and educational system. The minimal environmental impact this project will have on our region is more than offset by this huge positive financial impact. I urge you to allow Polymet to proceed with this much needed and environmentally safe project.</p>	EOO
<b>Sender Last Name:</b>	Patrick	<b>Submission ID:</b> 1022
1119	<p>As a ppcnrcned Minnesota citizen, I feel it is my obligation to let you know that I support PolyMet Miriug's NorthMet Project. At a time when our economic situation is unstable, I think we need the contribution that PolyMet will make to the state and local economy. The estimated 400 employees and hundreds of spin-off jobs will give a big boost to the financial situation in the Arrowhead Region, as well as the State of Minnesota, and a big boost to the morale and spirits of the people. It seems clear that PolyMet has completed an extensive environmental impact study that shows they can operate the proposed facility in an environmentally friendly atmosphere that will have a minimal impact on our environment. As a person who lives in northern Minnesota, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. The draft EIS demonstrlltles PolyMet can mine these metals AND protect air, water and natural resources, and I support the project. PolyMet will provide millions of dollars in local and state taxes to support our communities and education system. Let's get on with pennitting this mine. We need the jobs.</p>	EOO

3250	Dear MN Department of Natural Resources, I am writing to express my grave concern about the proposed PolyMet sulfide metal mining project proposed in northeastern Minnesota. The area that is being considered for this corporate project is amongst one of the largest natural wetland areas. The area is at a cross roads for drainage with portions of the wetland entering the St. Louis river watershed and ultimately Lake Superior and other portions of the wetland finding their way towards the Boundary Waters Canoe Area Wilderness and ultimately border waters and Canada. Sulfide metal mining has never been without issue. Whether it is the sulfuric acid drainage that can result from disgarded tailing piles or the vast treeless expanses that litter the area where once wilderness existed. Why is this project even being considered in this wild area. The short term jobs that can come from this project come at a potentially high cost. The cost of mercury ladened waters, damaged water systems and the habitat lost when open pit mines replace the wilderness. How many more square miles of this region should be considered for mining? Do we really want the the mines of the Mesabi range to move eastward into uncharted territories with such potentially high risks. Please reconsider your position on this project. I realize that the Department has to balance the state's best interest and that of the environment but to me, this controversial project if approved would result in irreversible damage, limited jobs and the highest returns to corporate interests that will never return their profits to our state's citizens or wildlife.	EOO,G7A,G7C
3773	I've served as President of the Bassett-Cadotte Lakes Property Owner's Association for the past 4 years. We hold 2 well attended meetings each year and the Poly Met situation comes up at every meeting. The property owner's are deeply concerned about the possibility of sulfur run-off from the proposed mining. We are doing everything possible to protect our valuable resource. We emphasize shoreline protection, septic system maintenance, buffer zones etc. Past evidence shows thre have been problems resulting from this time of mining.	G7A
<b>Sender Last Name:</b> Pearson		<b>Submission ID:</b> 251
264	We want to let you know that we support the NorthMet project. PolyMet will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefit. PolyMet's 400 employees and the hundreds of spin-off jobs will provide a huge economic benefit to Minnesota and the Arrowhead region. PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system.	EOO
418	The first comment I want to make is I think it's ridiculous to have a public meeting and not allow the public to speak, okay. It's unheard of -- maybe a new process -- but it smacks as if the outcome of this thing has already been decided, and this is to minimize people from hearing other people with like opinions communicate. So I think it's a very poor system that you've set up here -- the DNR.	PRO6
2627	Secondly, I'd like to ask the question as to why this project is different, and all the other mining projects similar to this. They've never been able to prevent the seepage problem. What do they expect different of this project to make it not happen?	G2
2628	And then, I guess, finally, is what kind of monitoring will there be as a safeguard to prevent seepage and other problems from going into the lakes. Thank you.	G2
<b>Sender Last Name:</b> Pegg		<b>Submission ID:</b> 1153
1268	The proposed project's are very short term & limited; the damages to the environment & our health are long term & profound.	EOO

767	Greetings. First of all, extend the comment period another 45 days. This issue will affect N. Minnesota for the next 100 years. The citizens and the environment deserve a thorough review of the proposal, unhampered by a limited time period. Second, we need more public meetings, particularly in Ely and Babbitt since these areas will be directly affected by run-off, infiltration through the ponds, and acid rain. Third, I am opposed to the project because the tailings pond will leach acid into the ground water. The proposed technology is unproven. This is not the place, if indeed there is ANY place to test new processes. Fourth, the separation process will use great quantities of electricity, produced by coal-fired power plants, which increase the amount of carbon dioxide in the atmosphere.	PRO3,PRO6

319	This letter is provided as support for the PolyMet Project near Hoyt Lakes, by NORAMCO Engineering Corporation. The strong economy of Northeast Minnesota is closely tied to natural resources, as has been seen by the effect on the pulp/paper/chip board industries, and also the faltering of iron ore. Tourism alone cannot support the standard of living these industries provide. The PolyMet project will allow a solid third leg to the wood industry and iron economies, which in turn will help enhance the tourism factor. I truly believe that PolyMet has a sound environmental plan which will allow the mine to earn a profit. Furthermore, the employees and community will have a more stable economy in which to live, and I feel both the environment and tourism will also be protected. We, at NORAMCO Engineering, are pleased to endorse projects that positively impact our region's economy and are in compliance with air, water and natural resource standards. NORAMCO Engineering Corporation strongly recommends issuance of permits for PolyMet Mining Company.	EOO,G11

937	Negative effects on water quality will be substantial and unacceptable. Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. Mining companies will simply be able to maintain water treatment facilities for that amount of time, and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that will require such long-term care	PD2,PD3,PD4

20511	VII. The Draft EIS Analysis of Impacts to Cultural Resources is Inadequate The National Historic Preservation Act ("NHPA") includes provisions that apply to Native American Tribes. 16 U.S.C. § 470a(d)(6); Muckleshoot Indian Tribe, 177 F.3d at 805. Under the NHPA, properties of traditional religious and cultural importance to a Tribe may be determined to be eligible for inclusion on the National Register, and in carrying out its responsibilities under Section 106 of the NHPA, federal agencies must consult with any Native American Tribe that attaches religious and cultural significance to these properties. Id; 36 C.F.R. § 800.1. The proposed NorthMet mine site and plant site are located within the 1854 Treaty Ceded Territory where the Bois Forte Band of Chippewa, Fond du Lac Band of Lake Superior Chippewa, and Grand Portage Band of Chippewa retain hunting, fishing, and gathering rights under the Treaty of 1854. Thus, in considering the potential impacts to cultural resources, the Corps must consult closely with the affected Tribes and Tribal members.	PRO5,G3,CR1,CR2,CR3,C

20512	<p>II. The Draft EIS Fails to Adequately Explain How the Proposed Mine, Which Would Destroy and Adversely Modify Designated Critical Habitat, Would Not Violate the Endangered Species Act (“ESA”) The Endangered Species Act (“ESA”) represents “the most comprehensive legislation for the preservation of endangered species ever enacted by any nation.” <i>Tennessee Valley Authority v. Hill</i>, 437 U.S. 153, 180 (1978). “The plain intent of Congress in enacting this statute was to halt and reverse the trend towards species extinction, whatever the cost.” <i>Tennessee Valley Authority</i>, 437 U.S. at 184. In enacting the ESA, Congress spoke “in the plainest of words, making it abundantly clear that the balance has been struck in affording endangered species the highest of priorities, thereby adopting a policy which it described as ‘institutionalized caution.’” <i>Id.</i> at 194. “One would be hard pressed to find a statutory provision whose terms were any plainer than those in [Section] 7 of the Endangered Species Act.” <i>Tennessee Valley Authority</i>, 437 U.S. at 173. “Its very words affirmatively command all federal agencies “to insure that actions authorized, funded, or carried out by them do not jeopardize the continued existence’ of an endangered species or ‘result in the destructions or modification of habitat of such species.’” <i>Id.</i>, (quoting 16 U.S.C. 1536) (emphasis in original). “This language admits of no exception.” <i>Id.</i> Thus, pursuant to Section 7 of the ESA, each federal agency must consult with the U.S. Fish and Wildlife Service to insure that any proposed action is not likely to jeopardize the continued existence of any threatened or endangered species, or result in the destruction or adverse modification of the species’ critical habitat. 16 U.S.C. § 1536(a)(2). The ESA therefore mandates that “federal agencies take no action that will result in the ‘destruction or adverse modification’ of designated critical habitat.” <i>National Wildlife Federation v. National Marine Fisheries Service</i>, 524 F.3d 917, 933 (9th Cir. 2007) (quoting 16 U.S.C. 1536(a)(2)). “Destruction or adverse modification” of critical habitat is defined as a direct or indirect alteration that appreciably diminishes the value of the critical habitat for both the survival and recovery of a listed species. 50 C.F.R. § 402.02. Such alterations include alterations that would adversely modify any of the physical or biological features that were the basis for determining the habitat to be critical. <i>Id.</i> The courts have found, however, that this definition “reads the ‘recovery’ goal out of the adverse modification inquiry, and that agencies must in fact consider impacts that appreciably diminish the value of critical habitat for either survival or recovery. <i>National Wildlife Federation v. National Marine Fisheries Service</i>, 524 F.3d at 934; <i>Gifford Pinchot Task Force v. U.S. Fish and Wildlife Service</i>, 378 F.3d 1059, 1069-71 (9th Cir. 2004). Thus, the agencies’ assessment of the impacts of a proposed action on a listed species’ critical habitat must include the project’s impact on the species’ habitat in terms of the species’ recovery as well as its survival, and how the action may impact the physical or biological features that were the basis for the species’ critical habitat determination. 50 C.F.R. § 402.02; <i>National Wildlife Federation</i>, 524 F.3d at 935; <i>Gifford Pinchot</i>, 378 F.3d at 1069. In addition, the agencies are not allowed to characterize as “insignificant” the potential impacts on a species’ critical habitat by considering only the broad scale or long-term impacts. <i>National Wildlife Federation</i>, 524 F.3d at 935; <i>Gifford Pinchot</i>, 378 F.3d at 1069. For the proposed NorthMet mine, the agencies acknowledge in the Draft EIS that the proposed mine site is within formally designated critical habitat for both Canada lynx and gray wolves. DEIS, 4.4-2,3. More specifically, the mine site is located within “Lynx Analysis Unit” 12 on the Superior National Forest, and 94% of this Unit currently pro</p>	WI1,WI5
20512	<p>As acknowledged in the Draft EIS, “the Project may affect historic properties of religious and cultural significance to the Ojibwa Bands on and off reservation, or tribal lands.” DEIS, 4.8-3. The Corps, however, is once again placing the cart before the horse by releasing the Draft EIS for public comment before this consultation occurs. <i>Id.</i> (stating that “a significant amount of consultation and survey work remains to be completed”); see also DEIS, 4.8-13 (stating that “[t]he identification of historic properties of religious and cultural significance to the Ojibwa is the subject of ongoing consultation between the [Corps] and the Ojibwa Bands,” and that “[t]he potential impacts to any historic properties identified will need to be assessed”); DEIS, 4.8-15 (“[t]he cumulative impacts of past, present, and future mining projects to Ojibwa culture are unknown, but may be very significant”).</p>	PRO5,G3,CR2,CR3,CR4

Comment ID	Comment Text	Theme Codes
20513	One of the primary purposes of NEPA is to allow meaningful public involvement in the environmental analysis, and this cannot occur where the analysis is simply described as ongoing and not disclosed for public comment in the Draft EIS. As set forth in the Draft EIS, It is the positions of the Ojibwa Bands that this chapter cannot be completed without significant additional consultation with the Tribal cooperating agencies, development of full, Tribal surveys of historic properties of religious and cultural significance to tribes, proper evaluations of natural and cultural resources based upon the recentlydefined (and much expanded) APE, and much more research. Therefore, the Tribal cooperating agencies take the position that even with the inclusion of all earlier changes and comments, the chapter will be far from ready for publication in the Draft EIS. The Tribal cooperating agencies expressly condition their comments on this position and maintain the position that Section 106 consultation is incomplete and inadequate, as to nearly every section. DEIS, 4.8-15. The Center agrees with this position of the Tribal cooperating agencies. In order to comply with NEPA’s public disclosure and involvement requirements, a Supplemental Draft EIS will need to be prepared and released for public comment in order to properly address this and other issues.	PRO5
20513	Similarly, as explained by EPA, the Draft EIS “has not described all impacts to tribes and tribal uses in the mine site area.” July 31, 2009, EPA Comments, p. 5. EPA thus “continues to recommend” that the Draft EIS “include an evaluation of impacts to tribal uses, insofar as the DEIS should disclose impacts to the environment and to the public from the project and provide pertinent information to all decision makers.” Id.	G3,CR2,CR3,CR4
20513	Last, impacts to cultural resources again indicate why the proposed land exchange between PolyMet and the Forest Service is a connected action that must be analyzed together in a single EIS. See July 31, 2009, EPA Comments, p. 5 (noting that “some direct impacts to tribal uses are related to the transfer of public land out of the Ceded Territory,” and questioning “how assessing the impacts of this connected action can be deferred to a separate analysis”).	PRO5,PD1
20515	VIII. The Draft EIS’s Analysis of Environmental Justice Issues is Inadequate and Misleading The Draft EIS attempts to brush aside any environmental justice concerns by stating that the affected community does not have a significant Native American population. What the analysis fails to consider and address, however, is that the affected Native American population has an increased interest in the natural resources that would be adversely affected, polluted, and destroyed by this mining proposal, as their culture is dependent on continued access to these natural resources, and in fact their current access to these resources is protected by treaty rights. When considered along with the related land exchange, there is no question that the adverse environmental consequences and related impacts resulting from this proposal would disproportionately affect the Native American Tribes and Tribal members. This is therefore a classic environmental justice issue in which a more privileged segment of society is making decisions that would benefit themselves – through jobs and the end products that would be produced – to the detriment of Tribal members in the region. As just one example of environmental justice issues that must be addressed and disclosed in considerably more detail, see DEIS, 4.5-22, n. 11 (Tribal cooperating agencies explaining that “the potential impacts to tribal members of a significant increase in mercury in fish harvested in on-Reservation and ceded territories waters has not been adequately addressed”).	G3,FM1,CR1,CR2,CR4

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
20516	<p>IX. The Draft EIS Fails to Provide Necessary Information Pertaining to the Closure Plan and Financial Assurance The Draft EIS explicitly defers its discussion and analysis regarding financial assurance. DEIS, 2-6 (stating that “[t]he amount of financial assurance associated with reclamation actions cannot be estimated until these actions are understood at a more detailed level of design” and thus “discussion of financial assurance figures and instruments are not included in the DEIS”); id., 3-38 (stating that details regarding the amount of financial assurance cannot be estimated until these actions “are understood at a deeper level of design detail”). As explained by EPA, the information regarding financial assurance must be included in the Draft EIS “because one key component to determining the environmental impacts of a mine is the effectiveness of reclamation and closure activities.” July 31, 2009, EPA comments at 5. Further, “EPA as found the amount and viability of financial assurance are critical factors in determining the effectiveness of closure and reclamation and therefore the significance of environmental impacts.” Id.; see also DEIS, 3-49, n. 13 (explaining that “[b]ecause of its experience in expensive cleanups of contamination from many defunct or bankrupt sulfide mines, EPA Region 9 has strongly urged other Regions over the past two years to require financial assurance disclosure in the NEPA process,” and that new national rules for financial assurance are under development by EPA because “Given the history of adverse environmental effects resulting from some hard rock mines, and the expenditure of public funds used in some cases to address environmental problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS (from InsideEPA.com, Tuesday, August 25, 2009)”). Indeed, in a comprehensive analysis and report prepared in 2003, it was found that the amount of financial assurances provided by mining companies usually falls far short of the actual reclamation and closure costs. Attachment 5 (“Putting a Price on Pollution, Financial Assurance for Mines Reclamation and Closure”). The report found that the mining industry and regulating agencies regularly fail to accurately estimate reclamation costs, potential for acid drainage generation, long-term treatment needs, and the effects of pollutants such as cyanide, mercury, and selenium that present expensive and potentially long-term reclamation issues. Id. The Tribal cooperating agencies agree that the long-term environmental impacts of the proposed project cannot be meaningfully evaluated without additional disclosure of the closure plan and financial assurance. DEIS, 3-49, n. 13 (“It is the position of the tribal cooperating agencies that financial assurance should be fully explored in the DEIS. This is especially important given the potential for very long-term/perpetual treatment, maintenance and monitoring that may be needed for the Proposed Action”); id., 4.1-131 (“Tribal cooperating agencies note that there is no up to date closure plan for the proposed project. It is the tribal cooperating agencies’ position that a closure plan is needed to evaluate long term environmental impacts and to inform calculations of financial assurance that would be needed for the project”). The required analysis and disclosure for financial assurance must also take into the account the high likelihood that perpetual treatment would be needed for this proposed mine to insure no future violations of water quality standards. And as noted by mining expert David Chambers, if a prediction of an end date on which treatment will no longer be required cannot be made with a reasonable degree of certainty, then the discharge and the mine should not be allowed to begin. Attachment 6 (“A Position Paper on Perpetual Water Treatment for Mines”). Minnesota law requires that a mine operator provide financial assurance to cover the contingency reclamation costs prior</p>	CR1

1	The Range Association of Municipalities and School (RAMS) wishes to go on record as being in support of the Environmental Impact Statement (EIS) that has been published by the Minnesota Department of Natural Resources (MDNR) and the Minnesota Pollution Control Agency (MPCA) regarding the PolyMet Project. RAMS is an organization consisting of 25 Cities, 15 School Districts, 10 Townships and 20 Associate Members made up of private and private non-profit organizations located in the Taconite Tax Relief Area (TTRA) We are excited by the large impact the project would have on the economy and tax base for our area and region. Our support however is based more on what the published EIS says and requires. Historically RAMS has supported projects based on the economy and the environment. Minnesota is known as a very tough place to receive permitting. We attribute that to both the MPCA and the MDNR, and support their process. Although we have been asked, we have never joined efforts to shortcut the process or change timelines. We know that when an EIS is published with facts and solutions, the interests of the environment have been the top priority. Based on our review of this EIS, RAMS supports the EIS and the permitting of the PolyMet Project.	EOO
1	As we debate the pros and cons of the Polymet project on the Iron Range the world demand for minerals continues to grow. This demand will be met by companies with high regards for air and water quality such as Polymet or it will be met by companies that do not have the same standards, such as the new copper mine currently being built by the Chinese in Afghanistan. Our country needs good jobs created by good companies. Polymets time has come and it is time to get to work.	EOO
1	Thank you for the opportunity to provide my comments on the draft environmental impact statement (OBIS) for PolyMet Mining Co. I believe that this project holds great promise for economic development on the Iron Range, and that is why I am hopeful that the EIS process can be completed and the adequacy determination be finalized. I appreciate the environmental issues that have been discussed in the DEIS and on going public comment period, and I am hopeful that PolyMet can take appropriate steps to address the concerns raised. As you know, PolyMet proposes to mine copper, cobalt, nickel, palladium, platinum and gold in an established mining district near Hoyt Lakes, Minnesota. The company would reuse much of the infrastructure from the former LTV Steel Mining Company and would employ hundreds of people. Nonferrous metals are used in applications in daily life throughout the United States, and we have few domestic sources. The United States imports between 40 and 95 percent of the nonferrous metals it uses. When we can't get the materials we need from domestic sources, we are forced to import them from countries that don't share our commitment to environmentally responsible practices. In addition, the carbon footprint of these imported materials is extremely large, as they are shipped around the globe for processing, manufacture and delivery to the end user. At a time when our state and national economies are increasingly global, competitive, and unstable, we must protect our shared commitment to economic development through responsible resource management. That is why I encourage you to continue to move forward with the EIS process to ensure that the project meets all applicable state and federal guidelines.	EOO
2	Without question, the world needs these minerals and the area can desperately use the jobs. This project cannot begin to move ahead soon enough.	EOO
2	On behalf of the membership I can state with confidence that the NorthMet Project has received overwhelming support due to two main reasons. First, and most obvious, the economic benefits to our members and their families. Many of them live on the Iron Range and consequently are very anxious to start their next project. Our Local currently has close to 900 active members and we have recently completed two very successful projects in Northern Minnesota. Mesabi Nugget and Minnesota Power's SCR project at Clay Boswell. Since then the amount of work has dropped off drastically and we are experiencing unemployment rates in excess of 50 percent. Secondly, nearly all of our members have worked at taconite plants in their careers. PolyMets' plan to reuse an existing brown field site (old taconite facility) along with the specifics of the Draft EIS overwhelmingly convince us that this project makes good sense with minimal environmental impact. In conclusion, on behalf of Boilermakers' Local 647, I strongly encourage approval of the Draft EIS of Polymets' NorthMet Project. We are all eager to be part of this project and trust that your department, after all things considered, will conclude that this is right for northern Minnesota .	EOO

3	I totally support the PolyMet project because it will contribute to the local economy at a time when we really need jobs. Plus all the spin off jobs it will create for the Arrowhead region & Minnesota. To the opposing side that are stating Polymet will impact the Boundery Waters. That statement is absolutely incorrect. The Laurentian Divide separates the Boundery Waters from the PolyMet project. We do send unpolluted pristine water from the north to the south by way of the Minnissippi River. By the time the river leaves the southern boundries of this state it is very polluted. My suggestion to who oppose, you spend the same amount, 20 Million dollars that PolyMet has spent on the Environmental Impact Statement to clean up the Mississippi River. Then I might consider listening to your side.	EOO
4	Need jobs. Good for the state	EOO
4	On behalf of the City of Aurora, as Mayor I have a responsibility to ensure the longterm health, sustainability and vitality of our community. Long-term sustainability requires a clean environment and stable employment. I feel that the Department of Natural Resources and PolyMet have thoroughly addressed the environmental issues related to the mining operation. PolyMet has invested millions of dollars in studies to inform the EIS and permitting process, fulfilling and oftentimes exceeding expectations. Based on the extensive documentation outlined in the EIS, I am confident that impacts to the air, water or land will, be minimal, if any. Foreign suppliers of these metals don't necessarily follow sound environmental practices, creating a greater global environmental impact. PolyMet can produce these metals, metals that we use every day, in an environmentally sound manner and create hundreds of stable jobs that can support families in our community. PolyMet's economic benefit will be widespread; the beneficial effects include increased employment opportunities, a larger tax base, and increased county revenue from production and property taxes.	EOO,G4
4	I am in favor of this project I believe this project can be done while protecting the environment We need the jobs this project will create, both in the short term with construction and long term with the plants employees and support industries We also need the tax base this plan will provide I am also in favor of this project providing us with metals that we otherwise would have to import	EOO
4	How can we conclude that the job openings created will be filled by northern Minnesotans? Maybe people will be hired from elsewhere who will expect to stay in the area after the mine closes. This has the potential to increase the economic burden to create even more jobs in the Northern MN.	EOO,RFI
5	One of the comments I'd like to make is I'm a business manager for the Heat and Frost Insulators for Local 49 out of Duluth, Minnesota, and a lot of my members live throughout northern Minnesota, Wisconsin, and we have a very big territory that we heat, insulate pipes, boilers, you know, green, you know, everybody thinks green, you know, for the environment and everything for safety. What we do is insulate mechanical systems, and as a business manager, I have a lot of people that come into my office to fill out applications for a job, and I put these people to work, and what I have in front of you right now, as you can probably see, these are just kids, young kids that come into my office that want a job, a good paying job. I'm a union business manager. We pay our fringe benefits with health insurance, a pension, just like what everybody wants, health insurance, and what I got in front of you right here is about 75 people, young kids, that have come into my office for a job. And not only that, I have about 30 percent of my membership that's off, that's not working at this time through these difficult times, so it's just not only about my membership, it's about young kids that come in that want to make a job to pay their bills, families, and have health insurance and a good way of life, and my comment is times have changed. I know there's a lot of concerns about this project, but today is the day, and we're not going to move forward if we don't get jobs, produce jobs, and carry on and move forth.	EOO
5	The Superior Nat'l Forest, the BWCA and Lake Superior are for everyone to enjoy and are not to be compromised for short sighted economic gain.	EOO
6	This mine threatens our water, Lake Superior & possibly Birch Lake, the Kawishiwi River and everything down stream.	WR3B,WR3D
6	The jobs are short-term & exaggerated. The mining companies will use machines, not people. They promise 400 jobs, but we'll be lucky if 200 people have jobs for 10 years.	SE3

7	Mine now baby.	EOO
7	I am in support of PolyMet. This is a huge opportunity for us.	EOO
9	Let's approve this project and get some development in the Northern MN. Northern MW, MW and this country needs this to happen. this will put people to work with stable jobs. The construction project will put hundreds of construction works to work for 2 years or more. This process of mining has proven to be clear and environmentally safe if done correctly. The studies that have been done with the process PolyMet is going to use looks as if it will leave a minimal impact. Let's get past this and move ahead with this project.	EOO
18	Steve Peterson, I'm the mayor of the city of Virginia. Well, I believe that PolyMet has done due diligence, and we need jobs, we need stability and optimism for the area. I think they have brought together all the people they talked about, they've spent upwards of \$20 million bringing in geologists, environmentalists, all the people that need to put this package together. And I'm no expert, but I think that when you put that kind of package together and you spend that kind of money, that there's a commitment on the PolyMet side. And I think that if we cry wolf every time somebody comes out with a new idea, we're never going to complete projects up in this area, and I think that's what's happening right now with some of the environmentalists. I think it's a viable project, and again, we welcome PolyMet to the area, to the whole region, and I think it's a win/win situation. I don't feel that going forward there's going to be problems because there are so many strict environmental regulations in place with EPA and all the other agencies, that PolyMet will be watched and monitored very closely, so I'm comfortable, and again, I welcome them and wish them all the best. That's about all I have to comment.	EOO
120	Let's try this: The people of this state want and deserve clean water. The people of this state want and deserve good jobs. We have the ability, the knowledge and the will to have both clean water and good jobs. This is not an either/or situation. We can, and must, have both clean water and good jobs. That's it.	G1,G7
679	I believe the damage done to the Boundary Waters Wilderness and Lake Superior from the outflow of contaminated discharge from the waste will be permant. One cannot rely on Polymet's wetland treatment plan. It's unreliable. There is leakage to rivers and lakes downstream. Our streams and lakes already suffer from the buildup of mercury. Now is the time to think ahead of what could destroy them for future generations – long after the jobs created have come and gone.	WR3B,WR3D
1552	Last night I saw a letter presentation at the Izaak Walton League which is why I am writing to you. I hope it matters that I take the time to do this.	G10
2058	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. The BWCA is a treasure because of its pristine nature. Please do not let it be dessimated by mineing.	G10
<b>Sender Last Name:</b> Petty		<b>Submission ID:</b> 2315
2764	As a longtime traveler in the BWCA I am appalled by the suggestion that we undercut one of the best things our state has going for it for a mine. I've guided trips in the BWCA for multiple summers and can tell you all about its beauty and its power to change teenagers for the better. Let's not threaten this resource. When I tell my friends from out of town that there are places in my state where one can still drink straight out of the lake they are impressed by Minnesota's commitment to environmentalism. Help me keep it that way.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
533	AIR QUALITY IN PRISTINE BOUNDARY WATERS: The DEIS does not approach the most important question of cumulative impacts of this mine and the others that are proposed in the district. Polymet can not be looked at as a single, one-time event in N.E. Minnesota. With permitting of Polymet will come at least 2, perhaps 4 or more new applications for permitting from other mining companies. What will be the total impact on the environment by all these potential mines and how will the EIS deal with mitigation of all these in concert? Specifically the Boundary Waters, which is down wind of all these projects, will be negatively impacted in terms of atmospheric haze from dust particles and other emissions blown into the air. According to the U.S. Forest Service, the Polymet project alone will cause significant haze impairments in the Boundary Waters 36 days each year! Tell us how this cumulative effect on air quality must be dealt with for Polymet and all future applications. In addition how is global warming affected by this mining operation and the combinations of all potential mines in the future?	AQ3,AQ4B
1124	WILDLIFE: The mine site disrupts natural corridors for the movement of wildlife. Specifically the Canada lynx which is a federally-listed threatened species that requires large territories and benefits from undisturbed forest corridors. No provision is made for mitigating this loss of habitat in the DEIS.	WI5
3246	BOUNDARY WATERS WATERSHED: There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed. This was not done and should be before permitting.	WR2A
3247	SULFATES IMPACT: Sulfates are a problem that are not dealt with rigorously in the DEIS. Sulfates in surface water demonstrably impact aquatic vegetation, specifically wild rice. In addition sulfates react with elemental mercury in a process known as mercury methylation. Methylmercury is the form that bioaccumulates in fish and animals that eat fish, including humans. What process has been identified to detect and mitigate methyl mercury in the environment and how will community health be dealt with and paid for? The Boundary Waters is a very unique National Park that deserves to be fiercely protected. Developing open mine pits without the proper monitoring and regulations spells doom for this pristine paradise - if not in our generation, certainly in our grandchildren's time. Please do the right thing and protect this national treasure by addressing the above issues.	WR1E,WR4B,WR4C,WR4F
3701	RECLAMATION: The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing. Because acid mitigation is difficult to predict and long term treatment after closing is necessary, there needs to be a large sum of cash held in escrow as a damage deposit and that amount should be specific and included in the final EIS.	PD3
3702	MONITORING PLAN?: Where is the plan for constant monitoring of the mining operation by the DNR? Waste rock needs to be sorted by sulfide content, tailings basins need to be inspected for leaks, and waste piles need to be sampled for pH in runoff water regularly. Do we just depend on the mining company to do its own monitoring? There should be a program set up in the EIS for constant monitoring of operations by an independent environmental concern or the DNR.	PD2,PD3,PD5

2482	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. I lived in salt Lake City, Utah from 1979 to 1985 and personally observed what I considered the devastating effects of sulfide mining on the area around the Kennecott Bingham copper processing area. The area around the processing area looked sterile and it did not appear as if there were even weeds growing in the immediate treatment area. I did not physically tour the site and all of my observations were from the air. Many times when making a final approach from the south to the airport we would be routed to the west side of the valley and make our approach to the airport directly over the treatment areas in West Jordan. I cannot visualize the type of operation I saw in Utah being placed in the Boundary Waters Area. The price of copper is high now but I also remember in 1983/4 when the price of copper was just a few pennies a pound Kennecott was laying off workers that had 20 or more years of service. Is it worth a few jobs and the tax money the State will receive to place a risk like this mine in such a unique and valuable area? The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	G2,G6
<b>Sender Last Name:</b> Philipson		<b>Submission ID:</b> 1316
1536	It is imperative that we protect the fish and wildlife that currently thrive in Superior National Forest and safeguard this area for future generations. The lessons learned (hopefully learned) from the continuing ground water pollution caused by the 3M issues in the Twin Cities area should be enough to show it is easier and cheaper to prevent the introduction of pollutants than to try and clean them up later. Your consideration of the above in this matter will be appreciated.	G2C
<b>Sender Last Name:</b> Phillips		<b>Submission ID:</b> 3676
1	Comment: Note: wetland classification is discussed in the comments on Section 4.2. It is correct that not all wetlands have the same carbon sequestration or emission potential. As a result of this and other terrestrial carbon-cycle uncertainties, the quantitative analysis of Project carbon footprint did not take any credit for the mitigation of wetland impacts. The discussion in the DEIS focuses on the fact that wetland creation will mitigate some of the carbon sequestration capacity lost from impacted wetlands, not that it will necessarily offset all sequestration loss. The assertion that there is a net decrease in carbon uptake due to an equivalent amount of Type 8 wetlands not being involved in mitigation, is not in a larger sense the appropriate metric to judge the overall impact on long-term GHG emission budgets. This is because it neglects to factor in the highly uncertain impact of methane on net radiative forcing. The current state of knowledge about wetland carbon sequestration and emission suggests that it is not yet possible to unequivocally assume that wetlands, as a whole, result in net negative radiative forcing. Recent research suggests a high degree of uncertainty surrounding carbon balance estimates for North American wetlands, including the rich peatlands mentioned in the comment, due primarily to their emissions of the more potent, but shorter lived GHG methane (Bridgman et al. The Carbon Balance of North American Wetlands. Wetlands 2006, 26(4), 889-916).	EOO

2	<p>The DEIS discussion of mineral fibers needs to be revised to accurately characterize applicable law and include important and available scientific information. The DEIS states that regulation of amphibole fibers is based on the District Court decision in Reserve Mining in 1974. In 2009, the Eighth Circuit Court of Appeals held that the Reserve case was “moot.” Legal determinations regarding mineral fibers from a moot decision regarding a different facility and based on 35-year-old science are not germane to the potential environmental impacts from PolyMet—particularly as more recent research and studies provide the best available information on this issue. The DEIS also is misleading in its description of so-called “MN-fibers” and “MN-regulated fibers.” No state agency has ever promulgated a regulatory definition of a “MN-fiber.” The DEIS discussion of fibers also is misleading and incomplete based on its failure to consider and discuss the most recent and relevant science available regarding the potential for health risks from fibers. The International Symposium on the Health Hazard Evaluation of Fibrous Particles Associated with Taconite and the Adjacent Duluth Complex—Regulatory Toxicology and Pharmacology Vol. 52, No. 1, October 2008 (“Symposium”), specifically evaluated the potential risks from taconite fibers and found that “fiber” emissions from Northshore Mining Company in Silver Bay, based on fiber emission levels that are many times greater than anticipated from PolyMet, do not pose a risk to human health or the environment in the area surrounding the facility. In fact, the Symposium describes the environmental risk of the “taconite-derived fibers” as “trivial.” Among the many specific findings of the Symposium’s researchers were the following: (a) “fibers” in the area are best described as “cleavage fragments,” which are separate and distinct from asbestos in their morphological characteristics and lack the carcinogenic properties of asbestos; (b) ambient “fiber” levels in the Silver Bay area are not significantly different than those found in other non-urban environments in the United States and Europe. In fact, the levels observed in Silver Bay are at what the World Health Organization considers the “low end” of “background” levels for airborne asbestos concentrations; and (c) a cancer risk assessment of environmental exposure in the Silver Bay area showed that even if one takes the overly conservative assumption that cleavage fragments generated at the Northshore facility have a carcinogenic potency equal to that of asbestos, the estimated risk of 0.24/1,000,000 cases would be comparable to the background rate of mesothelioma unrelated to asbestos exposure. The Symposium’s findings represent state-of-the-art peer-reviewed determinations that support that “fiber” emissions from PolyMet do not pose a health or environmental risk. The Final EIS should thoughtfully consider and address these relevant findings.</p>	EOO
3	<p>Comment: The analysis provided on p. 4.11-3 (section 4.11.3.1) states: “The upland forest communities surrounding the Mine Site to the east, south, and west would shield groundlevel views of the Mine Site in those areas...Potential users on elevated terrain to the east, north, or west of the mine would have a limited view of the mine and stockpiles.” This assesses receptors in publicly accessible areas other than those explicitly mentioned in section 4.11.1.1.</p>	EOO
4	<p>The statement in DEIS Section 4.13.3.1 that “it is unknown if the slimes layer exists under the facility” is incorrect and may lead to the erroneous conclusion that a significant data gap exists in the DEIS analysis. To the contrary, part of the additional geotechnical exploration performed in 2007 in the tailings basin was specifically targeted at Cell 2W, the area proposed for the Hydrometallurgical Residue Facility. As a result of this additional geotechnical exploration and from review of other historic tailings basin information, it is known that slimes exist under the proposed Hydrometallurgical Residue Facility location. Geotechnical modeling to evaluate the impact of the slimes on the stability and integrity of the proposed hydrometallurgical residue cell liner system was conducted for a worst-case scenario with only saturated slimes (no fine tailings lenses, though they exist rather frequently and aid in drainage and excess pore pressure dissipation) under the hydrometallurgical residue cell liner and dikes. This analysis will be made available as part of the FEIS and will be submitted as part of permitting to fulfill overall permit application requirements, thereby affording the public opportunities for further review and comment. Further, it is inappropriate to use the word “hazardous” when discussing the hydrometallurgical residue. “Hazardous” has specific regulatory implications when applied to discussion of solid waste; the hydrometallurgical residue is an Industrial Solid Waste and is not hazardous.</p>	EOO

4 Proposed designs of the waste rock stockpiles are consistent with those employed throughout the Minnesota Iron Range in similar, if not nearly identical, geotechnical and hydrogeologic settings. These designs have proven to be effective and stable for over 50 years such that failure of stockpiles of similar design is not reasonably foreseeable. Furthermore, given the characteristics of the stockpiled materials, consisting of silt, sand, gravel, cobble and boulder size materials, it can be anticipated that in the unlikely event of a slope failure, the failure will be relatively isolated and easily remedied. Therefore, such a failure would be unlikely to result in significant environmental impact. The addition of the stockpile liner systems and in particular the stockpile subgrade preparation that must precede liner construction will only serve to improve stability of the stockpiles. Existing evidence and subgrade improvement plans notwithstanding, it is routine for stability analysis to be performed and submitted as part of permitting, affording sufficient opportunity for further public review and comment.

EOO

4 A stability analysis has been performed and is presented in the following document listed in DEIS Section 7.0 References: Barr Engineering Company (Barr). 2009. "Preliminary Geotechnical Evaluation, Flotation Tailings Basin." GT01, Draft 02. March 18 The analysis presented in the Preliminary Geotechnical Evaluation was based on review of historic geotechnical information for the tailings basin and on the performance of additional geotechnical exploration in 2007 specifically in support of the DEIS and future permitting, including the following in-field testing: • Cone Penetration • Standard Penetration Testing • Dilatometer and Vane Shear • Seismic Shear Wave Velocity • Dissipation This in-field testing was performed at multiple locations within tailings basin Cells 1E, 2E and 2W. The in-field testing was supplemented with in-laboratory testing of tailings samples recovered from the field, which included standard materials classification testing and the following additional in-laboratory testing: • Triaxial Compressive Strength • Consolidation • Hydraulic Conductivity The cross-sections of the Cell 2E north tailings basin dam expected to exhibit the lowest slope stability factors of safety (Sections F, G and N) were analyzed using: • Effective Shear Strength Analysis (ESSA) • Peak Undrained Shear Strength Analysis (USSA peak) • Liquefied Undrained Shear Strength Analysis (USSA liquefied) The resulting slope stability safety factors as summarized in the Executive Summary of the Preliminary Geotechnical Evaluation report and as copied below were: Slope Stability Analysis Slope Stability Safety Factor Target Minimum Factor of Safety for Year 20 Proposed Conditions Section F Section G Section N ESSA ~1.5 2.63 2.86 3.22 USSA peak ~1.3 1.64 1.63 1.88 USSA liquefied ~1.05 1.055 1.06 1.11 In all cases the slope stability safety factors met or exceeded the target values. In the event that higher slope stability safety factors are desired by PolyMet for the USSA liquefied case and/or if performance monitoring during the life of the tailings basin shows slope stability safety factors lower than anticipated, the slope can be buttressed to improve safety factor values. A preliminary buttress design evaluation for the USSA liquefied analysis case was performed for the cross sections with the lowest safety factors (Sections F and G) in conjunction with the slope stability evaluation and the results are included in the following table, a copy of which has previously been presented to the MDNR: PolyMet's Consolidated Comments on NorthMet DEIS February 3, 2010 Page 55 of 61 Slope Stability Factor of Safety with Varying Buttress Height Top of Buttress Elevation (feet) Section F Section G Buttress Height (feet) Factor of Safety Buttress Height (feet) Factor of Safety 1535 48 1.06 31 1.06 1540 53 1.09 36 1.07 1545 58 1.11 41 1.09 1550 63 1.12 46 1.10 1555 68 1.13 51 1.12 1565 78 1.17 61 1.15 As evidenced by the summary of slope stability modeling results presented above and the evaluation presented in the Barr 2009 Preliminary Geotechnical Evaluation, Flotation Tailings Basin, the analysis that has been suggested has already been performed. This geotechnical evaluation will be resubmitted as a part of the application for a Tailings Basin Dam Safety Permit, which is the normal venue for agency review of such analysis, but also affording sufficient opportunity for further public review and comment.

1129 I am in support of the PolyMet Mining project. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. Based on the documentation outlined in the DEIS, I am confident that impacts to the air and water will be minimal. As a person who lives, works and plays in Northern Minnesota, I understand the need to ensure a safe environment project. Let's get on with a project that will do nothing but enhance the Iron Range. Thank you for your cooperation.

EOO

740	I request a time extension of 30 to 45 days for review of the EIS. I request more public meetings in more places to gather input. The current schedule is too limited. I request that the public meetings include the option for citizen statements and discussion in the open meeting.	PRO6
<b>Sender Last Name:</b> Piekarski		<b>Submission ID:</b> 3336
3629	In the past sulfide mining has caused extreme damage in the western United States. Letting sulfide mining occur near a pristine wilderness area such as the BWCA seems like we want to ruin our environment. Water is a resource that wars are currently being fought over, & we are thinking about letting people come in and potentially damaging it for several years into the future. I personally have been to the BWCA, & would hate to see it destroyed.	G7
<b>Sender Last Name:</b> Pier		<b>Submission ID:</b> 3129
3499	This is to express my concern about proposed mining operations in NE Minnesota. Information I have reviewed suggests that sufficient attention to negative environmental impact has not been provided. I have no confidence that the mining companies will adequately police themselves. I urge you to use extreme caution in assessing this proposal and to consider the potential for devastating and irreversible damage to this magnificent ecosystem.	G2,G8
<b>Sender Last Name:</b> Pierce		<b>Submission ID:</b> 2267
1860	The sulfuric acid and sulfates produced when the ore is mined will effectively contaminate not only drinking water and fish populations, but be devastating to wetlands and the St. Louis River watershed. The mining plan presented to the MN DNR won't prevent irreversible water pollution.	WR3D
2681	The PolyMet copper mine plan is being described by the mining industry as safe and of no threat to our water supply. However, similar mines (one in South Dakota) described as having low sulfur content in the rock have created very real acid mine drainage problems. We're told about 'new techniques', but studies have proved that this new technology is untested and false claims for it are being made.	G7
2682	Not only do our lakes, streams and forests provide a healthy tourist industry, they are a beloved part of our heritage here in the northland--enjoyed by the majority of Minnesotans. If we compromise our natural resources, there will be no possibility of renewal. PolyMet should be required to give letters of credit with no expiration date in amounts sufficient to ensure that no matter what happens to the company, state taxpayers don't get stuck cleaning up the mess.	G4
<b>Sender Last Name:</b> Pierson		<b>Submission ID:</b> 2859
458	According to the US Forest Service, this project will cause significant atmospheric haze from dust particles and other emissions. How will this be addressed, and what will be the impact on the area?	RFI,AQ5
2729	The Impact Statement predicts that the "West Pit" will begin discharging polluted water at year 65 and that arsenic, cobalt and selenium will exceed water quality standards.	WR3C
2730	There was little or no field sampling done on the movement of ground water through the bedrock. What are the possibilities of polluted mine drainage seeping into other areas, including the Boundary Waters?	WR2A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
2731	The Statement describes a relatively high sulfate concentrations in seepage from the Tailings Basin which would be released into the wetlands to the north and into the lakes downstream on the Embarrass River. What will the effect of this be on the fishing and other recreation activities in this area.	WR3A
3160	The Impact Statement talks of water from waste rock piles being polluted for up to 2,000 years (Table 4.1-45), yet no where does it provide for specific financial assurance from the mining companies for long term treatment or maintenance. Will financial responsibility for this be absorbed by the DNA?	PD4
3215	I spent most of my adult life making a living in northeast Minnesota...first in the recreational arena in the BWCA, then in the social services arena of the Iron Range. Coming from that background, I empathize with the arguments to explore mining development to ensure the survival of the communities in the region; but, one simple statement regarding the potential impact on what is being proposed with the Polymet mine: Last I heard, one should not eat the trophy trout that exist in some of the reservoirs created by the mining industry...and levels of toxic lead and mercury were remarkably high even in Birch Lake, due to the run off of decomposing mine tailings. One simply cannot assert that mining done on the potential scale of Polymet will not have the same effect. The evidence is right there in front of everyone. Learn from the past...and its immediate impact on the present. Do not add fuel to what is often a disregard of very real environmental concerns for relative short-term development benefits.	G1,G2C,G7A
3732	PLEASE DO NOT ALLOW THIS TO PASS! I have young children and if this passes, I will consider moving out of the area. I will not subject my children to this environmental disaster. I am currently not working and could possibly get a job to support my family if this does pass. But I'm not willing to trade the health of my children for a paycheck in my pocket. This project may produce numerous jobs but many people will leave and the tourists will stop coming, which will result in job losses for others. Please. Do not allow this to happen.	EOO,G1,G11
<b>Sender Last Name:</b> Pilipauskas		<b>Submission ID:</b> 1633
2054	With all of the sulfide mining that has taken place in the U.S and the consequences of those mines such as poisoning ground water and killing off streams and lakes why would we want to allow these kind of mines to drain into the Boundary Waters? Obviously they weren't allowed to mine in Canada for a reason. Tell them to go home and mess up their own water.	EOO,G7B
<b>Sender Last Name:</b> Piron		<b>Submission ID:</b> 1114
1220	I am writing to express my personal support for the Polymet project for the following reasons: 1. The Polymet project will provide several hundred high paying full-time jobs in the region that will benefit the local economies as well as Minnesota' - especially at a time when our country is in desperate need of good jobs. 2. The Polymet project will provide a reliable source of several metals critical to the production of electronics and other high tech components and products, thus reducing our dependence again on foreign countries that do not have our best interests in mind. 3. Polymet has complied with the regulatory requirements and deserves a chance to show that it can be both a huge benefactor to the regional and state economy as well as a responsible, caring steward of our natural environment. Please allow this important project to move forward at a time when our region, state and country truly need good jobs, economic development and a success story to celebrate.	EOO

3123 Non-ferrous mining in northeastern Minnesota proposal Dear Sir: This is not just another “iron ore” mining operation! Non-ferrous mining requires a process to separate the metals from sulfide minerals. If not done properly, the sulfuric mine drainage would cause irreversible groundwater and surface water contamination and other environmental degradation. The PolyMet Co. proposal for sulfide mining does not contain any examples of non-ferrous mining operations in Canada or the United States that have not resulted in environmental pollution including contamination of groundwater and surface water...during or after such mining. Supporters of the proposal believe that the opportunity to create new jobs far outweighs the potential threats to the environment and the company will be using “mining techniques that are much cleaner than those used in other countries”. However, the EIS does not state any of the older, present or newer technologies and methods have resulted in no introduction of hazardous material to the environment. In recognition of the environmental risks associated with this type of mining, other states have already established strict criteria for the permitting process for drilling exploration and mining of non-ferrous materials. They adopted these regulations fully realizing the tradeoff that was being made between needed jobs and maintaining a quality environment. State of Wisconsin Wisconsin has a “Mining Moratorium Law” that requires an applicant to provide examples of a mining operation in the U.S. or Canada that have not resulted in a significant environment pollution. The law includes specific qualifying criteria that must be satisfied in order for the example site, or sites, to be considered. The mining company must submit documentation from groundwater/surface water monitoring that includes data showing that: (1) An example mine has been closed for 10 years without the pollution of groundwater or surface water from acid drainage at the tailings site or at the mine site or from the release of heavy metals; and; (2) An example mine has operated for 10 years without the pollution of groundwater or surface water from acid drainage at the tailings site or at the mine site or from the release of heavy metals. In addition, the candidate mine or mines identified must be located in a sulfide ore body that together with the host rock has a net acid generation potential (i.e. the potential to create acid drainage). Furthermore, the candidate mine cannot be listed on the national priorities list of contaminated sites, and cannot be an operation for which the operator is no longer in business and has no successor that may be liable for contamination. The Department must verify the information and present its recommendations on satisfying the requirements of the Mining Moratorium Law before a mining permit can be issued. State of Oregon Oregon has established a Mined Land Reclamation (MLR) program which regulates mining that insures that off-site impacts (contamination of groundwater or surface water) and that the site is mined in a way that guarantees the reclamation of the site will be completed. It includes Best Management Practices (BMPs) that describe the mechanical means of minimizing or eliminating water-quality problems.

115 I think it would be good for the economy up there because jobs are needed, and I think they aligned my fears, what they were going to do to the environment, just by the methods that they are going to come up with and get the copper, minerals out. I think it would be real good for the area just to have the jobs and the economy. That's why I was for it, because I think it would really be good for the economy, because we need jobs up there. That's, basically, it.

167	We strongly support the Polymet project in Hoyt Lakes. We believe the draft EIS demonstrates that the impacts to the water and air will be minimal. Furthermore, Polymet is located on an existing brown field in an area where mining has occurred for over 100 years. The Polymet operation will impact the environment far less than the iron mining operation that occupied the minesite for the fifty years previous. A lot has been said about Polymet's proximity to the Boundary Waters. It IS NOT in the Boundary Waters watershed so this argument is nothing more than a red herring. Because the Northmet project will produce strategic metals essential to the American economy which are currently being imported, it is important to note we will no longer have to rely on foreign countries for these strategic metals. In an era where we are desperately trying to reduce our dependence on foreign oil it should be a lesson heeded. Besides, mining these metals in one country, processing them in another and then transporting them to the U.S. creates unnecessary greenhouse gas emissions. Foreign suppliers of these metals don't necessarily follow sound environmental practices, thereby creating a greater global environmental impact. We further believe that the benefits to be derived from the Polymet operation, such as providing livable wage jobs for over 400 people in an economy that desperately needs jobs; and injecting millions of dollars of state and local taxes into the state coffers at a time when the state badly needs additional dollars to operate should be of primary consideration. It will be a great boon to the local economy, encouraging growth in housing, retail development and hundreds of spin-off jobs. We on the Iron Range NEED this growth to survive and we've been patiently waiting for this interminable permitting process to be finally completed so we can get on with it. In closing, let me emphasize the we who live in Hoyt Lakes understand, perhaps better than anyone, the need to balance environmental concerns with the need to provide jobs for the region and we firmly believe that Polymet will take draconian measures to ensure that their operation will produce jobs and the metals critical to the United States in a responsible manner in accordance with Minnesota's strict environmental requirements to protect air, water and land.	EOO,G5

358	I live on the White Lakes chain. I know this is only the first request of many to follow. If this mine is permitted, there will be no way to save this area from degradation to the point that no one will want to be here. Don't do it.	EOO
429	I am concerned that the comment period is too short to allow adequate study and response to the DEIS. Please extend the comment period and take time to make the best decision possible considering the tremendous consequences to the area.	PRO6
2360	I am concerned about the need for financial assurance sufficient such that the citizens of Minnesota will not be left to clean up that remains when the Mining Company has taken it's profits and left the state (or declared bankruptcy). The EPA is developing rules to assess adequate financial assurance and the EPA believes financial assurance should be addressed in the DEIS, not later.	PD4

3766	Stuart Arkley, EIS Project Manager Environmental Review Unit Division of Ecological Resources Minnesota DNR 500 Lafayette Road Saint Paul, Minnesota 55155-4025 February 2, 2010 Dear Mr. Arkely, Please be advised that my wife and I DO NOT support the proposed Polymet sulfide mining operation in northeastern Minnesota. We have reviewed the Environmental Impact Statement and have concluded that it would be irresponsible to let this project move forward. Our land and water quality are simply too precious. Interestingly, this EIS reminds me of a similar EIS that I read years ago regarding oil exploration on the north slope of Alaska. The company, British Petroleum, assured everyone that they would effectively mitigate land, air and water quality and that no harm would be done to the environment. Imagine my surprise, or lack thereof, when the Anchorage Daily News reported about a spill that happened this past December. Their headline dated December 09, 2009 read, "Spill is one of worst on the North Slope." BP was fault. In fact, not only were they at fault, but they were still on probation from an even larger spill that occurred on their watch three years earlier. Time and time again we are promised one thing but delivered another. We cannot keep taking these chances, not when clean drinking water and our last remaining wild places are at stake. In closing, please know that I, (we), can always find other work, but we cannot just pull a new ecosystem out of our hats when something goes wrong. Thank you for your time. Sincerely, Chris and Catherine Pranskatis 2629 Van Vac Road Ely, MN 55731	EOO,G2,G7

308	I am writing you in regard to Poly Met Mining, Inc., North Met Project. I am the General Manager of Viking Explosives & Supply, Inc. in Hibbing, Minnesota, which provides explosives to the mining and quarry operations in Northern Minnesota. At the present time 30% of our employees are on layoff due to the reduced activity in the iron ore industry. We regard the Poly Met project as one of the only potentials to increase our production and employment. Hibbing, Minnesota at the present time has the highest unemployment rate in the State of Minnesota. The huge economic benefit that Poly Met will provide to our communities and educational system cannot be ignored. I recognize the need that the project be operated in an environmentally sound manner, as a graduate Mining Engineer and former General Manager of Raw Materials for LTV Steel I have had the opportunity to review their flow sheet and it is my sincere opinion that this project can be operated in a manner to minimize any environmental impacts. The critical need in our country for the metals they will produce is obvious. It is my opinion that their project should secure approval which will not only benefit us locally with jobs that are critically needed jobs but will be a domestic source of metals that are critically needed in our country.	EOO

Comment ID	Comment Text	Theme Codes
2	DEIS 4.1.2.1, Hydrologic Alteration of Streams, Lakes and Aquifers Impact Criteria, lists a series of parameters recommended for a “range a variability approach”, and states “The deviation from existing conditions, based on modeling, in the mean values of the hydrologic parameters help determine the degree of impact to stream ecology.” It is the tribal cooperating agencies’ position that there is no mechanism to accurately develop the data listed above. Field data collection is spotty or non-existent and the numbers used in this DEIS are derived from the MODFLOW groundwater model and XP-SWMM model. It is important to note that the MODFLOW model was developed to assess the rates of mine pit inflow and as such, the results it gives for areas outside the mine pit footprint are unsupported by data. The XP-SWMM is based on stream gage data that is 17 miles and 20 years distant from the proposed project. Therefore, the above listed parameters calculated for the Partridge River have little data to support them.	WR1E
2	The discussion of LTVSMC Tailings Basin seepage and exceedances of the mercury criterion is puzzling. In reviewing other permit applications and environmental review technical documents, Fond du Lac has heard repeatedly from the state agencies about taconite tailings’ affinity for sequestering mercury. Evidently seepage from the Tailings Basin (which currently holds only taconite tailings) contains mercury at concentrations that frequently exceed the applicable GLI standard (Table 4.1-30), but the discussion on page 4.1-48 includes completely contradictory information (“Mercury monitoring has occurred at the LTVSMC Tailings Basin and along the Embarrass River, which generally found mercury concentrations consistent with baseline levels....all samples were well below average concentrations in precipitation...”). Not only is this problematic for permitting this project, it also sheds doubt on other existing taconite operations and their lack of permit requirements to treat for mercury removal. Most of this region (the St. Louis River watershed) is not covered by the statewide mercury TMDL, and additional actions, both regulatory and watershed-based, must be employed to remove the mercury fish tissue impairment. It is irrelevant to compare tailings basin seepage mercury concentrations to ambient precipitation mercury concentrations; precipitation is not regulated through a NPDES permit.	EOO,WR4B,WR4E,FM1,F
3	DEIS 4.1.3.1 Proposed Action/Closure (Years 20-65) discusses process water (e.g. stockpile leachate) generation and required treatment at the WWTF, pumping to the East Pit, and flow through a passive wetland treatment system before filling the West Pit. The Band has seen no evidence presented of the long-term effectiveness of this treatment system, and in fact, a similar passive wetland treatment system employed to treat discharge from the Dunka Pit has not been effective in meeting effluent limits. The DEIS predicts that seepage from the Hydrometallurgical Residue Cells would cease after 34 years. It is the tribal cooperating agencies’ position that this 34 year timeframe is unlikely to be correct. Because all cap and liner systems leak, some pumping of water that enters the hydrometallurgical residue cells would be needed in perpetuity. This would be particularly true as the cap ages and develops additional leaks. Post-Closure (After Year 65) states that PolyMet would continue to collect and treat leachate....until monitoring show that treatment is no longer necessary to meet water quality standards”. Tribal cooperators note that stockpile leachate is predicted to not meet water quality standards for thousands of years (Table 4.1-41). Without a dry cap, Tailings Basin seepage will continue to occur; it is the tribal cooperating agencies’ position that water quality and hydrologic impacts to wetlands and the Embarrass River under this proposed alternative would be perpetual.	WR1A
4	Effect on Flow in the Embarrass River discusses alterations to flows in the Embarrass River due to seepage from the Tailings Basin during operations, closure and post-closure. It is the tribal cooperating agencies’ position that there will be surface water discharge to the Embarrass River. Aerial photography and state Public Waters inventory maps indicate that there is currently a direct surface water connection between the northwest corner of cell 2W and the Embarrass River. Aerial photos show that water discharging from the tailings basin follows a natural channel westward, through existing wetlands and intersects a channel that leads directly to the Embarrass River.	WR3A

4 Effects on Surrounding Groundwater Levels During Mine Operations states that “In this hydrologic setting, however, it is not practical to gather such locally variable input data for a MODFLOW model”. Tribal cooperating agencies disagree with this assumption. It is the tribal cooperating agencies’ position that in order to adequately predict potentially significant environmental impacts, hydrogeologic data must be collected that can be used as input to a MODFLOW model. Tribal cooperating agencies contracted with the United States Geological Survey (USGS) to review the uncertainty of the MODFLOW model and provide recommendations on how the model could be improved. The USGS report was submitted to the lead agencies in February of 2009 (USGS 2009, Letter Report reviewing PolyMet ground-water model. January 29, 2009). Tribal cooperating agencies organized meetings between USGS staff and participants in the EIS, including the applicant, to openly discuss all issues related to the USGS report, the MODFLOW model and the implications for the proposed project. The conclusions of the report and the meetings should be implemented so as to produce a useful model of project site hydrology. Tribal cooperating agencies believe that impacts to surface waters, groundwater, and wetlands for a project of this complexity demand a scientific, data driven approach rather than one based solely on professional opinion. Finally, it is the tribal cooperating agencies’ position that a robust groundwater model must be developed for this project in order to adequately characterize the potential impacts of various project alternatives to natural resources. The DEIS concludes that most surface water features, including bogs, are isolated and not affected by groundwater drawdowns (mine pit dewatering). As previously indicated, the empirical observations in the Adams 2009 email are insufficient to support the conclusions. The evidence presented in the email can be interpreted to indicate substantial impact of the Peter Mitchell Pits on adjacent lakes. However, it is the tribal cooperating agencies’ position that aerial photography, without ground verification or georeference is an exceedingly imprecise method for determining water levels in lakes and wetlands (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009). The DEIS also defers an analysis of hydrologic impacts until the future, relying upon monitoring to reveal impacts rather than developing strong predictive tools. It is the tribal cooperating agencies’ position that the DEIS should not rely on future monitoring to detect impacts as a substitute for the development of data and analyses that would reasonably identify and predict those impacts as part of a DEIS. Virginia Formation High Wall mitigation measures are discussed. Tribal cooperators strongly disagree with the assumptions used in the groundwater quality modeling for the mine site. It is the tribal cooperating agencies’ position that relying on the effectiveness of a technology with highly variable outcomes (limestone treatment) in calculating long-term water quality is not a conservative approach. The DEIS should provide a range of water quality results including the groundwater quality under a scenario where lime treatment and covering the Virginia Formation wall is ineffective. Effects on Upper Partridge River Morphology concludes that sediment deposition would only be temporary, and no other significant effects on river morphology would be expected. It is the tribal cooperating agencies’ position that the available data do not support the conclusions presented in this section. The impacts predicted by technical reports (RS73B) to the Partridge River are primarily reduction in base flow due to mine pit dewatering and those impacts are predicted by the MODFLOW model. MODFLOW modeling in (RS22-Appen.B) forms the foundation for the predicted impacts. The MODFLOW mod

5	West Pit Overflow again discusses the passive wetland treatment system as the mitigation for water quality impacts. Tribal cooperating agencies believe the characterization in the previous paragraph is misleading. First, as previously indicated, the WWTF would need to operate for a minimum of 2000 years in order to treat leachate from the stockpiles. Second, the effectiveness of the passive wetland treatment system has not been demonstrated and it is likely that the wetland treatment system would not function as the applicant has suggested (see discussion below). Finally, the long term water quality of the pit lake is a concern. It is unlikely that this water would ever meet surface water quality standards. It is the tribal cooperating agencies' position that the DEIS should discuss the implications of leaving a polluted pit lake at this site in perpetuity. The DEIS notes that "passive treatment is an important component of the MnDNR's regulatory goal of minimizing or avoiding the need for long term maintenance. Constructed wetlands performance, however is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards. Based on these uncertainties, it is the tribal cooperating agencies' position that primary water treatment at the WWTF would need to continue for thousands of years. This does not meet the Minnesota goal for maintenance free closure. The DEIS identifies a potential for water quality standards exceedances in an unnamed tributary. It is the tribal cooperating agencies' position that all waters of the state are protected by Minnesota water quality standards and using this unnamed water as a mechanism to dilute mine related contamination is not appropriate. In addition no flow information for this unnamed water is available. The DEIS states that "Water quality in the West Pit is expected to improve as oxidation would be negligible once the pit walls were submerged." It is the tribal cooperating agencies' position that because of continued inputs from the stockpiles, the tailings basins, and the pit walls, the pit lake could exceed surface water quality standards for thousands of years. Tribal cooperating agencies note that 20 feet of pit wall will never be submerged and as such constitute a perpetual source of mine related contaminants.	WR3A
6	Embarrass River Water Quality Results It is the tribal cooperating agencies' position that because the Embarrass River already exceeds water quality standards, it would be difficult to permit the addition of additional contamination from new or expanded sources.	WR3A
6	Water Quality in the Lower Partridge River states that "All parameters are expected to meet surface water standards under all flow conditions for all mine years as is predicted for the Upper Partridge River and Colby Lake". It is the tribal cooperating agencies' position that contaminants from the project would contribute to exceedances of standards below Colby Lake. Wild rice beds are located on the Partridge River immediately below Colby Lake. Therefore, the State of Minnesota wild rice standard for sulfate of 10 mg/l should apply along all of the Lower Partridge River.	WR4F
6	Mercury in Surface Waters discusses uncertainty as to whether the West Pit overflow would meet the GLI standard for mercury, and recommends additional analysis. Fond du Lac agrees; tribal cooperating agencies take the position that the analysis should be incorporated in the DEIS so that environmental impacts can be predicted and reviewed by the public. This may be one of the most significant environmental impacts of the Project, and clear analysis of the probability of non-compliance with water quality standards is undoubtedly a subject that requires full evaluation in the DEIS.	WR3I,WR4A
7	Increased Sulfate Loadings concludes that "the risk of increased sulfate loadings from the Mine Site promoting methylation of mercury in wetlands is expected to be low." Fond du Lac strongly disagrees with this conclusion; the Band believes that any increase in mercury or sulfate loadings is a significant environmental impact.	EOO
8	Nondegradation Standards suggests that simply monitoring for mercury from future West Pit overflows is sufficient. Tribal cooperating agencies disagree with this approach. It is the tribal cooperating agencies' position that the determination of the final water quality of the west pit should be included in the DEIS so that potential water quality impacts to Lake Superior can be characterized. As a downstream water quality regulatory agency, Fond du Lac is specifically concerned about this project's potential for further degradation of our most important on-reservation fishery, the St. Louis River. Any additional releases of mercury, or loadings of sulfate that enhance downstream methylation of mercury and bioaccumulation in fish, is an unacceptable violation of our water quality authority. As we do not have delegated §303(d) CWA authority, EPA Region 5 will be calculating a mercury TMDL for the Fond du Lac reach of the St. Louis River, which is impaired for mercury in fish (Fond du Lac has concurred with the state of Minnesota's impaired waters lists on our shared waters for the last three iterations).	WR4B,WR4C

9	DEIS 4.1.3.2 No Action Alternative/Effects on Groundwater states that “The monitoring data that are available do not suggest regular exceedances of groundwater evaluation criteria at downgradient evaluation points (e.g., property boundary). It is the tribal cooperating agencies’ position that data collected in 2009 show that private wells north of the basin have been impacted by historic tailings basin effluent. Although two additional groundwater samples north of the basins collected in 2009 indicate that exceedances exist at the property boundary, the full extent of the contaminant plume has not been defined. This section also predicts that over time, concentrations of groundwater contaminants from the LTVSMC tailings would diminish, “but the relatively high concentrations of aluminum, iron and manganese currently found downgradient of the Tailings Basin may reflect natural conditions in this area.” It is the tribal cooperating agencies’ position that the available data does not support this claim. In addition, a basic assumption (i.e. plug flow [TB-14, July 2, 2009, page 9]) of the contaminant transport modeling at the basin (RS74) assumes that all constituents in the groundwater are the result of past and current seepage from the basins. This is yet another example of troubling inconsistencies in model assumptions and conclusions drawn in the DEIS. Fond du Lac disagrees with several of the key conclusions in Table 4.1-69, “Water Resource Impact Summary of the No Action Alternative”. The tribal cooperators take the position that the basins will drain until seepage equals precipitation at which point the hydrology will have returned to approximately pre-basin conditions. As seepage declines, as has been already seen over the past 8 years, surrounding wetlands will begin to recover from the previous hydrologic impacts. The tribal cooperators take the position that the assumption of plug flow in the contaminant modeling suggests that as precipitation becomes the dominant source of new water to the aquifer, groundwater quality may improve dramatically.	WR1E
10	Hydrometallurgical Residue Facility Reclamation: (Drainage) It is the position of the tribal cooperating agencies that these pumping and water treatment activities would have to be conducted in perpetuity, and that the cover and liner would require perpetual maintenance.	PD6
10	Flotation Tailings Basin: It is the position of the tribal cooperating agencies that in order to adequately assess post closure impacts, this section should estimate the length of time that seepage collection would be required at the tailings basin.	PD2
11	It is the position of the tribal cooperating agencies that: • The applicant has not demonstrated the effectiveness of the secondary wetland treatment system. • The characterization of post closure activities as “occurring for many years” significantly underestimates the potential long term impacts of the project and the potential need for post closure activities to continue for hundreds or thousands of years. • Other continued maintenance activities would also have to be conducted in perpetuity (repair of stockpile and tailings dike slope erosion, wetland and outflow structure upkeep, woody species and tree removal on stockpiles and hydrometallurgical cells with membranes, tailings pond maintenance, and seepage collection from the Tailings Basin. • If this project would require perpetual maintenance, it cannot be deemed to be “reclaimed” and would violate the stated goal of Minnesota’s reclamation statute.	PD5
12	The DEIS differs from previous drafts that we reviewed and provided comments to the lead agencies. This version states that “At the brownfield Plant Site, Cliffs Erie LLC would be required to complete closure and reclamation activities required under an existing MnDNR- and MPCA-approved Closure Program.” Yet, on page 3-19 of the DEIS, it is stated that PolyMet “owns or leases 15,100 acres of which approximately one-third is predicted to have ground-level disturbance due to Project operations. Most of that area that would be disturbed has already been impacted by LTVSMC operations”. The July draft EIS included discussion of PolyMet as a responsible party for closure and reclamation activities under the VIC (Voluntary Investigation and Cleanup) program. It appears that any reference to PolyMet’s liabilities for the acres they have acquired has disappeared from the DEIS. Under NEPA, hazardous waste sites are “unequivocally relevant to future use of a site”, and in fact should be driving the decision-making process.	PD3
12	Tribal cooperating agencies disagree with the assumption that the proposed project would only result in social and economic benefits. The environmental impacts of the project on the 100 Mile Swamp, an undisturbed and very high quality wetland complex, would constitute a social impact. Furthermore, economic development that is not centered on heavy industry (tourism for example) would be adversely impacted by the project. At the end of the project life, there would also be negative economic impacts as the surrounding communities deal with the loss of primary employment and economic revenue streams that were dependent on the Project.	PD5

Comment ID	Comment Text	Theme Codes
13	It is the position of the tribal cooperators that water treatment of the discharge would be required to comply with the wild rice water quality standard. The Partridge River contains several wild rice beds immediately downstream of the proposed discharge point. In the discussion of demonstrating a Permeable Reactive Barrier (PRB) north of the tailings basin, the DEIS notes that it may require periodic recharging. The tribal cooperating agencies' position is that if this PRB is a proposed mitigation for an identified significant environmental impact, then the DEIS should include explicit estimates of how often "periodic recharging" would need to occur.	G1
13	Tribal cooperating agencies note that although they participated in the identification of potential mitigation measures for the tailings basin, they did not participate in the development of the tailings basin mitigation design. In addition, it is the position of the tribal cooperators that an untreated discharge of contaminated tailings basin water to the Partridge River in order to dilute and dispose of tailings basin water would have environmental impacts that must be avoided in order to adequately protect the environment	PD3
14	It is the position of the tribal cooperating agencies that this alternative was eliminated prematurely and without sufficient consideration. We note that analysis of unquantified environmental impacts, values, and amenities have not been evaluated as required by CEQ regulations. A study of this particular deposit was performed by U.S. Steel that recommended underground mining. By examining cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative. Under §404 of the Clean Water Act, the USACE is required to identify the "Least Environmentally Damaging Practical Action". Economics can play a role in determining the feasibility of an alternative, but it cannot be the sole source of making that determination. The economic analysis presented in the DEIS is flawed, because it does not take into account the money and resources saved by doing underground mining (reduced mitigation costs, etc.) 40 C.F.R. 23.10 (a)(2) "An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. The DEIS includes information comparing the initial capital cost of underground mining as compared to open-pit mining, but does not consider any other pertinent costs, such as wetland mitigation, wastewater treatment, pollution prevention and remediation, mine closure or reclamation or costs to purchase and exchange public forest lands. It is not possible to determine, based upon information presented in the DEIS, whether any of the costs associated with greater environmental risks of open-pit mining are included in the "unit costs" per ton from which the DEIS concludes that underground mining is infeasible. While the DEIS discusses the decrease in recoverable ore tonnage resulting from preserving pillars of ore left in place for geotechnical stability, it does not discuss the potential that open-pit mining methods to the depths specified in the DEIS will leave substantial ore reserves at depths inaccessible by open-pit mining. Although a consultants' memorandum is cited, the DEIS provides no basis to determine whether an independent review of feasibility of underground mining was performed, and includes no data pertaining to metals commodity pricing, costs of ongoing operations and reclamation, or profitability over time as a basis for determining whether underground mining is infeasible or simply less profitable than the proposed open-pit extraction. The DEIS does not diminish our concern that greater feasibility of open-pit mining may largely be attributed to the company's gross underestimation of future costs of long term water quality treatment, mine closure and reclamation.	PD5

14 Baseline. The baseline data for both the mine site and the tailings basin are sparse. A comparison of hydrologic data that was collected for two other projects in the region (GLIFWC letter to Jon Ahlness and Stuart Arkley, February 6, 2009) demonstrates that the PolyMet project is data-poor in the area of basic hydrology. The use of flow data on the Partridge River from a site twenty years and seventeen miles distant from the proposed project does not provide sufficient information to allow a full assessment of the hydrologic and environmental impacts of the project on the Partridge River. The lack of groundwater level data in the surficial aquifer and in the bedrock, except in the immediate vicinity of the mine pits, does not allow for a full or complete characterization of the watertable or the potentiometric surface in the bedrock or the surficial aquifer. The current bedrock groundwater model calibration to shallow wetland piezometers cannot be justified. The lack of groundwater level data at the tailings area except in the immediate area of the tailings piles prevents complete characterization of water tables, potentiometric surfaces, and groundwater flow direction. The dramatic scarcity of hydrologic data for the PolyMet project, both at the mine site and at the site of the tailings basins has been repeatedly recognized by hydrologists at technical meetings. Limited data collection to fill in the data gaps has recently been conducted and in general not incorporated into hydrologic analysis of the mine or plant site. Analysis. Hydrologic characterization using MODFLOW models was done for the immediate area of the mine pit and the tailings pile only. There are no groundwater models that were designed to characterize the watertables, the potentiometric surface in the aquifers, fluxes to rivers and streams or to predict impacts to the water tables or surface waters. The MODFLOW groundwater model at the tailings area is restricted to the tailings pile and cannot be used to characterize groundwater flow direction, the watertables, the potentiometric surface in the aquifers, fluxes to rivers and streams or to predict mounding impacts to the water tables or surface waters. Data driven models need to be developed and these impacts need to be predicted and evaluated. The view that mine pit dewatering impacts will be very limited or non-existent (Adams, John and Michael Liljegren. 2009 "Additional PolyMet peatland data/information." email communication to Stuart Arkley, February 1, 2009) is based on the assumption that there is little or no connection between the bedrock and surficial aquifers (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009). However, the scant data that does exist characterizing mine site hydrology suggests that there may be substantial connection between the bedrock and surficial aquifers. Such a connection would mean that dewatering of the mine pits could cause significant drawdown of the watertable in the surficial aquifer. Data presented in RS02 indicates that ammonia can be found in deep boreholes. Section 3.3 Analytical Results, Pg.10 of RS02 states: "The water sample from boring 05-407M exceeded the criteria for ammonia (1,900 ug/l)"; and goes on to state, "The sample from boring 05-401M exceeded criteria for ammonia (610 ug/l)."; and "Water quality criteria were exceeded for ammonia, aluminum, copper, and silver in both boreholes."; and concluded that, "The presence of ammonia in the deep boreholes may indicate that the water in the borehole came from the shallow surficial deposits. Ammonia is not typically found in deep bedrock systems but is common in wetland environments." Similarly, technical document RS10 concludes: "The presence of ammonia nitrogen in the samples likely indicates that there is a hydraulic connection between the bedrock aquifer and the surficial aquifer; however, the nature of this connection cannot

15	<p>The old LTVSMC taconite mining and processing site encompasses approximately 60,000 acres. The PolyMet project would use some of the degraded areas of the old LTV site to develop the mine plant site and re-use the tailings basin. Groundwater contamination from the previous mining activities is still an issue near the LTV tailings basin more than twenty years after operations ceased. Because of the limited distribution of monitoring wells, the extent of the contaminant plume is not known. However, recent well data show that the plume extends in some areas at least as far as private wells along the Embarrass River. In the wells that do exist near the tailings basin, pollutants including iron, sulfate, manganese, aluminum, and fluoride exceeded drinking water standards. Recent wells near the northern property line show substantial contamination of the groundwater aquifer (Barr 2009, Memorandum: Results of Tailings Basin Hydrogeological Investigation. June 2, 2009). The baseline data on which to base estimates of the impact of the proposed project on water quality at the mine site and the tailings basins is insufficient. The existing analysis for the PolyMet project calculates the additional constituents that the project will add to groundwater but is unable to realistically estimate what the resulting water quality will be because background water quality has not been incorporated into the estimates. Private domestic wells lie between the tailings basin and the Embarrass River where tailings basin discharge water is expected to ultimately discharge. Some of the sampled private wells have contaminants at levels several times the drinking water standard (Barr 2009, Memorandum: Results of residential well sampling north of LTVSMC tailings basin. January 27, 2009) Samples from these wells show exceedances of manganese and close to exceedances of the arsenic standard. Once a groundwater flow model is developed that would show the direction and rate of groundwater flow, that pattern of flow should be used to plan a groundwater sampling scheme that would map the extent of the existing contaminant plume. This data and analysis should then feed into estimates of how the proposed project would interact with existing contamination. The combination of existing conditions with impacts due to the proposed project would show what groundwater quality can be expected during and post project. Surface water quality at the project has been poorly characterized or left uncharacterized. The limited data that exist suggest that surface waters are already adversely impacted by mining activity. Mercury, sulfate and specific conductance have exceeded Minnesota surface water criteria in surface water samples collected near the tailings basin proposed for use by PolyMet, at nearby Area Pit 5, and mercury exceeds surface water criteria in the Partridge River downstream of Colby Lake. However, no water samples have been collected from lakes near the tailings basin (Heikkilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings pile have caused contamination of those waterbodies. Contaminant transport modeling suggests that the PolyMet project will cause manganese, aluminum and sulfate to exceed standards. Proposals to collect data and monitor groundwater after the issuance of the DEIS would not allow for identification of potentially significant groundwater and surface water impacts, or provide this analysis and information to the public during the primary public comment period.</p>	WR1A,WR1E
15	<p>Tribal cooperating agencies strongly disagree with this conclusion (that the peat “bogs are isolated from the underlying groundwater, receiving virtually all of their water and nutrient input from precipitation”). It is the tribal cooperating agencies’ position that there is no data to substantiate this assumption. This assumption is based on incidental observation and the analysis of aerial photography, which is by its nature imprecise (Adams, John and Micheal Liljegren. 2009 “Additional PolyMet peatland data / information.” email communication to Stuart Arkley. February 1, 2009). Tribal cooperating agencies note that the wetland delineation indicates the presence of several hundred acres of cedar swamps and tamarack wetlands. These vegetation types, by definition, rely on an influx of groundwater to support them. Finally, tribal cooperating agencies note that the wetland delineation does not encompass all wetlands that are likely to be affected by the project. Because no initial determination of the projects area of influence (AOI) on wetlands was made, the site field surveys of wetland and other vegetation was limited to little more than the area within the project fence. The existing characterization of wetland and other vegetation does not cover even one-half the area that might reasonably be expected to be impacted by secondary impacts of the mine due to disruption of the existing hydrology. Around the tailings basin virtually no wetland delineation has taken place although wetland impacts from inundation are likely to occur. It is the tribal cooperating agencies’ position that any conclusions based on this aquifer test data have a great deal of uncertainty given the variability in the results (Table 4.1-3).</p>	WR3B,WR3N

Comment ID	Comment Text	Theme Codes
15	Tribal cooperators note that hydrologic data indicates that this aquifer is saturated by tailings discharge water. It is the tribal cooperating agencies' position that therefore, it is not possible for recharge from precipitation to occur.	WR2H
16	It is the Tribal cooperating agencies' position that the existing LTVSMC tailings are contributing substantially to the level of constituents observed in the groundwater. Unfortunately the modeling of PolyMet contaminants at the basins does not take these or other existing constituents adequately into account (RS74 and TB-14). The result of this oversight is that the contaminant modeling done by PolyMet comes to the illogical conclusion that seepage water from PolyMet, after passing through both LTVSMC and PolyMet tailings, will be cleaner than the existing seepage that is passing only through the LTVSMC tailings. According to PolyMet's consultant "the predicted concentration of seepage from the PolyMet basin is lower than the actual measured concentration of existing seepage".(TB-14, page 9). It is unclear how the addition of mine waste to the basins would cause seepage water quality to improve.	WR2F
17	Tribal cooperating agencies note that additional legacy issues exist. Over the many decades of operations at the tailings basin, thousands of gallons per minute of tailings basin water have been discharged through the bottom of the basin, into groundwater. This water has then moved downgradient and into surrounding wetlands and as stated in the water quality section below, ultimately reaches the Embarrass River. It is the tribal cooperating agencies' position that despite very limited recent groundwater sampling that shows groundwater contamination at the property line and at private wells north of the basin, the full extent of the contaminant plume and the existing contamination to groundwater has not been defined. The Band questions the conclusion on page 4.1-16, that "At Closure, all historic and any potential operational AOC's would be investigated and remediated as necessary." It is not acceptable to defer remediation of known contaminated sites from past mining operations until closure of the proposed project operations at some unknown future date. PolyMet's acquisition of portions of the Plant Site, as we point out in earlier comments, should also confer remedial liabilities with clear timelines for remediating those lands. The DEIS treatment of this critical issue – responsibilities for legacy contamination, and inclusion of existing contamination in the modeling and predictions of future conditions – is grossly inadequate. It should also be made clear to the public, and be a consideration for any future permitting, that Cliff's permitted facility (SW625) for land treatment of petroleum contaminated soils within Cell 2W of the Tailings Basin is by definition a hazardous landfill.	WR1E,WR5A
18	It is the tribal cooperating agencies' position that these patterns (streamflow records suggesting significantly reduced summer flow) are not representative of the Partridge River near the mine site. The gauging station is seventeen miles from the mine site and the data from that station are twenty years old and therefore, unlikely to be representative of current conditions at the mine site.	EOO
19	It is the tribal cooperating agencies' position that, as stated in Minn. 7050, the 10 mg/l of sulfate standard for wild rice applies for waterbodies where wild rice is found. The PCA has used this approach in past permitting activities (MINNTAC Schedule of Compliance, 2008). The 10 mg/l sulfate standard also applies to the Partridge River below Colby Lake where several wild rice beds are located. Tribal cooperating agencies note that the Army Corps has not completed consultation on cultural issues with the potentially affected tribes. This delay means that the extent of existing wild rice beds has not been fully characterized.	WR1E,WR4F,CR1,CR2
21	Tribal cooperating agencies take the position that the contaminant modeling for the project has not been adequately vetted, and consequently produces results that are illogical. For example, the contaminant modeling for the tailings basins (RS74B and TB-14) proposes that adding PolyMet tailings to the existing LTVSMC tailings will improve the quality of seepage coming from the basins for some parameters. The assumption (TB-14 of July 2, 2009, page 9) that PolyMet seepage water from the basins will be of better quality than the current seepage water results in an unexpected modeling result. The modeling proposes that the more PolyMet seepage that PolyMet releases from the basins, the better the water quality will be for Al, Mn and Fe in the Embarrass River (see Tables in TB-15 of June 24, 2009). It appears that the modeling at the basins does not appropriately account for leaching from the LTVSMC tailings when predicting future seepage quality.	WR2F

2650	Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State the Lake Superior basin. The MNDNR is supposed to endeavor to maintain, enhance and improve the opportunities for quality outdoors experiences. That doesn't seem to be the case here. Can anyone explain why this is so? Perhaps the DNR commissioner, Mark Holsten can do this. Ask him why he is in support of this project. Thank you.	G6,G7A
<b>Sender Last Name:</b> Przybylski		<b>Submission ID:</b> 155
146	My name is Paul Przybylski and I have lived in the northern end of Minnesota, being the Iron Range, for the last 32 years. And I have seen both good times and bad times up there; but I have always wondered why we have maintained basically a single industry economy up there, being the Iron Range. Efficiencies within the iron mines have led to a decline in our young people population in that area -- and also hard economic times during different periods of our history. I believe that PolyMet will help reverse the decline of our young people population in northern Minnesota and also will provide a tremendous boost to our economy. As far as the environmental issues, I honestly believe, having travelled the world quite a bit, including more extensively in the United States, that the state of Minnesota enjoys an excellent reputation as safeguarding the environment of not only Minnesota, but of the world. And that if we allow PolyMet -- the operations such as PolyMet to move into other parts of the world, we will lose control of environmental controls that we impose which I think will provide safeguards to prevent pollutions of any magnitude. And I believe that the management of PolyMet, through their continuous public expression of their willingness to safeguard and improve the environment will continue. And I do not think that the PolyMet operation will have a significant impact in a negative way upon Minnesota; but will only add to the diversity of our state and our reputation as being people concerned with the world and how we live. Thank you.	EOO,G5
<b>Sender Last Name:</b> Ptacek		<b>Submission ID:</b> 2850
3206	I would like to add to the public comments concerning the proposed mine. Employed as an outfitter in the BWCA wilderness for four years during college, I helped to facilitate thousands and thousands of visitors to the wilderness. The reasons these people headed north were many, including beauty, solitude, spirituality, and to smile at the simple pleasure of knowing that some areas on this planet remain free from the impacts of man. I know this area well and love it more than anywhere else on earth, and I am not the only one. This land's value is far greater than any amount of mineral in the ground; the pristine environment found in northern Minnesota is something that cannot be bought back if it is lost. Please take this into consideration before any regretful decisions are made.	G11
<b>Sender Last Name:</b> Quick		<b>Submission ID:</b> 3602
3310	The DEIS enumerates several anticipated water quality concerns for surface water, groundwater, wetlands and the greater St. Louis River Watershed, which empties in to Lake Superior, both during and after the mine operation . How will these be addressed?	RFI
3873	The MPCA and USEPA have been understaffed and under funded in recent years. A project of this scope with untested and unproven processes would require substantial and consistent monitoring to ensure the watershed is not being polluted. I ask "Are these agencies able to handle an increased workload given the current scope of funding?"	EOO
3874	In addition to substantial monitoring I feel there must be public access to the monitoring data.	EOO
3875	Long-term Local Finances Mining projects similar in scope to this project have left enormous economic burdens on surrounding communities resulting from environmental degradation and social impacts, especially after closure of active mining. PolyMet talks of long-term jobs being for 20 years. In the life of a community that is very short-term. The mining companies involved must be required to put sufficient funds into escrow to alleviate both environmental and social long-range impacts. Companies who have no local ties must be held accountable for the impact their operations will have on those of us who live here.	G1

3876 Environmental Degradation Several states have a moratorium in place on this type of mining because it has caused horrendous environmental degradation everywhere it has been tried. Wet environments are more negatively impacted by the release of sulfur and mercury than dry environments. PolyMet claims they have a new procedure that will limit the environmental impact. Is a system that drains into the world's largest freshwater lake the best place to test this possibility? G7B,G12

**Sender Last Name:**    Quiram **Submission ID:** 3488

1119 Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with the project. WI2

1324 It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes. Wisconsin has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings basin for the disposal of its tailings and toxic materials - but that the basin already has stability issues making it unsafe. GT2

3238 In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. As an avid fisherwoman who grew up along the Minnesota River and was cautioned about consumption limits, I have always found areas in northern Minnesota, especially the boundary waters, a welcomed retreat where I do not have to be so afraid of the long term consequences of enjoying the states natural resources. WR4B,FM1

3688 Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term treatment required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for postclosure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after Polymet is gone. PD2,PD4

3762 Having studied the effect of the release of sulfuric acid into the soils in the Mekong Delta in Vientam, I can tell you first hand that soils and waters containing sulfides exposed to oxygen are able to support a very limited biotic community. Further, the PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site – the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the economic necessity of mining, and need for natural resources in our society, we need to be responsible in our decisions. Certain types of mines should simply not be permitted in certain places where the risk to the environment is too great. This appears to be the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Sincerely, Gina Quiram G2C,G8C,G11

3568	I and my husband are natives to the Iron Range. My grandfathers both worked in the iron ore underground mines and then the open pit mines. They were immigrants from Slovenia. My father was a shovel operator in the open pit mines until retirement in 1969. They loved our land and taught our family to love our land. In order to maintain the population of the Iron Range, we need employment. If this Polymet project does not get the DNR go-ahead, the Iron Range will depend solely on the taconite industry, which has shown in the recent past that it alone cannot sustain a modest, let alone a vibrant economy for us and our children and grandchildren, who love this area as much as we do. My husband and I, along with one of our sons have been mechanical contractors, structural steel erection contractors and crane service for over forty years. Our other son is a heavy equipment contractor. We all love the Iron Range and would be against this project if we thought it would harm our home in any way. We have looked at the process to be used very carefully, and feel that it is the future of copper mining and not the 'bad boy' that the opposition is trying to make it. Please consider this comment in your decision.	EOO

327	Teamsters Joint Council 32 is writing to ask for your support for the PolyMet Mining Company's proposal to develop a nickel, platinum, palladium, gold and cobalt mine near Hoyt Lakes. We believe that PolyMet working with federal and state agencies on a draft Environmental Impact Statement (EIS), has demonstrated that this project could and will be environmentally responsible. The Building Trades in Minnesota are struggling. The economic recession has devastated the building and construction industry that has employed our members for many years. As many as 50 percent of building trades workers are sitting on the bench on any given day. This project offers our members some hope because it will require approximately 1.5 million man-hours of construction over a two-year period. This will be a huge boost to the economy, not only in the immediate area, but in all of Minnesota. PolyMet has made your job relatively easy by proposing a very environmentally friendly project. Much of the infrastructure for transportation and processing will be recycled from the old LTV plant. Stockpiles will be managed so water infiltration is minimized. In the remote event that any water does percolate through the piles, it will be collected and treated. Sulfur in the ore will be used as fuel in the process and waste streams will be managed. Air emissions will be much less than other facilities in the region- so much less they're considered a minor source. The draft environmental impact statement for the project has done a very thorough job of looking at all the potential impacts and offering options for mitigation, where appropriate. The draft EIS should be deemed adequate so that permitting can begin quickly- and so our members can start working to build the facility.	EOO

3557	<p>The undersigned RANGE ASSOCIATION OF REALTORS have and will continue to support the Polymet Project on Minnesota's Iron Range. There have been many man hours and many, many dollars applied to the Environmental Impact Statement as well as mounds of research to insure land, air and water quality for our current and future generations. This has been a long and tedious study and we are confident in PolyMet's due diligence. They have followed all of the Minnesota Environmental standards as well as all other guidelines set and re-set by our laws and regulators and regulations. This project is a THUMBS UP project in all it has to offer, not only in jobs to the Range area but also badly needed tax dollars to our state and county. In an economy such as our country is in and still facing it is imperative that this company move forward and begin production as soon as possible.</p>	EOO
<b>Sender Last Name:</b>	Rasch	<b>Submission ID:</b> 3561
3824	<p>I have been to every major presentation by the PolyMet or MiningMinnesota people regarding nonferrous mining in Minnesota that was possible to attend. I have seen the mine plan and process change as required by environmental concerns. I have been on the fringe of the mining industry in Northern Minnesota for years since my graduation from college as a mechanical engineer in 1970. I am aware of how things have changed environmentally in the industry in that time. What I see with the PolyMet people are a group willing to do whatever it takes to do the job right and adhere to not just specific regulations but the spirit and intent of the law. As I'm sure you know that has not always been the case in the mining business. Whether you are a conservationist, environmentalist, Twin City dweller, Native American or a working miner you should support this project. We have an opportunity to have the most environmentally responsible copper mine in the world today right here in Minnesota. Not only providing all the economic benefits to an area that really needs it but a show place for the world to see that copper can be extracted in a profitable, environmentally responsible manner. Please accept my letter of support for the PolyMet NorthMet project.</p>	EOO
<b>Sender Last Name:</b>	Rauk	<b>Submission ID:</b> 3108
3488	<p>I am writing in regards to the PolyMet mining project. I am opposed to the mining in northern Minnesota. As a Minnesotan, I love our state and what it represents. If we allow the mining of our Northern country, I am concerned about the air pollution, ash disposal, water pollution, and where all of Polymet's waste will go. Northern Minnesota relies on tourism and real estate business; I worry that sulfide mining could potentially kill those related industries. Our waters are already under great stress; the people of Minnesota spoke loud and clear last fall when we voted and passed a tax increase to take care of our water and the land that we love. To now allow mining companies to come into our great state is very counteractive to what we agreed to protect. I agree with Senator Tom Bakk when he said, "I live there; the last thing I want is to do something that has long term impacts to the water quality for my kids or grandkids." We are at a pivotal point as Minnesotans and environmentalist. We need to protect what is ours for the future of our children and grandchildren.</p>	G2,G7,G11

1817	I was born in Duluth, so Lake Superior is very important to me. I don't want to see this national treasure polluted with sulfuric acid pollution. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	G7B,G11
1818	Minnesota's lakes, rivers and streams are critical to the health, economy and future of our state. That's why we need to ask new nonferrous mining companies to take a little extra care when they begin operations near these precious resources.	G7A
<b>Sender Last Name:</b>	Redmond	<b>Submission ID:</b> 3296
761	I would like to join the many people requesting a longer period for comment on the PolyMet mining proposal--ie, a 90-day extension, coupled with better publicity re the proposed project. I have been a user of the Boundary Waters for 45 years, have done my best to support local businesses in the North as part of this commitment. And, I recognize that the BWCAW is truly a unique area in this nation, if not the world. From what I've read, it does not seem that the mining could be done without substantial degradation of the waters nearby. I would like to see more scientific evidence that these uses are compatible. I would also like to see more informational and public participation meetings scheduled, before such a decision is made. We lose nothing by gathering more information. We could permanently degrade a treasure by rushing. Thus, as it now stands, I strongly oppose granting PolyMet's request.	PRO3,PRO6
<b>Sender Last Name:</b>	Reed	<b>Submission ID:</b> 3572
1973	1. PolyMet should be required to grant financial assurances (in excess of \$100 million) that might be required to clean up the operation in 20 years from now. This money should be to protect the taxpayers. 2. I am concerned about open-pit mining on the Superior National Forest land and ruining this prime natural resources 3. Upon reading the DEIS, it appears there is concern about mercury levels. This is of great concern. 4. I am concerned about other pollution mentioned in the DEIS.	WR3I,PD4,FM1

3821 I support the Polymet project in Hoyt Lakes and believe the draft EIS demonstrates that the impact to the water and air will be minimal. Furthermore, Polymet is located on an existing brown field in an area where mining has occurred for over 100 years. Much has been discussed about Polymet's proximity to the Boundary Waters, however it is not in the Boundary Waters watershed so this argument is unfounded. The Northmet project will help decrease the importing of strategic metals from foreign countries, who don't necessarily follow sound environmental processes. This, coupled with the decrease in energy used for shipping will help reduce global greenhouse gases. Most importantly, this project will provide living wage jobs for over 400 people in an economy that desperately needs them while injecting millions of dollars of state and local taxes at a time when state and local governments are facing revenue shortages and budget problems. And this doesn't even include the spin-off jobs and economic activity that will happen as a result of this project. The Iron Range NEEDS this growth to survive and has been patiently waiting for this interminable permitting process to finally be completed. I think everyone associated with this project understands and considers the need to balance environmental concerns with the need to provide jobs. I firmly believe that Polymet has and will take the necessary steps to ensure that they are producing jobs and metals critical to the US in the most responsible manner, following Minnesota's strict requirements to protect air, water and land.

762 Please take action to extend the public comment period for the Polymet mine, and present more public forums so citizens can find out more about this proposal. This mine may be only the first sulfide mine to be proposed for northern Minnesota, and people need to know exactly what such mines may do to this state.

PRO6

3586 We humans have done extraordinary damage to the earth that sustains us and to the creation God gave us to keep and till. We have forgotten that we are only one of many life forms here on this earth, and are intricately connected to all other forms, including those in the soil, water and flora. Sulfide mining is inherently dangerous to the surrounding environment, especially to the waterways. I seems to me we humans would examine very painstakingly any proposal that will further damage our life-support system. It is my understanding that the copper to be extracted is negligible in quantity compared with the amount of mining and rock disruption needed to obtain it, and the processing water. Further, Polymet is a Canadian company, and thus its permission to mine in the U.S. possibly opens the door to the rules of the Free Trade Agreement between U.S., Canada, and Mexico, requests for permission to mine in Minnesota by other multinational corporations, and rulings of the WTO which supersede those of individual countries let alone states. Consideration of this proposal seems to be mostly about jobs. Jobs of course are very important in today's high-unemployment economy, but in light of current knowledge about pollution and the high environmental cost of mining to any community in which it is located, and eventually to all of us, it seems wise to not allow Polymet to locate a mine in northern Minnesota. Therefore I ask that you diligently pursue the EIS in every regard with the aim of disallowing this mine.

1861 Mining copper and nickel in the Iron Range will cause sulfuric acid runoff which would enter the watershed, run into the St. Louis River via a tributary and from the St. Louis River into Lake Superior. Damage to plant and animal life would be irreparable. The sulfuric acid-polluted waters would require treatment "in perpetuity." Please do not use your position to sell out Minnesotans' precious waters to those who wish to mine Minnesota. Long term, safe drinking water for Minnesotans, NOT short term mining goals, is the legacy citizens expect and deserve from the DNR. I urge the DNR to adopt Wisconsin's standard and NOT allow sulfide mining anywhere in Minnesota, unless it has a proven ten-year, clean record.

WR3D

2685 What this type of mining will destroy in northeastern Minnesota, no man can replace. No one should take the authority to "approve" these mines.

EOO,G2

2939 What this type of mining will destroy in northeastern Minnesota, no man can replace. No one should take the authority to "approve" such mines.

3197 I have reviewed information on this and similar types of mining done at other sites in the US. I am concerned that the results at other sites have resulted in water pollution and damage to the environment that reclamation does not resolve. It is very disconcerting that approval could be considered for this project when the safety of the process has not been proven. I believe that MN should follow Wisconsin in requiring the mining company to prove the safety of their mining methods to people and the environment. Also, scientists have issued a statement asking for a ban on open pit mines. I hope that you will decide to take a very cautious approach and reject the PolyMet's environmental impact statement.

3738 The promise of jobs can be overwhelming and immediate needs can certainly cloud long term outcomes. Is there adequate funding now and will there be in the future to ensure total, complete and on-going monitoring by MPCA and USEPA? Is current knowledge adequate and testing methods available to absolutely know that the watersheds are not being polluted in increments undetectable until years after Polymet and others are gone? Will sufficient monies be held in escrow to (financially) prompt the companies to hold to their promises that mining will be done safely? Do we really know what hazards, impacts, outcomes will result? Best guessing, even by the best environmentalist, scientist, and very learned people have, at times, been totally disproved with costly results. This is not a 20 year project. The legacy of decisions made now will forever impact the future of this very sensitive, unique and beautiful area. I, personally, feel a responsibility to the future of this area . Does Polymet feel the same?

119	Our entire family is from the Iron Range. We have been mining for years. We, obviously, feel there is things to protect the environment, and we do it the right way. And we believe that, you know, we need jobs up there. If we could, we would move up there in a heartbeat, but we need to make a living, and right now there is no way to do that up there. We think PolyMet is a good company, and if they do everything correctly, we would have so many jobs for people up there. That's it.	EOO
2626	I grew up on the Iron Range. We've mined up there for years, many years. I have family that worked in the mines. You know, I think that the mining industry is a safe industry. They do a -- they do a fine job of protecting the environment, protecting -- protecting everything that they can, and I think that this is a value that a employer, future employer of the range, and I feel that this is an opportunity for my wife and I to possibly move back up to the Iron Range where we'd like to raise our family.	EOO

19247	DEIS 4.1.3.3 Mine Site Alternative again suggests that monitoring is sufficient to ensure the effectiveness of the lime treatment of waste rock stockpile leachate. Tribal cooperating agencies disagree with this approach, and take the position that the effectiveness of lime treatment is very important in the final water quality of mine effluent. Therefore, this analysis should be conducted prior to the construction of the facility, and the results included in the DEIS. Fond du Lac also disagrees with the proposal to apply a vegetated soil layer over the waste rock stockpiles. The tribal cooperators take the position that the effectiveness of the evapotranspiration caps has not been demonstrated. Tribal cooperating agencies have requested that this analysis be done (GLIFWC Comment letter of June 30, 2008 and GLIFWC comment letter of February 6, 2009).	WR2L
19248	Effects on Surface Water Quality within the Partridge River Watershed concludes that "both the Proposed Action and the Mine Site Alternative would comply with all surface water quality standards along the Partridge River." Tribal cooperating agencies note that wild rice grows on the lower Partridge River. Therefore, it is the tribal cooperating agencies' position that the wild rice sulfate standard applies and the mine site alternative effluent would exceed that standard (Table 4.1-74).	WR3C
<b>Sender Last Name:</b> Reutter		<b>Submission ID:</b> 3093
3033	There was little or no field sampling done on the movement of ground water through the bedrock. Since the mine and its waste storage site sits nearly on the continental divide it should have been determined if there is any chance that polluted mine drainage (including acids, metals, or sulfates) could move in the rock over time to the north and into the Boundary Waters watershed.	WR2A
3476	This is not a proven large scale mining process.	EOO
3477	The state of Wisconsin banned this type of mining due to the sulfite leakages into the ground water.	G7A
3478	Finally, mining like before will eventually expend the available natural resources and close down. It would be a public disaster if the BWCA were lost to future generations because we allowed mining operations during a brief period of time.	G11
3487	The DEIS does not outline any specific plan for reclamation after the mine site is closed. In the same vein there is no specific mention of the method or amount of financial assurance that the mining company will need to set aside for the potential disasters after closing.	PD3,PD4
<b>Sender Last Name:</b> Reynolds		<b>Submission ID:</b> 3447
3667	I am just a citizen concerned about the potential environmental and financial hazards to this state if we go ahead with this project. I have yet to hear or read about any non polluting form of this kind of mining. And the citizens are always left to finance the cleanup. I am sure this is about jobs, and I am sure folks in Northern Mn do not want to hear from the big city folks in the Twin Cities. But the taxpayers of this STATE will have to pay the price to clean this mess up, because there will be a mess. And I am a taxpayer.	PD4

2492 I have been a longtime resident of Minnesota, and I have been visiting the BWCA since 1980, and it has made an enormous impact on my life and the lives of my children. The area in and around the BWCA is very important to me, and I consider it a precious resource that is unique in the United States. We have very little unspoiled wilderness remaining in our country, and by protecting the area, we can provide a very special experience and reminder for future generations. We are already dealing with challenges due to water level changes and acid rain effects within the BWCA, and risking further impacts from projects such as the proposed mining activity strikes me as unnecessary and unwise. It upsets me that we may be making short-term financial decisions due to the economic crisis our country is facing without properly considering the legacy we wish to leave for the future.

2675 This letter is being written to fully support Polymet's effort to obtain mining permits. I am an insignificant stock holder but have been touched by the importance of the Polymet project. I do not have engineering degrees or expertise in the mining arena. I do have a very strong opinion on where our nation as a whole is heading. This year the United States have become more and more dependent on foreign governments. This has been through energy, mainly oil, debt, mainly incurred this year, and most important to this subject, raw materials, the same ones that will be mined by Polymet. As I see it we have a company requesting to mine ores by utilizing an existing facility tailing basins, power lines, etc. so minimal new ground is required to be disturbed. They have spent millions of dollars so far to make sure they will be probably the most environmentally responsible mining company ever in the United States if not the world. They are employing environmentally smart mining processes throughout. Our country is subservient to foreign governments for our oil since drilling from our vast supplies have been hampered or squashed by 'environment concerns'. These 'environment concerns' also want to squash the Polymet project. Many of the very ores that Polymet wants to produce is currently being obtained from foreign governments, some which are hostile to the United States. The United States should never be held hostage by any foreign concern. I was privileged to have had a tour of the Polymet facility. The journey there went through miles and miles of economic desolation. It was evident that economic prosperity had become a dim dream. Until then I was never in a casino that didn't have people waiting for a seat. The casino at the hotel was like a ghost town. Even after being awed at the tremendous magnitude of the reused facilities, I was really touched by talking to a few of the men currently hired by Polymet. They were seasoned miners that were almost giddy over having a job in their field of expertise and the prospect of being there with their friends for many more years. Their dreams may become a reality. It's now become personal. This is one of the best chances I have ever seen for the United States to become independent again at least in this field of raw resources. As global demand for raw resources will dramatically soar over the next few years, Polymet will help put the United States in control again leaving the foreign governments being dependent on us. Isn't that a welcomed reversal of the current trend? Polymet will also help thousands of local residents support their families and start to rebuild their lives. You have a company that wants to do the right thing for the United States, the state of Minnesota, the environment, and the residents. Please make a difference and issue the mining permits for Polymet.

3465	I have personally seen the results of such mining operations in Canada. The environment for almost 50 miles in all directions is completely destroyed. Trees are dead and wildlife is non-existent. It is unthinkable to allow such mining in our beautiful state just south of the Crown Jewel of Minnesota's tourism industry the BWCA. If this issue is really about offering jobs to the area then a better solution would be to lure Green Energy industries to the area to manufacture wind turbines, solar panels, and geothermal equipment thereby providing jobs and not destroying the environment. Our neighbors to the east of us, Wisconsin, has laws on their books explicitly forbidding this type of mining. Why would Minnesota even consider it? Kansas, California, Vermont, Michigan...etc. are locations of former sulfide mines that are 6 now Superfund sites awaiting clean up. Many of these location can never be cleaned up because of acid and heavy metal penetration into the aquifer. Do we really want to risk long term degradation of our natural resources for short term economic gain? Please do not allow passage of any legislation allowing this form of mining in our beautiful state. If it must be considered then DEMAND than an Environmental Impact Statement be prepared for review before any legislation is passed.	EOO,G1,G2C,G7A,G12
<b>Sender Last Name:</b>	Rich	<b>Submission ID:</b> 2792
3192	Along with all of these aspects of your decision, I strongly urge you to consider this: the Boundary Waters and Lake Superior coastal areas have long been home to many people seeking recreating and a back-door to the wilderness. Please don't let this be taken away from my brothers, sisters, and I. Keep the environment in mind and also let it be known that the Boundary Waters is my second home.	G11
<b>Sender Last Name:</b>	Richardson	<b>Submission ID:</b> 2314
2763	I have been hearing rumors that the Minnesota Boundary Waters area is at risk of environmental contamination, and have had it confirmed when hearing about happenings such as the NorthMet mining project. I would like to voice my opinion regarding the current events as one who knows the true value and beauty of the Boundary Waters and appreciates its singular place within Minnesota and the entire United States. Simply put, I feel the very idea of allowing a reputable pollution practice to occur anywhere near a wilderness area such as the Boundary Waters to be outright embarrassing. The idea that this practice is even being considered in such an area shines a poor light on Minnesota resource management. We know the risks. The damage has happened time and time again across our country, despite the promises of the mining promoters. I am disappointed that there is talk about throwing away future generations of soul-edifying experiences in exchange for a short-term economic stimulus package. I understand that creating and maintaining jobs in the area is a significant stress. This mining project, and others like it, however, is only a short-term solution. It is exchanging sustainable practices such as ecotourism for a relatively few years of economic gain. Is this project really worth so much, and our awe-inspiring wilderness area worth so little? I whole-heartedly encourage and support all efforts to maintain the Beautiful Boundary Waters wilderness area in it's current state, rather than sacrificing one of the most gorgeous places in the country for a few dollars gain.	G7,G11

3236	<p>I have read the draft EIS for the Northmet project and I have concerns about this project's impact on the environment in which I live. It is not in the best interest of my community or the Iron Range to create jobs at the expense of our health and water quality that is all we have. As I read the impact of the project on ten of the fourteen resources evaluated, I was stunned. Those that concern me most are: Mine site Groundwater Quality, antimony, manganese, and nickel predicted to exceed USEPA primary Maximum Contaminant Levels or MDH Health Risk Limits potentially FOR THE LONG TERM at the Mine Site. What will this mean for the health of the workers? And how will the sulfate would exceed the groundwater evaluation criteria? impact the entire watershed? (page S8) Groundwater Levels Downgradient of the Tailings Basin seepage would exceed aquifer flux capacity resulting in significant seepage upwelling and wetland impacts. Seepage of toxic chemicals will put our water quality at risk. (S8) Mercury methylation risk from high sulfate concentrations in seepage from the Tailings Basin released to wetlands (S9) and to the entire chain of lakes (S10). Fishing is a major tourist draw as well as a subsistence means for local tribal groups. Endangering fish is not in the best interest of our population nor our economy. I know that jobs vs. the environment is an ongoing tradeoff. But I teach environmental sociology and I also know that jobs rarely win in the long run. We must learn from other areas of the country where jobs were once thought to be more important than the environment. The jobs go away, and are predicted to last only a generation for this mine; the environmental damage takes many generations to mitigate, if that is even possible.</p>	G1,G2C,G7A,G11

3372	<p>I don't know a lot of the technical and deep-thought comments, but I would really prefer that this mining project doesn't go through. A few years ago I was introduced to the BWCA through the Wilderness Canoe Base at the end of the Gunflint Trail. It has made me a better person inside and out. To see the world's wilderness in such a beautiful way is amazing. This area has changed me and caused me to look at the world in a different way. I just want you to know that this mining project shouldn't go through because of its significance to my life and thousands of other lives. The Boundary Waters is a place of peace for us and we would hate to see it go away. I hope what I have said is at least considered.</p>	E00
<b>Sender Last Name:</b> Ringer		<b>Submission ID:</b> 3508
3694	<p>I live approx. 25 miles SE of the proposed Northmet mine site, and I have concerns about the whole project. 1. Money needs to be set aside for any cleanup costs that will be associated with this type of mining, and we know there will be environmental cleanup needed. 2. I am concerned about the other mining interests that are keeping a close eye on the Polymet project. Some of the other companies are interested in areas that would have any acid mine drainage heading thru Birch Lake and into the BWCA wilderness. 3. I am concerned about the DNR mineral rights leasing process. Our property was put on the lease rolls at the sale in Jan. 2009, and if we weren't so diligent about obtaining information for this whole process, we would not have known anything. 4. I am concerned that mining companies have too much power and control, and can dangle the carrot of new jobs, and the range communities gobble it all up, without looking at the bigger environmental picture. 5. I am concerned about the current Dunka mine site, and what it is leaking into the ground.</p>	PD1,PD4,G4A,G8C,G9,G13
<b>Sender Last Name:</b> Riordan		<b>Submission ID:</b> 2192
2598	<p>MR. RIORDAN: My name is Brian Riordan, R-I-O-R-D-A-N, of Esko, Minnesota. I am here to state that I wish for the PolyMet North project I would like it to go ahead and get their permitting in place so that myself, being a resident of Northern Minnesota, and my children and other people in the areas can benefit from the resources that are there for us to use. I think that the way that things are going to be mined in the area with the newer technology and the newer regulations, that it would be a safe and beneficial way to use the minerals that are in the area for the public benefit. I see no reason for not granting PolyMet to do this sort of mining in the areas and other ones also. The area has been used as open pit mines for many years, and there is no reason that they shouldn't be able to go ahead with the mining. Thank you very much.</p>	E00

1313 There is a history of water pollution and environmental degradation associated with sulfate mining. There simply is no guarantee that our waters will not be degraded – harming fish and wildlife. It is incredibly short-sighted to allow long-term damage for short-term gain. Water from waste rock piles will be polluted for up to 2,000 years. Minnesotans & future Minnesotans shouldn't be burdened for the benefit of a foreign company. We will be left with a mess to clean up.

G2C,G7A

30 I would like to say that I strongly support the PolyMet project. I worked at the former LTV site for ten years and currently work for U.S. Steel at Minntac right now, and I'm very confident that the material could be mined in such a way that would be environmentally friendly, and I'm sure that the mining company would try to do it the right way that it needs to be done. And that's all I have, I guess.

EOO

**Sender Last Name:**    Roalson **Submission ID:** 338

359 I am in favor of PolyMet's NorthMet project being approved for facilities/plant construction and mining activity. As long as PolyMet meets the safety and environmental criteria as laid out, and the DNR & MPCA continually monitors their compliance, the mining of non-ferrous metals should go forward. In addition, I propose that it be enacted, if possible, that the copper products such as wiring and tubing be made right here on the Iron Range for a strong value-added economic effect for this region and the whole state. There are strong environmental groups, however, that are dead-set against this project. To them I would say, "If we do not go forward with this now, the minerals will be mined elsewhere in the world, and monetary gains will benefit a dictatorship, warlord, or a terroristic network, and the environmental damage will be catastrophic due to no environmental oversight at all." (Worse than China today).

EOO,G1

1 The result of all these gaps in analysis is that, among other problems, the proposed action and the preferred alternative do not comply with the requirements of Clean Water Act ("CWA") Section 404(b)(1) guidelines.110 The CWA does not allow a permit when there are practicable alternatives that would have less adverse effects, when the Project would lead to a violation of state water quality standards, or when it would cause or contribute to significant degradation of waters of the United States.111 Significant changes in the design of the Project have occurred and other important information needed to determine the nature and magnitude of the Project's impacts has been developed since the public notice of the Project was provided by the USACE in May 2005. As indicated in the Tribal Position, 112 but omitted from the main text of the DEIS, 113 public notice for the Section 404 Permit should be reissued and that the Mirmesota Pollution Control Agency ("MPCA") should be afforded the opportunity to analyze and make a determination under Section 401 of the Clean Water Act.

2	A. Cultural resources. Section 106 consultation between the USACE and Tribes is ongoing. Therefore, despite significant changes through recent, increased consultation with tribal cooperators, the Cultural Resources chapter of the DEIS is still incomplete, and the requirements of the National Historic Preservation Act ("NHPA") 124 have not yet been fulfilled, and the Project cannot proceed until they are. Under the NHPA implementing regulations for the protection of historic properties, 125 the Band has been designated a "consulting party," and the lead agencies "shall consult with the THPO [Tribal Historic Preservation Officer] instead of the SHPO [State Historic Preservation Officer] regarding undertakings occurring on or affecting historic properties on tribal lands."126 Additionally, the lead agencies must consult with any tribes that attach "religious or cultural significance to historic properties that may be affected by an undertaking," regardless of the location of the historic property.127 The agencies must give a tribe "a reasonable opportunity to identify its concerns about historic properties, advise on the identification and evaluation of historic properties, including those of traditional religious and cultural importance, articulate its views on the undertaking's effects on such properties, and participate in the resolution of adverse effects."128 The regulations go on to inform agencies that they "should be aware that frequently historic properties of religious and cultural significance are located on ancestral, aboriginal, or ceded lands of Indian tribes... ," as in the Ceded Territory here. 129 One aspect of the identification of such historic properties is through gathering information from consulting tribes, through a variety of methods. 130 Where, as here, there are historic properties affected, then there is an entirely separate level of adverse-effects assessment that must be performed, again in coordination with consulting agencies. 131 In light of these rules, and as the chapter itself acknowledges, it is apparent that far more consultation and site work must be done to comply with Section 106.	AQ3,WI2,WI3
3	As the Band pointed out at least as early as its comments on the June 2008 PDEIS, the DEIS acknowledges that there are bald eagles that nest within 2.4 miles of the Project. 148 The Band is therefore concerned that this culturally-important animal could be subject to serious noise pollution or other habitat impacts, and further analysis must be done. Critical habitat, habitat segmentation, environmental mitigation measures, and changes in plant cover or forest type all fall under both the categories of traditional environmental and cultural analysis for purposes of the DEIS.	WI1,G3,CR1,CR2,CR4
4	11. Summary, Section III.B.2, p. S-10; The Tailings Basin and hydrometallurgical residue facility embankments may be geotechnically unstable due to the fines and underlying soils in the existing LTVSMC Tailings Basin. This potential problem is in addition to the potential problems created by storm events and/or flooding.	GT2
4	10. Summary, Section III.B.2, p. S-10; Potential loss of critical habitat for Canada lynx and gray wolf, and a greatly increased risk of vehicle strikes for these species are significant potential ecological impacts in the Mine Site area.	WI1
5	25. Section 4.1.2.1, p. 4.1-50; The DEIS states that "(t)here are currently no impact criteria for change in water levels", even though the DEIS acknowledges that drawdown in the Mine Site and groundwater level increases in other areas (e.g., north of the Tailings Basin) may affect surface water flows and wetlands. This is an issue that should be addressed at the DEIS stage, and criteria should be developed for changes in water levels.	WR3E
5	2. Sulfide mining and its attendant environmental degradation. It surprises me that Minnesota, as a way to create jobs for its citizens, is turning to an industry known for creating environmental degradation as part of its industrial processes. Wisconsin's experience with sulfide mining at the Flambeau mine resulted in the passage of the Mining Moratorium Law (s.293.50, Stats.). Why aren't we learning from Wisconsin's mining experiences?	G2,G12
6	2. There appear to be no contingencies for worst-case scenarios, such as flooding of pits or tailings basins.	WR3A
7	Similarly, the Draft EIS analysis for mercury and sulfates must also factor in the related impacts and contributions that would be created by the predicted water level fluctuations, which may be another major source of methyl mercury.	WR4A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
8	<p>The Draft EIS also fails to comply with NEPA by failing to disclose, address and respond to the credible scientific evidence strongly indicating that the wetland mitigation will be ineffective. See 40 C.F.R. § 1502.9(b) (agencies must discuss “any responsible opposing view”); <i>South Fork Band Council v. U.S. Dept. of Interior</i>, 2009 WL 4360798 (9th Cir. (Nev.)) at *6-7 (stating that an essential component of a reasonably complete mitigation discussion is an assessment of whether the proposed mitigation measures can be effective). As summarized by the Forest Service, “[f]urther analysis is needed to disclose how effective and reliable the [constructed] wetlands will perform in the field.” September 2, 2009 Forest Service Comments. For instance, in a 2001 report, the National Research Council found that “the literature on compensatory mitigation suggests that required mitigation projects often are not undertaken or fail to meet permit conditions.” Attachment 3 (“Compensating for Wetland Losses under the Clean Water Act”); see also, 1992 report by the National Academy of Sciences, concluding that “many [mitigation] projects fall short of the goal of returning ecosystems to the predisturbance condition, and there is indeed considerable controversy over whether or not wetlands can actually be restored”). The National Research Council further found that “[s]ome wetland types – in particular, fens and bogs – cannot be effectively restored with present knowledge.” <i>Id.</i> Moreover, because the legal and financial mechanisms for assuring long-term protection of wetland mitigation sites are often absent, especially for permittee-responsible mitigation, the National Research Council recommended that compensatory mitigation should be in place concurrent with, and preferably before, the permitted activity. <i>Id.</i> Similarly, the U.S. Government Accountability Office has found that the Corps has performed very limited oversight to determine the status of the required compensatory mitigation. Attachment 4 (“Wetlands Protection, Corps of Engineers Does Not Have an Effective Oversight Approach to Ensure that Compensatory Mitigation is Occurring”). Because many projects do not receive any oversight, the Corps cannot definitively assess whether the required compensatory mitigation has even been performed. <i>Id.</i> The Corps has thus consistently failed to ensure that the mitigation it has required as a condition of obtaining a 404 permit has been completed. <i>Id.</i></p>	PRO3
9	<p>In sum, these numerous predicted water quality exceedances are not allowed under the CWA (see e.g., 33 U.S.C. 1311; 40 C.F.R. § 122.4(d); 40 C.F.R. § 122.4(i)), and the EIS must more thoroughly assess and disclose the extent to which water quality violations are likely to occur.</p>	WR3I
10	<p>The Band continues to object to the lack of a comprehensive cumulative-impacts analysis throughout the DEIS. The CEQ has issued guidelines that illustrate the breadth of the required analysis, which the DEIS purportedly relies upon. 114 While the draft “Protocol to Assess Expanded Cumulative Effects on Native Americans” is mentioned in this section, there is no evidence that any expanded data collection or analysis was done in this area.115</p>	G3,CR2,CR4,CR5
11	<p>As noted in the Tribal Position, 116 there are multiple examples in the DEIS where cumulative impacts have not been fully addressed: 1. There has been no analysis of the 1854 Ceded Territory as a discrete area of impact. The Band continues to ask that it be included. As mentioned previously, cumulative effects to the 1854 Ceded Territory have not been adequately considered in the DEIS. The DEIS simply says “[t]he tribal representatives view themselves as uniquely and disproportionately impacted by mining activities in the 1854 Ceded Territory and it has not been possible to reach agreement on a number of conclusions within the DEIS.”117 In other words, the preparers believe that because they did some consultation but disagree with the Tribe, they need not properly evaluate impacts to Band members or the Ceded Territory in the EIS. This is entirely incorrect, given the federal agency trust responsibility to affirmatively protect these resources. For example, while Uniquely Affected Communities does mention that the Bands maintain rights under the 1854 Treaty, 118 it solely identifies as potentially-impacted resources wild rice and moose. It then states that wild rice is “common” in the region and compares the relative occurrence of moose resources as compared to “other portions of the 1854 Ceded Territory.” 119 These are not the appropriate standard for evaluation of the cumulative impact on those species, nor does it include the many other culturally important species that must be evaluated. Furthermore, the section acknowledges that there will be a loss of tribal access, and that there is no guarantee that there will be a “land swap” within the Ceded Territory that would then be available to the tribes. Another example is that cumulative impacts to wild rice have not been assessed. Wild rice grows in the Embarrass, Partridge, and St. Louis Rivers. Wild rice is a valuable tribal resource that has been declining throughout the 1854 Ceded Territory. Mine effluent is often associated with levels of sulfate that has impacted wild rice and hydrologic changes from pit dewatering and seepage from tailings basins can also impact wild rice, which is dependent upon a relatively stable hydrologic regime. More analysis of the cumulative impact on treaty rights is needed.</p>	G3,CR1,CR2,CR3,CR4

Comment ID	Comment Text	Theme Codes
12	2. Climate change implications of the proposed Project have not been detennined. The project would disturb extensive areas of peat. Peat is known to be an important carbon sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife will seek refuge as the climate warms.	AQ3
13	I. The DEIS fails to properly "disclose and discuss all major points of view." The Council on Environmental Quality ("CEQ") has implemented specific regulations regarding the requirements of a sufficient EIS, in accordance with NEPA. Under 40 C.F .R. Section 1502.9, a lead agency "shall make every effort to disclose and discuss at appropriate points in the draft statement all major points of view on the environmental impacts ofthe alternatives including the proposed action."8 All three Bands and two intertribal agencies (1854 Treaty Authority and Great Lakes Indian Fish and Wildlife Commission, or "GLIFWC") worked together to produce one set of comments on the July 2009 PDEIS to encompass the "Tribal Position." As requested, these groups jointly prepared, at significant time and expense, an integrated, in-line set of comments, which is attached with some edits to the DEIS at Appendix D, including the Tribal Position in blue. But the co-lead agencies the Minnesota Department of Natural Resources ("MNDNR") and the U.S. Army Corps of Engineers ("USACE") only selectively included tribal comments in the DEIS text or footnotes, instead of addressing all these major tribal points of view this way. Even where it does "disclose" tribal positions in footnotes, the DEIS offers none of the required "discussion" ofthese major tribal points of view. In short, the DEIS does not comply with the plain language of Section 1502.9 to make disclosures of major points of view at appropriate points, or to discuss them. The DEIS inconsistently also claims that it "includes almost all of the tribal position statements submitted in response to the July 31, 2009 Preliminary DEIS (PDEIS)" and that "the differing opinions are included in footnotes throughout the document."9 But this is untrue. While some revisions have been made, some tribal comments regarding key, controversial aspects of the Project have been entirely selectively left out of the DEIS Volume I footnotes and text. Examples of these problems include failure to either discuss or mention at the appropriate location the Tribal Position asking for inclusion of the expected leakage rate of waste rock liner and cover systems might be; 10 failure to discuss the Tribal Position on what long-term maintenance might be required for those systems;11 and what changes in the water quality predictions might result from those effects.12 The DEIS also fails to discuss the Tribal Position regarding the possibility that stockpile failure might occur and request that a slope stability analysis should be performed and the results included in the DEIS.13 Potential cumulative effects to the Partridge River, almost all of the Tribal Position regarding cumulative impacts analysis for air, and a large portion of the Tribal Position regarding cumulative effects to the St. Louis River watershed were also omitted. 14 The tribal cooperators had many conference calls with the lead agencies to try to resolve these and other disputes to ensure that the Tribal Position was included and discussed in the main body of the DEIS, even if only in footnotes, to no avail.15	PRO9
13	3. Cumulative impacts to culturally-important plant and animal species that are not listed as threatened or endangered have not been analyzed. Species that are important to tribal and non-tribal members would likely be impacted by mining projects, and these, too, must be evaluated. A substantial moose population has been identified in the mine site area by aerial and ground surveys. Moose are likely to be impacted through disturbance of two of the few wildlife corridors remaining along the Mesabi Range and through wetland impacts ofthis project. The Project has proposed the largest direct wetland fill ever permitted in this region. The wetland mitigation that is being proposed would be outside of the St. Louis River watershed and 1854 Ceded Territory.120 The MNDNR's Moose Advisory Committee studying the decline of the moose population in northeastern Minnesota has recommended preserving wetlands as sanctuaries for moose from heat stress. 121 Therefore the Project will have cumulative effects on the moose herd and tribal harvest in the 1854 Ceded Territory. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should have been done as part of this DEIS.	WI2,WI3,WI5,G3,CR1,CR4

14	4. The DEIS fails to adequately analyze cumulative impacts to the water quality of the Partridge, Embarrass, or St. Louis Rivers. In Colby Lake, the community water supply for the City of Hoyt Lakes, aluminum, iron, copper, and mercury concentrations already exceed MN WQS. 122 The existing large number of water quality exceedances and the suite of constituents, particularly trace metals, exceeding MN WQS shows the site has not been remediated from previous mining activities. Additionally, amphibole or asbestos-like mineral fibers, known to cause digestive tract cancers in high concentrations, have been identified as existing pollutants in the Hoyt Lakes community water supply and their presence should be identified in the DEIS. Related cumulative-impacts issues such as groundwater drawdown or mounding due to multiple mine projects, water quality in aquifers impacted by previous and existing other mine projects, and surface waters such as the Partridge and Embarrass Rivers and Second Creek that are impacted by multiple mines need further analysis. 123	WR5A
15	5. The cumulative effects of noise and vibration have not been analyzed although they were raised by the public during scoping.	N3
16	6. The cumulative risk analysis of transportation of hazardous materials has not been analyzed.	HM3
17	7. Discussion of the Project's cumulative effects on fish and macroinvertebrates is unreasonably limited to sulfate and mercury, and cumulative effects of habitat degradation on the fisheries of the region have not been discussed.	FM3
18	S. Post-closure impacts should also be included in the cumulative effects analysis because some mine features (e.g. pit lakes) would become permanent features of the landscape.	CR5,G3,CR1
19	III. The DEIS continues to lack sufficient characterization of existing and predicted impacts analysis of cultural resources and the 1854 Ceded Territory. Just as the DEIS does not evaluate cumulative impacts to the Ceded Territory, it does not fully evaluate direct and indirect impacts. Significant supplementation is needed.	CR2,CR3,CR4
20	A key piece of the work that remains to be done is traditional cultural property ("TCP") studies. The National Register of Historic Places defines a TCP as "one that is eligible for inclusion in the National Register because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history and (b) are important in maintaining the continuing cultural identity of the community."132 An appropriate investigation of the Project site using this standard, and in cooperation with all involved THPOs, must be performed and properly documented. 133 They will require a high level of tribal input and consideration of seasonal changes. As noted in the chapter, consultation is underway on this topic, but is far from complete.	CR2,CR3
21	The DEIS should include language to the effect that the Band continues to take the position that the Ceded Territory is itself a TCP and does not agree with the USACE's determination that it is not. 134 Nevertheless, in the interests of timely evaluating Project risks and mitigation, the Band has agreed, for the time being, to proceed in accordance with the USACE's offer to fully evaluate the Ceded Territory, including all factors that would be considered in a TCP analysis, pursuant to its trust responsibility. 135	G3,CR2,CR3,CR4
21	Based upon the Tribal Position, this chapter now includes language acknowledging that the acceptability of the proposed land swap for purposes of preserving treaty interests depends upon many factors, none of which have yet been evaluated. 136 This underscores the need to include consideration of the land swap in this EIS.	PD1

22	<p>A. Financial assurance. In order to determine the impacts of a mine, the effectiveness of closure and reclamation after the mine is no longer in use must be assessed.<sup>16</sup> But in the DEIS, there is no discussion regarding the type and estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the Project, despite tribal calls for it to do so.<sup>17</sup> Nor is there any discussion regarding financial assurance for the existing contamination associated with previous mining activities at the site that PolyMet would be responsible for cleaning up-as previously noted, the former LTV site is a brownfield. <sup>18</sup> This is of particular concern because the hardrock mining industry has a pattern of failed operations, which often require significant environmental responses that cannot be financed by industry. <sup>19</sup> In fact, there is widespread acknowledgement for the need to provide such financial assurance on projects like these. The General Accounting Office ("GAO"), in testimony before the Senate Committee on Energy and Natural Resources, U.S. Senate entitled "HARDROCK MINING: Information on Abandoned Mines and Value and Coverage of Financial Assurances on BLM Land," presented findings that in total, the federal government spent at least \$2.6 billion to remediate hardrock mine sites from 1998 to 2007, highlighting the need for adequate financial assurance. <sup>20</sup> The EPA recently identified mines as a priority class of facilities for which to develop financial responsibility requirements.<sup>21</sup> In 2009, as part of the largest environmental damage bankruptcy case in U.S. history, the mining company ASARCO was ordered to pay \$194 million billion to resolve environmental liabilities from operations that contaminated land,water, and wildlife resources on federal, state, tribal, and private land.<sup>22</sup> The State of Minnesota has spent millions of dollars remediating mine sites (e.g. Reserve Mining).<sup>23</sup> Yet financial assurance discussions have been postponed for the penning phase of this Project. This approach fundamentally contradicts federal and state environmental policy and the DEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, and reclamation.</p>	HM3,FM3,PD1
22	<p>On page 4.8-6, the paragraph beginning "In 1999, the U.S. Supreme Court held ... " should be moved down the page and inserted below the quoted portions of the 1854 Treaty in order to properly preserve the chronology of the authorities cited.</p>	EOO
22	<p>On page 4.8-9, the reference to the "two Indian trails," although edited, still improperly concludes that the preparer's third-party contractor "was unable to locate either trail."<sup>137</sup> As the Tribal Position states, any such attempt was not made in consultation with the Band's THPO (nor with any other cooperating tribe's THPO, to the Band's knowledge).<sup>138</sup> This field work must be re-done in consultation with the relevant tribes, who are well aware of the location and cultural importance of these trails.</p>	CR2
23	<p>Finally, citations in this section should be made consistent with the remainder of the DEIS, and additional proofreading is in order.</p>	EOO

24	<p>The preparers have not completed consultation with the potentially affected tribes regarding culturally-important species. This delay means that the extent of existing wild rice beds, which are protected both under federal and state law, has not been fully characterized. Consequently, evaluation of the impacts and cumulative impacts to wild rice has not been determined. The DEIS has unreasonably limited discussion of these impacts, as evidenced by its own language. For example, one footnote purporting to "discuss" the Tribal Position simply reprints it: "[i]t is the position of the tribal cooperators that water treatment of the discharge would be required to comply with the wild rice water quality standard. The Partridge River contains several wild rice beds immediately downstream of the proposed discharge point." 139 Wild rice areas are not only protected under the 1854 Treaty but under Minnesota State law. 140 Moreover, portions of the DEIS fail to recognize the field studies done in August and September 2009 that identified wild rice along the Upper and Lower Partridge River, the Embarrass River, and the lower St. Louis River, amongst other locations. 141 Given the obviousness of the threatened impact to such wild rice beds, additional analysis and mitigation must be included throughout the DEIS. As noted, wild rice grows on the Embarrass River, the lower Partridge River, and the St. Louis River; therefore, the MN WQS of 10 mg/l sulfate standard applies. 142 This standard would be exceeded by the PolyMet discharge. Furthermore, there are other projects (including Mesabi Nugget Phase II and Laskin Energy) that are discharging water with elevated constituents. Given these existing sources, it is unlikely that PolyMet would be able to discharge untreated tailings basin effluent without violating the CWA. Regardless, treatment of the tailings basin effluent prior to discharge to the Partridge River is not included in the potential mitigation measures. Again, the DEIS merely acknowledges this Tribal Position without addressing the obvious problems with any untreated discharge: " ... it is the position of the tribal cooperators that an untreated discharge of contaminated tailings basin water to the Partridge River in order to dilute and dispose of tailings basin water would have environmental impacts that must be avoided in order to adequately protect the environment." 143</p>	G3,CR1,CR2,CR4
24	<p>C. Band member use of other usufructuary resources. There has not yet been sufficient evaluation of Band member use of vegetation and other usufructuary resources in the APE, and there is no permissible basis to omit such evaluation where the USACE and other federal permitting agencies have a trust responsibility to the Band to maintain treaty resources in the 1854 Ceded Territory. The APE for the Project was not determined until August 11, 2009, after tribal cooperators insisted upon it, 144 and tribal consultation is ongoing. Historic and current tribal harvest information has not been finally determined even for the Plant or Mine Sites. Although this area is significantly disturbed and will be for the foreseeable future, the closure and reclamation plans should have a significant effect on native vegetation as it is reintroduced. The prevalence of invasive, non-native species and their ability to out-compete native plants in disturbed areas, coupled with PolyMet's plan to introduce non-native and invasive species to this area, would result in significant impacts to cultural resources that have not been discussed in the DEIS.</p>	G3,CR2,CR3,CR4
25	<p>Several wildlife species of high cultural and present-day value to the Band exist in the APE. Some of these include moose, whitetail deer, wolf, fisher, marten, and lynx, to name a few. Most notably, the Minnesota moose population is under a long-term population decline. 145 Mining operations will certainly do nothing to aid in the recovery of moose and are likely to reduce available habitat and impact travel corridors. Water, air, and noise pollution, combined with increased road density, have been shown to have negative impacts on most boreal wildlife species including wolves, moose, and lynx. Further evaluation of wildlife impacts must be done.</p>	WI3,WI5
26	<p>There are also specific defects in the lynx survey that was done at the PolyMet site so far. 146 First, it was conducted at the low point of the lynx population cycle. Therefore, the low numbers reported are not surprising. Surveys should have been done during the high point in the cycle because that is when lynx are competing for available habitat and many animals are dispersing looking for desirable areas. Impacts to the travel corridors and the removal of the mine site habitat would be particularly harmful to the lynx during these times. Second, lynx mortality is linked to the number of road and train trips through an area of suitable habitat. Lynx mortality would be a significant impact given the number of trips that are mentioned in the DEIS. Finally, data used in the DEIS for lynx mortality is out of date-tribal sources report that there are two additional lynx-train and one lynx-car collisions to add.</p>	WI1

Comment ID	Comment Text	Theme Codes
27	Several lakes and the Partridge River watershed are likely to be affected negatively, which will impact fish species and thus the Band's 1854 Treaty rights to harvest fish in those water bodies. The DEIS as written fails to mitigate the costs to fisheries and wildlife species that are protected under the 1854 Treaty. Treaty reserved fishing rights cannot be fully exercised when fish consumption must be restricted for health reasons to one or two meals per week. The entire DEIS must include proper analysis of the potential impacts of this Project on treaty rights. Any increase of methylmercury bioavailability in the Partridge River watershed constitutes a significant adverse impact to a critical trust resource.	G3,FM1,FM4,CR1,CR4
28	Moreover, the potential impacts to Band members of a significant increase in mercury in fish harvested in on-Reservation and Ceded Territory waters has not been adequately addressed. The State of Minnesota's mercury total maximum daily load ("TMDL") process will not adequately address the fish consumption impairment in these waterbodies, and any new discharges that would result in further degradation to waters with an existing water quality impairment would not be legally permitable under the CWA. <sup>147</sup>	WR5C,G3,FM1,FM5,CR1,C
29	B. Alternatives. Contrary to the express requirements of the CEQ rules, the DEIS does not even purport to identify a preferred alternative. <sup>24</sup> The Band has long cited this defect in PDEIS comments. <sup>25</sup> Multiple modifications have been cast as "mitigations," and the now-preferred methodologies remain as "alternatives." <sup>26</sup> For example, the use of LTV tailings for tailings berm construction and capping and the disposal of waste rock in the east mine pit are both now preferred, but they remain cast as "alternatives." <sup>27</sup> The DEIS must be revised or supplemented to reflect the actual preferred course of action for all material Project aspects. Without this, there is a high degree of uncertainty regarding the company's actual proposed course of action and effective review is unnecessarily complicated, in addition to violating CEQ rules.	ALT7,ALT9,PRO2,PD3
30	Finally, at or near the Project site, there is evidence that there were maple sugaring areas as recently as the 1950s, and the Band's THPO has specific knowledge of related artifacts and site specifics. Moreover, as part of the 1854 Ceded Territory, this is an area of importance for traditional plant and medicine harvest, and has great religious significance in connection with the Ojibwe Seventh Generation Prophecy. Again, additional consultation with the Band is imperative in order to comply with Section 106 and to preserve the sites.	FM4,CR1,CR4
31	D. Wetlands delineation. The physical environment and habitat comprises an integral part of the concept that cultural resources are natural resources for tribes, which the DEIS acimowledges. Therefore, characterization of natural features is doubly important. Many of the wetlands that have been delineated have been misidentified as "perched bogs." <sup>149</sup> They are actually cedar swamps, northern wet ash swamps, forested rich peatlands, northern alder swamps, and poor fens, all of which require groundwater inputs. <sup>150</sup> Indirect impacts to communities that require groundwater inflow have not been determined, but would likely be significantly different than expected impacts from the Project to perched bogs. The Project wetland delineation study identified over 390 acres of wetland community with a significant white cedar component. <sup>151</sup> Those cedar swamps were incorrectly named "cedar bogs" in the original wetland delineations and in later documents renamed "coniferous bogs." <sup>152</sup> The significance of this is that bogs tend to be precipitation fed, while swamps tend to be groundwater fed. Therefore, estimating impacts due to hydrologic disruption without requiring sufficient background data regarding groundwater or incorporation of the specific ecological requirements of culturally significant wetland vegetation is inadequate.	WE1,WE2
32	E. Socioeconomics. Executive Order 12898 specifically identifies Environmental Justice issues to be addressed regarding Native American Populations. <sup>153</sup> But in the DEIS Socioeconomics chapter, none of the issues identified in the Executive Order have been addressed, despite the Band repeatedly asking for further analysis. Under the heading "Environmental Justice," the DEIS summarily concludes that there will not be disproportionate impacts to Native Americans based on census reported populations alone. <sup>154</sup> It is the Band's position that any impacts to natural resources will disproportionately affect tribes due to their subsistence consumption of wild rice, fish, and other wildlife, and gathering of traditional plants and medicines within the 1854 Ceded Territory. Native Americans should be specifically evaluated as an affected population throughout this section.	SE2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
33	<p>The DEIS must be substantially supplemented to have sufficient detail to ensure that environmental consequences have been fairly evaluated and to provide a full opportunity for agency and public review. The sheer volume of reasoned, major opposing positions now included in the DEIS, and the lack of any explanation for their rejection, speaks for itself. The Band and others have repeatedly asked for justification for the conclusion that underground mining is not viable. The proposed land exchange is a connected action that cannot be deferred to a separate EIS process. The type and estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the project and pre-existing contamination, should be disclosed in the DEIS. The water quality and quantity impacts analysis in the DEIS must be supplemented to provide scientifically supported hydrologic and geochemical characterizations using all existing data before reasonable estimations of impacts to water resources, and strategies to mitigate those impacts, can be determined. A scientific assessment of the mine-related drawdown of the regional water table must be developed so that an assessment of indirect wetland impacts can occur. The DEIS must be supplemented with a comprehensive cumulative-impacts analysis that includes the 1854 Ceded Territory as a discrete area of impact. The DEIS must make a reasonable effort to assess the Project's potential for impacts on the exercise of treaty rights. These problems can only be corrected through a significant supplement to the DEIS, which can only be issued after proper analysis and full consultation.</p>	PRO3
34	<p>Since even before submitting its comments on the June 2008 PDEIS, the Band has explained the fundamental problem with the DEIS's failure to address possibly the most important alternative: underground mining.<sup>28</sup> The Band reiterates that the CEQ rules require that the EIS "present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public."<sup>29</sup> The DEIS does not contain the appropriate level of detail. The conclusion that underground mining is not viable, or preferable, remains substantially unjustified, despite repeated requests for further analysis.<sup>30</sup> This section states, without any economic analysis, that underground mining was "[n]ot economically viable. The rate of ore production of an underground mine would not support the processing rate necessary to economically process low grade ore .... Additionally, the ore deposit is shallow and broadly distributed throughout the Mine Site; [sic] which increases risk of the mine ceiling collapse unless a sizable amount of ore was left in place and not recovered."<sup>31</sup> At its heart, this is merely a cost-benefit claim, with an unsupported, one-sentence claim about the threat of mine ceiling collapse tacked on. In addition, this is not the appropriate use of a cost-benefit analysis for purposes of analyzing an EIS alternative. The CEQ regulations require that, where a cost-benefit analysis is "relevant to the choice among environmentally different alternatives," there are a variety of additional requirements, including "analysis of un-quantified environmental impacts, values, and amenities,"<sup>2</sup> in addition to other CEQ alternatives rules. As already argued in the Tribal Position,<sup>33</sup> significant additional study of the underground mining alternative is mandated, and the DEIS offers no discussion of the reasons for rejecting the alternative. The economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings, and waste rock disposal. A study of this particular deposit was performed by the prior owner of the site, U.S. Steel, that actually recommended underground mining.<sup>34</sup> PolyMet is well aware of this study, given that the company included it in a 2003 filing with the Securities and Exchange Commission.<sup>35</sup> In fact, by examining cross-sections showing the distribution of ore by depth,<sup>36</sup> it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative.</p>	ALT2

35	<p>D. Proposed Land Exchange. The current ownership by the U.S. Forest Service ("USFS"), and the possibility that the Project is effectively proposed to take place on what are USFS lands, must be addressed in the DEIS.<sup>37</sup> The Band has already identified this and other problems with the proposed land exchange "solution."<sup>38</sup> The proposed land exchange is a connected action that cannot be deferred to a separate EIS process. The land exchange could have implications for Band members' usufructuary treaty rights in the 1854 Ceded Territory, and these problems are plainly unexplored at this time, as is the possibility that any comparable offset will really be available: "Potential loss of access to public lands for tribal use due to the land exchange; however PolyMet intends to propose private lands within the 1854 Ceded Territory for exchange, which could offset the loss of access."<sup>39</sup> The Band has not agreed to such an approach. Alternately, the DEIS claims such a land swap "would" be an offset, even as it acknowledges the irreversible loss of culturally important natural resources.<sup>40</sup> Acreage, distribution of wildlife corridors, and access by Band members to the lands cannot be determined at this time because PolyMet has not made an offer for specific lands to exchange for the properties they are hoping to receive. This directly implicates the federal regulatory agencies' trust responsibilities to the Band; they cannot approve permits that will have impacts to treaty resources without any evaluation and mitigation.<sup>41</sup> The details of the land exchange must be submitted for consideration as part of the DEIS.</p>	CR4,ALT7,ALT9
36	<p>E. Water quality and quantity. Acid mine drainage ("AMD") is one of the greatest environmental liabilities associated with mining, especially in pristine environments like the Project mine site, that have economically and ecologically valuable natural resources.<sup>42</sup> There are no hard rock surface mines that exist today that can demonstrate that AMD can be stopped once it occurs on a large scale.<sup>43</sup> Inaccurate pre-mining characterization and interpretation often results in a failure to recognize or predict impacts to water quality and aquatic life.<sup>44</sup> Evidence from literature and field observations suggests that permitting large scale surface mining in sulfide-hosted rock with the expectation that no degradation of surface water will result due to acid generation imparts a substantial and unquantifiable risk to water quality and fisheries. <sup>45</sup> In a report comparing predicted and actual water quality at hard rock mines, two types of characterization failures were identified that led to differences between the predicted water quality in EIS documents and the actual water quality either during or after mining began.<sup>46</sup> These included: (1) insufficient or inaccurate characterization of the hydrology; and (2) insufficient or inaccurate geochemical characterization of the proposed mine.<sup>47</sup> The authors reported primary causes of hydrologic characterization failures as overestimations of dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size.<sup>48</sup> The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy.<sup>49</sup> The primary causes of mitigation failures were that mitigation measures were not identified, were inadequate, or were not implemented; waste rock mixing and segregation was not effective; liners leaked; tailings were spilled; or embankments failed, and land application discharge was not effective. <sup>50</sup> The DEIS suffers from all of these characterization failures. Project baseline data used for both the Mine Site and the Tailings Basin are insufficient.<sup>51</sup> A comparison of hydrologic data that was collected for two other projects in the region demonstrates that the PolyMet project is data-poor in the area of basic hydrology, much less mitigation.<sup>52</sup> Moreover, given the utility of the many existing studies of area hydrology, it is perplexing that the preparers have continually refused to use them, even as tribal cooperating agencies have repeatedly requested that they be used. Just a few publicly available examples include: the state Voluntary Investigations and Clean-up ("VIC") Program;<sup>53</sup> the Minnamax Project;<sup>54</sup> the LTVSMC Dunka Pit,<sup>55</sup> and historic MNDNR fisheries documents. <sup>56</sup> All these resources should be used to supplement the hydrology analysis and fully inform the permitting agencies and the public. There is no explanation for the DEIS' failure to use, for example, pre-mining flow and sulfate data available through MNDNR fisheries reports was not used to determine potential water quality impacts, or cumulative effects to flow and water quality in the Embarrass, Partridge, or St. Louis Rivers. Surface water and groundwater quality and quantity data collected for the Minnamax Project, LTVSMC Dunka Pit, and the VIC program were largely ignored.</p>	PRO2,PD3,WI1
37	<p>The acidity in the discharges and seepages will reduce the viability of wild rice beds that are downstream and that are used by Native Americans as well as being an important source of food for waterfowl. This pollution will continue for decades, hundreds and perhaps thousands of years. This in no way allows "Ground water and other water resources to be used in a way that preserves their integrity for future generations" as stated in the DNR goal quoted above.</p>	CR1

Comment ID	Comment Text	Theme Codes
37	The hydrology model that was applied used outdated data collected too far from the site. <sup>57</sup> The Project XP-SWMM model included in the DEIS is based on a stream gauging station for the Partridge River that is seventeen miles from the mine site and the data from that station are twenty years old. <sup>58</sup> Therefore, the results are highly unlikely to be representative of current conditions at the mine site.	WR3J
37	In the past, we (the citizens of Minnesota) have worked together to take care of Minnesota's environment. But this sulfide mining issue has polarized us. We are now "people who live in the northern part of the state" and the "rest of us." I am concerned that this polarization will not only damage the state as a whole, but also our desire to work together for the common good. I feel the mining situation was set up as a done deal. Prior to the formal environmental review process, no one asked us if we wanted to go this route, nor were we given choices. I think the polarization created by the proposed sulfide mine is forcing us to take sides instead of creatively thinking of alternatives for job creation and unbalanced state budgets. A neutral third party mediator could help us resolve some of our differences and come up with a workable solution to the sulfide mining issue.	EOO
38	7. Summary, Section III.B.2, p. S-9; Relatively high sulfate concentrations in seepage from Tailings Basin and downstream areas represent "high risk situations for mercury methylation". This represents a significant concern for adjacent ecosystems and potentially for human health.	FM1
38	6. Summary, Section III.B.2, p. S-8; Groundwater levels downgradient of the Tailings Basin are expected to cause groundwater seepage that would result in significant seepage, upwelling and wetland impacts. If these are expected impacts, then unexpected impacts caused by storm events, flooding, etc. could be even more significant.	WR2F
39	8. Summary, Section III.B.2, p. S-9; Direct water quantity and quality impacts to wetlands are expected for 804.3 acres in the Mine Site area. This is a large expected direct impact, and unexpected or indirect wetland impacts due to flooding, acid mine drainage, etc. could affect much larger areas.	WE2
40	13. Section 3.1.2.2, page 3-4, 1 st and 2nd paragraphs; The DEIS discusses backfilling of East Pit with Category 1 and 2 waste rock, but does not explain how waste will be physically sampled and chemically analyzed to be categorized.	PD11
40	12. Section 1.1, p. 1-1, 1 st paragraph; The text refers to "low-grade disseminated sulfide mineral ore", but does not mention the localized presence of massive or semi-massive sulfides. These higher sulfide materials, which may be either ore or waste, present a much higher potential for acid mine drainage.	PD11
41	14. Section 3.1.2.10, p. 3-14 to 3-15; These two paragraphs discuss saturated and unsaturated overburden and their respective sulfide content and leachability. The text concludes that the leachate from the saturated overburden will contain higher sulfate and metals concentrations than the leachate from the unsaturated overburden. This conclusion was based on the samples tested, but there is no explanation why this would be so. In general, the average sulfide content of saturated and unsaturated overburden should be the same, and thus the leachate from these materials should contain the same average sulfate and metals concentrations.	PD2
42	15. Table 3.1-9; This table contains a summary of the proposed stockpile liners and covers. The proposed liners for the Category 3 and 4 Waste Rock Stockpiles and the Category 3 Lean Ore Stockpiles are all proposed to be constructed with one 80 mil LLDPE geomembrane on top of a compacted low permeability sub grade (e.g., clayey soil). This proposed construction is inadequate: it does not provide enough protection (a one-foot drainage layer) for the liner, and it assumes that the liner will not leak. For stockpiles of waste rock of the proposed dimensions (up to 156.8 acres, and over 200 feet high), at least 6-8 feet of drainage layer should be placed on top of the liner in order to prevent the liner from being damaged by equipment and waste rock placement. In addition, HDPE should be used instead of LLDPE. In general, the DNR should require Polymet to construct the waste rock stockpile liners in a manner consistent with MPCA rules for solid waste landfills.	PD2
42	1. What is the driving force behind this process? The state of Minnesota will receive revenues and royalties from this mine and all other sulfide mines in the pipeline. How does this money play into resolving the state's budget deficit? We are not told how much money the state is planning to make as a result of the mining initiative, but obviously the state has a big stake in its success.	G1

43	16. Section 3.1.5.2, p. 3-28; The text states that sodium hydrosulfide, a hazardous substance, will be added to the autoclave discharge slurry for copper recovery. Table 3.1-12 indicates that 847 tons per year of sodium hydro sulfide will be utilized in a 45% solution with water (w/w), and that sodium hydro sulfide will be stored in a 52,600 gallon storage tank. Could this chemical increase the sulfide-leaching potential in the hydrometallurgical wastes?	PD2
43	17. Section 3.1.8, p. 3-49, footnote 13; The Tribal cooperating agencies' comment discusses the importance of financial assurance disclosure within the DEIS. The comment also mentions that U.S. EPA Region 9, based on their experience with sulfide mines, recommends financial assurance disclosure in the DEIS. It seems clear that financial assurance should be fully disclosed in the NorthMet DEIS. The state of Minnesota should consider legislation similar to the rules passed in 2000 by the state of Wisconsin that require the mining permittee to establish an "Irrevocable Trust Agreement" before mining begins and to maintain the agreement for an indefinite time period after mining ceases.	PD3,PD4
44	18. Section 4.1.1.2, p. 4.1-4 and 5; In this section about Mine Site hydrogeology, the DEIS makes a generalization about the relationship between surface water (i.e., wetlands) and groundwater. Specifically, the DEIS states "These bogs are isolated from the underlying groundwater, receiving virtually all of their water and nutrient input from precipitation. They receive essentially no groundwater inflow and have extremely low seepage rates to the underlying aquifer." The DEIS does not provide any data to support this generalization. See also the Tribal cooperating agencies' comment (footnote #2 on p. 4.1-5).	WR1E
45	19. Section 4.1.1.2, p. 4.1-8; The groundwater quality in the surficial aquifer at the Mine Site is based on only three monitoring wells, and none of the three wells is located in a proposed mine pit area. This sampling density does not constitute an adequate characterization of the existing groundwater quality in the surficial aquifer at the Mine Site.	WR1E
46	20. Table 4.1-4, p. 4.1-9; This table lists Groundwater Evaluation Criteria Applicable to the NorthMet Project. However, the table only lists "General" parameters (including chloride, nitrate, sulfate, etc.) and metals. There are no criteria for volatile or semi-volatile compounds, such as fuels and lubricants, which could be contaminants produced by mining equipment and related storage facilities. The table assumes that there is no interaction between surface water and groundwater (see comment #18 above), and therefore only lists human health-based (drinking water) standards. This is a significant oversight, and the table should be amended to include surface water standards (Minnesota Rules Chapter 7050), many of which are ecologically-based standards or criteria.	WR2E
46	21. Section 4.1.1.2, p. 4.1-11; Groundwater quality data for the bedrock aquifers (Duluth Complex and Virginia Formation) were collected from only nine wells in the Mine Site area. Four of these wells are pumping wells, which tend to dilute contaminant concentrations. This sampling density does not constitute an adequate characterization of the existing groundwater quality in the bedrock aquifers, especially since groundwater occurs mainly in fractures in these aquifers. Please see also General comment #3 above.	WR1E
47	22. Section 4.1.1.2, p. 4.1-11; Baseline groundwater quality in the surficial aquifer at the Plant Site is based on only one monitoring well. In addition other parameters, such as VOCs, should be monitored. This approach is inadequate for baseline data purposes.	WR1B,WR1E
48	23. Section 4.1.1.2, p. 4.1-12 and 13; Existing water quality within the Tailings Basin Pond and at the toe of the Tailings Basin; The text states that "(t)he LTVSMC Tailings Basin is a disposal facility and is not part of a natural surface water body or a point of compliance pursuant to Cliffs Erie's NPDES/SDS pennit, so comparison of these data with surface or groundwater standards is not appropriate ... " This text may have attempted to clarify that the Tailings Basin is not considered by Polymet to be "waters of the state", and therefore is not subject to Minn. Rules Ch. 7050. However, the Tailings Basin is an existing pond, there is likely some degree of ecological exposure to contaminants, wastes, etc. Thus, the water quality data of the Tailings Basin should be compared to surface water (Minn. Rules, Ch. 7050) standards or criteria. In addition, Table 4.1-7 should be amended to include these standards or criteria.	WR2G

49	24. Table 4.1-20; This table lists surface water quality standards that apply to the NorthMet Project, and it only lists General parameters (chloride, sulfate, etc.) and (total) metals. This table should be amended to include VOCs and other potential contaminants of concern. In addition, Toxicity Characteristic Leaching Procedure (TCLP) analyses should be completed on representative samples of Category 3 and 4 Waste Rock and Category 3 Lean Ore to determine if leachate from these materials poses a potential threat to surface water or groundwater resources.	WR1C
50	26. Section 4.1.2.2, p. 51. The DEIS reads: "Groundwater standards are U.S. EPA primary (MCL) and secondary drinking water standards and MDH HRLs ... " Since there is likely a direct connection between surface water, wetlands and groundwater (see comment # 18 above), the surface water standards and criteria (Minn. Rules, Ch. 7050) should also be applied to groundwater.	WR2G
51	27. Section 4.1.3.1, p. 4.1-66; The text states that "Polymet does not intend to sample the overburden during stripping activities, but rather would distinguish the three types based on field determinations." The DEIS should specify what field determinations will be used to distinguish the three types of overburden.	WR1A
52	28. Section 4.1.3.1, p. 4.1-66; This section states: "Polymet proposes applying a limestone treatment to the exposed Virginia Formation walls in the East pit while backfill is being placed during pit flooding to help neutralize the acidity of the rock face." The text does not provide any details for this plan. However, it seems unlikely that this method could effectively prevent oxidation and solution leaching on such a large scale (see Figure 4.1-3 in the DEIS). In addition, the oxidation and leaching processes will have already developed by the time backfilling occurs (year 20).	WR1E,WR2D
53	30. Section 4.1.3.1, p. 4.1-112; In this section, the DEIS describes the performance of constructed wetlands as part of the proposed closure plan. However, "Polymet assumed wetland removal efficiencies in the East pit passive wetland system would range from 50 to 80-90% for six parameters (Table 4.1-63)." Polymet's assumption was made in spite of the documented poor performance of the constructed wetlands at the nearby Dunka Mine. Specifically, data from the Dunka Mine showed that in some cases, constructed wetlands actually resulted in increases in nickel and zinc concentrations. The performance of the proposed constructed wetlands should be pilot-tested before implementing constructed wetlands on such a large scale as the entire East pit. If these constructed wetlands are proven to be successful, then there should be additional areas besides the East pit where they should be implemented.	WR3L
53	29. Section 4.1.3.1, p. 4.1-87; The DEIS states "Polymet does not propose to line the Tailings Basin, nor is the underlying LTVSMC Tailings basin lined." This proposal would likely lead to fairly large-scale groundwater contamination, despite the localized injection of bentonite and other small-scale response actions (e.g., seepage barriers) proposed by Polymet.	WR2D
54	32. Figure 3.1-10; This map shows the process water management for the first year of operation at the Mine Site. There is only one wastewater treatment facility, which is adjacent to the Central Pumping Station. Several wastewater treatment facilities may be needed if several pumping stations are used (see previous comment).	ALT8
54	31. Figure 3.1-1; This layout map shows that there is a "Central Pumping Station" at the Mine Site located just south of the West pit. This location hardly seems central to the Mine Site. In addition, several pumping stations may be necessary to adequately control surface drainage, due to several different directions of surface water flow in the Mine Site area.	ALT8
54	The economic benefit of this project has been over-estimated by PolyMet and its promoters because the short-term gain of 100 to 400 jobs has to be balanced against the loss of jobs and revenue for the state from recreation, tourism and related activities over a much longer period of time. As a Canadian company, PolyMet has already entered into an agreement with Glencore AG, a Swiss company, who will market 100% of production on the world market, primarily to China (See PolyMet Investor's Report, 2009). A foreign corporation will extract Minnesota's natural resource, send it overseas for production and leave Minnesota taxpayers with the pollution, waste and long-term expense of reclamation and clean-up.	SE3
55	33. Figure 3.1-13; This figure shows the existing drainage subwatersheds at the Mine Site. Note that surface water flow directions are generally away from the Mine Site, and not towards the Central Pumping Station. This could be problematic, especially during storm events or flooding.	ALT8

Comment ID	Comment Text	Theme Codes
56	34. Figure 4.2-5; This map shows "20 Year Wetland Impacts" at the Mine Site. The figure shows direct and indirect impacts on-site, but no off-site areas are shown. If data are available, the figure should be amended to show the (projected) impacts to off-site areas.	WE2
57	35. Figure 4.5-2 The map shows biological sampling points for the project area. However, there is only one sampling point in the Mine Site area and one sampling point in the plant site area (with seven total sampling points overall). For an adequate study there should be more data points within the Mine Site and Plant Site areas.	FM2
58	3. Creation of jobs. We all understand the need for jobs in this state. But is it necessary to create these jobs through an industry that damages the environment? Because Minnesota's beautiful northland attracts tourists (and creates jobs as well), wouldn't it be more advantageous to create green jobs in this area of the state? For example, some of the taconite tax revenues could be used to improve existing state parks. Green jobs created by such improvements would certainly be more in harmony with the image Minnesota is trying to convey.	EOO
58	36. Figure 4.7-1; "Predicted Nighttime Noise Levels" are displayed on this figure. The map shows "noise sensitive areas": how were these eight areas selected or identified? In addition, why were only human receptors considered?	N1,N4
59	1. Impacts to groundwater and surface water should be data-driven, and not based solely on professional opinion or empirical observations (e.g., page 4.1-61). Please refer to the Tribal cooperating agencies' comment (footnote #19).	WR1E
60	3. In the various sections pertaining to existing groundwater conditions, there is no mention of high salinity groundwater that is present in some nearby portions of the Duluth Complex (e.g., Mesaba Copper-Nickel Deposit). These high salinity waters could exacerbate leaching of metals into groundwater, and could present problems during and after mining operations.	WR1E
61	4. The DEIS does not explain how waste rock will be physically/chemically evaluated and managed during mining operations in order to separate the materials into the four designated waste rock categories. This would seem to be a regular (daily?) logistical problem due to the large volumes of waste rock and lean ore (394 million tons) that will be generated during mining operations.	PD11
62	5. Summary, Section III.B.2, p. S-8; Antimony, manganese and nickel impacts to groundwater quality at the Mine Site are expected to exceed MCLs or HRLs, potentially for the long-term. Given these expected impacts, there may be other unexpected impacts from other metals or contaminants not found in nature that are utilized during the mining operations.	WR2E

63	<p>The Minnesota NPDES General Stormwater Permit for Industrial Activity requires permit coverage for all types of mining for metal and nonmetallic minerals. The DEIS does not address this fact. The DEIS should be revised to include permitting of the Project site under the Minnesota NPDES General Stormwater Permit for Industrial Activity. This permitting would extend beyond the period of mining operations and into the Post-Closure time period. In Table 1.1-1 of the DEIS (pages 1-5, 1-6), the Government Permits and Approvals for the Project from the MPCA are listed as follows: (NOTE: SEE COMMENT LETTER FOR TABLE) This item is significant for multiple reasons: • Discharges that are permitting under an NPDES/SDS permit are, by definition, point source discharges. This means that the following statement in the DEIS is erroneous and should be revised: "The NorthMet Project would be a new facility, but PolyMet has proposed a water balance that avoids the need for any point source discharges during mine operations." (page 4.1-128) The inaccuracy of this statement has implications throughout the DEIS. All of these should be addressed in the revision of the DEIS. The stormwater discharges from the site should be clearly identified and listed as point source discharges throughout the entire DEIS. These discharges should be included in the water balance for the Project during mining operations. All text and tables should be revised to reflect this. • As a point source discharge of a BSIC (mercury), the site stormwater runoff comes under the control of MN Rules 7052. • When the mercury TMDLs in the downstream water bodies are done, the permitted stormwater discharge from the NorthMet site will be part of the Waste Load Allocation of these TMDLs. The SWPPP for the mine site will have to be modified to implement the measures considered appropriate in the TMDL study and implementation plan. These measures will then be mandatory for the mine site. o Nondegradation must be addressed in all the NPDES permitting for the site. This would include the site stormwater discharge permit as well as the process operation permit. Please see Comment #2. o The linkage between NPDES permits and the status of downstream waters (impaired and a TMDL is required but not yet completed) means that the MPCA may not permit the project (process, site stormwater, or construction) if there is any contribution from the Proposed Action to mercury levels or sulfate that would contribute to increased mercury methylation. Please see comment #4. Recommended Actions Related to Comment #1: Action 1 a: Revise the DEIS to acknowledge the requirement for the NPDES Industrial Activity Permit. Also, revise the DEIS to acknowledge that the water balance for the project includes point source discharges both during and after mine operation. Action 1b: Revise the DEIS everywhere the items in Action 1a above have implications. Action 1c: Revise the DEIS to address the nondegradation provisions under MN Rules 7050 and 7052, including a nondegradation demonstration. Please see Comments #2 and #5. Action 1 d: Revise the DEIS to acknowledge that the project will have to comply with any and all TMDLs on water bodies that the site contributes to, including o Embarrass River, o Partridge River, o unnamed waters of the state, o St. Louis River, and o Lake Superior. Include a commitment to this effect from PolyMet. Action 1e: Revise the DEIS to acknowledge that the linkage between NPDES permits and the status of downstream waters (impaired and a TMDL is required but not yet completed) means that the MPCA may not permit the project (process, site stormwater, or construction) if there is any contribution from the Proposed Action to mercury levels or sulfate that would contribute to increased mercury methylation. Revise the Impact Criteria in the DEIS, especially for mercury and sulfate, to comply with this fact. Revise the DEIS to acknowledge that meeting water quality standards is not a sufficient</p>	WR31,WR4B

64	<p>I have first-hand experience with water quality issues associated with mining of copper sulfide ore deposits. Up until 1996 I worked for the US Bureau of Mines, Twin Cities Mining Research Center as a groundwater hydrologist. My experience with conventional open pit mining of copper sulfide ores centers on several years of field work that I did at the Mineral Park Mine near Kingman, Arizona. The Mineral Park mine was a large conventional open pit operation that flourished from the 1950's through the 1970's. By the early 1990's when I worked there it had been mostly abandoned. The company that owned the mine at that time would not close it down entirely however because the remediation and closure costs were so high. As long as they kept the mine open they were not responsible for past mining impacts. All of the pits were flooded, and the company pumped acidic water from the pits onto old copper waste dumps. They produced some copper, but they also contributed to large volumes of acidic drainage which flowed either onto a large tailings impoundment or into a nearby creek. Acidic drainage would also flow from the base of the impoundment. Pumping to lower the pit lake level was required by the Az. DEQ, since as soon as they stopped pumping the pit lake level would rise to the natural groundwater elevation and become a point source for contamination of surrounding groundwater. Any geochemist will tell you that once exposed to air and water, sulfide waste rock produces acidic discharge that will continue for decades if not centuries. An abandoned and flooded open pit in a sulfide ore deposit becomes an acidic lake. The acidic water will also then mobilize other heavy metals. My experiences at the Bureau of Mines have made me deeply skeptical of mining company claims that they can guarantee zero contamination in perpetuity by using the "latest technology" (essentially liners or barriers of one type or another). Check out what happened in Montana with the Zortman-Landusky gold mine. They promised the latest technology tool with multiple liners and barriers. That was also a Canadian mining company. Perpetual water treatment is of course very expensive and mining companies are generally unwilling to commit to this type of mitigation long-term. They want to be able to walk away from any possible mess they make. They will try to externalize all the remediation and closure costs and stick Mn. taxpayers with the bill. Based on my 20 odd years of experience in dealing with mining companies on environmental issues I don't trust any of them to do what they say they will. Without a very very big bond, Minnesota taxpayers are being forced to take a huge risk here.</p>	G4A,G7A

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
65	<p>COMMENT #2: NONDEGRADATION - APPLICATION OF MN RULE 7050 On page 4.1-33, the DEIS includes the following text: "Because the Project is in the Lake Superior Basin, the Great Lakes Initiative (Lake Superior) water quality standards also apply (Minnesota Rules, chapter 7052). These Lake Superior standards can differ from the water quality standards for the same parameters in Minnesota Rules, chapter 7050. Where different, the 7052 standards supersede the 7050 standards, even if the 7052 rules are less stringent. For parameters not listed in Minnesota Rules, chapter 7052, the standards from Minnesota Rules, chapter 7050 apply. This is not accurate and should be corrected. All the elements of DEIS that are affected by this correction should be revised. MN Rule 7052.0300, subp. 1 includes the following language: "This part and parts 7050.0180 and 7050.0185 establish the non degradation standards and implementation procedures for surface waters of the state in the Lake Superior Basin. For the purposes of this part and parts 7052.0310 to 7052.0330, lowering of water quality means a new or expanded point source discharge of a BSIC to an outstanding international resource water, or a new or expanded point or nonpoint source discharge, for which there is a control document, of a BCC to a high quality water. The nondegradation standards established in this part and parts 7050.0180 and 7050.0185 for surface waters of the state in the Lake Superior Basin apply as follows:" (bold and underline added) As indicated by this language and other text from MN Rule 7052, the relationship between Rules 7052 and 7050 and the applicability of both of these Rules to this Project are not nearly as simple as stated in the text from the DEIS. MN Rule 7052.0300, subp. 1.C includes the following language: "Part 7050.0185 applies to the discharge of non-BCCs to all surface waters of the state in the Lake Superior Basin not designated as ORVWs, and to the discharge of BCCs to waters not designated as ORVWs or high quality waters. " This language applies to every chemical discharged from the NorthMet site, except mercury. It also applies to all the waters that the NorthMet site will drain to, including: • Partridge River • Embarrass River • unnamed "waters of the state" • Colby Lake • Whitewater Reservoir • Second Creek • Sabin Lake • Wynne Lake • St. Louis River • Lake Superior There are minimum requirements and protocols included under MN Rule 7050.0185. These should be followed. The DEIS should provide the information needed to make the "Determination of Significance". In particular, the data and analysis should be included to see if the discharge qualifies as a "significant discharge" under MN Rule 7050.0185, subp.2.G.3, as per MN Rule 7050.0185, subp.5. This provision must be applied to both the process discharge water and the stormwater discharge from the site (construction and site). This will require establishing the "baseline quality" consistently attained in the waters by January 1, 1988. If it is apparent that any of the discharges meet the significance test, the EIS should be revised to include sufficient information for the "Determination of reasonable control measures for significant discharges", as per MN Rule 7050.0185, subp. 8. Additionally, MN Rules 7050.0185, subp. 9 and 7050.0186 should be applied to any and all wetland impacts from the Project. Rule 7050.0185 applies to all pollutants. At a minimum, the analytic work in the revised DEIS should address all the chemicals on the GLI list of chemicals. Recommended Actions Related to Comment #2: Action 2a: Revise the DEIS to address the nondegradation provisions under MN Rules 7050.0185 and 7050.0186, including the significance test under MN Rule 7050.0185, subp. 2.G. If the new or expanded discharge from the Project meets the significance test, revise the DEIS to include reasonable control measures for significant discharges. Address all the pollutants that may be discharged from the Project. Ad</p>	WR3I

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
66	<p>COMMENT #3: FINANCIAL SUPPORT FOR LONG TERM MEASURES There are numerous instances in the DEIS where PolyMet proposes that long-term measures be implemented to address a problem identified in the DEIS. For everyone of these measures, there must be financial provisions proposed to assure that the measures will be funded for as long as they may be needed, even if PolyMet, or some other future owner of the Project, should go out of business. There are a variety of widely-accepted business methods to structure and implement such arrangements. The costs for such arrangements can be accurately determined in order to allow for almost every possible event or development over time. Such financial provisions are the only method of assuring that there will be the monetary support to implement the necessary and appropriate measures. Wherever a long-term measure is proposed to address a problem identified in the EIS and requires review and approval by any regulatory body, that regulatory body should require a suitable financial arrangement to assure funding support for the measure for as long as may be necessary. If such an arrangement is not provided, the proposed measure should be ignored in the context of the regulatory review and approval. For example, page 4.1-128 of the DEIS includes the following text: "As discussed previously, since neither the WWTP nor the East Pit constructed wetlands are expected to be consistently effective in mercury removal, there is some uncertainty whether mercury concentrations in the West Pit, or the ultimate discharge to the Partridge River when the West Pit begins to overflow around Year 65, would meet Great Lakes Initiative water quality standards. Mercury monitoring is recommended to determine if elevated mercury concentrations are found in the West Pit (see Section 4.1.3.5 for a discussion of recommended monitoring measures)." This text appears to be suggesting that the uncertainty about mercury concentrations in the West Pit over time (beyond Year 65) should be acceptable if mercury monitoring is implemented. Specific provisions to fund such monitoring over such a long period of time should be proposed by PolyMet, with a cost estimate and definite commitments to financial arrangements that will guarantee such funding from PolyMet. Such proposed funding arrangements must be sufficiently durable to assure implementation of the monitoring even in the event of Poly Met going out of business. Without such provisions, the monitoring proposal should be ignored and the uncertainty considered unacceptable. Many of the proposed mitigation measures included in the DEIS would require long-term funding to implement. For each of these measures, the DEIS should include proposals from PolyMet to provide funding mechanisms to support these mitigation measures. These funding mechanisms should be sufficiently robust and durable to assure long-term funding even in the event of PolyMet going out of business. Where monitoring is proposed as part of a mitigation strategy, there should be a discussion of the possible alternatives that may be required in response to the monitoring results. The estimated costs of these possible alternatives should be provided along with durable long-term funding mechanisms. Where funding mechanisms do not accompany mitigation measures, those mitigation measures should not be considered or accepted by the agencies reviewing and approving the DEIS. Recommended Actions Related to Comment #3: Action 3a: Revise the DEIS to include a cost estimate and proposed long-term funding mechanisms for every mitigation measure and proposed alternative that is proposed to be implemented beyond the duration of the mining operation. The proposed funding mechanisms must be sufficiently robust and durable to assure long-term funding even in the event of PolyMet, or some other future owner of the Project, going out of business.</p>	PD3,PD4

66	<p><b>COMMENT #4: CONTRIBUTION TO THE VIOLATION OF WATER QUALITY STANDARDS - IMPAIRED WATERS &amp; TMDLs THAT ARE NOT COMPLETE</b> The DEIS includes the following text: 4.1.1.3 Surface Water Resources Embarrass River The Embarrass River is not on the 303(d) list of impaired waters. however several lakes downstream of the Project (referred to as the 'chain of lakes') through which the Embarrass River flows are listed for "mercury in fish tissue" impairment, including Sabin, Wynne, Embarrass, and Esquagama Lake (Figure 4.1-1). Further downstream, most of the St. Louis River is also listed for "mercury in fish tissue" impairment. These lakes and the St. Louis River are not covered by the Statewide Mercury TMDL, but are impaired waters and are still in need of a TMDL pollution reduction study. These waters are not included in Minnesota's regional mercury TMDL because the mercury concentrations in the fish are too high to be returned to Minnesota's mercury water quality standard through reductions in atmospheric mercury deposition alone. A TMDL study of these waters is needed to determine what actions are required to reduce the mercury concentration in fish. 4.5.4.2 Background Mercury contamination of fish is a widespread problem in Minnesota and elsewhere. Many of the waterbodies in the Project area are among those listed as impaired by mercury, including Wynne, Sabin, Embarrass, and Esquagama Lakes (through which the Embarrass River flows); Colby Lake and Whitewater Reservoir in the Partridge River watershed; and segments of the St. Louis River (MPCA 2006, Minnesota's Impaired Waters and Total Maximum Daily Loads) (Figure 4.5-4). These water bodies have fish consumption advisories because the mercury concentrations in fish tissue pose a hazard to human health (MDH 2007, Fish Consumption). Mercury contamination of fish also poses a toxicity risk to fish-eating wildlife (Wolfe et al. 1998; Wiener et al. 2003). The waterbodies listed above, as well as most other waterbodies in the St. Louis River basin were excluded from the statewide mercury TMDL because mercury levels in the fish were above the level considered achievable by the TMDL. These waterbodies may be subject to one or more separate TMDLs to be developed in the future. 4.5.4.3 Project-related Effects The Proposed Action would result in the release of sulfate to areas that MPCA considers "high risk"for mercury methylation within the Embarrass River watershed. The MPCA Web site map for the 2010 303(d) list of impaired waters in the Lake Superior Basin shows the following water bodies to be impaired, at least for mercury, and needing to have a TMDL (the terminology on the map is "At least one use is impaired and a TMDL is required"): • Colby Lake • Embarrass Lake • Esquagama Lake • Sabin Lake • Saint Louis River • Wynne Lake. The DEIS states that discharge from the Project reaches all these water bodies. There have been multiple State and Federal court rulings regarding discharges to waters that have been listed as impaired and for which a TMDL is required, but not yet completed. See, e.g, Friends of Pinto Creek v. United States Env'tl Prot. Agc'y, 504 F.3d 1007 (9th Cir., 2007) cert. denied sub nom Carlotta Copper Company v. Friends of Pinto Creek, et al. 129 S. Ct. 896 (2009). During the period of time that a water body is in this status, "40 C.F.R. § 122.4(i) provides that "[n]o permit may be issued" [t]o a new source or a new discharger, if the discharge from its construction or operation will cause or contribute to the violation of water quality standards. The owner or operator of a new source or new discharger proposing to discharge into a water segment which does not meet applicable water quality standards or is not expected to meet those standards even after the application of the effluent limitations required by sections 301(b)(1)(A) and 301(b)(1)(B) of CWA, and for which the State or interstate agency has performed a pollutants load allocation for the pollutant to be discharged,</p>	EOO,WR3I,FM1,FM5

67	<p>COMMENT #5: LAKE SUPERIOR BASIN WATER STANDARDS AND NONDEGRADATION The DEIS includes the following text on page 4.1-31): All Project area waters are also designated Outstanding International Resource Waters (Minnesota Rules, part 7050.0460 and 7052.0300), which prohibits any new or expanded point source discharges of bioaccumulative substances of immediate concern (e.g., mercury) unless a non degradation demonstration is completed and approved by MPCA. The DEIS includes the following text on pages 4.1-127 &amp; 4.1-128: Nondegradation Standards Minnesota Rules, parts 7050.0185 and 7052.0300, establish nondegradation standards and procedures for surface waters statewide and for waters in the Lake Superior Basin, respectively. The statewide non degradation procedures are in place to protect all waters from significant degradation from point and nonpoint sources. The Lake Superior Basin non degradation procedures apply to new or expanded point source discharges of bioaccumulative substances of immediate concern (BSIC) (Minnesota Rules, part 7052.0350). The only BSIC with applicability to the Project is mercury. The NorthMet Project would be a new facility, but PolyMet has proposed a water balance that avoids the need for any point source discharges during mine operations. During Post-Closure (approximately Year 65), the West Pit would eventually fill and overflow. As discussed previously, since neither the WWTP nor the East Pit constructed wetlands are expected to be consistently effective in mercury removal, there is some uncertainty whether mercury concentrations in the West Pit, or the ultimate discharge to the Partridge River when the West Pit begins to overflow around Year 65, would meet Great Lakes Initiative water quality standards. Mercury monitoring is recommended to determine if elevated mercury concentrations are found in the West Pit (see Section 4.1.3.5 for a discussion of recommended monitoring measures). Many of the statements in these sections are irresponsibly inaccurate, incomplete, and/or misleading. "The statewide nondegradation procedures are in place to protect all waters from significant degradation from point and nonpoint sources" This statement is accurate, but the DEIS section provides no information or provisions in response to its applicability to this project. At a minimum, the DEIS should provide enough information to determine whether the degradation caused by the new or expanded discharges from the project are "significant" under Minnesota Rule 7050. "The Lake Superior Basin non degradation procedures apply to new or expanded point source discharges of bioaccumulative substances of immediate concern (BSIC) (Minnesota Rules, part 7052.0350). " This statement in the DEIS is incorrect. In MN Rule 7050.0300, subp. 1, there is the following text (highlighting added): "For the purposes of this part and parts 7052.0310 to 7052.0330, lowering of water quality means a new or expanded point source discharge of a BSIC to an outstanding international resource water, or a new or expanded point or nonpoint source discharge, for which there is a control document, of a BCC to a high quality water." Mercury is a BCC. All the receiving and downstream waters that are not currently on the 303(d) Impaired Waters List are High Quality Waters. Thus, the Lake Superior nondegradation procedures apply to both point and nonpoint source discharges of BSICs and BCCs from this project. "The NorthMet Project would be a new facility, but PolyMet has proposed a water balance that avoids the need for any point source discharges during mine operations. " This project is required to have NPDES stormwater permits for Construction Activity and Industrial Activity. These permits will cover site discharges, above and beyond the process discharges covered by another NPDES permit. By definition, discharges covered by NPDES permits are point source discharges. Thus, the project will have point source discharges during mine operations. In this se</p>	WR31

68	<p>COMMENT #6: MERCURY SEQUESTRATION IN MINE WASTE ROCK The DEIS includes the following text on pages 4.1-122 to 4.1-124. The highlighting has been added. Mercury in Surface Waters Mercury can be released to surface or groundwaters through mobilization of mercury stored in rock, soil, peat, and vegetation. Methylmercury is the biologically active form of mercury that accumulates in fish and is toxic to humans and wildlife. Current scientific understanding of the factors and mechanisms affecting mercury methylation and bioaccumulation is limited. Mercury concentrations in fish sampled from downstream lakes presently trigger advice to limit fish consumption. An increase in mercury bioavailability would be counter to state-wide efforts to reduce mercury concentrations in fish. This section discusses mercury from only a water quality perspective; the potential effects of the Proposed Action on the bioaccumulation of methylmercury in fish are discussed in Section 4.5. Direct Release of Mercury to Waterbodies from the Mine Site The potential for mercury to be released to waterbodies by exposing rock that contain mercury and the clearing of vegetation (primarily peat) is evaluated below. The NorthMet waste rock and ore contain trace amounts of mercury. Laboratory analysis of humidity cell leachates from waste rock samples found average total mercury concentrations between 5 and 7 ng/L, with concentrations unrelated to rock type or sulfur content (RS53/42, SRK 2007). Separate 36-day batch tests using local rainfall (12 ng/L total mercury) found that contact with Duluth Complex rock actually decreased total mercury concentrations to between 1.9 and 3.2 ng/L (RS53142, SRK 2007). Therefore, the data suggest that mercury present in rainfall or released by sulfide oxidation is typically absorbed by other minerals present in the mine waste rock. For these reasons, the release of mercury from waste rock and ore at the Mine Site is not expected to be a constituent of concern in groundwater seepage. Forest foliage is a major sink for airborne mercury. Mercury accumulated in the foliage of vegetation is then added to the surface litter layer and the soil upon litterfall (Ericksen et al. 2003). Porvari et al. (2003) reported significant increases in total mercury and methylmercury concentrations and loads in streams following clear-cutting and soil treatment (e.g., harrowing, scarification, and mounding) in a boreal forest catchment. Organic matter contained in peat also constitutes a large reservoir of mercury, but this mercury is strongly bound to the organic material (Drexel et al. 2002). Disruption of peat deposits, such as proposed excavation and stockpiling of peat at the Mine Site, resulting in oxidation and decomposition of the peat may increase the mobility of the stored mercury. Mining operations at the Project would result in forest clearing and soil and wetlands disruption over an area of approximately 1,536 acres (RS73B, Barr 2008). Desiccation-induced acidification of the peat can also be expected to mobilize mercury bound to the peat (Tipping et al. 2003). Periodic rewetting of exposed peat by precipitation and water level fluctuations may then promote methylation of mercury by sulfate-reducing bacteria within the oxidizing peat material and thereby mobilize mercury that has accumulated over many years. PolyMet proposes to place the excavated peat in either the Category 1 and 2 waste rock stockpile or the Overburden Storage and Laydown Area (Barr 2009, Technical Memorandum: NorthMet Waste Management and Modeling Assumptions for Overburden Material). Drainage from these stockpiles would be considered process water, which would be collected, possibly treated at the WWTF, and either pumped to the Tailings Basin for reuse/ultimate disposal (Years 1-11) or to help in the flooding of the mine pits (Years 12-65). The WWTF is not predicted to be very effective in removing mercury, with an average non-flow adjusted reduction during mine opera</p>	WR4A,WR4B,WR4D,WR4
69	<p>The Center has numerous members in the region who would be adversely affected by the proposed project. As proposed, the NorthMet mine would violate a number of environmental laws and regulations, including but not limited to the Endangered Species Act, state water quality standards and the Clean Water Act, laws and regulations intended to protect wetlands, the National Environmental Policy Act, the Superior National Forest Plan, and the Clean Air Act, and thus cannot be approved.</p>	G5A
70	<p>Additionally, the Draft EIS cumulative effects analysis is deficient in failing to discuss or disclose the considerable and serious water pollution that would occur if a series of copper-nickel mines are approved in the state, as currently anticipated.</p>	WR5A

Comment ID	Comment Text	Theme Codes
71	As commented by the Tribal cooperating agencies, the Draft EIS also fails to demonstrate that perpetual water treatment would not be required at the mine site. DEIS, 4.1-55. The agencies cannot simply assume that PolyMet’s estimation of 34 years for water treatment is correct. Id. If, as the Tribal cooperating agencies predict and other similar mines have shown, water treatment is likely to be necessary in perpetuity – for thousands of years (DEIS, 4.1-56 n. 15-16) – this obviously is a critically important factor for calculating financial assurance and insuring there will be no long-term legacy pollution resulting from this proposal. See DEIS, 4.1-112, n. 32 (Tribal cooperating agencies stating that a wastewater treatment facility “would need to operate for a minimum of 2000 years in order to treat leachate from the stockpiles”); DEIS, 4.1-113, n. 33 (stating that primary water treatment “would need to continue for thousands of years,” which “does not meet the Minnesota goal for maintenance free closure”).	WR3I
71	The Draft EIS is also inadequate in its analysis of potential releases of mercury, which should be a primary issue of detailed analysis due to the already high levels of mercury in surrounding waterbodies. For instance, both during and after mining, stockpile leakage containing mercury will discharge to groundwater in very close proximity to the Partridge River. There will likely be additional discharge and release of mercury from the tailings basin into groundwater and surface waters. The Draft EIS fails to provide a sufficient, quantitative, and cumulative analysis of the likely discharge of mercury to all surface waters in and downstream from the project area, both during and after the proposed mining.	WR5A
72	Regarding wetlands, in addition to the issues discussed below in the context of Section 404 of the CWA, the Draft EIS cumulative effects analysis is inadequate. The agencies cannot ignore the substantial impacts to wetlands resulting from taconite mining in this region. As explained by the Tribal cooperating agencies: At a regional scale, Iron Range taconite mining has impacted wetlands through direct wetland fill as well as indirect impacts due to air deposition of mine related contaminants, water quality degradation, and the flooding/de-watering of wetlands which lead to changes in wetland functional values. There are two additional geographic scales at which wetland cumulative impacts should be characterized: St. Louis River Watershed. The Fond du Lac band of Lake Superior Chippewa has identified this watershed as an area of concern. The cumulative impact analysis should quantitatively characterize the following: 1. The additive effect of PolyMet related air and water emissions to the Partridge and Embarrass River watershed wetlands and their impact on water quality of the St. Louis River. 2. The loss of wetlands and changes in wetland functional values in the St. Louis River watershed during the 3 timeframes, including a characterization of the potential for future mining impacts and the longterm maintenance requirements of the PolyMet mine as currently proposed. 1859 Ceded Territory. The Fond du Lac, Grand Portage, and Bios Forte tribes retains treaty guaranteed rights to harvest natural resources within the 1859 ceded territory. The cumulative impact analysis should quantitatively characterize the following: 1. The additive effect of PolyMet related air and water emissions to the wetlands of the 1859 ceded territory. 2. The loss of wetlands and changes in wetland functional values in the 1859 ceded territory during the 3 timeframes. 3. Loss of tribal access to wetlands in the 1854 ceded territory due to either the changes documented in 2. above, or due to mitigation of wetland impacts occurring outside of the ceded territory.	WE4,WE5
73	DEIS, 4.2-43, n. 38. Moreover, as with numerous other issues, the Draft EIS analysis of wetlands impacts is inadequate because much of the work and analysis is deferred until later. As commented by EPA, “the current mitigation options – two restoration sites in Aitkin and Pine Counties and on-site post-closure locations – compensate for only 68% of projected impacts.” July 31, 2009, EPA Comments, p. 1. While the Draft EIS “states that the rest of the uncompensated wetlands would be addressed as permit conditions,” EPA requested that all mitigation be included within the Draft EIS, prior to permitting. Id. This is indeed required by NEPA, both to allow an accurate assessment of wetland impacts, and to allow the public to be meaningfully involved in commenting on this significant issue of concern for the proposed action.	WE3,WE4

- 74 IV. The DEIS Fails to Adequately Explain How the Proposed Mining Project Would Not Violate the Clean Water Act (“CWA”) The CWA is designed to “restore and maintain the chemical, physical and biological integrity of the Nation's waters.” 33 U.S.C. § 1251(a). The goal of the CWA is that the discharge of pollutants into navigable waters be eliminated, and “it is the national policy that the discharge of toxic pollutants in toxic amounts be prohibited.” Id. Section 301 of the CWA prohibits the discharge of any pollutant into waters of the United States, except as provided by specific statutory authority. Id. § 1311. The CWA and its implementing regulations define “waters of the United States” to include wetlands and riparian habitats adjacent to waters of the United States. Id. § 1362(7); 33 C.F.R. § 328.3(b). “Pollutant” is defined to include dredged or fill material. 33 U.S.C. § 1362(6). Any applicant for a federal permit to conduct any activity which may result in the discharge into the navigable waters must provide the permitting agency with a certification from the State that any such discharge will comply with the CWA and state water quality standards. Id. § 1341. In addition, the CWA requires federal agencies to comply with state water quality standards. Id. § 1323(a); *Northwest Indian Cemetary Protective Ass’n v. Peterson*, 795 F.2d 688, 697 (9th Cir. 1986). A. Section 404 of the Clean Water Act Section 404 of the CWA regulates the discharge fill material into waters of the United States. 33 U.S.C. § 1344(e). The Secretary of the Army, acting through the Corps, may issue permits for such activities. Id. The Corps has adopted regulations to implement this permitting process, known as the “public interest” factors. 33 C.F.R. §§ 320 et seq. In addition, the EPA promulgated regulations, known as the “404(b)(1) Guidelines,” to eliminate unnecessary environmental impacts. 33 U.S.C. § 1344(b)(1); 40 C.F.R. § 230. The Corps must review all proposed section 404 permits under both the Corps’ public interest factors and EPA’s 404(b)(1) guidelines. 33 C.F.R. § 320.2(f). The Corps may issue individual and general permits under section 404 of the CWA. 33 U.S.C. § 1344(a) & (e). Section 404 of the CWA prohibits the filling or dredging of wetlands without first receiving a § 404(b) permit from the U.S. Army Corps of Engineers. 33 U.S.C. § 1344 (a), (d). The CWA and its implementing regulations “express a strong preference for wetland protection.” *National Wildlife Federation v. Whistler*, 27 F.3d 1341, 1344 (8th Cir. 1994). A Section 404 permit may not be issued if (i) there is a practicable alternative which would have less adverse impact and does not have other significant adverse environmental consequences, (ii) the discharge causes or contributes to violations of any applicable state water quality standards, (iii) the discharge would result in the likely destruction or adverse modification of critical habitat, (iv) the discharge will cause or contribute to significant degradation of waters of the United States, (v) the discharge does not include all appropriate and practicable measures to minimize potential harm, or (vi) there does not exist sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with the Corps’ Guidelines for permit issuance. 40 C.F.R. § 230.10-12; see *Bering Strait Citizens for Responsible Resource Dev. v. U.S. Army Corps of Engineers*, 524 F.3d 938, 946-47 (9th Cir. 2008). For the “practicable alternative” requirement, the Corps must follow a specific two step procedure. First, a correct statement of the proposed project’s “basic purpose” is necessary. See 40 C.F.R. § 230.10(a)(3). The Corps is to define the proposed project’s basic purpose. See 33 C.F.R. Part 325, App. B(9)(b)(4). Second, after the Corps defines the basic purpose of the project, it must determine whether that basic purpose is “water dependent.” See 40 C.F.R. § 230.10(a)(3). As one example, a gold mining p
- 75 DEIS, 4.2-22, n. 27. The Draft EIS fails to demonstrate that there is no practicable alternative which would have less adverse impact and does not have other significant adverse environmental consequences. The proposed mine is clearly not a “water-dependent project,” and thus the Corps must assume that practicable alternatives exist unless the applicant clearly demonstrates otherwise. *National Wildlife Federation*, 27 F.3d at 1344 (quoting 40 C.F.R. § 230.10(a)(3); see also 7050.0186(4) (prudent and feasible alternatives that do not involve wetlands are presumed to be available unless clearly demonstrated otherwise by the permit applicant). “This presumption of practicable alternatives ‘is very strong.’” *National Wildlife Federation*, 27 F.3d at 1344. The Draft EIS falls far short in demonstrating that there are no practicable alternatives that would have less severe impacts to wetlands. 40 C.F.R. § 230.10(a). As commented by the Tribal cooperating agencies, “[o]ther alternatives that were not considered in the DEIS (e.g. underground mining) would pose less harm to high quality wetlands, and may be less damaging to aquatic resources.” DEIS, 4.2-25, n. 33; see also DEIS, 4.2-25, 26 (finding that Mine Site and Tailings Basin alternatives would reduce impacts to wetlands).

|----|---|------|
| 76 | In addition, as stated, the permit applicant must also provide compensatory mitigation for unavoidable wetlands impacts, and if compensatory mitigation is accomplished by restoration or creation, the replacement wetland must be of the same type and in the same watershed as the impacted wetland, to the extent prudent and feasible. Minn. R. 7050.0186(6). For the proposed project, nearly all wetland compensation would occur outside of the St. Louis River watershed. DEIS, 4.2-36, 37. The applicant and agencies, however, have failed to sufficiently demonstrate that replacement wetlands of the same type and in the same watershed as the impacted wetlands is not prudent or feasible. Federal and state wetland mitigation requirements are clear that the preference for mitigation is within the same watershed where the impacts will occur, and it is not simply up to the permittee to decide whether opportunities within the watershed would be too expensive. The Corps and DNR must require that PolyMet restore wetlands within the St. Louis River watershed if an appropriate location can be found, regardless of the added cost to the mining proponent.  | WE3  |
| 76 | The proposed mine will cause and contribute to violations of state water quality standards, and therefore a Section 404 permit cannot be issued. 40 C.F.R. § 230.10(b)(1); see also, id. § 230.10(c) (not allowing permit to be issued if the proposal “will cause or contribute to significant degradation of waters of the United States”). As explained below in more detail, the Draft EIS acknowledges the following: West Pit overflow is predicted to “initially” exceed water quality standards. DEIS, S-8. Modeling predicts “that three parameters (i.e., arsenic, cobalt, and selenium) would exceed surface water quality standards when the West Pit overflows” and an “uncertainty analysis” “predicted exceedances of surface water standards for cobalt, copper, and nickel.” DEIS, 4.1-113. “The modeling results suggest that perhaps as many as five parameters (i.e., arsenic, cobalt, copper, nickel, and selenium) could exceed surface water quality standards, in addition to the relatively high sulfate concentrations.” Id. Groundwater seepage at the tailings basin would not be recovered and would eventually impact surface water quality in the Embarrass River. DEIS, 4.1-117-18. Modeling predicts that the proposed mine “would increase sulfate concentrations” to as high as 146 mg/L during low flow conditions. DEIS, 4.1-120. Wild rice grows on the lower Partridge River, and therefore the wild rice sulfate water quality standard applies; and the proposed PolyMet discharge would not meet this standard. DEIS, 4.1-187, n. 80. The proposed project, in combination with other past, present, and reasonable foreseeable future projects “have resulted in a significant increase in sulfate concentrations from baseline conditions of approximately 5 mg/L to the existing concentration of 149 mg/L . . . , which is expected to increase further as a result of the NorthMet and Mesabi Nugget Phase II projects.” DEIS, 4.1-189. Sulfate concentrations in the St. Louis River are sometimes elevated due, most likely, to mining related sulfate releases. DEIS, 4.1-194. Moreover, “[t]he activities included in this cumulative effects assessment, which include several mining projects, have the potential to increase sulfate concentrations.” Id. In addition, EPA’s comments indicate water quality standard violations for aluminum in the Embarrass River and Colby Lake. July 31, 2009 EPA comments at 3. This includes violations that could impact the drinking water supply of Hoyt Lakes. Id. See also Table 4.1-68, DEIS, 4.1-129. As explained above, the proposed mine would also directly result in the destruction and adverse modification of critical habitat for Canada lynx and gray wolves, and therefore a Section 404 permit cannot be issued. 40 C.F.R. § 230.10(b)(3). The proposed mine does not include all appropriate and practicable measures to minimize potential harm, and therefore a Section 404 permit cannot be issued. 40 C.F.R. § 230.10(d). The Draft EIS fails to provide sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with the Corps’ Guidelines for permit issuance, and therefore a Section 404 permit cannot be issued. In fact, the agencies admit within the Draft EIS that “[r]elatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent ‘high risk situations’ for mercury methylation,” and there is “uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard.” DEIS, S-9; see also DEIS, 4.1-124 (stating “there is some uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury and additional analysis of this issue is recommended”); DEIS, 4.2-194 (“[i]t is unclear to what extent increased sulfate loadings may have on mercury methylation within the downgradient wetlands and downstream lakes,” and the project “may contribute to cumulative ef | WR4B |

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
78	Additionally, just because the amount of wetlands that would be affected by the project proposal is so large should of course not mean that the permittee can look outside of the watershed for the required mitigation. The opposite should be true – that the larger the amount of wetlands to be impacted, the more important it is for the project proponent to mitigate the loss within the same watershed.	WE3
78	Moreover, there is no assurance that the wetlands to be restored at the Aitkin and Hinckley sites are of the same quality of the wetlands that would be destroyed at the mine site, as required. Because the proposed Aitkin and Hinckley sites are located so far away and to the south, these restored wetlands would not provide the same habitat that would be lost for wildlife species such as moose, lynx, wolves and other species that are not found that far to the south.	WI6,WE3
79	In addition, the amounts of wetlands that are proposed to be created or restored falls far short of the amount necessary to compensate for the wetlands that would be directly and indirectly affected by the proposed project. The Draft EIS claim that additional compensatory mitigation would be addressed later fails to comply with NEPA. 40 C.F.R. 1500.1(b) (“NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken) (emphasis added); see also DEIS, 4.2-39 n. 37 (stating that “unless the mitigation for the additional 475 wetland acres is identified in the DEIS, or there is a detailed statement of how the permit conditions would address the needed acres, the impacts must be considered unmitigated for purposes of the DEIS”).	WE3
80	It is apparent from the Draft EIS that the proposed NorthMet project would violate state water quality standards. For instance, for water quality in the Upper Partridge River, the Draft EIS states that West Pit overflow is predicted to “initially” exceed water quality standards. DEIS, S-8. According to the Tribal cooperating agencies, “the west pit is predicted to violate surface water standards for all years that predictions were made.” DEIS, 4.1-129, n. 45. And according to EPA, this overflow “clearly exceeds several water quality standards.” July 31, 2009 EPA comments at 3. Indeed, modeling predicts “that three parameters (i.e., arsenic, cobalt, and selenium) would exceed surface water quality standards when the West Pit overflows” and an “uncertainty analysis” “predicted exceedances of surface water standards for cobalt, copper, and nickel.” DEIS, 4.1-113. “The modeling results suggest that perhaps as many as five parameters (i.e., arsenic, cobalt, copper, nickel, and selenium) could exceed surface water quality standards, in addition to the relatively high sulfate concentrations.” Id; see DEIS, 4.5-16 (stating that “[t]he West Pit is expected to overflow around Year 65,” and that “[t]he initial overflow is currently predicted to exceed surface water standards for as many as four parameters (i.e., arsenic, cobalt, nickel, and selenium) . . .”). Furthermore, as noted by the Tribal cooperating agencies, “because of continued inputs from stockpiles, the tailings basins, and the pit walls, the pit lake could exceed water quality standards for thousands of years.” DEIS, 4.1-115, n. 35; see also September 2, 2009, Forest Service Comments (stating that additional “information/analysis/conclusions regarding the ability of the West Pit overflow’s to meet the Great Lakes Initiative should be included in the DEIS”).	WR3C
80	Last, as noted by the Tribal cooperating agencies, the public notice issued by the Corps for the Section 404 permit must be reissued, and MPCA afforded another opportunity to analyze and make a determination under Section 401 of the CWA, because significant changes have been made to the proposed action since the May, 2005 public notice. DEIS, 4.2-1, n. 1.	PRO3
81	Furthermore, the Draft EIS acknowledges that groundwater seepage at the tailings basin would not be recovered and would eventually impact surface water quality in the Embarrass River. DEIS, 4.1-117-18. Modeling predicts that the proposed mine “would increase sulfate concentrations” to as high as 146 mg/L during low flow conditions. DEIS, 4.1-120; see also DEIS, 4.1-64 (“[T]he total unrecovered NorthMet groundwater seepage from the Tailings Basin is expected to range from approximately 1,600 gpm in Year 1 to approximately 2,900 gpm in Year 20”). “The analysis indicates that groundwater seepage . . . would be the primary input of sulfate to the Embarrass River during low flows in all mine years.” Id. As recognized by the Tribal cooperating agencies, the limiting data indicate that surface waters already adversely impacted by past and ongoing mining activity, and “because the Embarrass River already exceeds water quality standards, it would be difficult to permit the addition of additional contamination from new or expanded sources.” DEIS, 4.1-120, n. 37-38. Modeling suggests that the proposed project would cause manganese, aluminum, and sulfate to exceed water quality standards. Id.	WR1A,WR2G

Comment ID	Comment Text	Theme Codes
82	In addition, mercury concentrations in fish sampled from downstream lakes already triggers advice to limit fish consumption, and an increase in mercury bioavailability “would be counter to the state-wide efforts to reduce mercury concentrations in fish.” DEIS, 4.1-122. As disclosed within the Draft EIS: The groundwater seepage rate from the Tailings Basin during mine operations would greatly exceed the groundwater flux capacity of the aquifer, which would result in significant upwelling of groundwater with elevated sulfate concentrations. This upwelling would inundate portions of the wetlands found north of the Tailings Basin, introduce relatively high sulfate concentrations to the wetlands and downstream lakes on the Embarrass River that represent high risk situations for mercury methylation, and could affect sulfate concentrations in downstream waters that contain wild rice.	FM1
83	DEIS, 4.1-129. As further disclosed in the Draft EIS, “[r]elatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River that represent ‘high risk situations’ for mercury methylation,” and there is “uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard.” DEIS, S-9; see also DEIS, 4.1-124 (stating “there is some uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury and additional analysis of this issue is recommended”); DEIS, 4.1-125 (acknowledging that the proposed mine “would result in increased sulfate loadings via groundwater to both the Partridge and Embarrass rivers”); DEIS, 4.1-126 (“increasing the sulfate load from the Tailings Basin could increase the potential for mercury methylation both in wetlands north of the Tailings Basin and at the downstream lakes”); DEIS, 4.1-127 (“seepage from the Tailings Basin would introduce elevated sulfate concentrations to a high risk situation for mercury methylation”). As recognized by the Tribal cooperating agencies, this “further analysis” must be presented within a Supplemental Draft EIS to allow this significant and directly relevant information to be reviewed by the public and other agencies. DEIS, 4.1-124, n. 39. Similarly, the “additional sampling” being conducted by PolyMet “to help better understand mercury dynamics in the Project area” is similarly directly relevant and highly significant information that must be presented to the public within a Supplemental Draft EIS. DEIS, 4.1-126.	WE2,WE4
84	Minn. R. 7050.0224 sets a standard for sulfates of 10 mg/L, which is applicable to all waters used for the production of wild rice. The Draft EIS fails to demonstrate how the proposed project would meet this standard not only in project area streams, but also downstream in the St. Louis River.	WR4F
85	The Center also incorporates by reference the Draft EIS comments submitted by Minnesota Center for Environmental Advocacy, Friends of the Boundary Waters Wilderness, Save Lake Superior Association, the Indigenous Environmental Network, the Sierra Club, and WaterLegacy.	G15
86	The Draft EIS acknowledges that the proposed NorthMet project, in combination with other past, present, and reasonable foreseeable future projects “have resulted in a significant increase in sulfate concentrations from baseline conditions of approximately 5 mg/L to the existing concentration of 149 mg/L . . . , which is expected to increase further as a result of the NorthMet and Mesabi Nugget Phase II projects.” DEIS, 4.1-189. Additionally, the NorthMet and Mesabi Nugget Phase II projects “have the greatest potential to affect sulfate, and potentially methylmercury, concentrations in the Partridge River.” Id. The Draft EIS, fails to explain, however, how the cumulative impacts of these and other past, present, and reasonably foreseeable future projects will still comply with all applicable water quality standards, including the state’s nondegradation policy.	WR5A
87	The Draft EIS further indicates additional water quality violations downstream in the St. Louis River, which discharges into Lake Superior. According to the Draft EIS, “[i]t has long been known that sulfate concentrations in the St. Louis River are sometimes elevated due, most likely, to mining related sulfate releases.” DEIS, 4.1-194. Moreover, “[t]he activities included in this cumulative effects assessment, which include several mining projects, have the potential to increase sulfate concentrations.” Id. The St. Louis River is already listed on the 303(d) list due to mercury in fish tissue, and this expected increase in sulfate is not allowed. See e.g., 40 C.F.R. § 122.4(d); 40 C.F.R. § 122.4(i).	WR4B,FM1

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
87	Similarly, for the Embarrass River, the Draft EIS acknowledges that seepage from the Tailings Basin “would introduce additional sulfate to several high risk situations for mercury methylation.” DEIS, 4.1-194. The agencies claim, however, that “[i]t is unclear to what extent increased sulfate loadings may have on mercury methylation within the downgradient wetlands and downstream lakes,” and that the project “may contribute to cumulative effects on methylmercury concentrations in downstream lakes that are already on the 303(d) list.” Id. Minnesota’s water quality standards and nondegradation policy are not merely aspirational goals that polluters are encouraged to obtain through trial and error as a project moves forward. Rather, there are mandatory, enforceable standards, and the agencies must not permit a project to proceed until the project proponent and the agencies can demonstrate actual compliance with these standards. See e.g., 40 C.F.R. § 122.4(d); 40 C.F.R. § 122.4(i); see also DEIS, 4.5-22, n. 11 (Tribal cooperating agencies, recognizing that “any new discharges that would result in further degradation to waters with an existing water quality impairment would not be legally permitable under the Clean Water Act (see <i>Friends of Pinto Creek v. EPA</i> (9th Cir.), known as the <i>Carlota Decision</i> ”).	G15,WE3,WI6
87	It is simply not credible for the agencies to acknowledge that numerous waterbodies in the project area are already in exceedance of mercury standards, with many not even included in the state’s regional mercury TMDL because mercury concentrations are too high, but then claim that major activities including NorthMet and Mesabi Nugget Phase II are “not expected to contribute to additional cumulative effects on mercury concentrations in water or fish tissue.” DEIS, 4.1-190. Substantially more information is required to fully explain what caused these waterbodies to be already severely impaired for mercury, as well as why the acknowledged addition of significant amounts of sulfates will somehow not result in additional mercury pollution.	WR4B
88	In addition, EPA’s comments indicate water quality standard violations for aluminum in the Embarrass River and Colby Lake. July 31, 2009 EPA comments at 3. This includes violations that could impact the drinking water supply of Hoyt Lakes. Id. As stated by EPA, to conclude that predicted levels (which significantly exceed water quality standards) ‘would not pose any human health risk’ needs verification and CENTER FOR BIOLOGICAL DIVERSITY’S DRAFT EIS COMMENTS 21 supporting documentation,” and the fact “that predicted levels could be almost three times the standard should be discussed in the DEIS.” Id.	WR3H
89	According to the Forest Service, nitrates are another constituent that is commonly exceeded for water quality at mine sites due to blasting agents utilized, and the Draft EIS must adequately explain how the proposed NorthMet mine would not result in water quality standard violations for nitrates. See September 2, 2009, Forest Service comments.	WR1E,WR3I
90	The Draft EIS also fails to disclose that Cliffs Erie currently holds NPDES permits at the NorthMet proposed site in which ongoing discharges are already violating their permit and the CWA. The Draft EIS is wholly inadequate in analyzing how the NorthMet mine can be expected to add massive amounts of waste on top of the unlined and already leaking tailings basin, in which CWA violations are already occurring, and somehow expect to maintain or exceed all applicable water quality standards. See e.g., DEIS, 4.1-63 (stating that “the Proposed Action would result in increased seepage from the Tailings Basin relative to existing legacy LTVSMC seepage, including both surface seepage through the Tailings Basin embankment and groundwater seepage through the base of the LTVSMC tailings”).	WR5A
91	The Draft EIS is also deficient in failing to adequately explain and demonstrate why no NPDES permits would apparently be required for the proposed NorthMet mine. As stated by the Tribal cooperating agencies, there will be surface water discharge to the Embarrass River, as there is a direct surface water connection between the northwest corner of cell 2W and the Embarrass River. DEIS, 4.1-107. “Aerial photos show that water discharging from the tailings basin follows a natural channel westward, through existing wetlands and intersects a channel that leads directly to the Embarrass River.” Id.	WR3C
773	The proposed PolyMet project would take over 6,700 acres of public land in the Superior National Forest. The DEIS provides no analysis of the land exchange and its impact on tribal rights, plant and animal habitat, and public assets.	PRO4

1152	The PolyMet project will lead to increased acidity of streams and rivers, especially the Partridge River which flows into the St. Louis River. This acidity will occur because of leaching of the exposed rock in the mine pits and the waste rock piles as they come into contact with air and water. The acidity leads to increased methylation of mercury which is known to harm fish and other aquatic forms of life. This will lead to increased fish consumption advisories and have a direct impact on fishing, recreational opportunities, tourism, treaty rights and human health. Because the area of the proposed open pit mining operation is much larger than what would be required for an underground mine, much more wildlife habitat would be destroyed for the project as proposed. Several endangered or threatened species will be impacted by this project including but not limited to the wood turtle, black sand shell mussel and the floating marsh marigold. The project is proposed to be located in habitat currently inhabited by Canada lynx and gray wolf, which are protected species. The impact of the proposed PolyMet project on wildlife is not acceptable. Endangered, threatened and protected species must be conserved.	WI2,WI3,WI5
1986	The PolyMet project will lead to increased acidity of streams and rivers, especially the Partridge River which flows into the St. Louis River. This acidity will occur because of leaching of the exposed rock in the mine pits and the waste rock piles as they come into contact with air and water. The acidity leads to increased methylation of mercury which is known to harm fish and other aquatic forms of life. This will lead to increased fish consumption advisories and have a direct impact on fishing, recreational opportunities, tourism, treaty rights and human health. Because the area of the proposed open pit mining operation is much larger than what would be required for an underground mine, much more wildlife habitat would be destroyed for the project as proposed. The project is proposed to be located in habitat currently inhabited by Canada lynx and gray wolf, which are protected species. The impact of the proposed PolyMet project on wildlife is not acceptable. Endangered, threatened and protected species must be conserved.	FM1
3311	The discharges from the mine pit and waste rock piles, seepages from the tailings basin and overflow from the flooded mine pit after closure are likely to pollute local ground water and water in the Partridge and Embarrass Rivers as well as downstream in the St. Louis River which empties into Lake Superior. Some of these are acknowledged in the DEIS to exceed water quality standards after closure including the Lake Superior mercury standard. It is also noted in the DEIS that the surface aquifers to the north of the tailings basin are already saturated by contaminated water from the old LTV tailings. This means that there will be little or no dilution of the polluted groundwater from additional rainwater and that more polluted water will be added to the same area by putting PolyMet's tailing slurry on top of the LTV tailings. Manganese, aluminum and sulfate discharges from the existing LTV tailings are already in serious violation of water quality standards. In the DEIS PolyMet is claiming that the discharges of these known pollutants from their tailings won't be any worse and therefore they don't have to do water treatment for their discharges. The Department of Natural Resources should not allow the mining companies to evade their pollution abatement responsibilities in this way.	EOO,WR3A,WR3I
3739	The proposed PolyMet project would take over 6,700 acres of public land in the Superior National Forest. The DEIS provides no analysis of the land exchange and its impact on tribal rights, plant and animal habitat, and public assets.	PD1

Comment ID	Comment Text	Theme Codes
3740	The DEIS does not require financial assurances from PolyMet even though the Environmental Protection Agency has advised states to require financial assurance due to the experience of expensive cleanups of contamination from many defunct or bankrupt sulfide mines in other states. PolyMet assets appear to be limited to this mine or are sheltered in foreign countries. The taxpayers of Minnesota should not be held responsible for the costs of the massive environment cleanup that is likely to result from this proposed project. The Department of Natural Resources already has the authority to force mining companies to pay for environmental cleanup but has not exercised this authority. For example, the LTV tailings basin continues to pollute groundwater after 50 years of operation and nearly ten years after closing. The addition of PolyMet tailings to this same basin will only aggravate a bad situation. Mining companies must be required to cleanup their own messes and must pay for the cost of cleanup when others have to do it for them. The Minnesota Department of Natural Resources has the responsibility to insist on design changes that would mitigate the environmental impact of the mining, ore processing and disposal of waste materials of this proposed PolyMet project. The Department's own Strategic Conservation Agenda calls for protection of all the state's natural resources and this is a case where they should exercise that responsibility.	PD4
3877	The proposed PolyMet copper-nickel mining project raises serious concerns about potential environmental contamination and deleterious effects on water quality, habitat, fish and wildlife and human health. Sulfide mining is new to Minnesota, but the experience of extensive acid mine drainage and water pollution in other states should alert public officials in Minnesota to the serious risks to the environment associated with this type of mining. In fact after considerable contamination associated with the Flambeau Mine near Ladysmith, Wisconsin placed a moratorium on sulfide mining operations until it can be demonstrated that such a mine has operated in a sulfide ore body for 10 years without polluting the groundwater and surface waters. Does Minnesota care less about the quality of its water and natural resources? The Minnesota Department of Natural Resources is charged with the protection of the state's resources for all the inhabitants of the state. The short-term financial gain of a Canadian mining company should not trump the long-term stake that all of us have in protecting our natural resources for future generations. The Minnesota Department of Natural Resources' Strategic Conservation Agenda 2009 - 2013 developed through extensive discussions lists several strategic goals. The goals listed below would be violated if this proposal is allowed to be permitted.	G2,G5,G12
3878	The area of the proposed mining project is home to several endangered or threatened animal and plant species and also provides a natural corridor for birds and other forms of wildlife from the south of Lake Superior to the areas north and beyond. The construction of the mine will destroy thousands of acres of wetlands, mainly high quality bogs that provide habitat for a number of species and also purify the water, regulate the water flow and sequester carbon which reduces climate change. The proposed replacement wetlands are not of comparable quality and are not even in the same St. Louis River watershed.	G2C,G7A
3879	Minnesota's natural resources are integral to many parts of the state's economy including mining, forestry, outdoor recreation and tourism. The lands and waters of the state must be managed so as to not exploit one of these parts at the expense of the others. The proposed PolyMet project would impact thousands of acres of forest and wetlands that will not be available for other uses for generations even with reclamation. Serious contamination of the ground and water due to acid rock and mine drainage will impact areas far removed from the mine and tailings basin sites. After closure the flooded mine pit will be a large body of water but will not be available for any recreation purpose. Contamination from there will spill into a tributary of the Partridge River and flow downstream into the St. Louis River and into Lake Superior. The ability of the Department of Natural Resources to ensure environmental integrity for significant parts of northeast Minnesota will be compromised if this proposed project is allowed to move forward.	G7A,G11
3880	As property owners in northern Pine County we have an individual responsibility to protect our wetlands and bog lake so that they will continue to provide suitable habitat for black spruce, sundews, pitcher plants, lady slippers and other flora and fauna in order that future generations will be able to enjoy the beauty that is Minnesota. We expect that public agencies will also honor their responsibility to protect our natural resources, especially on public lands, for all Minnesotans now and forever.	G7

3912 I am a resident and land owner in the Superior National Forest for the last twenty-five years. I am against any permits given for the PolyMet sulfide mining projects. This is an area pristine in water quality and needs to be protected not exploited by short term gains in company profits and jobs. Due to water contamination problems in other states from this activity (i.e. Idaho (Thompson Creek), South Dakota (Gilt Edge Mine), and Montana (Zortman-Landusky) taxpayers have been liable for clean-up not to mention the impact on the wildlife and overall environment. All mining is energy intensive and I do not support an activity that will increase the demand for this in a time when we are trying to reduce carbon emissions and oil consumption. I urge you to put a moratorium on oil sulfide mining in Minnesota.

G12

**Sender Last Name:**    Robinson **Submission ID:** 2276

2694 Please do not let short term gain bait anyone into decision that may have negative effects for generations to come. The BWCA and Birch Lake is a resource that exists now and will continue to provide for Minnesotans for years and years. All we need to do is to leave it unharmed. The risks of this project are obvious. Don't gamble away this precious Minnesotan resource. I have lived on Birch Lake for 5 years. Please spare it. The exploration drilling is already negatively affecting mine, and my Outward Bound Students experience.

763 I'm writing to request that the public input period be extended to at least 180 days on the above-referenced matter, with public and interactive hearings scheduled throughout the State of Minnesota. We are very concerned about the pollution of our water and land by sulfide mining in the northern region.

13 \_ The EIS should be clearer; PolyMet is not in the Boundary Waters watershed.

WR3B

160 I just wanted to send you an e-mail to let you know that I support PolyMet Mining's NorthMet Project. The Project's Economic Impact is substantial. \_ PolyMet will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefit. \_ PolyMet's 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region/my local business. \_ PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system. \_ Enough is enough; let's get on with permitting this mine. We NEED jobs. Environmental Precautions \_ PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. \_ PolyMet has demonstrated it can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. \_ The metals that PolyMet will mine are essential to green technology such as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters. \_ Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air and water will be minimal, if any.

EOO,G5

161	_ As a person who lives/works/plays in Northeast Minnesota, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project and I wholeheartedly support it. _ PolyMet project has been designed to minimize environmental impacts; reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. Domestic Production _ PolyMet will be a domestic supply of critical metals needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential products. _ I understand the importance of buying locally. PolyMet will mine and produce several metals not currently mined anywhere in the United States. _ I use these metals every day. PolyMet will be a domestic source of the metals we all use every day. _ Mining these metals in one country, processing them in another and then transporting them to the U.S. creates unnecessary greenhouse gas emissions. _ Foreign suppliers of these metals don't necessarily follow sound environmental practices, creating a greater global environmental impact.	EOO,G5
<b>Sender Last Name:</b> Rohlfig		<b>Submission ID:</b> 3082
3471	Have you ever been to the Boundary Waters??? Minnesota has precious habitat and environment. This will significantly and perhaps permanently destroy the fauna and flora, dependent on clear air and water. Not to mention the disruption of the aesthetics, and harm to human health.	G2C,G8
<b>Sender Last Name:</b> Rolan		<b>Submission ID:</b> 3500
3772	I believe that what is happening is wrong due to the fact that you are obviously missing the fact that you are possibly hurting alot of people and damaging their lives. You are completely overlooking the fact that this mining business can do more damage than not having it. And as one of the citizens of the U.S. i beg that you reconsider this idea.	EOO,G3
<b>Sender Last Name:</b> Rolloff		<b>Submission ID:</b> 1756
2295	I AM UNEQUIVOCALLY OPPOSED TO SULFIDE MINING IN THIS AREA! The hydrological nature of this area and it's location immediately adjacent to the Boundary Waters Canoe Area Wilderness and several major watersheds make this project completely unacceptable. Water quality concerns alone make this project one that should not proceed. I've seen sulfide mining in the western United States and have no belief that this project will do anything but seriously damage the environment in the region. It's also a well known fact that nature-based tourism is heavily dependent on perceptions of high quality natural resources. Poisoning the waters of northern Minnesota will seriously damage our nature-based tourism economy which is much more lucrative and long term than the short-term gain and job additions that sulfide mines would contribute. I am adamantly opposed to these mining projects and ask that the DNR determine that these projects are incompatible with the wilderness, hydrological, and economic values of northern Minnesota.	EOO,G7,G11

1	<p>XI. The Agencies Have Failed to Explain Why Additional Analysis and Information Could Not Be Provided Within the Draft EIS As stated and set forth above, for a number of issues including wetlands, water quality, cultural resources and financial assurance, the Draft EIS acknowledges that the agencies are still compiling information and that additional analyses have yet to occur. Additionally, many of the potential impacts of the proposal are unknown due to a lack of the necessary data and information. The CEQ NEPA regulations include a detailed regulation regarding “incomplete and unavailable information,” which has been ignored for the NorthMet proposal. 40 C.F.R. § 1502.22. According to the NEPA regulations, where there is incomplete or unavailable information, the agency must first make clear that such information is lacking. 40 C.F.R. § 1502.22. Moreover, “[i]f the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement.” Id., § 15022(a). The agencies have provided no information to indicate that it would have been an exorbitant cost to obtain any of the missing data or information that are relevant to the project’s environmental impacts. The agencies for the most part instead simply proclaim that such information and data will continue to be gathered during the permitting processing. Furthermore, even if the costs of obtaining the data and information are determined by the agencies to be exorbitant, the environmental impact statement must still disclose (1) a statement that such information is incomplete or unavailable; (2) a statement of the relevance of the incomplete or unavailable information to evaluating reasonably foreseeable significant adverse impacts on the human environment; (3) a summary of the existing credible scientific evidence which is relevant to evaluating the reasonably foreseeable significant adverse impacts on the environment; and (4) the agency’s evaluation of such impacts based on theoretical approaches or research methods generally accepted in the scientific community. 40 C.F.R. § 1502.22(b). The agencies have entirely failed to comply with this NEPA regulation concerning the missing data and information for the NorthMet proposal.</p>	PRO2,PRO3
2	<p>XIII. Technologies upon which PolyMet Relies to Treat Contaminated Water, Prevent Release of Contaminants and Leaching of Sulfuric Acid are Unspecified, Untested and/or Unreliable PolyMet proposes to rely on a wastewater treatment facility (“WWTF”) to treat contaminated water. The Draft EIS, however, provides no description of the proposed WWTF, or any information that would allow the public and other agencies to determine the effectiveness of the WWTF for treating the polluted waters. See e.g., July, 2009, MPCA comments (“it would be helpful to the reader to insert a paragraph that describes the proposed WWTF in moderate detail – at least in more detail than in the VERY brief description here . . . this is appropriate since use of the WWTF for treatment of various wastewaters factors in so prominently throughout the [Draft EIS] document and in the supporting modeling and prediction efforts.”); September 2, 2009, Forest Service comments (stating that “[t]here is very little information on the waste water treatment facility,” and that “[t]his is a critical facility for water quality protection and should be clearly described”). For example, information is not provided regarding the volume of water expected to be treated, the methods by which water would be treated, which constituents would be treated, the levels of chemical constituents in water which treatment would seek to attain, the way in which chemicals extracted through treatment would be disposed of or any data supporting the effectiveness of proposed treatment at the WWTF. As a result, there is no basis by which one could determine the amount or extent of potential environmental harm and pollution that will and will not be mitigated through the proposed WWTF, or whether reliance on WWTF treatment is reasonable.</p>	WR2G
2	<p>XII. The Draft EIS Fails to Provide Sufficient Information to Demonstrate that the Tailings Basin Design Will Prevent Catastrophic Failure PolyMet proposes to use the existing LTV tailings basin, which is known to already be leaking. The Draft EIS fails to demonstrate that this tailings basin will be adequately designed to prevent a catastrophic failure and severe contamination of the Embarrass River. In fact, the Draft EIS indicates that inadequate slope stability at the LTV tailings basin could result in release of the impounded tailings and process water, which could contaminate an extended reach of the Embarrass River down-gradient of the basin. The Draft EIS fails to provide disclosure and analysis regarding the severe adverse environmental consequences if such a failure occurs during or after operation of the proposed mine. The proposed project should not be allowed to proceed without a tailings basin design that is proven to be sufficient to prevent slope instability, catastrophic failure and the release of tons of impounded wastes and process water.</p>	GT2

Comment ID	Comment Text	Theme Codes
3	III. The Draft EIS analysis of impacts to water quality, groundwater, and wetlands is inadequate under NEPA See comments submitted by the Tribal cooperating agencies, as set forth in Appendix D to the Draft EIS, and also set forth within footnotes throughout Volume I of the Draft EIS, which are incorporated herein.	WR3I,WE2
4	In addition, despite the widely recognized concern of long-term acid mine drainage from sulfide mines, PolyMet’s plan to prevent long-term acid mine drainage by covering acid-generating rock is an unproven technology that is insufficiently addressed in the Draft EIS.	WR1E
4	Waste rock stockpiles are another substantial component of the proposed mine. Over the twenty year operations of the mine, 394 million tons of waste rock and lean ore would be stockpiled, with the maximum height of waste rock stockpiles at 240 feet and a total footprint of over 750 acres. The Draft EIS fails to provide a sufficient analysis of the potential environmental consequences of this mountain of created waste rock, including the potential for large scale slope instability, the movement of waste rock off the proposed area, the potential release of contaminants, and the significant mitigation that would be necessary for the massive stockpiles post closure.	WR2D,WR3I
5	PolyMet's proposal to treat future discharges through constructed wetlands is similarly unsupported, would likely require perpetual maintenance, and must be much more significantly analyzed through the NEPA process to demonstrate its effectiveness.	WR3L
6	As currently described in the Draft EIS, critical components of the proposed mine are unspecified, untested and unproven. Before either the environmental review or permitting process moves forward, PolyMet and the agencies must demonstrate that the proposed methods of waste disposal, treatment of contaminated water and prevention of discharge and acid mine drainage after closure are thoroughly developed, assessed and validated with objective data and analysis. See <i>Idaho Sporting Congress v. Thomas</i> , 137 F.3d 1146, 1150 (9th Cir. 1998) (holding that NEPA does not allow an agency to rely on expert opinion unsupported by hard data and objective analysis); 40 C.F.R. § 1502.24.	WR2G
7	XIV. The Proposed Mine Would Significantly Increase Mercury in Local Fish, Causing and Contributing to Human Health Risks that Are Not Properly Assessed and Disclosed in the Draft EIS The proposed mining project would increase the accumulation of mercury in the food chain within streams within and downstream from the project area, in which current levels of mercury in fish are already unsafe. This increased bioavailability of mercury would violate water quality standards and the state’s antidegradation policy, and may pose a substantial health risk that has not been properly analyzed or disclosed to the public. Waterbodies within and downstream from the project area already have unsafe levels of mercury in fish, and are subject to fish consumption advisories because the mercury concentrations in fish tissue pose a hazard to human health. Mercury levels are in fact to high that many of these streams were not included in the statewide mercury TMDL, as even the actions identified in the TMDL would not be sufficient to bring mercury to safe levels. The proposed mine would further increase these mercury levels, further harming fish and further increasing the health risk to those eating fish from these streams. More specifically, the proposed mine would result in the increased discharge of sulfates, which would increase the methylation of mercury. Mining operations are predicted to stimulate methylmercury production and thereby enhance the bioaccumulation of mercury both onsite and offsite as a result of increased sulfate or mercury concentrations in water draining from the site. In addition, the hydrologic changes and water level fluctuations from the proposed mine would likely further increase mercury methylation and mercury concentrations in the food chain. Similarly, the flooding of wetlands can also result in a significant increase in mercury mercury concentrations in fish. And the destruction of peat bogs and wetlands by the project would release stored mercury. Individually and collectively these factors may significantly increase the potential for the bioaccumulation of mercury in fish by increasing the production and bioavailability of methylmercury. The Draft EIS violates NEPA by failing to meaningfully analyze the environmental consequences to fish and human health risks to humans caused by this increase of mercury in fish tissue. And these undisclosed environmental and health risks may be severe, as methylmercury is recognized as a highly toxic substance that may cause a number of health risks to humans and other species. See EPA, Integrated Risk Information System, Methylmercury, CASRN 22967- 92-6; EPA, Mercury Health Effects, <a href="http://www.epa.gov/mercury/effects.htm">http://www.epa.gov/mercury/effects.htm</a> .	WR4A,WR4B,FM1,FM5

Comment ID	Comment Text	Theme Codes
8	XV. The Draft EIS Fails To Adequately Analyze and Disclose Impact to Domestic Wells The Draft EIS is also inadequate by failing to adequately analyze and disclose the likely environmental consequences from the proposed mine on drinking water wells located near the project area. The agencies must supplement or revise the Draft EIS to much more thoroughly assess and disclose the location of domestic wells, the contamination to these wells already being caused by the LTV tailings basin, the current water quality of these well sites, and a detailed analysis of the potential additional contamination of these wells resulting from the proposed mining project.	WR1E
9	XVI. The Draft EIS Fails to Demonstrate Compliance with the Superior Forest Plan and All Applicable Forest Service Regulations The Draft EIS acknowledges that the mine site is on the Superior National Forest, and yet there is no mention of the applicable Forest Plan standards and guidelines, or Forest Service regulations. The agencies must demonstrate compliance and consistency with the Forest Plan standards and applicable regulations before this project could proceed. See e.g., 16 U.S.C. § 1604(i). The Draft EIS states that according to the Forest Service, the mineral rights leased to PolyMet “do not include the right to open pit mine the National Forest System land.” Draft EIS, p. S-1. The proposed mine therefore would also violate PolyMet’s mineral lease and related laws and regulations.	PD3
<b>Sender Last Name:</b> Rose		<b>Submission ID:</b> 2240
2647	Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State the Lake Superior basin. Please help us top save one of the most pristine natural areas in the lower 48. The economy of Minnesota will disintegrate if the natural areas are harmed. Just listening to the test drilling is very unpleasant. When we were out birding near the test drilling sites, there were no birds to be seen. Actual mining would be even noisier. Because of mechanization, very few jobs will be created for these types of mines.	G7A,G8
<b>Sender Last Name:</b> Rosenthal		<b>Submission ID:</b> 2334
2797	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. In a strict business sense, the eco-tourism industry in this part of Minnesota will undoubtedly outlive any economic burp caused by adding few mining jobs in the area. We run a children’s summer camp at the cusp of the Boundary Waters Canoe Area Wilderness, and see lives changed summer after summer. Children come to our camp from all over the US and the world for that matter. ANY chance of even a scintilla of sulfuric acid, or other contaminants entering even a puddle is enough to end this discussion. We met a representative from the DNR (Gunflint Trail area) last year, who proudly announced the introduction of 4 million walleye fry into Lake Saganaga. The hope is that 25,000 will survive and multiply by the end of he next 5 years. We are truly grateful that such an expense was made to restore the Walleye population to an area that still holds the 1979 record for the state’s largest Walleye. We hope that the DNR and Army Corps of Engineers will remember values such as the sustainability of our pristine natural habitat when considering approving this project. If such a value is clouded by something else, then consider the notion of wasting the money that was expended on 4 million walleye fry when the waters in the BWCAW are lifeless. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	G2C,G6,G7A,G11
<b>Sender Last Name:</b> Ross		<b>Submission ID:</b> 3726
1	A more complete evaluation of sulfate removal alternatives including the expected efficacy of enhanced nanofiltration as a mitigation alternative is needed. Other possible methodologies, such as enhanced sulfide precipitation in flooded mine pits, should be considered.	WR2G

2686	WHEREAS, PolyMet Mining Co. proposes developing a copper, nickel, platinum, palladium, gold and cobalt mine and an ore processing plant at the former LTV Steel Mining Company plant near Hoyt Lakes; and, WHEREAS, It is projected that PolyMet will create 400 fulltime jobs with a payroll of \$40 million and more than 500 spin-off jobs with a \$242 million payroll in St. Louis County alone; and, WHEREAS, Construction of the \$600 million NorthMet Project will require about 1.5 million construction hours over two years; and, WHEREAS, PolyMet worked with federal and state regulatory agencies in drafting an Environmental Impact Statement (EIS) exploring potential impacts and ways to address them; the draft EIS demonstrates PolyMet can mine these metals AND protect air, water and natural resources; and, WHEREAS, PolyMet will provide millions of dollars in local and state taxes to provide much needed support to our communities and educational system; and, WHEREAS, PolyMet will have a positive economic impact on the City of Hibbing just as LTV Steel Mining Company had when it was operating. NOW, THEREFORE, BE IT RESOLVED, That the Board of Commissioners of the Hibbing Economic Development Authority hereby go on record in full support of the Poly Met Mining NorthMet Project. The motion to adopt the foregoing Resolution was duly supported by Member Larry Furlong, and upon being put to a vote, carried as follows:	EOO,G6
3651	Minnesota is loosing enough forests and lake land due to people already. Houses, buildings etc are ruining the beauty of our state. Mining this area for these resources would be stupid.	EOO
<b>Sender Last Name:</b> Rossi		<b>Submission ID:</b> 2954
3309	My husband and I are not residents of Minnesota yet but we have property in Ely, Minnesota and plan to move there in a couple of years. We are greatly concerned about the future of the area. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources	G2
3310	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. I am also concerned about the existing businesses in tourism in the area and the impact this will have on them.	G2,G11
<b>Sender Last Name:</b> Rothe		<b>Submission ID:</b> 283
297	I am writing today to request your consideration of my comments regarding this project. I am a life-long resident of Northeast Minnesota and part-owner of a construction company based in Superior, WI. I am fully supportive of PolyMet's NorthMet project for many reasons. 1. This project is within and adjacent to, abandoned mine property operated for decades by Erie / LTV Mining Company. Doing nothing is a worse option for these properties. 2. PolyMet will re-use much of the infrastructure already in place and left behind when LTV shut down in 2001. This closure was devastating especially to the cities of Hoyt Lakes and Aurora. 3. This will give a positive impact to these mining communities that desperately need jobs. Residents of NE Minnesota are hard-working and appreciate PolyMet for their fortitude in restoring a sense of hope for the eastern iron range. 4. I am confident that PolyMet will minimize the environmental impacts of the mining operation. ALL Minnesotans care about protecting our waters, wetlands, and air. Not just outsiders who have no concern about our people or economy. Mining is a way of life here. It's nothing new. 5. The DEIS is extensive, required years of diligence, and confirms my opinions that PolyMet will do it right and will follow through with the necessary environmental safeguards. 6. The demand for the precious metals PolyMet proposes to mine is increasing, and production by foreign nations comes at a much higher cost to the global environment. 7. Projects such as this have tremendous economic impacts to our region, and nation, at a time when it is needed the most. It is needed right here, right now. In summary, the DE IS proves that PolyMet can operate the mine while protecting our treasured environment. Please help ensure the project moves forward accordingly.	EOO,G6

3172	This is a reckless plan that will endanger an area that is a natural treasure!	EOO
<b>Sender Last Name:</b> Royseth		<b>Submission ID:</b> 8
8	For, what is it now, five years, Polymet has spent its own money to meet the strict environmental guidelines that Minnesota follows, as well they should. In that time any doubt I had that they would not be responsible stewards to my great land has disappeared. I'm not in a job that is tied in any way to the success or failure of PolyMet. I want to welcome PolyMet to our area and thank them for proving that they will be my responsible backyard neighbor.	EOO
<b>Sender Last Name:</b> Rubin		<b>Submission ID:</b> 3470
45	We will focus on additional deficiencies that make the DEIS unacceptable. Socioeconomic Impact When we are not in our Ely home, we rely on the income it provides when we rent it for short-term vacation rentals. Our customers rent our cabin because of the peace, the clean environment, the recreational opportunities, and the non-industrial character of the area. The NorthMet project threatens these values, and therefore our ability to rent the property and to sustain our income. The recreational values that NorthMet threatens include viewing lakes and rivers with wild rice, catching fish that can be eaten, and enjoying natural, unpolluted air and water. Some of the nearby lakes already have warnings about mercury in fish, so even a small incremental impact from Polymet could eliminate recreational fishing for edible fish. Degrading these scenic and recreational resources threatens our income. The Ely area and many of its businesses, such as our cabin rental, have invested and worked hard for many years to create a reputation and an image of a clean, unpolluted, non-industrial, relatively noise-free recreation area. Degrading even the "Ely image" or the "Ely brand" threatens those investments and their economic benefits. The DEIS addresses only the purported positive benefits that the mine would bring, namely jobs during the mine's operational period. The DEIS is deficient in ignoring mining's well-documented history of long-term, negative impacts on communities.	SE4
3675	Cumulative Impacts The DEIS is deficient in addressing cumulative impacts of the NorthMet project and other exploration and mining. The United States Forest Service (USFS) is currently considering applications for dozens of additional exploration and mining projects, as described in the Federal Hardrock Minerals Prospecting Permits Project (FHMPPP) <a href="http://www.fs.fed.us/r9/forests/superior/projects/prospecting.php">http://www.fs.fed.us/r9/forests/superior/projects/prospecting.php</a> ). The NorthMet project must identify, analyze, and discuss mitigations for the cumulative impacts of NorthMet in the context of these other proposed activities. The impacts include, but are not limited to, air and water quality (e.g., sulfate and mercury impacts on plants and animals, acid drainage, etc.), traffic and noise, and socioeconomic impacts..	CR1
3746	The DEIS is incomplete and unacceptable due to errors, misleading and unsubstantiated assertions, and omissions. The problems with the DEIS are not limited to the proposed NorthMet project; the project and DEIS will set a number of precedents for mining in northern Minnesota, so the DEIS must be evaluated in that context. The project should not move forward with permitting or any other activities until Polymet resolves the DEIS's deficiencies. The Tribal findings have already addressed many of the errors, unsubstantiated assertions, and omissions in the DEIS. We generally support the Tribal conclusions, and will not repeat those findings.	G8C,G15
19249	DEIS 4.1.3.4 Tailings Basin Alternative concludes that there would be no effect on flows or water quality in the Upper Partridge River. Fond du Lac strongly disagrees with this conclusion, and believes that discharging untreated tailings basin water to the Partridge River will have significant adverse water quality impacts.	WR3A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19249	DEIS 4.1.3.5 Mitigation and Monitoring Measures It is the tribal cooperating agencies' position that treatment of the tailings basin effluent that is captured by the vertical wells must be an integral part of the tailings basin alternative. This treatment could occur in the WWTF already proposed for this project or in a second facility closer to the discharge point. However, treatment of the tailings basin effluent prior to discharge to the Partridge River is not included in the potential mitigation measures listed below. Tribal cooperating agencies strongly oppose an untreated discharge of tailings basin water to the Partridge River. In addition, there are other existing facilities and mine proposals (Laskin Energy, Mesabi Nugget Phase II) that discharge, or are proposing to discharge water at this same location. Finally, water quality of the discharge would exceed the wild rice sulfate standard that applies to the lower Partridge River.	EOO,WR4F
19250	DEIS 4.1.4 Cumulative Effects on Water Resources Tribal cooperating agencies note that the USACE has not completed its National Historic Preservation Act §106 consultation with the potentially affected tribes. In addition, a survey for wild rice presence in the waters potentially affected by the proposed mine has only recently begun. Tribal staff have already found extensive stands in the Lower Partridge River, and non-tribal harvesters have reported to the state on the presence of wild rice in the Partridge River and in the St. Louis River downstream of its confluence with the Partridge. Tribal cooperating agencies believe that the consultation process and wild rice surveys should be completed and the results included in the DEIS. This data can then be used to evaluate the cumulative impact analysis to this important tribal resource.	WR1E,WR5C,CR2
19251	As previously stated, it is Fond du Lac's position that the public notice for the §404 permit should be re-issued and that the MPCA should be afforded the opportunity to analyze and make a certification determination under §401 of the Clean Water Act. Significant changes in the design of the Proposed Action have occurred, and other important information needed to determine the nature and magnitude of the Project's impacts has been developed since the public notice was provided by the USACE in May of 2005. Adverse water quality impacts and exceedances of groundwater quality standards are predicted as a result of the proposed Project. Additionally, the Project would lead to significant degradation of aquatic resources, including water quality standards violations in both the Partridge and Embarrass Rivers (see Table 4.1-68 for a summary of water quality impacts). MPCA should be afforded the opportunity to certify or deny certification to the Proposed Action.	WE4
19252	It is Fond du Lac's position that it is not possible to differentiate between rich forested peatlands, poor fens, and bogs using canopy cover alone. Identification of the low shrub, forb and graminoid layers are required. It is the position of the tribal cooperating agencies that the current wetland delineation does not encompass all wetlands that may be affected by the Project. Because no initial determination of the Project's area of influence (AOI) on wetlands was made, the site field surveys of wetland and other vegetation were limited to little more than the area within the Project fence. The existing characterization of wetland and other vegetation does not cover even one-half the area that might reasonably be expected to be impacted by disruption of the existing hydrology. Around the tailings basin virtually no wetland delineation has taken place although wetland impacts from inundation are likely to occur. The Army Corps is developing a workplan to assess impacts to these additional wetlands but this workplan has not been finalized or implemented. Given the importance of this work in assessing potentially significant impacts to wetlands, it is the position of the tribal cooperating agencies that this work should be included in the DEIS to allow for a full public review.	WE1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19253	Tribal cooperating agencies strongly object to the characterization of the hydrology at the mine site presented in the first paragraph. It is the Tribal cooperating agencies' position that the methodology used in the Adams 2009 email is not adequate for characterization of pit dewatering impacts to wetlands (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009). Problems with the methodology used in the email include: 1. Lack of recognition that aerial photos are a very imprecise measure of surface water level. 2. Photographs presented in the paper show that the Peter Mitchell pits are mostly flooded. Therefore there is little or no stress on surrounding wetlands at the time. 3. Lack of consideration of the topographic relationship of the landscape features including the depth of the Peter Mitchell Pits (P-M Pits approximately 80 feet deep, PolyMet pits approximately 800 feet deep). 4. Lack of recognition that some changes in groundwater hydrology would not be evidenced by the large changes in surface water level that could be detected by aerial photography. 5. Dependence on wetland soil conductivity values that are extremely low and for which supporting source citation in the professional literature cannot be found. The PDEIS appears to rely on "best professional judgment" for estimating impacts due to hydrologic disruption without incorporating specific knowledge of the ecological requirements of culturally significant wetland vegetation such as cedar, and without requiring sufficient background data regarding groundwater. A "best professional judgment" approach is being used as a replacement for data-based scientific analysis of potential impacts. Quantitative methods for estimating the impacts of drawdown and inundation on wetland hydrology exist, have been used at other mine sites, and can be used in addition to professional judgment. Tribal cooperating agencies take the position that subsurface flow through upland soils likely provides the micro nutrients necessary for rich forested peatlands, cedar swamps and poor fens found in the mine site area. Many of the wetlands that have been identified during delineation as "perched bogs" are actually cedar swamps, northern wet ash swamps, forested rich peatlands, northern alder swamps, and poor fens, all of which require groundwater inputs. Indirect impacts to communities that require groundwater inflow have not been determined, but would likely be significantly different than expected impacts from the Project to perched bogs.	WE1,WE2
19254	Tribal cooperating agencies take the position that a stable water table in NE MN is typically the result of groundwater inputs in periods of low precipitation.	WE2
19254	Tribal cooperating agencies take the position that northern alder swamps (FPn73) "occur in settings that receive mineral rich surface or subsurface flow, which is maintains surface water with nearly neutral pH." (MnDNR Field Guide to the Native Plant Communities of Minnesota, the Laurentian Mixed Forest Province, pg 205.) Tribal cooperating agencies take the position that "Surface water in Northern Wet Meadow/Carrs is derived from runoff, stream flow, and groundwater sources, it has a circumneutral pH (6.0 - 8.0) and high mineral and nutrient content." (MnDNR Field Guide to the Native Plant Communities of Minnesota, the Laurentian Mixed Forest Province, pg 292.) Tribal cooperating agencies take the position that Northern mixed cattail marshes "develop in areas occupied by fens or wet meadows following fires-usually during severe droughts-that remove accumulated peat from the fen or meadow". (MnDNR Field Guide to the Native Plant Communities of Minnesota, the Laurentian Mixed Forest Province, pg 298.) Tribal cooperating agencies take the position that this canopy cover depicts a northern rich spruce swamp (FPn62) which requires groundwater. Balsam fir and white cedar are both rich forest indicator species. Tribal cooperating agencies take the position that bunchberry and blue bead lily are both indicator species in the forb layer of mineral rich peatlands (MnDNR Field Guide to the Native Plant Communities of Minnesota, the Laurentian Mixed Forest Province, pg 317).	WE1

11	Comments on the proposed PolyMet Mining Project The Draft EIS is deficient on at least three points. First, the cumulative effects analysis is limited to the segmented project effects on discrete environmental elements such as the air, water and vegetation proximate to the proposed mining operations. The limited analysis assumes the effects of the actual mining operation are somehow separate from the effects of the processing, tailings basin and other aspects of the proposed project. While this incomplete analysis may be an attempt to satisfy the letter of the law, the analysis fails to fully satisfy the intent of the law; that is, to actually identify the cumulative effects of a proposed project. The analysis is limited and incomplete because it only considers some effects of isolated project components on segmented environmental media rather than the totality of the proposed project and its overall effects on the local as well as contiguous ecosystems. Further, with respect to the cumulative effects and GHG emissions, the analysis fails to do more than state there will be increased emissions. The cumulative effects analysis is deficient since it does not fully analyze the implications of current levels of GHG emissions nor does the statement of cumulative effects consider the additive effect of the GHG emissions from the proposed project and the complete array of adverse consequences associated with the GHG levels	WR5A,AQ3,AQ4B
17	The analysis fails to explicitly identify those adverse effects on the environmental systems that sustain human and other life and it does not identify, nor address, the broad range of consequences associated with the increase in GHG emissions from the proposed project. A second deficiency with the Draft EIS rests with the No Action Alternative. The analysis fails to consider the broad range of alternatives to supplying virgin raw materials required for manufacturing processes. The Project Purpose and Need assumes the only way to supply raw materials for the production of products by manufacturers is to use virgin raw materials as found in the various ores proposed to be extracted by the proposed project. An alternative to using highly subsidized (considering the full range of environmental and other externalities associated with this proposed project and the grossly undervalued state natural resources proposed to be sold to the project proposer) virgin raw materials, is to use Clean Production Technology. This jobs creating technology is a well established industry that reclaims materials and produces products using systems and processes with few adverse environmental impacts. Virgin raw materials should be the last source of materials to supply manufacturing processes.	ALT8
43	The No Action Alternative does not adequately examine the actual alternatives and the job creation options from those alternatives to the proposed project. The third deficiency is found in the analysis of the Socioeconomics. While the emphasis is on the increase in employment associated with this particular project, rather than jobs that can be created through some Clean Production Technology alternative, the analysis fails to consider the full set of adverse socioeconomic effects. Where is, for example, the analysis regarding the negative values associated with viewscapes filled with mountains of tailings and other mining debris, the perpetuation of a societal dependency on virgin raw materials rather than on greater use of reclamation and closed loop production systems or the long-term alteration of the landscape that could be caused by the proposed project? Where is the socioeconomic analysis of the local, short-term benefits as well as the long term adverse socioeconomic effects? This analysis requires a broader perspective when considering the benefits and burdens of the proposed project	SE3

1838	I understand the argument that this would create jobs and revitalize the area. For a short period this may be true. If however, the region is contaminated, many more jobs will be lost. The number of jobs that rely on hunting and fishing, skiing, sight -seeing, camping and other areas related to tourism, will be lost. The quality and safety of living in this area will be diminished. We could end up with a greater problem than what exists today.	EOO,G11
<b>Sender Last Name: Rule</b> <b>Submission ID: 2729</b>		
3179	Minnesota's greatest asset is our lakes, rivers, wetlands and wildlife. We should do nothing to put them at risk, especially allowing PolyMet Mining to open a mine in Minnesota.	G7
<b>Sender Last Name: Runck</b> <b>Submission ID: 142</b>		
11	their devastation. I ask the DNR and the Army Corps of Engineers to extend the public comment period and arrange for more public hearings. This is our health, let our voices be heard.	PRO6
133	My name is Taryn Runck and I'm a resident of Minnesota, I'm here testifying as a concerned citizen and one of millions of owners of our collective natural resources. It is in this role that I feel compelled to speak against the PolyMet project and in support of the no-action alternative. While some claim that with this project Minnesotans can have both jobs and the environment, a 2006 study of sulphide mining environmental impact statement shows that 100 percent of mines predicted no water pollution, 76 percent did in fact pollute, because of this and because of PolyMet draft environmental impact statement predicts ground water pollution at the mine site, we have every reason to believe that this project will harm our collective natural resources and the delicate ecosystems they sustain. This will harm our food and water, our health and well-being. I believe these natural resources are for the benefit of us all, not the relatively few who will profit short-term from	EOO,G7

137 My statement would be that I think there's enough environmental protections that we should allow this project to go ahead, and I don't see any minuses in it. And I think there's a lot of people that -- well, there's a certain amount of people don't want this to go ahead because this is their playground and they don't care if anybody works. And being a working person all my life, I think that this is a wonderful thing for northern Minnesota, keep our children in northern Minnesota yet. That's all I have to say. Okay? EOO

**Sender Last Name:**    Ruppert **Submission ID:** 1392

1625 Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State the Lake Superior basin. The eco-systems there deserve your protection! Our health and welfare depend upon protecting the natural environment and wildlife from contamination. We need to be proper stewards of the land and wild life not only for ourselves but for the future of our families. We are connected to the land and to the eco-systems presently living there. Please also read "Neither Wolf Nor Dog" by Keny Nerburn, aan author from Bemidji, MN who writes about this very topic of how to preserve our land and thus protect ourselves. G8A

**Sender Last Name:**    Russell **Submission ID:** 350

387 We have a family cabin on water feeding into the BWCA & that would be affected by PolyMet / mine contamination. Present y possible problems before issuing approval of the project!!!! EOO

2235 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. We need to protect these resources and I am worried that the impact of the project is overlooking these issues. G10

2236 The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Please consider these comments and be conservative in your actions as they relate to water quality G7B,G10

2477 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. Given the already impaired state of many of MN's waters (40% of the waters we test don't meet basic health standards and less that 20% of our lakes and rivers are even tested at all!) the last thing we need is another project that is almost certain to put a high quality water body at risk. This project is irresponsible, relies on proven-to-fail technology and doesn't address vital economic viability, habitat protection and long-term clean up & resource protection issues. We can do better than this! G7B

**Sender Last Name:**    Russelle **Submission ID:** 3468

530 Finally, although we do not know the trajectory of all components that will be affected by global climate change, two signatures that have been evident in Minnesota are increased intensity of precipitation in convective storms and higher minimum air temperatures in winter. There is a need to consider the resilience of the proposed mining (with perhaps a 20-year time horizon) and closure (with a 'permanent' time horizon) activities in light of changes that are forecast for the region by one or more simulation models. Again, I appreciate the care with which the DEIS was constructed, and hope these criticisms result in equally thoughtful responses. AQ3

1317	The mitigation strategies to prevent offsite movement of the leachate (caps, liners, subsurface drainage collection) likely are inadequate in the short term and certainly will be in the long term. For example, compacted 'clay' liners in manure storage pits nearly always leak. A cap that provides only 1.5 feet of rooting depth (Table 3.1-9 Cat 2, 3, and 4 waste rock) will result in vegetation that is regularly stressed by severe drought, leaving the soil surface exposed to erosion by convective storms and snowmelt runoff. These runoff events likely will involve gully erosion, because the soil cover will have little cohesion that develops in undisturbed soils. Although a bentonite layer will slow the exposure of the waste rock to infiltrating water, I do not believe that it would prevent exposure due to erosion. I expect that the geotextile membrane will be exposed after many of these erosion events, subjecting it to biotic and abiotic degradation.	EOO,WR2D
1945	As we know from the acid rain research done during the 1970s and 1980s, surface waters in northeastern Minnesota are very poorly buffered with regard to pH. Declines in pH will affect aquatic invertebrates and vertebrates. Furthermore, as the DEIS recognizes, the acidic leachate will contain high concentrations of some toxic metals, like antimony, and the high sulfate concentration will promote methylation of mercury. After decades of work to reduce the presence of contaminants in Minnesota waters, we recognize that contamination of fish by mercury is a persistent, serious problem, especially for those who depend on fish for a major source of protein. We know how readily mercury is transformed from compounds that have little biotic effect to those that cause severe nervous system damage at low concentrations. The mining operation and proposed closure greatly increase the risk of higher methylmercury concentrations in northeastern Minnesota ecosystems. It is critical to establish the flow paths of both shallow and deep ground water in the area. Does it follow surface flow paths or does it flow north? The pits will provide a large cross sectional area for water to move into ground water. The DEIS recognizes that inflows from the site will cause upwelling, which will result in increased horizontal flow away from the site. The DEIS does not forecast the extent or direction of movement of ground water that is impacted by material in the pits. To what extent do surface water and ground water mix? For example, if the Partridge River were severely impacted by mining activities or residual effects, will that affect ground water quality?	WR1E,WR4B,FM2

3881	<p>The Minnesota DNR and the Army Corps of Engineers are creating an Environmental Impact Statement on a new type of mine being proposed for Northern Minnesota near the Boundary Waters Canoe Area Wilderness, and 50 miles from Voyager National Park. This mine is different from long established iron ore mines that Minnesota has had over the years. These proposed mines, contain among the copper, nickel, platinum, and silver, significant deposits of sulfide. The sulfur in the resultant mine tailings could leach off into the surface and ground water, creating yellow and red steams and creeks with toxic heavy metals and sulfur. Water that contains heavy metals and sulfuric acid kills fish, birds, and other aquatic life. The watershed for these proposed sulfide mines includes that Kawishiwi River, which flows into the Boundary Waters Wilderness, and includes that St. Louis River, which flows into Lake Superior. Contaminated water flowing from abandoned mines is one of the most significant contributors to water pollution in the United States. A toxic form of pollution caused by sulfide mines is called Acid Mine Drainage (AMD). AMD can have severe impacts on aquatic resources, killing microorganisms, insects, fish, and other aquatic life. It stunts terrestrial plant growth, harms wetlands, contaminates groundwater, raises water treatment costs, and damages concrete and metal structures. There are several thousands miles of streams impacted by AMD within the United States. The economic losses on fisheries and recreational use mounts to hundreds of millions of dollars' annually. See appendices C and D. AMD causes elevated levels of dissolved metals and sulfates, which render the stream unsuitable as a source of drinking water for humans, livestock or for use as aquatic habitat for wildlife. Because of the potential for Acid Mine Drainage, sulfide mines require treatment systems to ensure that acidic water is not discharged. these systems must be in place for the life of the mine, and continue in perpetuity to treat acidic waters after the mine is closed. Due to the ongoing treatment process, the risk of discharging acidic water increases over time. Water treatment systems at reclaimed mining sites is complicated by changing levels of ground water and fluctuating rain fall levels over decades and centuries. If movement of the acidic water is not contained within an impermeable barrier (e.g. pipe, plastic, glass, etc.) the acidic water flows into the underlying groundwater system. Once the acidic water enters the groundwater system, the detrimental affects on flora and fauna becomes widespread. Containment and treatment of the affected groundwater system is difficult, if not impossible. Generation of acidic waters is a long-term situation that requires perpetual chemical treatment. Therefore, funding for long-term treatment of acidic waters and long-term responsibility and liability for environmental protection is on going. Mining companies and sulfide handling operators may not be perpetual and often go bankrupt. As a result, there are many examples of operators abandoning properties that discharge acidic water and requiring public money to clean up the site. See Appendix B. Unlike many dry Western states, Minnesota is rich in water resources that are especially vulnerable and are a great part of Minnesota's outdoor heritage for anglers, canoeists, duck hunters and of course wildlife. Our neighbors in Wisconsin have a moratorium on mining metallic sulfide ores written into law. In effect, the Wisconsin law says: "Industry can mine metallic sulfide ores in Wisconsin when it can show one mine in the United States or Canada that has operated and been closed for ten years without significant damage to its watershed." See Appendix A. The Izaak Walton League of America and the Minnesota Izaak Walton League, in particular, have a long history of fighting for, protecting, and preserving Minnesota's North Woods and the wildlife it contains. It was instrumental in</p>	G2C,G7A,G11,G12

277	I am writing to tell you that I personally and the company the employs me fully support Polymet Mining's Northmet Project. This project will have a huge positive impact on the local Northern Minnesota economy, plus it will provide approximately 400 new permanent jobs along with hundreds of spin-off jobs for local businesses like RMS. I am an avid outdoorsmen and I love to fish and hunt in our great north woods. The Polymet Project has been designed to minimize environmental impacts and will utilize multiple safeguards to protect the environment. Polymet will be a domestic supplier of many different metals, which we all use in someday almost every day. Polymet will also supply some critical metals that are currently not being mined anywhere in the USA. The bottom line is that this project makes sense and we need to move forward with the permitting process. Please call me if you want to discuss my opinions further.	EOO
<b>Sender Last Name:</b> Ruzynski		<b>Submission ID:</b> 153
144	All my relations are up in the Range. I'm originally from Floodwood, Minnesota and I'm a business agent for Local 49. I represent 13,000 men and women in the construction industry. And I am in full support of PolyMet and whatever we need to do to move this project along and to create jobs for men and women. I'm in support of it. And that's all I'd like to say. All my relatives are still up in the Range from Floodwood to International Falls on both side of my family. There's probably about a hundred of them and they are in 100 percent support also of this project. It's a good project and I don't see any concerns whatsoever of the environment or anything. I know it's a clean, green job. And it should go good. And you know that the main thing is we protect everything and I think they are doing a good job so far and will continue to do so. So I'm in support of that.	EOO
<b>Sender Last Name:</b> Ryan		<b>Submission ID:</b> 199
196	THERE IS ABSOLTELY NO WAY THE PROPOSED MINING SHOULD EVER GO FORWARD. I am a resident of Michigan and have visited the of proposed mining area and I believe that any activity that could possibly affect the area should be squelched IMMEDIATELY. There is no financial reason great enough that the State of Minnesota should ever take such a chance. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO
837	It is not acceptable to permanently disturb the wetland ecosystem of this area and to pollute any of the waters of Minnesota or the Great Lakes. If there will be groundwater pollution exceeding existing standards and unproven methods of water treatment, this project should not proceed as currently planned.	EOO
1697	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO
1915	Can you really trust the mine companies? Have you seen the Berkeley Pit in Butte Montana? Is that what we want for a reputation in Minnesota? <a href="http://en.wikipedia.org/wiki/Berkeley_Pit">http://en.wikipedia.org/wiki/Berkeley_Pit</a>	EOO
2638	I'm an electrician in Local 292 of the International Brotherhood of Electrical Workers, and I'm here at this meeting to listen to both sides -- all sides of this issue. It's my wish that a compromise between environment, the First Nations, the mining company and Labor compromise so that this project will start. I know that it won't be perfect, but the impact on the economy will be very significant. There's not that many products and businesses that can't be outsourced, but mining cannot be because we have the product in the state of Minnesota, so that is one thing we should take advantage of and not let this slip away. Thank you.	EOO

3882	We are writing to show our support for the draft Environmental Impact Statement for PolyMet Mining Co. We look at the PolyMet Mining Co. project as a great opportunity for Northern Minnesota, as well as the entire State. What a great green project when PolyMet will use the majority of an existing facility. We all talk about green but what a better way then to use an existing plant. PolyMet will produce copper, nickel, cobalt, platinum, palladium and gold. These metals are essential to green technology such as wind turbines, hybrid cars, computers, joint replacements and are necessary for pollution prevention devices such as catalytic converters. To mine these nonferrous metals with the regulation of environmental controls in our Nation rather than importing them from other countries who have little or no environmental regulation is really something one should consider when determining the adequacy of the draft EIS. This construction project will cost over \$600 million, and provide 1.5 million construction man hours and close to 400 stable jobs when fully operational. We need this on the Iron Range to help to diversify our manufacturing and provide a future for all of our families. We ask that you approve the adequacy of the draft EIS.	EOO
<b>Sender Last Name:</b> Ryks		<b>Submission ID:</b> 1021
1121	On behalf of the Duluth Airport Authority I appreciate your consideration of my comments regarding the draft environmental impact statement for PolyMet -Mining Company's proposed NorthMet mining project. This project is incredibly important to the economy of Northeastern Minnesota. PolyMet Mining will support 300 skilled tradespeople over the next three years and, when fully operational, the project will employ over 400 individuals with an annual payroll of \$40 million. There will be over 500 additional spin-off jobs in St. Louis County resulting in an economic impact of hundreds of millions of dollars annually. PolyMet will also generate tens of millions in local, state and federal taxes. Clearly, PolyMet will create jobs and build wealth in a region of the state that desperately needs both. As a frequent user of area lakes streams and forests, I would not be supporting PolyMet if this project and associated jobs would come at the expense of the environment. PolyMet has been rigorous in developing an environmentally sound project, as the draft environmental impact statement clearly points out. While nonferrous mining poses challenges far different from iron mining. PolyMet's proposal addresses these challenges. In particular, I am impressed with the multiple safeguards the company proposes to use to manage waste rock generated during mining. There will be liners, foundations, drainage collection and waste water treatment during mining, plus special covers and vegetation placed on the waste rock after mining to prevent water from contacting the rock. This foresight in planning will minimize the potential for any contaminated water to leave the site. I also appreciate that PolyMet will consume sulfur in the ore as a fuel during processing. Not only does this reduce reliance on other fuels, it also makes good use of the ore extracted. PolyMet has developed an excellent proposal and invested the time (nearly five years) and resources (more than \$20 million) to demonstrate the proposal can move forward without harming our environment. I urge you to deem the draft environmental impact statement to be adequate and to move forward with permitting as quickly as possible. Thank you for the opportunity to present my views on this critical project for northeastern Minnesota.	EOO

774	The process for securing public comments, including the hearings of December 9 and 10, is fundamentally flawed. 1a. The comment period should be extended to at least 120 days, as recommended by EPA among others. The DEIS is 700+ pages and supporting documents run to several thousand additional pages. The intent of public comments is to secure widespread citizen input. Citizen groups such as NMW are unfairly limited in submitting comments by the enormous burden on volunteers required to respond to thousands of pages of technical presentation. 1b. The process for obtaining public comments at the hearings is contrary to EPA intentions. Comments are intended to be public. Citizens should have the opportunity to hear and to learn from the comments made by others in a public forum, and to have their own views challenged by others. The process adopted by DNR/USACE precludes these opportunities. Additional hearings should be scheduled and should include the opportunity to present views in a public forum and to challenge the views of others as part of the process.	PRO6

775	The DEIS is premature. The DEIS should not have been released until the required land exchange between U.S. Forest Service and PolyMet has been completed. The DEIS is required to examine all potential environmental impacts associated with the Project. The land exchange may well introduce substantial impacts and these may in turn interact with other aspects of the Project which should be examined in the DEIS.	PRO4
1339	3c. The DEIS fails to adequately address a number of potential environmental impacts. These include the likelihood of structural failure at the tailings facility, the lack of structural integrity information for the proposed stockpiles, and the need for perpetual water treatment to avoid contamination to surface and groundwater resources. Structural stability of the tailings basin has been a serious concern since the Polymet project was first proposed. Three different tailings basin designs that have been presented in various draft documents. Reviews of these designs have expressed serious concerns with both the short-term and the long-term stability of the facility. A comprehensive analysis of the structural integrity of the latest tailings basin design must be included in the DEIS.	GT1
3312	3c. The DEIS fails to adequately address a number of potential environmental impacts. These include the likelihood of structural failure at the tailings facility, the lack of structural integrity information for the proposed stockpiles, and the need for perpetual water treatment to avoid contamination to surface and groundwater resources. Structural stability of the tailings basin has been a serious concern since the Polymet project was first proposed. Three different tailings basin designs that have been presented in various draft documents. Reviews of these designs have expressed serious concerns with both the short-term and the long-term stability of the facility. A comprehensive analysis of the structural integrity of the latest tailings basin design must be included in the DEIS.	WR2D,WR3I
3313	4) Data for analysis are often insufficient or absent. Analytic techniques are used inappropriately. Models are used inappropriately in the Project and rely on invalid data and assumptions. The MODFLOW model was developed to assess rates of mine pit inflow. Reported results are invalid for areas outside the mine pit footprint. The XP-SWMM model is based on stream gage data that is 17 miles from the proposed project and is 20 years old. DEIS modeling forecasts that the more PolyMet seepage released from the tailings basins, the better the water quality will be for Al, Mn and Fe in the Embarrass River. This incongruous result occurs probably because modeling at the basins does not appropriately account for leaching from the LTVSMC tailings when predicting future seepage quality.	WR1E
3741	The DEIS is incomplete. 3a. The DEIS does not address the need for financial assurance or identify the project components for which financial assurance is necessary. Inadequate financial assurance can have profound environmental impacts, extending over centuries. Financial assurance should be addressed in the DEIS rather than postponed to permitting decisions for which different regulations may apply. As quoted by the tribal cooperating agencies, "New national rules for financial assurance are under development by EPA, because 'Given the history of adverse environmental effects resulting from some hard rock mines, and the expenditure of public funds used in some cases to address environmental problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS.' (from InsideEPA.com, Tuesday, August 25, 2009)." The DEIS fails to identify that post closure treatments such as waste water at the mine site may have to continue for centuries. Financial assurance for such eventualities must be addressed in the DEIS.	PD4
3742	3b. The alternative of an underground mine was not examined in sufficient detail. The alternative is economically feasible. Profit margin should not be a consideration in examining the alternative in detail.	ALT8
3743	3d. The DEIS fails to address existing environmental problems at the mine and processing sites. Problems at the LTVSMC Tailings Basin must be adequately addressed through PolyMet's assumption of remedial liabilities under the VIC program, and mitigation measures should be included and discussed in the DEIS.	G9

1128	On behalf of the Aurora Housing and Redevelopment Authority (HRA) for the City of Aurora, the Aurora HRA supports economic benefits for revitalization of businesses and housing in the Aurora area. The proposal by Polymet, as stated in the EIS, seems to fit the economic and environmental strategy for the Aurora area. There have not been any environmental issues that would adversely affect Aurora or the people in the area. As a result, the commissioners of the HRA would strongly suggest that the DNR support this project in a favorable manner.	EOO

5	All this info is to say that my observation is that the people of MN are hard working, active, and productive. Having the Polymet mine in Northern MN will be a boost to the MN economy. It will provide families financial security, investments for their future and health insurance opportunities. Polymet jobs will help build self respect and self esteem through honest hard work. It will have a positive impact in MN on multiple levels. One of those levels is the environment. The USA is a leader in global environmental initiatives and policies. MN is a model for others to follow. Therefore it makes sense that having Polymet in Northern Minnesota will allow the world to see the importance of treating the environment with care and dignity. If we reject this project another location who are not as concerned about environmental safeguards may end up with this project. In such a case we have assisted, by omission, in hurting the very environment we want to protect. Please bring Polymet to Northern MN.	EOO
6	Mine site alternative. Submerging tailings is not a convincing mitigation strategy. Water tables may fill, there may be seepage to groundwater. This option needs a more vigorous analysis.	ALT2
6	Low margins of safety for tailings and embankments are a significant concern as it increases the risk of catastrophic failure.	GT2
7	On behalf of the Painters & Allied Trades Local 106, I am pleased to provide these comments that support an adequacy determination for the draft Environmental Impact Statement for PolyMet Mining Co. PolyMet is proposing to develop a mine for nickel, copper, gold, platinum, cobalt and palladium-metals that my members use daily and that are critical for our domestic economy. PolyMet also will transform the shuttered LTV Steel Mining Company facility into a processing facility for these important metals. Development of the mine and processing plant will require 1.5 million man hours of construction over a two-year period. When fully operational, PolyMet will create 400 full-time jobs with an annual payroll of about \$40 million. At least 500 spin-off jobs with an economic impact of more than \$242 million in St. Louis County alone will be created, as well. And PolyMet will help contribute to the local tax base. While all of those figures are important, the Painters & Allied Trades Local 106 would not be supporting PolyMet unless it was able to protect our air, water and natural resources. Based on the evidence found in the draft Environmental Impact Statement, it's clear that PolyMet will provide critical metals and create hundreds of jobs-all the while keeping our environment clean. The project won't discharge process water. It will be a minor source of air emissions and use sulfides in the ore as a fuel. It will re-use a brownfield site and have a minimal impact on our wetlands. Finally, PolyMet will set aside financial resources to pay for closure costs before the first shovel of dirt is moved. PolyMet is a win-win-win for our region, our state and our country. Please move quickly to determine that the draft Environmental Impact Statement adequately addresses potential environmental concerns and begin working on the permits so that this exciting project can begin operations as soon as possible.	EOO

7	We realize the proposed PolyMet project for a copper/nickel mine is different than the mines that are presently in operation, and we are encouraged with the new technology that will be used to protect our environment and lake waters. We have confidence in our state environmental agencies - the Minnesota Department of Natural Resources and Minnesota Pollution Control Agency. They have kept a strong eye on the taconite industry and fined them for any infractions. We feel they will be even more vigilant in watching what PolyMet does, to assure that our lakes are not in danger of pollution from acid runoff. We all care about our environment and do not want to see our tourist industry destroyed, but there is no buffer zone to the Boundary Waters. All the proposed mining projects are outside of the wilderness area. Tourism jobs are important to our economy, but they are seasonal and not the jobs that provide a livable wage to sustain a family. They are not the jobs that bring young families to our towns and help sustain a healthy community. Our communities are dying. Our schools and hospitals are in dire trouble without the population to support them. PolyMet NorthMet Project is not in the Boundary Waters Watershed. We need to balance the need for livable wage jobs with care for our environment. These mining jobs will help stimulate the economy of northeastern Minnesota. As people return to the Iron Range for these mining jobs, spinoff jobs will be created and people will be able to shop in their communities again. These jobs are essential to the year round health of our communities. There is a need for copper, nickel and other precious metals, and if it isn't mined here safely, it will be mined elsewhere (Russia) very badly. And that's the acid rain that will affect our beautiful Boundary Waters. We should be thinking globally and acting locally. That's conservation with common sense! The needs of local communities and all users can and must be balanced with the conservation of sensitive natural environments. We are fortunate copper/nickel mining didn't take place in the 1970s, and that there is safer technology today. We are proud that Minnesota has some of the country's strictest pollution regulations to protect our precious waters	EOO
8	The environmental standard should be comparison of impacts of this project to other existing mining and refining projects; not the best attainable or least objectionable environmental impact because the cost of minimizing environmental impacts is prohibitive and contrary to any perception of equity; a cornerstone of the US system of government. This environmental review has dragged on way to long without any other direct comparative measurements to other mining and refining projects; which would have ended this EIS review long ago.	EOO,G8C
9	I urge immediate acceptance of the environmental impact statement for this project noting the minimizing environmental impact goals are impractical and unlawful. There is an above average chance the US NSA may intervene in any event to stop this obstructionist activity of this critical supply metal to the US economy.	EOO
10	PolyMet talks about funds that will be set aside in case something happens. How much and in what form will the monies set aside for future clean up be? When will they be set aside? I sure hope prior to anything being started.	PD4
11	PLEASE READ THIS!!! <a href="http://dissepsilon.slu.se:8080/archive/00001874/01/Kappan_Avhandling_nr_08.88.pdf">http://dissepsilon.slu.se:8080/archive/00001874/01/Kappan_Avhandling_nr_08.88.pdf</a> Sulphide oxidation is catalyzed by a bacteria, named Thiobacillus ferrooxidans. Without that bacteria the oxidation would be much, much slower (it's in the above thesis, the reactions are described in the appendix). In nature, that bacteria is present everywhere. If you take fresh tailings, however, directly from the flotation processes, and bring them to the laboratory for leaching studies, the bacteria may not be present in the tailings. That may be the explanation for the difference in oxidation rate between field studies and laboratory studies. Has there been long term field studies with the tailings? It's very important, because that's the natural conditions, the real scenario for the tailings, with the bacterias present. I searched the DEIS and found nothing on field studies concerning the tailings - only wild rice. Why?	WR1E
12	Would the subaqueous tailing pond(s), over time, evaporate? If so, then what?	WR3A
12	What effects does winter have on the tailings ponds, etc?	WR3A
13	"The west pit would eventually fill with ground water and over flow. This initially would not meet surface water standards. For how long? There would be a reduction in the flow of the Partridge River. How much of a reduction, and what will the	WR3C

15	“The seepage of sulfates through the tailings would produce methylmercury.” How much? What’s the impact? What about the groundwater?	WR4A
16	“There would be an increase in the flow of the Embarrass River.” What effect will this have?	WR3E
16	“There is a potential for sulfates flowing north to impact wild rice.” How far north? How big of an area? What is the “potential” damage? What will be the damage to the aquifer(s)? And for how long?	RFI
17	“Minimal effects on the watershed of the St. Louis River.” Define minimal please?	WR5A
17	Problem: Tailings basin current alternatives: Use of the existing tailings basin for discharge of flotation effluent even with the dike/well alternative to capture leakage is unacceptable. Discussion: The tailings basin has leaked in the past and it will leak again. The current alternatives will not capture all leakage. The chemical make-up of the effluent is not completely known at this time and is likely to vary considerable over time of PolyMet’s operation. Proposed alternative: Rebuilding of the tailings basin with clay and impermeable liner at the outset of the project will minimize change of leakages, eliminate leakage discharge to Partridge River and be much easier to do before basin is used. (i.e. future mitigation)	GT1
17	Problem: Concentrated acids Discussion: The storage of HCL & H2SO4 seems safe enough in the indoor fully contained storage tanks. However, the E.I.S. did not make it clear to me that the safety of the rail cards and the unloading area was all it could be. The transfer of responsibility between the RR carriers and PolyMet requires definition. The RR Siding where these tank cars will await unloading requires containment provisions for spills and leakage. The unloading area also requires containment safeguards.	PD7
18	Problem: Discharges exceeding current state/federal concentrations. Discussion: Adoption of and insisting on the most stringent safeguards to prevent ground water and waterway contamination may or may not become reality on this project. My concern is the regulatory reality of PolyMet’s operation. A. Will the standards be relaxed for the project, thus giving the green light for the now stated concentrations of sulfate, antimony, nickel, & manganese to be discharged? B. If not will the water treatment facilities be upgraded to meet the standards?and C. Will adequate mine/mill test wells be set-up to enforce compliance?	RFI,WR3I
18	Problem: Mine put reclamation/backfill Proposed plan: The exposed ore body will have its ore faces covered upon completion of mining. The eat pit will be backfilled. Water accumulation in the spent pits will occur, overflow is likely. Discussion: The ground fracturing that will occur during drilling and blasting over the life of the mine will be extensive. Leaching and water migration into surrounding structure will occur. Covering exposed ore faces & subaqueous containment of waste rock will not alleviate these problems. Safeguards: Long term put pumping and water treatment will be necessary. Perimeter monitor wells will also be required.	EOO
18	Problem: Stockpiled material Proposed plan: Waste rock will be deposited on lined acreage and covered with weather proof membrane. Additional safeguards: Lean ore stockpiles may or may not be consumed over the life of the project and also need to be deposited in the same manner as waste rock. Economics may dictate long term storage of loan ore, as proven in nearly every mine nation wise, loan ore stockpiles still exist from mining activities 50 years ago. Proposed alternative: Treat all stockpiled material in same protected manner to avoid rehandling and later construction of safe long term storage pads.	PD11
19	I watch loons and bald eagles catch fish. I want them to live.	G2C
19	I am concerned about water, air & noise pollution in the Kawishiwi River area with this project. Who will guarantee that this area remains pristine?	RFI,G2B,G7A
19	The proposed mining district will severely impact by my habitat moose habitat for this declining species should be protected.	WI5
19	Birch lake is a treasure and we can’t allow it to be contaminated.	G7A
20	I am especially concerned about protecting clean air and clean water.	G2B,G7A

46	1. Discharge and seeps from the mine, pit lake, tailings and waste rock piles of the PolyMet project are likely to pollute water for decades, even thousands of years. Yet there is no showing that the PolyMet corporation can or will provide financial assurance to protect taxpayers from long-term pollution,.	PD4
47	4. Technologies upon which PolyMet relies to treat contaminated water, prevent release of contaminants, including sulfuric acid compounds, are untested or unreliable.	WR3D
48	(1.) My name is Darrell Godbout I am a Ironworker Business agent I represent over 1800 Union Ironworkers And we are in support of the polymet project. (2.)This is an existing mine site already. The property can't be developed for anything else. (3.)We all have families, friends and relatives living in the Arora, Hoyt Lake area who enjoy clean water and air. Poly met has taken the steps to ashore this area stays that way. (4.)We in port 80% of are copper this country uses from over sees companies that work with no environmental restrictions. Poly met has addressed all the environmental concerns to make sure they are a good community member and a company to have in are community. (S.)A lot of the people in charge of poly met are from the area. You will see them in the super market, kids ballgames, around town. They won't to walk with their heads hi knowing they are good for the community not destroying it. (6.) Polymet will create about 400 full time jobs and hundreds of spin off job and 1.5 million construction hours over 2 years. It is very clear Polymet is very good for northern M N. (7.)The things to remember are. (8.) Polymet has addressed all the environmental concerns. (9.) Polymet will provide millions of dollars in local and state tax to support the community and are schools. (10.) And last of all the jobs it will create in this area wich we are in need of.	EOO
49	I presently live in the Twin Cities, but grew up in Hoyt Lakes, MN, the site of the proposed PolyMet project. I am very happy to see the PolyMet Mining Project moving forward. It is long over due. It's time we finally start getting some job growth in Northern Minnesota once again, so that people like myself do not have to move away from the area to find employment. The towns we grew up in are now half the population they were when we lived there. It's frustrating, seeing how much control these lobbyist groups have, in delaying something which will be good for our state. I keep hearing about how this new project is being built on pristine wilderness land and how it will interfere with the wildlife habitat. PolyMet is being built on existing Mining Land which has been used for over half a century. With the improved technology being used today, this mine will be far more environmentally friendly compared to what was there before. With the tough economic times our country is facing, these are the type of projects we need. Projects that will bring jobs back to areas that have been hit hard with unemployment. It's time to move forward with the construction of PolyMet. We've jumped through enough hoops that keep. delaying the project. It's time our government let this project go through, and move on. It's a wonder anything can get done in this country anymore with the control the lobbyist groups have on everything. It's about time our country address the lobbyist problem we have in this country as well, so that job growth proposals like this don't keep getting shut down and stalled.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
51	<p>The AGC supports PolyMet's NorthMet project. We support this project for the following reasons. We believe the project will create badly needed jobs at a time when unemployment is 20% and higher. The existing labor pool is highly qualified for these jobs, allowing employers to hire quality Minnesota workers who need stable jobs to sustain their families. The State of Minnesota and the Iron Range will benefit immensely by providing millions of dollars in local and state taxes to support our communities and educational system. The construction industry is environmentally responsible. We believe in clean air and water, recycling, and sustainable design, construction, and development practices. We believe in taking care of the land and in conservation of resources. To this end, we believe PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families and the Minnesota communities in which we live. The metals that Polymet will mine are essential to green technology such as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters. PolyMet will be a domestic supplier of critical metals needed in medical applications, cell phones, computers and other essential products used in daily living. PolyMet will mine and produce several metals not currently mined anywhere in the United States. This is extremely important at a time when Minnesota is striving to differentiate itself in the global and domestic economy. Metals from the mine are necessary for modern society. Mining these metals in one country, processing them in another and then transporting them to the U.S. is highly inefficient and creates unnecessary greenhouse gas emissions. Foreign suppliers of these metals don't necessarily follow sound environmental practices, creating a greater global environmental impact.</p>	EOO
52	<p>Thank you for the opportunity to comment on the draft Environmental Impact Statement (EIS) for PolyMet Mining. On behalf of the Board of Directors and members of the Hibbing Area Chamber of Commerce, I am pleased to offer my support and to encourage a finding that the draft EIS is adequate so permitting for the project can begin. The Hibbing Area Chamber of Commerce supports the proposed PolyMet Mining project because it will provide critical metals used in our daily lives, it will create new jobs and economic development and it will operate in an environmentally sound manner, as documented in the comprehensive draft EIS. Part of the mission of the Hibbing Area Chamber of Commerce is to support local economic development and to highlight how local businesses can contribute to the sustainability of our economy. The PolyMet project is a perfect example-a local business providing critical metals used by my members every day and doing so in an environmentally sound manner. In particular, the Hibbing Area Chamber of Commerce notes that: PolyMet will re-use an existing brownfield site, which will minimize the destruction of wetlands. PolyMet will manage waste rock based on its potential to generate acid. Engineered liners, foundation drains to collect seepage for treatment and, in the end, covers for each stockpile will ensure that the minimal amount of water that contacts the rock will be treated, PolyMet will not discharge process water. PolyMet will use the sulfur found with the metals to process the ore-saving on greenhouse gas emissions and making the best use of the ore itself. PolyMet will have very few air emissions because it will use the sulfur as a fuel to process ore. PolyMet's residue will not be hazardous and will be stored in specially designed cells. PolyMet will set aside money to cover all closure costs-before the first spade of dirt is turned. PolyMet will achieve many of these environmental milestones with the help of many of my members - businesses that have developed globally recognized expertise in mining that will be put to good use in the PolyMet project. The United States imports as much as 90 percent of the metals that PolyMet will mine, making us reliant on foreign supplies of minerals we use every day. Many, if not most, of those foreign supplies are not produced with the same eye toward environmental protection that PolyMet has demonstrated throughout the draft EIS. The draft EIS does an excellent job of documenting the steps PolyMet will take to protect our environment, identifying impacts and providing mitigation alternatives. As such, the draft EIS should be found to be adequate and permit development based on the information contained in the draft EIS should begin immediately.</p>	EOO

53	The Minnesota Pipe Trades Association believes that the Polymet Project will be operated in a responsible and professional manner and in accordance with Minnesota's existing stringent environmental regulations as well as for the following reasons: The state of Minnesota has the finest environmental regulations in the country in regards to the mining industry. There are over forty pages of Minnesota Rules on record that were formulated with the input of Environmentalists, Area Citizens, Mine Owners, Labor and the Department of Natural Resources (DNR) in the 1990's. If these rules are enforced today and with the Cooperation of all parties, the mines have operated and the environment has been protected. I was very pleased to see the comprehensive DEIS and that the Army Corp of Engineers, the Department of Natural Resources as well as the American Indian Tribes all had input in the draft. The Minnesota Pipe Trades Association supports the Polymet Project.	EOO
54	I am writing this letter to express my support for approval of Polymet Mining's Northmet project. I work for Road Machinery and Supplies Co, an 80 plus year old Dealer in the equipment distribution and support industry. This project and the people and businesses of the Iron Range are vital to our state and economy. I believe Polymet, the DNR, MPCA and Corp of Engineers have required a level of scrutiny and detail in preparing the Draft EIS that sets a very high standard for understanding the impacts to our northern Minnesota natural resources. My family has enjoyed the beauty of the area near Tower for over 30 years and I have a strong personal stake in protecting this resource. The Polymet Project plan has been designed with safeguards to protect the environment. It comes at a time when Minnesota needs to show that we can balance economic opportunity, growth of our Mining heritage, along with responsible stewardship of our states natural resources. This project is well planned, has the safeguards needed and makes clear economic sense. Please move forward and issue the permits for this project.	EOO
55	I'd like to start off, I support the PolyMet mining project. I believe it will bring good-paying jobs to the area. It's one thing this area really needs. You know, instead of importing a lot of the jobs overseas, buying metals and the state of the economy that we are in right now, and there's no other way to do it, except for maybe have some jobs in Minnesota here. I believe they can do it safely. I believe the EPA should have strict regulations on them so if they don't do it safely, they pay the cons -- consequences before we do. I'm an average fisherman, hunter, and I've lived up in northern Minnesota my whole life, and I believe there are clean lakes up here, and there always should be. I'm a big -- I am big on domestic production. I believe we wouldn't be in this state of the mess if people wouldn't buy foreign vehicles, foreign -- everything comes from foreign. More or less, we need jobs. Jobs means taxes, dollars that stay in the United States, stay here. They don't go overseas. I know it's a world economy these days. Well, then the EPA should be a world thing also. You know, if we can't do it here, why should China, why should these foreign countries get away with things that we can't. It's just we need jobs. I'm a resident of Tower-Soudan. Last night, we had a vote on schools, because the state -- state is not providing money, taxes are not enough, so they tax us more. Well, how are we supposed to pay taxes when we don't have jobs? Everyone wants to live in the Cities and point fingers, but I believe we need jobs. I just believe that with all the -- with all the technology through these years, I believe we can do it safely, environmentally friendly, and provide families with not going to bed on worrying how to buy food, shelter, and how to provide future for their families. Thank you very much.	EOO

56	I have a Bachelor of Science Degree in Biology from the University of Minnesota with a Chemistry Minor. I (thankfully) reside year-round with my family on Wynne Lake, a few miles from the proposed Polymet site. After reading both the long- and short-form of the DEIS on the Northmet (polymet) Project and finding that the proposed methods of abatement and the procuring of metals within the limits of accountable environmental industry, I lend my support to this project. As my family's health and Wynne Lake's health are directly tied to this project being environmentally responsible, I am concerned that the project stays within set parameters. After reviewing the proposed plans set forth in the DEIS, I have confidence the project will be carried out in the most responsible way. This is where the ore is at, this is where it must be mined. The proposed project area has been a mine for years and with the abatement proposal, could be bettered (from the condition it is now in) once the project is finished. In an economy riddled with job loss, this project comes here at the right time. Our national security will benefit from this project. Those cell-phone parts and Hybrid car parts are made of the metals this project will produce and represent just a small example of products the raw materials from this project will become. Other countries have less stringent regulations and our dependency upon foreign imports of raw materials is detrimental to our economy and our national security. There is a global need for this project and we can do it in an environmentally sound manner here, or others concerned only with massive profit will carry out the same project without regulation and we will still pay environmentally as well as socially and financially. Because of the aforementioned mentioned reasons and many others, I support the Polymet project.	EOO
57	Do let the public know that just because this mine will move forward with the permitting process that you will continue to work with Polymet throughout the life of the mine to ensure the quality of the environment.	PRO3
57	Within this statement is my support of the Polymet Mining project. The mine that is proposed is one that has thoroughly been written by an independent third party, reviewed by federal, state, and tribal agencies along the way to shape the full development of the Draft Environmental Impact Statement. Polymet has been designed to exceed expectations, minimize environmental foot print, and reuse a good portion of existing infrastructure at a Brownfield site. The thousands of supporting documents written by professional world class engineers and geologists support this mine and should be moved to the permitting process as soon as possible. The Minnesota Department of Natural Resources, The Minnesota Pollution Control Agency, and the United States Army Corps of Engineers should be proud of their accomplishments in contributing to this complex document that is at hand. Polymet has demonstrated that it can produce these critical metals while following Minnesota's strict environmental requirements. My faith in the system we have put in place, here in Minnesota is high; it is upon you to continue your work as the convening authorities to allow the process to move forward.	EOO
57	The tax base for this state will be a positive seen many places. The economic benefits will help stabilize the area. Additional companies! corporations will follow to the area to be closer to these metals, spurring even more growth for our great state.	EOO
57	Do establish financial assurances for any issues that may arise in the future.	PD4
58	Further, the effects of long term environmental and climate change are not included in the uncertainty analysis.	AQ3
59	While a net loss of 1-3% of wetlands doesn't sound terrible, Northern Minnesota's peat lands are an invaluable and essentially irreplaceable resource. I have not seen any evidence that our-of-area mitigation replacement is adequate to compensate for peat land loss.	WE3
60	In view of the controversial nature of the proposed project and the extraordinarily poor record of similar mines implemented in the past, it would be a useful exercise, that would help place this in context, to look at any environmental reviews or predictions that were made for other sulfide mines and the subsequent condition of those projects.	PD8
61	Although the proposed alternative evaluation acknowledges a high likelihood of water quality problems as a direct and indirect result of mining activity, proposed mitigation measures are not adequately evaluated.	WR1E
62	It would also be useful to provide the public with a disinterested 3rd-party evaluation of proposed mitigation measures, and references to projects or locations where those measures have been successfully implemented.	PD8

63	Pumping water. Colby Lake, Barge #1, Booster Pump House #1, Tails Pond pumps, loading pockets, and many things all over the plant. Need relief valves on GIW pumps-suc. And disch. Of each pump if you are using such a pump.	EOO
64	First, I believe the Northmet project serves as an excellent example of advancing my research group's mission which is" to foster the economic development of Minnesota's natural resources in an environmentally sound manner to promote private sector employment. Our economic geology group, for example, has studied northeastern Minnesota's copper/nickel IPGM mineral resources for the past 24 years and now we finally have a technically and environmentally sound process to extract the low concentrations of metals they have studied which are needed to meet many of the United State's strategic uses for copper, nickel, cobalt, and platinum group metals. Just as our research institute has continually supported the taconite mining industry in the areas of geology, mine engineering, mineral processing, product metallurgy, and environmental engineering, we greatly look forward to supporting the advancement of copper/ nickel/ PGM mining in Northeastern Minnesota. We therefore plan to build, operate, and staff a new hydrometallurgical research laboratory on our Coleraine Minerals Research Laboratory campus to advance technical developments in the area of copper nickel mining and processing focusing on the use of our extensive mineral resources in Northeastern Minnesota. From a sustainability viewpoint, I feel the project offers an outstanding route to return the economic viability of this region in the State which previously existed and was lost due to the 2001 closure of the LTV Steel Mining Company and the loss of its 1400 permanent high paying jobs for the Hoyt Lakes area as well as for greater Minnesota. In addition, by operating with a philosophy of sustainability through maintaining high level safety, health, and environmental standards, this mining operation has great potential to make continuing and lasting contributions to the local, regional, and national economy. From a sustainability viewpoint, the project also wisely reuses the previous LTV Steel Mining company's iron ore crushing and concentrating facilities and equipment, as well as other infrastructure including LTV's previous rail lines, power lines, and tailings basin. It is important to recognize that the Northmet property and associated mine and processing plants have no surface water discharges and will institute groundwater monitoring stations to actually measure the results of its extensive environmental control efforts. I therefore believe that the parties involved have diligently prepared a very solid Environment Impact Statement which well informs the permitting agencies of the proposed actions required to conduct surface mining of the Northmet deposit and mineral processing of the Copper-Nickel-Platinum Group Elements contained in the ore. I also believe the EIS adequately assesses the potential environmental impacts of this new mining project and provides operating methods to control the level of these potential impacts. Additionally, the agency recommended mitigation measures identified provide an excellent set of operating procedures to further reduce environmental impacts potentially encountered during operation of the mine, mineral processing, and hydrometallurgical plants. I believe the proposed Northmet Project has well balanced the economic capture of strategic metals from the Duluth complex with a set of operating practices designed to maintain high level environmental standards to safeguard our valuable air, water, and land resources.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
65	We, in northeastern Minnesota realize that, by its very nature, a mining operation will affect our environment. The landscape of the region bears evidence of over a century of iron ore mining. However, through the oversight of the Minnesota Department of Resources, and the insistence of the people who live here, the scenic beauty of the region completely overshadows the traces left by mining operations. The thousands of tourists who flock to this region to enjoy sparkling blue lakes and thriving forestlands attest to that fact. Now, as we usher in a new kind of mining in northeastern Minnesota, some people are concerned that the same careful consideration for the environment that we have experienced for over 100 years will somehow cease to be important. Nothing could be further from the truth. Those folks who live and work in northeastern Minnesota are perhaps even more concerned about our environment than those who come use this area as their playground. After all, we appreciate the beauty of the region year after year, twelve months a year, and are careful custodians of the natural resources that make the region where we live and work so special. Through this EIS process, the Minnesota Department of Natural Resources has conducted an exhaustive study to ensure that copper/nickel and precious metal mining can occur in the region with a minimum effect on the natural environment. We believe and trust that those intense studies have considered and answered any questions concerning the potential effects of Northmet's operations and that the DNR will continue to partner with the residents of the area to ensure strict adherence to all of Minnesota's rules and guidelines concerning our environment. It is important to note that although most public discussion highlights concerns about the possible effects of copper/nickel mining on the natural landscape, the EIS process demands equal consideration of the socio-economic implications for the region. It has been found that that the Northmet operation will greatly benefit the region economically by creating approximately 400 new jobs and at least three times that number in support jobs. This, in turn, will generate additional revenue for the state's ailing budget, help strengthen our school districts statewide, and encourage additional retail activity in our region which will result in the development of stronger and wealthier communities on the Iron Range. Although the protecting the beauty of northeastern Minnesota remains of paramount importance it is also imperative that the people who live in the region can continue to work at productive jobs, raise healthy, well-educated families, live in thriving communities and enjoy all that northeastern Minnesota has to offer in recreational opportunities. It has been proven through the EIS process that the Northmet project can reliably adhere to the stringent environmental rules set forth by the state of Minnesota and, just as importantly, can help to ensure the quality of life desired by the people of northeastern Minnesota.	EOO
<b>Sender Last Name:</b>	Sandnas	<b>Submission ID:</b> 346
374	As a lifelong resident of Northern Minnesota, I have first hand knowledge of what these much needed jobs can do for our area. As much as we need these jobs, I am unwilling to compromise our drinking water and air quality. However, based on the documentation outlined in the DEIS, I am satisfied that PolyMet can extract these resources in an environmentally sound manner with minimal effects. I am in full support of Poly Met Mining's North Met project. As an American, I am greatly concerned about our growing dependence on foreign countries to meet our needs. This is a trend we urgently need to reverse and this project is a good start in the right direction. Let's move forward with a project that will enhance the Iron Range and reduce our dependence on others.	EOO,G2

1769	I have enjoyed the Lake Superior Watershed for many years at my cabin in Michigan. Pit mining was just approved there and I can see only short term gains. A watershed is not an isolated place; pollution originating in Minnesota migrates throughout the area. Please do not contaminate such a beautiful place.	G11
<b>Sender Last Name:</b> Satrom		<b>Submission ID:</b> 182
14	The EIS should be clearer; PolyMet is not in the Boundary Waters watershed.	WR3B
173	PolyMet will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefit. PolyMet's 400 employees and the hundreds of spinoff jobs will provide a huge economic benefit to Minnesota and the Arrowhead region/my local business. PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system. We should move forward with permitting this mine. We need and want jobs. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. PolyMet has demonstrated it can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. The metals that Polymet will mine are essential to green technology such as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air and water will be minimal, if any.	EOO,G5
174	I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project and I wholeheartedly support it. PolyMet project has been designed to minimize environmental impacts; reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. PolyMet will be a domestic supply of critical metals needed in medical applications, electric cars, catalytic converters, cell phones, computers and other essential products. I understand the importance of buying locally. PolyMet will mine and produce several metals not currently mined anywhere in the United States. I use these metals every day. PolyMet will be a domestic source of the metals we all use every day. Mining these metals in one country, processing them in another and then transporting them to the U.S. creates unnecessary greenhouse gas emissions. Foreign suppliers of these metals don't necessarily follow sound environmental practices, creating a greater global environmental impact. Thank you for considering my concerns and comments.	EOO,G5
<b>Sender Last Name:</b> Savage		<b>Submission ID:</b> 220
222	I would like to comment in support of the Polymet project in Hoyt Lakes. In this day and age, it is important to use common sense when it comes to developing our US resources and jobs and this project can be an essential part of our countries strategy. Everyone is concerned we protect our countries ability to compete, be self sufficient, and protects the environment as much as current technology allows. This project does all of that. It has been improperly labeled as a Boundary Waters project so as to evoke emotions and resistance. In reality, the site has been an existing mining site, Polybrite can meet the most stringent requirements and still generate job, taxes and protect the US interests. I work in the electronics industry and watch as millions of jobs are moved overseas, taxes are lost and America becomes indebted to other countries. We are losing our position in the world and no one seems to see the long term problem. Other countries are buying up natural resources in the world thus controlling the prices, all of which does not bode well for us in the future. Please let's not "cut off our nose to spite our face" as they say.	EOO
<b>Sender Last Name:</b> Schaaf		<b>Submission ID:</b> 1953
2473	This is insane. We need to save our environment, fish and wildlife now & not give in to money hungry companies that will destroy all of this. After it's gone, it will be too late to repair the damage.	EOO

727	I would like to see a time extension of 45 days to review the EIS - especially warranted for a project with the potential for so much environmental degradation. Meetings should definitely be open for citizen statements and discussion. What kind of a legitimate process is it without it? Additional meetings should be scheduled to reach a broader segment of the public.	PRO6
3634	It will be the height of irresponsibility if you allow this project to proceed. If you do you will be a player in a new version of an old story. Long term environmental loss for short term financial gain. And that gain will be mostly to the company, not the labor force. It is your responsibility and mandate to protect our natural resources. It is time for you to do so.	EOO
<b>Sender Last Name:</b> Schaefer <span style="float: right;"><b>Submission ID:</b> 1171</span>		
1286	Open-pit sulfite mining is simply not the same as taconite iron mining. The long term risk is not worth the short-term profit. I have no interest in visiting the Boundary Waters if there is open-pit mining on its edges. I will spend my money elsewhere and encourage my friends to do the same.	EOO,G11
19256	Fond du Lac does not agree with the DEIS statement that beavers cause artificial impoundments; the hydrological modifications that beavers create is natural.	EOO,WI2
<b>Sender Last Name:</b> Schatz <span style="float: right;"><b>Submission ID:</b> 1304</span>		
1513	The consideration of this action is deplorable and absurd. The BWCAW is a pristine area with a fragile ecosystem. You cannot overfish or bring in anything non organic, and this report claims that mining near it is A.O.K.? Please Please get your minds out of the short term and realize that a fleeting buisness venture is only around for a few years while an area such as the BWCAW can and will be around for hundreds.	EOO,G2C
<b>Sender Last Name:</b> Scheibe <span style="float: right;"><b>Submission ID:</b> 3711</span>		
1	The cumulative effects analysis is also significantly inadequate for a number of resources, including greenhouse gas emissions; water quality, including mercury and sulfate levels; wild rice impacts; wildlife; aquatic resources; and wetlands. See e.g., DEIS, 4.14-2, n. 2. For example, as set forth above, despite the large number of ongoing and future projects within this region, including Minnesota Steel, the Keetac Expansion Project and other expansion of taconite mines, the Essar Steel Expansion project, Mesabi Nugget, the Excelsior coal gasification plant, Franconia Minerals Birch Lake proposal, Duluth Metals Nokomis proposal, the Teck Cominco Mesaba mine proposal, the widespread mineral exploration, there is no quantifiable, detailed, or objective assessment of the overall amount of greenhouse gas emissions that will be caused by these projects, nor an assessment as to how this will impact the State's ability to meet goals and standards that it has committed to achieve. There is also a lack of a cumulative effects analysis regarding the amount and importance of the peat that would be destroyed, which serves an important carbon sink and also sequesters mercury; and the importance of the destroyed wetlands both as important carbon sinks and areas where wildlife will seek refuge during this era of unprecedented climate change. Id.	WR5A,WI5,FM3,AQ3,AQ4

1 Similarly, even though most project area waterbodies are already water quality impaired due to mercury pollution, with a TMDL already in place for some waterbodies and others too impaired for the TMDL to even be applied (see e.g., DEIS, 4.5-19, 20), the Draft EIS fails to include an adequate cumulative effects assessment regarding the amount of increased sulfates, mercury and other pollutants that will be produced cumulatively by these numerous projects and how these significant increases will somehow meet all applicable water quality standards and requirements. As explained, in order to consider cumulative effects, some quantified or detailed information is required, and general narrative statements about “possible effects” and “some risk” are insufficient. *Neighbors of Cuddy Mountain*, 137 F.3d at 1379-80. The proposed mine “would result in the release of sulfate to a high risk situation for mercury methylation” (DEIS, 4.5-21), and this “high risk situation” of one proposal must be considered cumulatively along with all other past, present, and reasonably foreseeable proposals to determine and disclose the overall risks to water quality, fish, wildlife species that prey on aquatic species, and human fish consumption. Significantly, this cumulative impacts analysis for sulfates and mercury cannot be limited to only project area streams, but must include downstream areas including the St. Louis River, the St. Louis River estuary, and Lake Superior; and must include an analysis of the potential impacts to the aquatic species present in these downstream rivers, streams and Lake Superior.

WR5A,FM3

1 XVII. The Draft EIS Cumulative Effects Analysis is Inadequate In accord with NEPA, the Forest Service must "consider" cumulative impacts. 40 C.F.R. § 1508.25(c); *Neighbors of Cuddy Mountain v. U.S. Forest Service*, 137 F.3d 1372, 1379 (9th Cir. 1998). “To ‘consider’ cumulative effects, some quantified or detailed information is required.” *Neighbors of Cuddy Mountain*, 137 F.3d at 1379. “Without such information, neither the courts nor the public, in reviewing the [agency’s] decisions, can be assured that the [agency] provided the hard look that it is required to provide.” *Id.* “General statements about ‘possible’ effects and ‘some risk’ do not constitute a ‘hard look’ absent a justification regarding why more definitive information could not be provided.” *Id.* at 1380. “Nor is it appropriate to defer consideration of cumulative impacts to a future date,” *id.*, as NEPA requires consideration of the potential impact of an action before the action takes place. 40 C.F.R. § 1500.1(b). The Draft EIS provides a very general, mostly non-quantified analysis for some resources, which falls short of the detailed analysis required by NEPA. In fact, in a major mining and NEPA decision, the United States Court of Appeals for the Ninth Circuit has rejected a similar cumulative effects analysis. In *Great Basin Mine Watch v. Hankins*, 456 F.3d 955, 971-974 (9th Cir. 2006), the court struck down the agency’s reliance on the same sort of acreage listing and brief, generalized descriptions of mining impacts in the region. The court required the agency to include “mine-specific ... cumulative data.” *Id.* at 973. Relying on prior cases, the court highlighted the need for a “quantified assessment of [other projects] combined environmental impacts” and “objective quantification of the impacts.” *Id.* at 972. Here, the Draft EIS fails to provide this necessary analysis. More specifically, there are a number of additional deficiencies with the cumulative effects analysis for various resources within the Draft EIS. First, the Draft EIS fails to include in its analysis a number of reasonably foreseeable proposals in the region. As stated by the Forest Service, “[a] list of reasonably foreseeable (including existing) projects should be included,” including the expansion of the Peter Mitchell pit, the Forest Service “Tracks” project, a Pellet Transfer Facility, Mesabi Nugget Phase II, and a proposed highway connection. September 2, 2009, Forest Service Comments. The Draft EIS also fails to explain that PolyMet fully intends for the Plant Site to be utilized for future copper-nickel mining projects in this region, as it would only be operating at approximately one-third capacity through the NorthMet project. The additional use of this Plant Site for additional mining proposals would presumably significantly increase the amount of waste that would be deposited into the LTV tailings basin, which again is already leaking from past mining. This would also greatly increase the amount of vehicle traffic and other disturbances in the immediate project area, as well as downstream.

PRO3,GT2,WR2G

Comment ID	Comment Text	Theme Codes
2	In addition to the comments submitted by the Tribal cooperating agencies regarding impacts to water quality, groundwater, and wetlands, the Draft EIS is also significantly deficient in addressing the cumulative effects of past mining in the Iron Range on these resources. Before permitting an entirely new form of mining in the state, the agencies must take a hard look at the past and ongoing legacy of water quality and wetlands impacts from the iron ore and taconite mining in northeastern Minnesota. The Draft EIS neglects to discuss the current and past pollution and wetlands impacts extending from Grand Rapids to Ely resulting from extensive mining, even though the proposed NorthMet mine would be located within this same, already polluted region. More specifically, the Draft EIS is inadequate in its discussion, analysis, and disclosure of the ongoing pollution that is already occurring at the LTV site where the NorthMet mine is proposed. As acknowledged in the Draft EIS, surface seeps have been identified on the south, west, and north sides of the LTV tailings basin, which is proposed to again be used by NorthMet. DEIS, 4.1-7. "In addition to these visible surface seeps, groundwater flows out from beneath the Tailings Basin into the surrounding unconsolidated deposits to the south, west, and north." Id. The current groundwater seepage from the LTV tailings basin north towards the Embarrass River already exceeds the aquifer flux capacity, which has inundated wetlands immediately downgradient of the tailings basin. Id; see also DEIS, 4.1-29 (stating that the "existing Tailings Basin is unlined and the perimeter embankments to not have a clay core or cutoff, which allowed for both surface seepage through the embankment and groundwater seepage under the embankment"). As explained by the Tribal cooperating agencies, the existing LTV tailings are already contributing substantially to the level of pollutants observed in the groundwater, and it is simply illogical for the agencies to assume that additional seepage of water created by the NorthMet mine would somehow be cleaner than the existing seepage that is currently passing through the LTV tailings. DEIS, 4.1-14 n. 5. The Center agrees with the Tribal cooperating agencies that it is "unclear how the addition of mine waste to the basins would cause seepage water quality to improve." Id. Wishful thinking is no substitute to the hard look required by NEPA. Similarly, EPA "remains concerned" about information gaps regarding the possible impacts to groundwater from portions of the former LTV Mine, particularly (but not exclusively) the tailings basin." July 31, 2009 EPA comments at 4. EPA is concerned that the proposal "would perpetuate seepage from the tailings basin, which could introduce contaminated or high sulfate groundwater into the receiving surface water bodies. Id. EPA thus recommends "that the DEIS thoroughly evaluate the benefits of a geomembrane cover to the tailings basin, insofar as the applicant's analysis has not established that it is infeasible, only that it would have higher costs." Id. In light of the ongoing pollution and high likelihood of additional pollution at this site, this issue needs far more detailed discussion within the EIS.	WR5A
4	The cumulative effects analysis for wildlife must also include and address the impacts being caused by ongoing climate change, and how this will likely affect wildlife and plants during the 20 year period of this proposed mine. Lynx are already threatened with extinction in the lower 48 states, the state's moose population is already in decline, and vegetation patterns are predicted to be altered, but there is no assessment of this significant impact in the Draft EIS.	WI5,AQ3

418	I am a boilermake apprentice with Boilermakers Local 647, Ramsey, MN. I wholeheartedly support this project. While being environmentally conscious, NorthMet is producing hundreds of jobs in an area that desprately needs employment; in a State that desperately needs employment. I do not see a down side!	EOO
418	The State should receive a higher percent of revenue in taxes. The local economy benefits from jobs, but the rest of the State does not benefit proportionately – and the resources belong to all the people.	EOO
<b>Sender Last Name:</b>	Schmitt	<b>Submission ID:</b> 1855
2464	I am greatly concerned that Wisconsin has banned this type of mining until it can be proven safe for the environment. Why would MN want to adopt standards lower than our neighbor state? What could be more precious to MN than the water quality of our lakes, rivers, and ground water?	G7,G14
<b>Sender Last Name:</b>	Schochet	<b>Submission ID:</b> 1771
17	d) Economic impacts: There would be substantial loss of tourism, both transient and seasonal. No one will come for recreation to an area devoid of solitude, scenery or serenity. For some jobs for 20 years, one would lose residents forever. Short-term gain would come at a price. Additionally, the clean-up costs of the mine discharges would be astronomical, and surely (as everywhere else) borne by the taxpayers. Cleanup would have to be carried out for an unlimited time (in perpetuity) and the mining company would surely not be prepared to do this.	SE3,SE4
299	c) Wetland destruction: There is much wetland, including peatland, a rare habitat, in the mining area; it is essential for many plants and animals, especially water bird. Destruction of peatlands also contributes to an increase in greenhouse gases; the effect will be substantial.	AQ3

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
305	b) Wildlife habitat: The mining operations (road construction, deforestation, stripping) would fragment and destroy wildlife habitat; noise and activity would seriously disturb wildlife. Recovering and rare species such as lynx and wolves would be affected.	WI2
1143	a) Water quality: Water quality would almost certainly be degraded by discharge from waste rock (full of toxic heavy metals and sulfides), by overflow from the containment pit (similar issues) and discharges from tailings basins into the wetlands and waterways around the mining site. Contaminated water would flow through rivers into Lake Superior, damaging its purity. Sulfate released from mining operations and rock would increase available mercury levels in waters, allowing accumulation in fish and aquatic wildlife. Mercury is already a concern in Minnesota's fish. A constructed wetland would hardly be sufficient to purify the discharged and leaked water of its toxic elements.	WR1E,WR3L,WE6,WE8
2324	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. As homeowners in northern Minnesota (Ely area), we are most concerned about the potential impacts of this project upon the quality of life and continuing economic prospects of northern Minnesota. The DEIS provided by the mining company itself indicates some of these impacts. And sulfide mining is well known from other parts of the world, where it has contributed enormous pollution problems and cost vast sums of money for cleanup (potentially forever).	G1
<b>Sender Last Name:</b> Scholtz <span style="float:right"><b>Submission ID:</b> 1570</span>		
952	The DEIS says nothing about what the effect of the mine will be on groundwater. This failure to consider the potential impact of groundwater contamination is an arbitrary and capricious oversight that renders the DEIS legally insufficient.	WR2C
<b>Sender Last Name:</b> Schonfeld-Hicks <span style="float:right"><b>Submission ID:</b> 1810</span>		
2397	I am a lifelong Minnesota resident. I have been visiting the Boundary Waters since I was young when my father took me on trips there with several of our friends. I have traveled to many places in the world, but the Boundary Waters is still one of my all-time favorites. I try to visit for skiing or canoeing at least once a year. I am very concerned about the news of the proposed PolyMet mine. I know that Wisconsin has a policy in which mining companies such as PolyMet must prove long-term sustainability and environmental benefit or neutral impact. There have been no instances anywhere in the world where they can show that this mining process is safe in the short or long terms. In fact, wetlands such as those at the proposed site on the edge of the Boundary Waters are one of the most dangerous places to locate a mine like this because it is so easy for the pollutants to leach into our groundwater and travel quickly to pollute many lakes and rivers far from the source area. I know that opening a new mine such as the one PolyMet has proposed seems like an easy short-term solution to the region's economic needs, but our state needs to look forward. There are very real economic concerns on the range. People need employment. However, destroying the lifeblood of Minnesota, which I would argue that our northwoods are, is not the answer. Our waters and woods are too unique and precious to put at risk in this way. I feel that this is an "old" solution. We need to look to the future and explore options that are cleaner and greener. They exist and may be less familiar, but our world is moving that way anyway. Lets put Minnesota at the forefront. We can be leaders in the green technology movement that is gaining steam around the world. Nations like the Netherlands, Denmark and Germany, among many others, have proven that developing environmentally sustainable technologies can be a lucrative pursuit. Please think about our children and their future. I have always planned to someday take my own children to the Boundary Waters as my father did with me. This proposal scares me because it makes me realize that we may not be able to swim and play and drink in the waters of the wilderness as I once did. Please don't let this essential part of our state's heritage and identity disappear.	EOO,G7C,G11

218	Compudyne, Inc. has been conducting business in Northeastern Minnesota for over 20 years. We would like to go on the record as a strong supporter of PolyMet Mining’s NorthMet Project. We have closely followed the efforts of PolyMet Mining during the permitting process. We believe they have done their due diligence and more to ensure the environmental impact of this operation is minimal and well within acceptable limits. We live here and understand and appreciate the value of our natural surroundings. If there was any chance of losing this resource, we would certainly object. But the Draft EIS clearly shows that this is not the case. It is evident that the demand for the metals to be produced at the PolyMet Mining NorthMet Project is only going to increase as we move into the 21st Century. This means not only short term relief to our economic situation, but a viable, sustainable contribution to our region. As a locally owned and operated business, we have witnessed and been impacted by the turbulent economy of our region. The Polymet project will have many positive economic impacts for our region and state. At a time when the entire world is struggling to recover from a deep recession, here is an opportunity to create hundreds of jobs with good wages and benefits plus the resulting millions of dollars in local and state tax revenue. The process of permit approval has gone on long enough – let’s get this great project underway!	EOO
<b>Sender Last Name:</b> Schrage		<b>Submission ID:</b> 3476
1112	Therefore, as a taxpayer and resident of northern Minnesota, I don't care to get stuck with the cleanup bill. The Iron Range already presents a 100 mile long industrial scar running west to east across northern Minnesota. The size of this industrial landscape represents a significant barrier to wildlife. There are only a few remaining intact corridors across this landscape.	WI5
3232	While the EIS identifies significant impacts to some of the remaining corridors, it fails to adequately mitigate these impacts. In addition to wildlife corridors, the EIS recognizes significant impacts to water quality, wild rice, mercury levels in fish, and visibility and air quality; however, sufficient mitigation for these impacts are not identified. The risks for spills and residue from the hydrometalurgical process are not well analyzed. Experience with other mining activities suggests it can cause significant groundwater contamination. The EIS needs to better identify how groundwater contamination will be avoided, and how it will be cleaned up if it's not.	EOO,WI5,FM1,FM4,AQ5,A
3679	I am concerned the proposed EIS does not adequately identify the environmental impacts of the PolyMet mine nor does it identify adequate mitigation for those impacts. The EIS needs to describe in greater detail the financial assurances to clean up the mess if the mine closes or goes bankrupt. The mining industry has a long history of leaving behind poisonous wastes that degrade the environment for generations after the mine closes. I'm unlikely to ever see much personal benefit from this mine.	PD3,PD4
<b>Sender Last Name:</b> Schubbe		<b>Submission ID:</b> 1100
210	Although there will be a loss of grey wolf and Canadian Lynx habitat, and fragmentation of lynx habitat; the DEIS indicates that neither loss nor fragmentation of habitat or vehicle strikes are expected to have a significant impact on grey wolf or Canadian Lynx populations. In addition, from section 4.4-10 of the DEIS, the United States Forest Service (USFS) indicated that no USFS management standards of guidelines would be violated.	WI5
211	The DEIS (section 4.6-32) indicates that the Project would increase the CO2 emissions in the atmosphere. NorthMet Project metals such as copper, nickel, platinum, palladium, etc. are vital for our current way of life (e.g., cell phones, computers, etc) and are necessary for green technologies to be implemented such as windmills for power generation, electric cars, etc. If NorthMet metals are not mined and processed under Minnesota's stringent environmental rules and regulations, the metals will be mined and processed somewhere else where environmental rules and regulations are less stringent or none existent. If our mining jobs are sent to another country, the overall global environmental impact would be negative and the potential for global warming would be greater.	EOO

214	Wetland mitigation planning is a required part of obtaining a permit to mine in Minnesota. As part of wetlands mitigation, a greater amount of wetland acres is typically required to replace wetland acres that have been impacted. No net loss of wetlands is allowed in Minnesota.	WE3
271	Stability of the Tailings Basin has been addressed in the DEIS. If additional mitigation (Tailings Basin Alternative) is necessary, the DEIS indicates that "Geotechnical stability would be enhanced by increasing the size of the rock buttress along the northern toe of the Tailings Basin".	GT1
524	Conservative modeling results have been interpreted in the DEIS to indicate that ground water standards for the Proposed Action will be exceeded for antimony, manganese, nickel, and sulfate for a long period of time (DEIS Table 4.1-45). Conservative ground-water model predictions can be addressed by installation of a ground-water monitoring system that can be used to detect ground-water quality problems if they arise and will allow them to be addressed before they reach the established compliance (property) boundary as defined by permit. Mitigation has been proposed in the DEIS as the Mine Site Alternative. Based on interpretation of conservative modeling the Mine Site Alternative eliminates all predicted exceedences except for antimony. As indicated in the DEIS, the predicted antimony exceedence most likely results from antimony lab testing that was compromised by leaching of antimony from lab apparatus which in turn falsely increased the amount present in rock and therefore modeling results. In addition, per the DEIS, sorption of antimony was not accounted for during the modeling and contributes to the model results being over conservative. The result is an overestimate of antimony concentration which results in model prediction of an antimony exceedence. The predicted antimony exceedence can be addressed during finalization of the Environmental Impact Statement or during permitting by refining the conservative modeling.	WR1E
525	In the DEIS the Proposed Action water quality standards have been predicted by conservative modeling to be exceeded at year 65 when the West Pit will begin discharging. In the DEIS it is indicated that the exceedence of water quality standards is expected to be a relatively short term effect. However, mitigation (Mine Site Alternative) proposed in the DEIS will lower concentrations for those parameters predicted to exceed standards. For either the Proposed Action or the Mine Site Alternative, pit water quality can be monitored as the pit is filling to detect water quality problems (if they occur) and allow adequate time for action to be taken (if necessary) to prevent water quality standards from being exceeded.	WR1F
526	According to the DEIS the Proposed Action will allow relatively high sulfate concentrations to be discharged in seepage from the Tailings Basin that could promote mercury methylation downstream and may cause sulfate standards for the production of wild rice to be exceeded. The MPCA addresses sulfate with respect to mercury methylation in their: "Strategy to Address Indirect Effects of Elevated Sulfate on Methylmercury Production and Phosphorus Availability" (MPCA, 2006). Additional field studies currently being done by PolyMet will allow the state to make a determination with respect to exceedence of the wild rice standard and to determine if an increase in sulfate concentration will lead to an increase in methyl mercury. If necessary, mitigation (Tailings Basin Alternative) presented in the DEIS can be implemented to address sulfate concentrations with respect to wild rice and/or mercury methylation.	WR1E,WR3I,WR4B,WR4F
1204	Thank you for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the PolyMet's NorthMet Project. I personally believe that the DEIS is a comprehensive document that adequately addresses state and federal requirements, including adequate evaluation of alternatives. Please accept this letter as my formal request that the DEIS be finalized and that the final document declared to be adequate. Based on a review of the DEIS and information provided during the Public Hearings (e.g. Aurora and Blaine, Minnesota), I have compiled issues that others may bring up with regard to the DEIS and attempted to provide a DEIS response as follows:	EOO
1205	Please accept this letter as my formal request that PolyMet's NorthMet Project Environmental Impact Statement be finalized and that the Final Environmental Impact Statement be declared to be "adequate".	EOO

3650	I don't believe its worth the risk by letting the mines work even with their new technologies. I have worked in logging most of my life and with that I know that even though we as loggers say we aren't hurting the environment, it is inevitable that the environment will be affected because of brown hydraulics or accident or accidents where fuel gets spilled, and also the destruction of the natural lay of the land. There are too many factors involved that it can't possibly fully contained. It affects not only the land and water but animals and humans. It will be a huge ripple effect.	G2C,G7A
<b>Sender Last Name:</b> Schuldt		<b>Submission ID:</b> 3683
19257	Tribal cooperating agencies take the position that the approximately 5,700 (RS13B) gallons per minute of tailings water released by past mine waste disposal activity has likely had a far greater influence on the hydrology of the area than beaver dams or transportation features.	WR3A
19258	DEIS 4.2.2 Impact Criteria states that "The most likely types of indirect impact on the functions and values of remaining wetlands at the Mine Site include fragmentation from haul road construction and indirect hydrological impacts that may result in a conversion of one wetland type to another or the conversion of a wetland to an upland." This is NOT an indirect impact but a direct impact.	WE2
19259	Tribal cooperators note that the work needed to properly assess indirect wetland impacts at the mine site and at the plant site has not been completed. It is the position of the tribal cooperating agencies that the wetlands work group should finalize the indirect wetland impact workplan and that the results of that investigation be included in the DEIS to allow a full public review.	WE1,WE2
19259	DEIS 4.2.3.1 Environmental Consequences/Proposed Action/Mine Site Direct Wetland Impacts states "The most common wetland types are coniferous bog (510 acres) and open bog communities (76 acres). These two communities comprise 73% of the direct wetland impacts at the Mine Site (Table 4.2-4)." Tribal cooperating agencies disagree. The wetland delineation study (RS14, Appendix A) identified over 390 acres of wetland community with a significant white cedar component. For example, wetland ID-48 (Table 4.2-3) was identified in delineation reports as dominated by white cedar. White cedar is an indicator of mineral rich waters. Renaming wetland ID-48 as a coniferous bog, as was done in Table 4.2-3, does not make that community a bog. Cedar dominated wetlands are cedar swamps, not bogs. The significance of this is that, bogs tend to be precipitation fed while swamps tend to be groundwater fed. Data from the wetland delineations (RS14) suggest that bogs are not the most prevalent wetland type. In fact, it appears that wetlands that require groundwater inputs: forested rich peatlands and poor fens are the most prevalent. Table 4.2-3 is not useful as it is presented. Whether deliberately or not, the total number of acres for each wetland is not provided on the table. This makes it impossible to determine to what real extent the wetland will be impacted. As an example, a given wetland of 100 acres may be able to survive an impact of 40 acres, but not an impact of 80 acres. If only the acres of impact are provided and not also the total wetland acres, then this determination is impossible.	WE1,WE2

19261	<p>Tribal cooperating agencies note that there is no reliable groundwater model for groundwater drawdown impacts of the proposed project. The estimates of groundwater drawdown are currently based on anecdotal observations and analysis of historical aerial photography. Therefore, there is no quantitative assessment of mine related drawdown of the regional water table. This serious data gap has prevented an adequate indirect impact assessment for wetlands from being conducted. Tribal cooperating agencies strongly disagree with the conclusion that “no indirect wetland impacts are anticipated at the Mine Site resulting from groundwater quality.” As previously indicated, there is no data based evidence or analysis on which to conclude that wetlands would not be affected by mine related water quality changes. Existing exceedances do not predict plant community changes that may occur due to additional disturbance. The Project’s discharges to groundwater and surface waters will have to comply with Minnesota water quality standards. Tribal cooperating agencies take the position that indirect impact acreages would be greater than 318.6 if data and quantitative analysis of mine induced drawdown had been conducted. As previously discussed, tribal cooperating agencies have reviewed the information in the above referenced email (Adams 2009) and it is the Tribal cooperating agencies’ position that the methods used are insufficient for prediction of indirect impacts to wetlands. For example, the projects referenced are located in upland areas of the range and are not proper reference sites for potential impacts at the PolyMet mine site. The Peter Mitchell Mine, although in close proximity, is very shallow compared to the proposed mine pits (Peter Mitchell pit is approximately 80 feet deep, PolyMet pit is approximately 800 feet deep). Tribal cooperating agencies take the position that the conclusion (“additional indirect impacts to wetlands associated with drawdown from pit dewatering is anticipated to be minimal, with little to no dewatering of wetlands expected outside the Mine Site”) is faulty. Based on the vegetation data collected from wetland delineations it appears that groundwater supported wetlands are common in the Project area. Indirect impacts to communities that require groundwater inflow have not been determined, but would likely be significantly different than the expected impacts from the Project to perched bogs. The discussion on 4.2-19 makes too many assumptions regarding the potential of nickel and antimony in groundwater. It is not clear why the presence of nickel and antimony in the waste rock would only affect ground water and not surface water runoff. It is also assumed here that all affected wetlands are not ground water influenced. This is not necessarily the case if Thuja occidentalis (Northern White Cedar) is present in any of these wetlands. This tree species is circum-neutral to slightly alkaline in regards to its hydrologic requirements, and therefore would not necessarily survive in an acidic precipitation-influenced bog. The DEIS concludes this discussion with the statement “Compensatory wetland mitigation would be required for any indirect wetland impacts determined through (this) monitoring”. Tribal cooperating agencies disagree with this approach. Monitoring would only identify impacts after they have become apparent in the wetland. Tribal cooperating agencies take the position that the DEIS should provide a detailed description of reasonably foreseeable impacts to wetlands so that decision makers and the public can have a complete picture of the environmental consequences of this project.</p>	WR1E,WR3N,WE1,WE2,W
19262	<p>The DEIS concludes that any indirect impacts along the transportation corridor from spillage would be minor. Tribal cooperating agencies disagree with this conclusion. As indicated in section 3.1.3 it is likely that ore dust would spill from rail cars and be deposited in wetlands adjacent to the rail line. No analysis of any type has been conducted to determine if such impacts would be significant.</p>	WE2,PD3

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19263	<p>PolyMet “proposes a surface seepage collection system that would capture essentially all of the surface seepage and return it to the Tailings Basin until the seeps dry out”. Tribal cooperating agencies take the position, based on the existing available contaminant modeling, that seepage capture would be needed for hundreds or thousands of years to avoid water quality and quantity impacts to wetlands. Tribal cooperating agencies take the position that the method referenced in the DEIS (from Barr 2008, Lined Tailings Basin Alternative – EIS Data Request) is inadequate to assess indirect wetland impacts. This method ignores the fact that there is an area of uplands north of cell 2W which has constrained the movement and direction of tailings basin seepage. Therefore, using the northern extent of wetland impacts of 2W for 2E, north of which there are no uplands, is unjustified. Ignoring the presence of the upland area north of cell 2W creates an underestimation in the extent of wetland impacts due to seepage. Tribal cooperating agencies have suggested a more conventional method for indirect wetland impact estimation to the lead agencies (Methods for evaluating indirect hydrologic impacts to wetlands, March 26, 2009). This method could be applied at both the mine site and the plant site. The method proposed by tribal cooperating agencies was developed by a consultant for the Army Corps for use in another sulfide mine project EIS (Crandon Mine Project Environmental Impact Statement: Wetlands Technical Memorandum, 2003). In addition to having been developed by the Army Corps, this method has been presented by tribal technical staff at professional conferences (Society of Wetland Scientists Conference, 2009 and 55th Annual Meeting of the Institute of Lake Superior Geology, 2009). Tribal cooperating agencies do not agree that the unconventional method described in the DEIS can produce defensible results for indirect hydrologic impacts to wetlands. A more robust method should be used and the analysis presented in the DEIS so the public can review a science-based assessment of potential impacts. Tribal cooperating agencies note that there is a serious inconsistency between this section and information presented in Section 4.1.3.1 of the DEIS. Section 4.1.3.1 states: “Therefore, future impacts to the hydrology of the aquifer and wetlands downgradient of the Tailings Basin were estimated by comparing predicted seepage rates for the Proposed Action (Hinck 2009) with the estimated groundwater flux capacity of the aquifer (155 gpm)(Technical Memorandum: TB-2 and TB-14: Tailings Basin Seepage Groundwater Quality Impacts Modeling Methodology). The current seepage rate toward the Embarrass River from the Tailings Basin (Cells 1E/2E and 2W) is estimated at 1,795 gpm, which continues to result in the upwelling of seepage water into the wetlands as the seepage rate exceeds the aquifer flux capacity by over 1,600 gpm. Under the Proposed Action, the unrecovered seepage rate is predicted to increase to a maximum of approximately 3,800 gpm in Year 20, over 2,900 gpm of which would be attributable to PolyMet (Hinck 2009). Therefore, under the Proposed Action, a significant increase (&gt;100%) in groundwater upwelling relative to existing conditions would be expected. Some of this seepage water would drain to existing streams, but because of the generally flat topography and extensive wetlands, much of this water would be expected to form ponds and inundate wetlands.” Tribal cooperating agencies take the position that the latest relevant information developed for the water resources section has not been incorporated into the wetland impact section. The presentation of two different methods is confusing and does not provide an adequate assessment of wetland impacts. A thorough hydrologic impact analysis that incorporates actual seepage rates from the tailings facility should be conducted. In addition, these seepage rates should be used, in conjunction with t</p>	WR1A,WR3N,WE1,WE2
19264	<p>Tribal cooperating agencies take the position that data from the wetland delineations indicate that bogs are not the most prevalent wetland type. In fact, it appears that wetlands that require groundwater inputs: forested rich peatlands and poor fens are the most prevalent.</p>	WE1
19265	<p>Tribal cooperating agencies note that potentially impacted wetlands that are part of the 100 Mile Swamp were identified by the forest biologist in 1997 as “lacking ecosystem representation in protected areas.” (SNF 1997, January) Interest in protecting the unique character of these wetlands was based on their “watershed integrity, the presence of riverine ecosystems, and large amount of interior forest present.” This information was further substantiated in a report by the MnDNR titled “Evaluation of Selected Potential Candidate Research and Natural Resource Areas.” (SNF 1997, December) This document describes the 100 Mile Swamp wetlands as “these sites represent the highest quality remaining examples of characteristic ecosystems in each ecological Landtype Association on the Superior National Forest.” Tribal cooperating agencies take the position that this information must be included in the functional assessment for this project and included in the development of mitigation requirements for this project.</p>	WE2,WE3

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19266	It is the position of the tribal cooperators that the proposed action and the preferred alternative would likely not comply with the requirements of §404(b)(1) guidelines, which do not allow a permit when there are practicable alternatives that would have less adverse effects, when the Project would lead to a violation of state water quality standards or when it would cause or contribute to significant degradation of waters of the United States. Other alternatives that were not considered in the DEIS (e.g. underground mining) would pose less harm to high quality wetlands, and may be less damaging to aquatic resources. As documented in Table 4.1-68, the Project would result in water quality standards violations.	ALT8,WR31,WE4,PD7
19267	DEIS 4.2.3.4 Tailings Basin Alternative states “It is recommended that existing wetland acreages and impacts be delineated prior to issuance of the Final EIS.” Tribal cooperating agencies take the position that this delineation should occur prior to the issuance of the DEIS so that the public can review a complete set of potential impacts from the project. Should it receive permits for its project, PolyMet will assume responsibility for all legacy contamination caused by the tailings basin to surface water, groundwater and wetlands. Therefore, tribal cooperating agencies take the position that the current exceedances, which are the result of decades of untreated discharges from the tailings basin, must be addressed by PolyMet as part of its closure plan.	WE1,WE2
19268	DEIS 4.2.4.2 Wetland Mitigation/Offsite Mitigation states that mitigation site analysis criteria were limited to sites of 100 acres or more. Fond du Lac has provided comments on several previous drafts of the EIS that the analysis should also have considered “clusters” of smaller potential sites. This recommendation has not been addressed.	WE3
19269	"Watersheds Neighboring Adjacent Watersheds" is an artificial construct that only serves to highlight the significant and permanent loss of wetlands within the St. Louis River watershed and the 1854 Ceded Territories. The significance of this permanent loss of resources within the Ceded Territories cannot be overstated.	WE2,CR1
19270	Mitigation Summary Tribal cooperating agencies take the position that unless the mitigation for the additional 475 wetland acres is identified in the DEIS, or there is a detailed statement of how the permit conditions would address the needed acres, the impacts must be considered unmitigated for purposes of the DEIS. The entire 4.2.4.4 Mitigation Summary section is inadequate. Any wetland restored after mine closure should not be included as any true mitigation because it cannot and will not ever compensate for the loss of wetlands during the 20+ years of mine operation. Mitigation ratios should be set higher for any “difficult to mitigate” wetland type such as forested, bog, and shrub wetlands. Furthermore, mitigation ratios should be fully discussed and finalized in the EIS and not in permitting.	WE3,WE4

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19271	<p>DEIS 4.2.5.2 Cumulative Wetland Impacts – Partridge River Watershed states that the analysis was restricted to the Partridge and Embarrass River watersheds because “several of the primary functions performed by wetlands are directly related to watershed processes”. Fond du Lac notes that not all wetland functions are related to watershed processes, therefore, the cumulative effects analysis should not be limited by it. Fond du Lac disagrees with the statement that “no fens are known to occur in the Project area.” Tribal cooperating agencies take the position that, based on the data from the wetland delineations, there are fens in the project area. Tribal cooperating agencies disagree that limiting the analysis of cumulative wetland impacts to the Partridge River is appropriate. Tribal cooperating agencies take the position that wetland impacts related to regional mining operations throughout the area as well as large wetland impacts of the proposed PolyMet project to the Embarrass River watershed must be included. In addition, the analysis must include impacts related to changes in wetland functional values, only impacts related to direct fill. At a local scale, PolyMet is likely to impact wetlands in the Embarrass River watershed as water that percolates through the bottom of the tailings facility enters that shallow aquifer. This water, which is likely to have degraded quality, will re-emerge at the surface within wetlands of the Embarrass River watershed. The high chemical load of this water will affect wetlands by degrading water quality and altering the wetland functional values. In addition, PolyMet air emissions may deposit contaminants in the watershed of the Embarrass River and further degrade wetland quality. The full extent of wetland impact resulting from 20 years of emissions from the proposed PolyMet project via air and water must be quantitatively characterized. This quantitative analysis should be done using model output (air, surface and groundwater). A quantitative assessment of changes to functional values should include an analysis of the effects of 20 years of surface and groundwater emissions along with the additive effects of air emissions for Embarrass River Wetlands. Finally, the PolyMet project as proposed includes a possibility of post-closure contamination of surface and groundwater. The wetland cumulative impact analysis must include a quantitative analysis of the long-term effects of mine effluent on wetlands of the Embarrass River. If mine related effluent is to be perpetual, this section must discuss the effects of perpetual mine discharge on wetlands. In regards to the Partridge River watershed, the analysis correctly focuses on 3 timeframes of analysis; Pre Settlement Resources, Existing Resources, and Future Resources. However, the cumulative impact discussion includes only wetland loss due to direct fill. There is no attempt in the document to assess cumulative impacts that result in changes to functional values. The issue of changes to wetland functional value has been highlighted to the USACE and the MnDNR during technical meetings. The DEIS should provide a quantitative analysis of the cumulative changes in wetland functional values for the Partridge River. This analysis must include the functional value changes related to maintenance of features of the closed mine (e.g. changes in water quality of mine site wetlands, changes in water flow through mine site wetlands, etc.).</p>	WE1,WE5
19272	<p>At a regional scale, Iron Range taconite mining has impacted wetlands through direct wetland fill as well as indirect impacts due to air deposition of mine related contaminants, water quality degradation, and the flooding/dewatering of wetlands which lead to changes in wetland functional values. There are two additional geographic scales at which wetland cumulative impacts should be characterized: St. Louis River Watershed. Fond du Lac has identified this watershed as an area of concern. The cumulative impact analysis should quantitatively characterize the following: 1. The additive effect of PolyMet related air and water emissions to the Partridge and Embarrass River watershed wetlands and their impact on water quality of the St. Louis River. 2. The loss of wetlands and changes in wetland functional values in the St. Louis River watershed during the 3 timeframes, including a characterization of the potential for future mining impacts and the long-term maintenance requirements of the PolyMet mine as currently proposed. 1854 Ceded Territory. The Fond du Lac, Grand Portage, and Bois Forte Bands retain treaty guaranteed rights to harvest natural resources within the 1854 Ceded Territory. The cumulative impact analysis should quantitatively characterize the following: 1. The additive effect of PolyMet related air and water emissions to the wetlands of the 1854 Ceded Territory. 2. The loss of wetlands and changes in wetland functional values in the 1854 Ceded Territory during the 3 timeframes. 3. Loss of tribal access to wetlands in the 1854 Ceded Territory due to either the changes documented in 2. above, or due to mitigation of wetland impacts occurring outside of the Ceded Territory.</p>	WE5,G3,CR1

19273	It is the tribal cooperating agencies' position that while there is no current documented tribal use of said resources, most band members do not report their harvest sites. Therefore, it should not be assumed that there is no use of resources in these areas. Additionally, tribal cooperating agencies note that the Area of Potential Effect for the Project was not determined until August 11th, 2009, and tribal consultation under §106 NHPA is ongoing. Therefore, historic and current Tribal harvest has not been determined for either the Plant or Mine Sites.	CR2
19274	Tribal cooperating agencies note that the Area of Potential Effect for the Project was not determined until August 11th, 2009, and consultation under §106 of the NHPA is still ongoing between the USACE and the Tribes. Therefore, historic and current Tribal harvest has not been determined for either the Plant or Mine Sites yet. The tribal cooperators' position is that while there is no current documented tribal use of said resources, most band members don't formally report their harvest sites at the scale that would allow identification of proximity to the mine site. If species of tribal concern 'relocated' to other lands and these other lands were private lands, there would be a loss of opportunity to harvest. Recent studies from the MnDNR, the Natural Resources Research Institute at University of Minnesota-Duluth and Tribal natural resource management staff indicate that preservation of wetlands may be one of most important factors in maintaining the moose population in northeastern Minnesota.	WI3,CR1,CR2
19275	Tribal cooperating agencies disagree with the conclusion that the effect on statewide lynx populations would be insignificant; this analysis does not consider the possibility that the Mine Site might include critical components of lynx habitat present, such as den sites. The DEIS concludes that "Therefore, the Project would be likely to adversely affect, but not significantly affect the Canada Lynx because of the direct loss of designated critical habitat, fragmentation of additional habitat within the critical habitat boundaries, and the increased potential (albeit low) for incidental take resulting from vehicular collisions." Fond du Lac notes that there is no scientific basis for this conclusion, and in fact, consultation with the US Fish & Wildlife Service on the potential impacts of the Project to Canada lynx or any other ESA species has not been concluded. This is another critical deficiency of this EIS process, and must be addressed before the Project can proceed.	WI1
19276	Fond du Lac disagrees with the conclusion that "Therefore, the Project is not likely to adversely affect Bald Eagles because the Mine and Plant Sites are more than two miles from any known nesting sites and do not provide optimal habitat for nesting and foraging bald eagles." Impacts to bald eagles could result from eagle feeding sites within or adjacent to the project area. Contaminants from the mine site, specifically mercury and heavy metals, could affect prey species thus having secondary impacts on eagle reproduction.	WI1
19277	Tribal cooperating agencies have noted concerns in previous drafts of the EIS that the project may create attractive nesting sites where mining or heavy vehicle activity takes place. This could result in increased adult or nest mortality. The tribal cooperators do not see any new evidence or clear analysis to support the claim that the Project is not likely to adversely affect Wood turtles.	WI2
19278	Tribal cooperating agencies reiterate previous DEIS review statements that single species conifer plantations have little wildlife value.	WI4
19279	Tribal cooperating agencies strongly disagree with the conclusions presented in the wetlands section. The methodology used to predict the acres of wetlands indirectly impacted by the project pit dewatering are not adequate to assess indirect wetland impacts.	WE2
19280	Tribal cooperating agencies consider the loss of mature forest a significant impact, and note that the activities on the mine site will prevent more forest acreage from reaching this mature community state, representing a nearly permanent loss of habitat.	WI2
19280	Tribal cooperating agencies' position is that Corridor 11 (Emmons & Oliver 2006) is currently a poor and obstructed corridor (pending the long term success of a proposed revegetation corridor), and Corridor 12 will likely be degraded as a corridor by the Project; these impacts should be considered significant.	WI5

Comment ID	Comment Text	Theme Codes
19281	The tribal cooperating agencies' position is that lake sturgeon were once prevalent in many tributaries to the Great Lakes, and that prior to the extensive dam construction on the lower St. Louis River, the upper St. Louis River was likely part of the historical range of the species. Tribal conservation officers have verified angler success in catching lake sturgeon upstream of the Minnesota Power hydropower dams in the past few years. The Fond du Lac Resource Management Division based its attempted restocking program on historical accounts of lake sturgeon abundance during the early logging period in Minnesota's history.	FM2
19281	The tribal cooperating agencies' position is that per Emmons & Oliver (2006), any new impacts to the existing wildlife migration corridors is by definition significant, and should require mitigation. No mitigation has been proposed for this impact. For the entire time period (decades) of mine development and operation, Corridor 12 would experience a significant direct loss or fragmentation of wildlife habitat, and impact the ability of many wildlife species to migrate throughout their ranges. Also, until the §106 consultation process between the USACE and the tribes is complete, it is not possible to determine the potential impacts to treaty-protected wildlife.	WI3,WI5,CR1,CR2
19282	The tribal cooperating agencies' position is that no conclusions about the presence of northern brook lamprey can be made in this analysis without specific surveys in the Project Area. Tribal fisheries biologists have definitively identified this species in the Dark River, just a few miles to the west of the St. Louis River.	FM2
19283	The tribal cooperating agencies' position is that there was not an adequate sampling effort to determine the presence of the creek heelsplitter ( <i>Lasmigona compressa</i> ) in the Project Area, particularly for a species that is already known to be limited in numbers or distribution. While the detection probability is low for each site, tribal fisheries biologists have sampled this species in the headwaters region of the St. Louis River, approximately a mile downstream of Seven Beavers Lake (B. Borkholder, pers. comm.) in 2008.	FM2
19284	DEIS 4.5.1.3 Habitat Conditions and Biotic Assemblages in Colby Lake and Whitewater Reservoir concludes that, in the absence of state-established biocriteria for fish communities, the fish assemblages/composition appear to be similar to what might be expected based upon physical and water quality conditions. The tribal cooperating agencies' position is that if there is data to support this statement, it should be cited in the EIS. The tribal cooperating agencies' position is that the benthic invertebrate data described in this section does not support a conclusion of good water quality. In the first place, the data is nearly 30 years old, and secondly, the presence of <i>Chaoborus</i> and the two other midge taxa is not indicative of good water quality; these species are not on the sensitive end of the pollution tolerance index.	FM2
19284	The tribal cooperating agencies' position is that the conclusions regarding potential anthropogenic impacts are in some cases inconsistent, and in other cases simply not defensible. The writers conclude that macroinvertebrate species richness (low EPT taxa) at one site may be of anthropogenic origin given its location downstream of the LTVSMC tailings basin, but dismiss that possibility with regards to the fish community. We would agree that most of these sampling sites represent headwaters habitat conditions (particularly B3), which alone can account for less-than-expected species richness. But there is no evidence to support a conclusion that low species richness in either the macroinvertebrate or fish communities is solely a manifestation of poor habitat, and not also potentially a result of previous mining impacts in the watershed. The QHEI scores are of little use in this analysis, as this index is notoriously poor in its power to distinguish the quality of habitat in headwaters streams; hard substrate is a key variable leading to a high QHEI score. In the technical report (Breneman 2005), the author expressed a disclaimer on the data interpretation from site B3, because of its habitat characteristics. It is critical to recognize that the six sampling sites in this survey represent 3-4 distinct habitat conditions, which is useful as background data but makes any comparisons problematic.	FM1,FM2
19285	The aquatic biota present in these streams have adapted over millennia to normal seasonal fluctuations in streamflow. But a reduction in summer baseflow would be expected to adversely affect the biota. The tribal cooperating agencies' position is that there is insufficient flow data and hydrologic modeling to support the conclusion that reductions in high end flows above Colby Lake would not have a significant effect on physical habitat for aquatic biota. Comments submitted on previous drafts of the EIS have expressed tribal technical staff concerns that any alteration of flow at the magnitude predicted will definitely result in a decrease of stream power, with a subsequent decrease in the size of particle able to be transported. Thus, increased sedimentation is likely to result.	FM2

19286	The DEIS acknowledges “local factors related to Project Construction and operation have the potential to affect mercury bioaccumulation either through mobilization of mercury stored in rock, soil, peat and vegetation on site, or through factors that may enhance the methylation of mercury....The primary concern related to mercury for the NorthMet Project is the potential for releasing increased sulfate loads, which could promote mercury methylation.” Additionally, “...the Proposed Action would result in the release of sulfate to a high risk situation for mercury methylation” as defined under the MPCA’s mercury strategy. Monitoring, however, has only focused on sulfate and methylmercury concentrations downstream of the Project area, and has not included sampling fish tissue to determine actual bioaccumulation. It is not sufficient to simply monitor in-stream concentrations; the true biological endpoint that Fond du Lac is concerned about is fish tissue mercury concentrations. This section reveals one of the most likely, and most environmentally significant adverse effects of the Project: a worsening of the existing mercury in fish impairment in waters downstream of the Project area. Fond du Lac’s position is that increasing methylmercury bioavailability in these watersheds is unacceptable, as access to fish that can be safely consumed is an essential component of treaty resource harvest rights. Consultation with tribes on cultural resource impacts is ongoing, and the potential impacts to tribal members of a significant increase in mercury in fish harvested in on-Reservation and 1854 Ceded Territory waters has not been adequately addressed. The tribal cooperating agencies’ position is that any increase of methylmercury bioavailability in the Partridge River watershed constitutes a significant adverse impact to a critical trust resource. The State of Minnesota’s mercury TMDL process will not adequately address the fish consumption impairment in these waterbodies, and any new discharges that would result in further degradation to waters with an existing water quality impairment would not be legally permissible under the Clean Water Act (see <i>Friends of Pinto Creek v. EPA</i> (9th Cir.), known as the Carlota Decision).	WR4B,WR5C,FM1,FM2,F
19286	The DEIS assumes that PolyMet will be a “new”, rather than “existing”, source of air emissions and, as such, that it does not exceed major source thresholds, making it a minor source. As a minor source, PolyMet would not be subject to BACT or modeling requirements. Although PolyMet has agreed to perform modeling anyway, no BACT analysis was performed. However, it is Fond du Lac’s understanding, after conversations with the MPCA and the EPA, that the status of PolyMet as a new source is not a certainty. If it is determined that the PolyMet project is a modification to an existing source, the project would be major. This is because the thresholds are different for new sources and modifications to existing sources. As a major source, BACT would become applicable. Our concern is that if PolyMet is ultimately found to be a modification to an existing source, the FEIS will be incomplete if it does not include a BACT analysis. In Table 4.6-5, please also include minor source permitting thresholds, as these could turn out to be applicable. It is FdL’s belief that the DEIS should address this issue in the most conservative way, i.e. by assuming it is an existing source requesting a major modification. By assuming the more favorable scenario, the impression is given that this decision has been made and is final, when that is not the case.	AQ2,AQ4A
19286	Despite several comments from tribes on previous versions of the DEIS, it appears that the release of fugitive emissions of reactive waste rock have not been addressed. The Band continues to be concerned about this issue, and believes that this analysis needs to be completed.	AQ1
19286	Tribal cooperating agencies’ position is that existing contamination seeping from the LTVSMC Tailings Basin must be adequately addressed through PolyMet’s assumption of remedial liabilities under the VIC program, and that mitigation measures should be included and discussed in the draft EIS to ensure that no new exceedences of the chronic aluminum aquatic life use criterion will occur. Fond du Lac does not believe that simply monitoring for aluminum is sufficient to protect aquatic life, particularly when the existing seepage is already causing exceedences downstream.	WR1A,WR1E,FM2,FM4
19288	DEIS 4.6-9 The DEIS does not explain why more stringent controls for fugitive air emissions are to be used on Tailings Basin roads than on Plant Site roads. What is the reason for the difference in 60% control for Plant Site roads versus 80% control for Tailings Basin roads? Please explain why the facility is not proposing to use the extra controls on both sets of roads.	AQ1
19288	Tribes have also commented several times previously that air emissions from the proposed Keetac expansion project need to be included in the PolyMet air quality and mercury analyses. This is essential for a valid cumulative impacts analysis.	AQ4B

Comment ID	Comment Text	Theme Codes
19288	DEIS 4.6-12 states that the FLAG Phase I report was used. Please discuss how use of the updated version of this document could change the findings.	AQ4
19288	DEIS 4.6-13 Modeling did not include current proposed tailings basin emissions. Increased emissions of PM10 and PM2.5 of 96 and 11 tpy, respectively, are expected. These emissions increases were initially deemed too low for concern. Then further analysis was done, but it has not been evaluated yet by the MPCA. The DEIS states that “data is included but should be considered preliminary”. Where is this data? It is critically important for this to be included in the DEIS (along with the applicable MPCA comments) not just in the FEIS, because by then the ability for tribes to comment will be past. This needs to be done because emissions from the facility are predicted to be very close to the NAAQS for PM2.5 (see comment below).	AQ4A
19288	DEIS 4.6-14 states that modeling for PM2.5 increment cannot be completed b/c EPA has not set a baseline date yet. The DEIS should state that the permit will be re-opened and this modeling will be done when the baseline date is set. That way, any needed mitigation can take place.	AQ4
19290	DEIS 4.6-15 states that the PM10 24-hr impact approaches the Class II increment level for the Mine Site. Fond du Lac cautions that Class II increment is very close to being fully consumed in this area. This is important to note due to all the expansion planned in the area.	AQ4B,AQ6,AQ8
19291	DEIS 4.6-16 The highest-sixth-high (“H6H”) corresponds to one exceedence per year, yet the standard says one exceedence is allowed per year, not over the five-year modeling period. Fond du Lac believes that the H6H from each of the five years of modeling should be examined to see if it exceeds the standard.	AQ4
19292	DEIS 4.6-17, Table 4.6-10. Fond du Lac notes that PM2.5 total is very close to the NAAQS (34 ug/m3 versus 35 ug/m3). This is especially concerning because PM2.5 emissions estimates from this project have a high degree of uncertainty. Again, this total comes very close to exceeding a health-based standard, with numerous new projects planned in the area. The DEIS needs to explain what measures are proposed to limit the chance of exceeding these standards. Will monitoring be conducted? What mitigation plans are in place if an exceedence is detected? What conservative measures were included in the modeling?	AQ5,AQ6
19293	DEIS 4.6-19 states that potential mitigation measures for visibility are located in Section 4.6.3.4, but that section is Tailings Basin Alternative. The section should instead be 4.6.3.5, Mitigation Measures.	AQ5
19293	The Tribal cooperating agencies’ position is that this analysis does not use the full particulate emission rate from the plant site, which would be 622 tpy using Table 4.6-6 with fugitive and mobile sources. Also unaccounted for are the additional 102 tpy from the tailings basin.	AQ4
19294	Fond du Lac notes conflicting statements due to risk effects. From the 2nd paragraph of this section, “Although the current Project utilizes LTVSMC tailings to develop a portion of the current Tailings Basin, sampling data from the LTVSMC tailings show that the toxic compounds are lower than the modeled tailings material, except for potentially for manganese, beryllium, cadmium, and antimony. Cadmium and antimony are included in this discussion, although the content of the LTVSMC tailings was below analytical detection limits... However, these four compounds were not drivers in the original risk assessment.” If cadmium is higher than what was modeled and is a major risk driver, this MEI analysis could be inconclusive as it does not take into effect the latest data. The Tribal cooperating agencies’ position is that regardless of the likelihood of farming being present at the boundary of the installation, the farm that is 6.5 miles away still might be within an area of exceedence of the MDH standard even though it is not at the maximum risk receptor point and must be evaluated to all direct and indirect toxic health risks associated with this project. It is also the position of the Tribal cooperating agencies that all risks outside the project boundaries need to be below MDH guidelines at the time that an air permit is issued to this facility.	AQ4,AQ6

19295	<p>DEIS 4.6-28 Greenhouse Gases Fond du Lac has repeatedly requested that the lead agencies develop a comprehensive analysis of the Project’s potential impacts on climate change, beyond a greenhouse gas inventory. The Ninth Circuit Court of Appeals held in Nov 2007, for the first time, that federal agencies must assess carbon dioxide emissions and other climate change impacts in environmental review documents prepared under the National Environmental Policy Act (NEPA). The Court’s unanimous decision in <i>Center for Biological Diversity v. National Highway Traffic Safety Administration</i> arose out of challenges to new automobile fuel efficiency standards for light trucks and SUVs developed by the National Highway Traffic Safety Administration (NHTSA). The Ninth Circuit took the unusual step of ordering NHTSA to prepare an EIS assessing carbon dioxide emissions attributable to the new standards, as well as the actual environmental effects associated with climate change. Petitioners alleged that NHTSA’s environmental review under NEPA failed to: (1) take the requisite “hard look” at the carbon dioxide emissions and other climate change impacts attributable to the new CAFE standards. The fact that ‘climate change is largely a global phenomenon that includes actions that are outside of [the agency’s] control . . . does not release the agency from the duty of assessing the effects of its actions on global warming within the context of other actions that also affect global warming.’ While NHTSA did the calculations necessary to determine how much extra carbon dioxide would be emitted, it failed completely to discuss in any detail the global warming phenomenon itself, or to explain the benchmark for its determination of insignificance in relation to that environmental danger. The Court faulted NHTSA for failing to “discuss the actual environmental effects” of the proposed standard, and directed the agency to “evaluate the ‘incremental impact’ that [those] emissions will have on climate change or on the environment more generally in light of other past, present, and reasonably foreseeable actions. In light of the Ninth Circuit’s emphatic declaration that the “impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impact analysis that NEPA requires agencies to conduct,” agencies cannot avoid evaluating climate change impacts for a broad range of projects requiring federal approvals or permits, such as energy facilities and transmission lines, casinos, landfills, mines, and transportation projects. The Court’s holding also suggests that simply quantifying emissions and comparing them to a baseline is insufficient. Instead, project proponents should be required to evaluate the interplay between a project’s emissions, emissions attributable to other past and reasonably foreseeable future actions, and the actual environmental impacts attributable to climate change.</p>	AQ3

19296	<p>In addition to the broadly recognized services that wetlands provide, they also store significant amounts of carbon. It has been estimated that wetlands (only about 6% of the world’s terrestrial area) contain carbon equal to the total atmospheric carbon store (Intergovernmental Panel on Climate Change, Working Group 11: Impacts, Adaptation and Vulnerability, 5.8.1 (2001)). Much of the carbon stored in wetland soils and vegetation will be released if they are drained, and the release of carbon will exceed sequestration. A relatively simple response to climate change is prioritizing avoidance of wetland impacts. Wetlands store more carbon than any other ecosystem. Including carbon storage in the §404 permit avoidance and minimization sequencing through the ‘least damaging practical alternative’ evaluation would be a logical step towards reducing the regional carbon footprint. Carbon sequestration services provided by forested wetlands and peat bogs must be considered in the avoidance equation alongside mitigation. The American Society of Wetland Managers climate change recommendations include: •incorporating adaptations to climate change in water projects to add safety factors for floods and erosion •added ecosystem protection and adjustment goals reflecting anticipated climate changes such as low flow protection for fish and other wildlife. •Add protection of wetland carbon stores as an explicit goal of the §404 permitting program •require impact reduction and compensation •Consider the impact of proposed activities on carbon stores in regulatory Permitting The Minnesota Carbon Sequestration Project, an interdisciplinary research group, produced an assessment of the potential capacity for carbon sequestration in Minnesota’s terrestrial ecosystems, on the request of the state legislature. After analyzing existing scientific literature, land use, and current state policies and programs on carbon sequestration potentials, they released a report in 2008 entitled The Potential for Terrestrial Carbon Sequestration in Minnesota. Key findings from the team include: • Peatlands in Minnesota contain the largest carbon stocks in the state, in excess of 4 billion metric tons • Release of this carbon to the atmosphere as CO2 can result from peatland drainage and conversion • Release of this carbon to the atmosphere would accelerate global warming and require greater reductions in CO2 emissions elsewhere • Destruction of 1,000 acres of peatland in Minnesota from mining or other activities would increase the state’s total CO2 emissions by 2% over 2005 levels Their top recommendation was to “Preserve the existing large carbon stocks in peatlands and forests by identifying and protecting peatlands and forests vulnerable to conversion, fire, and other preventable threats.” The Minnesota Climate Change Advisory Group, a broad-based group of Minnesota citizens and leaders, including a representative from the Fond du Lac Environmental Program, was created to develop state-level policy recommendations to Governor Pawlenty. In 2008, the group released “Minnesota Climate Change Advisory Group Final Report”, which included the following findings and recommendations: • Wetlands have among the highest potential carbon-sequestration capacities for any type of land cover in Minnesota. Peatlands are likely Minnesota’s largest single carbon sink, containing 37% of all carbon stored in the state. • Protecting these enormous carbon reservoirs is critical • Policy goals include protect and restore northern peatlands; by 2015, identify peatlands at risk of releasing greenhouse gases because of lowered water table or industrial uses such as mining; design policies to protect peatlands and wetlands from drainage and other carbon-releasing land uses.</p>	AQ3
19297	<p>Fond du Lac acknowledges that climate change regulations and requirements have not yet caught up with policy in Minnesota. But this Project is clearly in violation of the science-based recommendations of multi-disciplinary experts across the state and throughout the country. Climate change litigation has resulted in a clear mandate for the EIS process: any project subject to environmental review must include a comprehensive analysis of climate change impacts.</p>	AQ3
19298	<p>DEIS 4.6-40 In order to meet the conditions of the statewide mercury TMDL implementation plan for new or expanded sources, PolyMet proposes to work with crematoria on mercury reductions, but only suggest working to quantify their emissions. This may include research or evaluation of control technologies, but the DEIS indentifies no real, enforceable requirements to take action. Any air permits issued must contain clear deadlines for actions.</p>	AQ5,AQ6A

19298	DEIS 4.6-37 The text states that “calculated visibility impacts greater than 5 or 10% could occur at some point within the BWCAW on a small number of days each year (a maximum of 23 days per year above 5% and one day above 10%)”. Fond du Lac does not believe that 23 days of visible impact on visibility per year can be characterized as “a small number”. The Federal Land Managers are concerned with any number of days with a visibility impact above 5%. While the Band realizes that mitigation discussions are still underway between PolyMet, the MPCA, and the FLM’s, we would still like to have options presented in the DEIS stage so that we may comment on them. At this point, it is impossible to know what scale of mitigation may be possible, especially as a number of other sources in the area intend to perform mitigation, as well.	EOO,AQ5
19299	DEIS 4.6-42 It appears that tribal comments found on this page have not been addressed. This should be done in the DEIS	AQ4
19300	DEIS 4.6-45 Analyses of cumulative acid deposition, Class I and Class II air impacts, and mercury do not include the Keetac expansion. The Fuel Diversification item is a different project from a few years ago.	AQ4B
19300	DEIS 4.6-44 Table 4.6-21 shows that the total cumulative modeled air concentration of 7.5 ug/m3 is very close to the Class I PSD Increment of 8 ug/m3. This is a concern to the Band due to the number of other new projects proposed in the area that will also emit related pollutants.	AQ4B
19301	It is the position of the tribal cooperating agencies that noise contour maps should be developed for inclusion in this PDEIS. Noise contour mapping would allow reviewers to assess the impacts of noise to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the mine site (See figure 4.9-1). An assessment of noise impacts to all public access lands is important information for assessing cultural impacts to tribes with hunting, fishing and gathering rights in the 1854 Ceded Territory.	N1
19302	It is the tribal cooperating agency position that the Army Corps has not completed §106 NHPA consultation with potentially affected tribes. Therefore, this document does not estimate the potential degree of disturbance to tribal members who may be involved in traditional natural resource harvest harvests on national forest lands.	N1
19303	DEIS 4.7.3 Environmental Consequences/Summary concludes “Based on the above information, it is anticipated that the continuous generation of noise at the Plant and Mine Sites would have an insignificant effect on the noise environment during mine operations, Closure, and Post Closure.” Tribal cooperating agencies disagree with this conclusion. This document does not present enough information to make this claim.	N1
19304	DEIS 4.7.4 Cumulative Effects states “The cumulative effects of a few reasonably foreseeable projects (i.e., future developments) within a 10 mile radius of the Project area were also considered over the 20 years of Project mining.” Tribal cooperating agencies are not aware of any assessment that has been conducted. Contour mapping of cumulative noise sources should be presented in this section. Tribal cooperating agencies do not believe that an adequate cumulative impact of noise impacts analysis has been done. Meeting ambient noise standards is a different question than assessing impacts. Impacts should be fully characterized in this document and contour maps showing overlapping noise pollution from different projects provided. Without this information, it is not possible for the public to review the cumulative impacts of noise. In addition, the cumulative impacts of mine related vibration have not been assessed.	N6

Comment ID	Comment Text	Theme Codes
19305	<p>It is Fond du Lac’s understanding that this chapter is still being revised, as part of the ongoing §106 NHPA consultation process with the tribes. We note that the EIS cannot be considered final under federal guidelines, or a Record of Decision issued, until this consultation process has concluded. The tribal cooperating agencies’ cultural resources staff have worked to improve and refine the information and analysis in this chapter, as the protection of treaty resources is our prime concern. While the USACE did not determine that the 1854 Ceded Territory is a Traditional Cultural Property, the Grand Portage Band has documented its disagreement with this determination. The tribal cooperators are proceeding in accordance with USACE’s offer to fully evaluate the Ceded Territory, including all factors that would be considered in a TCP analysis, pursuant to its trust responsibility. The USACE has not completed consultation with the potentially affected tribes regarding culturally important species. The extent of existing wild rice beds has not been fully characterized; consequently, evaluation of the impacts and cumulative impacts to wild rice has not been determined. Wild rice grows on the Embarrass River, the lower Partridge River, and the St. Louis River; the Minnesota water quality criterion of 10 mg/l sulfate applies to these waters. There are other regional projects (including Mesabi Nugget Phase II and Laskin Energy) that are discharging water with elevated constituents. With these existing sources, it is unlikely that PolyMet would be able to discharge untreated tailings basin effluent without violating the CWA. But treatment of the tailings basin effluent prior to discharge to the Partridge River is not included in the potential mitigation measures. There has not yet been sufficient evaluation of Band member use of vegetation and other usufructuary resources in the APE, and there is no permissible basis to omit such evaluation where the USACE and other federal permitting agencies have a trust responsibility to the Band to maintain treaty resources in the 1854 Ceded Territory. The APE for the Project was not determined until August 11, 2009, and tribal consultation is ongoing. Historic and current tribal harvest information has not been finally determined even for the Plant or Mine Sites. Although this area is significantly disturbed and will be for the foreseeable future, the closure and reclamation plans should have a significant effect on native vegetation as it is reintroduced. The prevalence of invasive, non-native species and their ability to out-compete native plants in disturbed areas, coupled with PolyMet’s plan to introduce non-native and invasive species to this area, would result in significant impacts to cultural resources that have not been discussed in the DEIS. Several wildlife species of high cultural and present-day value to Band members exist in the APE, including moose, whitetail deer, wolf, fisher, marten, and lynx. Most notably, the Minnesota moose population is under a long-term population decline. Mining operations will certainly do nothing to aid in the recovery of moose and are likely to reduce available habitat and impact travel corridors. Water, air, and noise pollution, combined with increased road density, have been shown to have negative impacts on most boreal wildlife species including wolves, moose, and lynx. Further evaluation of wildlife impacts must be done. Several lakes and the Partridge River watershed are likely to experience adverse water quality and hydrologic impacts, which will impact fish species and thus the Bands’ 1854 Treaty rights to harvest fish in those water bodies. The DEIS as written fails to mitigate the costs to fisheries and wildlife species that are protected under the 1854 Treaty. Treaty reserved fishing rights cannot be fully exercised when fish consumption must be restricted for health reasons to one or two meals per week. The entire DEIS must include proper anal</p>	G3,CR1,CR2,CR3,CR4
19305	<p>The Project is clearly inconsistent with several of the identified land use plans: the Minnesota Forest Resource Council Landscape Management Plan (in particular, the goal of “providing diverse habitat to maintain natural communities and viable populations for the plant and animal species in northeastern Minnesota”) and the St. Louis River Management Plan (the goal “to promote preservation and improvement of water quality, recreational opportunities, ecological health and archaeological resources”). The mitigation measure (using native seed mix) is not sufficient to compensate for the adverse impact.</p>	CPLU1,CPLU2

19306	It is Fond du Lac's position that, because the Project would create a situation where the applicant would enjoy substantial financial gain while potentially creating disproportionately high and adverse human health or environmental effects on minority and low income populations, the Project requires a complete analysis of environmental justice (Executive Order 12898, signed by President Clinton on February 11, 1994; EPA's website at <a href="http://www.epa.gov/compliance/environmentaljustice">http://www.epa.gov/compliance/environmentaljustice</a> ). The casual dismissal of environmental justice issues in the DEIS is offensive. A simple recitation of census numbers and proportions of Native Americans in the regional and statewide populations is not a legitimate analysis. There are significant environmental justice concerns with the Project, including but not limited to: loss of usufructuary rights, permanent loss of wetlands in the 1854 Ceded Territory and the subsistence and cultural benefits they provide, increasing mercury in fish harvested from reservation and Ceded Territory waters, loss of wild rice resources, loss of wildlife species. These impacts must be fully considered in the DEIS.	SE2
19306	Since the proposed land exchange between PolyMet and the USFS/Superior National Forest has not even begun formal review, it is appropriate to consider the Project's compatibility with SNF plans. During preparation for the Forest Plan revision in 1997, SNF set about identifying natural areas on the Forest to potentially designate for permanent protection, to be maintained as natural. Their approach was to develop a list and general description of the highest quality remaining examples of common ecosystems present within each Landtype Association ("landscape"). Forest biologist Robin Vora conducted that assessment. His results were presented in a report titled "Identification of Potential Natural Areas, Including Representative Ecosystems, on the Superior National Forest." In the report he notes, "A network of natural areas helps to protect biological diversity at the genetic, species, ecosystem, and landscape scales. Natural areas representative of common ecosystems in natural condition serve as baseline or reference."	CPLU3
19306	In most cases, determination of the level of discussion on biological diversity should, as with all impacts, be made during the scoping process. The scoping process should be used to identify whether biological diversity will be an important consideration in the environmental analysis. Biological resources are important ecologically and economically. At the ecosystems level, maintenance of structural diversity and functional integrity is essential to the continued provision of important ecological services, such as regulation of hydrologic cycles, and carbon and nutrient cycling. Healthy, functioning ecosystems are necessary to support commercially and recreationally important fish and wildlife populations. Furthermore, the aesthetic, ethical, and cultural values associated with unique forms of life lend additional support to the establishment of biological conservation as public policy (Wilson, E.O. ed. 1988. Biodiversity. National Academy Press, Washington, D.C.) Physical alteration, as a result of resource exploitation and changing land use, is the most pervasive cause of biodiversity loss. Ecosystem alteration includes habitat destruction, simplification, and fragmentation. When natural areas are converted to industrial, residential, agricultural, military, recreational, or transportation uses, ecosystems are disrupted and biodiversity diminished. Beyond the direct removal of vegetation and natural landforms in local areas, development of sites for human use fragments larger ecosystems and produces isolated patches of natural areas. Climate change impacts biodiversity as well: the ability of ecosystems to shift their locations would be further hindered by fragmentation of the natural landscape that places inhospitable environments between current and future ranges. There are general principles of ecosystem management: minimize fragmentation (promote natural pattern and connectivity of habitats); protect rare and ecologically important species; protect unique or sensitive environments; that promote or protect biodiversity. This project is clearly inconsistent with those principles	AQ1
19308	The public process for the DEIS was grossly deficient in ensuring effective public participation and access to information to the Native American population potentially affected by the Project. The public hearings were tightly controlled, and did not include an opportunity for the tribal cooperating agencies' technical staff to provide their perspective to the public.	EOO
19309	The EIS process will not be complete or adequate until a full analysis of environmental justice issues has been conducted.	SE2
19310	The Tribal cooperating agencies' position is that the Army Corps has not completed consultation with potentially affected tribes. Therefore, this document does not estimate the degree of disturbance to tribal members who may be involved in traditional natural resource harvest harvests on national forest lands.	CR2,CR4

19310	Tribal cooperating agencies' position that the use of a few visual receptors to assess PolyMet related visual impacts is not adequate. Using this method means that the conclusions presented in this chapter apply only to those visual receptors and do not apply to any other publicly accessible area in the vicinity of the proposed project. Tribal cooperating agencies have requested that a more complete Visual Impact Assessment (VIA) be developed for inclusion in this PDEIS (GLIFWC Comment letter of June 30, 2008 and GLIFWC comment letter of February 6, 2009). Methods for a complete VIA were developed and used for other mine proposals as part of the Army Corps federal EIS process (Crandon Mine EIS Preliminary Draft Technical Memorandum: Visual Resources Section of Draft Chapter 3, November 2002). Despite these comments and Corps precedent, a complete VIA has not been included in this iteration of the PDEIS. A complete VIA would allow the public to review the impacts of project features to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the mine site (See figure 4.9-1). A VIA of all public access lands is important information for assessing cultural impacts to tribes who have retained the right to hunt, fish and gather on national forest lands	VI1
19311	DEIS 4.11.4 Cumulative Effects concludes "Therefore, there would be no long-term impacts during the Project life and Post-closure relative to Visual Resources and no cumulative effects analysis would be warranted." The Tribal cooperating agencies' position is that a cumulative impact of visual impacts analysis is needed. A thorough VIA following past Army Corps practices has not been conducted for this project and tribal consultation regarding cultural impacts have not been completed. Therefore, this conclusion is premature. Finally, the Tribal cooperating agency position is that the introduction of non-native, invasive species as a revegetation measure may have longterm visibility impacts to the site. It is the Band's understanding that the company and the Federal Land Managers are close to an agreement for visibility mitigation that is not fully fleshed out in the DEIS. Please address further.	VI2
19312	DEIS 4.13 Geotechnical Stability/ Environmental Consequences discusses waste rock slope stability analysis (deferred until permitting), low safety factors at the Tailings Basin because of slimes, and unknown stability or presence of slimes underlying the proposed Hydrometallurgical Residue Facility. The Tribal cooperating agencies' position is that this approach is not consistent with the federal EIS process. The purpose of this document is to provide information for all reasonably foreseeable impacts. The lack of a stability analysis for the stockpiles is a serious data gap given the serious environmental consequences of a structural failure of a stockpile. The structural stability of the tailings basin has been a serious concern since the PolyMet project was first proposed. This concern has led to the development of at least three different tailings basin designs that have been presented in various draft documents. Contractors reviewing these designs have expressed serious concerns with both the shortterm and the long-term stability of the facility. Tribal cooperators take the position that given the history of design problems, it is irresponsible to postpone a serious analysis of the structural integrity of the latest tailings basin design until the permitting stage. A complete stability analysis must be included in the DEIS to comply with NEPA and so that the public can review a complete set of possible environmental impacts associated with this project. The hydrometallurgical residue facility would contain the most hazardous waste materials produced by this project that, if released to the environment, would cause serious and long lasting contamination. The unknowns listed in the DEIS are a serious data gap and the tribal cooperating agency position is that the analysis should be conducted and included in the DEIS to comply with NEPA and so that the public can review a complete set of possible environmental impacts associated with this project.	GT1
19313	The Tribal cooperating agencies' position is that the existing facility has stability concerns before any Polymet tailings have been deposited on top of it. This simple fact illustrates the need for a complete structural stability analysis to be performed and included in the DEIS.	GT1
19314	Tribal cooperating agencies strongly disagree with this approach. The Tribal cooperating agencies' position is that this approach is not consistent with the federal EIS process. The EIS must identify alternatives and mitigation methods that address potential problems with the project. Sufficient data must be collected so that a complete structural integrity analysis can be performed and included in the DEIS.	GT1
19314	The Tribal cooperating agencies' position is that this approach is that the analysis must be conducted prior to permitting and included in the DEIS.	GT1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19316	Tribal cooperating agencies strongly disagree with this approach. The Tribal cooperating agencies' position is that the purpose of an EIS is to identify mitigation measures that address potential problems in the project. The analysis described in the previous paragraph must be conducted prior to permitting and included in the DEIS.	GT1
19317	The Tribal cooperating agencies' position is that given the lack of confidence in the structural integrity of the tailings basin, the dam break analysis and risk assessment must be conducted prior to permitting and the results included in the DEIS so that the public can be fully informed about the risks associated with this project.	GT1
19318	Climate Change implications of the proposed project. The project would disturb extensive areas of peat (Section 4.2) Peat is known to be an important carbon sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife will seek refuge as the climate warms.	AQ3
19318	It is the position of Tribal cooperating agencies that the CEQ guidelines on cumulative effects were only one of the sources used to develop the "Protocol to Assess Expanded Cumulative Effects on Native Americans." This protocol was submitted to the lead EIS agencies with the expectation that the additional information detailed in the protocol would be used to assess cumulative impacts on the potentially affected tribes. The Tribal cooperating agency position is that while the protocol is mentioned in this section, none of the expanded data collection or analysis that the protocol recommends was done. Therefore it is the tribal cooperating agency position that the cumulative impact section is incomplete and does not properly assess cumulative effects of the proposed project on natural and cultural resources.	G8C
19319	Cumulative impacts to plant and animal species that are not listed as threatened or endangered. The focus of the EIS on listed species is understandable but other species that are important to tribal and non-tribal members would likely be impacted by mining projects. Moose, for example, are likely to be impacted through disturbance along the few wildlife corridors remaining along the Mesabi range and through wetland impacts of this project. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should be done as part of this EIS.	WI5
19319	Cumulative impacts to wild rice. Wild rice is a valuable tribal resource that has been declining throughout the 1854 ceded territory. Mine effluent is often associated with levels of sulfate that has impacted wild rice and hydrologic changes from pit dewatering and seepage from tailings basins can also impact wild rice, which is dependent upon a relatively stable hydrologic regime. The cumulative impacts to wild rice have not been assessed	WR5A,WR5C,CR1,CR2
19320	The Cumulative effects of noise and vibration. These issues have not been analyzed although they were raised by the public during scoping.	N3,N6
19320	The DEIS fails to adequately analyze cumulative impacts to the water quality of the Partridge, Embarrass, or St. Louis Rivers. In Colby Lake, the community water supply for the City of Hoyt Lakes, aluminum, iron, copper, and mercury concentrations already exceed Minnesota water quality standards. The existing large number of water quality exceedances and the suite of constituents, particularly trace metals, exceeding standards shows the site has not been remediated from previous mining activities. Additionally, amphibole or asbestos-like mineral fibers, known to cause digestive tract cancers in high concentrations, have been identified as existing pollutants in the Hoyt Lakes community water supply and their presence should be identified in the DEIS. Related cumulative-impacts issues such as groundwater drawdown or mounding due to multiple mine projects, water quality in aquifers impacted by previous and existing other mine projects, and surface waters such as the Partridge and Embarrass Rivers and Second Creek that are impacted by multiple mines need further analysis. In particular, the contribution of legacy contamination from the LTVSMC plant site and tailings basin must be fully evaluated.	WR5A
19320	The cumulative effects on fish and macroinvertebrates. This discussion is limited to sulfate and mercury. Cumulative effects of habitat degradation on the fisheries of the region have not been discussed.	FM3
19320	The Cumulative risk analysis of transportation of hazardous materials. This issue has not been analyzed.	HM3

19320	The cumulative effects of the Project on the 1854 Ceded Territory has not been addressed.	G3,CR4
19322	The cumulative effects on air quality have not been adequately addressed. The cumulative analysis did not account for all of the PolyMet emissions from the tailings basin, nor did it factor in emissions from the Keetac Expansion Project. The attainment for PM2.5 is questionable because the 24 hr standard is almost met without those sources included in the modeling. The Class 1 PM10 increment analysis did not take into account the full particulate emissions from the tailings basin. That analysis also did not factor in any emissions from the Keetac Expansion Project, which plans to increase production by 61% by reopening another furnace line, nor is there any mention of the Essar Steel Expansion project that is planned. The present analysis showed that there was very little increment left without accounting for these sources and that as such it would have a significant impact by exceeding the increment limit. Data from the Central Regional Air Planning Association (CenRAP) indicate that visibility in Minnesota Class I areas is not expected to improve as much as is required by the Regional Haze Rule, even with expected reductions. Aggressive mitigation of NOx emissions is expected by the MPCA and the FLM's during the permitting process. The Tribal cooperating agencies should be included in these discussions to the extent possible.	AQ4B
19322	Fond du Lac is specifically concerned that water quality within the St. Louis River has already been degraded by past and present mining activities, as documented by Fond du Lac and 1854 Treaty Authority monitoring. Additional discharges of sulfate, mercury and other trace metals will have a cumulative effect on water quality in the St. Louis River. An Antidegradation Analysis for the Lake Superior Basin must be conducted for several contaminants in addition to mercury. The results of this analysis should be included in the DEIS.	WR5A
19324	For the reasons stated below, the DEIS is legally and technically flawed because it improperly segmented the decision regarding a possible land exchange into a separate environmental analysis, eliminated viable alternatives from its analysis, failed to adequately the cumulative impacts associate with this project, and insufficiently analyzed the environmental consequences to numerous resources such as water quality, wildlife, wetlands and air quality. Accordingly, the Sierra Club requests that DNR and the Corps conclude the NorthMet Project will cause significant and irreparable environmental harm and reject the Proposed Action. Alternatively, we request that DNR and the Corps fully and completely address the following deficiencies and concerns surrounding the DEIS and re-issue the DEIS for further public comment.	G8
19324	please see your way clear to supoort polymet mining.....	EOO
19324	In summary, Fond du Lac believes that the DEIS as published does not contain sufficient detail or complete analysis to ensure that environmental consequences of the Project have been fully considered, and the public provided opportunity for review. The deficiencies identified throughout the EIS process by the tribal cooperating agencies have been rarely addressed, let alone incorporated into the analysis. Outstanding significant issues include: • Elimination of the underground mining alternative • Inadequacy of scoping process • Inclusion of the proposed land exchange in this EIS process • Full discussion of appropriate financial assurance for reclamation, remediation and restoration of resources • Long-term treatment of contaminated water/consistency with maintenance-free closure goals • Clear discussion of PolyMet liabilities for legacy contamination, and inclusion of existing levels of groundwater contaminants in modeling predictions • Indadequate water quality impacts analysis • Project's affect on existing water quality impairment (mercury bioaccumulation) • Project's affect on wild rice waters (sulfate loadings) • Project's affect on wildlife corridors • Project's affect on air quality (new source of mercury; visibility in Class 1 airshed) • Inadequate analysis of geotechnical stability (waste rock stockpiles, tailings basin, hydrometallurgical residue cells) • Inadequate hydrologic and geochemical characterizations using all existing data; insufficient new data to support modeling and assumptions • Inadequate assessment of indirect impacts to wetlands • Inadequate cumulative effects analysis, across all resource categories • Inadequate analysis of impacts to the 1854 Ceded Territories and exercise of treaty rights • Inadequate analysis of environmental justice issues • Inadequate analysis of climate change impacts Fond du Lac expects that supplemental information and analysis must be forthcoming before the EIS process can conclude. We look forward to continued involvement and consultation on this Project and EIS process.	G8

19324	The piecemealing of the environmental impacts analysis is a violation of NEPA. First, despite PolyMet’s claims, the Forest Service has a duty to protect the surface lands of the Superior National Forest. Second, any possible land exchange is a “connected action” that the agencies must analyze under one EIS. Finally, as a connected action, there are numerous areas of environmental review that the DEIS unlawfully fails to address	ALT8
19326	The Forest Service has the duty to protect the public’s surface lands for forests, water, and multiple uses under NFMA, the Organic Act, and the Property Clause. Congress has the power under the Property Clause to regulate federal land. U.S. CONST. art. IV, § 3, cl. 2; California Coastal Comm’n v. Granite Rock Co., 480 U.S. 572, 580 (1987). Congress may even regulate conduct occurring on or off federal land which affects federal land. <i>Kleppe v. New Mexico</i> , 426 U.S. 529, 539 (1976).	PD2
19327	The proposed NorthMet Mine fails the independent utility test. First, as discussed above, the Forest Service interprets PolyMet’s deed language to the mineral rights as prohibiting open pit mining. DEIS at S-1. This is consistent with Eighth Circuit precedent, which holds that even in the face of private mineral rights the Forest Service has limited but substantial authority to “determine the reasonable use of the federal surface.” See <i>Duncan</i> , 109 F.3d at 498. Therefore, without the land exchange, the proposed NorthMet Project would not move forward. This project thus fails the independent utility test because it cannot reasonably be completed without the land exchange. See, e.g., <i>Wetlands Action Network</i> , 222 F.3d at 1118; <i>Utahns for Better Transp.</i> , 305 F.3d at 1183; <i>Native Ecosystems Council</i> , 304 F.3d at 894.	PD1
19327	Thus, although the United States and PolyMet currently disagree regarding whether PolyMet has the authority to open pit mine these minerals on the Superior National Forest, DEIS at S-1, the case law and Eight Circuit have clearly established that the Forest Service has substantial authority to itself “determine the reasonable use of the federal surface.” <i>Duncan</i> , 109 F.3d at 498. Since the NorthMet Project mine site is located on the Superior National Forest, DEIS at S-1, the Forest Service has the ability, right, and duty to restrict open pit mining on the national forest.	PD1
19328	Land transfers of public lands for private lands have recently been held to fully change the scope of environmental under NEPA, warranting acknowledgment and analysis within an EIS. <i>Center for Biological Diversity v. U.S. Dep’t of Interior</i> ,	PD1
19328	The DEIS identifies and considers in detail three alternatives: (1) the “no action” alternative; (2) the mine site alternative; and (3) the tailings basin alternative. DEIS at 3-50 – 3-62. The fundamental difference in the mine site relative to the proposed action is the long-term treatment and disposal of the waste rock at the Mine Site. This alternative would subaqueously dispose of the most reactive waste rock (Category 2, 3 and 4) in the East Pit while the least reactive waste rock (Category 1 and overburden) would remain as a permanent surface stockpile. DEIS Summary 2-15. The Tailings Basin Alternative consists of a modified design or layout to reduce the Proposed Action’s potential impacts to surface and ground water quality at the Tailings Basin. This alternative is the combination of several potentially viable individual mitigation measures to address seepage and geotechnical stability in the Tailings Basin. DEIS Summary 2-16. Thus, none of the alternatives evaluated in the DEIS involved different mining techniques or a different scale or magnitude of mining.	PD1
19328	As in <i>Center for Biological Diversity</i> , examining the environmental impacts of the proposed NorthMet project would substantially change if the agencies considered how land was owned, in particular applicable federal regulations under federal ownership. The DEIS would analyze the project’s potential impacts in light of the applicable federal requirements, such as the Organic Act, National Forest Management Act, and others. Since these regulations establish different standards and guidelines, the applicability of these regulations would significantly change the environmental impacts analysis and scope of issues that the environmental analysis must consider. For instance, the Superior National Forest Plan has far different standards than were used under the DEIS, such as “watersheds . . . are maintained or restored in a way that allows for the conservation of genetic integrity of native species,” which would substantially alter the analysis. <i>Superior National Forest Land and Resource Management Plan</i> , July 2004.1	PD1

19328 Minnesota Rules states that an agency may exclude an alternative if “it would not meet the underlying need for or purpose of the project; it would likely not have any significant environmental benefit compared to the Project as proposed; or another alternative, of any type, that will be analyzed in the DEIS would have similar environmental benefits but substantially less adverse economic, employment, or sociological impacts.” MN Admin. Code § 4410.2300(g). This rule does not allow an agency to eliminate an alternative that would have significant environmental benefit simply for economic reasons. The agencies eliminated an underground mining alternative because it determined that this alternative did not meet the purpose and need of project because such an alternative “was not economically viable.” DEIS at 3-64, Table 3.2.4. In addition, the agency eliminated this alternative because it claimed that the ore deposit is shallow and could increase safety concerns. Id. Finally, although not specifically referencing underground mining, the DEIS states that it eliminated alternative metal extraction technologies – underground mining is an alternative metal extraction technology – because it determined that “it would not have significant environmental benefits over the proposed action.” DEIS at 3.68. The cooperating tribal agencies disagreed with this rationale noting the significant environmental benefits of underground mining and a study by U.S. Steel of this mineral deposit, which recommended underground mining because the ore depths were so great that open pit mining would not reach them. Id. In addition, the agencies eliminated alternatives that had a modified scale or magnitude. The agencies determined that although these alternatives offered environmental benefits, the agencies still eliminated them because the reduced return on investment they were not economically feasible. DEIS at 3.70. The agencies did not attempt to link this rationale with the project’s purpose and need. Id. Each of the rationales advanced by DNR and the Corps are legally deficient reasons to eliminate underground mining or reduced scale as alternatives that the DEIS should have evaluated. First, the ecological costs of open-pit mining and above ground disposal of tailings and waste rock are immense. Underground mining would not destroy the breadth of wetlands that the proposed project would destroy. In addition, with underground mining there is no waste rock and above ground disposal issues because the toxic material is left underground. This greatly reduces the impacts to groundwater and surface waters. These are just a few of the environmental benefits that the DEIS should have explored in its comparative analysis of the underground mining alternative. In addition, a project of reduced scale would obviously have immense environmental benefits. Therefore, the agencies should have considered a smaller project alternative and compared the environmental impacts of the proposed project with this reduced scale alternative. MN Admin. Code § 4410.2300(g) (agency may exclude an alternative if “it would likely not have any significant environmental benefit compared to the Project as proposed”). Second, Minnesota regulations do not allow an agency to eliminate an alternative for economic reasons. See MN Admin. Code § 4410.2300(g). Thus, the agencies elimination of the modified scale alternatives is not justified under Minnesota law. The agencies should thus modify the DEIS to include this alternative in its detailed analysis. With regard to the underground mining alternative, the agencies attempt to shoe-horn this illegal economic rationale into the purpose and need exemption. DEIS at 3-64, Table 3.2.4 (agencies eliminated underground mining alternative because it determined that this alternative did not meet the purpose and need of project because such an alternative “was not economically viable.”). This rationale is not legally defensible because the purpose an

ALT8,PD1

19331 The DEIS’ analysis of cumulative impacts is conclusory and lacks any specific analysis. These are discussed in detail throughout these comments; however, the following example demonstrate the DEIS’ inadequacy. In discussing wildlife corridor impacts from the NorthMet Project in light of the other “reasonably foreseeable projects” the DEIS states: “the other reasonably foreseeable projects are anticipated to affect nine of the 13 wildlife travel corridors identified by Emmons and Olivier. . . . These impacts should be considered significant; however, relative to the impacts from these other reasonably foreseeable projects the contribution of the NorthMet project to cumulative effects on wildlife corridors would be minor.” DEIS at 4.4-32.

19331	DNR and the Corps used an inadequate scope of projects for its cumulative impacts analysis. First, the NorthMet Project acknowledges that the current project will only utilize approximately 30% of the existing processing plant's capacity. Yet nowhere in the DEIS do the agencies account for the probable expansion of this processing plant to 100% of its capacity. See PolyMet Mining Advancing Port Production Cooper, Nickel and Precious Metals in US at 8, 17 (2009) (attached hereto). Second, the agencies arbitrarily restrict the projects that they consider "reasonably foreseeable." For instance, with regard to cumulative effects to water resources, the DEIS states "In order to be reasonably foreseeable, an activity cannot be simply speculative, but should be included in government plans and budgets or, for private projects, have filed for required permits." DEIS at 4.1-173. To require that a project must "have filed for permits" in order for it to be considered for cumulative impacts is imposing an unreasonably strict definition of what is a reasonably foreseeable impact. For example, there are several mining projects in the advanced stages of exploration that DNR and the Corps should have considered as reasonably foreseeable. These projects include the Duluth Metals Ltd (Nokomis deposit) and the Franconia Minerals Corp (Birch Lake deposit). Ignoring the potential for these developments understates the cumulative impacts to the region. DNR and the Corps also arbitrarily restricted "reasonably foreseeable" future actions with regard to its analysis of cumulative impacts on wildlife. Once again the agencies failed to include the Duluth Metals Ltd (Nokomis deposit) and the Franconia Minerals Corp (Birch Lake deposit) in its list of future mining projects. See, DEIS at 4.4-27, 4.4-31; Barr Engineering Co., Revised Cumulative Effects Analysis – Wildlife Habitat and Sensitive Wildlife Species (March 31, 2009) at p. 21- 24. Ignoring the potential for these developments inappropriately minimizes the	ALT8,G1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19332	<p>The DEIS does not adequately disclose the full-range of potential impacts associated with the NorthMet Project because critical relevant data was not obtained. In addition, although the DEIS acknowledged a few of these data gaps, it did not claim that the information was not obtained due to financial reasons. Instead the DEIS just makes conclusions about impacts and alternatives based on this inadequate information. This is inadequate under NEPA. Under NEPA’s implementing regulations: “If the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement.” 40 C.F.R. § 1502.22. The data gaps in the DEIS are “essential to a reasoned choice.” 40 C.F.R. § 1502.22(a). Without this information, DNR and the Corps are not fully informed regarding the environmental consequences associated with the Proposed Project and its alternatives. Since the agency did not claim that these data gaps were the result of exorbitant costs, the DEIS is inadequate because the information discussed below is missing. For instance, the DEIS omitted mercury from its modeling and transport analysis for water quality impacts. Specifically, the DEIS states: “The models predicted concentrations for 26 parameters (i.e., silver, aluminum, arsenic, boron, barium, beryllium, calcium, cadmium, chloride, cobalt, copper, fluoride, iron, hardness, potassium, magnesium, manganese, sodium, nickel, lead, antimony, selenium, sulfate, thallium, vanadium, and zinc). Mercury was not included in either model because data for mercury were not available for stockpile liner leakage (RS53/42, SRK 2007) or groundwater recharge from the East and West pits (RS31, SRK 2007).” DEIS at 4.1-108. This omission of data is especially troubling because the water bodies impacted by the NorthMet Project do not comply with mercury water quality standards, discussed in detail later. In addition, the agencies do not claim that this data was omitted due to cost concerns. 40 C.F.R. § 1502.22. In addition, the DEIS provides insufficient information regarding stream flow data. The DEIS only provides information for the Embarrass River to 1964 and for the Partridge River to 1988. The DEIS completely fails to provide stream flow rates or water quality data for important stretches of the Embarrass and Partridge Rivers, such as Trimble and Spring Mine Creek. Later in these comments, Sierra Club addresses how flow fluctuations are an important factor in methylation. So without this information it is difficult, if not impossible, for DNR and the Corps to predict the water quality impacts to these water bodies; making it impossible to render a reasoned decision. Once again, the agencies do not provide a reason for this data gap. This is inadequate under NEPA. 40 C.F.R. § 1502.22. Finally, the DEIS provides insufficient information regarding the environmental impacts associated with aluminum leaching and groundwater. Even though the agency recognized the NorthMet Project would leach aluminum in significant quantities from the Tailings Basin, DEIS at 4.1-69, the agency did not model aluminum transport through groundwater because the existing concentrations in groundwater already exceeded water quality standards. DEIS at 4.1-78. Once again, the agencies do not provide a reason for failing to obtain this information. 40 C.F.R. § 1502.22. Without this information it is difficult, if not impossible, for DNR and the Corps to predict the groundwater quality impacts associated with aluminum.</p>	WR1E,G8
19333	<p>There are seven species that are federally or state listed as endangered, threatened, or considered species of special concern; 58 species that are considered Minnesota Species of Greatest Conservation Need, and 23 species listed on the USFS’s Regional Foresters Sensitive Species list that the NorthMet Project may potentially impact. The DEIS analyzes the direct, indirect, and cumulative effects of the project on these wildlife, wildlife habitat, and travel corridors. This analysis, however, is deficient for a number of reasons.</p>	WI2

19333	<p>Portions of the Mine Site lie within the revised boundaries of federally designated lynx critical habitat. DEIS at 4.4-3. The USFWS designated this critical habitat on February 25, 2009. 74 Fed. Reg. at 8,642 The DEIS mistakenly relies upon an assumption that there is no presence of Canada Lynx within the project area. Based upon a single year (2006) winter survey and several summer surveys, it stated that evidence of 20 different lynx were identified within 18 miles of the project site, including reproductive individuals, and that the nearest sighting was six miles from the Mine Site. DEIS at 4.4-3 First, the DEIS does not analyze at what point in the lynx-hare population cycle, the lone winter tracking survey was conducted. Lynx populations cycle according to the availability of their favorite prey and primary food source, snowshoe hare. This prey tends to cycle within a ten year term. The DEIS does not provide any information as to what point we are within the lynx-hare cycle, currently or when the winter survey was done. Moreover, analysis is needed of the full cycle, to obtain an accurate portrait of lynx numbers. This is especially important when the lynx populations are high. Population surveys of the lynx for just one year are meaningless without an understanding of where we are in the lynx-hare population cycle, and survey information is required for several of years immediately before and after the 2006 survey. It is anticipated that we are at the near low of the ten year cycle, but the DEIS provides no guidance on this issue whatsoever. Second, in order to be capable of providing more definitive conclusions about lynx presence and use of the Project area, the DEIS should have included winter lynx tracking data from several consecutive years, but it did not. The DEIS improperly relies upon a single winter survey in 2006 and numerous summer surveys. The DEIS claims that no lynx were found during summer wildlife surveys at the Project area in 2000 and 2005. Any determination, however, that lynx were not present within the area is not proven. Sighting of uncollared lynx are far rarer in summer, and the primary method to detect an uncollared lynx is through lynx tracks in snow. This is one reason the USFS is developing a new protocol for tracking lynx in the winter. The Forest Service chose this method because “with fluctuating budgets and resultant limited staff and shortfalls in equipment, a costeffective and practical method is needed.” See Catton, Shedd, A Snow Tracking Protocol to Survey and Monitor Lynx (<i>Lynx canadensis</i>) Populations on the Superior National Forest, Minnesota (2007); Abstract for presentation at Canada Lynx, Biological and Political Realities for Conservation Planning, International Workshop Grand Portage, MN Oct 2007 (attached hereto). Such data is readily available but was not relied upon by the DEIS. The Canada Lynx Project is a joint research project of the University of Minnesota Natural Resources Research Institute’s Center for Water and Environment, the Superior National Forest, and the U.S. Geological Survey’s Biological Resources Division. See Moen, Niemi, Burdett, Canada Lynx in the Great Lakes Region, Final Report (2009) NRRRI Technical Report No. NRRRI/TR-2008-14 Release 1.0., 6 (attached hereto) (hereafter referred to as “Moen Final Report”).</p>	WI1
19335	<p>The Project is within designated “critical habitat” for the lynx, and the DEIS acknowledges the destruction of approximately 1,454 acres of suitable habitat. The DEIS, does not however, address any of the objectives set forth in the Recovery Outline, the Conservation Strategy, or the Superior National Forest Plan.</p>	WI1
19335	<p>Third, the DEIS does not evaluate information readily available that there has been one female lynx (know as L11) documented to have moved within the Project area. Her location was near the southwest edge of the proposed mine site between Wetlegs Creek and the Partridge River, just over one mile south of the mine site and road, and a half-mile south of the rail line. This information was provided by live capture in February 2003, and telemetry provided by a radio collar and documented by researchers of the Canada Lynx Project. Data ended in November 13, 2006 when L11 was trapped and killed in Ontario. Moen, Ronald, Canada Lynx in the Great Lakes Region 2008 Report, at 7 (attached hereto). The radio collar signal placed the lynx in T59N–R13W, approximately at the corner of sections 16, 17, 20, and 21. Id. The DEIS should have addressed the fact that at least one female has been observed at the project site, as it is possible that other females may have entered the site since this data was recorded. The DEIS inaccurately concludes that the Canada Lynx would experience “localized direct loss and fragmentation of designated habitat and increased potential ... for incidental takes resulting from vehicular collisions; however, these impacts are not anticipated to threaten the overall species population level and abundance in Minnesota.” DEIS at 4.4-12. (emphasis added). This statement is not supported by the environmental impact analysis because the agency failed to consider numerous aspects of impacts to the lynx and their habitat as required by federal law.</p>	WI1

19336	Second, the Canada Lynx Conservation Assessment and Strategy as amended in 2003 provides direction on the management of Canada Lynx with National Forest. The Lynx Conservation Assessment and Strategy was developed to provide a consistent and effective approach to conserve Canada lynx on federal lands in the conterminous United States. Lynx Conservation Assessment and Strategy Page 7 (hereafter referred to as "LCAS") (attached hereto). When listing the Canada Lynx as threatened, the U.S. Fish and Wildlife Service concluded that the lack of guidance for conservation of lynx in the National Forest Land and Resource Management Plans and the Bureau of Land Management Land Use Plans impaired survival of the lynx throughout a contiguous part of the United States. Id.	WI1
19336	First, the DEIS does not address the 2005 Recovery Outline prepared by the Fish & Wildlife Service. These documents identify key objectives to ensure the protection of the lynx population while the formal recovery document is prepared. The DEIS must assess the Lynx Recovery Outline including evaluating recovery actions needed to maintain the four objectives identified in the document to make positive progress towards lynx recovery. These objectives are: (1) retain adequate habitat of sufficient quality to support a long-term persistence of lynx in the identified core habitat areas; (2) ensure sufficient habitat for immigration and emigration between the core areas and adjacent populations; (3) ensure that habitat in secondary areas remains available for continued lynx occupancy; and (4) to ensure that threats are adequately addressed to protect lynx population in the contiguous United States for at least 100 years. See U.S. Fish & Wildlife Service, Recovery Outline, Contiguous United States Distinct Population Segment of the Canada Lynx 12 (2005) [hereinafter "Recovery Plan"] (attached hereto).	WI1
19337	The proposed project is on federal land. Had the DEIS included an analysis of the connected action of the land exchange, it would have included a review of the Lynx Conservation Assessment and Strategy standards. Even separate from the land exchange issue, the LACS provides essential information concerning proposed projects on lynx habitat that was readily available to the Corps and DNR that should have been included in the DEIS. Neither agency performs an adequate analysis of reviewing these standards as applied to this NorthMet project.	WI1
19337	The DEIS failed to incorporate any these standards in its analysis, and therefore provides inadequate analysis to the DNR and the Corps.	WI1
19337	Third, In recognizing that northeastern Minnesota provides important habitat for the lynx, the National Forest Plans on the Superior National Forests have been revised to provide for the conservation of the lynx. Recovery Outline at 9. The Superior National Forest Plan states that its objective is to fulfill the purpose of a useful, proactive plan, until a formal Recovery plan is promulgated. They state, "the Plan is intended to err on the side of maintaining and restoring lynx habitat for lynx and their prey." U.S. Fish & Wildlife Service, Superior National Forest Plan, Appendix E (2004). <sup>2</sup> The Forest Plan sets forth procedural guidance to address mortality risk factors and guidance to address movement and dispersal risk factors, U.S. Fish & Wildlife Service, Superior National Forest Plan, E-6-E-8; the DEIS did not address either of these issues. As the Forest Plan is listed in the FWS Recovery Outline as being a document useful to the conservation of lynx habitat prior to a formal recovery document being prepared, the DEIS should have addressed the issues set forth within it. Failure to address these issues was a failure to consider an important aspect of the problem, and until DNR addresses these issues, the basis for the DEIS is arbitrary and capricious.	WI1
19339	The DEIS examines destruction to the lynx's habitat in terms of the geographical size of the project, but fails to adequately consider the effects of habitat degradation.	WI1

Comment ID	Comment Text	Theme Codes
19354	The DEIS states that Corridor 11 (identified as 16 in the Barr Report) and Corridor 12 (17) are near the mine site. The E & O Report identifies Corridor 11 as a “very small, but probably very important passageway.” E & O Report at 18. The DEIS, however, states that because Corridor 11 (16) is already impacted by the tailings basin, it is of minimal value and will not be further damaged. This statement does not adequately address how increased vehicle traffic and local development associated with the mine site could further impact Corridor 11. Additionally, the DEIS does not address the differences between the report it relies on that calls the corridor “very important” and the DNR’s assessment that the corridor is of “minimal value.” The analysis in the DEIS relating to the impact the project will have on Corridor 12 (17) runs directly counter to what the report states. The DEIS says that the Corridor will likely be indirectly impacted by reducing the size and degrading the quality of the habitat located to the southeast of the corridor, but that no direct impact to the corridor will occur. DEIS at 4.4.-31-32. The Barr Report, however; states, “Corridor 17 . . . contains High Quality corridor habitat where it is not significantly impeded by mining features. . . . In the reasonably foreseeable future, this corridor will be lost to the expansion of NorthShore’s mine pits to join into one large pit.” Barr Report at 56. As the DEIS indicates that Corridor 12 (17) will be impacted by this project, the aforementioned discrepancy must be rectified. If there is a total destruction of the one high value corridor by this project, there are no material facts to suggest that this is a minimal impact. Additionally, the agency must take a “hard look” at the problems involved, and must show that it was “genuinely engaged in reasoned decision-making.” <i>Citizens Advocating Responsible Development v. Kandiyohi County Board of Commissioners</i> , 713 N.W.2d 817, 832 (Minn., 2006.) A project that affects two out of 13 (18) wildlife corridors by increasing traffic, encroaching onto natural habitat, and potentially destroying one of the corridors is a significant impact that the DEIS must disclose.	WI5
19354	The DEIS’s failure to analyze the effect of the project on the quality of the Lynx’s habitat is an error that must be corrected. It is not enough to simply state the total quantity of habitat that will be affected.	WI1
19354	The project will result in large scale fragmentation of critical lynx habitat, yet little analysis was made within the DEIS on the project’s contribution to habitat fragmentation. Serious consequences occur with the habitat fragmentation. Studies has shown that fragmentation results in: (1) reduction of key snowshoe hare habitat and of patch size of late-successional forest; (2) increase in competing carnivores such as bobcats and coyotes; 3) increased edge densities between early successional and other forest types; and (4) changes in seral forest stands within landscapes. See Leonard F. Ruggiero, et al. 1999. <i>Ecology and Conservation of Lynx in the United States</i> . USDA-Forest Service. General Technical Report RMRS-GTR- 30WWW, at Chapter 4, pp.85-86 (attached hereto).	WI1
19358	The DEIS is inadequate in its assessment of the cumulative impacts of mining projects to the Canada Lynx. Under NEPA, a DEIS must examine “actions, which when viewed with other proposed actions have cumulatively significant impacts.” 40 C.F.R. 1508.25(a)(2). A cumulative impact is “the impact on the environment which results from the incremental impact of the action when added to other past, present and reasonably foreseeable future actions, regardless of what agency (Federal or non-Federal) or person undertakes such other actions.” 40 C.F.R. 1508.7, <i>Dep’t of Transportation v. Public Citizen</i> , 541 U.S. 752, 770 (2004), see also discussion above related to Cumulative Impact analysis. The Minnesota Supreme Court, when interpreting similar “cumulative impact” analysis requirements under Minnesota Environmental Policy Act (“MEPA”) (which is the state equivalent of NEPA) stated that the purpose of performing a cumulative impact assessment is to “determine whether the project, which may not individually have the potential to cause significant environmental effects, could have a significant effect when other local projects already in existence or planned for the future are considered.” <i>Citizens Advocating Responsible Development v. Kandiyohi County Board of Commissioners</i> , 713 N.W.2d 817, 829 (Minn., 2006). The DEIS concludes with little to no scientific evidence that the habitat and wildlife corridor loss will not have a cumulative impact on the lynx nor does the DEIS identify and discuss all of the projects that should be considered a past, present, or reasonably foreseeable future action.	WI5

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19359	The DEIS misstates the law. It states that although the cumulative impacts on wildlife corridors “should be considered significant,” DEIS at 4.4-32, the contribution of NorthMet is insignificant, therefore the NorthMet Project is a minor contributor to cumulative effects. It is an “erroneous assumption that if a given project does not in itself have the potential for causing significant negative environmental effects, there is no possibility of cumulative potential effects resulting from the project.” Citizens Advocating Responsible Development v. Kandiyohi County Board of Commissioners, 713 N.W.2d 817, 836 (Minn., 2006). While DNR and the Corps should find the loss of the two corridors significant, they should definitely find the total cumulative impact is unquestionably significant. As the Minnesota Supreme Court stated in Kandiyohi	WI5
19360	Likewise, this project’s impacts, while important and substantial, are not the only basis for determining cumulative impact. The agency must take a “hard look” at what the cumulative loss of 9 out of 13 corridors means for wildlife protection and habitat preservation. The analysis must be thorough and based on the best available science. For instance, the DEIS should determine the travel capacity of the remaining four corridors, analyze whether the remaining 4 corridors are enough to sustain the Canada Lynx population, what type of physical pressure does this place on the Lynx survival (how much farther will the lynx have to travel, what are the increased dietary demands due to this additional exertion), which roadless blocks are cut-off from the lose of these 9 corridors, and were these corridors also popular denning or breeding sites. A reasoned assessment would have looked at all of these issues plus more. There is no reasoned assessment or scientific reports to support that loss of 9 corridors is not a significant cumulative impact, rendering the DEIS inadequate.	WI1,WI5
19361	The DEIS does not account for future cumulative effects from either the Duluth Metals proposed mines, nor the Franconia mine. Duluth Metals is working to develop an ore reserve near Ely. The Nokomis property, which they seek to mine, covers approximately 3,000 acres. Franconia Minerals is seeking to develop a mine under Birch Lake, located to the northeast of the project area. <sup>3</sup> They also control mineral deposits in Maturi and Spruce Road Deposits. The Birch Lake project is in pre-feasibility studies and can reasonably be foreseen to be a potential future impact. Also, PolyMet itself has stated that the NorthMet Project will only utilize approximately 30% of the existing plant capacity, allowing for it to triple its capacity. PolyMet Mining Advancing Port Production Cooper, Nickel and Precious Metals in US at 8, 17 (2009) (attached hereto). DNR and the Corps should have accounted for these reasonably foreseeable actions when looking at cumulative impacts of habitat degradation. Additionally, while the DEIS states that the Emmons & Olivier Report on habitat loss through logging activities studied cumulative impacts through 2014, DEIS 4.4-27, in fact, the report stated; “[f]orestry data are available on a limited temporal scale. Specific state plans for harvesting are available through 2007 only. This means that beyond 2007, the cumulative effects with respect to all three actions are incomplete.” E & O Report at 20. Thus, the DEIS admits that the cumulative affects of mining projects combined with logging projects are not fully analyzed. The cumulative impact of logging in addition to the proposed project should be examined in order to fully estimate potential habitat loss.	WI5
19362	We have documented above in these comments that the 2006 lynx winter survey and the general wildlife summer surveys were insufficient for the DEIS to conclude that lynx were not present with the proposed project area. The DNR and the Corps are advised that rather than presuming that no lynx are in the project site, the opposite is true. By designating critical habitat for the Canada Lynx on February 25, 2009, the U.S. Fish and Wildlife Service stated in the final rule and in accompanying press releases that “[a]ll designated areas have recent verified records of lynx occurrence and reproduction and are considered occupied.” 74 Fed. Reg. at 8,617, see also U.S. Fish & Wildlife Service, News Release: Revised Critical Habitat Designated for the Canada Lynx (Feb. 24, 2009) (attached hereto). The DEIS should therefore perform an analysis that presumes that lynx have been using the project site. Indeed, Sierra Club has provided documentation above that at least one radio collared female was on or near the site before being killed in 2006 in Ontario Canada. It is therefore reasonable for the DEIS to take presence of lynx into consideration in an analysis on cumulative effects, and we strongly recommended that the DNR and the Corps remedy this deficiency in the DEIS.	WI1

19363	Both the Barr Report and E & O Report note the destruction of over 1400 acres of critical habitat and cumulative destruction of at least 9 travel corridors. As such, the DEIS must look at mitigation measures under both the requirements of NEPA and the ESA. DRN and the Corps have failed to do adequately examine possible mitigation measures. The DEIS has some mitigation “proposals” but does not clearly articulate which specific measures the agencies will implement. For example, the DEIS notes that there is potential for wildlife mortality due to the increased traffic at the project site, and states that a mitigation measure will be to control vehicle speed. The Barr Report, however, states that auto and rail collisions are a source of mortality for lynx, noting that one lynx was even killed attempting to cross a gravel road where speeds are only supposed to reach 30 mph. Barr Report at 13. The DEIS needs to take a “hard look” at available mitigation measures. For instance, the agencies should look to implement large animal culverts or overpasses along the main project road and railway. When discussing many of the travel corridors, the Emmon & Olivier report indicates this is a mitigation measure that may result in fewer mortalities. E & O Report at 8,12. Other reports regarding lynx protection have also proposed this as a mitigation measure. For example, the Washington State Lynx Recovery Plan recommends that “[t]he needs of carnivores should be considered during the design and site selection for crossing structures such as oversized box culverts and fences . . .” Washington Department of Fish and Wildlife, Lynx Recovery Plan 35 (2001) (attached hereto). This DEIS should examine this as a possible mitigation measure along with others.	WI5
19364	As stated above, the agency must look at all reasonably foreseeable environmental effects and important aspects of the problem. The DEIS entirely neglects to discuss the effects of climate change on the lynx or its critical habitat. According to the Intergovernmental Panel on Climate Change, the term “climate change” refers to “any change in climate over time, whether due to natural variability or as a result of human activity.” <sup>4</sup>	WI5
19365	DNR and the Corps overlooked some very important factors with regard to the waste rock stock piles. Each of these overlooked elements would significantly impact the quantity of constituents leached from these stockpiles. Without properly determining the amount and type of leachate, the DEIS has failed to examine the true environmental impacts associated with the waste rock stock piles, in violation of NEPA.	G9
19365	The NorthMet Project will unquestionably result in the destruction or adverse modification of critical habitat for the endangered Canada Lynx. First, the DEIS explicitly states that the NorthMet Project will destroy 1,454 acres of critical lynx habitat. DEIS 4.4.-10. Further, as discussed in the Wildlife section, supra, this project will significantly degrade critical habitat for the Canada Lynx by negatively impacting two of the lynx’s travel corridors, which are listed as critical habitat. (Specifically, the NorthMet Project will adversely impact travel Corridor 11, and completely destroy Corridor 12. Barr Report at 56.) This is a violation of ESA § 7(a)(2), which prohibits such destruction and adverse modification without an exemption. 16 U.S.C. § 1536(a)(2). Nowhere in the DEIS does DNR or the Corps address the NorthMet’ Project’s conflict with this essential federal law. This is inadequate under NEPA. 40 C.F.R. § 1502.16.	WI1,WI2,WI5
19365	The DEIS falls far short of the standard NEPA and federal courts have held is required for an EIS.	PRO3
19365	The analysis of environmental impacts within the DEIS is inadequate because there was no analysis as to the impact of climate change upon the lynx or its habitat. This deficiency must be addressed. See <i>Ctr. for Biological Diversity v. Kempthorne</i> , 588 F.3d 701, 2009 U.S. App. LEXIS 26160,*20 (where the court found an agency’s decision not arbitrary and capricious, noting “the Service’s EA did acknowledge climate change and enumerated its long term effects on polar bears . . .” (emphasis in original)). Climate change is an important aspect of the problem that the agencies must address with regard to the lynx.	WI5
19367	The agencies categorization system is inadequate and overlooks an important aspect of the problem. The DEIS proposes to categorize waste rock using its average sulfur content (and sulfur to copper content). DEIS 3.13 – 3.14.	CR1

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19368	By only focusing on the sulfur and copper content as indicators for leachate, the agencies have ignored an important aspect of the problem. Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). The DEIS must remedy this problem and disclose how Duluth Complex disseminated mineralized rock will release heavy metals significantly exceeding surface water standards at neutral pH conditions. In addition to copper, at a minimum, Nickel, Cobalt and Zinc are readily released in near neutral pH (+/- pH 7). <sup>12</sup> These releases are well documented. Nickel, Cobalt and Zinc are especially mobile at circumneutral pH. As early as 1976, circumneutral metals releases at the Dunka mine were known to have exceeded MPCA surface water standards. In 1983 these discharges were acutely toxic. <sup>13</sup> Other national scientific studies have documented similar leaching behavior from nickel sulfides. <sup>14</sup> These facts are ignored by the DEIS and hold significant potential for large long-term toxic environmental impacts from the PolyMet operation. Failure to analyze this information is a violation of NEPA. See Friends of the Boundary Waters Wilderness v. Dombeck, 164 F.3d 1115, 1128 (8th Cir. 1999).	PD2
19369	The liners and cover systems proposed are defective for a number of reasons. First, it is impossible to accurately segregate millions of tons of waste rock based on sulfur content. Moreover, the disseminated nature of the Duluth Complex makes it impossible to accurately identify and segregate millions of tons of disseminated mineralized Duluth Complex rock with statistically high accuracy and precision. Inevitably, some waste rock with a sulfur content higher than 0.5% will find its way into the Category 1 pile, and visa versa. Given this inevitability the DEIS must either re-examine the environmental consequences associated with leaching assuming that less than 100% of the waste rock is effectively sorted or it must require the lower categories of waste rock have the same liner systems as the higher categories.	PD2
19370	Moreover, as discussed above, acid and circumneutral leaching is expected from all stockpiles of mineralized Duluth Complex waste rock. This type of leachate has been found to exceed surface water standards and to be acutely toxic. <sup>15</sup> To date, the only potentially long-term strategy to prevent the above metals release is to keep water away from the mineralized Duluth Complex rock. The DEIS fails to disclose, analyze, or evaluate any of these environmental concerns. Due to the inherent inaccuracies with sorting Duluth Complex waste rock and the fact that acid and circumneutral leaching occurs with all stockpiles, the agencies must cover all waste rock stockpiles, including Category I and II, with synthetic membranes to eliminate infiltration. Additionally, the agencies should not allow PolyMet to use Category I waste rock as construction material due to its potential for non-acid metals releases. Only non-Duluth Complex rock should be used for construction. Second, the DEIS does not address what, if any, actions PolyMet will take to smooth the topography at the bottom of the pits before commencing stockpiling.	WR4B,PD2,PD11
19370	The DEIS never acknowledged this problem, which could have severe environmental consequences. To address this issue, the agencies can require PolyMet to remove all overburden from the bedrock and survey. Additionally, after removal of the overburden the agencies should require that PolyMet survey the bedrock under stockpiles, which would include mapping elevations and clearly identifying drainage channels. The agencies should require that changes in elevations that could cause a tear are dealt with and that all holes are grouted. Only after the above actions are completed, should the agency allow the stockpiling of waste rock. Moreover, if this liner has a catastrophic failure, the above survey information will provide valuable insight to locate all leachate discharge locations for mitigation.	PD11

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19371	<p>Third, the agencies need to redesign the stockpiles to ensure that precipitation does not come into contact with these stockpiles. As previously stated leaching in the Duluth Complex increases with low pH, elevated temperature, elevated oxygen, stockpile height, elevated ionic strength of water, rainfall, surface area, decreased alkalinity, increased organic ligands, stockpile composition. The elimination of infiltration water from mineralized waste rock is the only proven way to eliminate leachate. Elimination of infiltration water represents a considerable hurdle for the project. The average annual precipitation for the area is 28.4 inches. It can be expected that 855.9 acres of stockpiles can be expected to receive 660,008,592 gallons of precipitation in an average year. Uncovered AMAX test plots indicated 50% to 60% of precipitation was released as leachate.16 In an average year, calculations would predict PolyMet stockpiles produce between 330,004,296 to 396,005,155 gallons of leachate. This could lead to significant impacts since the infiltrated water will contain metals and sulfides. As noted, the Category 1 and 2 stockpiles will not have synthetic liners as part of their covers. The DEIS assumes the proposed 0.5% sulfur cutoff limit has the unlikely precision and accuracy of 100%. If the sulfur evaluation proves less accurate, acid leachate of the above heavy metals and copper can be expected in some areas for perpetuity. Toxic metal releases of nickel, cobalt, and zinc that also exceed surface water standards can be expected for perpetuity (see discussion above). The DEIS must discuss how releases would impact surface waters, such as the Partridge River watershed, which could be disastrous.17 Additionally, the DEIS should discuss how these releases effect the cumulative impacts to local drinking water supplies, such as Colby Lake. The stockpile reclamation proposed lacks specificity as to how the proposed stockpile design will prevent significant amounts of precipitation inflow into already leaching mineralized waste rock at closure. The DEIS states that PolyMet will construct the waste rock similar to the taconite waste rock stockpiles to have 60' lifts. DEIS at 3-39. In addition, the DEIS states that catch benches at least 30' in width would remain on all waste rock stockpiles. DEIS at 3-41. The DEIS does not state if the lifts and benches would face inwards or outwards or mention the bench slope direction. If the lifts faced inwards, like taconite lifts, it would maximize precipitation infiltration into the waste stockpiles. This is an inappropriate design for mineralized Duluth Complex stockpiles since they are chemically dissimilar to taconite waste stockpiles. Numerous reports conclude that it is imperative that water not infiltrate into mineralized rock stockpiles to prevent the formation of circumneutral heavy metal leachates and/or acid heavy metal leachates. The DEIS must specify how PolyMet would construct these benches and lifts in order to accurately assess the potential for metal and acid leachate.</p>	WR2D,PD2,PD11,PD3
19372	<p>Finally, the DEIS is silent with regard to a number of issues that will significantly impact the ability of the cover to prevent water infiltration and leachate production for perpetuity. For instance, the DEIS does not discuss how the synthetic membranes will be incorporated into the sideslopes or how the membranes will be maintained for perpetuity. This is especially problematic because PolyMet would cover the Category 3 and 4 stockpiles with yet undefined "soil." DEIS at 3-17. The DEIS fails to discuss how this cover will prevent infiltration since covering the tops, lifts, and benches may route stormwater to the steep uncovered sideslopes allowing infiltration and the resultant acid and circumneutral leaching of metals and sulfates.</p>	PD2
19373	<p>In addition, the DEIS provides no information or analysis with regard to the closure concentration/mass loading/toxicological impacts of mine drainage from the stockpiles to the Partridge River watershed including Colby Lake drinking water supply. The DEIS must address all of these inadequacies in order to sufficiently disclose the possible environmental impacts from these stockpiles, most importantly regarding the potential for leachate.</p>	WR3A,PD2,PD9

**Theme Codes**

19373 The DEIS discusses placing limestone additions into the waste rock piles to reduce anticipated acid leachate by raising pH. DEIS at 3-40. DNR and outside literature suggest such treatment may be somewhat effective for copper. Only focusing on a mitigation measure that addresses copper ignores an important aspect of the problem. The highest heavy metal concentrations from circumneutral leachate observed from Duluth Complex Material are nickel, cobalt and zinc and these metals leachate exceed surface water quality standards and are acutely toxic (see above). Scientific literature has documented the release of nickel at neutral and basic pH (at low sulfur concentrations), see above. Furthermore DNR pilot testing has demonstrated only a 10% reduction in nickel release by the use of limestone in a Dunka Mine Duluth Complex waste rock seepage. Clearly, under active control, limestone may reduce pH under acid conditions, reducing the catastrophic release of heavy metals from acid mine drainage. However it will not bring the aforementioned metals into compliance with today's surface water standards. Moreover, the proposed treatment effectiveness becomes questionable when you look at the sheer magnitude of waste rock involved – waste rock piles 300 feet high and 1/2 to 1 mile long. The DEIS never addressed a number of problems related to the scale of the stockpile. For instance, there are no controls to regulate or oversee the process. Without such controls it is impossible to understand how the limestone is working. In addition, scientific literature reports limestone is easily coated, rendering it useless. Therefore, periodic replacement is likely necessary. The DEIS never discusses how this will be accomplished. In addition, limestone will increase the hardness of the water. The DEIS never discloses the consequences to existing soft water biota from the added hardness being introduced. The DEIS must address all of these inadequacies in order to sufficiently disclose the possible environmental impacts from these stockpiles.

PD2

19373 These conclusory statements in the DEIS is not supported by any evidence within the DEIS. Froehlke, 473 F.2d at 348 (an EIS cannot be composed of statements “too vague, too general and too conclusory.”); Mid States Coalition for Progress, 345 F.3d at 536 (remanding for preparation of supplemental EIS when agency failed to “explain fully its course of inquiry analysis and reasoning.”); Ctr. for Biological Diversity, 538 F.3d at 1223-1224 (holding agency violated NEPA when it “shunted aside significant questions with merely conclusory statements, [and] failed to directly address substantial questions”). In fact, the DEIS assumes that once the mineralized Duluth Complex material is underwater, it will not leach. However, this assumption is not substantiated by the DEIS or existing literature. The DEIS assumes that pit water that is anoxic (<1mg/l) will not leach metals. The DEIS provides no scientific documentation to substantiate this statement and does not acknowledge the scientific evidence that contradicts this assertion. For instance, in 1980, DNR reported the results of Professor S. Eisenreich laboratory testing of Mineralized Duluth Complex rock at differing oxygen levels. After approximately 33 days at <1 mg/l dissolved oxygen results demonstrated a slow but consistent release of metals copper, nickel, zinc and cobalt. This leaching rate will probably increase significantly over time and continue in perpetuity. Other mines have observed similar leaching. From 1850 to 1950 the Tri-State mining district underground mined lead and zinc sulfates. The mining took place within the groundwater aquifer. After mine closures the diggings filled rapidly with ground water (anoxic). Today the remaining mining district has severe ground water acid and metal contamination.18 Additionally, acid leachate and sulfate as high as 3,500 mg/l were documented in inundated underground mines containing carbonate minerals at the Shullsburg, Wisconsin Zinc Mines. The DEIS suggest the waste rock before water inundation will be allowed to begin the acid mine drainage process (with the waste water treated and sent to processing). The DEIS indicates that this acid mine draining will cease once inundated. Existing scientific literature, however, suggests that once acid mine leaching begins inundation may not control it. The DEIS must address whether inundation can actually stop this process. Simple conclusory statements are not sufficient under NEPA. Froehlke, 473 F.2d at 348 (an EIS cannot be composed of statements “too vague, too general and too conclusory.”); Mid States Coalition for Progress, 345 F.3d at 536 (remanding for preparation of supplemental EIS when agency failed to “explain fully its course of inquiry analysis and reasoning.”); Ctr. for Biological Diversity, 538 F.3d at 1223-1224 (holding agency violated NEPA when it “shunted aside significant questions with merely conclusory statements, [and] failed to directly address substantial questions”). It is the responsibility of the Corps and DNR to remedy the deficiencies of the DEIS.

WR2F,PD2

19373	The Tribal cooperating agencies' concerns are justified because the agencies did not sufficiently quantify current water quality standards for both the ground water and surface water. The agencies overlooked an important aspect of the problem. Motor Vehicle Mfrs. Ass'n, 463 U.S. at 43. The DEIS should have presented information from the monitoring data for NPDES permits MN0042579 and MN0054089, which are the NPDES permits for the Tailings Basin. The monitoring data show that the Tailings Basin has violated, continues to violate and will continue to violate the Clean Water Act with regard to water quality standards.19	WR3I
19375	However, as Dave Chambers exposed, the assumptions that lead to a conclusion that water treatment will no longer be required after 65 years should be considered very tentative. Center for Science in Public Participation Comments at 10 (attached hereto). For example, the assumptions used in determining the scaling factors summarized in Table 4.1-37 – Solute Release Scaling Factors, (lab to field) for the release of contaminants from waste rock piles could easily contain inadvertent errors (for example in the choice of particle size, temperature, fraction of rock flushed by infiltrating water, and the upper limit of contaminant concentrations) that could cause a significant departure from the predicted contaminant loads assumed in the EIS. Id.	WR1E
19375	These findings call into question whether the conclusion in the DEIS that water quality standards will be met in 65 years represents reasoned decisionmaking. Froehlke, 473 F.2d at 348 (an EIS cannot be composed of statements “too vague, too general and too conclusionary”); Mid States Coalition for Progress, 345 F.3d at 536 (remanding for preparation of supplemental EIS when agency failed to “explain fully its course of inquiry analysis and reasoning”); Ctr. for Biological Diversity, 538 F.3d at 1223-1224 (holding agency violated NEPA when it “shunted aside significant questions with merely conclusory statements, [and] failed to directly address substantial questions”). In addition, these findings strongly suggest that the agencies should take a conservative approach with regard to financial assurances for closure, see detailed discussion below regarding financial assurances.	WR1E,WR3I,PD2,PD8
19375	Despite the chemical disparity between these two types of mining waste, DNR and the Corps never chemically characterized the NorthMet tailings to determine if they were compatible with the LTVSMC Tailings Basin design in the DEIS. Without such an analysis, the DEIS has failed to disclose an important and potentially significant environmental impact. The DEIS fails to document both chemically and toxicologically how this basin will treat into perpetuity the tailings. For instance, the DEIS failed to evaluate the tailing waste to determine if it is a hazardous waste as required by Minnesota Rule 7045. This testing would include toxicity and lethality as well as verifying none of the chemicals used are listed hazardous wastes. If it is determined to be hazardous waste, the waste must be regulated under the Resource Conservation and Recovery Act (“RCRA”). Without knowing the chemical make-up of the tailings, it is literally impossible to know if the LTVSMC Tailings Basin can serve its intended purpose. For instance, if these tailings are deemed hazardous waste, the LTVSMC Tailings Basin does not have appropriate design to serve as a waste receptacle, since it was only designed to remove solids from water.	PD2
19375	In the DEIS, DNR and the Corps unlawfully limited the “area of interest” for its sulfate analysis to the Partridge and Embarrass River sub-watersheds. This is inappropriate. The agencies should have included the St. Louis River from mile 179 to the mouth of the river in the area of interest the sulfate could impact this water body. By artificially limiting its analysis of sulfate impacts to portions of the river watershed that are already at excessive sulfate levels (the Partridge and Embarrass River sub-watersheds) the DEIS has failed to disclose the full impacts of mercury methylation.	WR4B
19375	The NorthMet Project, which will release sulfates, would affect the mercury methylation rate. The impact on the methylation rate is directly tied to the current sulfate concentration (i.e., if the sulfate concentration is less than 8 mg/l the impact is considerable, but if the concentration is above 8 mg/l the impact is negligible). The DEIS’s analysis of this issue was inadequate because it used an artificially limited “area of concern,” which only had a sulfate concentration of greater than 8 mg/l. However, if the DEIS had used a proper area of concern, the environmental consequences of this Proposed Project would be markedly different. The agencies need to modify the environmental review to include the appropriate area of concern.	WR4B

Comment ID	Comment Text	Theme Codes
19375	The DEIS should have disclosed a number of problems that could result from the use of silty sand soils. For instance, it is well documented that silt is a very poor engineering material because it lacks engineering plasticity necessary to remain stable from freeze thaw cycles, and will allow seepage. In addition, silt dries quickly and dusts. Silt is also readily carried off by storm water and forms colloidal suspensions that are difficult to settle without chemical additions. Finally, if the dikes break or erode substantially, they could allow the release of both silt-laden water and toxic levels to wetlands and surface water. Given the deficiencies with this material for engineering purposes, the DEIS should have disclosed this possibility and addressed the environmental consequences of such an incident. The DEIS needs to do one of two things to address this problem. First, it can disclose the disadvantages of using silt and chronicle the environmental impacts that could occur based on these deficiencies. Alternatively, it could use standard engineering materials instead of silt and have strict non-point runoff control measures.	EOO,PD4
19377	Second, mercury contamination of fish is a widespread problem in Minnesota and elsewhere. Many of the water bodies in the Project area are among those listed as impaired by mercury, including the Wynne, Sabin, Embarrass, and Esquagama Lakes (through which the Embarrass River flows); Colby Lake and Whitewater Reservoir in the Partridge River watershed; and segments of the St. Louis River. DEIS at 4.5-19. These water bodies have fish consumption advisories because the mercury concentrations in fish tissue pose a hazard to human health. Id. Mercury contamination of fish also poses a toxicity risk to fish-eating wildlife. Id. The water bodies listed above, as well as most other water bodies in the St. Louis River basin were excluded from the statewide mercury TMDL because mercury levels in the fish were above the level considered achievable by the TMDL. DEIS at 4.5-20. These water bodies may be subject to one or more separate TMDLs to be developed in the future. Id. Reducing the releases of sulfates, rather than increasing sulfate releases, as proposed in the PolyMet DEIS, is critical for delisting this water body for fish tissue mercury. Since increasing sulfate loads in these water bodies would exacerbate any future plans to address mercury levels, the DEIS must analyze how the NorthMet Project's increased sulfate loads would effect mercury methylation temporally (i.e., how much longer would it take for the sulfate concentrations to reduce to a level so they became a limiting factor on mercury methylation). Moreover, further degradation of these waters would violate the Clean Water Act. See, e.g., Friends of Pinto Creek v. E.P.A., 504 F.3d 1007 (9th Cir. 2007). It is a violation of the Clean Water Act to permit this mining proposal, knowing that the excess sulfate ions are likely to enhance methylation to the point that it would preclude the successful implementation of a mercury TMDL. See U.S. Environmental Protection Agency, Consideration Of Cumulative Impacts In EPA Review of NEPA Documents at 8-10 (1999) (attached hereto) (agency needs to consider temporal nature of impacts). Permitting of this mine could prevent for decades or even longer, delisting of the St. Louis River, an impaired water body under Section 303(d) of the Clean Water Act. The agencies failure to look at the temporal significance of continued pollution is a violation of NEPA.	WR4B,WR5A,FM1,FM5
19377	The agencies should have examined the sulfate impacts for water bodies further downstream where the sulfate concentration is below 8 mg/l, such as the Scanlon Dam in Cloquet at river mile 35. The reservoirs and estuary immediately below the Scanlon Dam are water bodies where sulfate is a limiting factor on methylation. DEIS 4.1-195. Since the sulfates emitted from the NorthMet Project could travel to these downstream water bodies, excessive sulfates could stimulate methylation in these water bodies. The DEIS should have included these other water bodies in its impacts analysis.	WR1E
19378	Finally, because the DEIS has inadequately assessed the environmental consequences of sulfate concentrations on methylation, the DEIS has also failed to address mitigation measures that could address this problem. Ultra filtration through special membranes can reduce their high volume, high concentration sulfate water to acceptable levels at an economically feasible cost. The DEIS should also discuss the possibility of "in pit" sulfate treatment.	WR1E,WR4C
19379	Although not disclosed in the DEIS, it would also expose sediments in the many beaver ponds on the Partridge River, yet another aspect the DEIS should have addressed.	EOO

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19380	The DEIS does not cite to any report or scientific data to support its proposition that flow fluctuations associated with the Proposed Project “is not expected to result in significant increases in mercury methylation.” Id. In fact, it is the “tribal cooperating agencies’ position that the data used to support the DEIS conclusion is inadequate.” Id. at fn. 42. This cursory analysis is not sufficient under NEPA. NEPA’s implementing regulations require that the information in an EIS must “be of high quality” with “accurate scientific analysis.” 40 C.F.R. § 1508.1(b). The regulations also state that EIS “shall identify any methodologies used and shall make explicit reference by footnote to scientific and other sources relied on for conclusions in the statement.” 40 C.F.R. § 1502.24. In this case, the DEIS does not provide reference to any source that supports its conclusion. Froehlke, 473 F.2d at 348 (an EIS cannot be composed of statements “too vague, too general and too conclusionary”); Mid States Coalition for Progress, 345 F.3d at 536 (remanding for preparation of supplemental EIS when agency failed to “explain fully its course of inquiry analysis and reasoning”); Ctr. for Biological Diversity, 538 F.3d at 1223-1224 (holding agency violated NEPA when it “shunted aside significant questions with merely conclusory statements, [and] failed to directly address substantial questions”). Moreover, there is likely no data to support the DEIS’s conclusion. With the decline in water level, labile organic matter in the surface becomes oxidized releasing bound mercury as well as sulfate to the dissolved phase. <sup>26</sup> In fact, water level fluctuations have been shown to be a major contributor of methyl mercury to the sub-watersheds of the Red River. This indicates that it would have the same impact on the Partridge River, Colby Lake and Whitewater Reservoir. The DEIS should provide sufficient scientific data to support this conclusory statement. Otherwise, the DEIS should address the problem of flow fluctuations and mercury methylation, which would include quantifying the mercury methylation from water level fluctuations	WR4A
19381	Moreover, because the DEIS failed to acknowledge that flow fluctuations could impact mercury methylation, it makes no attempt to mitigate these impacts. There are reasonable design and operating strategies that the agencies could put in place to reduce these draw downs. For instance, the DEIS could mitigate these impacts by establishing a schedule for water releases and withdrawals from the NorthMet project and other projects to minimize sediment exposure and therefore methylation. If we are going to allow them to use our water, then we have the responsibility to mandate that they use it in such a way that minimizes environmental degradation. This basic concept has not been suggested in this DEIS and needs to be addressed before it can be deemed sufficient.	WR4C
19382	Finally, the DEIS inadequately addresses sulfate loading to floodplains. There are natural fluctuations in aquatic systems that present high risk for mercury methylation such as the spring snow melt and storm events in which the waters rise into wetlands and bring with it a higher than normal load of sulfates. Most of Minnesota’s watersheds have a riparian flood plain that typically is inundated each spring and then the water slowly recedes. These lowland swamps and forests are naturally sulfate poor as is typical of surface and ground water in northeastern Minnesota. With the spring expansion of water into these floodplains, an increase in sulfate loading is added to the mix of organic matter, sulfatereducing bacteria, deposited mercury and low oxygen concentrations. In summary, any sulfate added to this system has the potential to enhance mercury methylation in the floodplain. The DEIS states that 54% of the Partridge River is a Type C channel according to a Level I Rosgen Geomorphic Survey. DEIS at 4.1-23. Type C channels are characterized as having a well developed floodplain. The DEIS also states that in general the Partridge River has a well developed floodplain for all but the Type B reaches, which account for only 13% of the channel. That means 87% of the Partridge has a well developed floodplain and is at high risk for mercury methylation if the operation delivers the high sulfate waters predicted by the DEIS. The DEIS, however, never discusses how this floodplain poses risks of methylation. Instead, the DEIS makes conclusory statements that are counter to the information known about the Partridge River’s floodplain without any reference to scientific information to support it. For instance, the DEIS states that “the NorthMet Project is not expected to contribute to cumulative effects on mercury in water and fish tissue in the Partridge River watershed.” DEIS at 4.14-9. The DEIS makes the same statement regarding the St. Louis River. Id. Once again, these conclusory statements are not supported by the record because agencies did not perform a geomorphic survey of that river. Froehlke, 473 F.2d at 348; Mid States Coalition for Progress, 345 F.3d at 536; Ctr. for Biological Diversity, 538 F.3d at 1223-1224. Had the agencies done such an analysis, they would have found a well developed floodplain, which is extremely susceptible to methylation.	WR4B

Comment ID	Comment Text	Theme Codes
19383	The agencies must remedy this deficiency by modeling the rising water levels, which would introduce sulfate into the high-organic wetland matrix, followed by falling water levels, which hydraulically deliver elevated methyl-mercury and/or phosphate to the stream for the floodplains and multiple backwaters and bays of the entire watershed. Otherwise, the DEIS is legally deficient.	WR4A
19384	In addition, the location of these stockpiles mandates that the agencies take a hard look at the mercury releases from these stockpiles and Tailings Basin. The Category 1, 2, and 3 stockpiles are located less than one-eighth of a mile from the Partridge River. A mile-long stretch of this stockpile is located about one-eighth of a mile from the Partridge River headwaters. The Category 1 and 2 stockpiles, with their associated mercury release from peat, may account for the largest source of mercury releases. These stockpiles, along with the Tailings Basin and other stockpile and pits, are potential pathways to the Partridge River, Embarrass River, and Colby Lake. Although the Partridge River is not listed as an impaired water body on the 303(d) list, further downstream most of the St. Louis River is listed for “mercury in fish tissue” impairment. DEIS at 4.1-33. In addition, Colby Lake and the Whitewater Reservoir are on the Minnesota 303(d) TMDL list because of mercury concentrations in fish tissue. DEIS at 4.1-37.	WR4B,WR4E
19384	There are a number of problems with this assessment of mercury impacts. First, while it may be true that minerals present in the mine waste rock will absorb mercury present in rainfall, this is not the only source of mercury release. The DEIS acknowledges that the waste rock will leach mercury concentrations between 5 and 7 ng/l. In addition, PolyMet proposes to include peat in the Category 1 and 2 stockpiles. Peat, which, owing to slow growth and efficient adsorption of mercury, can accumulate mercury deposited from many centuries of precipitation, discussed in detail below. <sup>27</sup> Therefore, the peat included in the waste rock stockpiles will be a massive source of mercury release. The DEIS should have accounted for each of these independent sources of mercury – waste rock leach, peat release and rainwater, modeled their respective releases, and then determined what impact the NorthMet Project would have on groundwater impacts.	WR4A,WR4E
19384	The DEIS does not provide a quantitative analysis of how mercury will impact water quality. Specifically, the DEIS states that: “The effects of the Proposed Action on surface water quality were evaluated using mass balance models linked to the hydrology predictions from the XP-SWMM model. . . . The models predicted concentrations for 26 parameters . . . . Mercury was not included in either model because data for mercury were not available for stockpile liner leakage (RS53/42, SRK 2007) or groundwater recharge from the East and West pits (RS31, SRK 2007).” DEIS at 4.1-108. The agencies attempt to justify this lack of quantitative data based on assumptions	WR4A,WR4B
19385	Given all these facts, it is incomprehensible and a violation of NEPA’s hard look standard that DNR and the Corps’s failed to require the same analysis of mercury release and transport as was performed for other constituents. The agencies must correct this error and provide a quantitative analysis of the discharge of mercury to the Partridge and Embarrass River from these pathways during and after mining, and from direct surface discharge from the West Pit after mining.	WR4A,WR4B
19386	In addition, the DEIS acknowledges that this project will eventually discharge to groundwater because the “West Pit overflow would ultimately be directed to the Partridge River.” DEIS at S-7. The DEIS does not address the environmental impacts associated with this known discharge. Instead the DEIS states that this issues will be addressed at closure. See, e.g., DEIS at 3-39 (“The East and West pits are expected to flood and have a net outflow of surface water. Outlet structures would establish the steady-state water levels in the East and West pits after Closure.”)	WR2C
19386	The DEIS inadequately addresses environmental impacts associated with surface water discharges because it uses an artificially restricted definition of surface water discharge – a surface discharge only occurs if there is a surface discharge to a surface water. For instance, the DEIS states with regard to the Tailings Basin “These water management methods would result in no direct surface discharge of process water at the Plant Site or Mine Site.” DEIS at 3-35. In addition, the DEIS states “[t]he Tailings Basin would be designed not to overtop, so there would be no surface discharges. It is expected that surface seepage would occur from the basin, but PolyMet proposes a surface seepage collection system that would capture essentially all of the surface seepage and return it to the Tailings Basin until the seeps dry out.” DEIS at 4.2-21.	EOO
19387	DNR and the Corps need to address these surface water discharges in the DEIS. In fact, these types of discharges are covered by the Clean Water Act’s requirement to get a National Pollutant Discharge Elimination System (“NPDES”) permit.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19388	The agencies must address this deficiency in the DEIS and address these surface water discharges because its current treatment of these discharges does not meet the hard look standard. See, e.g., DEIS at S-9 (“There is some uncertainty as to whether the West Pit overflow would meet the Lake Superior mercury standard, but this impact could be mitigated if it would occur.”). In addition, the DEIS cannot piecemeal this analysis by stating that it will address the pit overflow discharge to surface water at the time of closure because, as discussed above, this is a	EOO
19389	The analysis done by DNR and the Corps does not adequately reflect the possible environmental impacts to groundwater. The “conservative” (i.e., low probability of occurrence) predictions from the deterministic model were in some cases not only below the high probability of occurrence predictions, but below the mean figure in the probabilistic predictions. DEIS at 4.1-53 – 4.1-54. DNR and the Corps should not have used “conservative” (i.e., low probability of occurrence) values but rather the average or high probability values because using these conservative values downplays the environmental consequences (and allows illogical results like seepage from the NorthMet Project will improve water quality). The fact that the agencies should have used the median or high probability numbers is supported by the fact that studies found that environmental impact statements consistently under-predict water quality impacts. <sup>28</sup> There are many complex factors contributing to uncertainty and modeling simply cannot account for all these factors. <sup>29</sup> In addition, the agencies never identified in the DEIS whether the numbers they were relying on to predict water quality impacts came from the deterministic modeling or Uncertainty Analysis. Without this information, it is impossible for the public to assess the adequacy of impact predictions throughout the DEIS. Numbers given in tables without a reference to the where they lie in the range of probability (low, median to high) provide very little information regarding the validity of those predictions. The DEIS should have presented the full range of impacts in environmental consequences discussion. In sum, the DEIS presents arbitrary numbers as to water quality predictions, rather than revealing the full extent of the potential impacts on water quality. Arbitrarily selecting low probability numbers does not represent a “hard look” at the environmental consequences.	WR2C
19389	The DEIS inadequately addresses uncertainties surrounding impacts to groundwater resources. The manner in which the agencies addressed these uncertainties actually downplayed the possible environmental impacts of the NorthMet project to groundwater and, in some cases, allowed the DEIS to make illogical conclusions that are arbitrary and capricious.	WR2C
19390	The DEIS’ analysis of groundwater impacts from aluminum is inadequate and does not represent a “hard look.”	WR2C
19391	Rather than make unsupported conclusions, <i>Froehlke</i> , 473 F.2d at 348; <i>Mid States Coalition for Progress</i> , 345 F.3d at 536; <i>Ctr. for Biological Diversity</i> , 538 F.3d at 1223-1224, the agencies should take a hard look at the project’s impacts to groundwater from aluminum concentrations. This would include modeling the direction and rate of groundwater flow, model the extent of the existing contaminant plume, and model how the contaminant plume would change with the addition of the NorthMet leach of aluminum. This data and analysis should then feed into estimates of how the proposed project would interact with existing contamination. The combination of existing conditions with impacts due to the proposed project would show what groundwater quality can be expected during and post project.	WR1E,WR2C
19393	As stated earlier in this section, the DEIS asserted that issues relating to groundwater contamination “will be addressed at closure.” See, e.g., DEIS at 3-39 (“The East and West pits are expected to flood and have a net outflow of surface water. Outlet structures would establish the steady-state water levels in the East and West pits after Closure.”) Delaying such analysis until after mine closure does not meet the “hard look” standard required by federal law. Such an analysis must be included in the DEIS.	WR1A

Comment ID	Comment Text	Theme Codes
19394	<p>The DEIS inadequately deals with this peat destruction and associated mercury release in two significant ways. First, the DEIS does not quantify or take a hard look at how much mercury is sequestered in these wetlands and peat lands and what will happen to the environment when this mercury is mobilized. “What constitutes a ‘hard look’ cannot be outlined with rule-like precision. At the least, however, it encompasses a thorough investigation into the environmental impacts of the agency’s action and a candid acknowledgment of the risks that those impacts entail.” <i>Nat. Audubon Soc’y v. Dep’t of Navy</i>, 422 F.3d 174 (4th Cir. 2005). This superficial analysis at this issue in the DEIS is far from a hard look. For instance, the DEIS states: “Organic matter contained in peat also constitutes a large reservoir of mercury, but this mercury is strongly bound to the organic material. Disruption of peat deposits, such as proposed excavation and stockpiling of peat at the Mine Site, resulting in oxidation and decomposition of the peat may increase the mobility of the stored mercury.” DEIS 4.1-123. However, this is where the analysis ends. The agencies never attempt to determine how much mercury will be mobilized from this wetland and peat destruction, where this released mercury will go (i.e., which water bodies would be impacted), the odds that this mercury will become mercury methylation, what organisms or aquatic species will be impacted by this additional mercury. By ignoring all of these issues, the agency has failed to take the requisite hard look.</p>	WR4E,WE1,WE2
19394	<p>However, the DEIS fails to analyze the impacts to water quality from the local deposition and run-off of metal emissions. The failure to analyze these impacts renders the DEIS inadequate. <i>Motor Vehicle Mfrs. Ass'n</i>, 463 U.S. at 43. It included metals in its air quality analysis, and should have also included them in its local deposition and water quality impacts analysis. Given the amount of metals this project will emit, such as nickel, it is unconscionable that the agencies have not performed this analysis. It is quite possible that deposition of metallic emissions will lead to the conclusion that water quality standards in nearby water bodies will be violated. Without this information and analysis, it is impossible for the agencies to fully address the environmental consequences associated with the NorthMet Project.</p>	WR3M
19395	<p>Second, the DEIS’s discussion of how to mitigate or deal with this mercury release is inadequate. Like other elements in an EIS, an agency must discuss mitigation measures in sufficient detail to ensure there has been a fair evaluation of environmental consequences. <i>Robertson v. Methow Valley Citizens Council</i>, 490 U.S. 332, 352 (1989). The agency must take a hard look at these mitigation measures. See, e.g., <i>Neighbors of Cuddy Mtn. v. U.S. Forest Serv.</i>, 137 F.3d 1372 (9th Cir. 1998). Courts will find an EIS inadequate when it does not adequately discuss mitigation measures or does not discuss mitigation measures it should have discussed. See, e.g., <i>Environmental Defense Fund v. Froehlke</i>, 473 F.2d 346 (8th Cir. 1972) (failure to include land acquisition as mitigation measure for impact of channelization project on migratory fowl); <i>Oregon Nat. Res. Council v Harrell</i>, 52 F.3d 1499 (9th Cir. 1995) (remanded to consider additional mitigation measures); <i>Friends of the Earth v. Hall</i>, 693 F.Supp. 904 (W.D. Wash. 1988) (questioning mitigation measures). The DEIS states that to address this mercury release, “PolyMet proposes to place the excavated peat in either the Category 1 and 2 waste rock stockpile or the Overburden Storage and Laydown Area. Drainage from these stockpiles would be considered process water, which would be collected, possibly treated at the WWTF, and either pumped to the Tailings Basin for reuse/ultimate disposal (Years 1-11) or to help in the flooding of the mine pits (Years 12-65). The WWTF is not predicted to be very effective in removing mercury,” DEIS 4.1-123. “Since the WWTF is not expected to be very effective and effluent concentrations are predicted to remain above the Great Lakes Initiative standard of 1.3 ng/L, mercury removal prior to release (i.e., Tailings Basin seepage and West Pit overflow) would be important.” <i>Id.</i>; see also DEIS at 4.1-128. The DEIS then goes on to state that the tailings basin may remove mercury from the WWTF effluent during years 1-11. <i>Id.</i> Then after year 11, PolyMet would pump the effluent to the East Pit, which would eventually years later be turned into an artificial wetland, which “would be expected to be variably effective in removing total mercury.” <i>Id.</i> This analysis of mitigation measures does not represent reasoned decisionmaking that is reflective of a hard look analysis. Noting that the selected options would be variably effective at mitigating the impacts does not constitute a hard look. See, e.g., <i>Friends of the Earth v. Hall</i>, 693 F.Supp. 904 (W.D. Wash. 1988) (questioning mitigation measures). For instance, the DEIS does not discuss whether stockpiling peat will actually increase the methylation rate. All soil sequesters mercury. The inorganic mercury in the peat stockpile has a high potential to mobilize and methylate. The DEIS should have discussed the environmental consequences of stockpiling peat with regards to the methyl mercury burden of the already polluted aquatic system. In addition, the DEIS should have addressed ways to mitigate the methyl mercury problem associated with the stockpiles. For instance, perhaps the stockpile should be capped.</p>	WR4C,WR4E,WE2,WE3,W

- |       |  |         |
|-------|--|---------|
| 19395 | Finally, to mitigate this wetland loss, PolyMet proposes to replace this loss of wetlands with artificially constructed wetlands in Aitkin and Pine Counties. 4.2-36 – 4.2-37. The Aitkin mitigation site is located within the Mississippi River-Brainerd watershed. The Hinckley wetland mitigation site (which is located in Pine County) is within the Snake River watershed. Id. The lost wetlands, which consist mostly of peat lands that are better sequesters of mercury, are located in the St. Louis watershed. The NorthMet Project proposes the destruction of hundreds of acres of peat bogs, which means that hundreds of acres of mercury sequestering surface will be lost to the St. Louis watershed. Since the mitigation efforts involve the creation of artificial wetlands in a different watershed, these impacts will be permanent. The DEIS never discusses how this mitigation measure is slated for a different watershed, so that it will not alleviate mercury release impacts in the St. Louis Watershed. A watershed cannot be managed for mercury this way and expect it to ever be delisted for mercury contamination. Moreover, the DEIS does not disclose whether the newly created artificial wetlands will be peat lands, which sequester mercury better than wetlands. Since Aitkin and Pine Counties have disproportionately less peat bogs, this is likely to be the case. The DEIS did not take a “hard look” at this mitigation measure. At a minimum, the DEIS should have considered replacing the lost wetlands and peat lands with wetlands in the Lake Superior watershed. In addition, the DEIS should have considered a 1-for-1 peat bog replacement. See, e.g., Environmental Defense Fund v. Froehlke, 473 F.2d 346 (8th Cir. 1972) (failure to include land acquisition as mitigation measure for impact of channelization project on migratory fowl); Oregon Nat. Res. Council v Harrell, 52 F.3d 1499 (9th Cir. 1995) (remanded to consider additional mitigation measures); Friends of the Earth v. Hall, 693 F.Supp. 904 (W.D. Wash. 1988) (questioning mitigation measures). The impacts to the St. Louis watershed are aggravated by the fact that the proposed project’s ionic mercury and mercury attached to particles, which are the most chemically reactive, will be deposited locally, DEIS Figure 4.6-1, shows that the prevailing winds will deposit those species disproportionately within the Lake Superior watershed. The DEIS did not look at the total direct impacts of this mercury problem for the St. Louis watershed, which it should have done.   | WE2,WE3 |
| 19396 | Despite this over arching goal of replacing lost function in the same watershed, the agencies only analyzed with detail in the DEIS two mitigation sites that are located in different watersheds than the NorthMet Project. PolyMet proposes to replace this loss of wetlands with artificially constructed wetlands in Aitkin and Pine Counties. DEIS at 4.2-36 – 4.2-37. The Aitkin mitigation site is located within the Mississippi River-Brainerd watershed. The Hinckley wetland mitigation site (which is located in Pine County) is within the Snake River watershed. Id. The lost wetlands, which consist mostly of peat lands that are better sequesters of mercury, are located in the St. Louis watershed. Such a wetland mitigation analysis is inadequate. It is inadequate for several reasons. First, the agencies should have required PolyMet to detail what would be the lost function from these destroyed wetlands. Next, the agency should have had PolyMet determine if the mitigation wetlands would replace this lost value, in quantity and function. The wetlands which will be destroyed by the NorthMet Project serve a variety of functions that were not evaluated. For instance, these wetlands provide habitat for a number of wetland species, including lynx, wolves, moose, and a number of bird species. These species are not found as far south as the proposed wetland mitigation sites, so the proposed mitigation wetlands simply cannot replace this lost value. In addition, when PolyMet performs its wetland functional analysis, it should be sure to include an analysis of the wetlands that will be created on site. PolyMet is proposing to construct wetlands on-site after closure. These wetlands will serve a water treatment function. It is doubtful that wetlands, which receive mine waste discharges and serve as a passive treatment system will serve the same aquatic function as the destroyed wetlands. Second, the DEIS’ treatment of wetland mitigation was inadequate because it allowed PolyMet to rebuff federal standards that off-site mitigation should be located in the same watershed, without a detailed analysis concerning why such watershed replacement was not possible. The National Research Council reported that while as a nation we may have halted the loss of wetland acreage, we have by no means halted the loss of wetland value and function. <sup>35</sup> The new Corps rules were supposedly designed to change this so that the wetland permitting process actually identified the specific values and functions that were being lost and designed mitigation geared specifically to replace those losses. The Corps needs to require PolyMet to redo its wetland mitigation analysis so that at least some of the mitigation projects actually compensate for the functions and values lost. | WE3     |

19397	When preparing a DEIS, an agency must include all direct effects and their significance, along with means to mitigate adverse environmental impacts. See 40 C.F.R. § 1502.16(a) & (h). The purpose of NEPA is to “ensure[] that important effects will not be overlooked or underestimated only to be discovered after resources have been committed . . .” <i>Robertson v. Methow Valley Citizens Council</i> , 490 U.S. 332, 349 (1989). Further, publication of a draft EIS serves an informational role. <i>Id.</i> The EIS “gives the public the assurance that the agency ‘has indeed considered environmental concerns in its decisionmaking process.’” <i>Id.</i> , quoting <i>Baltimore Gas &amp; Electric Co. v. Natural Resources Defense Council, Inc.</i> , 462 U.S. 87, 97 (1983). Here, however, the DEIS only makes general geotechnical statements and concludes that “[g]eotechnical stability will be further analyzed during permitting when final facility designs will be available.” DEIS at 4.13-1. The DEIS is thus deficient in its analysis of pertinent direct environmental effects, and this deficiency does not allow the public to ascertain whether the agency has taken the required “hard look” at possible effects of the project.	GT1
19398	The DEIS acknowledges that the embankments are unstable in saturated conditions, stating “[r]eview of the proposed NorthMet Tailings Basin preliminary design geotechnical stability analysis indicates the perimeter embankments would be stable for unsaturated conditions, but have a low margin of safety for stability for saturated or static liquefaction conditions.” DEIS at 4.13-2 (internal citation omitted). Further information and analysis is required as to whether the upstream type of construction; both existing and proposed, is the proper type of tailings dam for this project site.	GT1
19399	Additionally, the DEIS proposes lined cells to store hydrometallurgical waste to be built on top of existing taconite tailings in cell 2W. DEIS at 3-33. The DEIS acknowledges that Cell 2E is unstable, stating, “[t]here are also layers of loose saturated slimes (fine silty tailings) within the LTVSMC stored tailings material that extend from the central portion of Cell 2E northward and connect with the perimeter embankment, which are subject to liquefaction under certain conditions and therefore may create instability of the perimeter dam.” DEIS at 4.13.-1. The DEIS does not, however, state whether cell 2W is also unstable; stating only that “. . . it is unknown if the slimes layer exists under the facility.” DEIS at 4.13-2. Without this information relating to the stability of cell 2W, the agencies and the public may not accurately assess the potential for contamination from the hydrometallurgical waste.	EOO
19400	While the two facilities are certainly not the same, this accident highlights the environmental consequences that can occur when an agency fails to adequately assess geotechnical stability. DEIS should still seek to provide all the relevant information related to both the existence of slimes and to whether the type of construction proposed is proper, in order to avoid any potentially catastrophic collapses that would result in significant water pollution and possible devastation of a community.	GT1
19401	In addition to the significant issues found with the tailings storage facilities, the waste rock stockpiles also offer cause for concern because a slope stability assessment has not been completed. The DEIS states, “[p]roposed heights and slope angles in the preliminary waste rock stockpile designs are within typical mine engineering practice, however a slope stability assessment has not been completed. Further design and analysis would occur during permitting to ensure that the proposed construction meets acceptable design standards.” DEIS at 4.13-2. The geotechnical stability of these waste stockpiles is incredibly important and the agencies must present information related to the stability for public review. If reasonably complete information is not included, “neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects.” <i>Robertson</i> , 490 U.S. at 352. As noted above, the ability to assess the adverse effects is a large part of the NEPA process, and because of this omission this DEIS is inadequate.	GT1
19402	The DEIS does not state whether water quality predictions took account of these inadequacies. For instance, the DEIS does not state whether the efficacy of the proposed liner is reflected in the “high liner leakage” scenario. DEIS at 4.1-75. If it was not included than the leakage potentially could be even greater than assumed in high liner leakage scenario. The DEIS must disclose whether this information was evaluated in its environmental consequences review. In addition, the DEIS should state whether the prediction of environmental consequences accounted for this slope instability.	EOO

19403	Lack of a viable reclamation plan and closure cost estimate is a major flaw in the EIS. The cost alone, however, is not the only area of concern. Another problem that has plagued mine reclamation plans is a complete failure to accurately predict environmental consequences associated with mine closures. A recent study showed that although 100% of the mines they studied had predicted compliance with all applicable water quality standards, in fact, 76% exceeded water quality standards and 64% of the time the mitigation measures did not work. Alan Septoff, Predicting Water Quality Problems at Hardrock Mines-A Failure of Science, Oversight, and Good Practice, 1 (2006) (attached hereto) [hereinafter Predicting], quoting Jim Kuipers & Ann Maest, Comparison of Predicted and Actual Water Quality at Hardrock Mines. This failure to accurately predict and then subsequently manage water quality impacts can result in significant negative impacts; on water quality, environmental health, and the costs that tax-payers have to shoulder. Predicting at 1. Based on the wide disparity of the EIS's submitted by the mines and the actual results, agencies must make improvements in the prediction and prevention of impacts to water quality and other resources. Id at 2. The DNR should have examined the reports that show a massive disconnect between EIS's claiming to have "minimal water impact" and the reality of the water quality after the mine closed. As there is an uncertainty in water quality predictions, DEIS 3-54, 4.1.-53, 4.1-60, etc., the DNR should have been extremely conservative in their assessment of potential reclamation costs.	PD3,PD4
19403	As part of this analysis, the DEIS should have addressed these recent scientific reports showing a higher likelihood of unpredicted contamination in projects that have the potential to create acid rock drainage and that are situated near ground or surface waters. 93% of the mines surveyed in Ann Maest and Jim Kuipers Study that were near groundwater and had an elevated potential for acid drainage exceeded water quality standards. Predictions at 3. 85% of the mines near surface water exceeded water quality standards. Id. The most ominous fact, however, is that of all of the sites that did develop acid drainage, 89% predicted in their EIS that they would not. Id. The disparity between the predicted and actual water quality exceedences is an important aspect of the problem, and should have been discussed in the reclamation plan and included in the DEIS specifically with regards to the financial assurances that the company would provide.	PD3,PD4
19403	Typically mine closure and post-closure costs run in the tens to hundreds of millions of dollars. Many of the measures that will be taken to avoid environmental and public health impacts require adequate financial assurances and/or bonding. When there are inadequate financial assurance measures taken, there is a significant potential impact to the public health, the environment, and taxpayers. That is why it is imperative that financial assurances be discussed as a part of the EIS process. The EPA notes that the severity of the consequences posed by hard rock mining is evident in the massive costs associated with the actions needed to protect public health and the environment after releases from these facilities. 74 Fed. Reg. 37,213, 37,217 (July 28, 2009).	PD8
19403	A very important part of the environmental analysis for a mine is evaluating the reclamation plan. The reclamation plan documents not only what the goals for the reclamation of the site will be (i.e. the designed post-closure use), but also what is needed in terms of reclamation methods and financial resources to achieve the reclamation goals. DNR and the Corp's decision not to discuss the reclamation plan in detail or address the best available science with regards to the potential for significant increases in contamination, coupled with the failure to include any financial assurance information renders this DEIS incomplete and inadequate. CEQ regulations require agencies to include all pertinent data in the EIS. An agency must "provide full and fair discussion of significant environmental impacts and shall inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment." 40 C.F.R. 1502.1. Moreover, NEPA's implementing regulations state that "a draft statement must fulfill and satisfy to the fullest extent possible the requirements established for a final statement . . . . If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion." 40 C.F.R. § 1502.9(a). The actual anticipated cost of closure and the full reclamation plan are items that would inform the public and decisionmakers about the merits or dangers of possible significant environmental contamination from the proposed action. Without this important information, the DEIS is inadequate.	PD5

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19403	<p>Here, the DNR's and the Corps' decision not to include this information is arbitrary and capricious because it is critical to the analysis of the long-term environmental impacts. Due to the importance of financial assurance information, in July 2009, the EPA identified copper mining as a class of facility within the hard rock mining industry that they were going to develop financial responsibility requirements for under CERCLA section 108(b). 74 Fed. Reg. 37,213 (July 28, 2009). The final rules are anticipated in 2011. Research performed by the EPA indicates that hard rock mining is responsible for the pollution of 3,400 miles of streams and 440,000 acres of land. 47 Fed. Reg. at 37,215. Further, the Forest Service believes that approximately 10,000 miles of rivers and other waterways have "been contaminated by acid mine drainage from the metal mining industry." Id. The metal mining industry releases between 1.07-1.5 billion pounds of toxic chemicals annually, which equates to approximately 28% of the total releases by all U.S. industry. Id. The fact that large mines will operate for decades may extend the timeframe for potential toxic releases and exposure to hazardous chemicals. Id. A significant reason for requiring complete financial assurance is the magnitude of the costs that federal agencies, state agencies, and ultimately the taxpayer have to shoulder in cleanup costs. Some mine owners have defaulted on their environmental liabilities associated with their mines, making the cleanup costs borne mostly by taxpayers. U.S. Government Accountability Office, <i>Environmental Liabilities, Hardrock Mining Cleanup Obligations</i>, at 1 (2006) (attached hereto) [hereinafter HMCO]. The average cost of addressing a mining site under the Superfund program is approximately \$22 million per site. U.S. Environmental Protection Agency- Abandoned Mines Land Team, <i>Reference Notebook</i>, at 14 (2004) (attached hereto). As of 2006, there were 63 hard rock mines on the Superfund's National Priority List. These sites are estimated to cost a total of 7.8 billion to remediate, and at least 2.4 billion of this is to be paid by the tax payer, rather than the company that was responsible for the contamination. Id. at 2. The Federal government spent at least 2.6 billion dollars to remediate hard rock mine sites between 1998 and 2007. 74 Fed. Reg. at 37,217. Additionally, while mining operators have provided financial assurances totaling approximately \$982 million for projects located on BLM land, the Government Accountability Office has determined that these assurances fall short of the stated reclamation budgets by approximately \$61 million dollars. U.S. Government Accountability Office, <i>Hardrock Mining, Information on Abandoned Mines and Value and Coverage of Financial Assurances on BLM Land</i>, at 15 (2008) (attached hereto). This shortfall, however, does not account for the potential for the reclamation costs to be significantly higher than originally estimated. The potential burden to the taxpayer is obvious, and as such reclamation costs and financial assurance instruments need to be discussed in the DEIS. The importance of this information to be analyzed in the DEIS can be shown by many regional EPA offices negatively rating EISs that do not contain this information. For example, EPA Region 10 has already promulgated standards for reviewing EIS's for mining projects. The agency will adversely rate any EIS that does not include adequate and complete financial assurance information. U.S. Environmental Protection Agency Region 10, <i>Region 10 Mining Financial Assurance Strategy</i> (2009) (attached hereto). The agency further states that "[e]nsuring compliance with financial assurance requirements at mineral processing facilities is an OECA national priority for 2008-2010." Id. at 6. In a 2007 comment on an mining related DEIS, Region 9 EPA requested information about financial assurance, stating "EPA believes this information is important in the EIS because the</p>	PD2,PD3
19404	<p>The DEIS should analyze whether this proposed project may have a net negative impact on the local and state economy. This should include analyzing direct costs associated with the project such as increased costs for road maintenance, operating the health, safety and environmental protection systems necessary for mining; supporting training and research and development for the industry; and providing various tax breaks and subsidies. This should include analyzing external costs such as increased costs associated with healthcare, lost productivity resulting from injury and health impacts, water treatment caused by surface mining, water infrastructure to replace damaged wells, limited development potential due to poor air quality, and social spending.</p>	SE3

19404	The DEIS' treatment of socioeconomic issues is inadequate. The DEIS acknowledges mining communities, compared to other parts of Minnesota, are characterized by poor socioeconomic conditions including higher levels of poverty and lower education rates. DEIS at 4.10-4 – 4.10-8. The DEIS, however, stops there and never attempts to analyze whether the proposed project would continue that trend of poor socioeconomic conditions. Instead, the DEIS claims that the proposed mining project would have a positive impact on the economy of St. Louis County and the region, primarily through the creation of jobs and the generation of tax revenue. DEIS at 4.10-26; see also DEIS at 4.10-15. However, its analysis is incomplete and ignores important aspects of the problem. For instance, the discussion of socioeconomics must analyze whether there are any detrimental aspects of mining economies. Socioeconomics cannot be reduced to the amount of money and jobs the project will ostensibly bring to the area but rather most consist of a robust economic analysis. It is imperative that the agencies look into the negative economic aspects of this project because a number of recent studies on mining have found that mining has an overall negative impact on state and local economies. For instance, a study on the impact of coal mining on the Kentucky state budget concluded that “the industry actually costs more than it brings to the state.” <sup>39</sup>	SE3
19405	The DEIS should also examine if there are additional economic impacts from the lost potential for jobs and other economic benefits from industries that are incompatible with surface mining both in the short- and the long-term. The very process of mining, concentrating, and refining the metal ores creates relatively permanent environmental damage, such as huge open pits, massive waste piles, extensive settling ponds, heavy metal pollution, acid mine drainage. <sup>44</sup> These reduce the attractiveness of minedover areas to new residents and businesses, making it difficult for mining areas to diversify their economies. <sup>45</sup>	SE4
19406	The dramatic effects of surface mining on the landscape and ecosystems render the land unusable for certain industries that could otherwise employ residents in an ongoing basis. Surface mining permanently limits the opportunities for new jobs in other incompatible sectors, such as sustainable harvesting of timber or tourism and recreation. The DEIS should, thus, analyze what are the lost opportunity costs.	SE3
19407	The expectations of increased employment are often based on the illusion that mining will provide long-lasting and continuously profitable employment. Studies demonstrate that not only are mining communities often less profitable than their counterparts relying on other industries, but also that the profits garnered are short-lived and followed by a period of high unemployment. <sup>46</sup> Professor Freudenburg of U.C. Santa Barbara and Lisa J. Wilson of the Watershed Research and Training Center used four criteria to analyze studies detailing the economic trend of numerous mining communities. <sup>47</sup> They ensured that the studies they utilized were performed over a significant period of time and that they provided quantitative assessments of the impacts of mining activities. <sup>48</sup> They looked only at studies which took into account at least one of the following attributes: incomes, unemployment rates, and poverty rates. <sup>49</sup> They ensured that only nonmetropolitan areas were included, so they were not influenced by uniquely metropolitan economic statistics. <sup>50</sup> While the conclusion notes that the immediate effects on income ranged mostly from neutral to positive; the analysis of poverty, unemployment and the overall trend was overall very negative. <sup>51</sup> The DEIS should analyze additional studies, including this one, to ensure that the agencies have taken a “hard look” at the socioeconomic impacts of this project.	EOO,SE3
19408	Although the DEIS acknowledges that a large portion of the St. Louis population, and its current source of income, comes from its retirement age residents, DEIS at 4.10-1 – 4.10-5, the DEIS never analyzes whether these individuals will want to remain in St. Louis with the proposed development. If these residents do not want to remain, the community could lose a large source of its income. As Professor Power notes in his report, as real earnings in St. Louis County decreased, other sources of earnings throughout the county increased. <sup>54</sup> In particular, from 1983 to 2000, earnings from Social Security payments and Medicare reimbursements increased by \$91 million. <sup>55</sup> The retired population within St. Louis county contributes a large portion of earnings into the local economy, and an increase in mining would likely bring about a decrease in retirement-related revenue because mining causes a reduction in the natural beauty and serenity of any area it takes place in, immediately reducing the appeal to prospective retiree residents. In order to take a hard look at the socioeconomic impacts, the DEIS must analyze how this project will impact the flow of retirement-related income into Iron Range communities.	SE3

Comment ID	Comment Text	Theme Codes
19409	The DEIS also ignores the volatility of the mining industry and simply assumes that the operating jobs will continue uninterrupted for 20 years. DEIS at 4.10-15. However, this assumption does not account for volatility of metal prices and increased environmental regulation, which may impact PolyMet’s decision regarding how long to operate the plant. The economic benefits of the mining industry relies on multiple uncontrollable factors. Primary among these factors is the internationally competitive nature of mining. The price and demand for metal and metal ores fluctuates on a global scale, often causing developing countries producing at a lower cost to see a higher and more consistent demand for materials. <sup>56</sup> In addition, mining is continuously undergoing technological advances, often requiring a smaller workforce than previously needed, leaving many out of work. <sup>57</sup> It is generally in the company’s best interest to employ as few as possible to cut costs while using technological advances to ensure increased production.	SE3
19410	Finally, the DEIS treatment of socioeconomic impacts with regard to closure of the NorthMet mine is inadequate. Regarding mine closure the DEIS states that “[u]nless new industry is developed in the East Range area prior to completion of these activities, it is assumed that 95 percent of working-age people formerly employed by the NorthMet Project would need to secure alternative local employment or would leave the area after this time.” DEIS at 4.10-16. The DEIS should have analyzed whether this project will permanently limits the opportunities for new jobs in other sectors incompatible with surface mining, how long it will take this community to recover from such an economic lose, whether there are mitigation measures that could address these impacts. The DEIS discussion of socioeconomics needs to include a discussion of the impacts of relying on a cyclical industry as the major economic driver of a community.	SE3
19411	In the DEIS, DNR and the Corps did not analyze the health impacts associated with air pollution, including particulate matter emissions. Instead, the agencies compared the air emissions to the National Ambient Air Quality Standards (“NAAQS”) and the state standards. DEIS at 4.6-13 – 4.6-17. The agencies concluded that, since the emissions were below these thresholds, the project’s air emissions would not have a significant effect. DEIS at 4.6-17. This analysis is not adequate and does not constitute a “hard look” under NEPA. First, as discussed above, particulate matter is a nonthreshold pollutant, meaning that any exposure above zero will have adverse health impacts. See American Trucking Associations, 175 F.3d 1027; see also 62 Fed. Reg. 38,652. Therefore, reliance on the NAAQS standards would not inform an agency about possible adverse health impacts associated with these emissions. Instead of only looking at the NAAQS and MAAQS, the agency must take a hard-look at the health and environmental impacts associated with particulate matter emissions to determine if the project’s emissions will have a significant impact. See, e.g., Uprose v. Power Authority of State of New York, 729 N.Y.S.2d 42, 46-47 (N.Y.A.D. 2 Dept. 2001) (environmental analysis that assumed all PM10 emissions were PM2.5 and compared to NAAQS was not sufficient “hard look” for an EIS because PM 2.5 is a nonthreshold pollutant). A hard look would entail determining if the air emissions associated with this project would lead to a significant increase in premature mortality, aggravation of respiratory and cardiovascular disease lung disease, decreased lung function, asthma attacks, and certain cardiovascular problems such as heart attacks and cardiac arrhythmia. The agencies should consider the studies that exist documenting the health concerns cited and other appropriate studies. <sup>60</sup> Such an analysis is especially required for particulate matter. The review for compliance with NAAQS shows that the expected 24-hour PM 2.5 predicted total ambient impact (plus the background) is 34 micrograms, which is just under the 35 microgram per cubic meter NAAQS ambient standard for PM 2.5. Given that PM 2.5 is a nonthreshold pollutant and that the NorthMet Project’s emissions are just under the NAAQS, the agencies must undertake further analysis before concluding that there are no significant public health impacts associated with these emissions.	AQ4,AQ6
19411	Second, it is known that older populations are more susceptible to the adverse health impacts associated with particulate matter, including premature mortality, aggravation of respiratory and cardiovascular disease lung disease, decreased lung function, asthma attacks, and certain cardiovascular problems such as heart attacks and cardiac arrhythmia. <sup>72</sup> Fed. Reg. 20,586 (April 25, 2007). There have been other studies that have provided compelling evidence that fine particle concentrations well below the national standard are harmful to the cardiovascular and respiratory health of our elderly citizens. <sup>61</sup> Although the DEIS acknowledges that the NorthMet project would be located in an area that has a very high elderly population, DEIS at 4.10-1 -4.10-5, the agencies never analyze the increased health risks to this segment of the population associated with these air emissions. This simply does not meet NEPA’s “hard look” requirement.	AQ6

19413	<p>In the DEIS, DNR and the Corps did not analyze the health impacts associated with air pollution, including particulate matter emissions. Instead, the agencies compared the air emissions to the National Ambient Air Quality Standards (“NAAQS”) and the state standards. DEIS at 4.6-13 – 4.6-17. The agencies concluded that, since the emissions were below these thresholds, the project’s air emissions would not have a significant effect. DEIS at 4.6-17. The agencies, however, did not compare the sulfur dioxide emissions with the new standards proposed by EPA. The agencies need to correct this analysis to compare the sulfur dioxide emissions with the new NAAQS standards that EPA is about to promulgate, otherwise the agency has failed to take a hard look at the environmental consequences of this proposed action. See, e.g., <i>Uprose v. Power Authority of State of New York</i>, 729 N.Y.S.2d 42, 46-47 (N.Y.A.D. 2 Dept. 2001). Once the Corps and DNR have performed this analysis, they will determine that the NorthMet Project will lead to a violation of the newly proposed NAAQS standard for sulfur dioxide. The DEIS states that the NorthMet Project will emit 293 ug/m3 for the 1-hour averaging time. DEIS at 4.6-17, Table 4.6-10. When you convert 293 ug/m3 to parts per billion you get 110 parts per billion. This is over the proposed new sulfur dioxide NAAQS of 50 and 100 parts per billion (“ppb”) measured over 1-hour. 74 Fed. Reg. at 64,810.</p>	AQ6
19414	<p>As discussed above, DNR and the Corps completed its air emissions impact analysis by comparing the NorthMet air emissions to the NAAQS and the state standards. DEIS at 4.6-13 – 4.6-17. Under this analysis, the agencies determined that the 24-hour PM 2.5 predicted total ambient impact (plus the background) is 34 micrograms, which is just under the 35 microgram per cubic meter NAAQS ambient standard for PM 2.5. In addition, the agencies determined that the Class II PSD Increment for 24-hour PM 10 for the project (plus the background) was 29 micrograms, just below the 30 microgram Class II PSD increment threshold. The agencies, however, did not provide the air quality modeling data for public review. Without this information, it is impossible to determine if the PM 2.5 emission inventory was sufficient and complete. For instance, the DEIS states that PolyMet will use the LTV taconite crushing equipment for NorthMet ore crushing and grinding. DEIS at 4.7-8. However, taconite does not have similar mineralogy to Duluth Complex material and crushing releases significant particulate matter. Without the modeling information, it is impossible to know whether the taconite crushing equipment emissions were inventoried and whether those emissions were assumed the same as with the taconite crushing or were updated to reflect the material that would be crushed in the NorthMet Project. Withholding this information has essentially precluded the public, including the Sierra Club, from effectively commenting on this analysis. The agencies must provide the air quality modeling data and allow for additional public comment. In addition, the agencies do not disclose whether condensable particulate matter was included in addition to filterable particulate matter in its air emission estimates. If the air emission estimates did not include condensable particulate matter, then the air emissions analysis is inadequate and the agencies determination that the Class II PSD Increment for 24-hour PM 10 and the NAAQS for 24-hour PM 2.5 were not violated is wrong. Withholding this information has essentially precluded the public, including the Sierra Club, from effectively commenting on this analysis. The agencies must provide the air quality modeling data and allow for additional public comment.</p>	AQ4,AQ8

19415	<p>In the DEIS, DNR and the Corps conclude that the NorthMet Project does not need to comply with the Prevention of Significant Deterioration Requirements (commonly referred to as the “PSD Program”) of the Clean Air Act because the “emissions from the Project are below ‘major source’ thresholds for the PSD program.” DEIS at 4.6-4. This is inaccurate. The 258,648 tons/year of carbon dioxide that the new NorthMet Project would emit far exceed the EPA’s proposed major source threshold for greenhouse gases of 25,000 tons/year.<sup>69</sup> Therefore, PolyMet is required to obtain a PSD permit for this project, which contains a Best Available Control Technology (“BACT”) emission limit for carbon dioxide. Such a limit is required by the Clean Air Act, as explained below. The Clean Air Act’s Prevention of Significant Deterioration (“PSD”) program applies to major new sources of air pollution. Among other requirements of the PSD programs, the Act imposes stringent emission limits on new major sources of air pollution based on the emission limits that would be possible if the “best available control technology” were incorporated into the design and construction of the facility. 40 C.F.R § 52.21(j)(2), App. H. See also 42 U.S.C. § 7479(3). The Clean Air Act defines “best available control technology” as follows: The term “best available control technology” means an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation under this Act emitted from or which results from any major emitting facility, which the permitting authority, on a case-by- case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such facility through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each such pollutant. 42 U.S.C. § 7479(3) (2009), App. E (emphasis added). A requirement for a facility to obtain a PSD permit with a BACT emission limit is triggered when a facility’s emissions will exceed a major source threshold for a pollutant “subject to regulation” under the Clean Air Act. 42 U.S.C. § 7475(a)(4); see also 40 CFR § 52.21(b)(50) (2007). While there has been an ongoing debate regarding whether GHG emissions, including carbon dioxide, are “subject to regulation” under the Clean Air Act, that debate will end in March 2010. In May 2009, EPA issued proposed rule to regulate GHGs from mobile sources under Title II of the CAA. 74 Fed. Reg. at 24,007 (May 22, 2009). EPA stated that it expects to finalize these final regulations in March 2010. 74 Fed. Reg. at 55,295 (“the light-duty motor vehicle rule, which EPA recently proposed and expects to promulgate by the end of March 2010”), 55,296 (“March 2010, when we expect PSD and title V requirements to be triggered for GHG emitters”). In addition, EPA has publicly announced that “it is EPA’s position that new pollutants become subject to PSD and title V when a rule controlling those pollutants is promulgated (and even before that rule takes effect). Accordingly, as soon as GHGs become regulated under the light-duty motor vehicle rule, GHG emissions will be considered pollutants ‘subject to regulation’ under the CAA and will become subject to PSD and title V requirements.” 74 Fed. Reg. at 55,300. Therefore, any major source of GHG that commences operation after March 2010 will have to obtain a PSD permit under the Clean Air Act. There is no dispute that the NorthMet Project will emit CO<sub>2</sub> and that these emissions will far exceed the EPA’s proposed major source threshold for greenhouse gases. NorthMet has stated that its direct CO<sub>2</sub> emissions (or more specifically its “carbon dioxide equivalent” (CO<sub>2</sub>-e) emissions) will be 258,648 CO<sub>2</sub>-e tons/year. DEIS at 4.6-31. These emissions exceed EPA’s proposed major source threshold for greenhouse gases of 25,000 tons/year. 74 Fed. Reg. at 55291.</p>	AQ3,AQ4A

19416	<p>The environmental review process under NEPA provides an opportunity to review the effect of agency action on the creation of greenhouse gas emissions and other climate change issues, such as the destruction of carbon sinks or decreasing the efficiency of carbon sinks. DNR and the Corps have failed to comply with NEPA because its analysis only addressed a limited subset of issues related to climate change. First, the DEIS does not address cumulative impacts of the NorthMet Project in light of climate change. The DEIS states “The potential impact of the NorthMet Project is evaluated only based on emissions of greenhouse gases from the project on its own and in combination with offsite emission generation. There are not analytical or modeling tools to reliably evaluate the incremental impact of a project’s discrete greenhouse gas emissions on the global and regional climate. In addition, there are no analytical and modeling tools to reliably evaluate any cascading impacts, cumulative effects, from a particular project’s greenhouse gas emissions on natural ecosystems and human economic systems in a given state or region.” DEIS at 4.6-32 (emphasis added). After claiming that there are no reliable modeling tools, DNR and the Corps completely shirk their obligations to examine impacts to effected resources (such as wetlands and wildlife) from climate change, including past, present and reasonably foreseeable future projects. For instance, although the DEIS acknowledges that the state of Minnesota has set a goal of reducing greenhouse gas emissions to a level at least 80% below 2005 levels by 2050, DEIS at 4.6-30, it does not address whether the NorthMet Project’s GHG emissions (258,648 CO<sub>2</sub>-e tons/year) will significantly impact the states ability to achieve that goal. It does not determine whether the incremental impact of this project, when considered with other past, present, and reasonably foreseeable future projects, will impact this state declared goal or any other possible impacts. In fact, the DEIS completely fails to determine whether the project will have a significant impact on the environment in light of climate change. DEIS at 4.6-28 – 4.6-33. Instead, the agencies simply make general statements regarding possible risks and then propose reclamation and mitigation activities to offset some of the impacts. DEIS at 4.6-32. The agencies never officially make a significance determination. In violation of NEPA, this perfunctory analysis consists solely of the conclusory opinion of agency personnel and provides nothing more than a general statement about some risk and ways to possibly mitigate those risks. See <i>Klamath- Siskiyou Wildlands Ctr.</i>, 387 F.3d at 996 (“NEPA documents are inadequate if they contain only narratives of expert opinions.”); <i>Ocean Advocates v. U.S. Army Corps of Engineers</i>, 402 F.3d 846, 869 (9th Cir. 2005); <i>Friends of the Earth, Inc. v. U.S. Army Corps of Eng’rs</i>, 109 F.Supp.2d 30, 42 (rejecting EA’s brief discussion with no analysis). It falls well short of the “hard look” that NEPA requires and fails as an assessment of the cumulative impacts. <i>Anderson v. Evans</i>, 371 F.3d 475, 486 (9th Cir. 2004); <i>Ocean Advocates</i>, 402 F.3d at 869. Climate change is the classic example of a cumulative problem; emissions from numerous sources combine to create the most pressing environmental and societal problem of our time. <i>Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.</i>, 538 F.3d 1172, 1217 (9th Cir. 2008). Indeed, “[o]ne of the most important environmental lessons that has been learned is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant when considered individually, but assume threatening dimensions when considered collectively with other sources with which they interact.” <i>Communities for a Better Env’t v. California Resources Agency</i>, 103 Cal.App.4th 98, 114. (Cal. App. 2002). As the Ninth Circuit stated in <i>Center for Biological Dive</i></p>	AQ3

Comment ID	Comment Text	Theme Codes
19417	The second way that its climate change analysis is insufficient is that the DNR and the Corps did not use climate change as an additional screen to determine if impacts to certain resources would be significant. For instance, the analysis did not address the combined effects of the NorthMet Project with the weakened physical condition and declining reproductive fitness of the Canada Lynx caused by global climate change. While the DEIS generally discusses global climate change as something that may affect “forest ecosystems, water resources, other unique ecosystems, agriculture and human health” it doesn’t take this analysis to the next level. DEIS at 4.6-28 – 4.6-33; see also DEIS at Section 4.4. For instance, the DEIS never examines how climate change is affecting the Canada Lynx, its habitat, or that of its primary prey, the snowshoe hare. DEIS at Section 4.4. The record reflects no analysis of whether or how the weakened condition and reduced habitat and prey capacity caused by climate change combine with the impacts of disturbance and harassment caused by the NorthMet Project to harm the lynx. Id. In addition, although the DEIS acknowledges that “Minnesota’s forested areas could decrease by 50-70%” it never overlays this information onto its wildlife significance analysis. For instance, it never determines whether this lose of forested lands, in conjunction with other known impacts such as corridor degradation, would lead to a significant impact on the Canada Lynx or other wildlife. See DEIS at 4.6- 29 and DEIS Section 4.4. This is not a sufficient analysis. So while the DEIS claims that the NorthMet Project will not significantly impact the Canada Lynx, see, e.g., DEIS at 4.4-32, it reached that conclusion based on a limited analysis that excluded overlaying climate impacts on top of the other impacts. See, e.g., Grand Canyon Trust v. Fed. Aviation Admin., 290 F.3d 339, 345 (D.C. Cir. 2002) (“[E]ven a slight increase in adverse conditions that form an existing environmental milieu may sometimes threaten harm that is significant. One more factory . . . may represent the straw that breaks the back of the environmental camel.”) (quotation omitted). This is not sufficient under NEPA.	AQ3
19418	NEPA’s implementing regulations mandate that an EIS discuss “possible conflicts between the proposed action and the objectives of Federal, regional, State, and local (and in the case of a reservation, Indian tribe) land use plans, policies and controls for the area concerned.” 40 C.F.R. § 1502.16. Here, the DEIS does not discuss how the NorthMet Project conflicts with the Endangered Species Act, Clean Water Act, the National Forest Management Act, the Organic Act, and other related laws.	G5A
19419	The NorthMet Project will unquestionably result in the destruction or adverse modification of critical habitat for the endangered Canada Lynx. First, the DEIS explicitly states that the NorthMet Project will destroy 1,454 acres of critical lynx habitat. DEIS 4.4.-10. Further, as discussed in the Wildlife section, supra, this project will significantly degrade critical habitat for the Canada Lynx by negatively impacting two of the lynx’s travel corridors, which are listed as critical habitat. (Specifically, the NorthMet Project will adversely impact travel Corridor 11, and completely destroy Corridor 12. Barr Report at 56.) This is a violation of ESA § 7(a)(2), which prohibits such destruction and adverse modification. 16 U.S.C. § 1536(a)(2). Nowhere in the DEIS does DNR or the Corps address the NorthMet’ Project’s conflict with this essential federal law. This is inadequate under NEPA. 40 C.F.R. § 1502.16.	WI1
19420	As discussed in detail above, the NorthMet Project’s Tailings Basin will discharge pollutants to surface water via a hydrological connection with groundwater. For at least two of these constituents, mercury and aluminum, these point source discharges would cause or contribute to the violation of water quality standards. <sup>70</sup> Thus, PolyMet would not be able to obtain a NPDES permit for these discharges. 40 C.F.R. § 122.4(i). Nowhere in the DEIS does DNR or the Corps address the NorthMet’ Project’s conflict with the Clean Water Act. This is inadequate under NEPA. 40 C.F.R. § 1502.16.	WR3I
19421	Since the DEIS ignores the fact that this project is locate on Forest Service lands, it never analyzed whether this project was in compliance with various statutes that govern national forests, specifically the Organic Act and NFMA.	PD4,CPLU3

19422	Prior to statehood, Minnesota was comprised of approximately 18.6 million acres of wetland. Minnesota Board of Water and Soil Resources, Wetlands Regulation in Minnesota, 3 (2003). Currently, Minnesota only has about half of that, approximately 9.285 million acres, remaining. Minnesota Department of Natural Resources, <a href="http://www.dnr.state.mn.us/wetlands/index.html">http://www.dnr.state.mn.us/wetlands/index.html</a> . The Minnesota Legislature adopted a policy of promoting no net loss of wetlands. See Minn. Stat. § 103A.201, subd. 2(b). Minnesota courts have also expressly held that the state has a strong policy devoted to wetland protection. See, e.g., Application of Christenson, 417 N.W.2d 607, 615 (Minn. 1987) (“[v]anishing wetlands require . . . protection and preservation”); Application of Central Baptist Theological Seminary, 370 N.W.2d 642, 649 (Minn. Ct. App. 1985) (“[w]etlands provide a unique natural ecosystem because they are capable of supporting a greater diversity of life than other habitats.”); County of Freeborn by Tuveson v. Byrson, 243 N.W.2d 316, 322 (Minn. 1976) (wetlands “are something to protect and preserve.”). The DNR estimates the total direct wetland impacts at 854.2 acres, DEIS 4.2- 9, and an indirect wetland impacts at 667.9 acres, for a total predicted impact of 1,5221.1 acres. DEIS 4.2-24. The DEIS has not proposed to replace in quantity or quality these impacted wetlands. Nowhere in the DEIS does DNR or the Corps address the NorthMet’ Project’s conflict with the Minnesota Protection laws. This is inadequate under NEPA. 40 C.F.R. § 1502.16.	WE3,WE4
19422	For the above stated reasons, the Sierra Club recommends that the DNR and the Corps reject the Polymet project or substantially revise the DEIS to address these deficiencies and provide the public with an opportunity to review and comment the document.	G10
19422	The mere fact that our State of Minnesota is even considering the swap of precious waterways and wilderness areas for jobs is incomprehensible to anyone with an understanding of the consequences of copper mining. The long-term, significant pollution threat, served up by PolyMet Mining, is a poor bargain for the short-term employment gain. Copper mining has a terrible reputation for trashing its immediate and downstream environment. Historically, copper mining has always been a rape of the land; has always contaminated rivers and lakes; has always left behind pollution and lasting damage for others to clean up. No amount of money can undo the damage and restore the mine vicinity and downstream environment to its original condition. Look to other states with mining, and you’ll find wasted land, and limits to other economic opportunities, in mining’s tracks. Look to our own state and you’ll find many environmental mistakes made with past mining ventures. The risks of PolyMet’s mining proposal far outweigh any rewards gained by job creation. All the years of environmental growth and all the future generations negatively impacted by the inevitable waste of the land, far exceed the few years of benefit the jobs will provide. We must refuse to sell our environmental health for short-term economic gain (neither ours, Canadian owned Poly- Met’s, nor it’s stock holders). Future jobs will always be created and economies will always improve, while damaged, fragile ecosystems, far too often, cannot be recovered. We must keep Minnesota clean and environmentally healthy for ourselves and for our future generations. We must not sell one of Minnesota’s most valuable resources - our natural world, which distinguishes us from most other states. The pain is simply not worth the gain. The grandeur of our Northland is too precious to risk damaging. It is through our protection of our land that we will distinguish ourselves from citizens of many other states.	G2A
19422	I have been employed on the proposed Polymet plant site and am concerned about legacy pollution from taconite mining and the probability of more serious pollution likely to result from opening up a sulfide ore body in Minnesota’s wetlands.	G9
19424	p. 1-6 "Section 401 Water Quality Certification/Waiver. Waived by default in May 2006" The DEIS should address why the Water Quality Certification was waived and if the MPCA will waive its authority in future regulation of Polymet	RFI
19426	p. 2-6 "The amount of financial assurance..." The DEIS should address the recent historical documentation of the failure of the State of Minnesota to use available statutes to require adequate financial assurance. (Reserve & LTV)	PD4
19427	p. 2.8 "...availability of new information related to potential impacts..." (2.3.4) The DEIS should address the probability that the permitting of Polymet would lead to a cascade of permits for other development in the Duluth complex. (As Duluth Metal's Rick Sandri puts it, Polymet is the snowplow and Duluth Metals is the car behind the plow. [Minnesota Public Radio, April 21, 2009 as reported in Mining Minnesota-News]) The DEIS should have an evaluation of probable effects after Polymet plows through the EIS process.	G8C

- 19427 p. 2-8 "Issues Incorporated into EIS After Scoping" The EIS should incorporate a study of why the mining industry has failed to sustain prosperous communities on the Iron Range even when those communities are almost surrounded by active mining operations. (Virginia, MN. Minntac Mine, Minorca Mine, United Taconite Mine.) G8
- 19428 p. 3.3 "The peat would be removed and stockpiled..." The DEIS does not adequately describe the disposition of peat as it applies to carbon sequestration. AQ3
- 19429 p. 3-11 "In areas where peat is present, seepage would be prevented by compressing the peat..." Peat compression did not prevent seepage at Minntac tailings pond and Dunka LTV site. (Minntac Schedule of Compliance, November 15,2007. Dunka Variances) PD10
- 19430 p. 3-48 "Closure Cost Estimate" This section should fully address financial assurance. Recent failures of the State of Minnesota to have adequate financial assurance (Reserve and LTV) should be reason to inform the public about those failures and of the likelihood that non-ferrous mining corporations will wield the same political power that created earlier failures. (Regulatory Capture) PD3,PD4
- 19430 p. 3-12 "...limiting the oxidation of the sulfide minerals..." DEIS should address the leaching of metals at neutral Ph. (Tempel, Regina N. Oxidation Kinetics of Arsenic-sulfide Minerals at Neutral Ph, 2004) PD2
- 19431 p. 3-51 "No Action Alternative" The Purpose and Need of the Project did not document any long term economic benefits. There is no assurance of long term prosperity but if the project goes forward there is documentation of long term economic and environmental liabilities. Mining rebates and subsidies should be documented as obvious supporting evidence for the No Action Alternative. ALT8
- 19432 p.3-56 "Table 3.2-2 TBM-7" Proposed use of paper mill residue should initiate a base line study of endocrine disruptors in the plant site and mine site watersheds so that added endocrine disruptors from mitigation measures can be properly assessed. Endocrine disruptors may be synergistic so a multi- generational fathead minnow test should be conducted and results included in the DEIS. PD8
- 19433 My main personal concerns with the Draft Environmental Statement (DEIS) are that it does not include an analysis of the long term economic consequences of a mining project as would be predicted by an economist familiar with the broadly accepted theory of the Resource Curse and the DEIS does not address endocrine disruptors which have been given serious consideration by Minnesota's legislature and scientific community. My wife and I have a special interest in endocrine disruptors being we were never blessed with children. We hope to protect future generations from being damaged by minerals and compounds associated with mining in Minnesota. Failure to even mention the Resource Curse or endocrine disruptors suggests that this DEIS was crafted to be defensible by mining proponents rather than to be informative for the public. SE3

3781	I urge further study on this matter. I believe the following excerpt from the DEIS is important: " In some cases the results of the deterministic modeling and the Uncertainty Analysis conflict, which makes it difficult to draw firm conclusions (Table 4.1-48). Nickel, for example, is predicted by the deterministic modeling to meet groundwater evaluation criteria in the West Pit. The Uncertainty Analysis, on the other hand, suggests that the deterministic modeling predictions underestimated nickel concentrations in the West Pit. Although the conservatism of some of the assumptions used in the Uncertainty Analysis can be argued, it is clear that the Proposed Action would exceed groundwater evaluation criteria for at least several solutes (i.e., antimony, manganese, nickel, and sulfate along several flow paths), even when accounting for high liner leakage rates and assuming natural attenuation by sorption. As indicated in Table 4.1-45, some of the waste rock stockpiles have the potential to leach solutes to groundwater for long periods (i.e., over 2,000 years), so these effects would be significant (RS74A, Barr 2008). " If the DEIS "can not draw firm conclusions" we can not in proceed with a clear conscience. The long-term (2000 year) potential consequences of this plan far exceed the short-term (20 year) economic benefits in my opinion. Thank you for you careful study of this matter.	EOO,G7B,G8B

2887	As a citizen of Minnesota I am concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. It appears to me that there will be short-term economic gains with massive long-term problems. I am primarily concerned that there will be environmental damage to surface and groundwaters in northern waters. I am firmly in opposition to this type of mining in Minnesota.	EOO,G7A
<b>Sender Last Name:</b> Schwarze		<b>Submission ID:</b> 3105
1287	Require resolution of tailings basin geotechnical stability and seepage issues identified by the Tribes and the U.S. Environmental Protection Agency.	GT2
1879	Require detailed and cumulative impacts of potential mercury increases in fish as related to the PolyMet project and other nearby pollution sources, including mercury methylation as well as discharge and emissions. All lakes in the White Iron Chain of Lakes currently have mercury advisories for fish consumption, and this is an area of vital importance to members.	WR5C,FM1,FM3,AQ4B,AQ
3502	Include cumulative air and water quality effects on lakes and rivers from all sources, including other mines. This EIS may set the standard for all water quality impacts analysis, and good cumulative impacts analysis is critical to protect water quality in the White Iron Chain of Lakes.	WR5A,CR1,AQ4B
3503	Include future development of sulfide-mining by companies already doing exploratory drilling in the analysis of cumulative effects. (Tribal position)	G9
3504	Require financial assurances in the EIS before any permitting process gets underway. (U.S. EPA position)	PD4
<b>Sender Last Name:</b> Scofield		<b>Submission ID:</b> 306
320	I am writing this letter in support of the Polymet Mining's NorthMet Project. It is my understanding that Polymet will be a 0 discharge plant in terms of water and thus there will not be any contamination of the local watershed. It is also my understanding that Polymet has spent over 20 million dollars for the EIS in order to provide an environmentally sound project. Polymet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed part of our state. There was a copper mine in the upper peninsula of Michigan that is no longer operating. It is in a very pristine area as it was when it was operating and is still after having been closed for many years. These plants can operate in harmony with nature under the current rules. In my view, due to the current rigorous environmental regulations in the State of Minnesota, the environmental risk is very small yet the reward to the state is very large. I strongly encourage you to grant Polymet the permits required to make this project a reality.	EOO

3130	If you are counting votes for this PolyMet deal, then please count my vote as “against” the PolyMet deal going forward. However, I am pessimistic when situations such as this PolyMet deal arise. Politicians will always claim credit for providing jobs for their faithful, and this PolyMet deal will prove this out. Minimally, I hope that PolyMet is required to set aside more than enough money to clean up the future messes it will no doubt create, both short-term and long-term.	EOO,G4
<b>Sender Last Name:</b> Scott		<b>Submission ID:</b> 3677
1	A stability analysis has been performed and is presented in the following document listed in DEIS Section 7.0 References: Barr Engineering Company (Barr). 2009. “Preliminary Geotechnical Evaluation, Flotation Tailings Basin.” GT01, Draft 02. March 18 A portion of the Preliminary Geotechnical Evaluation specifically addresses the structural stability of the basin and more specifically addresses the topic of liquefaction by way of the slope stability analysis performed using Liquefied Undrained Shear Strength Analysis (USSA liquefied) tailings strength parameters. The results of the analysis show slope stability safety factors within values accepted regionally for tailings basin dam construction.	EOO
2	Minnesota Rules, Chapter 7050 does not define wild rice waters as all waters where wild rice is found. Minn. Rule 7050.0224 indicates that wild rice waters within the Lake Superior Basin have been identified and listed as such in Minn. Rule 7050.0470, subp. 1. The Partridge River is not listed as discussed on p. 4.1-47 of the DEIS. In this and in other footnotes, the Tribal cooperating agencies have suggested that the numerical sulfate standard of 10 mg/l strictly applies to any water body where wild rice happens to be growing, regardless of the amount of wild rice present or the actual use of the water body for wild rice cultivation or harvesting. While PolyMet understands and respects the cultural importance of wild rice for the Tribal cooperators, it disagrees with their interpretation of the MPCA’s rules, which are the source of the relevant water quality requirements. The meaning of these rules may be an issue that must ultimately be resolved in permit proceedings, but PolyMet believes that the scope of the water quality standards applicable to wild rice waters is not nearly so broad as suggested by the Tribal cooperators. The MPCA’s water quality rules set forth two standards for Class 4 waters relevant to wild rice --- a narrative standard, prohibiting the material impairment or degradation of wild rice waters, and a numerical sulfate standard of 10 mg/l, “applicable to water used for production of wild rice during periods when the rice may be susceptible to damage by high sulfate levels.” See, Minn. Rule 7050.0224, subps. 1 and 2. The 1997 rulemaking, which added the narrative standard to the rule, also designated twenty-four specific water bodies within the Lake Superior Basin as “wild rice waters.” These water bodies with “current and/or historic stands of wild rice” were identified from a list of 124 lake and river segments located within the 1854 Ceded Territory and ranging over three different watersheds that had been submitted to the MPCA by the Fond du Lac Band. According to the Statement of Need and Reasonableness (SONAR) for the 1997 rule, only wild rice waters within the Lake Superior Basin were ultimately designated as wild rice waters by the rule, because the scope of the rulemaking was narrowed to that watershed. The SONAR indicated that the designation of any additional wild rice waters “would be considered in future rulemakings . . .” Thus, within the Lake Superior Basin, the waters to which the narrative and numerical wild rice water quality standards apply have been limited by rule to those water bodies that have been specifically designated as wild rice waters. None of the water bodies designated as wild rice waters is located downstream from the project, and thus none should be impacted by project operations. Even if could be argued that the pre-1997 numerical sulfate standard continues to apply to a broader group of waters within the Lake Superior Basin than those specifically designated --- a position that does not seem to be supported by the 1997 SONAR --- the applicability of that numerical standard is still limited to waters “used for the production of wild rice . . .” This language strongly suggests that as originally adopted, this agricultural standard was intended to apply only to wild rice beds that are actively harvested or under active cultivation, and not to any water body where wild rice happens to be found, however minimal the amount. Again, none of the downstream water bodies that may be impacted by the project meet this criterion. Moreover, the MPCA rule states that the numerical sulfate standard is merely to be used “as a guide” in determining the suitability of waters for the production of wild rice and other listed uses, and does not specify that the standard must never be exceeded.	WR1E,WR4F

3	Other reasonably foreseeable projects in the area will also affect eight of the 13 wildlife travel corridors (DEIS 4.4.5.3). And the list of reasonably foreseeable projects does not include additional likely mining projects like Duluth Metals, Franconia, Encampment Minerals, and others. The cumulative impacts on these corridors is not adequately analyzed by the DEIS.	WI5
4	My wife and I own lakefront property south of Ely. We rely on local groundwater for drinking and all household needs. We rely on surface water, and its attributes such as wild rice and edible fish, for recreation and as a scenic resource. We rely on the recreational, non-industrial character of the area for part of our income. We have serious concerns about the impacts of Polymet Mining’s proposed NorthMet project. This letter provides our comments on the NorthMet project Draft Environmental Impact Statement (DEIS). The DEIS is incomplete and unacceptable due to errors, misleading and unsubstantiated assertions, and omissions. The problems with the DEIS are not limited to the proposed NorthMet project; the project and DEIS will set a number of precedents for mining in northern Minnesota, so the DEIS must be evaluated in that context. The project should not move forward with permitting or any other activities until Polymet resolves the DEIS’s deficiencies. The Tribal findings have already addressed many of the errors, unsubstantiated assertions, and omissions in the DEIS. We generally support the Tribal conclusions, and will not repeat those findings. We will focus on additional deficiencies that make the DEIS unacceptable.	G8,G11
5	This is arguably the most important part of the NEPA process, yet the Band’s request to be a cooperating agency was not honored for over one year after our original request to the USACE St. Paul District office. Tribal concerns were not fully identified during the state-led scoping process, nor when the Scoping Decision Document was issued, because the federal lead agency did not conduct its federal trust responsibility to the tribal governments to include them “at the earliest possible point” in the EIS process. While the Minnesota Environmental Policy Act (MEPA) considers scoping to be essentially concluded with the issuance of the Final Scoping Decision Document, NEPA does not consider scoping complete until the EIS analysis is complete. This disconnect between the state and federal environmental review process created a substantial disadvantage for the Band in our ability to elevate tribal concerns early in the scoping process of this EIS. It is the Tribal cooperating agencies position that additional consultation and evaluation is needed to determine the degree of impact on the 1854 Ceded Territory as a result of this project. Although groundwater hydrology and impacts to groundwater, Cultural Resources, and impacts to wild rice were "incorporated" after scoping, cumulative effects for a number of resources were not added. To adequately determine impacts and mitigation strategies a greater understanding of groundwater hydrology at the site is required. In addition, impacts resulting from groundwater drawdown and inundation cannot be determined without additional data. Consultation is ongoing with the USACE regarding Cultural resources and impacts to wild rice.	PRO1
6	Tribal cooperating agencies disagree that the amount of ore that could escape from rail cars would be “small.” Taconite pellets currently litter most of the railroad right of way between the plant site and the proposed mine site, confirming that ore can and does spill from the gaps along the side door. Second, fugitive dust escaping through these gaps is also a concern. These very small particles have the potential to cause contamination of soils and wetlands that are located along the rail route, as evidenced by ongoing contamination issues at the Flambeau Mine in Wisconsin. Tribal cooperators are unsure how ore debris can be visually distinguished by rail track maintenance crews from other rocks and ore that litter the embankments. In addition, spillage of ore pieces into the wetlands and creeks that are located along the rail line could not be easily identified and recovered. It is reasonable to assume that some acid drainage and metal leaching would occur along the waterbodies located along the rail line.	PD5
7	Hydrometallurgical Residue Cell Design and Operations”: It is the position of the tribal cooperators that this section should describe expected leakage rates during operations as well as the long-term effectiveness of the liner system. Given that the applicant has not proposed any long-term maintenance of this system, these parameters should be described in this section and taken into account in sections of the EIS that predict long-term surface and ground water quality. “Hydrometallurgical Residue Cell Closure”: It is the position of the tribal cooperators that this section should describe expected leakage rates during operations as well as the long-term effectiveness of the cover system. Given that the applicant has not proposed any long-term maintenance of this system, these parameters should be described in this section and taken into account in sections of the EIS that predict long-term surface and ground water quality.	PD2

Comment ID	Comment Text	Theme Codes
8	It is the position of the tribal cooperating agencies that the existing Closure Plan is insufficient to allow an adequate assessment of post-closure impacts. The Proposed Action has changed significantly since the development of the Closure Plan, and additional detail is needed to appropriately inform post closure impacts, since those impacts depend on the specific plans and methods used to close the mine. For example, the conclusions of the West Pit Lake Uncertainty Analysis indicate that "some of the waste rock stockpiles have the potential to leach solutes to groundwater for long periods (i.e., at least 2000 years)." Water quality of the leachate would "exceed USEPA primary MCL's and MDH Health Risk Limits." In order to adequately assess the environmental impacts of the Proposed Action, additional detail on the specific environmental impacts of this leachate and information about the remediation activities that would be needed to avoid damage to surrounding waters should be included in the Closure Plan.	PD7
9	Mine Pit - East/Central Pit Category 4 Foot Wall Cover: It is the position of the tribal cooperating agencies that this section should describe the long-term effectiveness of the geosynthetic membrane that is proposed to cover the Virginia formation rock wall. Given that the applicant has not proposed any long-term maintenance of this system, expected long-term leaching rates should be described in this section and taken into account in sections of the EIS that predict long term surface and ground water quality.	PD3
9	West Pit Filling: It is the position of the tribal cooperating agencies that this section should acknowledge that the pit lake will remain at the site in perpetuity and will exceed water quality standards, and should clearly discuss its status as a "water of the state."	PD2
10	The Proposed designs of the waste rock stockpiles are consistent with those employed throughout the Minnesota Iron Range in similar, if not nearly identical, geotechnical and hydrogeologic settings. These designs have proven to be effective and stable for over 50 years. As such the waste rock stockpiles stability is not expected to be problematic. The addition of the stockpile liner systems and in particular the stockpile subgrade preparation that must precede liner construction will only serve to improve stability of the stockpiles. Existing evidence and subgrade improvement plans notwithstanding, it is routine for stability analysis to be performed and submitted as part of permitting, affording sufficient opportunity for further public review and comment. However, preliminary analysis can be provided for the FEIS to document the basis for conclusions regarding stockpile stability.	EOO
11	Analysis of rock buttressing to increase the geotechnical stability of the northern slope of tailings basin Cell 2E has been provided in conjunction with the submittal of the Barr Engineering Company (Barr) 2009 "Preliminary Geotechnical Evaluation, Flotation Tailings Basin." The analysis clearly predicts the success of the buttressing approach. Buttress material will be obtained from existing waste rock and/or overburden stockpiles near the tailings basin. As such, any impacts on the environment should be near neutral as compared to existing conditions. Further, since it is inevitable that certain things will not be known before operations begin, it is common practice to employ a design-build approach (a.k.a. the Observational Approach) to allow the design to be periodically reviewed and modified to optimize the design based on observations made throughout the life of the tailings basin, rather than based on data obtained and assumptions made only prior permitting and construction.	EOO
12	Proposed designs of the waste rock stockpiles are consistent with those employed throughout the Minnesota Iron Range in similar, if not nearly identical, geotechnical and hydrogeologic settings. These designs have proven to be effective and stable for over 50 years. As such the waste rock stockpiles stability is not expected to be problematic. The addition of the stockpile liner systems and in particular the stockpile subgrade preparation that must precede liner construction will only serve to improve stability of the stockpiles. Existing evidence and subgrade improvement plans notwithstanding, it is routine for stability analysis to be performed and submitted as part of permitting, affording sufficient opportunity for further public review and comment.	EOO

13	<p>During development of the preliminary design for the Hydrometallurgical Residue Facility cells, the MDNR and PolyMet specifically discussed the design of the cell cover system and the potential need for long term management or potentially management in perpetuity of liquid recovered from the cell drainage collection system. This drainage would result from the small amount of infiltration that could occur through the single geomembrane barrier component of the cell cover system that was initially proposed, while being prevented from escaping the cell by the composite liner system. To minimize the infiltration to the maximum extent practicable, PolyMet subsequently proposed supplementing the cover systems' geomembrane barrier layer with an underlying geosynthetic clay layer. This composite cover system design exceeds regulatory design requirements for industrial solid waste management facilities and designs normally implemented in the State of Minnesota, minimizes the potential for future infiltration by providing a final cover system with performance matching or exceeding the performance of the liner system, and will thereby minimize and likely eliminate long term drainage management requirements after operating water is removed from the cell. The capability of the proposed composite cover system to virtually eliminate infiltration and thereby eliminate the need for long term pumping and water treatment is evidenced by the composite cover performance computations presented in Appendix I of PolyMet Technical Design Evaluation Report RS28T (Barr, 2007), which show zero inches of infiltration through the cover at closure. Perpetual maintenance of liner systems is not required. After liner construction, the liner is covered with the hydrometallurgical residue and thereafter is never again open to the environment; it is protected by the overlying layer of residue. Access to the liner therefore becomes unnecessary. This is the case for all permanent lined solid waste management facilities – once the liner is covered with the site-specific waste being disposed of, the liner is permanently protected, requires no maintenance, and is never again accessed. Similar to liner systems, the barrier layer components (i.e., geomembrane, geosynthetic clay) of final cover systems are also permanently covered with protective soil layers to prevent future damage from animals, hail storms and other natural events that might otherwise cause harm to the barrier layer component of the cover system. Since the barrier layer is protected, its hydraulic barrier function remains intact long term and no maintenance to the barrier layer of the cover system is required. Maintenance of the soil components of the cover system above the final cover system barrier layer is required, particularly during the first several years after completion of cover construction. During this time period cover vegetation is still becoming established and it is common for occasional erosion repair and reseeded to be required until a dense stand of vegetation is established. In the long term, little to no maintenance of the final cover system is required, particularly for sites where an open meadow type end use is envisioned, such as with the Hydrometallurgical Residue Facility cells.</p>	ALT8

14	A stability analysis has been performed and is presented in the following document listed in DEIS Section 7.0 References: Barr Engineering Company (Barr). 2009. "Preliminary Geotechnical Evaluation, Flotation Tailings Basin." GT01, Draft 02. March 18 The analysis presented in the Preliminary Geotechnical Evaluation was based on review of historic geotechnical information for the tailings basin and on the performance of additional geotechnical exploration in 2007 specifically in support of the DEIS and future permitting. The slope stability safety factors determined from the additional exploration and analysis have previously been presented and are summarized as follows: Slope Stability Analysis Slope Stability Safety Factor Target Minimum Factor of Safety for Year 20 Proposed Conditions Section F Section G Section N ESSA ~1.5 2.63 2.86 3.22 USSA peak ~1.3 1.64 1.63 1.88 USSA liquefied ~1.05 1.055 1.06 1.11 In all cases the slope stability safety factors met or exceeded the target values. In the event that higher slope stability safety factors are desired by PolyMet for the USSA liquefied case and/or if performance monitoring during the life of the tailings basin shows slope stability safety factors lower than anticipated, the slope can be buttressed to improve safety factor values as follows: Slope Stability Factor of Safety with Varying Buttress Height Top of Buttress Elevation (feet) Section F Section G Buttress Height (feet) Factor of Safety Buttress Height (feet) Factor of Safety 1535 48 1.06 31 1.06 1540 53 1.09 36 1.07 1545 58 1.11 41 1.09 1550 63 1.12 46 1.10 1555 68 1.13 51 1.12 1565 78 1.17 61 1.15 The geotechnical analysis presented as part of the Preliminary Geotechnical Evaluation clearly demonstrates the viability of the proposed rock buttress approach and the increased slope stability safety factors that result. Use of buttressing is a common approach to improving slope stability and adjustments can be made to the design of the buttress if monitoring performed throughout the life of the proposed 20-year project shows a need for increased buttressing, thereby mitigating associated risks. It should also be noted that in the context of a tailings basin whose configuration (i.e., dam height, dam construction status, seepage condition) changes throughout its life, the geotechnical evaluation of the dam is ongoing. The stability conditions are continually evaluated as performance monitoring data is gathered and analyzed. Therefore, preparation of definitive and final slope stability analyses prior the initiation of the project is not possible and not prudent. It is imperative that the ongoing performance of the dam be monitored throughout the projected 20-year life of the project and for some period of time thereafter, that adjustments to the dam design be made as needed to maintain targeted slope stability factors of safety, and that facility permits accommodate this required flexibility.	EOO
15	There are numerous methods that could be used to mitigate water quality of the West Pit during pit filling (an approximate 45 year period) and many of these methods are described on pages 4.1-166 and 4.1-167. As stated in DEIS (page 4.1-167), if these mitigation measures were not successful at improving West Pit water quality to applicable discharge limits at the time of overflow, the West Pit overflow structure could be altered to route flows to the WWTF for treatment before discharge until the overflow would meet applicable discharge limits. Treatment at the WWTF (if needed at all) is not expected to be required long-term as pit wall oxidation would be negligible once the West Pit is completely flooded, thereby significantly reducing solute loadings to the pit lake.	EOO
16	There are numerous methods that could be used to mitigate water quality of the West Pit during pit filling (an approximate 45 year period) and many of these methods are described on pages 4.1-166 and 4.1-167. As stated in DEIS (page 4.1-167), if these mitigation measures were not successful at improving West Pit water quality to applicable discharge limits at the time of overflow, the West Pit overflow structure could be altered to route flows to the WWTF for treatment before discharge until the overflow would meet applicable discharge limits. Treatment at the WWTF (if needed at all) is not expected to be required long-term as pit wall oxidation would be negligible once the West Pit is completely flooded, thereby significantly reducing solute loadings to the pit lake.	EOO
17	As noted in the response to Footnote 3 (p. 3-10), this comment ignores the significant time and effort that PolyMet and the permitting agencies have made to develop this project 'with the end in mind' of preventing long term impacts or the need for long-term post closure activities.	EOO

18	It is correct that much of the area north of the Tailings Basin is fully saturated, with the water table at or very near the ground surface. In these areas, there would be very little aquifer recharge. However, approximately 30% of the area between the toe of the Tailings Basin and the power line to the north is composed of upland area, where recharge would be occurring. The 0.3 inches per year recharge rate referenced in the DEIS represents the average over the entire area (both upland and wetland) north of the Tailings Basin which is made up of zones where no recharge is occurring and zones where recharge is occurring. This rate is less than 5% of the regional average annual recharge rate for this part of the state (Delin and Falteisek, 2007, USGS Fact Sheet 2007- 3002).	EOO
19	In PolyMet’s review of the July 31, 2009 PDEIS it was suggested adding a clarifying sentence that said, “[The USEPA primary drinking water standard] is the maximum allowable amount of a contaminant in drinking water that is delivered to the consumer, reflecting required water quality after treatment.” This sentence was not incorporated into the published DEIS.	WR3I
20	Our members also share a deep concern for water quality, biodiversity, wetland conservation, land use, and many other types of environmental factors that would be negatively affected by the proposed PolyMet Mine. Our analysis of the DEIS has revealed a number of major deficiencies in the DEIS and the potential for enormous harm to the environment and natural resources from the Proposed Project. We do not believe that the Proposed Project should proceed unless and until all of the deficiencies are addressed and mitigation measures are in place to fully deal with all of the potential environmental harms.	G8
21	6. The DEIS fails to analyze surface ownership of the lands needed for the Proposed Project. The federal government owns the surface lands needed for the open pits of the Proposed Project. These lands are managed by the U.S. Forest Service as part of Superior National Forest. The lands were acquired by the federal government under authority of the Weeks Act, and it is the federal government's legal opinion that these lands cannot be used for open pit mining. Yet the DEIS fails to address or analyze the surface ownership issues, options for how these issues might be resolved, or environmental impacts for any such alternatives. The Proposed project cannot move ahead with a resolution to this issue, so it is astounding that the DEIS did not address this issue and fully analyze the impacts from the options. This is a major failing of the DEIS, and must be corrected in the Final EIS.	PD8,CPLU4
22	7. The DEIS fails to analyze any alternatives to open pit mining. The DEIS looked at only one option for mining the minerals in the Proposed Project area: open pit mining. The Proposed Project envisions the excavation of three open pits at the Mine Site. Other options, such as underground mining, were never considered. These other options would have significantly different environmental impacts, and perhaps less severe environmental impacts than open pit mining. Yet no other option to open pit mining was considered in the DEIS, so the public has no opportunity to evaluate other options and their associated environmental impacts.	PD4
23	8. The DEIS fails to adequately analyze impacts of increased sulfates on wild rice. The PolyMet Mine will result in enormous sulfate releases that will exceed the state standard for wild rice, which is sensitive to sulfates. These sulfates will likely eliminate wild rice in the Partridge and Embarrass Rivers, and diminish the famous wild rice beds in the St. Louis River estuary near Duluth, which is 100 miles away from the mine. Wild rice is a key food source for many species of waterfowl, and plays an important role in the culture and diet of Native Americans. 6 Minnesota has established a Wild Rice Standard limiting sulfates to 10 mg/L to permit wild rice to thrive. (Minnesota Rules 7050.0224). This standard was established based on research by Minnesota biologist John B. Moyle, who established the relationship between wild rice and sulfates in the 1940s. In 1944, Moyle wrote in the Journal of Wildlife Management, "No large stands of rice occur in waters having a sulfate content greater than 10 p.p.m., and rice generally is absent from water with more than 50 p.p.m." (Journal of Wildlife Management, 1944, Vol. 8, pp.177-184.) Mr. Leonard Anderson, in his comments on the DEIS, has extensively documented the presence and quality of wild rice stands on the Partridge, Embarrass, and St. Louis Rivers, and correlated the presence and health of these stands with sulfate levels. The League endorses his comments, his analysis, and his recommendations on wild rice and sulfates. The DEIS did not adequately analyze impacts of the increased sulfate levels on wild rice in the Partridge, Embarrass, and St. Louis Rivers. This failure must be rectified in the Final EIS.	WR1E,WR4F

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
24	9. The DEIS fails to adequately analyze increased mercury methylation and mobilization from the Proposed Project. Increased levels of sulfates leached from the PolyMet Mine will increase mercury accumulated in fish tissues, causing harm not only to the fish but to animals and people who eat the fish. The DEIS did not adequately analyze the potential impact of the mine on mercury levels in downstream waters and fish. The discussion of methyl mercury is one of the most significant inadequacies in the PolyMet DEIS and one of the greatest threats should the Proposed Project move ahead as proposed in the DEIS.	WR4B,AQ6A
25	a) Inadequate analysis of mercury sequestration in peat bogs. The proposed mitigation, to replace these wetlands with artificially constructed wetlands in Aitkin and Pine Counties, will result in substantial mercury impacts to the Lake Superior watershed. This wetland mitigation proposal should therefore be rejected through the Section 404 permit process with the U.S. Army Corps of Engineers.	WE3,WE8
26	b) The DEIS admits that the Mine Site would result in an increase of 7-42% in the export of methyl mercury into the watershed, which would be transported down the Partridge River to Colby Lake, both water bodies of which already have prohibitively high mercury in fish tissue.	WR4B,FM1,FM5
27	c) No TMDL (Total Maximum Daily Load) process has yet started let alone implemented for the St. Louis River watershed as required by Section 303 of the federal Clean Water Act, despite the listing of these water bodies as impaired by mercury currently. The addition of mercury from the Proposed Project makes it unlikely that this mercury contamination could ever be remedied.	WR4B
28	d) The DEIS fails to adequately address the significance of sulfate releases and their impacts on increased methylation of mercury. The sulfate-reducing bacteria that produce methyl mercury require carbon, water, sulfate, and mercury. The huge increases in sulfates by the Proposed Project will increase the methylation of mercury in the Partridge, Embarrass, and St. Louis Rivers, including the St. Louis River estuary. (See Compeau, G.C. and R. Bartha, "Sulfate-reducing bacteria: Principal methylators of mercury in anoxic estuarine sediment," Applied and Environmental Microbiology, 1985, Vol. 50, pp. 498-502.)	WR4B
29	10. The DEIS fails to adequately analyze the impacts to wildlife corridors impacted by the Proposed Project. The PolyMet mine will obstruct at least two of the remaining 13 corridors where wildlife can cross the 120 miles of the Mesabi Iron Range. These corridors are important not only for mammals like moose and wolves but also for the northward migration of the deciduous forest and all its components in the face of climate change. The DEIS ignored the mine's impact on wildlife corridors.	WI5
30	11. The DEIS fails to adequately analyze the unstable tailings basin that the company plans to utilize for the Proposed Project. PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials, but the stability of the tailings basin has been a serious concern since the project was first proposed, and has resulted in multiple designs. The DEIS acknowledges the potential for basin structural failure: "The NorthMet Tailings Basin and hydrometallurgical residue facility embankments would have a low margin of safety due to fines and underlying soils in the existing LTVSMC Tailings Basin" (S-10). The DEIS and PolyMet have failed to address the safety issues, indicating instead that "further design and analysis would occur during permitting ..." (4.13-2). Failure of the basin would result in serious and long-lasting contamination. A complete stability analysis and acceptable basin design should be a part of the Final EIS. Before any of Poly Met's tailings are deposited on top of existing tailings, existing structural deficiencies must be resolved. The tailings basin will contain extremely hazardous waste materials. An appropriate design is critical, and should be identified in the DEIS.	GT1

- 30 1. The Draft EIS fails to describe or analyze impacts of the proposed action on the wilderness character of the BWCAW. The Boundary Waters Canoe Area Wilderness (BWCAW) is a federally designated wilderness area protected by Congress. The BWCAW was an original unit of the National Wilderness Preservation System. It is the most heavily visited wilderness in the national wilderness system. People from all over the nation, and indeed from all over the world, come to visit the area because of its wilderness character. The Wilderness Act, 16 U.S.C. § 1131, et seq., governs the administration of the Boundary Waters Canoe Area Wilderness. Section 4(b) of the Wilderness Act imposes on the federal government a fundamental duty to protect the wilderness character of designated wilderness, above all other purposes for which an area may be established: Except as otherwise provided in this Act, each agency administering any area designated as wilderness shall be responsible for preserving the wilderness character of the area and shall so administer such area for such other purposes for which it may have been established as also to preserve its wilderness character. Except as otherwise provided in this Act, wilderness areas shall be devoted to the public purposes of recreational, scenic, scientific, educational, conservation, and historical use. 16 U.S.C. § 1133(b) (emphasis added). The agency's duty to preserve wilderness character is non-discretionary. Nothing in the Wilderness Act allows an agency to avoid that duty and authorize the degradation of the wilderness character of a designated area. The Boundary Waters is also governed by the Boundary Waters Canoe Area Wilderness Act of 1978, which aims, in part, to "protect[], enhance[], and preserv[e]" the "natural values" of the BWCAW. 92 Stat. 1649 § 1 (1978). The federal agencies that manage wilderness use four qualities of wilderness in their analysis of wilderness character. The four qualities are "untrammled," "undeveloped," "natural," and "solitude or a primitive and unconfined type of recreation." See Peter Landres et al, Keeping It Wild: An Interagency Strategy to Monitor Trends in Wilderness Character Across the National Wilderness Preservation System, Gen. Tech. Rep. RMRS-GTR-212. The analysis of impacts from the proposed project on the wilderness character of the BWCAW is not addressed in the DEIS. 2 At least several types of impacts to wilderness character must be analyzed. These include but should not be limited to noise and sound impacts from drilling, blasting, processing, etc.; impacts on the night sky from lights associated with the project; and impacts on air quality. Sound and noise impacts to wilderness character are much more sensitive than the common noise standards cited in the DEIS at Table 4.7-3. In a recent court case dealing with impacts to wilderness character of the BWCAW, the federal court found: On the other hand, agency activity that results in noise that is louder, more constant, more frequent, or of a different quality, is more likely to degrade the wilderness character from its present condition and thus violate § 4(b). See Izaak Walton League v. Kimbell, 516 F. Supp. 2d at 990. As such, any noise from new mining operations heard within the Boundary Waters has the potential to degrade wilderness character, and such impacts must be thoroughly analyzed to comply with NEPA. The Final EIS for the PolyMet Mine must analyze impacts on the wilderness character of the BWCAW. If this analysis shows impacts to wilderness character, the Proposed Project must not move forward.
- 31 2. The Draft EIS fails to adequately analyze impacts of the proposed action on haze and visibility in the airshed above the Boundary Waters Canoe Area Wilderness. Both the Boundary Waters Canoe Area Wilderness (BWCAW) and Voyageurs National Park are classified as Class I areas under the federal Clean Air Act. As such, both areas fall under the Clean Air Act's Prevention of Significant Deterioration (PSD) program. 42 U.S.C § 7472. The "Class I" status provided to Voyageurs National Park and to the BWCAW meant, among other things, that existing visibility impairment would have to be eliminated. 42 U.S.C. §§ 7491-92. Both the US. Forest Service and National Park Service testified before the Minnesota Pollution Control Agency in November 2009 that the State's Regional Haze State Implementation Plan (SIP) will not result in meeting the ultimate goal of haze reduction by 2064. Despite this testimony, the agency approved the Revised Regional Haze SIP on December 15, 2009, and sent the plan on to the federal Environmental Protection Agency (EPA). EPA has yet to decide whether to accept the Minnesota SIP. The DEIS, page 4.6-55, admits that even the interim goal of haze reduction set for 2018 will not be met with the Proposed Project. The DEIS is silent on whether with the additions of pollutants from the Proposed Project that the ultimate goal can be achieved by 2064. This failure to adequately analyze these impacts must be corrected. The Final EIS for the PolyMet Mine must more adequately analyze impacts on visibility and haze in the BWCAW, the contribution of the Proposed Project to the projected failure to reach the interim haze goal for year 2018, and the impacts of the Proposed Project on achieving the ultimate elimination of haze by year 2064.

32	3. The DEIS fails to fully analyze the waste rock piles from the Proposed Project that will contaminate run-off water for up to 2,000 years. The DEIS, Table 4.1-45, shows that water run-off from the waste rock piles generated by the Proposed Project will be contaminated for up to two millennia. Mines that cause such lengthy contamination and/or require perpetual treatment should not be permitted. It is unlikely that PolyMet Mine corporation will still be in existence in 100 years from now, let alone for 2,000 years. The DEIS does not examine how mitigation measures such as liners, etc., will still be operating after 2,000 years.	WR2D,WR3I
33	The DEIS also fails to properly examine how financial assurance will be in place to cover contaminated run-off for up to 2,000 years. The DEIS also fails to properly examine how water treatment will be conducted for up to 2,000 years. These glaring shortcomings must be corrected in the Final EIS.	EOO
34	4. The DEIS fails to adequately analyze the West Pit's discharging of polluted overflow water at year 65. 4 The DEIS, page 4.1-113, predicts that the West Pit will begin overflowing at year 65, and discharging heavy metals such as arsenic, cobalt, selenium in excess of water quality standards (according to one analysis in the DEIS) or cobalt, copper, and nickel in excess of water quality standards (according to another analysis). Both analyses predict high sulfate concentrations as well (DEIS 4.1-113). Minnesota should not allow pollution of its waters with heavy metals and high sulfates. Sulfate pollution also exacerbates mercury methylation, which increases bioaccumulation in fish tissues, making them unsafe to eat. The DEIS fails to adequately analyze the environmental impacts and possible mitigation measures for the overflow of the West Pit in year 65. The DEIS fails to adequately analyze the financial assurance needed to respond to the overflowing of these contaminated waters. The Final EIS must analyze these problems.	EOO,WR3A,WR3I
35	5. The DEIS fails to adequately analyze all of the impacts related to the destruction of more than 1,500 acres of wetlands. The Proposed Project would cause direct and indirect impacts to over 1,500 acres of wetlands. Most of the wetlands that will be impacted at the mine site are peatlands. Peatlands have been identified as one of the best terrestrial environments for sequestering carbon, a contributor to global warming.	WE2
36	The destruction of 1,000 acres of peatlands would result in a two percent increase in Minnesota's overall carbon dioxide emissions. The DEIS acknowledges that "project facilities and operations would result in additional greenhouse gas (GHG) emissions in the Arrowhead region" (S-10).	AQ3
37	The peatlands at the proposed mine site have been identified as high quality wetlands in federal and state inventories. The peatlands represent habitats that are increasingly rare on the landscape, and should be protected from destruction. Reports commissioned by the Minnesota Legislature and by Governor Pawlenty call for the protection of peatlands because of their ability to capture and secure carbon. Minnesota needs to heed these recommendations and halt any further destruction of these valuable habitats.	WE1

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
38	<p>The first concern is that I have found no suggestion that a Generic EIS may be needed for sulfide mining projects in northern Minnesota. PolyMet's NorthMet Project is anticipated to be the first of several proposals for sulfide mining of precious metals in northern Minnesota. At least two other proposed mine projects have been made public: Duluth Metals and Antofagasta's "Nokomis Project" near Birch Lake and the Kawishiwi River, and Franconia Minerals' "Birch Lake Project" at Birch Lake. I understand that there are numerous mining exploration permits to search for precious metals in the Duluth Complex rocks. I understand that if ore containing small percentages of precious metals is found, mines would be proposed which would presumably utilize similar sulfide mining processes to extract precious metals from the rocks. A Generic Environmental Impact Statement (GEIS) is a specific form of environmental review that can be used to study certain types of projects not adequately reviewed on a case-by-case basis. The authorization for conducting alternative forms of environmental review, such as a GEIS, is found in Minnesota's Environmental Policy Act, MS 116D.04, Subd. 4a. Specific criteria for determining the need for a GEIS and the unit of government most appropriate to oversee its preparation, and the general process and content of a GEIS are identified in Minnesota Rules, part 4410.3800. Although only the Minnesota Environmental Quality Board (EQB) is authorized to order a GEIS, any person or government body may request the EQB to consider the preparation of a GEIS. I suggest that MN DNR and US ACE ought to be requesting the EQB to order a GEIS for sulfide mining in northern Minnesota. According to Minnesota Rules, part 4410.3800, a GEIS may be ordered by the EQB to study types of projects that are not adequately reviewed on a case-by-case basis. Subpart 5 lists twelve criteria to be considered in determination of the need for a GEIS. I think at least nine of the twelve criteria are relevant to sulfide mining projects in northern Minnesota. Those criteria are listed below: A. if the review of a type of action can be better accomplished by a generic EIS than by project specific review; B. if the possible effects on the human environment from a type of action are highly uncertain or involve unique or unknown risks; C. if a generic EIS can be used for tiering in a subsequent project specific EIS; D. the amount of basic research needed to understand the impacts of such projects; E. the degree to which decision makers or the public have a need to be informed of the potential impacts of such projects; G. the potential for significant environmental effects as a result of the cumulative impacts of such projects; H. the regional and statewide significance of the impacts and the degree to which they can be addressed on a project-by-project basis; K. the need to explore issues raised by a type of project that go beyond the scope of review of individual projects; and L. the need to understand the long-term past, present, and future effects of a type of action upon the economy, environment, and way of life of the residents of the state.</p>	G10
39	<p>My second concern is that numerous position statements and comments submitted by the tribal cooperating agencies have not been adequately addressed in the DEIS. The tribal cooperating agencies have a multitude of well-reasoned arguments and differences of opinion with the content and conclusions in the DEIS. I counted 262 such position statements and comments in the footnotes to the DEIS. When the environmental review process for the NorthMet Project began, I was pleased to learn that tribal agencies representing Minnesota Chippewa tribes covered by the 1854 Treaty had seats at the table in the DEIS process. However, when I first looked at the DEIS, I was very disappointed that the differing opinions of the tribal cooperating agencies were relegated to footnotes in a smaller font than the rest of the DEIS document. It seems that the preparers of the main text of the DEIS are not adequately familiar with or respectful of the treaty rights reserved for the Ojibwe/Chippewa tribes in the 1854 Treaty. The 1854 Treaty is federal law. When the land in the NorthMet Project area was ceded to the United States, the Ojibwe chiefs who agreed to the treaty wisely reserved rights to hunt, fish, and gather in the ceded lands. If the MN DNR and US ACE do not address the position statements of the tribal cooperating agencies, it seems that both MN DNR and US ACE would be vulnerable to lawsuits aimed at protecting tribal treaty rights reserved in the 1854 Treaty. It seems to me that in the face of huge state and federal deficits and difficult economic times, it would not be prudent to allow our state and federal agencies to be vulnerable to such treaty rights litigation. Out of respect for the position statements and comments submitted by the tribal cooperating agencies, I have compiled the 262 footnotes from the main document of the DEIS, and I put them in a 12-point font that matches the main text of the NorthMet DEIS document. This compiled set of DEIS footnotes is 35 pages long. I have attached a copy of this compilation to this message. I ask that the MN DNR and US ACE please address all of these position statements and comments before issuing a final EIS.</p>	G10

Comment ID	Comment Text	Theme Codes
40	When we are not in our Ely home, we rely on the income it provides when we rent it for short-term vacation rentals. Our customers rent our cabin because of the peace, the clean environment, the recreational opportunities, and the non-industrial character of the area. The NorthMet project threatens these values, and therefore our ability to rent the property and to sustain our income. The recreational values that NorthMet threatens include viewing lakes and rivers with wild rice, catching fish that can be eaten, and enjoying natural, unpolluted air and water. Some of the nearby lakes already have warnings about mercury in fish, so even a small incremental impact from Polymet could eliminate recreational fishing for edible fish. Degrading these scenic and recreational resources threatens our income. The Ely area and many of its businesses, such as our cabin rental, have invested and worked hard for many years to create a reputation and an image of a clean, unpolluted, non-industrial, relatively noise-free recreation area. Degrading even the “Ely image” or the “Ely brand” threatens those investments and their economic benefits. The DEIS addresses only the purported positive benefits that the mine would bring, namely jobs during the mine’s operational period. The DEIS is deficient in ignoring mining’s well-documented history of long-term, negative impacts on communities.	SE4
41	The DEIS is deficient in addressing cumulative impacts of the NorthMet project and other exploration and mining. The United States Forest Service (USFS) is currently considering applications for dozens of additional exploration and mining projects, as described in the Federal Hardrock Minerals Prospecting Permits Project (FHMPPP) ( <a href="http://www.fs.fed.us/r9/forests/superior/projects/prospecting.php">http://www.fs.fed.us/r9/forests/superior/projects/prospecting.php</a> ). The NorthMet project must identify, analyze, and discuss mitigations for the cumulative impacts of NorthMet in the context of these other proposed activities. The impacts include, but are not limited to, air and water quality (e.g., sulfate and mercury impacts on plants and animals, acid drainage, etc.), traffic and noise, and socioeconomic impacts..	G8C
42	Our property is almost adjacent to USFS land. The DEIS mentions a land exchange between NorthMet and USFS, but the DEIS gives no information on the land to be exchanged. This exchange land becomes part of the NorthMet project. The DEIS is not complete if it does not describe in detail the location, extent, and character of these exchanged lands. How might these lands, potentially adjacent to our property, be impacted by future exploration and mining on USFS land, such is in the FHMPPP?	PD1
43	The DEIS analyses impacts primarily over a 5-mile radius from the project site (e.g., Figure S-2). The environmental and socioeconomic impacts will occur over a much larger area. If DEIS is to claim credit for mitigations as far away as Aitkin and Hinckley (e.g., Table III-1, page S-19), it must also address impacts over a similar area. The impacted area includes our cabin south of Ely, and other nearby areas where natural and non-industrial characteristics are the foundation for their recreation-based economy.	CR1
44	The DEIS mentions “legacy cleanup responsibilities” (page S-21), and there are many other monitoring, maintenance, and potential remediation requirements that will continue for a very long time after the mine stops operations. Guaranteeing geotechnical stability of the tailings dam is just one aspect of this long-term requirement. Polymet must make financial provisions for these, well before the end of its operations. The DEIS implies that taxpayers are to fund these NorthMet obligations.	PD3,PD4
45	This letter is in support of the Draft Environmental Impact Statement prepared by the State of Minnesota and various federal agencies on the proposed NorthMet mining and processing Project of PolyMet Corporation. I have read the entire document and have found it to be comprehensive in addressing the issues and alternatives for the proposed NorthMet mine and operation. From my review and in discussions with my staff, the effort put forth by the various State and Federal agencies, in conjunction with PolyMet and the myriad of consulting specialists, demonstrates the range of topics identified and addressed, including the recommendation of best practice alternative solutions in order to minimize and/or mitigate environmental impacts from the project. Duluth Metals therefore recommends that the State and Federal agencies proceed in a prudent, yet timely manner to complete their review of the draft comments and proceed with the Final Environmental Impact Statement on the Project.	EOO
46	I am submitting these comments on behalf of Kristin Henry for the Sierra Club. Please confirm receipt. A hard-copy of the comments and a digital copy of the attachments will follow via FedEx overnight mail.	RFI

47	The tribal cooperating agencies were highly dissatisfied with the lead agencies' attempt to edit or eliminate the tribal alternative position statements in the draft of the EIS that would be released for public review, and with their initial intent to prevent the tribal cooperators from conducting a final review of the DEIS before it was published. Fond du Lac and Grand Portage both formally invoked the dispute resolution process provided in the MOU for the PolyMet EIS cooperating agencies. For the record, Fond du Lac is not satisfied that our positions are presented in the DEIS as we intended them to be, and we do not believe that our status as a cooperating agency has been fully afforded. We attempted to bring specific expertise on issues of tribal concern to this EIS process, and engaged with other federal agencies (USEPA, USGS) to bring better science and analysis to bear in the process, but our efforts have been largely dismissed. The potential for this project to create significant adverse impacts to reservation and treaty-protected resources is of grave concern to Fond du Lac, and we take this opportunity to repeat our positions on flawed analyses and conclusions, lack of supporting data, EIS inadequacies, and new issues identified in our review of this draft document.	G8
48	Clearly, a federal land exchange process is a connection action, in that the Project cannot proceed unless the exchange is legally completed, and the exchange itself depends upon the larger action for justification. EPA Region 5 comments on the July 2009 draft of the EIS explicitly point out that the requisite EIS process for the federal land exchange should be conducted within this EIS process, as they are connected actions: "EPA finds it difficult to consider the U.S. Forest Service (USFS) land exchange as a separate action. Based on the interpretation of its authorities, USFS maintains that a land sale or transfer must occur for the applicant to access the mineral body, currently on public land. The PDEIS indicates that effects of land transfer will be addressed in a separate analysis prepared by the USFS. We further note that some direct impacts to tribal uses are related to the transfer of public land out of the Ceded Territory. We question how assessing the impacts of the connected action can be deferred to a separate analysis. (Kenneth Westlake, U.S. EPA to U.S. Army Corps of Engineers (August 25, 2009)). The Project is proposed to be sited on approximately 6,700 acres of United States Forest Service lands within the Superior National Forest (SNF). These lands are also within the 1854 Ceded Territory, where the Fond du Lac, Bois Forte and Grand Portage Bands retain usufructuary rights under the Treaty of LaPointe (1854). The SNF lands proposed for exchange (and permanent removal from public management), contain high quality forested wetlands and peat bogs that lie within the Lake Superior basin, as well as vegetation communities and wildlife habitat for species of prime importance to Band members exercising their treaty-protected hunting, fishing and gathering rights. Since the location of the proposed non-federal land has not yet been identified, it is simply not possible to evaluate the environmental characteristics of the land, the value of the land to the public or the impacts of the proposed land exchange on cultural resources. The DEIS acknowledges that there could be an impact on cultural resources due to the loss of access to public lands for tribal use due to the land exchange. There remains substantial disagreement between the lead agencies' discussion of this issue in the DEIS, and the position of the tribal cooperating agencies, who have consistently raised concerns about potential environmental, cultural and economic impacts of a land exchange on tribal treaty resource use within the Ceded Territory. The tribal cooperating agencies have noted that, since land exchange is based on monetary value, not acreage, there could be a permanent net loss of public lands within the Ceded Territory. Additionally, "there could be other types of losses based on the natural resources found on the original versus exchanged lands." (DEIS 4.9-2, Appendix D, Tribal Positions on July 2009 PDEIS)	PD1
49	The Minnesota Pollution Control Agency, under its delegated water quality standards authority, has a responsibility to ensure that a proposed action (in this case, the issuance of a USACE §404 wetland permit) is consistent with the state's water quality standards through its §401 certification process. The MPCA waived this certification responsibility by default when the permit application was publicly noticed in 2005. It is the Band's position that the USACE should reissue notice of the §404 permit application, and that MPCA should evaluate the §404 permit application under its Section 401 certification process, because the Project design has significantly changed since the initial public notice of the permit application, and because of the massive scale of wetland impacts and potential for degradation of aquatic resources of national importance. The DEIS for the U.S. Steel Keetac Taconite Mine Expansion Project indicates that MPCA will be conducting a §401 certification on the USACE §404 permit for that project; this project certainly warrants the same scrutiny.	EOO,WE4

50	Fond du Lac’s position is that financial assurance should be fully explored in the DEIS, and EPA review comments on earlier drafts also strongly recommend that it be included in the DEIS: “The PDEIS does not include information on financial assurance. EPA recommends including financial assurance information because one key component to determining the environmental impacts of a mine is the effectiveness of reclamation and closure activities. EPA has found the amount and viability of financial assurance are critical factors in determining the effectiveness of closure and reclamation and therefore the significance of environmental impacts. EPA has recognized the importance of disclosing financial assurance in EISs in the “National Hardrock Mining Framework (September 1997)” developed by several EPA national water, waste, and enforcement offices (Kenneth Westlake, U.S. EPA to U.S. Army Corps of Engineers (August 25, 2009)). There is a high potential for very long-term or perpetual treatment, maintenance and monitoring needed for the Project. Because of its experience in expensive remediation actions for many defunct or bankrupt sulfide mines, EPA Region 9 has strongly urged other Regions over the past several years to require financial assurance disclosure in the NEPA process. New national rules for financial assurance are under development by EPA, because “Given the history of adverse environmental effects resulting from some hard rock mines, and the expenditure of public funds used in some cases to address environmental problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS” (from InsideEPA.com, Tuesday, August 25, 2009). Fond du Lac has strongly recommended that the lead agencies keep adequate financial assurance considerations ‘front and center’ during the EIS process. The Band requested technical assistance from EPA Headquarters and the National Hard Rock Mining Team, and specifically requested that agency experts conduct a workshop for the Project EIS lead agencies, cooperating agencies, and the company on financial assurance considerations for the PolyMet project. The Band hosted this workshop in November 2008, which was attended by representatives of the DNR, USACE, MPCA, the US Forest Service, PolyMet, and tribal cooperating agencies. Unfortunately, it appears that the lead agencies are choosing to disregard the recommendations of the EPA on this matter, instead relying upon the state’s own untested regulations and guidelines somewhere ‘down the road’ before issuing the permit to mine.	PD4
51	Tribal cooperating agencies note that under the proposed project, the Wastewater Treatment facility will need to treat water for hundreds or thousands of years to avoid contamination to the Partridge River, and that the CPS would need to operate for hundreds or thousands of years in conjunction with the WWTF.	PD1
52	In the “Waste Rock Cover and Liner Systems” section, Fond du Lac notes that this section should describe expected leakage rates as well as the long-term effectiveness of both the liner and cover systems. Given that the applicant has not proposed any long-term maintenance of these systems, these parameters should be described in this section and taken into account in section of the EIS that predict long term surface and ground water quality.	PD4
2471	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. Tourism is an important industry for Minnesota, and for those of us who live here, the protection of our pristine natural environment, especially in the northland, is critical to our ability to enjoy what little is left of our spectacular wildlife, trees, lakes and rivers. Sulfide mining would be the kiss of death for much that we hold dear. I cannot express, strongly enough, how deeply I oppose the opening of our state to this project. The money and jobs this project would bring would not begin to compensate for the attendant losses, which would last far beyond the life of the mine. The PolyMet DEIS describes serious environmental issues associated with this proposed mine. These issues should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	G2,G11

3029	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. Although PolyMet describes its proposed mining operation as "state of the art," it remains for them to prove that this system has been used elsewhere and closed without serious environmental consequences. Previous PolyMet sulfide mines have caused serious environmental problems. Yet, they too were undoubtedly "state of the art" for their time.	EOO
<b>Sender Last Name:</b>	Scuffy	<b>Submission ID:</b> 1090
1194	I am writing you in regards to the Poly Met Mining, Inc North Met Project to give my full support to the project. I feel that the Poly Met project would be a huge economic benefit to the iron Range and also for the state of Minnesota. The job opportunities alone that would be created from this project would be a plus for families that live and want to stay in Northern Minnesota. I do not feel that the good people of PolyMet Mining would want to have a mining process that would have a significant affect on the environment considering that they and there families live here as well, not to mention the tight leash the pollution agencies have on the mining industry already. I have been a resident of northern Minnesota for 36 years and I can't see this mining process being any worse than other mining taking place across the Iron Range. I feel this project needs to succeed.	EOO
<b>Sender Last Name:</b>	Seckinger	<b>Submission ID:</b> 368
408	p. 3-58 "Table 3.2-2 TBM-25" Consideration of underground mining should not have been eliminated. Consideration of underground mining in the Duluth Complex has been optimistically evaluated by other mining corporations. (Franconia Minerals, birchlakeproject.com)	ALT8
<b>Sender Last Name:</b>	Seifert	<b>Submission ID:</b> 3509
49	130 jobs = 2000yrs of pollution. It is not a formula that makes any sense. Politically it doesn't even cut it. Has PolyMet made any guarantee that a certain percentage of locals will be employed? No. Will American companies be benefiting from the minerals removed? No. PolyMet is a shell company with no real assets. It appears from minimal research that PolyMet is part of a huge Canadian mining conglomeration. There is no guarantee that PolyMet itself will even emerge as the true operator of the NorthMet project. There is nothing to stop PolyMet from pushing through this permitting process and selling the entire approved proposal off to the highest bidder. Even if PolyMet emerges as a upstanding mining operator, the costanalysis falls far short of logical. 130 jobs for maybe 20 years. Realistically, the only significant benefit to the community will be in short term construction jobs. Local people will be hired and let go upon completion of the treatment works and other facilities. Taking into consideration that mining, like any industry, strives for automation, the proposed 130 will likely be 1/2 that by the time the project is up and running. Nothing in the DEIS even mentions that if the price of copper drops significantly, the project will shut down. Are we Minnesotans willing to open our precious northern lands up to sulfide mining in exchange for a few short-term jobs? The answer should be no.	SE3,SE7
3695	The DEIS fails to address significant issues. The most troubling to me are the expectation of a successful land exchange without identification and public comment prior to the permitting phase. Particularly given that land exchanges need to be based on market value. The proposed PolyMet project sits on land that has enormous market value because of the mineral rights. Any proposed land exchange would need to include this increased market value in the exchange analysis. Given this, it is very unlikely that appropriate land would be found within the same watershed. If acceptable land is not identified within the state, the land exchange would fail. Even the EPA realizes that the land exchange process needs to be incorporated into the EIS. It is not some insignificant hurdle to jump through. This entire project is predicated on the completion of a land exchange. It is an absolute failing on the part of DNR and the Corps to not identify and address the land exchange complete in this DEIS.	PD1,PD3

3696	Another area of major concern to me is the lack of financial assurance. Sulfide mining has proven to be an absolute disaster in terms of long-term clean up costs. In reality, there is no true "clean up". Sulfide mining leaves a tremendous environmental, social and economic void. PolyMet will be no different. Without bankruptcy-proof financial assurance up front, the project should not move forward.	PD4
3761	I am deeply opposed to this proposed mining operation. I do NOT believe that it supports sustained job creation. Most importantly, it will have permanent negative impacts on our most valuable resource, water. I love northern Minnesota, I love the BWCA. These treasures need to be protected.	EOO,G7
3779	The cumulative impact analysis is silent on the other sulfide projects just waiting for PolyMet's approval. It is no coincidence that Duluth Metals' partnership with Antofagasta occurred just a month after the DEIS was published. Franconia Minerals is also waiting in the wings. Non-ferrous mining should not be approved in MN; or at least not until successful, long-term mining operations with minimal environmental degradation has been demonstrated elsewhere. PolyMet is the worst form of non-ferrous mining- open-pit. There is no reason at this time to allow open-pit sulfide mining in MN. The cost is too high and potential payoff too low in comparison to the economic and environmental waste.	G8C,G9
<b>Sender Last Name:</b> Seiler <span style="float: right;"><b>Submission ID:</b> 1626</span>		
2041	These concerns about safe water go far beyond the boundaries of States. Every US citizen should be afforded good quality water for drinking and recreation. Haven't we done enough damage to the environment? Isn't it time to be responsible citizens in all manners of existence - in personal and business life.	EOO,G7B
<b>Sender Last Name:</b> Seitz <span style="float: right;"><b>Submission ID:</b> 193</span>		
188	As a lifelong Minnesota citizen, one who values the state for its vast natural resources, most notably clean WATER, I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	G7
1064	The DEIS also acknowledges that the project would cause direct and indirect impacts to more than 1,500 acres of wetlands, most of which at the mine site are peatlands. Peatlands have been identified as one of the best terrestrial environments for sequestering carbon, a contributor to global warming. The DEIS acknowledges that "project facilities and operations would result in additional greenhouse gas (GHG) emissions in the Arrowhead region" (S-10). Because peatlands at the mine site have been identified as high quality wetlands in federal and state inventories; and because the peatlands represent habitats that are increasingly rare on the landscape, these wetlands should be protected from destruction. Also, reports commissioned by the MN State Legislature and by Governor Pawlenty call for the protection of peatlands for their ability to capture and secure carbon. Because of this overwhelming evidence, Minnesota must heed these recommendations and halt any further destruction of these valuable habitats.	WE2
1123	The DEIS acknowledges the potential for loss of critical habitat for gray wolves and Canada lynx because the project is in designated critical habitat for these protected species. There would also be an increased risk of vehicle strikes for both species. Because this habitat was designated for the lynx and wolf to prevent further population declines, Minnesota should not permit the diminishment of habitats for these species.	WI1
1297	Please consider extending the comment period on the Polymet DEIS. As the first proposed sulfide min in Minnesota, I think there are so many issues to consider before safely moving forward.	G10
1328	It is my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials – but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet must complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	GT2

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3244	Concerning impacts on water quality, I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. This is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations.	EOO
3245	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR4B
3700	Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care. We must have financial assurance from this proposed mine, a point which is lacking serious exploration in the DEIS.	PD4
3782	THE POLYMET DEIS DESCRIBES SIGNIFICANT ENVIRONMENTAL ISSUES ASSOCIATED WITH THIS PROPOSED MINE. These issues must be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. As this is the first proposed sulfide mine in Minnesota, it is IMPERATIVE that we proceed with utmost caution and carefully plan for the future: for our state, our natural resources and for the generations - plural - of residents that will be affected by our actions today. I urge you to think more broadly than what short-term special interests and a handful of jobs will bring to the state and consider the longlong- term effects of what sulfide mining will truly bring to our state. I will be carefully watching the actions of the Minnesota DNR and expect that all of my above points, and all of those points raised in the DEIS, will be properly addressed in the EIS and be fully and completely resolved before any further action on this or any sulfide mine is taken.	G2,G10

| 1182 | I am sending this letter to express my support for PolyMet Mining's NorthMet Project. I believe the PolyMet project will create jobs and revenue that will benefit the entire state of Minnesota. I also think that we have the technology and the ability to prevent environmental disasters. I also think that the state of Minnesota has the ability to oversee and detect any environmental contamination and the power to ensure cleanup should any environmental damage occur. As a person with a family who lives, works, and plays in Northeast Minnesota I feel that this EIS is a good foundation on witch to build this project and I strongly support it. Domestically producing these metals makes much more sound environmental and economic sense so lets permit this mine and get the jobs we need in this state. | EOO |
| 1563 | I am in support of the PolyMet Mining project. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families. Based on the documentation outlined in the DEIS, I am confident that impacts to the air and water will be minimal. As a person who lives, works and plays in Northern Minnesota, I understand the need to ensure a safe environment project. Let's get on with a project that will do nothing but enhance the Iron Range.  | EOO |

--------------------------------	---------------------------

398	I would like to first of all write to you in support of the Northmet Project Polymet Hoyt Lakes, Mn. As a business and residential homeowner in Virginia and Hibbing, Mn, I have seen the local economy be heavily dependent on the mining sector. We have attempted to diversify but ultimately return to our mining facilities to insure our economic survival. We are presently experiencing a new era of mining with the DRI nuggets and hopeful non ferrous mining. We are confident the extraction and production of these metals will be conducted in an environmentally friendly manner. We can enjoy the beauty of the lakes plus the positive economic impact Polymet will provide to northern Minnesota. We support the Polymet project and the economic impact it will provide to northern Minnesota and the entire state of Minnesota. We do have to remember that job creation has to be conducted hand in hand with a business plan that assumes a healthy clean environment for our children in the future. I have confidence in Polymet officials that their business plan is pro environment with 2010 technologies. Let's support the project.	EOO

9	The narrative pertaining to the “no-action” alternative in regard to socioeconomic consequences seems to be excessively short. This alternative assumes that the socioeconomic conditions on the eastern Mesabi Range will continue to deteriorate at the current rate. This assumption does not take into account that many of the communities in this part of Minnesota are “holding on” in the hopes that the PolyMet project will come to fruition. We believe that conditions will plummet if this project and other pending Cu-Ni projects are not allowed to proceed. The narrative also states that some of the taconite mines are conducting exploration efforts in anticipation of expanding. While this may be true to some degree, some of these exploration efforts are also aimed at extending known reserves. This should also be explained in the “no-action” alternative.	ALT1
---	--	------

3150	Waste Rock Characterization – there is virtually no discussion regarding the battery of tests that PolyMet has conducted over the last five years in order to determine when, and to what degree, the waste rocks and tailings materials will generate acid mine drainage (AMD). Furthermore, there is no mention of the consultations they had with experts in the AMD field to determine the most environmentally safe way to dispose of their waste products. We feel that a document of this magnitude should provide to the public a short 1-2 page narrative that at least discusses what PolyMet has done regarding their waste characterization test work. While it would be impossible, and probably unnecessary, to discuss in detail all of this characterization work we feel that the public should be informed of the types of test work that have been conducted and that PolyMet takes the AMD potential very seriously.	PD2

3687	Sp, this proposal aims to fix out mining economy for the next 20 years. The companies proposing operations are from Canada, so the money will ultimately leave not only MN, but the U.S. too. What will revive the mining economy when these become exhausted? I do not believe the forthought has been extended far enough into the future on this matter. The proposed operations are not only dangerous to NE Minnesota's environmet, but also absurd to be thought of, to solve any long term problems we will face.	G1,G2
<b>Sender Last Name:</b> Shaw		<b>Submission ID:</b> 3536
3799	I am a out of state resident but own a second home in northeastern Minnesota. I am fully against this type of mining or any additional mining in the area. I could have purchased my property in Michigan or Wisconsin but chose northern Minnesota because it is the last true wilderness left in the upper Midwest. I may not be able to vote in local elections, but I pay Minnesota property taxes and support local businesses and of pay my share of sales tax. There are many of us whose voices are not heard and sometimes even ridiculed. Before retirement I was active in the mining business for a major mining equipment manufacturer. I have seen Copper mining and processing all over the world. I do not want it as my neighbor. This short term gain would be a long term disaster. T Shaw	EOO
<b>Sender Last Name:</b> Shepard		<b>Submission ID:</b> 1189
1304	I am concerned that the level of financial assurance required of PolyMet will be insufficient. Ongoing water treatment required by extensive pollution is not acceptable. The value of waters impacted by the mine and of the wilderness surpass the value of the mine.	G4A,G7B
3868	Dear Mr. Arkley, I am regular visitor and summer wilderness guide to the BWCA. For the sake of all the local communities and the watersheds that would be effected by the pending mining projects. I implore you to do whatever you can to give a voice to concerned Minnesota residents, such as myself. I fear for what long-term negative impacts these projects could have. Thank you so much for your support. Sincerely, Anna Shepard	G2
<b>Sender Last Name:</b> Sherman		<b>Submission ID:</b> 3449
3218	PolyMet acknowledges that some acidified water will escape and enter lakes, streams, wetlands, and rivers in the region. Their assurance that safe drinking water standards will be met only addresses one designated use for water. Ecosystem services will most certainly be impacted. It would destroy thousands of acres of wetlands and forests, put endangered species at risk and place the burdens of environmental harm disproportionately on Indian tribes who have rights to the land that would be most impacted. It is likely that the PolyMet project would increase mercury levels in fish and adversely affect wild rice growing downstream. The DEIS is inadequate in many ways. The information on current water quality problems and the polluted site that will be used for dumping wastes from the processing plant is inadequate. The DEIS ignores real historical impacts of local mines, rather than admitting the risks of the project, and contains no proof that either the public interest in Superior National Forest land or tribal interests in treaty lands will not be irreparably harmed. I oppose the PolyMet project because it is likely that the mine and processing plant will pollute Minnesota's precious waters for hundreds or thousands of years to come and have serious impacts on the environment, human health and tribal rights. I agree with the tribal cooperating agencies and the U.S. EPA that the DEIS is incomplete and does not demonstrate that the proposed mining and processing operations could be done without harming the environment and tribal resources and without putting taxpayers at risk for substantial ongoing cleanup efforts that would be needed at such a massive disturbance of sulfide rock. The tribes and the EPA have pointed out many inadequacies of the PolyMet DEIS.	WR1E
3668	PolyMet sulfide mining project. Sulfide mining, which would be new to MN, has a long history of environmental problems and the current technology available to address the impacts isn't adequate. Often, taxpayers have been stuck with the clean-up costs. The PolyMet DEIS provides no financial assurance to protect taxpayers in the event that PolyMet company goes out of business, leaving seeps and wastes behind.	PD4

3674	NorthMet Project is a big project. Advantage- electronic recycling is the best idea, which we can use in our own country. As people need more metal. Disadvantage- It pollutes the ecosystems. It's said that MN is known as 10,000 lakes but due to any negative reason the state is not going to be known because of this and all the other lake [illegible] can be stopped if the lake are polluted.	G7
<b>Sender Last Name:</b> Shexpa		<b>Submission ID:</b> 3333
3626	NorthMet Project – PolyMet Mining, Inc., is doing a great job. More people should be aware of the environmental protection + pollution. I encourage more of these works.	EOO
<b>Sender Last Name:</b> Shinner		<b>Submission ID:</b> 2259
2669	The PolyMet sulfide open-pit mining project proposed on public land in Minnesota's Superior National Forest would harm the environment and has not been properly studied in the Draft Environmental Impact Statement (EIS). The Indian Tribes who looked carefully at the PolyMet mine and the draft EIS have already commented that the studies of water pollution, wetlands, mercury in fish, wild rice, endangered species, financial risks and perpetual pollution from the sulfide mine are inadequate. Before any permits are even considered, all of the additional analysis recommended by the Indian tribes must be done. The United States Environmental Protection Agency also said that the draft EIS is inadequate because it doesn't explain what lands would be exchanged for the 6,700 acres of public forest lands that would be taken by the mining company and because there is no assurance that the public won't end up paying the costs for pollution. The gaps in the EIS found by the U.S. EPA must be filled to protect the public. Sulfide mining would be new to Minnesota. Acid mine drainage has occurred in nearly every mine of this type, polluting water and leaving taxpayers to bear the costs. Destruction of forests and wetlands can harm endangered species and increase global warming, while mercury and sulfate pollution of water create risks to wild rice, ecosystems and human health. Please stop the PolyMet mine unless the company can prove in the EIS that it won't harm the environment. As a start:	EOO,G4A,G8
<b>Sender Last Name:</b> Shippar		<b>Submission ID:</b> 2257
2667	Minnesota Power has reviewed the draft EIS for the Polymet Northmet project and commends the Minnesota Department of Natural Resources (MNDNR) as the Responsible Governmental Unit (RGU) and the U. S. Army Corps of Engineers (USACE) for their thorough environmental review of this Project. The planning, public communication and input associated with the review of this project will significantly and appropriately advance the environmental assessment process to the benefit of all Minnesotans. Minnesota Power recognizes the significant positive socioeconomic impact to the region resulting from the Northmet Project, which will be reusing an existing facility to process the area's native minerals. This project will bring growth and revitalization to the Eastern Mesabi Range, which was economically devastated by the closure of LTV Steel Mining Co. in 2001. Minnesota Power appreciates the efforts of MNDNR and USACE in their comprehensive review process and looks forward to the completion of the Northmet permitting process. Minnesota Power believes that a thorough and exhaustive review process requires key parties asking the right questions to provide a framework and mechanism for ensuring that responsible stewardship of our precious resources is maintained. Minnesota Power supports this project and looks forward to a successful completion of this process and the eventual start of the Northmet Project.	EOO,G6

3248	I have spent the last 6 years working in the BWCA and Lake Superior. Respect and preservation of the surrounding watershed and land holds not only an intrinsic value, but an economic one as well. While the creation of such a mine will create jobs in the short-term, the lasting effects of the mine will not only hold environmental impacts, but will create a significant loss of jobs in the tourism industry, which will sustain long after the mine has ceased to exist. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. In light of these issues this mine should not be approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	G1,G2C,G11
<b>Sender Last Name:</b> Shoden		<b>Submission ID:</b> 228
234	I am writing to you to give my full support to the Polymet project. The Iron Range, as well as the State of Minnesota, will greatly benefit economically. We need this project to succeed! I personally know some of the Polymet employees, and know how they feel about the environment. They will do everything humanly possible, to minimize any affect, the project would have on the environment. I totally trust these people, who also have families and live on the range.	EOO
<b>Sender Last Name:</b> Shrode		<b>Submission ID:</b> 1656
664	PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials in an already unstable basin. Failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet must complete a stability analysis of the basin and devise an acceptable design before proceeding. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues must be resolved before this mine is approved by the MN DNR and the U.S. Army Corps of Engineers. Lake Superior is seriously stressed. It is beyond reproach to further imperil this inland sea for a short term, unsustainable and destructive industry.	GT2
992	I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time. It is an unfair burden to pass on to future generations who will be left to pay for these operations.	PD2,PD4
1902	from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	FM1
2097	Regarding: PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I am a visitor to the areas and do not want them affected. It is not acceptable to risk national forest and other areas by claiming that the mining is not IN the Boundary Waters. One cannot seriously believe that the "exploration" in Birch Lake is not having an effect on that environment, much less active mining and its long term after effects.	G2A
2098	This moves beyond the environmental impact issue into area economics. This is a dangerous, short sighted economic solution to an area that has green and sustainable answers at their doorstep. Rather than further degrading the recreation and tourism opportunities and experiences and the local businesses, now is a prime opportunity to plan for promoting citizen access to and protection of wilderness areas and the businesses that facilitate such activities. We are being told that "green industry" is the future. Now is the time to step up to the plate and put the money where the mouth is. If it may be thought that because I don't live in the affected area that I don't know what it is like to suffer economic depression, our long time family business is being destroyed by an imminent domain process that is putting three people who support families and the community out of work. We will be making hard changes in our lives. We certainly are not going to sell out our environment for a job; it may very well be the key to our personal future.	EOO,G11

1	The Draft EIS also fails to include moose in its discussion of the few remaining wildlife corridors in the region, and in its cumulative impacts assessment for wildlife and wetlands impacts. As noted by the Tribal cooperating agencies, the Minnesota wildlife advisory committee studying the decline of the moose population in northeastern Minnesota has recommended preserving wetlands as sanctuaries for moose from heat stress, and the yet PolyMet is proposing the largest direct wetland fill ever permitted in this region, with the proposed wetland mitigation located outside of the St. Louis River watershed and 1854 ceded territory. The proposed project will thus clearly contribute to cumulatively significant effects on the state's moose populations and Tribal harvest in the 1854 ceded territories, which the Draft EIS has failed to assess or disclose. 1 Additionally, the Draft EIS cumulative effects analysis is inadequate by failing to consider cumulative impacts to bird species, which are currently in decline due to habitat losses and fragmentation. See e.g., Lind, J; Danz, N.; Jones, M.T.; Hanowski, J.M.; 2001 Annual Update Report: Breeding Bird Monitoring in Great Lakes National Forests 1991-2001 (NRRI 2001); Birds Of Conservation Concern, 2002 (identifies species and subspecies and populations of birds "in need of additional conservation action"; follows up and expands on a 1995 list of migratory nongame birds that are likely to become candidates for ESA listing without additional conservation actions. The report identifies species that are of the highest priority for conservation efforts and attempts to include all species thought to be at risk in order to focus conservation attention on them "well in advance of a possible or plausible need" for ESA protection); available on line at <http://migratorybirds.fws.gov/reports/BCC2002.pdf>

WI5

2662 This letter will serve as official notification that I support PolyMet Mining. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air, water or land will be minimal, if any. I believe that PolyMet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed area. Unfortunately, after 9 years of service, I lost my job with LTV Steel in 2001, when LTV permanently dosed. For several years I struggled to support my family, picking up jobs wherever I could. In 2005, I was hired by PolyMet and have worked at the Hoyt Lakes site since then. With the PolyMet Mine, hopefully soon, in the construction phase and in actual operation, these job opportunities would bring hope to others who are still struggling from LTV dosure and others seeking employment as well. I have lived in this area all of my life and I am obviously concerned about our environment, not only for myself but for my family as well. I am also an avid sportsman, especially enjoying hunting and fishing. I am very interested in maintaining a healthy natural environment, not only for my own enjoyment but for the enjoyment of future generations. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project.

EOO,G2

3883 As a college student, I spent my summers fishing in and around the Boundary Waters/Quetico Provincial Park/Shebandowan Lake area ...on both sides of the border...and always by canoe. The abundance of small mouth bass in the area was the target and the results were always spectacular. I still spend time in the area, with both my father and son...and can honestly say the fishing is still fantastic. Given my love of the outdoors coupled with my interest in engineering, my field of study at University was Metallurgical Engineering with a specialization in Hydrometallurgy. Upon graduation, I had the good fortune to work for several mining companies that were focused on non-ferrous extractive metallurgy. I strongly believed then, as I still believe today, that hydrometallurgy is the best approach for a harmonious existence between extractive metallurgy and the environment. Non-ferrous minerals [chalcopyrite, chalcocite, pentlandite, bornite,...] can be separated and reduced without damaging the environment. The technology and approach, as detailed in the DEIS, works. PolyMet Mining has clearly done their homework with respect to protecting the environment. In addition, the NorthMet Project will bring much-needed jobs to the Hoyt Lakes area and allow young families to return and enjoy the great fishing and hunting, while providing them with the financial security to raise their families. The project should be allowed to proceed as quickly as possible and bring back those young families to the area. Self-interest groups should not be allowed to side-track/delay the project any longer. People need jobs. America needs a secure and domestic source of nickel [rather depend on foreign entities that, at times, can appear to be so hostile]. It's time to get going!

309	I am writing in support of the PolyMet Mining Project. PolyMet has taken the time and expense in working with federal and state regulatory agencies on their draft Environmental Impact Statement. I urge you to let the decision to approve this EIS stand on its own merit. Mining of copper, nickel and platinum is not conducted today as it was thirty and forty years ago. Fears of environmental damage based on past practice is unfounded. If today's PolyMet EIS passes all regulatory agency scrutiny, then the project must be allowed to move ahead. PolyMet must not be hindered by fears from the past nor standards above and beyond today's requirements. I know several key PolyMet employees. They are outstanding Northeast Minnesota citizens who will provide economic development critical to the future of our region, and be excellent stewards of our environment. I have four adult sons. Three of which relocated to the Minneapolis-St. Paul area to find gainful employment. Their hearts are still in the Iron Range. PolyMet has the potential to provide opportunity and a life style they, and scores of others, deserve close to home. Thank you for your prudent and timely action on this important matter.	EOO

162	Extend the comment period beyond Feb 3	PRO6
1582	I understand that even the engineers designing this project project that acidified mine wate storage areas will begin to leak into ground and surface water in about 60 years. How can this be acceptable? No amount of develpment or temporary mining jobs is worth turning the Arrowhead into the hydrologic equivalent of the wasteland around Sudsbury, Ontario.	EOO,G7A
1583	Just because a dirty-process mining company finds it currently economic to mine these deposits is no reason to allow it to happen now. Leave the deposits in the ground until there is a clean way to mine them, if there ever is.	EOO
<b>Sender Last Name:</b> Simpkins		<b>Submission ID:</b> 2345
2818	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. This looks like a case of short term gain and long term disaster. Are you willing to clean up the mess?	G4,G6
<b>Sender Last Name:</b> Sink		<b>Submission ID:</b> 3451
3731	I urge the DNR to support legislation that requires copper mining in Minnesota be held to the strictest standards in regards to contamination of water and land and clean-up procedures. The desire for copper and even need for copper must be weighed against the common good. Does our rock contain a high enough percentage of copper to warrant such large-scale disruption? To risk the health of local populations or threaten the watershed in the area? I argue that it is not worth it if our rock is not copper-rich, no matter what the price of copper on the market today.	G2,G5,G7
<b>Sender Last Name:</b> Skaer		<b>Submission ID:</b> 3706
1	More indirect impacts to wetlands have also not been quantified. As noted in the relevant Tribal Position, ore dust will spill from rail cars and be deposited in wetlands adjacent to the rail line.109 But no analysis of any type has been conducted to determine if such impacts would be significant. Other alternatives (e.g. underground mining) that would pose less harm to high quality wetlands, and may be less damaging to aquatic resources, were not adequately considered.	WE2

3593	I am a resident of St. Louis Park, MN and an undergraduate at Carleton College in Northfield, MN. The BWCAW has been an important part of my life for as long as I can remember, and my family and I take long canoe trips up there every summer. The importance of such a unique and peaceful facet of our state's identity cannot be understated, and any mining operation that threatens the area in the future should not be allowed the opportunity to jeopardize this precious region and its surrounding areas. The NorthMet project would set a dangerous precedent along with posing an environmental risk. Do not let this go forward.	EOO,G2
<b>Sender Last Name:</b> Skoog		<b>Submission ID:</b> 240
250	I think granting a permit to Polymet is a poor idea. To call this a jobs project is very misleading. 10 to 12 other states have tried this mining, and they have not been able to find a real answer for the waste. Putting it in big liner then treating the waste water for the next 100 years is not a sound solution. I oppose this and hope you consider the toxic runoff that will make its way into our waters.	G7B
251	Why was there a drilling barge on a lake near Ely?	EOO

32 Thank you. My name is Roger Skraba. I'm the mayor of Ely. I'm here to support the PolyMet project. It will be a business incubator for our community. We look at it, the City of Ely is like a commerce center. We draw people from Isabella, Babbitt, Tower, Ely, and we're hoping, if a lot of folks come and start businesses around the area and more people live -- not specifically in Ely, but in Babbitt or Aurora, they're going to gravitate towards Ely, so we're going to benefit some from the business from that. We're also hoping we can pick up a few of the employees, because they want to live in our environment, they want to live next to the woods and work on the other side of that ridge, and that's something that I think needs to be addressed. As -- as mayor of a city, gateway to the Boundary Waters Canoe Area Wilderness, we are pretty particular about what goes in our water, and this project is on the other side of our watershed. This is on the Lake Superior watershed, not into the Nelson River watershed. All our water goes up to Hudson Bay, down the Nelson -- Lake Winnipeg to the Nelson River. We're -- the city council has sent me to make a presentation, and we are confident that it will not pollute our watershed. I have been -- I did read the -- not the whole EIS, but a bunch of the EIS, and I'm confident that PolyMet has met and -- and exceeded the standards that the DNR and PCA, Minnesota Pollution Control Agency, has set. I am -- I'm impressed at their desire to work with everyone involved in the permitting process, from what I've seen, on -- on the -- on the property itself, where the water is going to go, how they're going to contain it, how they're going to treat any of the runoff with a wastewater treatment plant to keep the sulfides out and they're going to cover -- they're going to put a blanket underneath, they're going to put a blanket on top, you know, a cover, so we're not going to get the leaching. They're going to try. It's -- it's good to see. I think everyone is aware of what can happen. And they're going to mitigate as -- to the point of when, if it is an issue, it will be brought forth and they'll have to deal with it. The good thing about the sulfide in this project is that it is a low sulfide. It's not high. It's in the small percentages. And from the -- from the stuff that I've read and learned about, it takes a long time for that sulfide, long in the time of nine months to a year to two years, for it to really react, and -- and it won't be in the air that long, most of the sulfide they're using. Again, I think the -- the biggest -- the biggest issue that our council sees are -- are the jobs that are going to come, the economic development. Our downtown is pretty -- is starting to go away, and -- and I'm not desperate, I'm not here desperately -- it's not like I'm here, this is the last savior. I'm saying this is one of the straws in the big pile that makes a -- a -- a community. Or it's part of the fabric of our community. Mining's always been in Ely, Minnesota. The miners -- that's why Ely is where it's at. 1888 we started, and it was because of the iron-ore mining and the timbering, and so we -- we have a history of mining, and I hope -- I hope that we can help contribute to this next level of mining. And I -- and I think I -- I have to state that the permitting for Franconia or Duluth Metals is separate from the PolyMet mining permit. PolyMet is PolyMet, and I sit on the St. Louis County planning commission and we give out conditional use permits, and each one is unique to itself. And I truly believe that with this permitting process, and I'm -- I'm -- I'm impressed to see what -- the process that we're going through now, getting the information. Where it goes from here, I -- I don't know. I don't know where you guys take this information, how you compile it, and what you do with it. But it -- it is a -- it's a process that, so far, I've been impressed with, what you guys have done. I'm -- I don't feel

EOO,G10

2607 MR. SKRABA: Hi. My name is Roger Skraba, I am Mayor of Ely, Minnesota, and I was asked to come down here and testify in favor of the PolyMet DEIS from the City Council of Ely. It was a unanimous decision. We are here to talk about a couple of things. One of the main things I want to bring up is the PolyMet project is on the other side of the Laurentian Divide, so the watershed from this project does not interfere with the Boundary Waters in any way. As far as air pollution goes, it has 90 percent less air pollution than the taconite mining that was formerly, so the air pollution issue isn't as big of an issue as a lot of folks are led to believe. It will bring in hundreds of thousands of dollars of taxes in the long run for the whole area, northern St. Louis County, Babbitt, Ely, the Taconite Tax Relief Area. That is one of the advantages. We need commerce in our area businesses. Ely is a hub, is a business hub in the area right now. We are hoping that if the PolyMet project gets permitted and people start living in the Range that they will come to Ely for an evening of meals or to shop and then find out how quaint and beautiful it is and live there. That is my goal. My goal is get more residents so we can lessen the tax burden on everyone else. Sorry to sound like a businessman, but that is what we've produced that program to do right. Our population could use a little hit. We could use a few more people. The PolyMet process that they are talking about using is a proven process. It's not new. All parts of it have been used in other places successfully in the world. It's fortunate that this EIS calls out this process and investigates it. From the information that I have read and that I have gathered, I am going to find it hard to believe that the government can prove that it isn't a safe way, and I look forward to the government scrutinizing this because that is part of the process. What else do I want to talk about? The PolyMet project will bring in approximately 400 new jobs, up to they are talking about like 500 spinoff jobs from different manufacturing. Whether or not Ely is successful in getting the raw copper that will be produced on the plant to make wire or to make copper tubing or to make anything out of the copper, whether Ely is successful or any other communities are, the fact that the potential is there is what we are excited about. Our communities could benefit from it directly or indirectly. As far as our concern about polluting the Boundary Canoe Area Wilderness, again it's on the other side of the Divide, the watershed goes the other way. Each project, whether it's PolyMet, Duluth Metals or Franconia, they are all stand-alone projects. They are all different. The PolyMet project is on the other side of the Laurentian. The Franconia and Duluth Metals are on this side, and they in themselves will be scrutinized even more because if they do pollute that pollution does enter the watershed and does affect our commerce and the way we will be viewed as a world-class place to come. Ely is known worldwide. You can go anywhere, pretty close anywhere in the world and say Ely, Minnesota, somewhere and someone is going to say I have been there or I have a friend that goes there. We don't want to ruin that, and I am here to make sure it doesn't get ruined. The Council sent me to support this, and I hope that PolyMet is successful in their process. Thank you.

3358 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have VERY SERIOUS concerns about the safety of this project and its potential impacts on Minnesota's natural resources. If Minnesota does not have its natural resources, what are we as a state? That's what makes this place worth living in.

EOO

3359 The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. This is very important to the citizens of Minnesota and of the United States.

Comment ID	Comment Text	Theme Codes
22	My main comment about this would be that Minnesota has some of the best environmental standards in the world right now, and I'm really frustrated by all the delays in this project. When I came to speak at the draft, I was actually employed. Now I'm unemployed, and I'd really like to see this process move along. I think it's taking way too long, and even this delay now on the draft for a longer comment period, to me, it just -- it's been five years. It's time to get this project going so the people that live up in this area can work. And there's a lot of areas in the world where these projects are done and they aren't done with even close the environmental standards that we have here, and why not do it and do it with the best environmental standards around. It's time to get the project going.	EOO,G10
1253	Is this mining project worth the cost of ruining MN's most untouched region? Is it worth destroying the enviroment by polluting the crystal clear water with toxic run off? When it is gone you can not bring it back to it's original state. Please listen to the people of MN who last year voted to protect it clean water.	G7C
1558	Additional comments: My family is from northeastern MN. Currently, we live in Texas but we spend our summers in MN, while I work. We plan to live there in retirement. It is hard to believe that you would allow this type ,of mining in NE MN when there have been no prior sulfide mining that has proven safe for the environment. Jobs are not worth destroying our environment. Please do not allow this mining to be done in my home country.	EOO,G11
2345	I want to express my concerns on the minning project. I hold an opinion of a nature enthuseist as well as a member of a community with a demand for a perservation of the natural environment. Most citizens in Minnesota are passionate about wildlife and the enjoyment we recieve from our memorize and futures to come here. I for one, am aware the potential threat of many surrounding ecosytems for many years to come. It saddens me to think that one day my grandchildren will not be able to experience the true beauty of the boundary waters.	EOO
3198	THERE COULD BE NO GREATER MISTAKE THAN TO ALLOW PLYMET TO GO FORWARD WITH THIS PROJECT. WILL YOU ALLOW GREED TO OVER-RIDE RATIONAL BEHAVIOR AND COMMON SENSE. OUR BOUNDARY WATERS AND JOINING AREAS ARE OUR GREATEST NATURAL RESOURCE. NOT POLY-MET AND WHAT THEY CAN GRAB. I WANT TO KNOW WHO IS GETTING PAID OFF BY THIS NOW! THIS PROJECT SHOULD NOT GO THROUGH. PERIOD!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!! AS IF THE ARMY CORPSE EVER DOES ANYTHING RIGHT ANYWAYS.	EOO
3504	I live 2000 miles from the canoe country, but I have been going to Ely for 30 years, taken 57 canoe trips into the Quetico/Superior, have introduced a dozen Arizonans to that area, and sponsor 3 scholarships at Vermilion Community College every year, for wilderness studies. Leave this wilderness alone. I've seen Sudbury, Ontario, and what nickel mining does to the environment. The Arrowhead region is a national treasure; please treat it as such. Michael Smith Tucson, AZ	EOO

**Sender Last Name:** Smolich **Submission ID:** 3714

1	Water quality within the St. Louis River watershed has already been degraded by past and present mining activities. Additional discharges of sulfate, mercury and other metals will contribute to the cumulatively significant effects on water quality in the St. Louis River watershed. As noted by the Tribal cooperating agencies, an Antidegradation Analysis for the Lake Superior Basin must be conducted for several contaminants in addition to mercury, and the results of this analysis must be included in a revised DEIS.	WR5A
2623	I'd just like to say that ever since the LTV closure, we need jobs to support our schools, support our community, support local businesses, maybe attract some satellite industries. Like I said, it's very important for the city, as a whole, to have a project like PolyMet on the east end of the Iron Range. Everything that I've read, their environment -- I believe they'll do this in an environmentally-friendly way. And basically, that's -- you know, we got to keep our new school full, and fill up some houses and build some new houses, and small towns are going to die off. I mean, it cost more to run your waste water and your water plants, and if you don't have people to support them, I mean, your small towns are just going to go away. So that's, basically, all I got to say. And thanks for having this forum down here.	EOO

3885 As part of the public comment period currently underway regarding the draft EIS for the PolyMet project, the Cook County Board of Commissioners would like to express its appreciation for the thorough review process that has been conducted to identify and mitigate any significant negative environmental impacts. After meeting with Barr Engineering consultant Brad Moore, and considering Mr. Moore's background with the MN DNR and MPCA, the Cook County Board of Commissioners understands that there would be minimal negative impacts to the ground water or air quality in Cook County, that the EIS adequately addresses the impacts to and needs of the mining and processing sites as well as the impacts to surrounding counties, and that proper technologies are in effect to mitigate environmental concerns going forward into the future. Having said that, and understanding the positive economic and social value this project brings to northeastern Minnesota, both short and long-term, the Cook County Board of Commissioners supports the EIS as the proper tool to use for mitigation on the PolyMet project.

41 Sulphide oxidation is catalyzed by a bacteria, named Thiobacillus ferroxidans. Without that bacteria the oxidation would be much, much slower (it's in the thesis, the reactions are described in the appendix). In nature, that bacteria is present everywhere. If you take fresh tailings, however, directly from the flotation processes, and bring them to the laboratory for leaching studies, the bacteria may not be present in the tailings. That may be the explanation for the difference in oxidation rate between field studies and laboratory studies. Has there been long term field studies with the tailings? It's very important, because that's the natural conditions, the real scenario for the tailings, with the bacterias present. I searched the DEIS and found nothing on field studies concerning the tailings - only wild rice.

WR1E

139 My name's Greg Solberg. I'm not for the mine, I'm not against the mine. I'm pretty sure I'm not going to stop the mine, so I want to be on the side, the middle guy. I want to -- I don't want to listen to all the mining stuff and I don't want to delve into the environmentalists who think we're going to die tomorrow. I want to know the truth, and since it's probably going to happen, let's just make sure we do it right the first time. And I have this research thesis I got from a Swedish grad student that I'd like someone to look at, and that's really all I have. That was quick and easy. I'm concerned because I own 120 acres just south of Sudan, which is 20 to 25 miles north of the proposed mine, so it's kind of in my backyard or -- backyard, more or less. So I'm concerned and, you know, just -- I'm a north -- it's my dream, my 120 acres, I've got that, and I've started planning a log cabin. I just wanted to own a little piece of this earth, have a log cabin since I was about five, so -- and so, you know, this is a concern, but as long as they do it right, it maybe isn't. That's all.

EOO

360 I spoke with a few people from the DNR and PolyMet at the Blaine discussion and have some real concerns that the tailings will not be handled correctly.

G2D

361 I gave an oral comment, left a copy of the attached research, and want to make sure you guys have this in your hands as well. Please read this!!! Here's a link just in case: [http://diss-epsilon.slu.se:8080/archive/00001874/01/Kappan\\_Avhandling\\_nr\\_08.88.pdf](http://diss-epsilon.slu.se:8080/archive/00001874/01/Kappan_Avhandling_nr_08.88.pdf) I'm not trying to stop the mine - I have no say in the matter. Since it will go through, I want to be assured that things will be done right the first time. Also, I really think you guys would be better off leaving the politicians behind - their BS is not helping your cause. At the very least, sit them down and teach them. Well, that's my opinion anyway.

G14

1	I am writing on behalf of myself, my two sisters and my family to comment on the Draft Environmental Impact Statement (DEIS) for the NorthMet Project (Polymet Mining, Inc.). Our family has canoed, fished and hunted in the BWCAW and the Superior National Forest for nearly 50 years. We are concerned that this project will result in a significant loss of publically owned forest and wetland habitat, and that it will degrade the water quality of the Partridge, Embarrass and St. Louis River watersheds. We eat the fish and game, consume the wild rice and drink the water from this area. As proposed, this project has the potential to significantly impact the natural resources of this fabulous land of forests, lakes and rivers, and to further contaminate the food and water we obtain from it. I am a science and math teacher for junior and senior high students at the Cloquet Christian Academy. I have taught there for 22 years. My husband works as a wildlife biologist. We have raised three daughters and all of them loved to go camping and fishing, especially in the canoe county of northeast Minnesota. As young girls in our teens, my two sisters and I attended Widjiwagon YMCA camp near Ely. This is where we learned about canoe camping and fell in love with the BWCAW. We still go on canoe trips together every year in the Boundary Waters. This land is important to us. As citizens of this great state we depend on the Department of Natural Resources (DNR) to protect Minnesota's lands and waters. In your publication, A Strategic Conservation Agenda 2009-2013 Part 1: Strategic Directions, published in May of 2009, you describe your mission and conservation strategies for the future. Following are some of the statements made in this document that relate to this mining proposal: • DNR's mission is to provide for commercial uses of natural resources in a way that creates a sustainable quality of life. • DNR's goal is to conserve and enhance natural lands, habitat, water resources and watersheds and to provide healthy fish and wildlife populations. • Mining and reclamation are planned to ensure environmental integrity while producing important mineral products. • Prevent the conversion of forest, and protect peatlands and wetlands to mitigate the effects of climate change by sequestering carbon. • Expand the sustainable woody biomass supply to meet the state's renewable energy goals. • Seek to improve land and water health at local, landscape and watershed scales. • Apply regulatory tools to conserve water supply and promote land and water-use practices that protect water quality. I am encouraged by these statements from the DNR which represent a strong conservation agenda. Your document lays out a good strategy for sustainable use of our natural resources. However, I am very disappointed that the DEIS for the NorthMet project, prepared by the same DNR, falls far short of accomplishing what you claim to be your own agenda. As citizens, we all need and use the minerals that would come out of this mine. The economy could certainly use the jobs it would provide. To be responsible citizens, we also need to know the real costs and risks of copper-nickel mining, so an informed decision can be made. If mining proceeds, it must be done in a way that protects our environment, and is an ecologically sustainable form of land use. This DEIS does not clearly identify all the environmental costs and risks of this proposal, especially the cumulative impacts. The project does not meet environmental standards, nor provide a sustainable approach to mining. The greatest concern about the Polymet mine is the impact to water quality due to pollution from heavy metals, sulfates and mercury. These serious concerns are being raised by many people and I fully agree with them. However, the project will also have a huge impact on public forest lands, wildlife habitat and land use. My comments focus on these issues which include the destruction and degradation of a significant	G2
2	As mentioned in the discussion of Section 3.1.5.3 "Management of Process Waste Products," the type of dam construction used for both the existing taconite tailings and proposed flotation tailings impoundments is upstream-type construction, which is the most unstable of the dam construction types. This fact is reflected in the discussion of the long term stability risks for the tailings impoundments themselves, and has implications for the stability of the hydrometallurgical tailings storage facilities which will be built on top of existing tailings impoundment 2W.	GT1
3	Recommendation: A thorough testing program for verifying the target permeabilities of the various subgrade barriers should be required. If testing indicates that the specified permeabilities are not being reached, then corrective measures should be required.	PD11
3	• Monitoring of the sedimentation ponds discharge is recommended as part of any NPDES/SDS permit. (DEIS, p. 4.1-110)	WR1A
3	• There is some uncertainty as to whether the West Pit overflow would meet the Great Lakes Initiative standard for mercury and additional analysis of this issue is recommended. (DEIS, p. 4.1-124)	WR3I
4	• It is recommended that groundwater quality downgradient of the Tailings Basin and waste rock stockpiles be monitored on a regular basis to ensure that actual groundwater quality is consistent with model predictions. (DEIS, p. 4.1-172)	WR1B

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
4	• It is recommended that the sulfur concentration and pH of the tailings be monitored regularly to ensure they remain below a specified percent sulfur and above a specified drainage pH to prevent the development of acidic conditions or increased solubility of metals within the Tailings Basin. (DEIS, p. 4.1-172) [Note: It is recommended that the specified level of sulfur be 0.13%, the average tailings sulfur content assumed in the water quality modeling.]	WR1A
4	• It is recommended that the effluent from the WWTF be monitored regularly to ensure the proper level of treatment is being attained as this effluent is an important factor affecting the quality of groundwater seepage from the Tailings Basin (DEIS, p. 4.1-171)	WR2G
4	• Intermediate monitoring locations between these source areas and regulatory points of compliance (e.g., Dunka Road) are recommended to serve as “early warning” of any groundwater quality issues. (DEIS, p. 4.1-172)	WR1B
5	The DEIS notes that the mine site groundwater quality with respect to antimony, manganese, and nickel are predicted to exceed Maximum Contaminant Levels (MCLs) or MDH Health Risk Limits, potentially for the long term at the Mine Site. In particular Sulfate would exceed the groundwater evaluation criteria of 250 mg/L.	EOO
6	3.2: Project Alternatives: Paragraph 3, p 3-50 states that “NEPA requires that a “range of alternatives” must be discussed....This includes all reasonable alternatives which must be rigorously explored and objectively evaluated...” It is questionable whether either the rigor or objectivity of the project alternative analyses meets the intent of NEPA. For example, failure to include in any analyses in this DEIS Northmet data/information regarding Franconia; Duluth Metals; Encampment and Tech Cominco is problematic.	ALT8,PRO2
6	2.3.4: Issues Incorporated into EIS after Scoping: It is noted that the DEIS will have “greater emphasis” on several areas not anticipated at the time of the Final SDD: these include methylation of mercury; fine particulate emissions and greenhouse gas emissions and climate change, among others. The current DEIS provides inadequate information for judging the validity of assumptions and conclusions regarding these critically important issues. (see below)	G2B,G8,AQ3,AQ4,AQ6A
7	Have models used to project methylmercury concentrations included estimates of expected variation in measures under varied conditions? Please clarify.	WR4A
7	4.1.2.4 Mercury Impact Criteria: Note is made of the relationship between sulfate and production of methyl mercury. MPCA (2006) policies relevant to this issue are outlined and recommendations are to “avoid or minimize the discharge of water with elevated sulfate concentrations to methylmercury “high risk” situations.” It is not clear, however, to what extent the Northmet Project incorporates these recommendations into their operating plans. No details are provided and “high risk” is not defined. This should be clarified.	WR1E
7	The goal of transparency should also be advanced by providing detailed information for public review of Project principals: the corporation; staff, collaborators; consultants; affiliated organizations, agencies, and universities who participated in all phases of the Project proposal. There should be public review of potential conflicts of interest and/or disclosures of interest. The relationship between Project funding entities and researchers should be known in full. The DEIS Northmet should provide evidence that science-based data and information from independent research institutions were used in preparing the Project proposal. And the project should provide data regarding the extent to which this Project will impact the growing, collective adverse impacts of human activities in the Arrowhead region of MN.	PRO2
7	Tables such as 4.1-97 (p 4.1-190) and text (eg, p 4.1-189 and 4.1-193), throughout the Draft EIS Northmet, contain measures of mercury and methyl mercury concentrations. Since there are significant methodological issues involving such measurements of mercury, the question is whether the analyses reported reflect recognized causes of and degrees of variation in mercury concentrations. For example, significant daily variations have been noted by researchers: <a href="http://toxics.usgs.gov/highlights/mercury_streams.html">http://toxics.usgs.gov/highlights/mercury_streams.html</a> and <a href="http://toxics.usgs.gov/highlights/metals_variation.html">http://toxics.usgs.gov/highlights/metals_variation.html</a> .	WR1E
7	4.1.3 Environmental Consequences: It is stated: “The mining, ore processing, and tailings disposal operations associated with the Project may cause changes to the quantity and quality of ground and surface water in the Project area.” The word “may” should be changed to “will”.	EOO

Comment ID	Comment Text	Theme Codes
8	Potential Indirect Wetland Impacts: It is not clear in the DEIS that robust methodology exist to quantify the changes in surface or groundwater flow rates and patterns needed to project wetland impacts from the Project. What specific methodologies have been used and have they been validated?	WE2
9	While wind roses for Hibbing show a north north west through west-northwest direction 25% of the year and south-southeast through southeast 15% of the year, Ely shows a pattern of west westsouth for the months of April through September. (University of Minnesota: <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> . )Thus, the BWCA which is only 34km or 21 mi from the Project Site would receive winds from the Polymet Project Site for several months of the year. To what extent will this add to the worrisome burden currently being experienced by Class 1 areas BWCA and Voyageurs NP? At BWCA, visibility impairments have been documented for 200 days in a recent year. Has the potential impact of the Northmet Project on BWCA been quantified as part of this DEIS? Has the potential impacts of other mining activities between the Northmet Project Site and the Franconia; Duluth Metals; Encampment and Tech Cominco projected mining sites been quantified as part of this DEIS? These are critical data that must be included in the Final EIS.	AQ4,AQ4B,AQ9
10	The Vegetation and Wetland sections of the DEIS both describe a rich diversity of forest and wetland habitats, most of which are rated as being of high quality. Yet the impact from the loss of such a large area of forest and wetland is dismissed as being not significant. The rationale being used is that although the amount of area destroyed is large, when compared to the rest of the watershed, or northeastern Minnesota, or the whole state, it is minor in comparison. This is an illogical assessment of cumulative impacts. The DEIS should analyze the size of the project's impacts as compared to other development activities that cause permanent loss of forestland, such as roads, trails, housing, cabins, business, industry, and transportation. Then it should assess the cumulative impacts of the mine, these other development activities, and future mining activity, along with the other stress factors that northeastern forests and wetlands are facing such as global warming, growing recreational demand, and expansion of biomass harvesting, invasive species and new insect and disease problems such as the emerald ash borer. Can the argument be made that our forests, wetlands and watersheds will be able to withstand the cumulative effects of all these factors, plus a huge increase in mining activity?	SE3
10	The Wildlife section of the DEIS identifies a rich variety of wildlife species that are located on or near the project site. This list includes many important boreal forest animals including the Canada lynx, gray wolf, great gray owl, three-toed woodpecker, northern goshawk, blackbacked woodpecker, boreal owl, black duck and many others. Based on this list, the project area, especially the Mine site, provide high quality habitat for wildlife. According to Table 4.4-4 this project will destroy about 5 square miles of forest and wetland habitat. An additional area will be indirectly affected. Yet, the DEIS indicates the project will not have significant impact to wildlife because: • Most of them are relatively common species (pg 4.4-1). • They will disperse to other nearby habitats (pg 4.4-1, 4.4-10, 4.4-12, 4.4-15, 4.4-17, 4.4- 20) • The project will not effect their survival at a statewide scale (pg 4.4-12, 4.4-13). It is a well known fact that displaced wildlife cannot successfully relocate into adjacent areas as those habitats are already occupied and at their current carrying capacity. A significant net loss of wildlife will occur, and over much of the 5 square miles wildlife will nearly disappear. The forest and wetland mitigation proposed will do little to replace this wildlife habitat loss. The logic being used is that if the mine project does not threaten the existence of a plant or animal population at a large scale, then the impact is non-significant. This is not a rational approach to assessing impacts. The loss of 5 square miles of quality forest and wetland habitat is obviously significant, especially in the light of the fact that more mines will follow this one. As farmers drained and plowed the wetland and grassland on their individual farms years ago each one could say it was not significant because it was only one farm in a sea of prairie. Yet today over 90% of the wetlands and prairie are gone in most of southern and western Minnesota. The northern forest is a sea of trees today, but if we continue to take 5 square mile bites out of it the losses will add up.	WI2,WI5

Comment ID	Comment Text	Theme Codes
11	I feel anyone who believes they won't do damage is a fool. Their PR spin doesn't fool me. No mine of this type is safe in wet environments such as NE Minnesota. They don't care about MN, they only care about the profits they'll make exploiting Minnesota's greatest treasure the BWCA. We hold a vast amount of precious, clean water. Water is worth protecting! Plus, if PolyMet and society wants copper so bad, we've got 60 years of copper buildup in our landfills. Everything from computers, electronics, appliances, old vacuum cleaners, etc. Let them go into the recycling business.	EOO
12	• Recommendation: Since reclamation planning poses a significant environmental and economic impact of the mine development, a complete preliminary reclamation plan and cost estimate analysis should be included in the DEIS. The plan should be developed to show the reclamation liability on a year-by-year basis. (see report section 3.1.7.2 Reclamation of Mine Site, Closure Cost Estimate)	PD3,PD4
12	• Recommendation: All Category 2, 3 and 4 waste rock should be backfilled into the mined-out East Pit, and Category 1 waste rock should be used to fill (i.e. top off) all of the remaining room in the East Pit. (see report section 3.2.2 Mine Site Alternative)	PD11
13	The financial burden associated with closing the mine is largely incurred in the first few years of the mine's life. When a mine is developed much of the disturbance takes place in the first few years of operation. As the mine operates the pit will get deeper, and waste piles larger, but the plant area and tailings impoundment will stay largely the same.	PD4
14	Recommendation: All Category 2, 3 and 4 waste rock should be backfilled into the mined-out East Pit, and Category 1 waste rock should be used to fill (i.e. top off) all of the remaining room in the East Pit.	PD11
15	This has the cost advantage of utilizing existing facilities for treatment. However, at closure the treatment systems will be 20 years old, and some capital expense will likely be necessary to replace aged and worn components. This is probably most relevant for the nanofiltration system, which is likely to see heavier use given that it is the polishing system for sulfate, which will be a long term concern in the mine discharge.	PD4
16	Since the DEIS is a document that is tied directly to the state and federal agencies that will be issuing the permits necessary for the mine to operate, it would be reasonable for the public to assume that the agencies can and would require some or most of the mitigation measures described in the DEIS when they issue the permits for the mine. But the way the mitigation measures are described in the DEIS all of the mitigation measures would be voluntary. That leaves this reviewer, and the public, unsure of what the final project will look like and what affects it will actually have.	G2D
17	This reviewer agrees that the major potential source for mercury emissions is from the air exhaust of the autoclaves. This has been a significant problem in the autoclave emissions from gold mines in Nevada, where the mercury content is significantly higher than the mercury content of the NorthMet ore. However, the concern is that high temperature processes like the autoclaves can volatilize mercury, and this mercury must be recovered through mercury capture equipment on the autoclave exhaust. One of the major concerns with these capture systems is ensuring that they are performing as planned. At the present time the State of Nevada is the only regulatory jurisdiction that has mercury air emission standards for mines, and mercury air emission standards for mines are being developed by the USEPA. Under Nevada's standards mercury emissions from autoclaves are mostly monitored only once a year, and are sometimes based only on manufacturer's specifications with no monitoring. Once a year measurements will not provide enough data to ensure statistically reliable measurements of the efficiency of the mercury capture systems.	AQ5,AQ6A
18	As suggested in the DEIS (p. 4.1-172), a monitoring plan should include appropriate monitoring for mercury to ensure that mercury is not leaving the tailings basin via water discharges.	WR4C
19	Recommendation: In order to ensure that the mercury capture systems on the autoclaves are functioning as designed, a monitoring scheme should be required that will provide statistically reliable data on the autoclave mercury emissions.	WR4C,AQ5
19	Monitoring of air mercury emissions from coal-fired power plants on a continuous basis was installed on 16 boilers at coal-fired power plants and used for monitoring operations and compliance reporting. On average these systems operated about 90 percent of the time. The technology for measuring mercury economically and often enough to provide meaningful data is available.	AQ5,AQ6A

Comment ID	Comment Text	Theme Codes
20	The waste with the most potential to impact water quality is the hydrometallurgical waste, which will be stored in lined cells built on top of existing taconite tailings in cell 2W. If the material on which the hydrometallurgical cells are built is unstable, then the hydrometallurgical cells will also be vulnerable to rupture during a seismic event. It is known that unstable areas exist in tailings cell 2E:	EOO
21	This subgrade will be the only barrier between leachate from the waste rock and groundwater for Category 1 and 2 wastes. Although this waste is not projected to generate AMD, it could contribute to Metals Leaching. Quality control in the placement of the subgrade barrier will be particularly important. Achieving these permeabilities, especially the lower ones, could be difficult unless the subgrade material has significant clay content. Amending this material, once in place, would be time consuming and expensive.	PD2
21	However, it appears that the potential stability of the tailings in cell 2W is not known:	EOO
22	If the slime layers are present under cell 2W, as would be expected, then this poses a risk to the integrity of the hydrometallurgical cells during an earthquake event.	EOO,GT2
23	The long term integrity of both the flotation and hydrometallurgical tailings storage facilities is necessary to protect water quality. However, significant questions still remain to be addressed regarding the long term vulnerability of the waste storage facilities to seismic events. And, in addition to the significant issues outstanding with the tailings storage facilities, there is similar concern for the waste rock piles.	WR2D,GT2
24	"Proposed heights and slope angles in the preliminary waste rock stockpile designs are within typical mine engineering practice, however a slope stability assessment has not been completed. Further design and analysis would occur during permitting to ensure that the proposed construction meets acceptable design standards." (DEIS, p. 4.13-2) As implied in the quote from the DEIS above, analysis of these critical questions is not being conducted as a part of the DEIS. The DEIS indicates that:	GT1
25	Geotechnical stability is too important an issue to leave for analysis until after the mine has been permitted. This is an issue that must be addressed in the DEIS, and is a major flaw of the DEIS.	GT1
26	This concern has been echoed by the tribal cooperating agencies: "... given the lack of confidence in the structural integrity of ... (liquefaction at the plan site, stockpile liner systems stability, stockpile heights and slope angles, tailings basin stability, dam break analysis) ... a risk assessment must be conducted prior to permitting and the results included in the DEIS so that the public can be fully informed about the risks associated with this project." (DEIS, p. 4.13-2) This reviewer strongly concurs with the above conclusion of the tribal cooperating agencies. As discussed, these stability issues should be thoroughly investigated and the issues resolved as a part of the DEIS process.	GT2
27	Recommendation: Geotechnical stability is too important an issue to leave for analysis after the mine has been permitted. These stability issues should be thoroughly investigated and the issues resolved as a part of the DEIS process.	GT1
28	• Monitoring for ore spillage is recommended to determine the effectiveness of mitigation measures. (DEIS, p. 4.1-86)	WR1A
29	• Water quality monitoring should be required to ensure that actual groundwater concentrations are within model predictions. (DEIS, p. 4.1-92)	EOO
29	• It is recommend that PolyMet either provide engineering calculations showing that the West Pit outlet channel would be stable or provide appropriate energy dissipation or erosion control measures prior to discharge to the wetlands. (DEIS, p. 4.1-104)	WE2,WE3
30	• Mercury monitoring is recommended to determine if elevated mercury concentrations are found in the West Pit. (DEIS, p. 4.1-128)	WR4C
30	• Close monitoring of the pH and water quality of collected leachate from these stockpiles is recommended to ensure the effectiveness of the lime treatment. (DEIS, p. 4.1-135)	WR1A
30	• In order to minimize the risk of accidental tears of the underlying geomembrane liner during the removal of the reactive waste rock, a nominal overliner thickness of 24 to 36 inches is recommended. (DEIS, p. 4.1-164)	WR2D

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
31	• The stockpiles should be treated with limestone (in either lump or ground form) to help neutralize the potential for ARD, and to reduce the potential for acidification of groundwater and surface water at the mine site. (DEIS, p. 4.1-165)	WR1A
32	• Treat drainage from the Overburden Storage and Laydown Area as process water at the WWTF. (DEIS, p. 4.1-166)	WR2G
33	• Increase the backfill of the East Pit to allow for a geomembrane cover over the entire exposed Virginia Formation. (DEIS, p. 4.1-166)	WR2D
33	• Expedite flooding of the West Pit. (DEIS, p. 4.1-166)	WR3A
34	It is recommended that such storm water management controls be designed and installed. (DEIS, p. 4.1-168)	EOO
35	Trains consisting of up to twenty 100-ton side dumping ore cars would transport the ore from the Mine Site to the Processing Plant. The cars would have hinged sides that drop down when the cars are tipped at the Coarse Crusher for unloading. Ore could escape the confines of the rail cars during transport. The plan for limiting the escape of ore (with metal contaminants) from the rail cars is to load the cars at the centerline to keep fines from reaching the edge of the car where they would be subject to spillage through the hinge gaps. The likelihood that this procedure will prevent spillage from rail cars is, quite frankly, not good. Unless rail cars are designed to be completely enclosed, there will be spillage and most probably metals contamination along the rail haulage line. Given time, the spillage from the rail cars could be spread from the rail line across a wide area by wind.	PD7
35	• It is recommended that PolyMet investigate alternative sources of relatively inert embankment material to use in lieu of the LTVSMC coarse tailings. Potential (DEIS, p. 4.1-168)	WR2D
35	• It is recommended that PolyMet maintain the seepage collection and pumping barrier on Second Creek during closure. (DEIS, p. 4.1-169)	WR3A
36	• It is recommended that PolyMet establish a permeable reactive barrier (PRB) test cell during mine operations to facilitate the evaluation of alternative construction materials and a range of mass and flow loading scenarios to help define the effectiveness of a PRB for a full-scale treatment of groundwater seepage from the Tailings Basin during closure. (DEIS, p. 4.1-170)	WR1A
37	• Close monitoring of the pH and water quality of collected leachate from the waste rock stockpiles is recommended to ensure the effectiveness of the lime treatment in maintaining a relatively high pH. (DEIS, p. 4.1-171)	WR1A
38	• Monitoring should be conducted to ensure that woody species do not get established in areas where they could damage the stockpile covers. (DEIS, p. 4.1-171)	EOO
39	• It is recommended that the water quality of the West Pit be monitored regularly during closure (i.e., before pit overflow in Post-closure). (DEIS, p. 4.1-171)	WR1A,WR3C
40	3) What are the global and economic factors that could lead to a reduction in the work force below estimates, or a closing of the plant earlier than expected?	SE3
40	I am concerned that while the impacts of a single project may seem negligible, there are multiple projects under consideration in northeastern Minnesota, and that permitting multiple sulfide mining will lead to significant negative impacts on the long-term health of what has been a significant resource for the socio-economic well being of this region—environmental tourism.	G8C,G11
41	4) What will be the fall-out from a precipitous drop in employment, should it occur?	SE3
42	5) What are the trade-offs between jobs created from mining versus growth from tourism based on the unique wilderness and environmental aspects of this region?	SE4
43	6) What financial safeguards will be put in place to provide for future closure and post-closure problems or issues that arise once the original mining company (Polymet in this instance) is no longer actively mining or seeking to expand operations in this region?	PD4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
44	7) What percent of the revenues coming from this mine will stay in the area or for that matter the United States?	SE7
44	8) What percent of the processed resources will be used to meet domestic use versus shipped across the border to Canada or elsewhere?	RFI
45	9) What concessions is the State of Minnesota and USFS willing to make to facilitate this project (in addition to the proposed land exchange)	RFI,PD1
46	In summary, the DEIS is not able to address some of the less tangible potential impacts of increased mining in this region. Many of the most dynamic, forward-thinking individuals in my community, who have promoted and been recognized on a state-wide level for community-based efforts towards responsible management of our wilderness resources—came to this region because of the unique wilderness and pristine lakes. Our ability as a community to attract such people likely will suffer from extensive mining activities, unless adequate monitoring and regulatory oversight is transparent and functioning on a regular basis. I also am worried about the negative impacts that are outlined in the DEIS regarding short term influxes of workers during construction and the abilities of the local and county agencies to deal with possible related stresses to present infrastructure.	G8
46	10) What are potential long-term health risks to workers at the mine? Long-term health problems caused by taconite mining in the region are just now coming to light. Will the burden of paying for potential unexpected health risks be on individuals, the State (and taxpayers), or the mining company? As noted in the DEIS “Thus, there remains an uncertain level of potential health risk from airborne amphibole fibers for the Project.” The potential exists for the release of amphibole mineral fibers from the proposed operations, which could pose a potential public health risk of uncertain magnitude.	SE5,CR1
47	1) Water quality—The risks associated with the proposed and alternative plans are based on a combination of deterministic and probabilistic analyses. The Uncertainty Analysis approach was used to assess only certain conditions. Given that probabilistic approaches more explicitly recognize and acknowledge uncertainties in the input parameters for the various models, I would like to know if the FEIS will acknowledge these uncertainties explicitly using probabilistic methodologies rather than deterministic approaches.	WR1E
48	With regard to the overall review process, the communities of Northeastern Minnesota would benefit from an extension. The issues are complex: 1) the project proposes new technologies and approaches that are not proven; 2) the socio-economic aspects of the proposed project are based on a number of assumptions that need to be fully debated and outlined; 3) the regulatory environment on both a State and Federal basis is governed by budgetary mandates and resource allocations that may or may not mean that there is sufficient time or support to adequately review the DEIS and more importantly the long term monitoring of the mine throughout its lifetime, into closure, and in post-closure periods.	PRO6
49	The DEIS notes that in some cases the results of the Uncertainty Analysis used to evaluate input parameters for the modeling of flooding and water quality downgradient of the Tailing Basin, waste rock stockpiles, and Partridge River surface water quality conflicted with the results of the deterministic modeling. It would appear that additional review of the conflicting results is warranted.	EOO
50	Regarding water quality in the Lower Partridge and Embarrass rivers: All parameters are predicted to meet surface water quality standards during all flow conditions for all mine years. What about post-mine years? The DEIS states that there will be an expected increase in sulfate concentrations under average flows of 20 mg/L predicted at PM-13, although sulfate concentrations are already somewhat elevated in this area. Again, these consequences are estimated based on modeling of various scenarios.	WR3A
51	2) Mercury—There is a reason that sulfide mining has not been allowed or encouraged in humid environments such as that of the Project Area. How quickly will potential mercury exceedances be detected and mitigated? What financial safeguards will be available to the communities to address future problems like the ongoing Dunka Pit contamination?	WR4C,PD2,PD4,PD5
52	3) Noise Pollution--Blasts from mining operations in the vicinity of our current home are intrusive, especially for my husband, who suffers from hyperacusis and tinnitus. The proposed plant may not impact us directly but expansion of this mine and other mines in the area in the future will lead to a deteriorating environment.	N3

53	Adequate safeguards to protect the environment require careful initial design, monitoring to make sure that the systems (both active and passive) are functional and can identify problems quickly, and sufficient resources to develop and complete closure design and long-term monitoring systems. I am concerned that these issues will not receive adequate critical review in the FEIS.	G2,G4
53	I have worked for an Environmental Consulting firm for over three decades and have seen the effects on project clean-ups that stem directly from such budgetary issues. The enforcement of regulations only works if there is sufficient budget and personnel to provide diligent oversight. Will Federal and State Regulatory Agencies be able to guarantee that sufficient resources will be available to provide oversight over the duration of the project and into post-closure time?	G4
54	1) A series of dikes and ditches would capture and convey most, but not all, of the surface runoff and process water to the WWTF by the CPS.	WR3K
55	2) The long-term mitigation plan with regard to permanent surface waste rock stockpiles relies on the integrity of liners and cover systems.	WR2D,PD2
56	3) What safeguards will be in place for shipping metal concentrates offsite for final processing?	G9
56	4) For large surface waste piles, what is the long-term monitoring plan to determine when 'water quality discharge limits are met?' Is it possible for conditions to change (i.e., climate, precipitation, or anthropogenic changes) such that there could be changes in the values of water quality after the initial discharge limits are met? Also, as noted in the DEIS "The MPCA has set forth a strategy (MPCA 2006, Strategy to Address Indirect Effects of Elevated Sulfate on Methylmercury Production and Phosphorus Availability) for addressing the effects of sulfate on methylmercury production that encompasses technical, policy, and permitting issues. The strategy acknowledges that the technical basis does not exist to establish specific sulfate discharge limits."	RFI
57	2) How reliable are the estimates of the number of jobs that will be generated over the lifetime of the project?	SE3
57	1) Discussion of financial assurance figures and instruments should be included in the DEIS. These are integral elements in assessing the potential negative impacts of a project, weighed against short-term financial return.	PD4
58	The DEIS Northmet proposes a form of mining that is highly controversial in Minnesota, the U.S. and globally. (Precious Waters. <a href="http://www.preciouswaters.org/resources/polymet-mining-activityminnesota/">http://www.preciouswaters.org/resources/polymet-mining-activityminnesota/</a> ; Sulfide Mining: <a href="http://bwcaboard.com/board/viewtopic.php?f=88&amp;t=1698">http://bwcaboard.com/board/viewtopic.php?f=88&amp;t=1698</a> ; OK Tedi Mine: <a href="http://archive.wri.org/biodiv/pubs_content_text.cfm?cid=1860">http://archive.wri.org/biodiv/pubs_content_text.cfm?cid=1860</a> ; Environmental Impact of Mining: <a href="http://rainforests.mongabay.com/0808.htm">http://rainforests.mongabay.com/0808.htm</a> .) This controversy is fueled in part by a consistent pattern over decades of hard-rock mining companies overstating the benefits of hard-rock mining while understating the true aggregate costs and adverse impacts on the environment and health. (Power TM. Economic Role of Metal Mining in MN, 2007: <a href="http://www.cas.umn.edu/econ/documents/faculty/power_econRoleMetalMining.pdf">http://www.cas.umn.edu/econ/documents/faculty/power_econRoleMetalMining.pdf</a> ; Boulanger A, Gorman A. Hardrock Mining: Risks to the Community, 2004: <a href="http://www.womenandenvironment.org/newsreports/issuereports/Mining_Health_Report_final_lo%230.pdf">http://www.womenandenvironment.org/newsreports/issuereports/Mining_Health_Report_final_lo%230.pdf</a> . For these reasons, the DEIS Northmet should provide clear and convincing evidence that the proposed Project will provide citizens of MN with benefits that exceed the risks. In light of the well-documented deleterious impacts on the environment of hard-rock mining in the U.S., the Project proposers should offer detailed evidence as to why the predictable and often devastating effects of hard-rock mining witnessed at mining sites in the U.S. over many decades will not occur with the Northmet Project in northeastern Minnesota.	EOO
58	1.5: Agency Roles and Responsibilities....This would be a convenient place to include all governmental and non-governmental organizations; corporations, consultants, etc. who worked under the direction of "Lead Agencies; Cooperating Agencies, Others". Transparency of the process is critical to serve the public's interest and such information would benefit that interest.	PD9
59	1.6.1: Tribal Cooperating Agency Positions Included in the DEIS: In paragraph 2 last sentence (P1-8) it states "...differences of opinion remain between the lead agencies and the tribal cooperating agencies." Question: Are the differences noted between the DEIS lead agencies and the tribal cooperating agencies differences of opinion or differences in agreement as to facts or both? See 4.1.1.2 below.	RFI

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
59	2.3.1: Potentially significant Issues: It is noted that the “Final SDD determined that the EIS would also address the potential cumulative impacts associated with the combined environmental effects of the Project and of past, present, and reasonably foreseeable future actions relative to: Air Quality; Biological Resources; Water Quality; Economic Impacts and Social Impacts. Nowhere in the DEIS, including Chapter 4.0: summary of the cumulative effects (Section 4.14) are the nearby proposed hard-rock mining operations of Franconia; Duluth Metals; Encampment; and Tech Cominco referred to, yet each of these proposed projects—within <25 miles of the Northmet Project site—are expected to have potentially major impacts in the region. To the extent that all these areas are bound together in regional linked ecosystems, the failure to include reference to these projects as noted in the Final SDD is surprising and suggests that Project proposers do not accept the premises embodied in NEPA and/or the heightened legal protections of BWCA and Voyageurs National Park which will clearly be impacted by hard-rock mining.	G9
60	3.2.1: No Action Alternative: It is stated that: “This alternative would avoid the environmental impacts associated with the proposed Action; however, the social and economic benefits from the Project would not occur.” Extensive data accumulated over decades indicates that this statement should be modified to include that fact that the highly predictable “bust” cycle that is part of “boom” and “bust” mining cycles would cause “social and economic” hazards as result of this Project.	ALT1,G1
61	3.2.3: Tailings Basin Alternative: (1) Vertical wells (to capture and pump Tailings Basin seepage): in this and other sections the term “seepage” is used but not defined (under Definitions iv). The term “surface seepage” is used. It would seem that “seepage” could occur at the “surface” or below the surface from hard rock fractures resulting from drilling, blasting, and other mining operations. While surface seepage could be recognized and recovered, how does this Draft EIS Northmet propose to 1. Detect subsurface “seepage” and 2. Determine the rates, location, directional flow; and ultimate destination of groundwater in aquifers; bogs; streams; rivers; lakes?	RFI
62	4.1.1.2 Groundwater Resources (see 1.6.1 above): The lack of hydrologic data for the Northmet Project that would allow clear characterization of current bedrock groundwater, flow directions at the mine site and tailing basins is outlined. My review of the supporting data does not provide such detail. Question: Do the DEIS Lead Agencies have a disagreement regarding the facts of available data upon which key hydrological estimates can be made? The data is either available for such analyses or it is not available. There should be no “difference of opinion”.	RFI
63	Also, on p4.1.5 footnote a similar “difference of opinion” is noted regarding the “underlying surficial aquifer.” If it is the tribal cooperating agencies’ position that any conclusions “..based on this aquifer test data have a great deal of uncertainty given the variability in the results” do the DEIS lead agencies have data that refute the “uncertainty given the variability in the results?” It would seem that variability can be quantified and the degree of uncertainty ascertained. Isn’t it the responsibility of the DEIS and lead agencies to clarify this?	PRO3,PD8
64	On p 4.1-3 note is made of fractures and joints in the bedrock and groundwater flow through fractures. If fractures occur at deep water levels, one could expect potentially contaminated mine waste chemicals to reach areas other than the Partridge and Embarrass River watersheds and perhaps distant sites such as Birch Lake. The geology of this region could allow this scenario. Have analyses been done to explore such possibilities? Contaminated pits will be present for many years during which time extremes in weather will occur; thus a plausible scenario would involve entry of mine contaminants into adjacent watersheds (see Fig 4.2-9). Please clarify this question.	RFI,WR2A
65	To achieve this goal, the DEIS Northmet should be a transparent and clearly science-based project proposal. The goal of transparency should be advanced by providing detailed information regarding the respective roles of the lead federal and state agencies. The unique, separate and at times, conflicting roles of the Forest Service and Bureau of Land Management regarding oversight and management of the Superior National Forest and mineral resources should be elucidated. The focus, mission and legal underpinnings of these entities are different and goals, objectives, and expected outcomes related to this Project and related projects should be provided.	PRO2
66	4.1.1.3: Surface Water Resources: Mercury in Water: (p 4.1-48). It is noted that “PolyMet is conducting additional sampling in wetlands, streams, and downstream lakes in the Embarrass River watershed under an MPCA approved plan to help better understand mercury dynamics.” It should be noted that mercury is an important water hazard but the MPCA should broaden its project to include detailed quantification of acid mine drainage; sulfates; and other heavy metals. Focusing only on mercury provides an incomplete assessment of impacts of hard-rock mining.	WR1E

Comment ID	Comment Text	Theme Codes
66	This raises the question: What is the position of the proposers and lead agencies for managing water quality not in conformance with state quality standards and prior to approving a new mining operation. Shouldn't the existing water quality variances from standards be corrected before approvals are given for new mining projects?	RFI
66	On p 4.1-8: Groundwater Quality: a quote from MN Rules, pt. 7060.0600 states: "The groundwater may in its natural state have some characteristics or properties exceeding the standards for potable water supplies. Where the background level of natural origin is reasonably definable and is higher than the accepted standard potable water and the hydrology and extent of the aquifer are known, the natural level may be used as the standard." It is not clear in the accompanying tables and text how this applies to the current DEIS data. How frequently has this been observed in data collected for this DEIS? The definition of "natural state" would be critical since polluted water left to resume a "natural state" could still be polluted and thus require remediation.	WR1E
67	Since baseline and current mercury and methyl mercury concentrations in watersheds of this Project are critical to assessing virtually all priority categories of this EIS (Water; Fish; Humans; etc) it is surprising that such data are not available to better inform the water assessments and resulting conclusions. The MN Regional Copper-Nickel Study prepared by the MN Environmental Quality Board (EQB) addressed water quality from mineral mining as a concern in 1979 study of Filson Creek, S Kawishiwi River and environs. Increased metals levels of Nickel, Copper and Zinc were found. Related studies of Unnamed Creek and Birch Lake at Bob Bay related to taconite mining (Erie Mining Company's Dunka Pit) documented increased concentrations of sulfates and nickel.	WR1E,WR4B
68	Specific information should be included in the final EIS regarding: who is doing the sampling, who will do the measurements and what will be the timetable for accomplishing the assessments. The details of this MPCA plan should be appended to the DEIS. Such attention is needed for this matter given the hazards of mercury, particularly methyl mercury on fragile ecosystems and also the consequences for bioaccumulation of mercury and implications for human consumption of fish. MN has a growing problem with mercury in water and has existing statewide mercury fish advisories that limit human consumption of fish: see <a href="http://www.health.state.mn.us/divs/eh/fish/index.html">http://www.health.state.mn.us/divs/eh/fish/index.html</a> .	WR1E,WR4B
69	Seemingly "low" concentrations of mercury in water do not necessarily reflect mercury in the biota and fish tissue concentrations which may be logs higher and directly toxic to humans and on wildlife who feed on fish. The critical importance of these issues has led to creation of proposed national mercury monitoring network: see: <a href="http://toxics.usgs.gov/highlights/mercnet.html">http://toxics.usgs.gov/highlights/mercnet.html</a> .	WR4B,FM2
70	Has there ever been a circumstance reported in the peer-reviewed literature when such mining operations have not caused such changes? Hard-rock mining causes clear predictable and adverse acid and metal-rich drainage. This DEIS focuses primarily on mercury but as noted above numerous metals leach from mining sites with toxic consequences for the biota. (Kimball BA. Assessment of metal loads in watersheds affected by acid mine drainage..Applied Geochemistry; 17; 2002:1183-1207)	RFI
71	4.1.3.5 Mitigation and Monitoring Measures. On p 4.1-172, Mercury monitoring is noted the MPCA Mercury Strategy (2006) that recommends water monitoring for sulfate releases and effects on methylmercury production and establishment of five monitoring sites on streams draining wetlands..." The language in this paragraph and the next paragraph where it states: "PolyMet should develop a similar mercury monitoring plan for the Mine Site..." are ambiguous. What specifically is the responsibility of PolyMet for achieving the MPCA 2006 recommendations and what does the word "should" mean? Please clarify.	EOO
71	4.1.3 Environmental Consequences: Note is made of Uncertainty re key assumptions and the use of "Uncertainty Analysis" for selected contaminants. Since uncertainty analysis requires a variety of objective and subjective data inputs, such simulations may produce highly variable outputs. It is stated that the analyses were approved by the resource agencies? Could the methodology, data input and analyses be appended to this EIS?	PRO3

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
72	4.1.4 Cumulative Effects on Water Resources: It is most disconcerting that there is “..existing seepage from the LTVSMC Tailings Basin” and that the Draft EIS suggests that the duration of these impacts would be extended. Why have the seepage problems not been corrected? The law requires polluting offenders to comply with remediation plans. The current problems should be corrected before any new mining operations are approved.	WR5A
73	As noted earlier, shouldn't the Cumulative Effects summaries in this and other Chapters include major projected mining activities of Franconia; Duluth Metals; Encampment; and Tech Caminco? If not, please provide rationale.	WR5A
74	4.1.4.2 Water Quality: Northern MN, including the area of Northmet Project, has significant existing mercury impaired waters. (Fig4.5-4 and p 4.1-189 re Colby Lake) Almost 1,500 waterbodies in MN require Total Maximum Daily Load (TMDL) list. Remarkably a TMDL pollution reduction study has not been performed for Colby Lake to address this impairment. It would seem reasonable that this Draft EIS Northmet address when this will be accomplished and by whom. Is this planned prior to the projected operation of the Northmet Project?	WR4B
75	On p 4.1-196 it is noted that MPCA (2006) “recommends avoiding “discharges” of sulfate to “high risk” situations, which include wetlands, low-sulfate water...where sulfate may be a limiting factor in the activity of sulfate-reducing bacteria...re the potential for methylmercury production.” Has Northmet Project accepted this recommendation? Who will be responsible for ensuring that the recommendation is followed?	WR1E
76	4.2 Wetlands: It would seem reasonable that “non-field” and field analyses be used to determine wetland locations unless there are scientific data that confirm that “non-field” analyses provide as much information as “non-field” plus “field” review. This DEIS states that only “non-field” analyses were used. Why?	WE1
76	Note: Please clarify: Throughout the DEIS statements are made that recommendations have been made after study (such as the above by MPCA.) I am unclear as to what the disposition is on such statements. Are these all included in the final EIS? Are these negotiated with Polymet? Who makes the decision and what is the process? The current DEIS does not provide information to answer this question.	EOO
77	4.2.1.2 Wetland Delineation: Since wetlands in MN are protected by both federal and state laws, it would seem critical that precise definitions of wetlands, including their characteristics be included in the Draft EIS. This is especially true in light of the fact that 70% of the wetlands are “high quality.” (p4.2-25)	WE1
78	While much effort has gone into the preparation of this DEIS Northmet, there are major deficiencies: The DEIS does not clearly demonstrate that Project benefits outweigh the risks; there are major gaps in transparency of the Proposal, with no information provided on disclosures or potential conflicts of interest; and finally, each section of the DEIS Northmet contains statements and conclusions that lack supporting documentation of the assumptions upon which these statements and conclusions are based. Profuse generalizations often mask the lack of specific evidence-based answers to critical questions. Much data in this DEIS was provided by consulting organizations, whose science expertise, and relationship (programmatic and fiduciary) with the lead agencies and mining company are not included.	G8
79	4.2.1.3 ; 4.2.1.4; Wetland Classification System: The question is whether the Wetland Classification System Descriptors (see Table 4.2.1 and 4.2-2) may be ascertained by only “nonfield” analyses or whether a more accurate description would result from both non-field and field assessments as noted above.	WE1
80	4.2.4.3: Monitoring: A wetland monitoring plan is not included in the DEIS. But such a plan “should” be implemented. Such a plan has apparently been initiated by Barr 2005 and “may need to be expanded.” Several features of this plan are suggested (p4.2-37). Since wetland monitoring is arguably the most important element of the Project's role in ensuring minimum harm to wetlands, it would seem critical that this plan be included in the EIS. This deficiency should be corrected.	WE3

Comment ID	Comment Text	Theme Codes
81	4.4 Wildlife; The fact that numerous species are deemed fragile in MN: federally and state listed endangered, threatened, and species of special concern (ETSC—7species); MN Species of Greatest Conservation Need (SGCN-58 species); the USFS Regional Foresters Sensitive Species (RFSS—23 species), indicates that, while conservation and environmental policies in northern MN have merit, there are major threats to this region from human activities, including mining, proposed sulfide mining and logging and industrial development. It is in this context that this DEIS must be viewed with the plausible likelihood that the Northmet Project will only add to these environmental burdens and threats to wildlife. I found no evidence in the DEIS that the proposed Northmet Site was monitored over time for evidence of the species noted above. This deficiency should be corrected.	WI2
81	Note: Dynamical systems analyses have apparently not been used in preparation of this and other Chapters and Sections of the DEIS. As complex systems, ecosystems lend themselves to such modeling and simulation. The ACE and DNR should incorporate such tools into the EA/EIS process and make the findings public.	G8
82	Canada Lynx: on p4.4-3 it is stated that “.portions of the Mine site lie within the revised boundaries of federally designated lynx critical habitat. A recovery plan has not yet been issued for the Canada Lynx.” Will specific responsibilities for the Northmet Project regarding protecting Lynx habitat be included in the final EIS? Has PolyMet physically inspected the proposed Project site for lynx dens?	RFI,WI1
83	The question is: How and to what extent will proposed Project activities affect these species and other species, in the context of all changes in human development in northeastern MN that may compound the adverse effects of mining?	WI5
83	Under NEPA and CEQ regulations, cumulative effects must be evaluated for project proposals, including alternative proposals, along with direct effects and indirect effects. It is therefore critical that a comprehensive assessment of the current and proposed mineral mining impacts on Lynx and snowshoe hare populations be conducted for the areas under consideration for mining and adjacent areas of Lynx habitat.	WI5
84	4.4.3.1 Proposed Action (Environmental Consequences): It is stated that the Final EIS will include results of consultation between USACE and USFWS regarding potential effects on Canadian Lynx and other federally listed species. I suggest that this consultation summary as well as the “process” be included with specific findings from research, assumptions and methodologies used. What specific efforts have been made at the Project site to identify Lynx? Have trail cameras been deployed? Have there been searches of the site for Lynx den sites. Or are statistical data being used to describe the potential impacts of mining on these species?	RFI,WI1
84	Road density has been found to directly affect predators high in the food chain: elk, wolves, wolverines, bears and lynx. (Switalski TA. How many is too many: A review of road density thresholds for wildlife. Wildlands CPR Newsletter, RoadRIPorter, 2006). Although the extent of proposed road development in this DEIS NorthMet may not suggest a deleterious effect on Lynx, it is the combination of multiple seemingly small changes across Lynx range and habitat that must be assessed, since seemingly minor effects in a complex system may in aggregate cause profound and deleterious, often unforeseen, adverse impacts. (Emmons & Olivier Resources. Cumulative effects analysis on wildlife habitat loss/fragmentation...Prepared for MN DNS, May 15, 2006; Fed Reg 2003 vol 68, No. 128. Part III. Dept of Interior: Fish and Wildlife Service. 50CFR Pt 17: Endangered and Threatened Wildlife and Plants; Notice..re Canada Lynx. Final rule. Pp 40076-40101; Hickenbottom JR et al USDA Forest Service Biological Assessment (Canada Lynx) Lynx biological Assessment, Dec. 1999). The current DEIS Northmet does not provide sufficient information to clarify this issue?	WI5

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
84	Finally, the cumulative effects analyses are few and incomplete with little information provided about the broader implications of this Project and other hard-rock mining activities in various phases of development and in the queue in the Arrowhead region. While it is vital that Minnesota take a focused view of the potential impact of the Projects, it is critical that a broader view be taken by Mn and lead agencies of the context in which this and related projects are taking place in northeastern MN. The impacts on the biota and on human health of such projects will be felt locally, regionally and globally. The aggregate effects must be critically examined since science tells us that our current rate of human activities affecting land use are unsustainable. (Foley et al. Our share of the pie. Science, 2005: <a href="http://www.pnas.org/content/104/31/12585.full">http://www.pnas.org/content/104/31/12585.full</a> ; Boakes et al. Extreme contagion...Proc R Soc B, 2009: <a href="http://rspb.royalsocietypublishing.org/content/early/2009/11/25/rspb.2009.1771.abstract">http://rspb.royalsocietypublishing.org/content/early/2009/11/25/rspb.2009.1771.abstract</a> ; Foley et al Global Consequences..Science, 2005: <a href="http://www.sciencemag.org/cgi/content/abstract/309/5734/570">http://www.sciencemag.org/cgi/content/abstract/309/5734/570</a> ; Haberl et al. PNAS 2007: <a href="http://www.pnas.org/content/104/31/12942.full.pdf+html">http://www.pnas.org/content/104/31/12942.full.pdf+html</a> )	G8C
85	4.4.5 Approach (Wildlife Travel Corridors): The list of projects identified as potentially impacting wildlife corridors does not include the Franconia; Duluth Metals; Encampment and Tech Cominco projects in the nearby Ely area. Please include these projects in your analyses. It is inconceivable that further development of mining in these areas is not relevant to the cumulative impact of the Northmet Project and other human activities in animal corridors in northeastern MN. Will Table 4.4-9 be revised to reflect these projects?	WI5
86	4.5.3.1 Proposed Action (Environmental Consequences: Fish): Water Quality Effects p4.5-15: Was the conclusion reached in this paragraph informed by the most recent Climate Change data regarding disruptions in normal cycles of extreme weather events? (WHO; UNEP Intergovernmental Government Panel on Climate Change: <a href="http://www.ipcc.ch/">http://www.ipcc.ch/</a> ) Do the assumptions regarding lack of impact even under extreme low flow conditions include changes predicted by Climate Change forecasts? This question applies to all other sections that have reached similar conclusions.	FM1
87	4.5.4: Mercury and bioaccumulation in Fish: The DEIS does not include important science regarding metal contamination from hard rock mining and toxicity in fish and macroinvertebrates other than mercury. Cadmium (Cd), lead (Pb) and zinc (Zn) in water and streambed sediment have been found to exceed Ambient Water Quality Criteria (AWQC). This deficiency should be corrected. (Maret TR et al. Fish Assemblages and Environmental Variables...Trans Am Fisheries Soc 2002;131:865-84. <a href="http://afsjournals.org/doi/abs/10.1577/1548-8659(2002)131%3C0865:FAAEVA%3E2.0.CO%3B2">http://afsjournals.org/doi/abs/10.1577/1548-8659(2002)131%3C0865:FAAEVA%3E2.0.CO%3B2</a> )	FM1
88	Even in MN's two Class I areas (BWCAW and Voyageurs NP), visibility impairment is being quantified. New construction and development, including mining companies on the Iron Range, threaten to add to the problem. Global sources of air pollutants are increasing. The projected added air pollution from the proposed activities in this DEIS and subsequent proposed sulfide mining must be evaluated in the context of such changes. Fine particles (which have serious human and environmental adverse effects) will clearly be generated from multiple sources associated with this Project including forest disruption, soil erosion, road building, mining, vehicular traffic, etc.	AQ4,AQ4B,AQ9
88	4.6.1.1 Existing Conditions: Regional Climate and Meteorology: Surface data are reported from the Hibbing Monitoring Station with estimates of the wind direction, etc. Why aren't other closer monitoring data provided. For example, wind roses for MN and surrounding cities ( <a href="http://climate.umn.edu/wind/windRoseClimatology.htm">http://climate.umn.edu/wind/windRoseClimatology.htm</a> ) provide data from Ely, MN Municipal Airport.	AQ4,AQ5
89	Since one of the major wilderness areas in the U.S. and MN is near Ely (BWCA) it would be imperative to know what impact Northmet Project will have on air quality of the BWCA, which is already suffering from degradation of ambient air quality from power plant and other point sources.	AQ4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
90	Particulate Matter (PM) especially, PM 2.5 micrometers is invisible so one would not expect to see it. Yet these fine particles pose threats, not only to the environment, but to human health. Fine particles are a known cause of cardiovascular disease (heart attacks; strokes); respiratory disease (asthma, COPD) and cancer, particularly, lung cancer. (Department of Health and Human Services: <a href="http://www.atsdr.cdc.gov/general/theair.html">http://www.atsdr.cdc.gov/general/theair.html</a> . The language in this DEIS should be revised to reflect the above. Finally, vehicular traffic and exhaust adds fine particles and other air toxicants to ambient air. Have estimates been made of the contributions to fine particle pollution over the life of the proposed Project?	AQ6
90	4.6.1.2 Local and Regional Air Quality: On p 4.6-2 it is noted that “ambient monitoring data from the closest monitoring stations to the Project are provided in Table 4.6.2.” It is not clear where the “nearest monitor” to the Northmet Project Site was; the data are from MPCA 2008 but the monitor source is not listed. If the data in Table 4.6-2 are from a remote monitoring site, the Northmet Project should request relevant data from MPCA for the Site environs. Also, note is made that the MPCA data was for 2004-06. These data are out of date and should be updated to ensure reliable baseline data are available from the Site.	AQ4,AQ5
91	In addition, the DEIS Northmet and other mining activities in this region appear to conflict with the Forest Service Mission and Goals (USDA Forest Service Strategic Plan FY 2007-2012, USDA, FS-880, July 2007; USDA FS Land and Resource Management Plan, Superior National Forest, July 2004) which state: “Forest Service Mission (is to) sustain the health, diversity, and productivity of the Nation’s forests and grasslands to meet the needs of present and future generations;” and a primary goal: “Promote ecosystem health and conservation using a collaborative approach to sustain the nation’s forests and watersheds.” Hard-rock mining is in direct conflict with the purpose for which the SNF was created. The aim must be to reconcile the strikingly differing legal mandates and missions of lead agencies with stated aims, goals and objectives of PolyMet Northmet Project and related mining and human development activities in northeastern MN.	CPLU3
91	4.6.3.1 Proposed Action (Criteria Pollutants): The assessments of human toxicity from exposure to chemicals used at the Mine Site (Table 4.6-17) need to consider the lung health of workers at the time of their employment. Preexisting respiratory diseases may be exacerbated by exposure to chemicals included in this table. Of great importance is the documentation of cigarette smoking status of workers since some chemicals on this list are mutagens or carcinogens. In general, combined exposure to inhaled chemicals and cigarette smoke may increase the likelihood of development of lung cancer. The Northmet Project should have ready access to state- of- the -art smoking cessation program, including a Quit Line to support workers’ smoking cessation. (these resources may be obtained from the MN Department of Health)	AQ6
92	In addition to the above threats to human health, the mining activities, miners but protect from inhaling fine particles of hard rock dust. Lung neoplasms have been associated with mining and are markedly increased in tobacco smokers. There are concerns about the risk of mesothelioma among hard rock miners: (Univ. MN: <a href="http://taconiteworkers.umn.edu/about/study_goals.html">http://taconiteworkers.umn.edu/about/study_goals.html</a> . Lemen RA, et al. Epidemiology of Asbestosis-Related diseases. Envir Health Persp., 1980: <a href="http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1568524/pdf/envhper00470-0008.pdf">http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1568524/pdf/envhper00470-0008.pdf</a> )	AQ4C,AQ6
93	4.6.4.5 Cumulative Mercury Emissions. As noted above, the projected hard-rock mining operations of Franconia; Duluth Metals; Encampment and Tech Cominco must be included in this analysis and Table 4.6-22.	AQ4B
93	4.6.4.7 Summary of 2006 Visibility Class I Study Scope (Updated 2009): Regional Haze and Visibility Impairment. : On p 4.6-50 a table of projects and actions are presented. Again, this table needs to include all “foreseeable” projects that will adversely impact the air quality of northeastern MN, including Franconia; Duluth Metals; Encampment; and Tech Cominco projects.	AQ4B
94	4.7 Noise: It is stated that the effect of noise on wildlife is reviewed in section 4.4. However, a review of 4.4 reveals a dearth of references to the wealth of science regarding the compelling adverse impact of noise on wildlife and human health. A separate section devoted to this topic should be written and included in the DEIS. The cumulative effects of noise as animals move along corridors over ranges of a few meters to > 100 miles must be considered. (Radle AL. Effect of Noise on Wildlife: A Literature Review.	WI2,N4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
95	4.8 Cultural Resources: Regulatory Framework: It is stated that Cultural Resources management within Federal and State agencies seeks identify cultural resources and balance the need for development with protection. Not included here is an analysis of public opinion in the Arrowhead as to whether the regulatory process is fairly achieving this balance. Development is driven by economic considerations that would likely overshadow the power of those whose goal is to protect Cultural Resources. This DEIS should provide evidence to support conclusions that suggest there are no cumulative effects associated with cultural resources.	PRO5,G3,CR1,CR2,CR3,C
95	Summary: p4.7-9. The use of the word “continuous” is confusing. Does not “discontinuous” noise matter, eg, blasting; 100 ton mine truck traffic; etc? For those people who frequent the environs of the proposed Project for recreation, fishing, hunting, and such activities, the data presented in 4.7 would likely adversely affect their experiences.	N6
95	<a href="http://interact.uoregon.edu/MediaLit/wfae/library/articles/radle_effect_noise_wildlife.pdf">http://interact.uoregon.edu/MediaLit/wfae/library/articles/radle_effect_noise_wildlife.pdf</a> . The DEIS fails to provide evidence regarding the serious and growing human health effects of noise. Former U.S. Surgeon General William H. Stewart said in 1978: “Noise must be considered a hazard to the health of people everywhere.” (Goins L, Hagler L. Noise Pollution: A Modern Plague. S Med J 2007: <a href="http://web.ebscohost.com/ehost/pdf?vid=2&amp;hid=102&amp;sid=72c7f778-d60d-4a16-9a7f-010ec30d90a7%40sessionmgr104">http://web.ebscohost.com/ehost/pdf?vid=2&amp;hid=102&amp;sid=72c7f778-d60d-4a16-9a7f-010ec30d90a7%40sessionmgr104</a> )	N5
96	4.10.2: Impact Criteria: This sections fails to include explicit review of the “boom” and “bust” cycles of mining (as noted above) that are extensively documented in the literature and relevant to the DEIS Northmet.	SE3
96	To understand the potential impact of the proposed Project and related projects, systems analyses are required. The DEIS is narrow in scope and fails to address important questions regarding the potential impact of proposed hard-rock mining on the forest and related natural systems. The conclusions in the DEIS do not follow a principle of the USDA U.S. Forest Service: “We use the best scientific knowledge in making decisions and select the most appropriate technologies in the management of resources.” ( <a href="http://www.fs.fed.us/aboutus/mission.shtml">http://www.fs.fed.us/aboutus/mission.shtml</a> ) With science-based and unequivocal dynamic changes in global climate (WHO; UNEP Intergovernmental Government Panel on Climate Change: <a href="http://www.ipcc.ch/">http://www.ipcc.ch/</a> (reflected in Ely environs weather in recent years), coupled with multiple recent and pending major human developments in northern MN (mining; new roads; new building; new power sources; and the like) the failure to use the best science, including dynamic systems methodologies, will have grave implications on the future sustainability of these treasured forest and wilderness areas. The data and information provided in this DEIS is inadequate for formulating conclusions let alone formulating the critical questions regarding effects of sulfide mining in SNF, adjacent ecosystems and in the critically protected areas such as BWCA and Voyageurs National Park, which by law require special attention for preservation.	PRO3,G8
96	4.9.1.1 Federal Land Management: A discussion regarding the feasibility for a land exchange between USFS and PolyMet is discussed. This DEIS should not be approved or move forward until such time as the feasibility and legality of this idea be decided. The statement: “This analysis is based on a successful completion of the land exchange and elimination of National Forest lands from the Project” suggests the authors of this DEIS can predict the future. It is impossible for the public to fairly evaluate this DEIS with such speculation.	PRO4

Comment ID	Comment Text	Theme Codes
96	4.10 Socioeconomics: The major and growing contribution to the Arrowhead region in MN of tourism is not presented in this section and should be so that a more complete view of the economy of this region may be understood. Tourism contributes \$11 billion to MN economy, with >41 million visitors annually. These numbers have increased steadily in recent years. The Northeastern region has 16% of the >41 million visitors or about 6.56 million visitors with generation of >\$719 million in Gross Sales. This activity contributes 17,932 private sector jobs. (Explore Tourism 2008: <a href="http://www.tourismroi.com/Content_Attachments/26124/File_633480214451131154.pdf">http://www.tourismroi.com/Content_Attachments/26124/File_633480214451131154.pdf</a> . A critical question not addressed in the DEIS is the extent to which current and proposed major increase in mining in the region will increase, have no effect or decrease tourism to the Arrowhead of MN. This DEIS needs to address this critical question with data. To focus on shortterm financial gain from sulfide mining and not incorporate long-term consequences, including the predictable “boom” and “bust” mining cycles, in the DEIS analyses is a major deficiency of this DEIS. Potential depression of the tourism industry and land values in the Arrowhead, would have a devastating adverse effect on the entire region for decades to come. (Thomas M. Power (Economics Dept., University of Montana: “The Economic Role of Metal Mining in MN: Past, Present, and Future” prepared for MN Center for Environmental Advocacy and the Sierra Club, 2007.; <a href="http://www.sosbluewater.org/mn_mining_economics_power.pdf">http://www.sosbluewater.org/mn_mining_economics_power.pdf</a> .) Unfortunately, a study funded by industry (Labovitz School of Business, Duluth) failed to incorporate destabilizing boom and bust cycles and adverse impacts on the growing tourism industry in their narrowly focused analysis. ( <a href="http://www.ironrangeresources.org/_site_components/documents/user/aboutreportspublications230.pdf">http://www.ironrangeresources.org/_site_components/documents/user/aboutreportspublications230.pdf</a> .)	SE3,SE4
97	4.10.3: Socioeconomic Consequences: Impact Analysis for Planning (IMPLAN) was based on old data that does not reflect the current fiscal crisis. What impact will this have on estimating the “boom” and “bust” predictable cycles of the proposed mining?	SE8
98	4.10.4: Cumulative Effects: Note is made that the data in Tables 4.10-15-16 do not appear to be based on the recent, unique fiscal situation in the U.S. and MN. Also note that neither this section nor the section “Socioeconomics” p S14 (Summary) reflect on compelling data regarding the “Boom” and “Bust Cycles”, an issue of critical importance to the integrity of the Draft EIS Northmet as reflected by Thomas M. Power (Economics Dept., University of Montana: “The Economic Role of Metal Mining in MN: Past, Present, and Future” prepared for MN Center for Environmental Advocacy and the Sierra Club, 2007.; <a href="http://www.sosbluewater.org/mn_mining_economics_power.pdf">http://www.sosbluewater.org/mn_mining_economics_power.pdf</a> )	SE3
98	4.10.3.1: Proposed Action: Environmental Justice: What assumptions are being made to support the statement that: “Therefore the Proposed Action would not have disproportionately high or adverse effects on minority populations?” While it is suggested that the proposed “boom” resulting from the proposed mining would benefit low income persons, isn’t it logical to assume that the “bust” that could occur at any time during the proposed 20 year operation of the mine would have a deleterious impact on low income families—potentially a devastating impact on persons who lack safety nets of community support?	SE2
99	4.14 Cumulative Effects: The USFS must ensure that a full range of cumulative impacts, past, present and foreseeable future, from mining in this area and adjacent areas or regions are included in the analyses. The DEIS Northmet 2009 is narrowly focused and it appears to this reader not meet the CEQ definition and intent of the National Environmental Policy Act. The cumulative and related effects of mining exploration and hard rock mining in this area and the impacts of extending the 100 mile plus Iron Range corridor deep into northeastern Minnesota’s SNF and BWCA wilderness areas, have not been addressed adequately as required by National Environmental Policy Act (NEPA) of 1969 (29) (CEQ Sec. 1508.7: Cumulative Impact). Cumulative Effects analyses on wildlife habitats in this region have demonstrated the need for such information. (Emmons & Olivier Resources, Inc. Cumulative effects analysis on wildlife habitat loss/fragmentation and wildlife travel corridor obstruction/landscape barriers in the Mesabi Iron Range and Arrowhead regions of MN. MN DNS, May 15, 2006).	G9
99	Although the DEIS states that for many projected changes above the levels would be compliant with MN or related standards, it is the case that these increases and projected adverse impacts will combine into the aggregate of such changes in other mining activities to produce a net negative impact on the environment in the Arrowhead region.	G8C

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
100	This project will cause a net reduction in wildlife habitat and increase habitat fragmentation. On a local scale the loss is quite significant. The DEIS should clearly state, not obfuscate these facts. If the company were environmentally concerned, the DEIS would contain actual measures they plan to take to mitigate the loss, not suggestions of what they might be able to do.	WI2
100	A reasonable measure, from a sustainability standpoint, would be to ask Polymet acquire an area of similar quality forest and wetland habitat and put it in public ownership. At a minimum, they should be required to replace the public forest land area that will be destroyed. This should be land that is currently unprotected from development, and is located in the St. Louis River watershed. The DEIS states that Polymet and the USFS are exploring the feasibility of a land exchange (pg 4.4-7). This land exchange needs to be identified and secured prior to completion of the EIS, so the relative merits of the two parcels for wildlife habitat, recreation and other resource benefits can be evaluated in the light of public scrutiny.	WI4,CPLU4
101	The Wildlife Section of the DEIS primarily evaluates the effects of the project on rare species (The federally- and state-listed Endangered, Threatened, and Special Concern species; the Minnesota Species of Greatest Conservation Need; and the U.S. Forest Service Regional Foresters Sensitive Species) (pgs 4.3-5 to 4.3-9 and 4.4-1 to 4.4-9). Very little is said about other more common plants and wildlife using the area, or the value of the habitat for wildlife in general. Their concern is focused only on those species that have some legal standing or protection. To adequately analyze plant and wildlife impacts all kinds of wildlife and their habitat should be considered. Their overall value at the plant and animal community level should be analyzed. In addition, their recreational and economic values to people should also be considered, especially since much of the project site is currently public forest land.	WI5
101	A significant omission in the DEIS is that I find nothing about the impacts to Canada moose. This is an important species in northeastern Minnesota that may be in trouble. What is the value of the habitat for moose that will be lost and how will this impact their population? Both wetlands and conifer cover are key habitats for moose and this project would destroy a large amount of each.	WI2
102	The potential for long-term, cumulative impacts from copper-nickel mining are enormous. The Polymet project will be a precedent setting event. It is imperative that the DNR and COE permit this mine in a way that truly protects the environment and is sustainable. The regulatory bar should be set high enough so this type of mining is done correctly from the beginning. The mining companies should not be allowed to get rich at the expense of our forest, wetland, water and wildlife resources, which would all be seriously impacted by the current form of the DEIS.	EOO,G8C
102	The DEIS states that bald eagles are not likely to be adversely affected by the project because the project site is more than 2 miles from any known nest sites and it does not provide optimum habitat for nesting and feeding (pg 4.4-13). However, eagles and other water birds may travel long distances to feed and rest, and will use nearly any body of open water at times. The tailings basins and other open water bodies on the project site will most likely be used at times by eagles, osprey, herons, ducks, geese, kingfisher, mink, otter, etc. These species are common on taconite tailings basins. What contaminants will they be exposed to? What is the likelihood they could bio-accumulate heavy metals, mercury or other contaminants? Could this be an issue for hunters who may eat waterfowl that have used these contaminated waters?	WI1,WI2,WI3,FM1
103	The DEIS states that the project will create 278 acres of open water by flooding the West Pit and that water quality will exceed surface water standards for several parameters (pg 4.4-19). The West Pit will be fenced to deter wildlife, but that will not prevent most of the species listed above from accessing the pit and its contaminated water.	WI2
103	A similar concern applies to the Partridge, Embarrass and St. Louis rivers. Increased sulfate discharge from the mine and discharge of atmospheric mercury from the processing plant would likely increase export of methyl mercury from these watersheds. This could affect fish and wildlife all the way to Lake Superior. An increase in sulfate discharge may also destroy what is left of wild rice beds in the St. Louis River watershed. Wild rice is a critical habitat for fish and wildlife. How will these contaminants be evaluated and monitored? This is not discussed at all in the Vegetation or Wildlife sections of the DEIS.	WR4B,WR4C,WR4F,G3,C

Comment ID	Comment Text	Theme Codes
104	The DEIS states that two studies have been done that have identified between 15 and 18 wildlife corridors left along the Mesabi Iron Range (pg 4.4-30). These vegetated corridors provide avenues for plant and animal migration across the heavily disturbed Range. According to the DEIS two of the corridors will be impacted to some degree by Polymet. The DEIS goes on to say that several other corridors will be significantly impacted by other projects. They conclude that the impacts by Polymet are relatively minor in comparison, and thus are not a concern. This is not a valid conclusion. If other corridors will disappear, then those left at Polymet become even more important. Every effort should be made to minimize the impact and restore them fully. The corridors may become even more important in the future if climate change occurs and plants and animals are forced to migrate northward.	WI5
104	The overall concern I have with this DEIS is that it takes a minimalist approach that seems to disregard or underestimate the project's impacts. The measures given to avoid, minimize and mitigate the impacts are narrow and inadequate. The significant environmental dangers that copper-nickel mining presents, the possibility of cumulating impacts from more mines in the future, and the need to develop our lands in a sustainable manner demand a much stronger EIS, or a moratorium on copper-nickel mining as Wisconsin has done. We need a project and a company that will set high standards that will meet, not avoid, the sustainability goals laid out in DNR's Conservation Agenda.	G2D,G12
105	There is a low level of commitment made in the DEIS to protect the environment. It is clear that Polymet and the DNR are willing to only meet the minimum requirements to obtain the mining permits. The language in the DEIS indicates they will not achieve high environmental standards, or mine in a way that has a low impact on Minnesota's natural resources. My hope is that the DNR and COE will force Polymet to abide by higher standards, or deny their permits.	EOO
105	In addition, there is no financial assurance that the project would be mitigated or cleaned up when the mining is done. Copper-nickel and other types of sulfide mining have a history of placing huge burdens on taxpayers to clean up the pollution they have left behind. What kind of financial resources does Polymet have, and will a bond be posted for cleanup to protect taxpayers? Will the DNR request that the state require some kind of financial protection for environmental cleanup? If Polymet cannot afford to mine copper-nickel in an environmentally sustainable manner, then our state cannot afford to permit the mine.	PD4
106	According to the DEIS this project will impact 1522.1 acres of wetland. This is a tremendous loss of wetland in a state that advocates a policy of no-net loss of wetlands! According to the DEIS the Polymet mine will operate for 20 years and thus the minerals extracted from this mine will only provide a temporary financial benefit to the state. These wetlands, which have a number of known beneficial functions and values, will be lost forever. What is the economic cost of this wetland loss to the St. Louis River watershed? How can this huge wetland loss be justified? Why is underground mining not considered as an alternative to reduce these significant wetland impacts?	WE2,SE4
107	This project will destroy a diverse variety of high quality wetland types including both perched bogs and groundwater flow influenced wetlands. Coniferous bog and open bog are the wetland types that will be most impacted. Nearly all of the wetland mitigation will take place offsite in a different county and watershed, and will create a different type of wetland. There will be a net loss of coniferous and open bog, and other wetland types in the St. Louis River watershed. The important water quality functions and values that such wetlands provide to the watershed's ecosystem will be forever lost. How much change will occur in surface and groundwater temperatures, flow regimes, storage volumes and water quality in the headwaters of the receiving streams as a result of the removal of so much wetland? Wetlands, and especially peatlands, also provide a high level of carbon sequestration which is important for combating climate change. Peatlands are nearly impossible to create artificially. These issues and impacts have not been adequately addressed in the DEIS.	RF1,WR3N,WE2,WE3
108	The Wetlands section of the report refers to the presence of white cedar and balsam fir in the coniferous wetland communities (pg 4.2-5). Cedar and fir are very important as thermal cover for wildlife. What is the extent of these cover types in the project area? White cedar is an important cover type in the northern forest that is declining in abundance in Minnesota because it is very difficult to regenerate, especially in areas with high deer numbers. Will the wetland mitigation for this project include the establishment of white cedar to replace what is lost on the project site? If so, how will this be accomplished since both wetland mitigation sites are located in areas of the state that have high deer numbers?	WI2,WI4,WE1,WE3

Comment ID	Comment Text	Theme Codes
109	The large area of wetland loss, the diverse types and high quality of these wetlands and the difficulty of recreating such wetlands are factors that strongly indicate more effort should be made to avoid this wetland loss, and that mitigation should be required within the St. Louis River watershed.	WE3
109	Like wetlands, a large area of forestland will be destroyed by this project. Most of it is diverse, high quality forest. Much of this forest is rated by the DNR as having a "High Biodiversity Significance". Most of it is currently public forestland. This section of the DEIS focuses on rare plant species, but does not discuss many other important aspects of this forest land. What are its recreational values for hunting, trapping, hiking, bird watching, berry picking and other outdoor activities? What are its commercial values for timber harvest and biomass? What is the carbon sequestration value of this forestland? How and will these values be mitigated or will their loss be another permanent cost for this temporary mining project?	SE4,AQ3
110	The level of detail available is appreciated in the sense that a great deal of significant information is being disclosed, and it is too often the case that detailed information is withheld from the public largely because agencies don't consider the public to have the expertise necessary to review and competently comment on this detailed information. On the other hand, the large volume of detailed technical reports appended to this DEIS pose real challenges for public sector reviewers with limited resources and limited time to review this information. However, given a choice between too much or too little detailed information, this reviewer believes that it is always best to err on the side of more information, because too little supporting information often means that critical details and assumptions go unreviewed, and can lead to significant errors in the project design.	EOO,PRO6
111	Recommendation: Ore-transport rail cars should be completely enclosed, for example a tipple-dump type car that would not have hinges that could leak, and which could be sealed with a hardtop cover to prevent windblown dust loss. Soil monitoring along the rail line should be required to document the absence or presence of soil contamination. Provisions should be made to remove at least the top one foot of soil as a part of mine closure. Failure to remove contaminated soil has led to contaminated storm water runoff at other mine sites.	PD7
114	• Mercury monitoring recommended for receiving waters for sulfate releases to high risk areas for methylmercury production. Five monitoring sites on streams draining wetlands (two of which receive seepage from the Tailings Basin) and five additional monitoring sites at the downstream Sabin and Wynne lakes should be established. (DEIS, p. 4.1-172)	WR4C,WE3
114	• PolyMet should develop a similar mercury monitoring plan for the Mine Site, in particular, to ensure that mercury concentrations within the West Pit would meet Great Lake Initiative standards at the time of overflow (~Year 65). This should include monitoring of mercury from peat in the Overburden Storage and Laydown Area as well as mercury concentrations in WWTF effluent. (DEIS, p. 4.1-172)	WR4C,WE3
114	• It is recommended that monitoring of both groundwater and surface water include both total and dissolved aluminum on a regular basis to ensure that the state water quality standard for dissolved aluminum would be maintained. (DEIS, p. 4.1-172)	WR1A
115	• A recommended mitigation measure is shielding the operation light sources downward to reduce light impacts. (DEIS, p. 4.11-5)	G2E
115	• Recommendation: A thorough testing program for verifying the target permeabilities of the various subgrade barriers should be required. If testing indicates that the specified permeabilities are not being reached, then corrective measures should be required. (see report section 3.1.2.10 Waste Rock and Overburden Management)	PD2
115	• It is recommended that wetland monitoring be conducted during Project operations and Closure over a larger area (to be determined during permitting) to determine if any additional impacts would occur. (DEIS, p. 4.2-24)	WE3

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
115	• Recommendation: Ore-transport rail cars should be completely enclosed, for example a tippedump type car that would not have hinges that could leak, and which could be sealed with a hardtop cover to prevent windblown dust loss. Soil monitoring along the rail line should be required to document the absence or presence of soil contamination. Provisions should be made to remove at least the top one foot of soil as a part of mine closure. Failure to remove contaminated soil has led to contaminated storm water runoff at other mine sites. (see report section 3.1.3 Proposed Transport of Ore)	PD7
115	• It is recommended that existing wetland acreages and impacts be delineated prior to issuance of the Final EIS. (DEIS, p. 4.2-27) [Note: Tribal cooperating agencies take the position that this delineation should occur prior to the issuance of the DEIS so that the public can review a complete set of potential impacts from the project.]	WE1
116	• Recommendation: As with the rail transport of the ore, soil monitoring at the concentrate loading facility and along the rail line from the plant should be required to document the absence or presence of soil contamination. (see report section 3.1.5.1 Beneficiation Plant)	PD7
117	• Recommendation: Centerline construction of the expanded tailings facility should be considered even though it would be more costly, and would likely require the destruction of more wetlands. (see report section 3.1.5.3 Management of Process Waste Products, Flotation Tailings)	WE2,PD10
118	Shipment of concentrate from the plant is also projected to be by rail. However the concentrate will either be shipped in pneumatically sealed rail cars, or in rail cars with a rigid cover. These are appropriate methods for concentrate shipment.	PD7
119	• Recommendation: Given the nature of the material to be stored in the hydrometallurgical residue cells, these cells should be designed to withstand the maximum credible earthquake. (see report section 3.1.5.3 Management of Process Waste Products, Hydrometallurgical Residue Cell Design and Operations, Cell Seismic Stability)	GT2
119	• Recommendation: A better description of the composite liner for the hydrometallurgical residue cells should be included in the DEIS. The additional cost associated with a double liner with leak detection for the hydrometallurgical residue cells is not cost prohibitive. A double liner with leak detection would provide maximum protection for the residue material, and should be required. (see report section 3.1.5.3 Management of Process Waste Products, Hydrometallurgical Residue Cell Design and Operations, Cell Liners)	WR2D,PD2
120	• Recommendation: It should be clearly stated in the DEIS what levels of contaminants would trigger the use of capture wells for treatment, and what standards the treatment of the water must meet in order to be discharged into the Partridge River. (see report section 3.2.3 Tailings Basin Alternative)	WR2G
120	• Recommendation: Closure water treatment, as well as the other closure costs, will probably require a financial surety of approximately \$100 million. This is too important an issue to be ignored in the DEIS process. The financial surety amount should be analyzed and disclosed to the public in the DEIS. (see report section 4.1.3.1 Proposed Action, Closure (Years 20 to ~65))	WR3I,PD2,PD4
121	• Recommendation: More discussion and verification should be given to the finding that the sulfide sulfur content of the tailings is and will remain under 0.13% and non-acid producing. (see report section 4.1.3.1 Proposed Action, Effects on Groundwater Quality at the Tailings Basin)	PD2
122	• Recommendation: The mitigation of storm water management controls should be required, not recommended. This is good pollution prevention practice. (see report section 4.1.3.1 Proposed Action, Non-contact Stormwater Runoff)	EOO
123	It should be recognized that concentrate poses significant risk for contamination because of its high metal content and the small particle size of the concentrate material. Recommendation: As with the rail transport of the ore, soil monitoring at the concentrate loading facility and along the rail line from the plant should be required to document the absence or presence of soil contamination.	PD7
123	• Recommendation: At a minimum, contingencies should be put in place to fund long term water treatment well beyond the 65-year limit assumed in the DEIS. This is for the protection of the budget and citizens of Minnesota and the environment. (see report section 4.1.3.1 Proposed Action, West Pit Overflow Water Quality)	WR3I,PD4,PD5

Comment ID	Comment Text	Theme Codes
124	Under the Proposed Action, flotation tailings would be placed on Cells 1E and 2E of the former LTVSMC tailings basin. The existing LTVSMC tailings basin is unlined. The future tailings basin perimeter dams would be raised in an upstream construction method using compacted LTVSMC bulk tailings. Upstream construction poses the highest risk for seismic and static failure of tailings dams. Most tailings dam failures have been associated with upstream dam construction.	PD11
124	• Recommendation: In order to ensure that the mercury capture systems on the autoclaves are functioning as designed, a monitoring scheme should be required that will provide statistically reliable data on the autoclave mercury emissions.	G2B
124	• Recommendation: Geotechnical stability is too important an issue to leave for analysis after the mine has been permitted. These stability issues should be thoroughly investigated and the issues resolved as a part of the DEIS process. (see report section 4.13 Geotechnical Stability)	GT1
125	The International Commission on Large Dams and UN Environmental Program offer the following assessment of the three basic types of tailings dam construction methods – upstream, downstream, and centerline. (See Figure A – Types of Sequentially Raised Tailings Dams)	PD10
125	The primary concern with upstream tailings dam construction is its susceptibility to failure during earthquakes. If the tailings upon which the dam is constructed are saturated with water, the tailings do not form a stable foundation for the dam under seismic loading. (See Figure B – Upstream Dam Construction with Zones of Liquefied Slimes) Tailings are placed in a saturated state. Tailings materials are relatively uniform in their size and shape, and typically have very low permeability, a fact often cited by mining engineers to argue that liners are not needed for tailings facilities. As a result, it will be difficult to consistently drain the water from all the tailings under the proposed dam expansion.	PD10
125	Continuing to use upstream-type dam construction methods to increase the capacity of the tailings at the NorthMet tailings facility is the least expensive approach, but poses the most risk to long term seismic stability. The proposed buttressing in the Tailings Basin Alternative would help, but not eliminate this concern. Recommendation: Centerline construction of the expanded tailings facility should be considered even though it would be more costly, and would likely require the destruction of more wetlands.	WE2,PD10
126	The hydrometallurgical residue cells will be constructed at the edge of the existing tailings Cell 2W. Construction of the hydrometallurgical tailings cells on existing tailings, which are susceptible to seismic liquefaction, and are contained by upstream-type dams, also poses long term seismic stability risks. For an upstream-type tailings dam, which uses the tailings themselves as a structural foundation for the dam, the tailings must be dewatered in order to safely support the dam under seismic loading. Not only are these cells constructed on top of existing tailings, which have the potential to liquefy during an earthquake, but the taconite tailings cell was also constructed using upstream dam construction method, the most seismically unstable tailings dam construction method. If a portion of the Cell 2W dam fails in an earthquake, it would likely cause the failure of the hydrometallurgical residue cell located on top of it. Recommendation: Given the nature of the material to be stored in the hydrometallurgical residue cells, these cells should be designed to withstand the maximum credible earthquake.	EOO,PD8
127	There is no drawing of the "composite liner" so it is assumed that this is not a double liner with leak detection, but merely a synthetic liner placed directly on top of a GCL liner. A double liner with leak detection would be the most protective liner design approach.	EOO,WR2D,PD2
128	Recommendation: A better description of the composite liner for the hydrometallurgical residue cells should be included in the DEIS. The additional cost associated with a double liner with leak detection for the hydrometallurgical residue cells is not cost prohibitive. A double liner with leak detection would provide maximum protection for the residue material, and should be required.	EOO,WR2D,PD2
128	Probably the most glaring omission is that there is only the most scant analysis of the financial surety that will be needed for this project. As is discussed in more detail to follow, the financial surety for this project could easily be in excess of \$100 million. This is very significant potential impact to the budget and citizens of Minnesota, who are ultimately accountable should the mine operator go bankrupt without an adequate financial surety to close the mine and treat waste water. If the mine operator were to go bankrupt without an adequate financial surety public funds for closure would either need to be provided, or the public would bear the environmental consequences of not properly closing the mine. Either way, the public would pay, probably for centuries.	PD4

129	A very important part of the environmental analysis for a mine is evaluating the reclamation plan. The reclamation plan documents not only what the goals for the reclamation of the site will be (i.e. the designed post-closure use), but also what is needed in terms of reclamation methods and financial resources to achieve the reclamation goals. The reclamation plan will be a living document. The mining plan and the timing of various mine activities will change during mine operation, and new reclamation technologies might be available when it is time to close the mine. However, mine reclamation should not be developed based on future technologies, or future financial resources. The pre-mining reclamation plan needs to lay out a basic approach to reclamation, using technologies that are proven and have measurable costs, and with enough detail to provide a conservative but reasonable estimate of what these closure costs will be. This cost estimate would be used to establish the amount of the post-closure financial surety, until it is amended by subsequent estimates that are based on actual operating costs and pre-closure reclamation experience at the site.	PD3
130	The goal for the first version of the reclamation plan should be to assess whether there are technologies available to responsibly close the mine (i.e. assuming the mine operator goes into bankruptcy and the regulatory agencies must assume responsibility for closing the mine), and to assess these technologies in enough detail to conservatively estimate the cost (i.e. to ensure that the public will not bear the financial responsibility for cleaning up and closing a mine abandoned by an operator). The reclamation planning presented in the DEIS does not meet this standard.	PD3
130	The discussion of site reclamation in the DEIS does go into considerable detail about what will be done to close the various mine facilities, but it does not go far enough to present these details as a complete reclamation package that can be assessed in terms of what the overall reclamation goals are and how they will be met, whether the closure technologies that are proposed are viable, and how much implementing these closure and post-closure technologies will cost.	PD3
131	The present Closure Plan2 does contain short term goals and objectives derived from a number of project reports that discuss the various mine facilities and how they will be closed, but it doesn't discuss the methodology of how this will be accomplished, or how much it will cost.	PD3
132	Typically mine closure and post-closure costs run in the tens to hundreds of millions of dollars. This is a significant potential impact to the public that should be discussed as a part of the DEIS process. Today many, if not most, mining DEISs do analyze the reclamation plan as a part of the DEIS process.	PD3,PD4
133	A "preliminary" reclamation closure cost estimate is presented in the DEIS Table 3.1-14 "NorthMet Project Preliminary Closure Cost Estimate Summary." However, this "preliminary closure cost estimate" is not supported by detailed calculations and/or information. One of the technical support documents "PolyMet Technical Design Evaluation Report RS52 Mine Closure Plan Report" does discuss mine closure, but again does not provide sufficient documentation to substantiate this closure cost estimate. Lack of a viable reclamation plan and closure cost estimate is a major flaw in the DEIS.	PD3,PD4
134	Recommendation: Since reclamation planning poses a significant environmental and economic impact of the mine development, a complete preliminary reclamation plan and cost estimate analysis should be included in the DEIS. The plan should be developed to show the reclamation liability on a year-by-year basis.	PD3
135	Annual review of the reclamation plan, and costs, as proposed in the DEIS (pp. 3-43, 3-44) is the best way to review and update reclamation estimates.	PD3
136	An example of a reclamation plan with an appropriate level of planning detail and cost estimates is the Pogo Project Reclamation and Closure Plan, December 2002. The document is available through the Alaska Department of Natural Resources, Anchorage, AK, and was submitted as the referenced reclamation document for the Final Environmental Impact Statement, Pogo Gold Mine Project, USEPA, Region 10, September 2003.	PD3
137	Every DEIS should contain a Draft Reclamation Plan, which includes a detailed analysis of the financial surety, so that it is demonstrated before the project is allowed to proceed that project closure can be accomplished using demonstrated reclamation techniques, and at a cost that is affordable. Lack of a viable reclamation plan and closure cost estimate is a major flaw in the DEIS.	PD3

138	In Table 3.1-7 “Waste Rock Placement Schedule” it can be seen that all of the Category 1 & 2 waste rock is produced in years 1-11. Backfill of the East Pit begins in Year 12, so the 125 million tons (approximately) of Category 1 & 2 waste would require temporary storage and then must be moved into the East Pit. If Category 2 & 3 & 4 Lean Ore and Waste Rock are backfilled instead, only 57 million tons (approximately) of this material would require temporary storage before being moved into the East Pit. Therefore, this option provides not only a potential environmental benefit, but also a significant economic benefit to PolyMet, since some 68 million tons will need to be moved only once, instead of twice.	PD11
139	“Under this alternative, the permanent subaqueous disposal of the most reactive waste rock (all Category 2, 3, and 4, waste rock) in the East Pit, rather than in permanent surface stockpiles, would virtually eliminate long-term sulfide oxidation and associated solute release and would significantly improve groundwater quality at the Mine Site relative to the Proposed Action. This predicted enhancement in groundwater quality would ultimately result in improved water quality in the Partridge River for most parameters.” (DEIS, p. 4.1-146) These statements also support the supposition that water quality would be better protected by the Mine Site Alternative.	EOO,PD11
140	The alternative reduces the Project’s potential impacts to surface and ground water quality by capturing approximately 95 percent of the seepage generated from the PolyMet operation including from the proposed NorthMet tailings by a series of vertical wells installed on the lower-most bench of the tailings facility. Captured seepage would be pumped and directly discharged to the Partridge River.	WR1F
141	In the DEIS it is stated: “If it were determined upon further analysis during permitting, or during operational monitoring, that pretreatment were necessary prior to discharge, a treatment facility would be installed.” (DEIS, pp. 3- 52, 3-53) It is not clear from the wording in the DEIS what would trigger the requirement for “pretreatment,” or what standards the pretreatment would need to meet prior to discharge.	WR2G,PD8
142	Recommendation: It should be clearly stated in the DEIS what levels of contaminants would trigger the use of capture wells for treatment, and what standards the treatment of the water must meet in order to be discharged into the Partridge River.	WR2G
143	Another aspect of the Tailings Basin Alternative is buttressing of the toe of a portion of the northern embankment of Cell 2E. Any effort to increase the stability of the present upstream-type tailings dams would be lower long term financial risk to the public, and lessen long term environmental risk.	PD11
144	An analysis of the costs of underground mining is given in support document “ALT11 High Level Underground Costs,” PEG Mining Consultants Inc, July 30, 2009. This was not a detailed analysis of the costs of underground mining at the NorthMet site. The document is only 2+ pages in length, and lays out what must be rough estimates of the costs of underground mining compared to open pit mining. The scope and depth of the analysis presented in ALT11 is not enough to state conclusively that underground mining is not economical at this site.	ALT8,EOO
145	That being said, based on my experience I would agree that underground mining would not be viable given metals prices today. However, a significant portion of the mill processing facilities are already in place from previous mining. Underground mining might be economical at this site in the future with an increase in metals prices, and when the processing technology proposed for the NorthMet operation has been proven enough to clearly quantify the costs.	ALT8,EOO
146	The comments by the tribal cooperating agencies also yield some additional information on the topic of potential underground mining. “A study of this particular deposit was performed by U.S. Steel that recommended underground mining. By examining cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, must be evaluated to determine the viability of this alternative.” (DEIS, p. 3-64)	ALT8,EOO

147	Upstream-type tailings dam construction, which was used for the existing taconite tailings, poses a long-term stability risk to the proposed hydrometallurgical residue cells. Upstream-type construction will also be utilized to contain the project's flotation tailings, and again poses a long-term risk, although less than that to the hydrometallurgical residue cells because the hydrometallurgical residues contain much higher levels of contamination. A thorough analysis of the risk associated with tailings dam construction has not been done, and needs to be conducted as a part of the DEIS.	PD11
148	One of the most important components of closure, especially from a financial standpoint, is whether there will be a need for long term water treatment. There are a number of places in the DEIS where it is stated that water treatment after closure will be required, but this is probably best summed up by the following sentence: "Additional wastewater treatment - during the approximately 45-year closure period, the WWTF would be operating at reduced capacity and this excess capacity could be used to provide additional treatment of process water, East Pit overflow water, or even West Pit lake water." (DEIS, p. 4.1-167)	WR31,PD5
149	It is not clear from the discussions in the DEIS just what the Closure water treatment scheme will be. In RS52, the Mine Closure Plan Report, closure water treatment is described as follows:	WR31,PD3
150	The basic costs of the system have been estimated in RS29T, although it is clearly stated in that document: "Costs for the potential treatment technologies considered in this evaluation are outlined in Appendix F. These estimates represent preliminary (feasibility study level) costs, not detailed costs that would be associated with the design and construction of a wastewater treatment facility. These costs are developed as a basis for comparing alternatives in this evaluation." (RS29T Wastewater Treatment Evaluation, Barr, 30Mar07, p. 5-12)	PD4
150	However these cost estimates are useful in that they give at the very least an order of magnitude estimate of the capital and operating costs for the water treatment system. It is also obvious from these estimates that with not too much more effort this approach could be used to develop an estimate for the purpose of establishing a financial surety for closure water treatment.	PD5
150	The Closure water treatment systems will need to operate for at least 45 years, and the existing treatment systems will be 20 years old when closure begins. Given that the closure operating period is over twice as long as the 20 year mine operating period for which the cost estimates were made, and that the treatment systems will quite likely need to be replaced and upgraded during this 45 year period, using a figure of twice the cost estimate for the operating mine would seem to be a reasonable estimate. That would place the net present value of the Closure water treatment in the range of \$54 million to \$74 million for financial surety purposes.	PD5
151	This is a significant amount of money, and an amount for which the public is potentially liable should the mine operator go bankrupt. It should also be noted that the cost estimate in Table 3.1-14 "NorthMet Project Preliminary Closure Cost Estimate Summary" (p. 3-48) does not appear to contain water treatment operating and capital costs.	PD4
151	Recommendation: Closure water treatment, as well as the other closure costs, will probably require a financial surety of approximately \$100 million. This is too important an issue to be ignored in the DEIS process. The financial surety amount should be analyzed and disclosed to the public in the DEIS.	PD4
151	It is well known that mine waste can produce contamination by way of Metals Leaching (ML) under neutral or basic pH conditions. It should also be noted that the flotation process produces tailings with a sulfide sulfur content that is just under the range that could produce Acid Mine Drainage (AMD). Recommendation: More discussion and verification should be given to the finding that the sulfide sulfur content of the tailings is and will remain under 0.13% and non-acid producing.	WR1E,PD2
152	Recommendation: The mitigation of storm water management controls should be required, not recommended. This is good pollution prevention practice.	EOO

Comment ID	Comment Text	Theme Codes
152	The mitigation measures proposed in the DEIS are almost exclusively recommendations vs. requirements. The description of the mitigation measures end with statements like: the measure “warrants further consideration;” or, “it is recommended that ...;” or, the measure “should...; or, could..., or would...” The agencies should clearly state which of the mitigation measures would be required in the permits, and which they consider to be voluntary for the mine operator. That way the public has the ability to weigh the importance of the voluntary mitigation measures, and can then comment on the relevance and importance of the voluntary mitigation measures.	G2D
153	However, the assumptions that lead to a conclusion that water treatment will no longer be required after 65 years should be considered very tentative. For example, the assumptions used in determining the scaling factors summarized in Table 4.1-37 – Solute Release Scaling Factors, (lab to field) for the release of contaminants from waste rock piles could easily contain inadvertent errors (for example in the choice of particle size, temperature, fraction of rock flushed by infiltrating water, and the upper limit of contaminant concentrations) that could cause a significant departure from the predicted contaminant loads assumed in the DEIS.	WR3I
154	It should also be noted that water quality standards for mercury could be exceeded in the long term discharge from the West Pit: “Since neither the WWTF nor the East Pit constructed wetlands, which are the two primary treatment facilities for inflow to the West Pit, are expected to be consistently effective in mercury removal, concerns exist regarding the potential mercury concentration in the West Pit.” (DEIS, p. 4.1-123)	WR3I
156	Deterministic modelling and the Uncertainty Analysis both indicate the possibility of potential water quality exceedances from the West Pit discharge after closure, although PolyMet disagrees with this analysis. Predictive results for post-mining water quality and quantity for many mines over the last two decades have yielded very poor results. <sup>3 3</sup> Comparison of Predicted and Actual Water Quality at Hardrock Mines, Kuipers et al., 2006. This strongly suggests that a conservative approach to requiring financial surety for Closure water treatment should be taken.	WR3I
157	Recommendation: At a minimum, contingencies should be put in place to fund long term water treatment well beyond the 65-year limit assumed in the DEIS. This is for the protection of the budget and citizens of Minnesota and the environment.	WR3I,PD4
158	Clarification: This reference to the cessation of WWTF operation may be an inadvertent error, but if not please cite the documentation that supports the statement that the WWTF will not be required after year 50.	RFI
158	It is not apparent why the WWTF would no longer be required after year 50. This time frame for the WWTF does not appear to be substantiated by the discussion in the DEIS, or in the supporting documents.	WR3I
159	In virtually every case, the mitigation measures are almost exclusively recommendations vs. requirements. The description of the mitigation measures end with statements like: the measure “warrants further consideration;” or, “it is recommended that ...;” or, the measure “should...; or, could..., or would...”	G2D
160	The agencies should make it clear which of the mitigation measures they consider important enough to make requirements in a permit, and the mitigation measures for which they are still weighing the environmental benefit versus the cost to the operator. In this way the public can provide more meaningful comment on the proposed project.	G2D
161	See the consolidated list of recommendations, including both the recommendations from this review and the voluntary recommendations taken from the DEIS, at the end of the report.	G14
162	All waste rock piles are to have engineered liners. The waste rock with the least predicted ability to generate acid mine drainage and/or metals leaching is the Category 1 and 2 waste rock. Category 1 waste rock piles will have an engineered barrier layer and overlying drain layer to minimize the amount of waste rock seepage that will enter groundwater. Categories 3 and 4 waste rock liners have additional liner protection in the form of a synthetic liner placed on top of the engineered subgrade barrier. In describing the subgrade barrier layer to limit vertical infiltration from the waste rock piles, it is stated that the barrier layer will have permeabilities ranging from 5x10 <sup>-7</sup> to 1x10 <sup>-5</sup> cm/sec. (DEIS, Table 3.1-9) Clarification: How will this specification be tested during construction? What methods will be employed if testing indicates that the target permeability is not being attained?	PD2,PD11

163	Recommendation: The agencies should clearly state which of the mitigation measures would be required in the permits, and which they consider to be voluntary for the mine operator. That way the public has the ability to weigh the importance of the 'voluntary' mitigation measures, and can then comment on the relevance and importance of the voluntary mitigation measures.	G2D
164	To require that a project must "... have filed for permits" in order for it to be considered for cumulative impacts is imposing an unreasonably strict definition of what is a reasonably foreseeable impact.	WR5A
165	For example, there are several mining projects in the advanced stages of exploration that should be considered as reasonably foreseeable. These projects include the Duluth Metals Ltd - Nokomis deposit and the Franconia Minerals Corp - Birch Lake deposit. Ignoring the potential for these developments understates the cumulative impacts to the region.	WR5A
166	Recommendation: Mining projects in the advanced stages of exploration should be included as reasonably foreseeable impacts for analysis of the NorthMet project's cumulative impacts.	G9
<b>Sender Last Name:</b> Sorensen <b>Submission ID:</b> 2211		
2618	Oh, I support PolyMet. I am a laid off boilermaker and this project could give me and my family work. It could give me work and feed my family. So that's all I have got to say. I am all for it. Thank you.	EOO
<b>Sender Last Name:</b> Soular <b>Submission ID:</b> 2256		
2666	This letter will serve as official notification that I support PolyMet Mining. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air, water or land will be minimal, if any. I believe that PolyMet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed area. After thirty-five years of service, I lost my job with LTV Steel in 2001, when LTV permanently closed. For several years I struggled to support my family, picking up jobs wherever I could. For the past two years I have worked at PolyMet at Hoyt Lakes, Minnesota. PolyMet is an excellent project that demonstrates we can have both economic development and a good, clean environment for everyone to appreciate. I have lived in this area all of my life and I am obviously concerned about our environment, not only for myself but for my family as well. I have children and grand-children that also reside in this area. I am also an avid outdoorsman and I am very interested in maintaining a healthy natural environment, not only for my own enjoyment but for the enjoyment of future generations. I believe that PolyMet can operate - and create nearly 1,000 direct and indirect jobs - without threatening the most important legacy we will leave our children - the clean environment we have enjoyed in Northeastern Minnesota for generations.	EOO,G2
<b>Sender Last Name:</b> Soules <b>Submission ID:</b> 2206		
414	First of all, there's -- just a couple months ago a federal judge in the Eastern District of Wisconsin ruled in a case called the Highway J Case that public meetings where the comments are limited to just being taken by a stenographer as opposed to being made out in the open, that that violates the National Environmental Policy Act, so in my view the way in which public comments are being received at this public hearing violates federal law.	PRO6
415	Secondarily, given the EIS has only recently been released and given that the comment period extends until early February, it is again my view that there should be additional public hearings near the end of the EIS process, not just near the beginning of the process.	PRO6

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
416	And then finally, and probably most importantly, I do believe it was highly inappropriate to have a series of public officials, elected politicians who were on record supporting this project to speak at the beginning of an informational meeting on this environmental impact statement. I believe that that tainted the entire -- the entire meeting process, and I think there should be subsequent public hearings which are not front-loaded with a bunch of pro comments by elected officials, that should be just be a pure informational session as opposed to cheerleading -- cheerleading sessions.	PRO1,PRO6
417	And then finally, given that it is an 1800-page EIS document, I think -- and given the purpose of the National Environmental Policy Act that citizens are able to provide informed comment and play -- essentially have an informed role in the EIS process, I think that the comment period should be extended past February 3rd, at least by 30 days, probably 60 more days, just so that people have time to digest the document and then provide truly informed comments.	PRO6
769	As a threshold matter, I would like to elaborate on the comments I made to a court reporter at the December 10 meeting in Blaine. I believe that this EIS process does not satisfy the National Environmental Policy Act's (NEPA) goal of informed public participation. In particular, I think the process is deficient in three respects: 1) At the Blaine meeting, the DNR improperly allowed certain project proponents (e.g., pro-mining state lawmakers) to make comments in public, while forcing everyone else to make their comments in private to a court reporter. This is problematic for two reasons: first, by limiting public comments to project proponents, the Minnesota DNR improperly tainted the entire public hearing in favor of the project. This "informational" meeting felt more like a political rally than a neutral forum for public comments. Second, by prohibiting citizens from speaking in public, the DNR undermined NEPA's goal of "informed public participation." Friends of the Boundary Waters Wilderness v. Dombeck, 164 F.3d 1115, 1130-31 (8th Cir. 1999) (citation omitted). 2) I continue to believe that, given the enormous size of the draft EIS, and the serious implications this project has for Minnesota's environment, a longer comment period should have been provided. Again, NEPA is intended to ensure "both informed decision making and informed public participation." Id.; see also 40 C.F.R. § 1500.1(b) (recognizing that "public scrutiny [is] essential to implementing NEPA"). Providing a longer comment period serves these important goals. 3) The DNR's decision to hold only two public meetings, both of which were held relatively early in the comment period, prevented many members of the public from having enough time to properly review the EIS so they could provide informed comments. Further, I believe that additional public meetings should have been held, particularly in the Twin Cities (as well as other parts of the state). NEPA contemplates robust public participation in agency decisions that affect the environment. Holding a single public meeting on the northern outskirts of the metropolitan area -- at a location inconvenient to urban residents, those dependent on public transportation, and many minority communities -- hardly satisfies the spirit of this law. The solution to the above-mentioned defects is obvious: the DNR should extend the public comment period an additional thirty to sixty days; hold additional public meetings on this project (including at least one meeting in the Twin Cities proper);	PRO6
1063	Loss Of Wetlands - The project would allow the loss of 1200 acres of wetlands in St. Louis County and the St. Louis River watershed, with an inadequate mitigation plan. Beyond the negative effects on water quality and habitat, the loss of these wetlands will result in a loss of the carbon sequestration benefits provided by these wetlands.	WE3
3243	I also have deep concerns about the substance of the draft EIS, including the following: 1) Water Quality - Water quality concerns have not been adequately addressed in the draft EIS. Water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. The mine's tailings basin will also produce discharges high in sulfate concentrations, which will turn mercury into methylmercury, making fish dangerous to consume.	EOO,FM1
<b>Sender Last Name:</b> Spaeth		<b>Submission ID:</b> 1700
5	My principal concerns revolve around noise and water pollution potential which I don't feel the DEIS has sufficiently addressed to alleviate my concern. I am also weary of the precedent being set for more and more mining in the region. It is presently a gem of a National Recreation and Wilderness Area which attracts tourism, provides jobs, and is sacred ground for the spiritual connection to nature that it provides.	G8A,G11

2187	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I admire recent mining improvements and applaud the industry's respectable advances. I also feel the type of mining proposed for this wetland area is unstable. The short term gain is out of balance with the long term loss. I would be supportive when legislation approves appropriate financial assurance.	G4A,G7C
<b>Sender Last Name:</b> Sparks		<b>Submission ID:</b> 3130
1020	I am writing to express my concern about the DEIS for the proposed sulfide mine in Minnesota. I don't think that the DEIS has clearly identified the means that will be used that absolutely eliminate the possibility of contamination of the wetlands. How will the basin be designed to insure stability over time? How will the basin be designed to eliminate all possibility of hazardous waste materials from escaping?	WE2,WE3,GT2
<b>Sender Last Name:</b> Spaulding		<b>Submission ID:</b> 2574
3132	I am writing to endorse the acceptance of the Polymet Draft EIS. After reviewing the document I believe it is comprehensive and will ensure that the project goes forth in a manner acceptable to the people of Minnesota.	EOO
<b>Sender Last Name:</b> Speckman		<b>Submission ID:</b> 2827
913	We can't risk harming the water quality in our state and especially in that area. Losing 1200 acres of wetlands in St. Louis County and the St. Louis River watershed will result in a net loss in carbon sequestration provided by these wetlands. Wildlife and fish might be harmed, which eventually harms all of us. Don't do this. Just don't.	AQ3
3196	Find other ways to bring jobs to the area. Let's stop harming our natural resources.	G2
<b>Sender Last Name:</b> Spector		<b>Submission ID:</b> 1769
1101	Concerning impacts on water quality, I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. This is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care. Once our clean water is gone, ITS GONE FOR EVER. Do not take the word of an industrial concern because they don't and won't live in this state. They're only motivation is to dangle a few jobs in front of the local miners while they'll be carting cash out of the state. Once problems arise, they'll ask the state to clean them up. DON'T BE SUCKERED, YOUR NAMES WILL FOREVER BE ASSOCIATED WITH THE DAMAGE DONE!	PD2,PD4

3217	I love the Boundary Waters. It is a big part of my family and our tradition. It is hard for me to think about people destroying my family's tradition just for copper and nickel. The Boundary Waters are not just a big part of my family tradition, they are a huge part in many people's lives. This mining process will hurt the environment of the Boundary Waters hugely. Sulfates in the water impact our health and aquatic vegetation. Sulfates and elemental mercury react to each other in a process called Mercury methylation. Methylmercury is the form that bio-accumulates in fish in which humans eat. I will never understand why people would want to harm this great natural boundary. It is a hard concept for me to comprehend. There are a million reasons why this mining process is bad. I only named a couple. Please think about what you are about to do and think about how it could affect so many animals' and people's lives. Think about the right thing to do and how you would feel if you lost something close to you. Just think about it.	G2C,G7A
<b>Sender Last Name:</b> Spiespdf		<b>Submission ID:</b> 2837
3199	I hope Minnesota will prevent this type of mining and any others that carry unknown environmental impacts from occurring like Wisconsin has. The proposal is insufficient in demonstrating that environmental impact is minimal and worthwhile. This mining has the potential to cause great environmental problems such as ground-water pollution, acid rain, etc. As a Minnesotan, I do not want to take the chance at degrading our environment to produce short term financial gain. Let's not open doors for foreign business to degrade the Minnesotans' quality of life by stressing and damaging our fragile,fertile, beautiful ecosystems.	EOO,G2,G7A
<b>Sender Last Name:</b> Spoeth		<b>Submission ID:</b> 3395
3685	The proposed Polymet mine in Northern Minnesota is a huge economic risk for Minnesota. The short term economic gains do not outweigh the long term environmental and economic burdens. Taxpayers will have to pay for the remediation of this project's clean up if large financial assurances are not given up front by Polymet.	G4A
<b>Sender Last Name:</b> Spreth		<b>Submission ID:</b> 3335
3628	Sulfide mining has proven destructive in every case across the United States. Wisconsin currently has a moratorium against sulfide mines until a company can prove that they won't pollute. According to the Minnesota Environmental Policy Act this sulfide mining project should not be considered because it will impair water quality near Hoyt Lakes. Eventually, that water drains into Lake Superior.	G7B,G12
<b>Sender Last Name:</b> Spry		<b>Submission ID:</b> 1046
1149	I support PolyMet Mining's NorthMet Project.	EOO
3552	I support the Polymet "NorthMet" Project. I applaud all of those people who have spent tens of millions of dollars and hundreds of thousand, if not millions, of manhours putting this eis together. Mining is not new to this area nor are the people working on this project and eis. Polymet has taken all environmental precautions into consideration for this new style of processing in MN. The amount of effort put into this eis and the environmental precautions placed into the design for this mine is not seen anywhere else in this world. There should be no reason not to move forward on this project. The local economical impact for this project will be huge. The state economical impact will be huge. The regional economical impact will be huge. And it will continue to trickle down to help the entire national economic situation. Putting people to work is the backbone to a stable economy. It is time to act, now. Thank you for considering my support for this project.	EOO

1197	I support the PolyMet Mining NorthMet project. We need to create jobs in this country and this project will do just that.	EOO
<b>Sender Last Name:</b>	Staffon, Jones, Blakeborough	<b>Submission ID:</b> 3699
1	The Polymet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers	G2
2	9) What is the basis for Polymet not lining the tailings basin while the underlying LTVSMC tailings basin is also not lined? (Section 4.1.3.1) What assurances can be provided that there will not be extensive groundwater contamination even with the other response actions that are propose by Polymet e.g. bentonite injection and seepage barriers?	RFI
2	8) The relationship between surface and groundwater (Section 4.1.1.2) is not adequately characterized. What are the data on which these assumptions are based?	WR2A
3	The alternative to sulfide mining is for the state of Minnesota to raise revenue by selling back the mineral interest that they hold on millions of acres in Minnesota back to the surface estate owners. This will increase property values and lead to a stabilization of environmental conditions more conducive to attracting non-mining business and promote the stated goal of the IRRB to diversify the economy.	EOO
4	Control of metals will end up overseas anyway inflating the cost of buying them back. Potholing of our national forests through an erosion in the Weeks Act is a greater economic harm. The PolyMet project and the filling of the excess capacity for its plant through the mining of areas north of the plant will cause a polluted corridor from Superior, Wisconsin, to Lake of the Woods on the Canadian border creating a barrier to wildlife migration and contaminating a food supply for thousands of hunters and fishermen. This contamination will affect all of the states by diminishing and poisoning migratory birds on the Mississippi flyway including all states fronting the Mississippi River. This activity constitutes a violation of the Migratory Bird Act and other law.	WI2
5	Public opposition has been disregarded from the method that the DNR has used for conducting due process notice and hearing, to the repeal of environmental and mine worker safety laws by the legislature, to the overturning of Aitkin Counties decision to deny exploration permits.	PRO6
5	Picher Oklahoma needs to be looked at as an example of what is likely to happen in Northeastern Minnesota if PolyMet goes through. Picher was the center of a zinc and lead mining region in Oklahoma until the 1970's. Recently it has had lead poisoning among its children of 30 percent. The inability to mitigate the pollution and fix this problem has resulted in it being declared a superfund site by the EPA. Residents continue to live in denial that mining companies, former governments, or their own bad judgment are responsible for their diminished property values. They blame the EPA for low property values because of the listing as a superfund site.	G8
6	My great-grandparents raised ten children in Elmer Township, which fronts the St. Louis River. Currently, the township's biggest employer is the peat mine. More mining. My Greatgrandmother is buried in the cemetery there. When the farmers are gone her grave will grow over from neglect and her life as an immigrant farmer at the turn of the twentieth century will be forgotten. PolyMet pollution will stop any chance of a revival of an agricultural economy. Mining and PolyMet will kill all other economic activity and displace the people who care about any other aspect of the economy. Ely, Two Harbors, and Duluth with their prosperous tourism economies, are next on the list of mining destruction. The Range delegation won't stop until no one has anything and all that is left are the ghost towns across the whole region. No consideration is shown for the economic loss of displaced farmers, cabin, resort and other property owners.	G1

Comment ID	Comment Text	Theme Codes
6	The PolyMet proposal is not just a mine it includes a processing facility. This processing facility should be of a more serious and alarming concern. The process proclaimed to be clean and water based in fact involves large quantities of toxic chemicals and is sulfuric acid based. It simply substitutes water born pollution for the airborne pollution of a smelter. Nothing in the Minnesota DNR's Environmental Impact Statement is reassuring that large quantities of these pollutants will not be discharged into the St. Louis River. The St. Louis River already has a PH lowered from iron mining activity. Fish consumption advisories are posted along the river and people have had to seek medical treatment from acute mercury poisoning from eating the fish. The PolyMet project will inflame the mercury problem and project it downstream to contaminate the drinking water of cities like Duluth, Cloquet, and Superior, Wisconsin. The results of studies done to show pollutants in the various watersheds from year to year are subject to manipulation, e.g. the pollution would be minimized by dilution at high water levels, and should be deemed suspect, inaccurate, and minimized.	WR1E,WR2D,WR5A,FM1
6	The EIS prepared by the Corp of Engineers fails to assess inflow into from the nearby 100 mile swamp and the Partridge River. No testing has been done to assess this inflow. The EIS neglects to assess pollution already occurring in the partridge river, Embarrass River, and St. Louis River already occurring from iron mining and other sources. No assessment is made of negative economic impacts.	WR3J
6	A key part of the environmental portion of the EIS is the treatment method indicated at 3-9, 3-10. The EIS states there in part that treatment of reactive water will be done by "membrane separation and chemical precipitation technologies. Experience of the MDNR and MPCA has shown at the Soudan Mine site that proper treatment of mine water is unavailable. The DNR stipulated to the payment of a ten thousand dollar fine to the MPCA, agreed to pay for a twenty -five thousand dollar supplemental environmental project, and put ninety thousand dollars in escrow for future non-compliance related fines. The DNR remains out of compliance with legal emissions standards for copper, cobalt, and mercury. A Study conducted initially in Sweden, replicated by Canada, and a college in Minnesota showed that the addition of Sulfides to a swamp stimulates the production of methylated mercury for which fish consumption advisories have already been issued.	WR1E
7	The DNR cannot be trusted as it continues to be in violation of the law at the Soudan Mine site. It's EIS recites conclusions and not facts and is not properly explained. The tailings basin is not to engineering standards and will collapse as the Forbes basin has, as can be seen on Google Earth. An aerial view of other taconite mine basins shows that most mines allow run-off of their tailings pond water and simply berm around the collapsed and leaking sections of tailings. PolyMet is going to have to pump out the 100 mile swamp and in the process flush every bit of it through its pit basin and with it will be pumped out every bit of poison any sulfide mine has ever given up and in the process kill the swamp. Why should people in Wisconsin have to suffer the pollution of our interstate water for jobs in Minnesota and Michigan when it's legislature has made PolyMet Sulfide Mining categorically ILLEGAL.	G7C
7	Chemical precipitation, a.k.a. bioremediation, has failed at other sight as well. At the Buck/Dober Mine complex in Iron River/Caspian Michigan, the discharged water has left a trail of Acid Mine Drainage and metal precipitate leading to the Iron River and is clearly failing from a simple visual inspection of the site. Even if bioremediation is partially successful in neutralizing acid and precipitating out heavy metals, it result in a release of arsenic and other toxic substances and never sequesters methyl mercury that becomes toxic to fish and humans. In general, all liners leak and eventually release toxins into river systems. PolyMet's promise to have a liner and cover system constructed of "local till overburden soils generated from the processing of overburden removed from the mine pit and stockpile footprint areas" are merely a description of the stockpiles themselves and promise the no run-off will be collected and treated. This assertion is not supported by any proof and is merely speculative on the part of PoyMet	WR2C

Comment ID	Comment Text	Theme Codes
7	The additional pollutants combined with the already poor health of the river will cause problems for the St. Louis River Estuary, and it is foreseeable that it could contaminate our drinking water out into Lake Superior. The contamination of the St. Louis River is a civil legal violation of the riparian water rights of the downstream water users for drinking, recreational, agricultural, industrial, and other purposes. This contamination is not merely regulatory or administrative, it is a violation of common law, a taking without compensation by state government if the project is permitted, a violation of the Great Lakes Compact, a violation of the NEPA law and other law. The permitting of pollution of Minnesota waters to the detriment of downstream users given the vast holdings of the State of Minnesota of mineral interests for lease, its entrenched relationship in the industry, subsidies given or allowed by the State of Minnesota, and equity owned by Minnesota officers constitutes an unconstitutional taking without compensation and not for a public or legal purpose. The pollution from the PolyMet toxins will end up in our Duluth/Superior drinking water, degrading and destroying our health and our prosperity.	WR3E,WR3I
7	The solid silting/suspended solids clouding the St. Louis river including the Spirit Bay estuary will be increased by PolyMet. The methyl mercury contamination, silting, and other toxic contamination of interstate waters is un-neighborly, provides poor public relation with, and is illegal and offensive to the neighboring state of Wisconsin that has seen the wisdom in banning this type of mining. The inability of the State of Minnesota to treat or effectively regulate mine run-off and sulfide/methyl mercury pollution in particle, is outlined in their "Progress Report" authored by Bavin & Berndt in May of 2008. The LTV tailings basin in particular, has shown a higher discharge of these pollutants.	WR1A
8	The MDNR's claim that adding toxic waste from metals processing to the old LTV's tailings basin will result in the now admittedly toxic run-off turning clean underscores the stupidity of the whole project. Adding limestone to the tailings basin with the tailings from the Dunka Pit has failed to stop or arguably even decrease the release of sulfides, heavy metals, mercury, arsenic, and other toxic substances. This is indicated in the DNR's own Bavin and Berndt study. The claim that sulfide mining tailings and discharge at PolyMet will turn polluted water into clean water is just as erroneous as the claim made that sulfide pollution and limestone can produce a commercial grade of Gypsum. China has tried this with catastrophic results. The Chinese company that exported wallboard made with industrial waste sulfides is facing hundreds of millions of dollars in liabilities for supplying a defective product used in US homes.	WR1E,G9
9	In April of 2008, the Duluth News Tribune Article relating to a rate increase wrote that there would be a ten percent rate increase fully attributable to subsidizing a lower rate for PolyMet. From 2006-2007 income from Minnesota Powers energy business went up from 52.4 million to 65.9 million, so why the need for unprecedented rate increases? With an increase in community opposition to PolyMet has come a change in the story. Now the Tribune writes that a rate increase is needed by "so we can bring cleaner, greener energy into our systems."	G1
9	I am writing to object to the manner in which the following hearing is being conducted. It is clear from the attached news release that the hearing being conducted presents a safety concern and that the hearing is being conducted in spite of a clear and present danger to the public. The danger being that the hearing is being conducted in a building where the available parking space for that building is being expected to be exceeded. No regard has been given in that light to the safe occupancy capacity for the building that the parking lot serves.	PRO6
10	I would like to speak to the socioeconomic benefits that are identified in the Draft EIS, and one of those comments is that I understand that the -- the length of the mining operation is 25 years or 20 years, and then there's an additional 45 years for mitigation and cleanup and so forth. My point I'd like to make is that if you are a young person who hopes to be hired on on this project, let's say you're 20, by the time you're 40, 45, the mining operation will cease to exist and you will not have enough years to retire, and so there you are at 40, 45 without a job. And so I wonder if someone has weighed the cost benefits of that impact, and I'd like to see a response to that in the final draft statement. That's it. That's all I want to say.	SE3
15	1) How will the waste rock generated by the mining operation be evaluated and handled so that the materials can be segregated into the four waste rock categories? This issue appears not to be addressed.	PD11

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
15	2) The Tribal Cooperating Agencies make cogent and well researched comments about the impacts from this proposed activity on surface and groundwater. Their comments should receive serious consideration (eg footnote 19). Impacts based on data should receive higher credence than impacts based on professional opinion or empirical observation.	EOO,WR1E
16	3) It appears that there are no contingency plans for unexpected but potential scenarios such as flooding of tailings basins or pits.	WR1E
17	4) The EIS addresses groundwater seepage due to groundwater levels down gradient of the tailings basin that would cause seepage, wetland impacts and upwelling. What about other impacts, e.g. flooding, storm events etc?	WR3A,WE2
17	5) What is the response to concerns from the "high risk situations for mercury methylation" (p. S- 9) for human health and the environment?	FM1
18	6) The case needs to be made for adequate protection provided by the proposed waste rock stockpile liners and covers. The construction that is proposed is inadequate. Eighty mil LLDPE geomembrane on top of clay soils is inadequate for a variety of reasons.	PD2
19	7) Why are financial assurances not fully disclosed in the NorthMet DEIS? The comments regarding this issue provided by the Tribal Cooperating Agencies are valid and deserve to be fully addressed.	PD4
20	This letter will serve as official notification that I support PolyMet Mining. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air, water or land will be minimal, if any. I believe that PolyMet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed area. I have lived in this area all of my life and I am obviously concerned about our environment, not only for myself but for my family as well. I am also an avid sportsman, especially enjoying hunting, fishing and trail riding. Actually, my job is grooming trails. I am very interested in maintaining a healthy natural environment, not only for my own enjoyment but for the enjoyment of future generations. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project.	EOO
20	History of environmental degradation resulting from similar mining-several states have a moratorium in place on this type of mining because it has resulted in horrendous environmental degradation. Wet environments are far more impacted by the release of sulfur and mercury than dry environments. Polymet claims they have a new procedure that will limit the environmental impact. Is one of the last great freshwater systems in the world the best place to test this new science? In reality we use the products made from these ores so we should ensure the mining is done safely. The DEIS indicates more needs to be required of Poly met to ensure that the mining will be done safely for the people, plants, animals and environment, both during the active mining period and well in to the future.	EOO
20	Long-term financial guarantees-Mining projects similar in scope to this project have left enormous economic burdens on the surrounding communities resulting from environmental degradation and social impacts, especially after closure of active mining. Polymet talks of long-term jobs being 20-years. That is short-term in the life of a community. Our communities suffer enormous financial burdens that are peaking now due in part to the closing of iron mines over 20 years ago. Mining companies involved must be required to put sufficient funds into escrow for both environmental and social impacts. These companies without local ties must be held accountable for their impact as they reap what must surly be enormous financial gains.	PD4
20	Water and air quality monitoring-The MPCA and USEP A have been understaffed and underfunded in recent years. A project of this scope with untested and unproven processes would require substantial, consistent monitoring to ensure the watersheds are not being polluted. The DEIS enumerates several anticipated water quality concerns for the immediate area surface water, groundwater, wetlands and the greater St. Louis River Watershed (which empties in to Lake Superior) both during the mine operation and after closure. In addition to monitoring there needs to be public access to monitoring data.	WR1A,WR1E,AQ5

21	This letter will serve as official notification that I support PolyMet Mining. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air, water or land will be minimal, if any. I believe that PolyMet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed area. In previous years, I spent a lot of time in this area as my family resided here. Upon my retirement a few years ago, I moved to this area and made my home in Aurora. I am obviously concerned about our environment, not only for myself but for my family as well. I am also an avid sportsman, especially enjoying hunting, fishing and trail riding. I am very interested in maintaining a healthy natural environment, not only for my own enjoyment but for the enjoyment of future generations. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project.	EOO
22	This letter will serve as official notification that I support PolyMet Mining. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air, water or land will be minimal, if any. I believe that PolyMet will produce these metals in an environmentally sound way and generate significant economic activity in a depressed area. I have lived in this area all of my life and I am obviously concerned about our environment, not only for myself but for my family as well. I am also an avid sportsman, especially enjoying hunting, fishing and trail riding. I am very interested in maintaining a healthy natural environment, not only for my own enjoyment but for the enjoyment of future generations. I also serve on the Aurora City Council. As a local elected official, I have a responsibility to ensure the long-term health, sustainability and vitality of my community. Long-term sustainability requires a clean environment and stable employment. PolyMet can produce these metals in an environmentally sound manner and create hundreds of stable jobs that can support families in this community. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this EIS lays the proper groundwork for developing an environmentally and economically sustainable project.	EOO
22	The permit for PolyMet should be denied because the technology is unproven on a large scale separating a variety of metals. The lack of reliability in the process creates an undue risk of financial and environmental harm when the technology fails and an already open and polluting pit has to be mitigated with public money after the PolyMet business fails. This risk increases when market conditions are taken into consideration. Minnesota has never had a profitable sulfide mining operation and will be competing with already developed and profitable mining regions around the world. The PolyMet project also disregards the basic economics of supply and demand. As metal prices have increased numerous other projects have materialized or will be coming online for production which will overwhelm PolyMet's profitability and requiring large public subsidy for it to survive or for closure.	EOO,PD2
22	Furthermore, the time period for the mine to operate has been exaggerated in the EIS. The mine does not have the capacity to supply the mine for twenty years with a supply of economically processable ore. Any claim to the contrary given uncertain prices for the ores and on the basis of unproven technology regarding what level of richness in ore can be economically and viably be processed is for propaganda purposes only. The Flambeau Mine is an example of a plant that failed to live up to the promise of longevity for job creation.	EOO
22	PolyMet is claiming publicly that it will create 400 jobs at its processing plant. The plant that they are seeking a permit for will be 3 times the capacity of the mines. The EIS needs to be corrected to reflect this and reprocessed for additional comments based on the corrections and the additional mines that are proposed to supply the additional capacity need to be specified in the reprocessed EIS. Otherwise, the permit can only allow permitting for a plant that will only meet the capacity of the permitted mine.	PD9
22	The following are my comments in response to the DEIS promulgated by the MDNR on the PolyMet project proposed for roughly a few miles north of Hoyt Lakes Minnesota. The project as portrayed by the media is indicative of a mentality of gold fever. It has mostly been described as precious metals mining when the DEIS itself refers to sulfide mineralized deposits and the emphasis of the project is on the production of base and not precious metals. The emphasis on jobs creation from the project take on the air of desperation. A subject for a sequel to a Stephen King movie.	EOO

|----|--|-----|
| 22 | GPM,inc(all 37 employees) strongly support the Polymet project in Hoyt Lakes. We believe the draft EIS demonstrates that the impacts to the water and air will be minimal. Furthermore, Polymet is located on an existing brown field in an area where mining has occurred for over 100 years. The Polymet operation will impact the environment far less than the iron mining operation that occupied the minesite for the fifty years previous. Because the Northmet project will produce strategic metals essential to the American economy which are currently being imported, it is important to note we will no longer have to rely on foreign countries for these strategic metals. Polymet operation will supply livable wage jobs for over 400 people in an economy that desperately needs jobs; and injecting millions of dollars of state and local taxes into the state coffers at a time when the state badly needs additional dollars to operate should be of primary consideration. GPM, Inc will need two additional employees as just a token of new jobs throughout Minnesota that will be developed to support the economic expansion. GPM, inc needs this to prevent layoffs let alone adding new jobs. We have been patiently waiting for the permitting process to be finally completed so we can save our business. Please speed the process up----not another delay....PLEASE(say all 37 empyoyees)! | EOO |
| 22 | Furthermore, the burden of proof in reviewing the permit issued by the DNR needs to be adjusted to reflect the DNR's financial interest as an industry participant. The burden of proof needs to be reallocated to the DNR to show the truth and accuracy of the EIS claims made. The DNR leases property to mining companies a practice which has continued through the EIS comment period. The DNR is not impartial as an industry participant and it would be unfair to the public and the industry to set a precedent a deferential standard for the DNR. For example, the DNR will give permitting preference to mines for which they have a lease and will receive a royalty.  | EOO |
| 23 | Every day I see an add promoting gold or other metals investment. This unregulated situation invites market manipulation. When the ads are withdrawn sales will decrease and so will prices. The industry manipulates prices. On a trip to Arizona in 1979 I rode with a truck driver who told me that his twenty thousand pound load of copper was being brought to the warehouses to await a price increase. This manipulation makes our community vulnerable to industry blackmail for the jobs it creates and the pollution from a non-producing and abandoned mine.   | G1  |
| 24 | The DNR's plan for more mining has already caused an obstruction in the goal of economic diversity. The economics of the State of Minnesota owning mineral rights to twenty-five percent of the mineral rights beneath the state creates a cloud on economic development by creating a fear of uncompensated relocation for mining and redistributes the tax burden to non-mining businesses as a result of lowered collection from the encumbered land.   | EOO |
| 24 | I care about jobs and economic prosperity in Northeast Minnesota as much as anyone and that is why I oppose PolyMet. The economic dislocation of jobs in industries such as tourism and the economic impacts of its pollution will far outweigh the four-hundred jobs to be created. PolyMet is simply a taking. A taking of our clean water, property values, and health. It will increase costs for other businesses. Increased health care costs, a larger share of the tax burden for businesses that remain and as we have already seen increased cost of electricity to subsidize PolyMet that must absorbed by small business. Polymet has already been subsidized heavily. Much of the taking is yet to come. The already acidic condition of the St. Louis River as indicated by the sign at the swinging bridge in Jay Cook and the toxic condition as indicated by the fish consumption advisory at the Munger Trail bridge indicate a fragile condition that cannot sustain more loading of these substances.  | G1  |

1234	I am very concerned about the possibility of sulfide mining in Northern Minnesota and especially in close proximity to the Boundary Waters and the watershed of Lake Superior. I strongly urge a moratorium on permits for sulfide mining until strong assurances can be given that the groundwater and surface waters can be protected. We have a moral obligation to protect the few wilderness areas we have left.	EOO,WR3B,WR3D,G12
1576	We must stop sulfide mining until miner can prove conclusively they do not pollute groundwater and surface water. We must not stick taxpayers with horrendous clean up bills as other states have. I strongly urge that no more mining permits be issued to sulfide mining interests.	EOO,G4A,G7A
<b>Sender Last Name:</b> Stavnes		<b>Submission ID:</b> 178
169	My name is Steve D. Stavnes and I support the Northmet project 100%. The Iron range is in desperate need of new mining/technology that will enable the communities to flourish. The environmental impact appears to be minimal and the new technology seems state of the art.	EOO
<b>Sender Last Name:</b> Steen		<b>Submission ID:</b> 1351
1578	I'm surprised at the possibility of an open pit mine in very close proximity to some of our states most beloved wilderness. The proximity to the BWCAW will no doubt place it in shared watersheds. I understand the sulfide concentration is relatively low resulting in the need for more material removal to gain enough precious metal to make the project worthwhile. This makes me wonder if the risks of a foreign company, cutting a inefficient mine in our most loved park is really worthwhile.	EOO,G2A,G7B
<b>Sender Last Name:</b> Stefanyshyn		<b>Submission ID:</b> 3685
19556	Hydrogeological data under and downgradient from the tailings basin. Very little appears to be known about the hydrogeology of the area under and down gradient from the tailings basin. It is unclear to me at this point what additional data might be collected in response to the DNR's recent request to PolyMet. However, more data on groundwater elevation, depth to bedrock, and groundwater flow is needed before an accurate model of ground and surface water impacts can be undertaken. As the EIS notes, it is impossible to estimate impacts on groundwater elevation based on available data, and thus the EIS provides no assessment of the subsequent impacts on vegetation, wetlands, and other surface water resources downgradient from the tailings basin. Sufficient data to make this assessment must be gathered and included in the draft EIS before permitting can proceed.	WR2A

3145	I looked at the EIS but did not find what I was looking for: a section that would specifically address the acid runoff concern. If it is in there please let me know where I might find it. Before going ahead with this project I think a small scale trial run needs to be done to answer the pressing questions. I think it would be a serious mistake to give the go-ahead to this without having the answers needed to address the environmental impact. Acid is my greatest concern. How much acid is produced by this project and what will be done about it needs to be established before moving ahead. For a small scale demonstration run experiment I would think the UMD NRRI would be an ideal facility. Please do not go ahead with this project without having a clear answer. Once we have unintended consequences there is no turning back. We certainly must get this right the first time.	WR1E

2200	WHAT MEASURES ARE IN PLACE TO MITIGATE POSSIBLE WATER SEEPAGE FROM THE OPERATION?????	WR1A
2397	ARE APPROPRIATE DISPOSAL MEASURES IN PLACE?????	PD9
2398	WHAT PROVISIONS ARE IN PLACE FOR RECLAMATION AFTER MINING CONCLUDES???????	PD3
2399	BY APPROVING THIS PROJECT WILL THIS OPEN THE FLODGATE FOR MANY ADDITIONAL MINE VENTURES???????	G9
2400	WHAT PROVISIONS ARE IN PLACE FOR MONITERING THE NORTHMET PROJECT?????	PD8
<b>Sender Last Name:</b> Stenberg		<b>Submission ID:</b> 3317
3610	Wetlands are declining at a rapid rate. We have to fight to preserve what little natural wetlands we have left. Minnesota creates millions of dollars in revenue from outdoor activities. Diminishing our wetlands will have a major impact on the income Minnesotans make from the outdoors.	G7C,G11
<b>Sender Last Name:</b> Stephens		<b>Submission ID:</b> 2221
8	I also strongly recommend that the DNR and the US Corps of Engineers look at an alternative way of accessing this, and that's through underground mining, which seems to be a better way of getting at the metals, protecting the jobs that they have been promised but, yet, limiting the environmental damage, and I'm disappointed in that they have not looked at that carefully, that they have not looked at this at all. It's not listed as an alternative in the Draft	ALT3
419	I'm very concerned that not enough time is being given to the public to study the proposal. I'm not opposed to mining in Minnesota if it's done carefully and we balance the interest, but I don't think that 90 days is nearly enough time for a project of this kind. I strongly support the DNR and the US Corps of Engineers to give the project at least another 30 days to extend the comment deadline to March 8th, 2010.	PRO6
420	I also strongly support additional public meetings in Duluth and in Ely and in the Fond Du Lac. I do believe that this mine is going to affect all of Minnesotans, is going to be served as a precedent for other future mining for nickel and copper, and how we choose to get at those precious metals is very important.	PRO6
421	availability of the hard copy of the -- of the DEIS. It seems like it's very difficult to get access to that.	PRO6
422	I also feel it's important that we receive comments from the Forest Service, who is the land manager of this particular area, at least until the land exchange or land sale goes through, and the US Fish & Wildlife Service. I don't seem to see their comments anywhere around there.	PRO6

Comment ID	Comment Text	Theme Codes
423	One other thing: I'm a little concerned about this particular type of public hearing. I want to make sure that the public has an opportunity to make sure that their comments are heard in a public forum, and while I appreciate the opportunity to have this noted in a very clear and concise way, I think we also need to balance that with making sure that people have an opportunity to be heard amongst other Minnesotans.	PRO6
599	And I'm also concerned that the area for the proposed strip mine does overlay critical habitat for the Canada Lynx. I think that maybe some mitigation or some modification of the project may be in order in order to minimize impact to the Canada Lynx.	WI1
2629	Finally, I believe that the more transparent and the more information that is available to the public benefits all Minnesotans. I'm -- while I'm appreciative of the opportunity of 300 jobs, I'm also concerned of the prospect of technology that has not been proven to protect our water resources and the impacts of sulfuric acid on our water and our watersheds for decades to come.	G7
2630	many other Minnesotans have, and I must stress again the need to expand/extend the comment period at least another 30 days, particularly since there have been some problems with people filing their comments on the website of DNR, to at least	G10
<b>Sender Last Name:</b> Stephens and Henry		<b>Submission ID:</b> 3684

19434	p. 4.1-1 "Water Resources" The DEIS should address endocrine disrupting compounds. "The widespread, continual, and low-level contamination associated with EDCs does not lend itself to remediation. Therefore, preventing the initial use and release of EDCs will likely be more effective in reducing environmental contamination." (MPCA, Endocrine Disrupting Compounds, A Report To The Minnesota Legislature, January 15, 2008)	WR1E
19435	p. 4.1-4 "These bogs are isolated from underlying groundwater..." (Last sentence on page) The December 14, 2009 meeting of the Iron Range Resources Board included a handout that reported on page 36 that "Keetac has historically exceeded its winter season turbidity limits for NPDES monitoring..." The report indicated that ground water inflow contributed to the increased turbidity. This documentation of historic exceedances should generate an acknowledgement in this DEIS that the State of Minnesota does not enforce discharge limits.	EOO
19436	p. 4.1-6 (... there is some groundwater flow to the south...) (Last paragraph) How much?	RFI
19437	p. 4.1-7 "...the number of seeps and the seepage rate have declined since January 2001 when LTVSMC terminated tailings deposition in the basin." (Second paragraph) This DEIS is grossly inadequate for not disclosing that a reason for declining seeps is the fact that collection and pump-back of basin seepage was terminated in 2001. The fact that the State allowed exceedances of effluent limitations should be disclosed in this document so that the public can assess the probability of enforcement of permit requirements on Polymet.	WR1E
19438	p. 4.1-16 "Legacy Groundwater Quality Issues..." Table 4.1-9 and 4.1-10 do not list lead-tainted grease barrels. The Tuesday, August 28, 2007 MEP newsletter reported the following: "And at least one of the [LTV] sites appears to be an old barrel dump," said Doug Beckwith, the PCA's supervisor of the hazardous site assessment team in northern Minnesota. "We haven't done an assessment of that dump site as yet." The DEIS should document the status of those lead contaminated barrels.	WR5A
19439	p. 4.1-29 "...surface seepage at most locations has declined or stopped since tailings disposal was discontinued in 2001." The DEIS should disclose to the public that the pump-back of polluted seepage was terminated in 2001. The decision process for terminating seepage pump-back should be documented. Any modeling of Polymet ground water or surface water pump-back should include a study of the cessation of that pump-back for at least eight years being the State of Minnesota has demonstrated at the LTV tailings pond that pump-back cessation is a State policy.	WR1E
19440	The Flambeau mine demonstrates that prediction of the results of limestone treatment are remarkably inaccurate. (Furtman, The Buzzards Have Landed, 2007)	WR1E
19441	p. 4.1-67 "...it would flow through a wetland treatment facility..." (Last paragraph) Effectiveness of wetland treatment has not been documented. The Dunka wetland treatment site still requires a variance.	WR3L

Comment ID	Comment Text	Theme Codes
19442	p. i Acronyms and Abbreviations contains a listing for Acid rock drainage (ARD) but the DEIS does not emphasize Acid Mine Drainage. The EPA and reputable scientists regularly reference acid drainage from a mine as Acid Mine Drainage (AMD). Failure to give AMD its own listing in this document suggests that it is a promotional brochure for the mining industry rather than a science based document. p. iii Acronyms and Abbreviations lists Voluntary Inspection and Cleanup Program (VIC). The DEIS does not contain such a listing. VIC probably refers to Voluntary Investigation and Cleanup Program. VIC definition should be corrected.	EOO
19442	p. 4.1-171 "Recommended Monitoring Measures" A test for endocrine disruptors in all potential receiving waters including ground waters should be conducted to establish a base line reference and should be included in the DEIS.	WR1E
19443	p. 4.2-44 "Water resources other than wetlands..." Mud Lake T. 59N R. 13W on the Superior National Forest map (2003) is shown as Yelp Lake on the Superior National Forest map (1972). Yelp Lake and Yelp Creek do not appear to be properly identified in the DEIS.	WE1
19443	p. 4.2-1 "The MPCA did not act on the Section 401 request..." (Third paragraph) The DEIS should describe for the public the reasons why the MPCA did not act on the Section 401 request so that the public can evaluate the probability that Minnesota State Agencies will adequately regulate sulfide mining in Minnesota's wetlands.	WE4
19444	p.4.3-19 "Addition of organic amendments to the Tailings Basin" Proposed organic amendments should be identified. Base line endocrine disruptor tests should be conducted so that impact of subsequent operations can be evaluated.	EOO
19445	p. 4.4-19 "Open Water" This section should include an analysis of Mud Lake. (Designated as Yelp lake on Superior National Forest map. (1972)	WI2
19445	p. 4.6.-1 "Existing Conditions" This section should disclose mining industry failures to comply with state air quality rules and standards. (U. S. Steel, Keetac, United Taconite) The public should have information to assess the probability of future mining operations respecting permit conditions.	AQ4B
19447	p. 4.6-32 "Greenhouse gas reduction measures" The processing location and technology for metals other than copper should be addressed in the DEIS. Off-site third party processing mentioned in the Cover Sheet should have been addressed in the body of the DEIS.	AQ3
19448	p. 4.6-40 "...Project would not be permitted until a verifiable plan can be approved..." (3rd Par) Verifiable plan should be included in DEIS.	AQ4
19449	p. 4.8-1 "...with the goal of balancing the need for development with protection." (1st Par) The DEIS has not documented a need for sulfide mining development.	CR1
19450	p. 4.8-3 "...a significant amount of consultation and survey work remains to be completed." DEIS is inadequate without completion of consultation and survey work.	CR1,CR2,CR3
19451	p. 4.8-8 "...an amendment was passed that guaranteed that the tax advantages of the 1941 taconite legislation would be maintained..." (First Paragraph) The DEIS should clarify this statement to acknowledge that the tax advantages have generally accrued to the mining industry rather than to local schools and communities of the Iron Range, most of which are struggling under both conditions of boom and bust. The DEIS should enumerate rebates and subsidies to the mining industry including the FY 02-06 rebate of 20% of School and University trust funds to taconite mining companies. (DNR Division Fact Sheets, Taconite Mining Grants)	CR1
19452	p. S-1 "USFS and Polymet are exploring the feasibility of a land exchange" Details of any land exchange should be part of this DEIS so the public can evaluate the desirability of any such exchange as a connected action to the proposed project.	PD1
19453	p. 4.8-8 "...because the project is located in a mining area..." (Third paragraph) The proposed open pit mine is located within the Superior National Forest, a multiple use recreation area. It makes no more sense to say that the proposed mine site is appropriate for mining because of its proximity to a mining operation than it would to declare that the Peter Mitchell pit is appropriate for logging because it's next to the Superior National Forest.	CR1

19454	p. 4.8-15 "Cumulative Effects" During the summer of 2008 my wife Pat and I were picking blueberries near Cook County 3. A gentleman who identified himself as a member of the Fond Du Lac band stopped to visit about fishing and commented on moose sign in the vicinity of Plouffe Creek. As a descendant of Europeans, I am pleased to live in an area where we can have a friendly relationship with our tribal neighbors. I believe that the continued encroachment of mining interests on tribal resources is a threat to that relationship.	G3,CR1,CR2,CR4
19455	p. 4.10-1 "...surrounding areas would experience some portion of the Project's socioeconomic effects." (First Paragraph) No long term beneficial socioeconomic effects have been documented at the county level. The DEIS should incorporate the report titled The Curse of Natural Resources: An Empirical Investigation of U.S. Counties (Alex James, David Aadland-May 2009).	EOO
19456	p. 4.10-1 "...the IRR provides grants and other programs to foster community redevelopment..." (Second Paragraph) The DEIS is incomplete and misleading. It should document the millions of tax dollars that are rebated to mining corporations every year by the IRR when those funds should have been routed to schools and community businesses to foster community development.	EOO
19457	p. 4.10-12 "Participation in Voluntary Associations" The fact that no environmental organizations are listed is a sad reflection on this DEIS. This bias should be considered as evidence of inadequacy and lack of professionalism.	EOO
19458	p. 4.10-14 "The economic multiplier effect for St. Louis County was estimated using the Impact Analysis for Planning (IMPLAN) model completed by the University of Minnesota Duluth (UMD) Labovitz School of Business and Economics Bureau." (1st Par) Page B-3 of the Labovitz School of Business and Economics report (March 2009) states that: Unless a cost-benefit analysis is done, and the study of alternatives is presented, the percentage of total activity in this report is not immediately relevant to decisions about mining investment. The DEIS should contain a cost-benefit analysis.	SE3
19459	p. 4.10-15 "...the Project would create an economic benefit to the community..." The DEIS does not support this statement. Table 4.10-14 reports that employment at the LTV site went from 3,000 in 1970 to 1,400 in 2001. Automation is eliminating jobs and there is no data in this DEIS to suggest that the trend will change.	SE3
19460	p. 4.10-15 "...few members of these tribal communities live in the immediate vicinity of the project." My wife and I live within 15 miles of the project. We frequently encounter tribal members in Soudan and Tower.	EOO
19461	p. 4.10-15 "Operating Period" Labor force projections do not appear to take into account the effects of automation. Mining productivity more than doubled since I started working at Minntac in 1969. The ongoing elimination of mining jobs by automation should be documented in the DEIS. (The Economic Role of Metal Mining in Minnesota: Past, Present, and Future, Thomas Michael Power, October, 2007)	SE3
19462	p. S-2 I.B "uninterrupted operation" The history of mining in Minnesota does not document or suggest the possibility of uninterrupted operation of mines to meet the purpose and need of the project as stated in this paragraph. Mining was interrupted while this DEIS was being prepared.	PD9
19462	p. 4.10-16 "...five percent of working-age people...would remain to help with long-term closure..." The DEIS does not provide documentation for the five percent statement. If the statement is accurate, will financial assurance be calculated to provide funding for that level of employment? Financial assurance should be addressed in the DEIS.	RFI
19463	p. 4.10-17 "The projected labor force for the steady state operating period..." Steady state operations in the mining industry do not have steady state employment. The DEIS should analyze the expected job losses from continuing automation.	SE3
19464	p. 4.10-19 "Project tax impacts are based upon IMPLAN model estimates..." The IMPLAN model does not appear to incorporate tax rebates to the mining industry. Rebates and other services and subsidies provided by state agencies to the mining industry should be enumerated and the impact analyzed in terms of Opportunity Cost.	SE8
19465	p. 4.10-21 "Post-Closure and reclamation activities are expected to generate 20 to 50 jobs..." What is the basis for the prediction of 20 to 50 jobs? Will financial assurance be calculated on that basis? p. 4.10-16 predicts 5% of employees remaining post-closure. What is the basis for the differing predictions?	SE8

Comment ID	Comment Text	Theme Codes
19466	p. 4.10-26 "Conclusions" The project should be evaluated for negative socioeconomic impact in regards to the Resource Curse, Regulatory Capture, Deep Capture and Opportunity Cost.	SE3
19467	p. 4.13-4 "If during permitting...designs and analyses suggest risks..." (Second Paragraph) As a resident of the Iron Range I expect risk analysis to be available in the DEIS.	GT1
19468	p. 4.14-7 "...analyzed for additive and synergistic cumulative effects." Endocrine disruptors should be included for their additive and synergistic effects.	G8
19468	p. 4.14-1 "Cumulative Effects" The Minnesota Legislature, Legislative-Citizen Committee on Minnesota Resources, and U.S. EPA have recognized endocrine disruptors as a problem in Minnesota. Recognizing that the proposed Polymet project would be layering sulfide mining slimes and plant discharges on top of existing iron mining discharges and recognizing that various endocrine disruptors can be synergistic at low levels, multi-generational fathead minnow tests should be conducted to protect Minnesota citizens and environment from potential damage. The results of the endocrine disruptor tests should be presented in the DEIS. Tests should be conducted in all mining tailings ponds before dilution or attenuation in public waters.	G8C
19468	p. 4.14-3 Table 4.14-1 "Water Quality Changes" The DEIS should examine the potential effect of proposed sulfide mining projects on the corrosion of pilings in the Duluth-Superior harbor. The corrosion apparently involves sulfates, iron, copper, organic material and bacteria. This problem is documented and should be addressed. (Andy Greder, Duluth News Tribune, December 7, 2009. Randall E. Hicks, CURA Reporter, Spring/Summer 2009)	G8
19469	p. 5-14 "Socioeconomics" The conclusion of beneficial effects is not documented. It does not appear that negative effects have been evaluated. Opportunity Cost, Regulatory Capture, Deep Capture, and Resource Curse should be evaluated by impartial economic consultants. It does not appear that the DNR as RGU has demonstrated the impartiality that would be required for them to select such a consultant. The technical comments presented by tribal representatives suggest that they would be the logical entity to be selected and funded to thoroughly examine socioeconomic impact.	EOO
19470	p. S-2 I.B "The processed resources would help meet domestic and global demand..." The DEIS does not document this claim. Polymet output has been contracted to Glencore, a commodities and derivatives trader which might hold output off of the market for speculative purposes. Glencore is based in Switzerland. The DEIS does not document the claim that output would enter domestic markets. Glencore has a financial relationship with China. (Reuters, September 17, 2009) Minerals from our wetlands could very likely be creating value added jobs in China. (Reuters, October 30,2009)	G1
19471	p. S-9 "...the Proposed Action would exceed groundwater evaluation criteria at the Mine Site for at least several parameters." Existing ground water and surface water contamination should be cleaned up before permitting additional degradation. (Notice of intent to sue. Law offices of Charles M Tebbutt, January 25, 2010)	EOO
19472	p. S-10 Socioeconomics "Beneficial effect..." The DEIS does not evaluate economic negative effects from mining at the local, county, state, and national levels. Effects should be evaluated in terms of the Resource Curse, Regulatory Capture, Deep Capture, and Opportunity Cost. (Hanson, Jon D. and Yosifon, David G. The Situation: An Introduction to the Situational Character, Critical Realism, Power Economics and Deep Capture, 2003)	SE3
19473	p. S-14 Cumulative Effects "...would reduce sulfate loading..." Both the Partridge and Embarrass River feed the St. Louis River. Sulfate destination would be the same.	WR5A
19474	WAG supports the No Action Alternative as the preferred choice to promote the economic and environmental welfare of the State of Minnesota.	EOO

Comment ID	Comment Text	Theme Codes
19474	The two authors cited above document that for hundreds of years, residents of mining areas have more often been victims than beneficiaries. Local support for mining projects is generally driven more by a lack of alternatives than for a love of mining. This DEIS should address the political power structure that channels development energies to mining projects rather than to support locally generated economic alternatives.	G1
19474	The DEIS should address the socioeconomic deficiency in entrepreneurial spirit in mining economies. (Jim Skurla, Labovitz School of Business, Duluth News-Tribune, September 1, 2008)	SE3
19476	Processing of Nickel concentrate should be evaluated for environmental impact. "Not the best quality nickel concentrate. In a good nickel market it is a very salable product, but probably only about 4 or 5 places in the world can take that," he said. (Reuters, June 18, 2008. Polymet CFO Douglas Newby) The 4 or 5 places should be listed and evaluated for smelting or processing techniques. In the event of a bad nickel market, the DEIS should address disposition of nickel concentrate.	G1
19477	Polymet's marketing contract with Glencore, a Swiss derivatives and commodities trader, should be acknowledged as an indication that there is no requirement to use Polymet output to satisfy domestic markets.	G1
19477	The DEIS failed to list information available to document the large cost of subsidizing mining in Minnesota. The Governor's Committee on Minnesota's Mining Future (September 2004) listed the following groups of organizations. The costs to the public of supporting those mining promotion groups should be calculated and listed.	PD9
19477	Copper market manipulation (Sumitomo et al) should be acknowledged in the DEIS as evidence that there is no reliable evidence for real supply and demand in commodities markets. Similarity between commodity market and financial market manipulations should be evaluated. The wisdom of destroying real natural resources to create derivatives should be addressed.	G1
19477	The DEIS does not mention mining slimes as a major output of the Polymet plant. Failure to use professionally accepted terminology to describe plant processes could mislead those using the DEIS as an evaluation instrument. A definition and quantification of mining slimes in the Polymet process should be included in the DEIS. Public presentations by mining promoters have referred to some mining wastes as "washed sand." (Joe Scipioni to MPCA, May 24, 2007, verbally. Joe Scipioni to LCCMR, August 18,2009, verbally. Frank Ongaro to film audience, January 13, 2009, verbally. Polymet presenters, April 29,2008, printed handout.) The handout referred to washed sand and to the ore body as "roughly 3 percent" valuable minerals. These misleading statements should be corrected in the DEIS.	PD9
19479	The use of University Trust Funds to subsidize mining which is supposed to support the University Trust Fund should be examined in the context of the snake eating its own tail. Long term sustainability is questionable. The DEIS should address historical negative socioeconomic consequences of having our political system dominated by mining. (Roles of Public Organizations, The Governor's Committee on Minnesota's Mining Future)	EOO
19480	In support of the above issues and others to follow, Wag incorporates by reference comments by the following individuals and organizations: Northeastern Minnesotans for Wilderness Save Lake Superior Organization Tribal Cooperating Agencies Water Legacy Leonard Anderson Bruce Johnson Elanne Palcich Robert Tammen Stephen J. Jay Center for Biological Diversity	G15

19480	SULFIDE MINING DISTRICT The DNR Lands and Minerals Division has been studying copper-nickel mineralization in northeast Minnesota for the past thirty years, and has a facility full of core samples at its Hibbing location. The DNR Lands and Minerals Division knows full well that exploration is taking place throughout the Arrowhead region of Minnesota as part of a sulfide mining district. The DNR continues to sell leases for mining exploration throughout the Duluth Complex. The isolated environmental review process for PolyMet goes against NEPA and MEPA legislation. This process is being done ahead of a complete environmental scoping and impact study which needs to consider the cumulative impacts of a sulfide mining district in the Arrowhead Region of Minnesota. A complete review needs to consider the cumulative impacts to water, air, wetlands, forests, and wildlife in accord with the Clean Air Act, the Clean Water Act, the Wetlands Conservation Act, and the Endangered Species Act. The PolyMet DEIS is circumventing the law in regards to cumulative impacts of metallic sulfide mining as being proposed and as being facilitated by the DNR Lands and Minerals Division. Franconia, Duluth Metals, and Teck all have exploratory drill sites adjoining each other and adjoining Polymet. How can this not be considered a metallic sulfide mining district? Furthermore, this extension impacts the watershed flowing into the Boundary Waters Canoe Area Wilderness, which has special protection under the national Wilderness Act. It appears that putting PolyMet first on the list of possible metallic sulfide mines is purposely circumventing Federal law, and misleading the public by declaring that this type of mining will not impact the BWCAW. Mining Minnesota advertises the following copper-nickel companies on their website: PolyMet, Franconia, Duluth Metals, Encampment, Kennecott/Rio Tinto, and Teck Cominco. The planning for a sulfide mining district is advertised by the mining companies themselves. PolyMet must be considered as part of a sulfide mining district.	G1
19480	CUMULATIVE EFFECTS The PolyMet/ NorthMet draft environmental impact statement does not adequately address cumulative effects.	G8C
19481	The PolyMet DEIS is also remiss in openly addressing the fact the PolyMet is seeking permitting for 1/3 of the plant capacity as inherited from LTVSMC. This under-permitting leaves open the door for adjoining companies such as Franconia or Duluth Metals to use the PolyMet plant with minimal additional permitting, even though such mining would directly impact the waters of the BWCAW. The DNR has already stated that permitting for additional capacity would not require a full EIS.	CR1
19482	CUMULATIVE EFFECTS ON TRIBAL LANDS The disregard of consideration of a sulfide mining district becomes an environmental justice issue when tribal lands, as part of the Treaty of 1854, are being swept aside as part of a piece meal approach to permitting metallic sulfide mines.	CR4
19482	The USFS is also remiss in this regard, because much of the land involved in a sulfide mining district would be part of Superior National Forest. The USFS is seeking to circumvent its responsibility in this part of the process by requesting special federal legislation to sell USFS land directly to PolyMet. A land sale to PolyMet would undermine the Weeks Act, which has been in place since 1909. Our current Federal legislators would perform an unethical service by setting aside legislation and a purpose that has been in place to protect public lands and waters for the past 100 years.	G9
19484	CUMULATIVE EFFECTS ON TRIBAL LANDS The disregard of consideration of a sulfide mining district becomes an environmental justice issue when tribal lands, as part of the Treaty of 1854, are being swept aside as part of a piece meal approach to permitting metallic sulfide mines.	G3,CR1,CR4

Comment ID	Comment Text	Theme Codes
19485	<p>CUMULATIVE EFFECTS WITH OTHER PROJECTS FURTHER ALONG IN THE ENVIRONMENTAL REVIEW PROCESS Even without the consideration of a sulfide mining district, the PolyMet/Northmet DEIS does not adequately address the cumulative impacts of other projects that are ahead of PolyMet in the environmental review process. The cumulative effects would include air pollution and haze over class I air quality areas, an increase in the mercury and sulfate load of waters within the St. Louis River watershed and the adjoining Rainy River watershed, the cumulative impact on wildlife and wildlife corridors, noise and light pollution on a 24 hour basis, total loss of forests and wetlands as part of global warming, total contribution of green house gases, and total general impact on air and water quality. These projects include the Mesaba Coal Gasification Project which is in the final environmental impact statement stage and includes Hoyt Lakes as its second choice of a site and also as the second site to be built upon completion of its first site choice; Mesabi Nugget which shares the former LTV property with PolyMet and which was fast tracked without environmental review of its plant construction, so is currently in the early stages of production; an expansion of the Arcelor-Mittal taconite production into the Biwabik area; and continuing operation and expansion of the Peter Mitchell mine near Babbitt. In addition, the Essar Steel taconite/steel plant which has been permitted for the Nashwauk area will contribute large amounts of green house gases and haze, affecting the St. Louis River watershed as well as air quality and micro- climate in the Arrowhead/Boundary Waters area. Since none of these environmental impact statements include the permitting of PolyMet, but are ahead of PolyMet in the review process, NEPA and MEPA laws are not being followed. The total emissions of these projects need to be addressed before another project can anticipate permitting. This again involves the Clean Air Act, the Clean Water Act, federal haze standards, mercury TMDL limits, the Wetlands Conservation Act, and the Endangered Species Act. The Mining Minnesota website also advertises the expansion of Minntac and Keetac.</p>	G9
19486	<p>CUMULATIVE EFFECTS OF METAL LEACHING Although the PolyMet DEIS lists 17 metals and 8 general parameters (Table 4.1-50) as seeping into ground water, the DEIS gives no information on the cumulative effects of these metals on ground water quality. This is in total disregard to human health. Even if the maximum concentration of each individual metal or parameter stays within water quality limits, what is the effect of all of these contaminants within the water supply? What effect does drinking this water have upon the health of humans, wildlife, fish, and plants—and upon the wildlife, fish, and plants that might be consumed by humans? What are the synergistic effects of these contaminants, for example of a combination of cobalt and nickel? Are some of these contaminants considered carcinogenic? The same is true of surface water contaminants (Table 4.1-20). Other tables include 4.1-5, 4.1-6, and 4.1-7. Nor is there a summary of cumulative impacts of chemicals that are used in the hydrometallurgical plant processes and stored in the plant residue tailings. Even if water is treated within the WWTF, what impact do the treatment chemicals have upon water quality and water that ultimately seeps into ground water or surface water? Although PolyMet claims that not one drop of this water will reach surface water, what happens if there is a failure within this system? This must be explained and addressed within the EIS process. This quote is from the State of Washington Department of Ecology: “Different chemicals combined together in the same effluent can have unknown additive effects even when the individual toxicity of each chemical is well known.” Whole Effluent Toxicity (WET) testing is done, in this case by a University, to determine cumulative effects. The DEIS cannot continue to rely on testing done by an engineering firm that is dependent for its income upon the mining company, and that uses software models that are not available to the public.</p>	WR5A,WR5C
19487	<p>CUMULATIVE IMPACTS ON FUTURE ECONOMIC OPPORTUNITIES The DEIS does not address the end product of PolyMet’s mine closure –which is land that cannot be used for any other purpose. The waste rock piles will be too large and unstable for any use, the tailings will be too large and contaminated, and water treatment will have to continue indefinitely into the future. This will preclude forestry, recreation, tourism, or any other real estate or business development. Any income from these industries would be lost as soon as PolyMet would begin operations. Again, this issue is not addressed as part of a sulfide mining district. Nor are PolyMet’s 400 projected jobs anywhere substantiated. PolyMet does not explain where or how these workers would be used. In comparison, Mesabi Nugget is using 75 workers in its plant operations.</p>	SE3

19487 CUMULATIVE EFFECTS ON THE ST. LOUIS RIVER WATERSHED This DEIS is remiss in addressing the cumulative effects of additional mining within the St. Louis River watershed. The St. Louis River is already highly impacted by drainage from Minntac’s operations. The issue of leaching from Minntac’s tailings basin and the issue of contaminated water that has been recirculating through the Minntac plant since its start-up in 1967 and which Minntac now seeks to release into the environment, is already a burden on our resources. United Tac (Forbes), Minorca, Keetac and HibTac also drain into the St. Louis River watershed. The St. Louis River watershed is so impacted for mercury, due to air and water emissions from the taconite plants and power plants that run them, that the state agencies have not been able to include the watershed in its mercury TDML plans. Potential leaching from the PolyMet mining operation, which would drain into either the Embarrass or Partridge River, and which would be added to leaching from the former LTV Steel Mining Company tailings, must be considered in regard to the cumulative impacts that are already placed upon the watershed. The St. Louis River ultimately drains into Lake Superior. The Nature Conservancy is currently working to preserve and restore the St. Louis River estuary because of its significant values. Individual mine sites cannot be isolated from the watersheds that they impact. This also becomes an economic impact concern. The St. Louis River watershed is used by tribal communities, and by others who hunt, fish, recreate in the area, or live in the watershed and drink its waters. A supply of jobs could be created to clean up and maintain the watershed for its intrinsic uses. The benefits of this would stay within the state, rather than be shipped abroad for use by other nations.

WR5A

19487 This issue is not adequately addressed simply because of the volume of tailings and tailing slime that will be placed upon a tailings basin that is already leaching pollutants, that contains pollutants of unknown quantity and origin, and that is already considered unstable. The issue alone should be enough to prevent the permitting of PolyMet under the current plan. The LTV tailings basin was used to store coal ash, and dredging from the manmade wetlands that were designed to filter heavy toxic metals from the Dunka site. The potential leaching of unknown contaminants from the LTV tailings basin needs further analysis. PolyMet’s sulfide tailings are not being treated any differently than the tailings of the taconite plants. We know that the taconite tailings continue to pollute the St. Louis River watershed, and also some of the northern waters. The DEIS does not address the cumulative effect of the leaching of PolyMet’s tailings, as part of the LTV basin, on the St. Louis River watershed. Along these same lines, the agencies have not been able to figure out a plan for the disposal of Minntac water that has been recycled during the current lifespan of the plant, and is now so polluted that it is corroding plant infrastructure. The choice is now whether to allow this water to be drained into the north or south watershed. PolyMet also plans to recycle its water for the 20 year projected life span of the plant. PolyMet’s alternatives then become whether its tailings will leach into the Embarrass River or the Partridge River. This is, in effect, the same problem facing Minntac. Minntac’s sulfate load has destroyed wild rice and fisheries due to low level leaching from its tailings basin. In fact, tailings basin must be allowed to leak, in order to prevent water build-up which will collapse the dikes. This is what happened at the coal ash spill on Highway 61 by the North Shore. If PolyMet is permitted without this problem being addressed, then Duluth Metals will be next in line to store its tailings in the Dunka basin. These tailings will leach directly into the Boundary Waters Canoe Area.

G9

19487 CUMULATIVE EFFECT OF WETLAND LOSS The PolyMet DEIS does not adequately address the loss of carbon sequestration from the destruction of forests and wetlands on PolyMet’s proposed mine site. The agencies have refused to use the most up-to-date information on carbon sequestration and its impact on mitigating local climate change impacts. The agencies have downplayed the impact of global warming gases to be emitted, and PolyMet has transferred some of these impacts to the electric power plants by projecting the use of electric rather than diesel equipment. However, electric shovels and blasting rigs are much more expensive than their diesel counterparts, so what guarantee is there that PolyMet would follow through on this plan? The DEIS does not account for possible carbon taxes and the impact those taxes would have on an industry that produces 99% waste rock. This also needs to be addressed under socio-economic impacts. The loss of the specific conifer bogs of the 100 Mile Swamp, which will not be replaced through PolyMet’s wetland mitigation plan in Aitkin County, do not follow the Wetland Conservation Act , and should not be approved by the ACOE. The ACOE is also remiss, along with the USFS, in not addressing the loss of wetlands within the St. Louis River watershed, and as part of a sulfide mining district. This is misleading the public and does not follow NEPA law.

19489	ALTERNATE PLAN WITHOUT AN AUTOCLAVE/HYDROMET Once permitted, PolyMet would need to seek funding in order to build its autoclave/hydromet. The construction of this plant would take approximately two years. During this time, PolyMet has theorized shipping out ores that have gone through crushing and flotation. This is not addressed anywhere in the DEIS. The raiing of this product, with its potential to leave behind a trail of acid producing dust or waste rock, MUST be considered as an alternative plan within the DEIS. The DNR is remiss in not addressing this issue, which was brought up at least two years ago.	PD7
19489	CUMULATIVE IMPACTS ON WILDIFE, FISH, BIRDS Wildlife habitat and corridors are not adequately addressed, because of lack of cumulative impacts as part of a sulfide mining district, cumulative impacts regarding other projects and expansions, cumulative impacts due to mining exploration, and cumulative impacts of metal deposition from air emissions and dust into the ground and water. Loon studies and the effects of mercury on loon populations MUST be addressed within this DEIS. The loss of habitat for migratory birds, which are also suffering habitat loss along their migratory routes, needs to be addressed as part of a cumulative study. Fish and aquatic life need to be studied for bio-accumulative impacts due to metals, mercury, and other contaminants. This DEIS is top heavy on promoting the mining of low-grade sulfide ores, without adequate regard for the huge amount of waste rock and accompanying leaching of metals and acid mine drainage, as well as the impact on the environment of the moving of such vast amounts of rock and their ultimate storage—and the accompanying impact on the connected ecosystem that is being fragmented or destroyed. The job of the ecological division of the DNR is to provide this information for the EIS process.	WI2,WI5,FM3
19491	CUMULATIVE ECONOMIC IMPACTS Everywhere it is advertised that huge amounts of metals will be dug out of the Duluth Complex mining district, when in actuality huge amounts of waste rock will be crushed in order to extract less than 1% mineralization. The DEIS is perpetuating an economic scenario which cannot be substantiated as being sustainable, simply because of the large amount of waste rock that must be removed, using large amounts of dwindling oil and gas resources, which are undoubtedly going to rise in costs. This DEIS is relying almost totally on an economic report put out by the Labovitz School of Business which is funded by the taconite industry. This report gives a very favorable and biased economic outlook for the mining of low grade sulfide ores. Other studies by Tom Powers of the University of Montana and by William R. Freudenburg of the University of Wisconsin and University of California give much different versions of the economic implications of mining. These studies must be included under socioeconomic impacts.	EOO,SE6
19492	CUMULATIVE IMPACTS ON HEALTH The DEIS lacks a section on health effects. This would include exposure to air pollutants, fibers and dust, exhaust and particulates. Effects of 24 hour a day noise on workers, wildlife, and residents need further study. Water contamination of wells and city drinking water supplies need to be studied for the cumulative effects of heavy metals and other contaminants. Synergistic effects of contaminants need to be studied. Potential endocrine disrupters entering the watershed from chemicals used in the flotation process and in the autoclave/hydromet process must be studied as part of synergistic and cumulative impacts on water supplies and impacts on fish, wildlife, and humans. The PolyMet DEIS has not waited for results of tests trying to determine the number of cases of mesothelioma among Iron Range workers, a cancer that is caused by asbestiform fibers. These are the same kind of fibers that were implicated in the Reserve Mining case, and that ultimately stopped Reserve Mining Company from dumping its tailings in Lake Superior and contaminating Duluth’s drinking water supply. These same fibers can be airborne when rock is crushed and ground to a powder form in order to extract low grade minerals. The air in the processing plants is often filled with dust, and dust can also blow off tailings basins. Workers bring this dust home on their clothing and in their vehicles. Results from the mesothelioma studies will take several more years. Cumulative health impacts of mercury must also be addressed as part of a taconite mining district and the potential of a sulfide mining district. The health hazards of mercury in fish have the biggest impact upon pregnant women, children, and segments of society that rely more heavily on fish as a food supply. Studies regarding the mercury-sulfate-methylized mercury bio-chemical chain must be included and analyzed as part of this EIS process.	EOO,WR5A,WR5C,FM3,A

19493	<p>NO ACTION ALTERNATIVE The DEIS conclusion that a no action alternative would allow for continued leaching of the current LTV tailings into the watershed defies logic. According to a VIC agreement, the current owner of the LTV tailings basin is responsible for clean-up. If the regulatory agencies cannot manage the clean-up of taconite tailings basins, how can the agencies assume, or the public expect, that these same agencies will be able to oversee clean-up of sulfide tailings? The acid mine drainage and heavy metals leaching from sulfide tailings have the potential to last for centuries. The sheer volume of tailings left from the mining of less than 1% metals will ensure that contamination will be a problem that will require “perpetual” treatment, even though the agencies downplay this problem by labeling the treatment as “long-term.” The obligation of both mining companies and agencies over such a long time period is a huge liability.</p>	ALT8
19494	<p>AIR QUALITY The PolyMet DEIS is inadequate in labeling PolyMet’s impacts upon air quality as “insignificant.” The 20 mile proximity of PolyMet to the Boundary Waters Canoe Area Wilderness will undoubtedly increase haze in a Class I area. This will come at a time when federal statute requires an overall reduction in haze. The impact of haze within the BWCAW and Voyageurs National Park needs to be considered as part of a sulfide mining district. Once sulfide mining is permitted in Minnesota, the expansion of that mining will be very difficult to delay, especially considering that PolyMet has 2/3 excess plant capacity. The DNR has stated that expansion of PolyMet’s plant capacity would not require a new EIS, even though this would overwhelm the tailings basin and multiply contaminants going into the water and the air. The impact of haze within the BWCA and Voyageurs National Park must also be considered as part of cumulative effects involving Mesabi Nugget, which shares part of the former LTV mine site with PolyMet, with Peter Mitchell mining operations, with Arcelor – Mittal expansion plans, with the proposed Mesaba Coal Gasification Project (FEIS), with Essar Steel (permitted) and with expansion plans for Minntac and Keetac. The PolyMet DEIS does not address acid rain and its impact upon the wilderness. Because the hydromet process puts more pollution into the water than the air, and because wet scrubber technology is to be implemented, the possible ramifications of acid rain are being neglected. Acid rain falling in the plant and mine site vicinity will contribute to the leaching out of toxic heavy metals. Acid rain in a wilderness setting upsets the ecological balance. In eastern states, acid rain left lakes and streams devoid of fish. SO2 and SO3 from plant emissions will contribute to acid rain.</p>	AQ4,AQ4B,AQ4D
19494	<p>SUPERHIGHWAY STUDY COMPLETED BY ST. LOUIS COUNTY A hearing was held in January 2009 regarding the building of an economic development corridor between Hoyt Lakes and Babbitt. As of today the project is on hold, pending further funding. This road project needs to be addressed in the PolyMet DEIS because of cumulative impacts on wildlife, wildlife corridors, wetlands, air pollution, and noise, and because the road would facilitate movement of mining vehicles within a sulfide mining district. Because PolyMet preferred an alternative road site that would border its mine plan operation, this alternative must be included in the PolyMet DEIS as a distinct possibility. St. Louis County spent a significant amount of money on the road study, and is planning to renew the project as soon as funds become available. Previous funds were from the federal government, and additional federal stimulus money will be released in 2010. This road project would be a necessary part of a sulfide mining district. Because the agencies have failed to address this issue as a whole, significant impacts will be ignored. Additional Superior National Forest wetlands and forests would be destroyed. Since all submitted potential effects must be considered within an EIS, the agencies cannot arbitrarily exclude potential impacts and the opportunity for public input. According to dIALOG notes from January 21, 2010, Paul Bergman indicated that non-ferrous activities in Lake County are picking up. “Plans are in place between Lake and St. Louis Counties to designate the Denley Lake Road (Old Tomahawk, FR 424), a County State Aid Highway. This alignment is the major east west link south of Birch Lake.” The redesignation of Denley Road as a county road, and its subsequent widening, must be addressed within the PolyMet DEIS. This road would facilitate non-ferrous mining traffic, and would also impact wildlife habitat and corridors. NEPA law requires that all such impacts be considered. The PolyMet EIS process must acknowledge these road projects as part of its mining proposal.</p>	G9

19494	CONSULTING FIRM CONFLICT OF INTEREST The DNR hired Al Trippel of the London-based consulting firm Environmental Resources Management to oversee the NEPA process. Al Trippel has been on the Aquila payroll, conducting baseline environmental studies necessary prior to submitting a mine application for Aquila's Back Forty gold-zinc deposit between Michigan and Wisconsin. Al Trippel's consultation was called on the carpet in Michigan for conflict of interest. His conclusions about the potential for acid rock drainage were also questioned in Michigan. The PolyMet DEIS needs to include unbiased research on acid mine drainage, such as that done by Canadian scientist Dr. David Blowes, who spent 20 years studying mines and trying to manage AMD. His studies, as well as studies by other researchers, conclude that there is no sulfide mine in existence that is not polluting the groundwater to some extent or another, and that the potential for pollution is greater in a water-rich environment (such as that of northeast Minnesota). According to the report "Comparison of Predicted and Actual Water Quality at Hardrock Mines, The reliability of predictions in environmental impact statements," prepared by James R. Kuipers and Ann S. Maest, 2006, "Despite assurances from government regulators and mine proponents that mines would not pollute clean water, researchers found that 76% of studied mines exceeded water quality standards." This DEIS is relying on a consulting firm representative who is conflicted out and Barr engineering models that cannot be reproduced by the public in drawing its conclusions about the impacts of metallic sulfide mining in northeast Minnesota's watersheds. This represents a gross inadequacy in the conclusions of this DEIS while misleading the public on the impacts of this kind of mining on sensitive ecological areas. And where the DEIS actually concludes that certain metals will exceed drinking water standards during different aspects of the mining process, those conclusions are overturned by charts and figures from Barr Engineering which put all pollutants within state standards. Nowhere are the cumulative impacts of these pollutants addressed. Treatment for any pollution, contamination, or spills is left up to Poly Met and treatment upon closure is open-ended and to be monitored. The agencies will have no control over this project or the environmental degradation that it leaves behind outside of a few state reclamation laws. These laws include the total demolition of all buildings upon closure, and providing some kind of ground cover on site. The entire plant and mine site will be virtually unusable upon mine closure. This is not addressed under IRREVERSIBLE OR IRRETRIEVABLE COMMITMENT OF RESOURCES. The PolyMet DEIS is inadequate in addressing the potential threat of acid mine drainage and toxic heavy metal leaching in the wetland environment of Minnesota and the consequences of that pollution within the St. Louis River watershed. The PolyMet DEIS is inadequate in ignoring the potential impacts of a sulfide mining district upon the Rainy River watershed.	G10
19494	The fish population is also subject to mercury contamination, and mercury deposition is airborne. Aquatic life, fish populations, and birds and wildlife that feed on aquatic species are all exposed to cumulative toxic effects of mercury, acid rain, and heavy metals. These impacts are not presented in the PolyMet DEIS in a way that clearly defines the total kinds of impacts that affect plant and animal life in Superior National Forest, the Boundary Waters Canoe Area Wilderness, and Voyageurs National Park.	FM1,FM3,AQ6A
19496	By reading through the PolyMet DEIS, one can see that the copper nickel mine plans are based upon the same design as the taconite plans. This plan includes tailings basins, ditches, dikes, waste rock piles, and open pits. Although the mining of sulfide ores is known to create acid mine drainage, there is very little difference in the design of these mines. PolyMet's plan includes some liners under tailings that are considered to be most reactive and that contain residue from the proposed autoclave/hydromet. However, the majority of PolyMet's tailings would be placed upon unlined tailings in the former LTVSMC tailings basin, an area that is already considered unstable. The remedy for this would be to build higher dikes out of less porous materials. It is also known that tailings basins need to leach in order to prevent a build-up of water pressure that could collapse the dike walls, as happened in the coal ash spill on Highway 61. (See MPCA records for more information.)	EOO
19496	The handling of this DEIS process is enabling the start up and expansion of sulfide mining in the Arrowhead Region of northeast Minnesota without proper concern for the high standard of air quality and water quality that has remained OUTSIDE OF THE IRON MINING DISTRICT. The opening of a SULFIDE MINING DISTRICT will destroy the quality of the remaining environment that has acted as a buffer zone between the Iron Range and the BWCAW.	AQ4B

19497	As citizens of this area and this state, we are stepping forward to call a halt to this EIS process, and the beginning of an EIS process which considers the full impact of opening a sulfide mining district within the Arrowhead Region of northeast Minnesota.	EOO,G8C
19498	The socio-economic impact of mining on the Iron Range needs to be reanalyzed.	SE3
19499	The Arrowhead Region of northeast Minnesota that is slated for metallic sulfide mining has never been mined. It does not contain the cluster of mining towns that trail the former natural open pits across the Iron Range. The Arrowhead Region consists largely of Superior National Forest lands, which have been used traditionally for logging, recreation, tourism, camping, hunting and fishing, and tribal rights. The metallic sulfide range also pushes right up against the Boundary Waters Canoe Area Wilderness. Land in this area has been used for real estate, tourism and recreation, and as a buffer zone surrounding the Boundary Waters. Ely was the lone Iron Range town left out of the taconite development, and has created an economy based upon tourism as the gateway to the BWCAW. The impacts of mining are not compatible with the character of a tourist area that's based upon wilderness.	SE3,SE4
19500	What northeast Minnesota needs right now is a DEIS that figures out how to clean up our mercury pollution, how to remove sulfates from the watershed, how to treat taconite tailings basin pollution, and how to clean up our water and air. This will generate plenty of jobs.	G1
19501	This is a moral issue which is substantiated by science. The DEIS plainly shows that metals will contaminate our water supply for centuries. No cost-benefit analysis has been done in regard to health and a healthy environment and what that contributes to a local economy. Nor have the impacts of increased pollution within the St. Louis River watershed been analyzed in regard to tourism along the North Shore and in Duluth. There is no mention within the DEIS of clean-up costs due to bankruptcy failure or failure of pollution control methods, although sulfide mining clean-up costs in other states have been as high as \$500,000,000.	SE3
19502	In the report, "The Economic Impact of Ferrous and Non-Ferrous Mining On the State of Minnesota and on the Arrowhead Region and Douglas County, Wisconsin," Appendix B, p. B-1, it states, "Policy recommendations should be based on the 'big picture' of total impacts, and a cost-benefit analysis would be needed to assess the environmental, social, and governmental impacts of ferrous and non-ferrous mining in the State." This is the very report which the PolyMet DEIS has relied upon. Therefore, the PolyMet environmental impact process must include an independent cost-benefit analysis as stated above.	SE3

19502	The following quote is from the Iron Mining Association of Minnesota website: “Recovering iron from taconite is a challenge, especially at a cost the world will tolerate. Equipment is massive and complicated. It takes enormous amounts of energy.” The quote represents an industry that mines 25% iron. What economic implications does this hold for an industry that would be mining less than a half a percent of metals? The politically expedient path to the permitting of metallic sulfide mining is based upon projections for a future economic market that nobody can predict. However, an economy based upon low grade metal extraction is not going to lead to world market stability. Therefore, the socioeconomic section of the DEIS is incomplete, biased, and unacceptable. It is already out of date, as the 35% figure regarding the mining industry segment of the regional market comes from studies that were done previous to March of 2009. Subsequent to this, two of the taconite plants shut down for the remainder of the year. A more accurate study, one which would not be funded by mining company money, would be based upon an averaging of mining industry contribution to the regional market. While the mining component of the economy fell, tourism held its own. However, tourism doesn’t affect the Iron Range directly, because mining has impacted the landscape, leaving behind few tourist destinations. These kinds of economic issues must be part of the socioeconomic record set forth in the DEIS. Furthermore, the socioeconomic impact chapter needs to include some kind of market analysis that covers speculation, hedge funds, and stockpiling as part of price manipulations in the copper/precious metals market. The ores of the Duluth Complex are extremely low grade, making them extremely susceptible to price changes. Company bankruptcy places the burden of environmental clean-up on the taxpayer. The agencies performing this DEIS have a responsibility to the taxpayers of this state to insure that this kind of mining is sustainable in the marketplace and that companies are required to post financial resources up front to ensure that any clean-up costs from metallic sulfide mining will be paid for by the company, not the taxpayer, should the company go bankrupt or otherwise close with a one to twenty year time frame. The politics and the economics do not justify the opening of a sulfide mining district in northeast Minnesota. Agency heads who truly understand this issue, although pushed into permitting by political pressure, bear the burden of sacrificing the Arrowhead Region of Minnesota to foreign mining companies.	SE6

19503	<p>CARBON FOOTPRINT OF POLYMET’S OPERATIONS This issue must have its own chapter within the DEIS. The carbon footprint must begin with the loss of forests and wetlands on the proposed PolyMet mine site, and include the fact that wetlands would be lost in St. Louis County, but “preserved” in Aitkin County. This results in a release of CO2 to the Arrowhead Region, and a loss of carbon sequestration. The mine site would also destroy forests and their carbon sequestration role. The mining of less than 1% ores results in 99% waste rock. This chapter must address how much carbon would be released into the air in order to mine 99% waste rock. This would start with the amount of carbon this is released in constructing the large machinery that is needed for mining, including trucks, tires, drills, blasting equipment, railroad equipment, plant equipment, etc. The record must include the amount of CO2 that would be released from the use of this equipment, and also from the operations of the plant and hydromet/autoclave. Additional information needs to be compiled on the release of CO2 as limestone (200,000 tons per year) and plant chemicals are mined, produced, and railed or otherwise transported into the area. The record needs to include CO2 released from the vehicles of the workers as they commute to the plant/mine site. Since this is a rural area, all workers would commute. Next the record must track the shipping out of the semi-finished product, first by rail to Lake Superior, and then by barge on the Great Lakes and by ocean going vessel to China. This part of the carbon record contains how much CO2 would be released from the mining operations. Next, the amounts of metals that would be used in wind turbines or parts, solar parts, or hybrid or electric vehicles or vehicle catalytic converter parts must be calculated as a carbon offset. The shipment of these devices back to the United States, and projected shipment of the products across the United States must then be calculated and subtracted from the carbon offset. This figure would then be compared to the original CO2 figure from the mining operations to determine whether PolyMet’s mining operations would leave behind a positive or negative carbon footprint. If the result of this carbon footprint study results in PolyMet leaving behind a global warming footprint, then this project must be scuttled. It will not be sustainable in the future economy. This study must be conducted by an independent consultation agency. Al Trippel and his ERM agency must be disqualified, due to conflict of interest regarding the Back Forty mining project. Barr Engineering must be disqualified, as they represent PolyMet. This DEIS must include studies made by our own agencies of changes in plant species and wildlife related to climate change within our own Arrowhead Region. The public perception is that the DNR and USFS have personnel in the field who are documenting such changes and making recommendations to preserve our natural biodiversity. The public expects that such documentation be a part of this record. Our tax dollars are funding the jobs of personnel within these agencies; their expertise needs to be included within this DEIS.</p>	SE3,G2A,G8C
19503	<p>I am sending these comments and concerns in regard to the Draft Environmental Impact Statement for the proposed Polymet mine in Minnesota. I've been advised it helps to mention specific pages where I have concerns, but there are few pages that do not raise concerns. I believe the DEIS is inadequate throughout.</p>	G8
19504	<p>First, it does not seem logical that this DEIS is being commented on while the surface rights (in the Superior National Forest that are needed for an open pit mine) have not been fully and/or officially obtained. It also does not seem logical that many issues should rely on future monitoring to detect impacts, when there are already impacts that are not being properly monitored now. The recent notice of a citizen suit concerning the leaking tailing's pond at the LTV site must be addressed before future impacts from the Polymet operation can be seriously measured. This becomes even more of a concern when the DEIS does not supply adequate information on ground and surface water, nor an initial determination of the Project's area of influence on wetlands. DEIS repeatedly states issues will be answered later in the permitting process. The DEIS' purpose is to evaluate these questions in the D The EIS.</p>	PRO3
19504	<p>Since the DEIS does not adequately measure the problems left by past operations, it makes it impossible to estimate future impacts--or to hold Polymet financially liable if/when problems occur in future operations. Financial liability must also be addressed in the DEIS in order to measure whether there are better alternatives to open pit mining and the use of a tailings pond that is already leaking. I'm not a chemist or geologist, but these appear to be elemental omissions.</p>	PD3,G9

Comment ID	Comment Text	Theme Codes
19505	Reserve Mining was required to stop dumping tailings in Lake Superior in the 1970s to protect the public drinking supply. Those tailings were supposed to sink into a deep part of the lake and stay there—they didn't. Tailings ended up in the drinking water in Duluth and elsewhere. The cost to Reserve Mining to move their tailings' pond on land has been blamed for their bankruptcy just a few years later. The DEIS need thoroughly address the stability of the existing tailings pond Polymet plans to use. Will adding more tailings to it potentially cause it to fail, potentially creating an enormous spill of toxic material? The DEIS needs to spell out who will pay for cleanup if it does fail. According to numerous regulators, the state of Minnesota gave assurances to the mining company that took over after Reserve left, that they would not be liable for the environmental problems left by Reserve. This is another example why relying on future monitoring instead of measuring the current conditions could be a recipe for disaster--and an unknown expense for the taxpayers of the state.	ALT8,PD4
19505	The DEIS cumulative effects analysis also fails to address the asbestos-like mineral fibers found in the ore in the area. These have been identified in the Hoyt Lakes community water supply and have also been an issue in regards to fugitive dust emissions at the Peter Mitchell Mine and Northshore mining--and others-- including LTV.	AQ1,AQ4C
19506	Fugitive dust created by the blasting, moving, and crushing of rock must be addressed. Suppression of dust could create more leaching problems since it is often done with water. Testing by the Minnesota Department of Resources has shown water and oxygen are not a good mix for this type of ore. Dust escaping from trucks, trains, or ships used to transport ore and concentrate must be addressed. This is of special concern because other companies may be using the old LTV site for processing. Since there are currently taconite pellets littering the rail tracks in the area, it is apparent future leaks and spills of ores and concentrate are inevitable, including fine particles escaping into wetlands, rivers, lakes--and workers' lungs.	RFL,AQ1
19507	A recent report by the United States Army Corps of Engineers on the corrosion of steel pilings used for docks, bridges, and bulkheads in the Duluth Superior harbor, highlights the questions that remain unanswered in the DEIS. The study indicates copper in the water in the harbor is partly to blame for potentially tens if not hundreds of millions of dollars in replacement cost to stabilize and/or replace existing steel pilings. The study also mentions the history of Cu enrichment in sediments along the shore of Lake Superior and mentions metal rich ore as a source. If more metal rich ore is moved into this environment, will it make it even more expensive to solve and fix this problem? Shipping is extremely important to many businesses in the region--including mining. Who pays to fix present and future problems in the harbor? I'm concerned it will be taxpayers--and not only those from Minnesota.	G9
19508	Because of an apparent lack of transparency by the Minnesota Department of Health, the University of Minnesota is currently studying the health effects of taconite ore dust on workers in northeast Minnesota. This issue is decades old and has been kicked down the road for most of that time. The lack of details on past and future mining impacts in this DEIS further erodes Minnesota's past reputation for good government.	G8
19509	My name is Matt Tyler. I live in Finland, Minnesota in Lake County. I am an angler and avid wild rice harvester. Wild rice and fish are a significant part of my diet. Because I rely on these natural resources for sustenance, I take the protection of water resources in my region very seriously.	G7
19510	I have reviewed the Polymet-NorthMet DEIS and many of the supporting technical documents, and have concluded that it is scientifically inadequate. I share many of the concerns raised in the Cooperating Tribal Agency findings, and have identified additional deficiencies. I describe three significant problem areas and their possible solutions below.	G8

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19511	<p>Wetlands are asserted to be unconnected to groundwater without reference to field data and despite important DNR literature to the contrary. The DEIS asserts in several places that wetlands and other surface water features near the mine site have little hydrologic connectivity to groundwater. “Based on this empirical evidence as well as prior studies (Adams et al. 2004, Siegel and Ericson 1980), it appears that the ability of the poorly sorted surficial glacial sediments in the Project area to transmit water is highly variable and to a large extent surface water features, including wetland bogs, are isolated from, and not affected by, groundwater drawdown from nearby dewatering activities impacts to wetlands and other surface water features at the Mine Site (Adams and Liljegren 2009; and Adams 2009).” (DEIS p. 4.1-61-62) These assertions were made primarily on the basis of two emails from a consultant despite well reasoned arguments to the contrary by tribal cooperating agencies, who advocate on-site examination to determine connectivity (DEIS p. 4.1-61). Furthermore, the discussion in the DEIS is vague and carelessly refers to surficial and bedrock groundwater interchangeably (DEIS p. 4.1-62). Together this suggests a deliberate attempt to confuse the public and minimize the potential effects of pit dewatering and groundwater pollution on wetlands. The assertion that surface water features have little connectivity to surficial sediments (i.e. the surficial aquifer) is contradicted by the SWMM hydrologic model (RS-73A). The model showed that groundwater flow through the surficial aquifer is a significant contributor to Partridge River flows. When the groundwater component of the SWMM was turned off, the model hydrographs were “much more ‘flashy’ than the ones recorded at the USGS gauging station” and “did a poor job in matching base flows.” (RS-73A p. 25). Detailed Forest Service soil maps of the mine site (RS-73 Figure 8) show that organic peat soils are intermingled at a relatively fine scale with loamy lowland and sandy upland soils. The presence of loamy lowland soils between peat and upland soils suggests that peat is not accumulating at the wetland edges because decomposition is possible there. This would tend to suggest that the wetlands have a more neutral pH and at least some connectivity to the surficial aquifer. Some of the potentially impacted wetlands at the mine site have been classified according to the Cowardin system (DEIS Table 4.2-3). While most of the wetlands are coniferous bogs, many other types are present, including alder thickets, wet meadows, marshes, and hardwood swamps. The latter types of wetlands are more generally indicative of surficial groundwater inflow, as they are systems where decomposition is more prominent than peat formation. (MN Dept. Nat. Res. 2003) Northeastern Minnesota’s wetland communities have recently been described and classified in Field Guide to the Native Plant Communities – The Laurentian Mixed Forest Province (MN Dept. Nat. Res. 2003). Based on hundreds of field plots and many detailed studies, the guide has classified forested coniferous peat forming wetlands in Minnesota’s Laurentian Mixed Forest ecological province into eight native plant communities. Based on the distribution maps in the guide, below are the six types that could occur at the mine site and their connectivity to groundwater: • FPn62 Northern Rich Spruce Swamp (Basin) – may be connected to groundwater • FPn63 Northern Cedar Swamp – connected to surficial aquifer • FPn81 Northern Rich Tamarack Swamp (Water track) – connected to groundwater • FPn82 Northern Rich Tamarack Swamp (Western Basin) – may be connected to groundwater • APn80 Northern Spruce Bog – isolated from groundwater • APn81 Northern Poor Conifer Swamp – often adjacent to communities influenced by groundwater Clearly, groundwater flows are potentially important in five of the six types of coniferous peatlands, regardless of the presence of water</p>	WR2I,WE1,WE2

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19512	<p>Partridge River hydrologic models do not accurately reflect known precipitation variability. The U.S. EPA Storm Water Management Model (SWMM) used to model the hydrology of the Partridge River watershed was calibrated using stream gauge and precipitation data from a period that is not representative of the long-term precipitation pattern in the region. “In order to assess the representativeness of the 1978-1987 period of simulation, precipitation occurring during this period was compared with the 112-year period of record (1896-2008) for Northeast Minnesota available from the National Climatic Data Center (<a href="http://www.ncdc.noaa.gov/oa/climate/climatedata.html">www.ncdc.noaa.gov/oa/climate/climatedata.html</a>) as a surrogate for the relatively short 10-year period of flow records for the Partridge River. The data show that the 1978-1987 period included one very wet year, several fairly average years, a relatively dry year, but no very dry years. Therefore, there is some uncertainty regarding the models predictions of dry extremes.” (DEIS, p. 4.1-97) My own analysis of the same data from the National Climatic Data Center confirms this and emphasizes the importance of including very dry years. Very dry years have been relatively frequent in the past 20 years. Four very dry years (&lt;24” precipitation) occurred between 1989 and 2009. Furthermore, extremely dry years (&lt;19” precipitation) have occurred twice in the last 100 years, most recently in 1976. In contrast, there was 24.6” of precipitation during the driest modeled year (1980). Consequently, the 30-day low flows used to represent “dry” conditions are probably not low enough. If, as the DEIS states, 30-day low flow periods represent a worst-case scenario with the highest potential for surface water quality impacts (DEIS, pg. 4.1.110), then the omission of very and extremely dry years means that the worst case scenario is not realistically “bad” enough. This is unacceptable for a project that has potentially very serious impacts. To be credible, the final EIS must include modeling of very dry and extremely dry years. This could be done by running a continuous simulation of the watershed using the calibrated model with precipitation data from water year 1970-1971 through water-year 2008-2009, and then selecting the lowest 30-day low-flow value from this period. This period would include one extremely dry year (1976 - 18.3”), and four very dry years (1989 – 23.9”, 1997 - 22.0”, 2003-23.7”, 2006 - 22.6”). The 1970-2008 continuous model period should improve prediction accuracy over running individual very dry and extremely dry water years because longer runs are thought to better represent the “multi-annual variability in soil moisture conditions across the study watershed” and minimize the impact of initial model conditions (RS73A, p. 28). This longer run could also be used to revalidate the model over the 1978-1987 period for which stream gauge data is available. Precipitation data from 1970-2008 is available from the Tower (ID: 218311) and Brimson (ID: 210989) weather stations, and the combined Ely (ID: 212543) and Winton Power Plant (ID: 219101) weather stations.</p>	WR3J

19513 groundwater pollutant transport models fail to include important hydrologic processes and variation in soils and precipitation. The models used to assess the movement of waste rock leakage and mine pit water in groundwater at the mine site (DEIS 4.1 p.73-80, RS-74A) do not accurately reflect the heterogeneity of the soils at the site, the three dimensional nature of groundwater flow, exfiltration, or the temporal variability of precipitation. The models used to simulate groundwater quality at the mine site are “simple two-dimensional cross-section models” that assume no lateral flows (RS-74A, p. 83). In essence, these models can be thought of as a series of “tubes” of layers of soil and bedrock through which water and pollutants (solutes) move between the waste rock piles and the Partridge River. These “tubes” are referred to as pathways in the DEIS. Six pathways were modeled: one pathway between each of the five waste rock piles and the Partridge River, and one pathway between the west pit and the Partridge River. The head of the pathway for the category 4 lean ore pile began at the rim of the east pit, so seepage from the pit was also modeled. Each of these pathways was 10 meters wide (RS-74A, Table 6.2), with five 1m deep soil layers (RS74A, p. 84-85) along the entire length. Soils were modeled with a constant conductivity of 9.3 ft/day, which is based on the average sampled conductivity of wetland soils. Recharge from precipitation was set to a constant 1.5”/yr (RS-74A, p. 85), which is the average yearly infiltration for glacial deposits in the calibrated SWMM model. The scientific literature shows that such a simplistic model is of little predictive value when there is high spatial variability in soil and/or bedrock conductivity and porosity. It is well known that spatial variability in soils and bedrock controls groundwater flow and solute transport, and that the incorporation of variability in models is generally required to predict solute transport (Mackay et. al 1986, Guven et al. 1992, Mas-Pla et al. 1992, Kapoor and Gelhar 1994, Phanikumar et al., 2005, Salamon et al., 2007, Hu et al. 2009). Although there are still many challenges, methods to characterize and incorporate heterogeneity have been developed over the last 30 years (e.g., Dagan, 1989, Gelhar, 1993, Cushman, 1997, Hyndman et al., 2000, Zhang, 2002, Rubin, 2003 and Meerschaert et al., 2006). Soils at the mine site are clearly very spatially variable, which indicates a high degree of spatial variability in the hydrologic conductivity and porosity of the surficial aquifer (RS-73A, Figures 8- 9). This is also clearly evident in the wide range of soil types, soil depths, and conductivity values sampled at the site: “The bouldery drift of the Rainy Lobe that covers the Mine Site has an estimated hydraulic conductivity range of 0.1 to 30 ft/day (Siegel and Ericson, 1980). Lab permeameter tests on the silty sand from drill core and test trenches at the Mine Site found the hydraulic conductivity values to be 0.00043 to 0.0081 ft/day, while field testing of the various unconsolidated deposits found a range in hydraulic conductivity values of 0.012 to 31 ft/day (see RS02). The ability of this unit to transmit water is highly dependent on the thickness of the sediments (Adams et al., 2004; Siegel and Ericson, 1980).” (RS-74A p. 15-16, emphasis added) “The surficial sediment across the site are relatively heterogeneous, ranging from very dense clay to well-sorted sand” (RS-2 p. 13). Furthermore, soil depth varies considerably throughout the site, ranging from 0 to 50 feet, but generally less than 25 feet (RS-2 Table 6, RS-74A p. 14-15). These features prompted the author of RS-2 to conclude that, “the ability of the surficial aquifer to transmit water was highly variable depending on location” (RS-2 p. 13) The model clearly does not reflect the known spatial variability in the surficial aquifer (soils) at the mine site, and consequently has little predictive value f

WR2A

19513 My concerns about sulfide mining are based, partly, on the demonstrated results of taconite mining in Minnesota. First, the tailing basins of several mines in the State leak and discharge chemicals in excess of the State standards. Second, these excess discharges are varianced by the State without penalty to the mines. Little, if any efforts are made to enforce the existing standards. No shutdown of generating additional pollution is being made. This inaction sets the behavior pattern of the taconite mines regarding the standards. If this performance is tolerated by the State and citizens, there is no assurance that Sulfite mining, being more environmentally dangerous, will be held to the standard. Second, there has never been a sulfide mine that has not polluted the air and water with its discharges. The proposed Polymet mine is upwind of the BWCA and the watershed goes either back into the BWCA or into Lake Superior. Both air and water emissions beyond the standards are possible with potentially disastrous results, killing plants, fish and polluting whose effects will last many years past the active life of the mine. Third, evidence of past pollution by sulfide mines have resulted in State money being expended in the cleanup with taxpaying citizens bearing the brunt of cleanup. In some cases, no cleanup is attempted leaving a permanent scar on the earth. There is no evidence that sulfide mining can be accomplished without pollution. Moreover, the State of Minnesota has not demonstrated a will to stop the pollution of existing mine operations. I am opposed to sulfide mining in my neighborhood for these reasons and I will have to suffer the consequences.

19514	The 1854 Treaty Authority would like to highlight a number of additional resource concerns related to the proposed project, even though comments made on the preliminary draft EIS still hold value and are relevant to this version of the EIS.	G8
19515	Under the proposed project, it appears that long-term or even perpetual water treatment, site maintenance, and monitoring will be needed after closure to protect the environment and meet water quality standards. We don't believe that this meets the goal of a maintenance free closure. Specifically, issues remain in regards to the stability of the tailings basin, and the effectiveness of the permeable reactive barrier (PRB). It is untested and has not been demonstrated to work in any similar situations. In addition, the PRB would need periodic recharging/replacement which would need to occur at regular intervals for as long as water treatment is needed.	WR3I,PD4
19516	The waste water treatment facility (WWTF) and the passive wetland treatment system might also not be as effective as predicted. The EIS states that the collected Hydrometallurgical Residue Cell drainage would be treated by the WWTF until approximately year 34, but no discussion of the maintenance and repair of the caps used on the tailings basin is included. Infiltration from precipitation will increase as the caps age and develop additional leaks. With continued flow of water through the tailings basin, we cannot see how the assumption of treatment ending at year 34 can be justified.	WR2G,WR3I,WE6,PD3,PD
19516	Also in regards to the WWTF, the preliminary draft EIS states: "Without a demonstration of effectiveness, the wetland treatment must be assumed to be ineffective due to short-circuiting. The primary objectives for the WWTF are to ensure that the treated process water is of sufficient quality to allow reuse in the Beneficiation Plant and to help meet groundwater standards for groundwater seepage from the tailings basin. The treated process water quality design targets reflect a combination of state surface and groundwater standards, although the most restrictive of the two is not always proposed (RS29T, Barr 2007). The WWTF effluent represents the primary source of antimony, arsenic, and sulfate to the tailings basin pond and seepage from Cells 1E/2E during mine operations (Wenigmann, Pint, and Wong 2009). Since the WWTF effectiveness would be an important factor affecting the quality of groundwater seepage from the tailings basin, we recommend monitoring of the WWTF effluent as a leading indicator of potential groundwater issues at the tailings basin (Section 4.1.3.5). " Nothing has changed in regards to the design of the WWTF to the draft EIS, and this statement quote still has relevance. The draft EIS also mentions the passive treatment ability: "Constructed wetlands performance, however, is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards." This version of the EIS leaves out the following sentence from the previous version: "Furtlter, the assimilative capacity of these wetlands is limited and they would presumably require long-term maintenance to ensure its effectiveness." The EIS has not addressed legacy issues with the site and seems to minimize potential issues. Page 4.1-19, states there has "not been any documentation of any offsite contamination, and the extent of onsite contamination from the legacy sites appears to be limited to localized soils and possibly groundwater. "	WR1E,WR2G

19516	We appreciate the effort and attention wild rice received in preparing the draft EIS. On page 4.1-47 it states that Minnesota Rules, part 7050.0470 does not designate wild rice waters along the Partridge River. We would like to note that these rules do not attempt to identify all wild rice waters, so care should be taken on how this list is referenced or utilized. The Natural Wild Rice in Minnesota report included an attempt to summarize all wild rice waters in the state, but is an ongoing work in progress as better or new information is acquired. Field work conducted in 2009 by the project proposer did identify a number of rice stands in the Partridge River. In addition, the 1854 Treaty Authority also investigated the river from approximately Colby Lake downstream to its confluence with the St. Louis River in August 2009. Several areas containing wild rice identified in the draft EIS were confirmed during this survey. However, we also documented additional areas of rice in the section of river downstream of county road 110. Wild rice was also identified in the St. Louis River near the county road 100 crossing, and in Second Creek where it discharges into the Partridge River. Wild rice growth can be affected both by water quantity and water quality. A water quality standard for sulfate of 10 mg/L exists for waters which support wild rice. As shown in Table 4.1-67, measured sulfate concentrations exceed this standard in several waters containing wild rice. It is our understanding that this standard must be met in areas where wild rice is found (and perhaps historically found as well). The EIS states that sulfate levels in Partridge River are approximately 149 mg/L downstream of Second Creek. Impacts from this level of sulfate on the rice beds in the Partridge River are unknown, but sulfates in this range could be or like ly are affecting wild rice growth and success. In fact, recent work completed at the University of Minnesota Duluth indicates impacts on wild rice from elevated sulfate levels. Additional discharges from the project would increase sulfate loading and/or concentration levels in these waters. We are interested in following how water discharges would be permitted in relation to the wild rice water quality standard.	WR4F
19518	The 1854 Treaty Authority still has concerns about the National Ambient Air Quality Standards (NAAQS) and Prevention of Significant Deterioration (PSD) Increment Impact Analysis. On page 4.6-13 its states that modeling analysis done to date does not reflect the current Proposed Action for the tailings basin. Those changes represent a 19% increase in PM 10 and 5% increase in PM2.5. Even though the EIS is supposed to include all current and reasonably foreseeable projects occurring in the area, the Mesabi Nugget Phase II project and the Keetac Expansion Project have not been included in the modeling analysis. This is troubling because modeling that has occlrrred to date show that 24-hr PM IO and PM2.5 NAAQS impacts for the Plate Site assessment were modeled at 97% of the standard (page 4.6-13). The modeling for the maximum 24-hour PM 10 impacts in the Mine Site approaches the Class II Increment for PSD (29 mg/m3 versus 30 mg/m3), and the 24-hr PM2.5 Class II NAAQS modeling shows the total plant, minc, and background total equaling 34 ug/m3 out of the standard 35 ug/m3. With the Mesabi Nugget Phase II and the Keetac Expansion Facility emissions added in as well, the modeling might show violations of the standards. Table 4.6-22 is still missing the Mesabi Nugget Phase II project, the Keetac Expansion Project, and the Essar Steel Facility. Due to this, the increase of potential mercury emissions will be considerably higher.	AQ4B
19518	As mentioned earlier, previous comments and language submitted by the Tribal collaborators are still relevant in addressing issues in this version of the EIS. Specifically in the ail' section, we have question of whether fugitive emissions will be reactive and to what extent in generating acid runoff. The proposed action calls for water or dust suppression being used on all unpaved roads at the Plant Site resulting in a 60% reduction in emissions, and more controls on the roads to the tailings basin with an even greater estimated reduction of 80%. We would like to further understand what additional controls are forecasted to be used on the roads used to transport construction materials at the tailings basin, and if these controls should be used on all roads. 19518	Nearly all of the wildlife impact analyses that were presented dealt with species of special status (endangered, threatened, special concern, USFS regional forester sensitive, etc.). We understand that there is a trend to manage for multi-species and indicator species, yet the importance of moose and other game/furbearer species to tribal interest demands a high enough priority that these species should be addressed specifically. Certainly we support protection of species of concern as well, but others are often of high priority, particularly for a project that is impacting species and habitat permanently. Regarding access, in planning for reclamation phase, it would nice to see options that would allow for some public access to the site. Successful reclamation could make the site a valuable treaty-right or recreational resource in the future. Furthermore, some disagreement may exist on the analysis of wildlife corridors. Page 4.4-30 of the EIS states: "Emmons and Olivier may have underestimated the number of corridors by treating all historic mining features as impediments to travel and not accounting for closed mines, revegetation, and natural succession." As that study was peer reviewed and Barr Engineering's did not undergo the same rigorous review, it is a concern that Barr's study may have over-estimated the ability of some wildlife to bypass what they term "moderate impact features".	WI3,WI5
19518	The proposed project would have significant impacts to wetlands, with approximately 1552 acres impacted from the total project. If the project moves forward, it is our understanding that this would be the largest wetland impacts ever permitted in the region. Much of the planned mitigation would occur outside of both the St. Louis River watershed and the 1854 Ceded Territory. This raises concern if resources within the watershed and those guaranteed by treaty with the United States are being properly preserved and protected. Other tribal collaborators have raised concerns about the predicted impact of wetland drawdown and its effects on the surrounding area. The wetland delineation has had questions raised about the proper classification of wetlands and their dependency on groundwater upwelling. Wetland impacts could even be greater than what is stated in the EIS.	WE1,WE2,WE3
19518	No matter how the proposed project is viewed, it would result in a permanent loss or change to treaty guaranteed resources and the exercise of treaty rights. Any type of land exchange with the U.S. Forest Service would not directly address this impact. As the draft EIS states, the tribes view natural resources as cultural resources. It is impossible to separate the two. Further consultation required by federal agencies is needed to better understand effects to cultural resources, and to properly plan for avoidance or mitigation.	PD7,G2B
19520	The EIS states that financial assurance requirements for the project are not included in the document, but will instead be determined during the permitting phase. We are concerned about this approach given the potential for long-term/perpetual treatment, maintenance, and monitoring that may be needed from the proposed project. The environmental effects, expensive cleanups, and bankruptcies at other precious metal mines raise a significant red flag. This project may stand on its own, but completing financial assurance disclosure during the EIS process will help understand the needs to safeguard the environment and protect the public from significant expenditures.	PD1
19520	Finally, an additional consideration along these lines is the possible future need to complete a Natural Resource Damage Assessment and Restoration (NRDAR) claim against the project. In the event that natural resources are injured from a project (perhaps likely in this case), the NRDAR process attempts to make the public whole for its losses. The public is compensated for lost resource services, typically through the identification and completion of restoration projects. Depending upon the impacts, this can be a significant expense for a company. It is necessary now to visualize the potential need for this process down the road, and we believe it is important to build in the necessary monitoring for baseline data before and during operations.	CR1
19521	We all have concerns about Sulfide mining in Minnesota. We are particularly concerned about the sulfide mining on 6,700 acres in the Superior National Forest and other public lands. We are concerned about the impact these mines have on surrounding bodies of water. Upon investigation, we have found no evidence of any clean sulfide mines in existence now or in the past. Furthermore, the DEIS has not found any clean Sulfide mining operations. We feel that the evidence we have reviewed suggests that it is not possible to conduct Sulfide mining with out a devastating and incapacitating impact to the surrounding environment and ecosystems.	EOO,PD1,PD3,PD4,PD10

19522	As a family we have been harvesting wild rice in the true Native American tradition for 30 years in many areas of Minnesota. We have great concern about increasing Sulfate concentration in areas surrounding the sulfide mine by 20 mil./liter. Wild rice cannot survive in water when it's levels of Sulfates rise above 8 mil/liter.	WR4F
19523	Additionally it seems Tribal rights guaranteed by treaties with the federal government will be violated by the destruction of wild rice in the area around the proposed Sulfide mine.	G3,CR4
19524	Primarily we believe that the only way to properly protect the fragile and unique ecosystems that exist in the area surrounding the proposed sulfide mine is to not build one in the first place. However, if the mine must be built, we strongly believe a thorough analysis of the following aspects of the proposed sulfate mine should be completely addressed before the sulfate mining commences in Minnesota:	G8
19525	Perpetual financial guarantees to the public for any clean up created by sulfide mining.	PD4,PD8
19526	Analyze impact of increased mercury on the water and air as it affects fish & wildlife.	WR4B,FM1,AQ6A
19527	Protect tailings and rock piles from ever leaking or collapsing and spilling pollution into rivers, Lakes, water supply, and wetlands.	WR2D,GT2
19528	Consider extensive Public input.	EOO
19529	Several sections of the DEIS are incomplete and deficient and should be revised. This should be done under the NEPA aegis and not left to the permit process. The DEIS also presents a frightening specter of massive wetland loss, massive waste rock piles and tailing ponds, polluted surface and groundwaters, guaranteed acid mine drainage, and the likely need for perpetual treatment of waste streams. (Read massive public bailout)	PD10,PD3
19530	First and foremost, the proposed project lands do not even belong to PolyMet. The NorthMet DEIS assumes the successful completion of a land exchange of 6,700 acres between USFS and PolyMet. This is a connected action and should have predated the DEIS. A land exchange would need to go thru an EIS and the NEPA process. This is not a done deal because it also involves the transfer of public lands with retained usufructory rights by the Tribes under the 1854 Ceded Territory. The larger question is should the land be used for mining purposes in the first place. In 1997 the area of the mine site was studied by the USFS in its Forest Plan Revision process and found to be worthy of permanent protection as a " candidate Research and Natural Area". "Features that gave this area a high ranking were its watershed integrity, the size of its wetlands, the presence of riverine ecosystems, and the large amount of interior forest present." (Friends of the Boundary Waters Wilderness (FOBW) report: "PolyMet Mine Site: Important Natural Area Will Be Obliterated for Dangerous New Mine", June 2009) Subsequently, the Minnesota DNR, The Nature Conservancy and the North Central Forest Experiment Station also cited the need to protect this area. However, when the USFS Forest Plan Revision was released in 2004, the area was not designated as a " candidate Research and Natural Area". Interestingly, the initial scoping for the PolyMet Project began in 2004...	PD1
19530	The NorthMet Mine would be situated in an area of wetlands known as the "100 Mile Swamp". "The mine would occupy and destroy over 1,000 acres of that peatland... Destruction of the more than 1,000 acres of peatland by PolyMet's proposed mine would release approximately 2.7 metric tons of CO2 to the atmosphere. This would increase Minnesota's total annual emissions of CO2 by two percent (above 2005 levels)" (FOBW report: "PolyMet Mine's Destruction of Peatlands Would Significantly Increase Minnesota's Carbon Emissions", June 2009). The depletion of this carbon reservoir is contrary to Minnesota's comprehensive plan to reduce emissions of greenhouse gases. The Minnesota Terrestrial Carbon Sequestration Project, an interdisciplinary group commissioned by the Minnesota State Legislature, cited as its number one recommendation: "Preserve the existing large carbon stores in peatlands and forests by identifying and protecting peatlands and forests vulnerable to conversion, fire, and other preventable threats." (FOBW, <i>ibid</i> ) In <i>MCEA v. Holsten</i> (2008), Minnesota's environmental review laws were extended to include greenhouse gas emissions and climate change.	AQ3

19531	<p>It is incomprehensible that the DEIS is largely silent on the question of financial assurance. In a landmark study: “Comparison of Predicted and Actual Water Quality at Hardrock Mines: The Reliability of Predictions in Environmental Impact statements”,(Kuipers, Maest and associates, 2006), Kuipers found: “Of the 25 case study mines, nine (36%) have developed acid drainage to date. Nearly all mines (8/9) that developed acid drainage either underestimated or ignored the potential for acid drainage in their EISs. Of the 25 case study mines, 19(76%) had mining-related exceedances in surface or groundwater. However, nearly half of the mines with exceedances (8/19 or 42%) predicted low contaminant leaching potential in their EISs. The constituents that most often exceeded standards or that had increasing concentrates in groundwater or surface water included toxic heavy metals such as copper, cadmium, lead, mercury, nickel, or zinc (12/19 or 63%), arsenic and sulfate (11/19 or 58% each), and cyanide (10/19 or 53%).” Kuipers has also estimated the taxpayer liability for clean-up costs at closed hardrock mining sites in the U.S. to be upwards of \$12 billion. The average acreage per mine involved is 1,800. The current cost for financial assurance where acid drainage has been identified is \$80,000 per acre. We can see that it is likely that surface and groundwater will be affected; it is likely that there will be acid mine drainage; and the costs of clean-up will be dear. It is recommended that state and federal agencies hire a professional consulting firm to calculate mine reclamation costs. A detailed mine closure and reclamation plan with realistic financial cost predictions is necessary in the DEIS. The current DEIS is deficient.</p>	PD4

19531 The DEIS contains several statements that lead to the conclusion that waste streams will need to be treated for tens to thousands of years. “Water draining from stockpile liners and water collected in the stockpile foundation underdrains after Closure would be monitored, returned to the WWTF for treatment if necessary, and ultimately discharged to the East Pit treatment wetlands.” (DEIS 3-42) “Once the entire facility is closed, any water collected by the seepage collection systems would be returned to the pond until it can be demonstrated by water quality that it is no longer necessary to actively manage Tailing Basin seepage.” (DEIS 3-45) “Inspection, maintenance, and reporting activities would be required at the Mine Site and Plant Site after the Closure activities are complete... These Post-Closure and reclamation activities would be expected to be ongoing until such time as the various facility features are deemed environmentally acceptable, in a self-sustaining and stable condition.” (DEIS 3-49) “Other continued maintenance activities that would continue throughout Closure and Post-Closure would include repair of stockpile and tailings dike slope erosion, wetland and outflow structure up-keep to ensure they are functioning properly, woody species and tree removal on stockpiles and hydrometallurgical cells with membranes, tailing pond maintenance, and seepage collection from the Tailings Basin.” (DEIS, *ibid*) “The generation and disposal of tailings in the Tailings Basin would end in Year 20, but PolyMet proposes to retain a permanent pool of water, primarily from precipitation with Colby Lake withdrawals as a backup, over a portion of the Tailings Basin for water quality purposes. All collected surface seepage would be pumped back into the Tailings Basin until the seeps dry out or water quality discharge limits are met, except for Second Creek where the seepage recovery system would be removed at Closure. The collected Hydrometallurgical Residue Cell drainage, which previously was being used at the Plant Site, would be pumped/trucked to the WWTF for treatment until approximately Year 34, when the drainage is expected to end.” (DEIS 4.1-55) Dr. David Blowes, a geologist from Ontario, Canada and the world’s foremost authority on mining liner systems, stated that all liners leak, usually at an average of 8 years post-installation. (Presentation at the University of Minnesota, Duluth, November, 2008) Therefore, pumping drainage from the Hydrometallurgical Residue Cells would need to be continued indefinitely. “The Post-Closure period is considered to begin once the West Pit begins to overflow and drain into the Partridge River, which is estimated to occur around Year 65 (Figure 4.1-21) The West Pit overflow would not occur until several decades after mining ceases. PolyMet would continue to collect and treat leachate from the permanent waste rock stockpiles at the WWTF until monitoring shows that the treatment is no longer necessary to meet water quality standards.” (DEIS 4.1-56) But, according to Table 4.1-45 (p. 4.1-80), the stockpile leachate is expected to exceed groundwater criteria for “around 2000 years”. “Sometime after the West Pit overflows, the WWTF would be decommissioned and the constructed wetlands would indefinitely provide the primary treatment of waste rock stockpile leachate.” DEIS 4.1-111) “Constructed wetlands performance, however, is not sufficiently reliable to function as the primary treatment measure for assuring consistent year-round compliance with water quality standards.” (DEIS 4.1-113) “The best policy for an agency with the responsibility for water protection is to deny any application for a mine that includes a requirement for long-term water treatment. If a prediction of an end date on which treatment will no longer be required can not be made with a reasonable degree of certainty, then a discharge should not be allowed to begin. The long-term risk to the public, who is the ultimate guarantor for

WR2D,WR3I,PD3,PD5

19532 The total direct and indirect impacts to wetlands is 1522 acres. The vast majority of them are rated as high quality wetlands. PolyMet plans are to mitigate 1,287 acres. Given required mitigation ratios, this is a 475 acre shortfall. All but 175 acres would be outside the Partridge and Embarrass Rivers watersheds. These are the largest wetland impacts that have occurred in these watersheds. The mitigation would also occur outside the 1854 Ceded Territory. This would result in the loss of treaty-guaranteed rights to access the wetlands and harvest natural resources within the 1854 Ceded Territory.

WE3

19532	Groundwater and surface water quality would be degraded and in many cases exceed current water quality standards. “Several parameters are predicted to exceed USEPA primary and secondary MCLs and MDH Health Risk Limits at multiple flow paths for various periods and durations.” (DEIS 4.1-78) This refers to exceedances of groundwater evaluation criteria at the Mine Site for arsenic, antimony, sulfate, iron, manganese, nickel, and copper. Table 4.1-45 (p. 4.1-80) predicts these will exceed groundwater criteria for “around 2000 years”. “The West Pit overflow would discharge to an unnamed “waters of the state” and would have to meet effluent limitations based on meeting surface water quality standards... The modeling results suggest that perhaps as many as five parameters (i.e., arsenic, cobalt, copper, nickel, and selenium) could exceed surface water quality standards, in addition to relatively high sulfate concentrations.” (DEIS 4.1-113) See Table 4.1- 64 (p.4.1-114) “Groundwater seepage from the Proposed Action, however, would not be recovered and is expected to range from 1,600 gpm (Year 1) to over 2,900 gpm (Year 20), which would eventually impact surface water quality in the Embarrass River. In addition, liner leakage from the hydrometallurgical cells would seep from cell 2W...this liner leakage is predicted to have a very high sulfate concentration (i.e., over 7,300 mg/L as measured in laboratory testing)” (DEIS 4.1-118) “The Proposed Action would result in increased sulfate loadings via groundwater to both the Partridge and Embarrass Rivers.” (DEIS 4.1-125) Sulfate loading in the Partridge and Embarrass Rivers would be expected to damage wild rice crops and increase the risk of mercury methylation. August and September 2009 field surveys found wild rice at various locations along the Upper and Lower Partridge River, Embarrass River and further downstream in the lower St. Louis River. There is a 10 mg/L sulfate standard in Minnesota for wild rice waters during periods when the rice may be susceptible to damage. Current sulfate levels in undisturbed waters (read absence of mine effluent) on the Partridge River average 5-6 mg/L. Sulfate levels measured on the river downstream of the LTVSMC Tailings Basin average 149 mg/L. The NorthMet Mine’s contribution is predicted to be 174 mg/L (DEIS Table 4.1-96 p. 4.1-188) Current sulfate concentration on the Upper Embarrass River above the Tailings Basin average 4.6 mg/L. Sulfate concentration below the LTVSMC Tailings Basin is 36 mg/L. Under the proposed Action, it would increase to 53 mg/L. This is clearly in violation of the sulfate standard. The MPCA has used the sulfate standard in past permitting activities (MINNTAC Schedule of Compliance, 2008) “There are four lakes downstream of the Embarrass River that are on the 303(d) list for mercury in fish tissue impairment. These lakes stratify, which can further promote mercury methylation. Therefore, increasing the sulfate load from the Tailings Basin could increase the potential for mercury methylation both in the wetlands north of the Tailings Basin and at the downstream lakes.” (DEIS 4.1-126) The Proposed Action would violate section 404 (b) (1) of the Clean Water Act which prohibits permitting when water quality standards are violated or significant water degradation would occurs.	WR1E,WR2D,WR3I
19533	The Canada lynx is protected under the ESA as a federally-listed threatened species. Twenty individual lynx were identified within 18 miles of the Mine or Plant Sites. Potential lynx habitat could be lost for the duration of the mine operations (over 20 years), and an additional 20 years or more after closure before suitable lynx habitat would reoccur at the Mine Site. Wildlife corridors 11 and 12 would see significant impacts and would require mitigation. Corridor 12 (Mine Site) would experience a significant direct loss or fragmentation of wildlife habitat which would impact the ability of many wildlife species to migrate throughout their ranges.	WI1,WI5
19534	The PolyMet Project is predicted to release 8.3 lbs/year of mercury. The mercury TMDL standards require new or expanding facilities expecting to emit more than 3 lbs/year to arrange for a reduction equal to the new emissions from existing sources in the state. PolyMet currently does not have a specific mercury emission control plan and would not be permitted.	AQ5,AQ6A
19535	PolyMet will add 30 tpy of SO2 and 159 tpy of NOX and 1,175 tpy PM10, thus contributing to the predicted failure of the State of Minnesota to meet the current Regional Haze State Implementation Plan goal, which is to reduce emissions from Northeastern Minnesota by 30% over 2002 levels. Amphibole minerals are present in the Duluth Complex and in close proximity to the NorthMet deposit. Nine percent of the fibers collected from samples PolyMet has tested are amphibole minerals which: “could pose a potential public health risk of uncertain magnitude.” (DEIS 4.6-60)	AQ4C,AQ6

Comment ID	Comment Text	Theme Codes
19536	“Polymet proposes clearing of uplands and wetlands, and a revegetation plan that includes the use of nonnative and potentially invasive species, which would prevent the Project Area from meeting the goals of the MFRC Landscape Management Plan to promote diverse, natural floral and faunal communities and populations and maintain a spatial structure consistent with Northeastern Minnesota ecology.” (DEIS 4.9- 3)	CPLU1
19537	The cumulative impacts of the loss of wetlands, changes in wetland functional values, air and water emissions into these watersheds and long-term maintenance requirements of the PolyMet Project would cause a permanent and irreplaceable loss of cultural resources in the 1854 Ceded Territory. Impacts to the natural resources will disproportionately affect the Tribes due to their subsistence consumption of rice, fish and other wildlife within the 1854 Ceded Territory.	IR2
19537	What impact will the PolyMet Project have on the socioeconomic condition of the East Range? In order to best weigh the pros and cons, economists usually perform a cost/benefit analysis. This was not produced for the PolyMet DEIS. What was provided is an accounting of the direct effect of 448 new jobs and the indirect and induced multiplier effects on employment. The cost of increased public services and protection, adverse economic impacts during temporary shutdowns and closure and the negative impacts associated with the loss of natural resources and environmental degradation have not been addressed. “The challenge represented by metal mining is that it is a landscape-intensive activity that almost always has had a significant negative impact on the natural environment. That means that it has the potential to damage one part of the local economic base, environmental quality, while developing another, the mineral deposit. To the extent that the environmental damage could be significant and permanent while the mineral development, in contrast, is relatively temporary, significant economic policy issues are raised: Is there a net gain or loss to the local economic base as a result of developing the mineral deposit?” (Thomas M. Power, “The Economic Role of Metal Mining in Minnesota: Past, Present, and Future”, October 2007, p. 31)	SE3
19538	The existing LTVSMC tailings facility has stability concerns: there is a risk of failure along the impoundment perimeter under stress conditions. This is before any PolyMet tailings have been deposited on top of it. Structural stability of the Tailings Basin has been a serious concern. Serious analysis of the structural integrity of the latest tailings basin design has been postponed until the permitting stage. A stockpile slope assessment has not been completed. These are serious gaps given the environmental consequences of a structural failure of the tailings basin or stockpile.	GT2
19539	The NorthMet Project DEIS must be rejected due to the preponderant evidence that the Project will cause irreparable harm to the environment and is likely to become a superfund site that we taxpayers can ill afford.	G2A,G5A,G7A
19540	I have serious concerns regarding the draft EIS for the polymet mine. The draft EIS does not have the proper “frame work” in planning for the reclamation of the mine once it is closed. The long term treatment of complications is complex and could become extremely expensive. I do not want this cost passed on the Minnesotans’. The final EIS should have provisions setting aside a trust with the maximum predicted cost of the “worst case” mitigation cost.	PD3
19542	In addition to understanding groundwater movement, the final EIS needs to have a plan to constantly monitor the mining operations by the DNR. The proposed mining site/sites are too closely approximated to biologically sensitive areas. It is imprudent to leave monitoring and inspection to the mining company. The DNR needs to provide this service or have an independent entity fulfill the “policing” of the mine sites. This is a significant aspect which should be in the final EIS.	PD8
19542	The final EIS also needs to include and field sampling tests to understand how water moves through the bedrock. If this testing is not completed, it could dramatically interfere with clean-up and recovery/ mitigation. Currently in the draft EIS does not demand this testing. This is a critical piece that needs admission into the final EIS.	WR2A
19543	There are other concerns which also require routine monitoring and addressing in the final EIS. Emissions, according to the USFS, the Polymet project alone will cause an average of 36 days of haze every year, the potential disruption of wildlife corridors specifically the Canada Lynx which is a federally listed as a threatened species, and the cumulative effects of the multiple mines that will inevitably develop in the surrounding area. These additional concerns need to be addressed in the final EIS.	WI2,WI5,AQ4,AQ4B

19544	I believe that this project is not compatible with the surrounding public and private land usage.	EOO
19545	From our perspective the DEIS is inadequate to describe a project that would protect Lake Superior and its watershed from toxic and perpetual water pollution from this proposed copper-nickel mining and processing operation. A summary of our reasons follows with detailed discussion directly after.	G8
19545	Prevention of Significant Deterioration Review The Project may well be “designed” to limit “presumed” synthetic minor emissions below major source thresholds but for reasons stated in comments on Section 4.6.1.3 herein no modeling calculations have been submitted that give any surety that the Project should not be permitted as a major source for PSD. Modeling results would need to be calibrated after the fact which has proven to be the case in most if not all of the reference metallic sulfide mines in the U.S. and elsewhere. The nature of this type of mining does not allow for modeling errors without enabling significant negative environmental consequences. Vivo”, Cook et al, Feb 1982). Toxicity has been shown to depend upon a number of factors. One factor is intensity or concentration of fibers during human exposure. (Ref. “Taconite Fibers Lecture: Can Amphibole Fibers/Particles Contribute to Mesothelioma and Other Asbestos Related Diseases in Northeast Minnesota?”, Philip M. Cook, Ph. D. June 17, 2008, sponsored by MN Dept of Health) How would the level of exposure during mining and processing be determined on a regular basis with a test protocol determined by factor analysis? Stationary test monitors and corresponding analytical procedure (MDH 851 and 852) have been in use for years. The USEPA also has an “activity-based” test protocol (AHERA) for determining levels of exposure to both PM10 and PM2.5 sized fibers during normal activities in areas receiving airborne and natural pollution. Why does the DEIS not address these issues? (Ref. “U.S. EPA Asbestos Assessment for El Dorado Hills (CA), May 2005) • The “background” comments dwell on semantics of the definition of asbestos and not on the toxicity of the amphibole and asbestos-like fibers found in the vicinity of the Northmet deposit. Fragments of fibers and fibers themselves have the same properties and are equally toxic per recent studies at the USEPA Laboratory. See previous refs) So-called “MN-fibers” are defined by the MPCA as having characteristics and effects similar to “asbestos” in legal documents. These fibers include cummingtonite-grunerite and ferroactinolite. The fact that chrysotiles do not register at high levels on fiber sampling efforts in this area is not surprising since significant numbers of these fibers do not occur naturally in this mining district. Why was this document released with such selective use of scientific references describing the toxicity of these materials? This violates NEPA rules. Non-Asbestos Fibers pp 4.6-58, 59 • The DEIS avoids discussion of the most relevant studies of “asbestos-like” and asbestos fibers from air samples taken from ore from the eastern Mesabi Range (e.g. Cook et al, 1982ff) The staff at the EPA Laboratory in Duluth have conducted exhaustive studies on fiber samples of these ores and found that their toxicity is greater than that of comparable “asbestos” fibers. • MPCA classifies ferroactinolite and cummingtonite-grunerite as “asbestos” or “asbestos-like” fibers. The Control City Standard (Ref. Reserve I and US v Reserve federal cases) has not been mentioned as a potential standard for the Hoyt Lakes, Babbitt and other locations surrounding this proposed project. This federally recognized standard serves as an excellent measure of community exposure to toxic fibers. The effectiveness of BACT controls could be measured in this context. Nearly pure veins of these amphibole materials have been identified as intrusions into the Duluth complex. Why has the DEIS not addressed this potential threat to humans in the vicinity of the Polymet Northmet site? From MDH data, 85% of mesothelioma cases from as far back as 1984 were employees of Erie Mining on the same site as the proposed Project. Statements downplaying the significance of this exposure are backed by erroneous and irrelevant references in the DEIS. The public needs to understand as part of this DEIS that these fibers are a threat to their health. Per NEPA rules	AQ4,AQ4C

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19546	<p>No valid justification has been given for not treating the project as a major PSD source. BACT requirements must apply based upon experience of fiber sizes emitted from the proposed mining and processing equipment. The “top down” BACT analysis must include PM10 particles to include all toxic fibers. Improved filtration would be required in addition to the standard baghouses chosen for the Plant emission points. Proximity to residential communities is not a factor used to determine the effect of pollution from toxic substances such as fibers from amphiboles and sulfide ores. The surface material and water in all directions from the mine and plant would be permeated with fibrous material from this project. Amphiboles on the surface would at some time reach a level detectible by EPA activity-based testing and analysis. Sulfide particles would react with air and water to acidify the water in the vicinity of the project. The damage is cumulative over time especially with contributions from other mining activity in the area. PSD and cumulative effect rules must be applied in any EIS for this proposed project per NEPA rules. Tailings basin air emission control by “capillary action” and wet tailings disposal has not shown to be effective in places like Milepost 7 at Silver Bay. Fiber monitors at the F1 (Beaver Bay) location routinely register high levels of amphibole fibers in the ambient air in strong northwest winds. Dust is often visible as far away as highway 61 blowing into Lake Superior. The proposed type of emission management would not be adequate to protect the public from either short or long term exposure to toxic fibers. EPA studies identify peak exposure to toxic amphibole and asbestos-like fibers as a basic parameter affecting toxicity of ingested fibers. What is the peak exposure to PM10 and PM2.5 fibers in the sulfide, oxide and amphibole classes during high velocity winds using either fiber counts or weights? How does this correlate with the EPA toxicity studies of these fibers? These issues must be addressed in the EIS per NEPA rules.</p>	AQ4A,AQ4B,AQ4C
19546	<p>The DEIS acknowledges “an uncertain level of fibers on the project”. This would suggest a need for continuous monitoring supported by a factor analysis to determine the best placement of the monitors. Climate factors clearly affect sampling results and should be simultaneously recorded. EPA scientists have determined that so-called cleavage fragments with the same characteristics as asbestos are as harmful to the lungs as asbestos. The Crump and Berman studies did not evaluate data past 15 years longevity of workers and is irrelevant in determining the true long term effect of exposure to these fibers. NEPA requires that impacts from unknown environmental factors be closely evaluated in the EIS. The project plan does not meet that standard. Inclusion of the Cook et al U.S. EPA research on relative potencies of complex mixtures of mineral particles would help alleviate this inadequacy.</p>	AQ4C
19547	<p>The Minnesota Department of Natural Resources (DNR) stated repeatedly that this document would be finalized and released as the Draft Environmental Impact Statement (in 2008). SLSA accordingly retained me to assess the document’s compliance with federal and state law, and to help write comments for submission to the agencies. Because of the complexity of the issues and the volume of information, we all felt that it was imperative to begin this work prior to public notice of the DEIS in order to have sufficient time to review it. I do not believe it would be possible to conduct a thorough review of the DEIS for this project in 45 days; thus my first advice to the organizations is to request a longer public comment period. (Which we did and were refused without notice.)</p>	PD2
19548	<p>My understanding is that the DNR has asked PolyMet for additional information on four issues: design and safety of the tailings basin dam; the increase of sulfates in the Embarrass River and the impact on wild rice waters; the discharge of sulfates and the impact on mercury methylation; and the discharge and movement of arsenic and antimony into and through groundwater. Because the DEIS is likely to change significantly in regards to these issues, for the most part they are not included in this assessment. This should not be construed as a lack of concern about these issues, however. Based on the information available at this time, each presents risks of environmental and/or safety impacts to the extent that the project could not be legally permitted as proposed.</p>	G7A,G7B,G8

Comment ID	Comment Text	Theme Codes
19549	Moving beyond these four issues, it still appears to be the opinion of the DNR that it can put out an incomplete DEIS for public comment, and fill in the missing information in the Final EIS. This is a disservice to the public and does not comply with federal regulations. Because this is a joint federal-state EIS, the environmental review process must comply with federal law, despite the fact that a state agency has taken the lead. Under the federal regulations, The draft statement must fulfill and satisfy to the fullest extent possible the requirements established for final statements in section 102(2)(C) of the Act. If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion. 40 C.F.R. 1502.9(a). For reasons explained below, the CPDEIS (did) not come close to meeting “the requirements established for final statements.” If the first public DEIS is substantially similar to the CPDEIS on the issues identified below, we should expect that another iteration of the draft EIS will be prepared and put on public notice before agency decisions are made.	G9
19550	The only discussion of financial assurance that I found in the CPDEIS is in section 2.3.1. It states that the final scoping document determined that the EIS would “evaluate the reclamation costs and their effect on facility design, construction, and closure. Financial assurance estimates associated with corrective actions cannot be developed until the corrective action is known; therefore, discussion of the assurance costs would not be included in the EIS.” The CPDEIS (did) not include an evaluation of reclamation costs; this needs to be added to the DEIS released for public comment. Minnesota law requires that a mine operator provide financial assurance to cover contingency reclamation costs prior to receiving a permit. Minn. R. 6132.1200(4)(B). The DEIS needs to discuss not only reclamation costs, but the contingency reclamation costs that will be covered by financial assurance, and the financial assurance mechanism that will be used to meet this requirement. Unless we know that a sufficient amount of money will be available to cover closure costs when mining ceases, we cannot conclude that the planned closure activities will prevent environmental impacts.	PD4
19551	The CPDEIS (admitted) that it does not address the fact that the mine site is on land that is currently owned by and under the jurisdiction of the United States Forest Service. The CPDEIS (indicated) that the mine project is unlikely to go forward unless there is a land exchange, but it does not describe the impacts of that exchange. Instead, it indicates that a separate EIS will be prepared. This violates the federal regulations, which state: Agencies shall make sure the proposal which is the subject of an environmental impact statement is properly defined. Agencies shall use the criteria for scope (Sec. 1508.25) to determine which proposal(s) shall be the subject of a particular statement. Proposals or parts of proposals which are related to each other closely enough to be, in effect, a single course of action shall be evaluated in a single impact statement. 40 C.F.R. 1502.4(a). The criteria for scope read: To determine the scope of environmental impact statements, agencies shall consider 3 types of actions, 3 types of alternatives, and 3 types of impacts. They include: (a) Actions (other than unconnected single actions) which may be: (1) Connected actions, which means that they are closely related and therefore should be discussed in the same impact statement. Actions are connected if they: (i) Automatically trigger other actions which may require environmental impact statements. (ii) Cannot or will not proceed unless other actions are taken previously or simultaneously. (iii) Are interdependent parts of a larger action and depend on the larger action for their justification. 40 C.F.R. § 1508.25. Under these provisions, the impacts of the land exchange must be presented to decision makers and the public at the same time and in the same EIS as the other impacts of the project. When read in combination with the requirement that the draft EIS present everything that is required of the final EIS, it becomes clear that the draft EIS cannot be released until information on the land exchange is available and incorporated into the document. It would be prejudicial to the public interest to encourage public review of a draft EIS when potentially significant impacts have not been included.	PD8
19552	The (DEIS) is also inadequate because it does not assess reasonable alternatives that are likely to have less environmental impact than the mining plan as proposed. These include the underground mine alternative and the reduced production alternative. The fact that the mining company does not choose to consider these alternatives is not a legitimate reason for eliminating them from study. If there might be significantly less environmental impact from these alternatives and if the alternatives are technically feasible, they must be assessed. Eliminating an alternative simply because a permittee indicates that it would not go ahead with the project if the alternative was required would allow permittees to avoid increased costs for environmental protection at their own discretion. This would essentially nullify the Minnesota Environmental Rights Act.	PD4

Comment ID	Comment Text	Theme Codes
19552	Although this alternative is identified as one that will be studied in the EIS, I did not find any mention of it in the assessment of water quality impacts. While the section on wetland impacts states that this alternative would result in a reduction in water discharged to area wetlands and the Embarrass River, the discussion does not provide enough information by which to make a comparison to other alternatives. It appears that PolyMet is using the potential impacts on wetlands and stream flow as an excuse to avoid preparing an analysis that would allow an informed decision. The DNR should insist that this alternative be fully explored, and complete an assessment of potential impacts that could be compared with PolyMet's preferred alternative. Particularly if the drainage is treated before discharge when the current cells are drained, at first blush this appears to be an alternative that could significantly ameliorate the water quality impacts of this project.	ALT8,PD1
19554	We incorporate by reference and attachment the comments of David M. Chambers, Ph.D. of the Center for Science in Public Participation. His comments cover a number of DEIS topics including this section. In some cases his comments are aimed at improving the DEIS. In other cases the basis and assumptions of the design are described as problematic.	EOO,G8,G15
19554	Many of the potential impacts of this project are still unknown because of a lack of data. Some of these gaps in critical information are pointed out in the DEIS, and some are not. However, the DEIS does not address the cost of obtaining the information for any of these gaps. Under the federal regulations, If the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement. 40 C.F.R. 1502.22. All of the gaps in information described below are essential to a reasoned choice between the alternatives of granting permits for this mine, denying them, or requiring additional mitigation measures. Without the information, the agencies simply have no idea what the impacts will be, and thus cannot make the judgment that the benefits of the project are worth the impacts. It is thus critical to know whether "the overall costs of obtaining" the information are "exorbitant." This information is completely absent from the DEIS.	G8
19555	Stream flow, sedimentation, and water quality data (see Table 4.1-6). First, it is troubling that there is no stream flow data beyond 1964 for the Embarrass River, and beyond 1988 for the Partridge River. The lack of recent flow data calls into question the assessment of the severity of impacts to the Partridge River from mine dewatering, and the water quality modeling for the Embarrass River (which is based in part on dilution of pollutants from streamflow). Second, neither stream flow nor water quality data are available for the points of greatest impact to the streams, including Trimble Creek and Spring Mine Creek, area lakes, and the stretches of the Embarrass and Partridge Rivers closest to the mine site and tailings basin. Finally, there is no sedimentation data for the rivers in the mine area. In many forested locations, sedimentation from haul roads and stream crossings are the largest source of impact to streams, with the volume of traffic being the greatest single factor determining the degree of impact.	WR3J
<b>Sender Last Name:</b> Sternal		<b>Submission ID:</b> 3486
3760	I do not want this mine to be built. 1) It has not been proved that Polymet has the balance sheet to make good on their commitments. Polymet is a development stage company that could easily walk away from the mess it is about to create. 2) It is a marginally profitable project in competition with copper and nickel produced globally at less cost. A small fluctuation in the price of copper will result in the mine closing. 3) In the future water will be more valuable than copper. Let's forgo the environmental destruction and wait for the opportunity to profit from a renewable resource. 4) Have you seen the Anaconda pit in Butte, Mt? 5) Wisconsin law allows permitting mines if they can show a similar mine that has not polluted during ten years of operation and for ten years following closing. So far, no applicants; let's follow their lead. 6) Mines pollute, why allow it? For 400 jobs?	ALT8,EOO,PD2,PD8,G2,G4

2400 Do not consider allowing PolyMet to begin sulfide mining in our state! For all the reasons outlined below, this would be an egregious decision. The economic gains from sulfide mining won't even go to the people suffering the environmental consequences. Further, Minnesota stands to gain more economically, as well as in the precious currency of natural beauty and recreational opportunity, by preserving the integrity of Lake Superior and the BWCAW. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. G2

**Sender Last Name:**    Stiles **Submission ID:** 1162

1277 Please stop the Poly-Met mine. Water is such a valuable resource in Minnesota, why would we jeopardize it? Minnesotan's value of our natural resources and do a lot of activities outdoors. As a small business owner PolyMet needs to step up to the plate and put down assurances that they'll run a clean mine. EOO,G7B

3258 How can we transition a national forest area into an industrial complex? The noise and dust pollution plus disruption of native habitat and wildlife that has been protected for 100's of years is intollerable. Only the people of the United States should profit from such a wilderness area, not corporations seeking profits for a few individuals. The Lessard Council in 2009 voted to protect 187,000 acres of forest for all to enjoy. We need to protect these large tracts of natural habitat from industrial mining. G2C

**Sender Last Name:**    Stitt **Submission ID:** 3301

3595 Dear Sir or Madam: I am very concerned about this project. Please do not carry out this mining project – it would waste a lot of rock and likely contaminate water and kill fish and water insects without producing adequate benefits to justify the drawbacks. EOO,G2C

**Sender Last Name:**    Stone **Submission ID:** 1103

1208 The Grand Rapids Area Chamber of Commerce would like to go on record as a strong supporter of the PolyMet Mining Project. Included with this letter is a copy of a resolution of support that was passed by our Board of Directors on August 27,2007. This resolution lists the reasons for our support and confirms our commitment to the PolyMet Mining Project. Thank you for the opportunity to comment on this very important project. EOO

1377 I have been paddling in the BWCAW since I was 16. I love that region more than I can express in words, and value greatly having access to clean air, clean water, and wild spaces. I have spent more than 120 days in the wilderness since age 16 -- as a visitor, guide, Forest Service wilderness ranger and Outward Bound Instructor. Not only does this proposed mine endanger my favorite recreation, it also endangers my career. If the mine pollutes the border lakes, it will harm one of the most sustainable sources of revenue in this region. Mining may only last a few years, but if we treat this area with care, the recreation industry can use it forever. G2B,G2C,G11

1599 Both my husband and I were born and raised on the Iron Range. We have lived and worked here all of our lives and now have children and grandchildren living in the area. We visit the BWCA W regularly for recreational purposes and support a clean environment. As both a scientist and a life long local resident, I support the Polymet project in Hoyt Lakes. We need the jobs to sustain our local economy and ultimately to support our American economy by reducing the need for foreign imports. Minnesota has a strict permitting process and regulatory controls in place to protect the environment and I have confidence in that process. There is no reason to believe that we cannot combine a strong local economy with environmentally sound mining practices. Therefore I strongly support Polymet's NorthMet project. EOO,G11

3252 The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. We are very fortunate to have such a large area of fresh water. It seems extremely short sighted to put it at risk without failure proof methods for mining along with the financial guarantees that it will be the mining company who pays for the clean up and not the tax payers.

EOO

**Sender Last Name:**    Strain **Submission ID:** 2203

2611 Hello. I'm John Strain. I support the PolyMet project for the following reasons: One, for economic development, for job creation and for construction services that would be provided to build the facility. I also think it's our responsibility as U.S. citizens to supply our own natural resources, not to rely on Third World countries. I feel that the MPCA and the Minnesota Department of Natural Resources can manage this project in an environmentally sound fashion. Thank you. (Oral comment concluded.)

EOO

**Sender Last Name:**    Strebig **Submission ID:** 2204

2612 My name is Kelly Strebig. I have over 30 years experience in health and environmental research, and I'd like to just make a positive comment. This is an exceptionally good, clean mining and processing operation, and I hope it goes through as soon as possible. It's really well planned and well done from both a health and environmental standpoint. And that's the end of my statement.

G5

**Sender Last Name:**    Strom **Submission ID:** 3080

3469 I find it hard to believe that MN DNR would even let a project of this nature even get this far. They need to protect our irreplaceable natural resources and wild areas they if lost cannot be replaced.

3792 The cited EIS does not concern itself with the cultural implications of the proposed mine. Does anyone really care about the natural biotic community to be destroyed in this mine project? In our nation that loses nearly 2.2 million acres of land every year, do we not want to step back to consider what's at stake here? It's more than JOBS! In an area long noted for its boreal forests, water ways and wildlife, mining simply is not a compatible ingredient to add today. In spite of the oft-cited technology supposedly sufficient to "save" the area noted, we need to give attention to what we're destroying in the name of profits and jobs. I cannot imagine that future generations will support our decision to destroy up to 6,700 acres through mining rather than keep these northern areas free from such exploitation. Please note the following article. Thank you. R. Struck For: StarTribune January 21, 2009 Mining in NE Minnesota: Buyer Beware! A recent article in the Cook County NewsHerald, "New Technology Bringing Big Mining Dollars to the Northland" is a challenging story of huge implications, some good and a great deal that's bad. This feature follows an article in the StarTribune and a challenging follow-up article by columnist Nick Coleman on the same topic regarding the perils of "hard rock mining". The articles remind me of the old adage: If it sounds too good to be true, then it is! Why beware? As noted in the NewsHerald article, a quote directly from Range View, a publication of the Iron Range Association, "...New environmentally sound technologies are allowing the region to wring our maximum value from its existing natural resource base." This phrase may be politically correct for the mining industry but it hides the crude reality that to accomplish this task, thousands of northern forest and watershed acres will be permanently destroyed, an area of about five square miles, two of which are wetlands. The implications of acid mining drainage are staggering as a result. The Herald article did not note that The PolyMet mine would destroy, in addition to the 854 acres of wetlands, more than 1,700 acres of other vegetation, and that wetland credits mentioned can not replace this natural biotic community. Nor did the article note that this large open pit mine would probably be followed by a half-dozen or more copper mines stretching from the Ely area to Aitkin County. This tidbit was reported later in the Duluth Tribune. What Minnesotans need to know about hard rock mining is nicely captured in the flyer, "Metallic Sulfide Mining, Environmental Impacts", provided by Northeastern Minnesotans for Wilderness. This brochure cites several chilling situations which include: 1. In Canada, for every ton of copper produced, 99 tons of waste rock is discarded... the source of sulfide mining's biggest hazard: acid mine drainage. 2. In 1995, more than 300 snow geese were killed when they drank the contaminated water at the Berkley Pit, a closed copper mine in Butte, Montana. 3. Roman mine sites in Great Britain continue to generate acid drainage 2,000 years after mining ceased. 4. The US Environmental Protection Agency calls the drainage the "largest problem facing the U.S. mining industry." The numbers are astounding. More than 7,000 kilometers of streams in the eastern United States are affected by acid drainage. In the western U.S., the Forest Service estimates that between 20,000 and 50,000 mines are currently generating acid on Forest Service Land. 5. Acid mine drainage has already polluted more than 12,000 miles of rivers and streams and over 180,000 acres of lakes and impoundments in the U.S. 2 6. Neither PolyMet nor the Environmental Protection Agency has identified a single hard rock mining site that is totally safe from acid drainage.

3793	<p>7. The state of Wisconsin has a moratorium on sulfide mining. Wisconsin Act 171 requires that no mining company will be given a mining permit unless they can: A) Prove that an existing mine has operated in a sulfide ore body for 10 years without polluting the groundwater and surface waters with acid mine drainage at the tailings site or mine site, or from the release of heavy metals; and B) Prove that a mining operation that operated in a sulfide ore body and has been closed for 10 years has not polluted the ground and surface waters with acid mine drainage and other heavy metals. To date, no sulfide mining permits have been issued. The seduction of new wealth, jobs and growth of commercial enterprises emanating from the PolyMet mine, and other mines in northeastern Minnesota, is a compelling influence for many reasons. Good jobs are hard to come by and with Minnesota's \$1.2 billion revenue short fall already hitting the wage-economy of northern Minnesota, such a proposal has some positive issues going for it. Yet we need to step back and consider carefully what we're doing to our natural landscape. It's not enough to just say we need JOBS, JOBS, JOBS. There is more at stake than jobs and the shifting economic realities today. Consider for a moment: Why is it that we are willing to rush into a project that destroys so much of our northern forests and watershed areas for the sake of temporary jobs and profits? How is it that we feel we can manipulate that which gives us life and yet destroy it? How would we feel if such a mine is proposed close to the Twin Cities? Is not our life dependent on our landscape? Why do we think we can continue to destroy our natural resources, our land, water and air quality, and still live in the world as though nothing has changed? Are we content to accept this form of ecological genocide because we're not individually affected by the process or outcomes? I am not against jobs, profits or reasonable economic growth. But I am against such things if the costs are too high. If these mines come in, we stand to lose what is worth more than profits. We are putting at serious risk the very natural resources that have made Minnesota so attractive for generations, and those to come. Looking ahead, will future generations of Minnesotans inherit a landscape ravaged by mining or an intact, ecological community of great natural beauty? This is the challenge for all Minnesotans, not just those up north. ### Submitted by: Richard C. Struck 40 County Road 44 Grand Marais, MN 55604 theledge@boreal.org 218-387-2608</p>	EOO,G2,G12

258	<p>Dear Sir: Give Polymet their permits. They have met the requirements that exist on the books today. The government agencies have done their job in the EIS, and they know much more about the permit and the permitting system than any obstructionists. Polymet has followed due process and shown that they can and will conform to the laws. Polymet deserves to be given their permits. They have earned the right to mine the ore they already own. Trickle down economics will prevail. The Polymet project will create over eight hundred new jobs in construction phase, and over four hundred long term new jobs working the plants and the mine. The Polymet company will be of enormous benefit to other ancillary businesses on the iron range. The Polymet project will be a benefit to the whole state of Minnesota. The Polymet project will put people to work when unemployment is over 10% nationally, and higher on the iron range of northern Minnesota. Ignore the lies of the radical far left evnviros. Give Poltmet their permits and let them conduct invironmentally safe mining on the iron range, where the regular folks know how to do mining, safely and at a profit, employing real people from the iron range and the state of Minnesota. It will be a happy day when the hard rock miners of the iron range can go back to work at Polymet and earn a living mining metals in a safe, profitable way. Sincerely,</p>	EOO,G6

133	<p>At this hearing I also request that it contain an open-mike period for questions by the public</p>	PRO6
3179	<p>Another concern is that the DEIS does not account for unforeseen circumstances and human error. As far as I am aware only deterministic modeling was used to analyze potential pollution transport and rates, rather than stochastic modeling which would account for more extreme scenarios. In the age of global climate change we are likely to see increased weather extremes that would impact seepage and drainage throughout the project area. I would like to see more stochastic modeling done to account for such extreme weather patterns before this type of sulfide mining is deemed ?safe?.</p>	WR1E,AQ3,AQ4

3181	PolyMet says only so much acid seepage and pollution will occur, but what will happen to the surrounding groundwater, rivers and wetlands if they are wrong and the rates are higher? Minnesotans need to be aware of the risks involved. Rarely does a process extensive as this proceed without incidence or error. What if trucks hauling ore are stalled in open air during a blizzard? What if a labor strike held up operations? What if a truck broke down during a heavy rainstorm and acid runoff from the rock/ore drained to the road? What if a waste rock or tailings pile collapses? How does PolyMet plan to address pollution that lasts beyond their 65 year wastewater treatment plan? Given the history of mining operations in MN and elsewhere, there is hardly a precedent of these companies responsibly compensating the public. Rather there is a precedent of damage to natural areas and clean-up/pollution costs left to the public. The final EIS needs to address these concerns in order to present a more realistic analysis of this project to the public.	WR1E,WR3I
3639	I find many flaws in this argument, the first being that 20 years of natural resource extraction by a foreign held corporation hardly qualifies as significant and sustained economic development for Minnesotans. Along with the U.S. EPA suggestion, stronger financial assurances need to be made to the public to insure that PolyMet is held responsible for any and all clean-up and pollution costs. Given the nature of sulfide mining it seems likely that there will be groundwater pollution and wetland contamination, and the impacts of these will extend well beyond even their 65 year wastewater treatment plan. If we as Minnesotans are going to allow in foreign-held companies to extract OUR natural resources they should at least be held financially responsible for any and all impacts they cause in this extraction process. Furthermore, PolyMet should be required to build any and all processing facilities in MN, rather than shipping ore to other regions.	PD4
3640	On our farm, we were once sold a ?leak-proof liner? for a pond, and a muskrat promptly chewed a hole in the liner, rendering it useless. While I understand that PolyMet's proposed waste rock pile liners will be more durable than our little pond liner, Kuipers et. al. (2006) demonstrated that mitigation measures such as dikes, pumps, liners, etc are the most common points of failure. What assurance can PolyMet make to the public if their liners do n't prove as reliable as they now claim?	PD2,PD8
3641	During the 20 year construction period the waste rock piles will be partially uncovered and the project plans to channel runoff through dikes to be pumped to the plant for treatment. What happens if there is a massive pump failure or flood situation that overwhelms the pumps? Again, mitigation measures are one the most common points of failure outlined in the Kuipers study. The final EIS needs to include realistic analysis of the potential for pollution damage in the event of extreme weather events, unforeseen disasters, etc.	WR3A,PD11

3607	PolyMet should NOT be allows to mine in Minnesota – Period. Our land and water are precious resources to us and worth more than any monetary amount. Do not spoil our lands with your greed!	EOO,G2
<b>Sender Last Name:</b>	Sulander	<b>Submission ID:</b> 2739
3184	Minnesota should not allow any mining proposal (such as PolyMets or others) that have such serious and long term pollution problems. These are flawed proposals that do not merit approval by Minnesota. Wisconsin has already prevented such proposals from proceeding until the mining process can be fully evaluated and determined to be safe in the long run for future generations. Minnesota should at least match Wisconsin's caution, and go even further to fully evaluate the PolyMet and other such mining proposals. What Minnesota will find: the long-term damage from this type of mining is not worth the small short term gain from a few mining jobs.	EOO,G12

198 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. Public television recently ran a series about the history of our National Park, which makes it clear that there has always been tension between commercial development and the parks. I feel very strongly that the park system in Minnesota is a unique treasure whose preservation far outweighs the risk of damaging it through this and other projects. I am a business owner, and understand the need for industry, but there also needs to be some places where other priorities are more important. I understand the PolyMet proposal, and am concerned about the stability of the basin among other issues that could have a profoundly negative environmental impact. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.

EOO

**Sender Last Name:**    Sundbom **Submission ID:** 3170

3537 A project like this will be a welcome to area.It will be nice to see it happen in minnesota instead of another state. This is the next phase of minning in todays market place. If we as people of minnesota donot allow this to happen here it will happen in some other part of the US. It will be a well needed investment to the area.

EOO,G1

**Sender Last Name:**    Sundquist **Submission ID:** 1241

1390 This project should not be permitted without a state of the art water treatment plant built to last forever.

G7A

**Sender Last Name:**    Suttie **Submission ID:** 1072

499 I hope someone nas a rock solid agreement from Polymet that should there be damage as a result, the company will be held totally liable for repairing it, (if that can even be done.) - Please reconsider this craziness, it's not too late

PD4

521 I think this mine and others like it are insane being placed so close to one of the most beautiful areas in the country. I refuse to see how the BWCAW and probably Lake Superior watershed will not be damaged with the potential leaching of sulfuric acid from run-off from this mine.

WR3B,WR3D

**Sender Last Name:**    Swarts **Submission ID:** 1734

738 It the mine is to be implemented, the very least that can be done is to not cut corners when dealing with the waste. Already it will have environmental effects; the least that can be done is to mitigate those that are already known about.

GT2

1068 The impacts that the mines will have on the water of the area are unacceptable to me. I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. 2,000 years is a long time; it is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time. Not only that, but in doing so we are passing on the burden to future generations. My children and the rest of my descendants will pay the price for our greed. Such long-term care will take a long term-financial commitment, and I doubt that any company will be willing or able to pay for its continual management.

PD2,PD4

1108 In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. Other mines that claim to be environmentally friendly have had drastic impacts on the environment. It is already predicted that this one will release toxins into the water. It is unacceptable to me to continue on with a project that is predicted to have such drastic effects. After all, if the other mines claimed to be safe, and turned out not to be so, this one that predicts the pollution of the river is bound to have a drastic impact.

WR3A,FM1

2256	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. When such a project involves so many generations of Minnesotans, the very least that we can do is spend more time assessing the technology and the impact.	G10
<b>Sender Last Name:</b> Swedberg		<b>Submission ID:</b> 3229
3136	This is a horrible idea with short term gains outweighing common sense. The potential for pollution of ground water, runoff and quite possibly Lake Superior is to great for this project to have any value to the Citizens of this State. The citizens of the Iron range are a vulnerable group of Adults and this proposal seeks to take advantage of them and then quite likely abandon them with an environmental mess. Who will be responsible for the safe maintenance of mining by-products/effects when Polymet declares bankruptcy or is sold to another party? We have the chance to stop this... and that is the greater good for all concerned	EOO,PD2,PD4
<b>Sender Last Name:</b> Swinda		<b>Submission ID:</b> 10
9	Mike Swinda from Chisholm, Minnesota. Just here to support PolyMet today. I'm a firm believer, I've grown up here on the Iron Range all my life, and third generation actually of mining and mining related. And I'm a firm believer that PolyMet has all the safeguards in place to protect our environment. The majority of the people there are from the area and they wouldn't, to the best of my belief, ever allow anything that would endanger our environment because we all live, hunt, play, recreation in this area. So I just wanted to come in and show support for the project. And also state that this is also going to be a big benefit for our community as far as jobs go. And all the spinoff from this project would be a tremendous boost for our economy, both local and statewide and further out, if you will, across the U.S. Many factories that I deal with, being a company owner here on the Iron Range, would benefit from this, and also all of their employees would benefit from this. So in closing, I'm just here to show my support today for PolyMet.	EOO
<b>Sender Last Name:</b> Synnes		<b>Submission ID:</b> 2327
2785	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources. I live here and I really don't care to see PolyMet, or any other operation, destroy my home. There is simply no way to extract these minerals without damage to the environment and there is a significant risk of major damage to the waters on which I depend. I would ask that the PolyMet mine not be allowed to operate.	EOO,G2,G7
<b>Sender Last Name:</b> Szymialis		<b>Submission ID:</b> 3715
1	The cumulative effects analysis also fails to adequately address the overall cumulative impacts on the numerous ongoing and proposed projects within this region on wild rice, a significant Tribal and public resource which is already on decline throughout the 1854 ceded territory.	G9,WR5A,WI5
2	[see table included in comment document, page 66] As shown by these materials, and the attached map which includes an overlay of the map from the Copper Nickel Study on top of a map of the NorthMet mine site, the NorthMet mine site is clearly in the area identified by the Copper Nickel Study as having significant resources accessible only through an underground mine. 136 Assuming that the NorthMet DEIS assertion is true that underground mining is not currently economically feasible, it is reasonable to assume that underground mining at the NorthMet mine site will become economically viable in light of historical trends of increasing metal prices and the cost saving which will be experienced after the initial investments needed for the infrastructure to process the ore for the open pit mine are in place. Accordingly, it is reasonably foreseeable that an underground mining operation at the NorthMet mining site will be pursued and the cumulative impacts from this underground mining activity should be acknowledged and analyzed in the NorthMet DEIS.	G9

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
3	Even as these earlier environmental review documents indicate the extent to which an underground mine could be an alternative feasible technology with significant environmental benefits to the proposed open pit mine, the NorthMet DEIS now indicates that underground mining technology will not meet the purpose and need of the Project separate from economic considerations. The NorthMet DEIS must support its conclusions that an underground mine does not meet the purpose and need of the project with adequate documentation and analysis to allow the public to evaluate this alternative and the agency's conclusion that an underground mine will not meet the purpose and need of the Project.	ALT3
4	The Project requires formal Section 7 consultation because, if built, it will have tangible negative effects on designated critical habitat for the Canada lynx, including permanent destruction of designated critical habitat; destruction of suitable denning habitat <sup>38</sup> ; and habitat fragmentation that damages local and regional habitat connectivity. Formal consultation was not begun before publication of the DEIS, depriving the public of the opportunity to review and consider the information in the consultation materials.	WI1
5	Diminishment of the approaches to the corridors will diminish the value of the wildlife corridors themselves, and make it less likely that dispersing lynx can cross safely through less hospitable mined areas in the Range. The degradation of wildlife corridors and fragmentation of core lynx habitat areas conflicts with the Service's Final Lynx Recovery Outline, which emphasizes the importance of large habitat patches and the connectivity of those habitat patches, so that lynx may move between habitat patches, as they commonly do over substantial distances. <sup>51</sup> Generally speaking, for individuals in a species that must move across the landscape to find suitable denning, feeding, sheltering, or rearing habitat, the inability of individuals to disperse as they previously could can cause an influx, or crowding effect. The consequences of habitat fragmentation and the edge effect include higher mortality rates, decreased recruitment, and increased stress on surviving individuals unable to disperse as needed and in the direction desired. <sup>52</sup>	WI1
6	The DEIS does not include and fails to consider significant information showing that at least one lynx, known as "Lynx #11" or "L11," is known to have moved through the Project area. L11 was located at least once just off the southwest edge of the mine site, between Wetlegs Creek and the Partridge River, roughly one mile south of the mine site and road, and a half-mile south of the rail line. The location data was produced between February 12, 2003 (when L11 was live-captured and fitted with a radiocollar by the researchers of the Canada Lynx Project <sup>54</sup> ) and November 13, 2006 (when L11 was trapped and killed in Ontario). <sup>55</sup> The radio collar signal placed the lynx in T59N-R13W, approximately at the corner of sections 16, 17, 20, and 21.	WI1
7	In addition, a recent EPA Region 10 memorandum specifically addresses the issue of financial assurance information as related to NEPA. The memorandum states that: "a key component to determining the environmental impacts of a mine is the effectiveness of closure and reclamation activities. The amount and viability of financial assurance are critical factors in determining the effectiveness of reclamation and closure activities and, therefore, the significance of environmental impacts. This is particularly important when long-term water management and treatment will be needed." <sup>4</sup> The memorandum goes on to describe steps EPA Region 10 can take under NEPA to improve financial assurance at new and operating mines, notably indicating that financial assurance estimates for the preferred alternative should be included in the draft EISs authored by the EPA and that the EPA should adversely rate draft EISs that do not include adequate and complete financial assurance information, particularly where long-term water management is reasonably foreseeable. <sup>5</sup> In clear contradiction to these statements made by the EPA, the NorthMet DEIS claims that "[t]he amount of financial assurance associated with reclamation actions cannot be estimated until these actions are understood at a more detailed level of design", asserting that "[t]his detail is more typically available during the permitting process." <sup>6</sup> As discussed above, the EPA regularly requires environmental impact statements to include detail regarding required reclamation actions and mitigation measures needed to provide information regarding financial assurance as part of the environmental review process. The assertion made in the NorthMet DEIS that the level of detail regarding reclamation and required mitigation measures needed for financial assurance is "more typically available during the permitting process" is simply not true. <sup>7</sup> The EPA regularly requires this type of information in environmental impact statements, especially for hardrock mining operations for which long-term water treatment will be required, as is the case for the NorthMet Project.	PD4

Comment ID	Comment Text	Theme Codes
8	Moreover, the DEIS fails to account for all the confirmed lynx tracks, sightings, mortalities, and scat locations discussed in the technical document upon which the DEIS relies. An area map <sup>56</sup> is provided in a technical supporting document, ENSR's 2006 Canada Lynx Assessment Final Report, and it does show locations of confirmed lynx scats collected in the winter of 2006, but it does not show the locations of L11 and other confirmed lynx nearby, and in any case the map is not provided as it should be, in the DEIS itself.	WI1
9	The DEIS also provides incorrect, out-of-date figures for lynx mortality from lynx-vehicle collisions. The DEIS cites DelGuidice et al. 2007, which reported five confirmed roadkilled lynx in Minnesota since 2000. <sup>57</sup> Since 2007, at least one additional road-killed lynx has been found. In addition, it is critical to note that not all road-killed lynx are reported or located; there are almost certainly more road-kills of lynx happening than we find out about. <sup>58</sup> Moreover, the DEIS is silent about the two confirmed lynx-train mortalities in the Arrowhead since 2002. Accordingly, there have been at least eight detected lynx mortalities due to lynx-vehicle collisions since 2000, rather than five, and it is likely that the true number is higher than eight.	WI1
10	Additionally, the Draft EIS cumulative effects analysis fails to address the amphibole or asbestos-like mineral fibers, which have been identified as existing pollutants in the Hoyt Lakes community water supply and thus their presence must be identified and analyzed in the DEIS.	AQ4C
11	The alternatives section is the heart of an environmental impact statement. 40 C.F.R. 1502.14. Agencies must therefore rigorously explore and evaluate all reasonable alternatives. <i>Id.</i> at 1504.14(a); see also <i>Muckleshoot Indian Tribe v. U.S. Forest Service</i> , 177 F.3d 800, 812-13 (9th Cir. 1999). An agency may not define a project so narrowly that it forecloses a reasonable consideration of alternatives. <i>Fuel Safe Washington v. Federal Energy Regulatory Commission</i> , 389 F.3d 1313, 1324 (10th Cir. 2004). The alternatives analysis for an EIS requires full examination of a "no-build" alternative (meaning status quo in an undeveloped state) and examination of a spectrum of "real" options, not just those tailored to the desires of the project proposer. See <i>Fuel Safe Washington</i> , 389 F.3d at 1324 (10th Cir. 2004); <i>Custer County Action Association v. Garvey</i> , 256 F.3d 1024, 1040 (10th Cir. 1002); <i>Muckleshoot Indian Tribe</i> , 177 F.3d at 812-13. For the proposed NorthMet project, both smaller scale proposals and underground mining alternatives should have been included in the alternatives analysis.	ALT2,ALT8
11	Due to the numerous and significant violations of state water quality standards, the Endangered Species Act, and other state and federal laws and requirements, as identified and explained above, the proposed NorthMet project cannot be permitted to proceed. And due to the numerous and significant problems with the Draft EIS, as identified and explained above, a revised Draft EIS must be prepared if the agencies decide to continue consideration of the proposed NorthMet mine. Thank you for the opportunity to provide comments on the Draft EIS, and please keep me on the mailing list regarding this proposed project.	G5A,G10
12	The Draft EIS is also seriously deficient in failing to analysis the impacts of past iron ore and taconite mining in this region on sulfate levels and mercury pollution, including the resulting impacts to fish and wild rice. The very purpose of an EIS is to inform the public and the decision maker in order to insure better decisionmaking for projects that may affect the environment. These purposes cannot be fulfilled until there a detailed, objective analysis of the past and ongoing impacts of past mining in this region on sulfates and mercury, prior to considering a new wave of future mining in the region. This is especially critical due to the fact that streams in the project area and downstream are already acknowledged to be substantially impaired due to current mercury pollution. While its easy to blame mercury problems on other states and regions, it is not simply a coincidence that areas downstream from the iron range have considerably higher mercury and sulfate levels than prior to the onset of decades of mining in this region.	WR5A

Comment ID	Comment Text	Theme Codes
13	Overall, the NorthMet DEIS does not take the “hard look” required by law. Rather, much of the information provided is encyclopedic, describing ways in which the Project purports to fit within various regulatory regimes. In many areas the DEIS lacks real assessment of the environmental and health impacts resulting from the Project. Summary conclusions without any documentation supporting these conclusions are offered in place of rigorous evaluation that allows the public and regulators to weigh the true impacts of alternatives and the Project overall. As discussed, below, MCEA has identified substantial inadequacies in the DEIS. As a result of these inadequacies, it is not sufficient for the Minnesota Department of Natural Resources (“DNR”) and Army Corps of Engineers (“ACE”) to merely prepare a Final EIS. The DNR and ACE must first submit a revised Draft EIS for public review and comment. MCEA urges the DNR and the ACE to require additional evaluation of environmental effects consistent with these comments prior to publishing a final EIS for the NorthMet Project.	PRO3,PRO6
13	The Draft EIS analysis for mercury and sulfates is also deficient in failing to consider and include the related impacts that would be caused by destroying hundreds of acres of peat bogs and wetlands, which are known to sequester mercury, and which would further release mercury into the environment, streams and waterbodies.	WR4B,WR4E,WE2,WE8
14	The NorthMet DEIS indicates that under the No Action Alternative, groundwater levels and quality would remain similar to existing conditions. <sup>13</sup> However, the DEIS fails to provide accurate or reliable baseline data which can be used to determine what groundwater levels and quality would be under the no action alternative. Specifically, the DEIS fails to adequately characterize legacy leakage from the existing LTV tailings basin and associated contamination from the old LTV processing site and related Areas of Concern which have been identified as part of Minnesota’s Voluntary Investigation and Cleanup Program (“VIC”). Accordingly, the conclusions reached in the DEIS regarding environmental conditions under the no action alternative are suspect. The DEIS indicates that accurate baseline conditions have not been determined, yet bases its assessment of natural conditions related to the No Action Alternative on “relatively high concentrations of aluminum, iron, and manganese currently found downgradient of the Tailings Basin”. <sup>14</sup> The DEIS further assumes that under the No Action Alternative seepage of relatively high sulfate concentrations would continue to discharge into wetlands north of the Tailings Basin, notwithstanding the potential improvements in background environmental conditions if the contamination from tailings basin seepage were improved and the Areas of Concern cleaned up. <sup>15</sup>	ALT1
15	The DEIS describes likely aspects of the form climate change will take, regionally – warmer average temperatures, higher total rainfall, higher rates of evaporation, more frequent droughts, and fewer but more extreme rain events, etc. – but there is no analysis of how these changes would affect the assumptions in the DEIS and the long-term consequences of the Project. For example, would the higher temperatures increase rates of redox reactions in waste rock, hydrometallurgical tailings, the materials in the East Pit, and the highly reactive category 4 rock exposed in the pit walls? Would the more frequent periods of drought, reduction in ice cover in winter, warmer temperatures, and higher rates of evaporation cause water levels in the pits to drop substantially over a number of years or decades? If water levels do drop substantially, might the fewer but more intense rain events cause water levels to rise and fall, periodically exposing and re-submerging the more reactive categories 4, 3 and 2 material in the pit? Nothing we could find in the DEIS addresses questions such as these, which apply the acknowledged likely effects of climate change to the presumed functioning of the Project during and following operations and reclamation. Please address these issues directly in before the FEIS is released, and if they are already addressed, then please address them more fully.	AQ4A,AQ5

16	<p>The NorthMet DEIS failed to include in its cumulative effects analyses the current and anticipated mineral exploration in the Superior National Forest and the three other sulfide-metal mines (other than PolyMet) that are very likely to go into production in the not-too-distant future (presuming they could obtain the necessary permits). State and federal regulations require the NorthMet DEIS to analyze the cumulative potential effects of hardrock mineral exploration in the Superior National Forest, currently being considered by the U.S. Forest Service “Federal Hardrock Minerals Prospecting Permits Project”. This U.S. Forest Service project is currently in the scoping phase for an EIS to evaluate the environmental impacts from “current and anticipated future proposals” for hardrock mineral exploration in the Superior National Forest.<sup>122</sup> This Hardrock Minerals Prospecting Project will evaluate the environmental impacts from federal hardrock mineral exploration in the Superior National Forest for the following: 1) 32 current permit applications from Duluth Metals Corp., Lehmann Exploration Management Inc., Encampment Resources L.L.C., and Prime Meridian Resources Inc.; 2) future permit applications, current and future operating plans; and 3) future use and occupancy authorizations (Special Use Permits) on the SNF over the next 20 years.<sup>123</sup> An analysis of environmental impacts from these activities in an EIS by another federal agency is a clear indication that these types of activities fall within the parameters of a NEPA cumulative impacts analysis and should have been considered in the Polymet DEIS. Additionally, three other sulfide-mining companies – Duluth Metals, Franconia, and Teck Cominco – are developing hardrock mining proposals that are reasonably foreseeable and should be included in the cumulative impacts analyses. Nevertheless, the DEIS never mentions Franconia Minerals, or Teck Cominco. Duluth Metals is mentioned once, but not for purposes of analyzing Duluth Metals mine’s likely contribution to cumulative environmental effects.<sup>124</sup> The NorthMet DEIS does not explain why the Franconia, Teck Cominco, and Duluth Metals proposals are not included. Even if specific project details are not yet available, sufficient information shows that the projects are reasonably foreseeable. Plans do not have to be so far along as to “constitute actual proposals” to conclude that a project under current consideration is a “reasonably foreseeable future action.” See <i>Tex. Comm. on Natural Res. v. Van Winkle</i>, 197 F. Supp. 2d 586, 618 (N.D. Tex 2002) (remanding Corps EIS for failure to include reasonably foreseeable plans in cumulative effects</p>	PD4
17	<p>In short, these mines are engaging in development activities, and are receiving investment interest and capital influxes that are described as allowing funds for project development, such that there are more than reasonably foreseeable future actions. The development activities of these mining projects amount to much more than simply “exploratory drilling events.” An environmental effect is “reasonably foreseeable” if it is “sufficiently likely to occur that a person of ordinary prudence would take it into account in reaching a decision. <i>Mid States Coalition for Progress</i>, 345 F.3d 520, 549. Because it is reasonably foreseeable that these three mines will be built, all of their likely effects must be included and discussed in the DEIS sections discussing cumulative effects analysis.</p>	PD3
18	<p>The DEIS has failed to include the Duluth Metals, Franconia Minerals, and Teck Cominco sulfide mining projects in the cumulative effects analysis for GHG emissions and climate change effects. These omissions must be corrected in the DEIS before an FEIS is released for public comment.</p>	AQ4B
19	<p>The NorthMet DEIS should recognize the potential that underground mining could be pursued after the mineral deposits accessible through an open pit mine are exhausted and analyze the impacts from an underground mining operation at the NorthMet mine site as reasonably foreseeable. Significant mineral resources exist below those which are proposed to be accessed by the open pit mine under consideration in the NorthMet DEIS. The Minnesota Regional Copper-Nickel Study (“Copper Nickel Study”) specifically stated that “the copper-nickel mineralization in the resource zones is known to occur both near the surface and at great depths”, recognizing that “the creation of both open pit and underground mines appear to be distinct possibilities in northeastern Minnesota.”<sup>134</sup> As indicated in the map and table included, below, the Copper Nickel Study shows that the area in which Polymet is located (“Zone 5”) is within a region identified by the Copper Nickel Study as an area in which the amount and grade of the ore available through underground mining operations is significantly higher than that which would be accessible through an open pit mine.<sup>135</sup></p>	G9

20	The discussion of mitigation measures included in the NorthMet DEIS fails to meet the standards required by federal regulations. The NorthMet DEIS simply identifies a number of mitigation measures which might help address some of the environmental impacts from the proposed action, but fails to indicate if any of the mitigation measures will be required or even which of the mitigation measures are preferred. NEPA requires more. NEPA requires the NorthMet DEIS to discuss mitigation measures in sufficient detail to ensure that environmental consequences have been fairly evaluated. <i>Robertson v. Methow Valley Citizens Council</i> , 490 U.S. 332, 333 (1989). It is insufficient simply to list possibilities rather than include a reasoned discussion of the possibilities and the impact they would have. See <i>Northwest Indian Cemetery Protective Ass'n. v. Peterson</i> , 795 F.2d 688, 697 (9th Cir.1986), rev'd on other grounds, 485 U.S. 439, (1988). "CEQ regulations require that the agency discuss possible mitigation measures in defining the scope of the EIS, 40 CFR § 1508.25(b) (1987), in discussing alternatives to the proposed action, § 1502.14(f), and consequences of that action, § 1502.16(h), and in explaining its ultimate decision, § 1505.2(c)." <i>Robertson v. Methow Valley Citizens Council</i> , 490 U.S. 332, 352 (1989). "[O]mission of a reasonably complete discussion of possible mitigation measures would undermine the 'action-forcing' function of NEPA. Without such a discussion, neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects." <i>Id.</i> The bulk of mitigation measures listed in the Polymet DEIS amount to little more than suggestions of potential measures that might have some mitigating value.137	G2D
21	The failure of the NorthMet DEIS to provide information or specificity regarding the mitigation measure which could be used to ensure that the West Pit overflow will meet the Lake Superior mercury standards.138	WR4C
21	The failure of the NorthMet DEIS to provide information or specificity about the effectiveness of nanofiltration units to remove sulfates and other solutes or discussion of alternatives that might reduce sulfate concentrations in discharges closer to background (natural) levels.139	WR2G
21	The lack of accurate baseline data and use of existing contamination as natural conditions is significant as there is the distinct possibility that existing contamination at the old LTV plant site and seepage from the tailings basin is contributing to these high concentrations of metals and sulfate concentrations. However, the NorthMet DEIS fails to provide information regarding contributions from the old LTV plant site and seepage from the tailings basin to the high metal and sulfate concentrations downgradient of the tailings basin. The failure of the NorthMet DEIS to ascertain the extent to which existing contamination is contributing to these high concentrations of contaminants violates NEPA's mandate to take a hard look and establish baseline data on which the impact to the environment from the Project and different alternatives can be determine	ALT1
21	The failure of the NorthMet DEIS to provide information or specificity regarding stormwater management facilities that may be needed to manage sediment associated with stormwater runoff. The NorthMet DEIS indicates that stormwater management facilities may be needed it does not propose any in the DEIS and simply recommends that such storm water management controls be designed and installed.140	EOO
22	The concerns regarding the lack of specificity and information concerning mitigation measures discussed in the NorthMet DEIS listed above is a small sampling of mitigation measures inadequately addressed in the NorthMet DEIS. MCEA's experts identify numerous other mitigation measures included in the NorthMet DEIS which fail to include the level of specificity or information needed to allow the public to adequately weigh the environmental risks and availability of mitigation measures to address these risks associated with the Project.141 The type of broad generalizations and vague references to mitigation measures found throughout the NorthMet DEIS do not include the detail as to mitigation measures that would be undertaken, and their effectiveness as required by NEPA. <i>Neighbors of Cuddy Mountain v. U.S. Forest Service</i> , 137 F.3d 1372, 1381 (9th Cir. 1998). Without specific information regarding the available mitigation measures to address these and other environmental concerns identified in the NorthMet DEIS, MCEA is unable to properly evaluate the severity of the adverse effects associated with the NorthMet DEIS or the long-term environmental impacts anticipated from the Project. The DNR and ACOE must clearly indicate whether any of the mitigation measures identified will be adopted and how effective the mitigation measures would be if adopted, or given a reasoned explanation as to why such an estimate is not possible. <i>Id.</i>	G2D

23	<p>The approach taken by the NorthMet DEIS in regard to connected actions does not comply with state or federal regulations. Federal and state laws require that the environmental impacts of connected actions be evaluated in a single EIS. 40 C.F.R. § 1508.25(a)(1); <i>Thomas v. Peterson</i>, 753 F.2d 754, 757 (9th Cir. 1985); Minn. Rule 4410.200, subp. 4 (“connected actions . . . must be considered in total. . .”). A connected action includes any action that “cannot or will not proceed unless other actions are taken previously or simultaneously.” 40 C.F.R. § 1508.25(a)(ii). Under Minnesota Rules, connected actions include any projects where one induces the other or where one project is a “prerequisite for the other.” Minn. R. 4410.0200, subp 9b(A) and (B). The NorthMet DEIS fails to analyze the power source for the NorthMet Project and the land exchange between the Forest Service and Polymet as connected actions in violation of legal requirements under NEPA and MEPA. The NorthMet DEIS indicates that it “identifies and analyzes the potential alternatives and impacts for the Project based on the successful completion of a land exchange and elimination of National Forest lands from the Project.” The NorthMet DEIS states that “the USFS and PolyMet have been having detailed discussions exploring the feasibility for a land exchange. The USFS has identified approximately 6,700 acres of National Forest land to exchange to PolyMet for a yet to be determined non-federal land” indicating that “[o]nce the current discussions have been completed and a feasible land exchange proposal has been identified, the USFS will be initiating an Environmental Impact Statement (EIS) evaluating the proposed land exchange.”<sup>142</sup> The DNR and ACOE must include the land exchange as a connected action in the NorthMet DEIS. The failure of the DEIS to include the land exchange as a connected action is a fundamental inadequacy of the DEIS.</p>	PRO4
24	<p>Both federal and state regulations require that connected actions must be discussed together in the same environmental impact statement (“EIS”). See 40 C.F.R. § 1508.25(1), Minn. Stat. § 116D.04; Minn. R. 4410.2000, subp. 4. Two projects are considered connected actions if they are related and one project would directly induce the other; one project is a prerequisite for the other and the prerequisite project is not justified by itself; or neither project is justified by itself. The courts have defined connected actions as actions that would not take place independently of one another. <i>Native Ecosystems Council v. Dombeck</i>, 304 F.3d 886, 894 (9th Cir. 2003). The land exchange between the Forest Service and Polymet is clearly a connected action which must be evaluated in the Polymet DEIS under both NEPA and MEPA. The land exchange and the NorthMet project are related and the land exchange would not be necessary “but for” the NorthMet Project. The EPA specifically identified the failure of the DEIS to include impacts related to the potential land exchange as a ‘red flag’ issue and of considerable concern. The EPA noted that the land exchange is a connected action to the NorthMet project, indicating that discussion of the land exchange cannot be deferred to a separate EIS. (See EPA Comments, dated August 25, 2009). Notwithstanding the federal and state regulations requiring the DEIS to include the land exchange as a connected action and the EPA’s identification of this issue as recently as August 25, 2009, the DNR and ACOE issued the DEIS for public comment without including this critical information.</p>	PRO4
25	<p>The NorthMet DEIS cannot avoid the analysis of the true environmental impacts of the Project by stating that it intends to purchase power from Minnesota Power and fail to analyze the environmental impacts associated with the production of this energy as a connected action in the same environmental review document. The NorthMet DEIS indicates that electrical service would be provided for the Project by a new Minnesota Power electrical substation located on Minnesota Power property southwest of the Mine Site near the Dunka Road.<sup>146</sup> The NorthMet DEIS indicates that the Project will purchase 59.3 megawatts (MW) from one of Minnesota Power’s coal-fired power plants.<sup>147</sup> Supplying 59.3 MW of electricity to the Project requires electricity generation and the generation of electricity is a separate, connected action that has environmental effects. As indicated earlier, alternative energy sources must be considered. In any case, it is not sufficient for the NorthMet DEIS simply to identify a “power purchase” from Minnesota Power. The purchase will require Minnesota Power to generate additional electricity. The generation of electricity, whether from coal, natural gas, hydro or wind is a “connected action” with environmental effects that must be disclosed, analyzed, and if possible mitigated. The generation of this energy is a necessary and connected action to the Project that will have major environmental consequences.</p>	ALT8,PRO3

25 The land exchange is a connected action that must be addressed in this DEIS, but even if it were not a connected action, the environmental indirect and cumulative effects from the land exchange must be evaluated here. Indirect effects are those “caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.”<sup>143</sup> A cumulative impact is “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.”<sup>144</sup> The land exchange is a “reasonably foreseeable future action.” Indeed, the DEIS admits that the project hinges on a successful land exchange. <sup>145</sup> The environmental impacts of the land exchange will occur as an indirect (if not direct) effect of the NorthMet Project and must be disclosed and analyzed here. The NorthMet DEIS did not include any analysis of the environmental impacts from a land exchange between the Forest Service and Polymet. The DNR and ACOE cannot defer analyzing the direct and indirect effects or of the cumulative impacts from a land exchange to a separate EIS as proposed. Inclusion of this analysis in the NorthMet DEIS is required for the DEIS to meet federal and state adequacy standards for an EIS. A land exchange between the Forest Service and Polymet is a reasonably foreseeable future action which will unquestionably have impacts on the environment, including impacts on wildlife, vegetation, wetland destruction and mitigation, green house gas emissions, and multiple other environmental impacts. The failure to include an analysis of the cumulative impacts from the land exchange in the NorthMet DEIS prevents the public from understanding the full scope of environmental impacts associated with the NorthMet Project. Inclusion of this analysis in the NorthMet DEIS is required for the DEIS to meet federal and state adequacy standards for an EIS.

26	<p>The format of the informational meetings held by the DNR and the ACOE on December 10, 2009, in Blaine and on December 9, 2009, in Aurora did not meet the minimum requirements for public meetings required by federal and state regulations. The DNR and ACOE sponsored the meetings in Blaine and Aurora DNR “for the purpose of considering public comments on the Draft EIS”.<sup>148</sup> The DNR was required to hold an informational meeting on the NorthMet DEIS after the DEIS was completed and made available for public review and comment. Minn. R. 4410.2600, subp. 2. The ACOE was not required to hold an informational meeting under its rules or NEPA regulations. However, while NEPA did not require the agencies to hold an informational meeting on the NorthMet Project DEIS, once the ACOE decided to convene an informational meeting, it was obligated to conduct this meeting “in accordance with statutory requirements” applicable to the Army Corps of Engineers. 40 C.F.R. § 1506.6. The informational meetings held in Blaine and Aurora did not meet the statutory requirements for meetings or hearings sponsored by the ACOE. Federal regulations governing hearings and meetings conducted by the ACOE include specific requirements for the conduct of ACOE hearings. Specifically, pursuant to 33 CFR § 327.8, members of the public must be permitted to submit oral or written statements concerning the subject matter of the hearing, to call witnesses who may present oral or written statements, and to present recommendations as to an appropriate decision. 33 CFR § 327.8. While the meetings in Blaine and Aurora were billed as an “informational meeting” rather than a “hearing”, the involvement of the ACOE and controlling regulations required that the meeting be conducted in a manner to ensure a fair and unbiased presentation of information or to ensure that competing points of view were allowed to be expressed in a fair and equitable manner. The fundamental concept of due process and responsibility of government agencies to the public requires nothing less. As indicated in the attached declaration of Matthew Norton, the format of the informational meetings regarding the NorthMet DEIS failed to provide the public an opportunity to consider or discuss the environmental impacts of the Project in an open and unbiased manner.<sup>149</sup> While the meeting was ostensibly structured to provide the public with an opportunity to obtain a fair and unbiased assessment of the risks and benefits of the Project, the decision by the DNR and ACOE to allow policy-makers and elected officials to speak and provide their endorsement of the Project while denying other members of the public to express their concerns or disagreement with the positions voiced by policy-makers and elected officials resulted in a one-sided presentation which was weighted in favor of the Project. Rather than an even-handed, unbiased and accurate portrayal of the project, members of the public were provided, from the politicians, with personal endorsements and at times inaccurate representations of the project. There was no equal time provided to speakers who might have expressed different points of view about the project. Conducting the event in such a fashion violated the obligations of both the DNR and ACOE to ensure that the environmental review process for the NorthMet Project met fundamental standards of due process and public participation to which agency sponsored meetings should be held.</p>	PRO6

27	<p>Closely related to NEPA’s mandate that agencies take a “hard look” at environmental impacts is NEPA’s prohibition against agency reliance upon conclusions or assumptions that are not supported by scientific or objective data. NEPA’s implementing regulations require agencies to: [I]nsure the professional integrity, including scientific integrity of the discussions and analysis in environmental impact statements. [Agencies] shall identify any methodologies used and shall make explicit reference by footnote to the scientific and other sources relied upon for conclusions in the statement. 40 CFR § 1502.24 (Methodology and Scientific Accuracy). “Unsubstantiated determinations or claims lacking in specificity can be fatal for an [environmental study] .... Such documents must not only reflect the agency’s thoughtful and probing reflection of the possible impacts associated with the proposed project, but also provide the reviewing court with the necessary factual specificity to conduct its review.” Committee to Preserve Boomer Lake Park v. Dept. of Transportation, 4 F.3d 1543, 1553 (10th Cir. 1993). The CEQ regulations require that: “NEPA procedures must ensure that environmental information is available to public officials and citizens before decisions are made and before actions are taken.” 40 CFR § 1500.1(b). To ensure information is available to citizens before decisions are made and before actions are taken, underlying environmental data from which the agency drew its conclusions must be provided in the DEIS. 40 CFR § 1502.24. Courts have held that NEPA requires that the public receive underlying environmental data from which an agency expert derived her opinion (citing for authority 40 CFR § 1502.24). Idaho Sporting Congress, 137 F.3d 1146, 1150 (9th Cir. 1998). See also Siskiyou Regional Education Project v. Rose, 87 F.Supp.2d 1074 (D.Or. 1999) (holding an environmental assessment inadequate for lack of scientific support). Further, 40 CFR § 1502.1 mandates that NEPA documents be “supported by evidence that the agency has made the necessary environmental analysis.” Consequently, the DNR and ACOE have a duty to disclose the underlying scientific data and rationale supporting the conclusions and assumptions in the FEIS. Unsupported conclusions and assumptions in the NorthMet DEIS violate NEPA. Public availability to the underlying information on which DEIS conclusions are based is the key to fulfilling NEPA requirements. Massachusetts v. Watt, 716 F.2d 946, 951 (1st Cir. 1983) (“[U]nless a document has been publicly circulated and available for public comment, it does not satisfy NEPA’s EIS requirements.”); Dubois at 1287 (“Because of the importance of NEPA’s procedural and informational aspects, if the agency fails to properly circulate the required issues for review by interested parties, then the EIS is insufficient even if the agency’s actual decision was informed and well-reasoned.”). Each of MCEA’s experts identifies specific concerns regarding the lack of underlying documentation supporting key conclusions reached in the DEIS. The failure of the NorthMet DEIS to include the information on which the DEIS conclusions were based is a direct violation of NEPA.150 The DNR and ACOE must provide the information identified by MCEA’s experts to the public and allow the public an opportunity to evaluate this information and comment on it prior to the release of a Final Environmental Impact Statement (“FEIS”).</p>	PRO2,PRO3
28	<p>The DEIS recognizes that potential improvements in environmental conditions could result from the No Action Alternative. However, notwithstanding this recognition, the NorthMet DEIS continues to reference “baseline conditions” which include contamination from the old LTV site and violations of NPDES permits as its basis for the assessment of environmental conditions under the No Action Alternative. The NorthMet DEIS must include information regarding the extent of environmental improvements associated with remediation of the Areas of Concern and reissuance of the NPDES permits in its assessment of environmental conditions under the No Action Alternative. The NorthMet DEIS should provide this information to allow the public to have an accurate understanding of the environmental benefits associated with the No Action Alternative.</p>	ALT1
28	<p>A number of Areas of Concern which are part of Minnesota’s Voluntary Investigation and Cleanup Program (“VIC”) are still outstanding at the old LTV plant site and tailings basin. In addition, ongoing violations of the NPDES permits have been identified through daily monitoring reports provided by Cliffs Eerie to the Minnesota Pollution Control Agency. Under a “no action” scenario, clean-up of Areas of Concern and NPDES permit enforcement would likely improve water quality conditions in and around the site. Therefore, the “baseline” conditions which have been used in the NorthMet DEIS do not accurately reflect baseline conditions under the no action alternative. Federal regulations require the Minnesota Pollution Control Agency to ensure that corrective actions are taken by the permit holder to address these ongoing NPDES violations. The NorthMet DEIS indicates that these corrective actions could reduce sulfate loadings of impacted waters yet still bases its assessment of baseline conditions used for the No Action Alternative on the existing contamination.16</p>	ALT1

Comment ID	Comment Text	Theme Codes
29	The NorthMet DEIS did not adequately consider an underground mining alternative or provide adequate justification for eliminating this alternative from consideration. An underground mine could be a feasible and prudent alternative with a significant environmental benefit to the proposed open pit mine. While the NorthMet DEIS indicates that an underground mine would not meet the purpose and need of the Project, the DEIS provides no justification for this separate from economic considerations.17 The NorthMet DEIS fails to explain why an underground mine cannot meet the stated purpose of the mine, “to produce base and precious metal, precipitates, and flotation concentrates from ore mined at the NorthMet deposit by uninterrupted operation of the former LTVSMC processing plant site.”18 Earlier drafts of the NorthMet DEIS recognized that underground mining technology could meet the purpose and need of the project, was technically feasible, was an available technology, and could possibly offer significant environmental or socioeconomic benefits when compared to the proposed project.19 Additionally, the Response to Public Scoping Comments recognizes that underground mining technology could offer environmental benefits to using the proposed open pit mining technology to mine the ore deposit.20 Likewise, the NorthMet Mine and Ore Processing Facilities Project Final Scoping Decision (“Final Scoping Decision”) recognizes that environmental benefits may be associated with a smaller footprint from an underground mine.21	ALT3
30	While the underground mining alternative was ostensibly rejected due to the additional cost associated with it, the environmental impact of an underground mine involves a smaller environmental footprint than an open pit mine. Considering the anticipated amount of financial assurance which would be required to address the larger-scale environmental footprint of an open pit mine, the additional costs of an underground mine could be offset by the smaller environmental footprint of the mine and likely smaller financial assurance requirement for this type of mine. The NorthMet DEIS fails to rigorously explore and objectively evaluate an underground mine as a viable alternative or to justify its exclusion from consideration as an alternative as required by NEPA.22	ALT3
31	The NorthMet DEIS also fails to consider alternatives for electricity consumption which would significantly affect the project’s impact on the environment. Consideration of alternative energy sources should be a major component of the EIS given the enormous variation in environmental impacts between different sources. See, e.g., U.S. Department of Energy, Carbon Dioxide Emissions from the Generation of Electric Power in the United States ( <a href="http://www.eia.doe.gov/cneaf/electricity/page/co2_report/co2report.html#electric">http://www.eia.doe.gov/cneaf/electricity/page/co2_report/co2report.html#electric</a> ). The environmental consequences of generating power for the Project, along with an evaluation of alternative energy sources, must be evaluated in the EIS. See additional discussion of this issue, <i>Infra</i> , pp. 52-56.	ALT8
32	While there is some uncertainty regarding the impacts from increased sulfate loading on methylmercury rates, the NorthMet DEIS also underrates current scientific understanding of mercury biogeochemistry and the environmental factors controlling methylation rates.26	EOO,FM1
33	The NorthMet DEIS indicates that the West Pit overflow might not meet the Lake Superior mercury standard.29 The potential exceedance of the Lake Superior mercury standard by the West Pit overflow must be more fully discussed in the NorthMet DEIS, including a clear identification of mitigation methods which can be used to ensure that the West Pit overflow complies with the Lake Superior mercury standard. The NorthMet DEIS may not simply put off consideration of an identified and necessary mitigation measure until some point in the future. The NorthMet DEIS must clearly discuss potential issues in water quality associated with the West Pit overflow and measures which can be taken to prevent these water quality violations.	WR3I,WR4C
34	The NorthMet DEIS fails to include a comprehensive reclamation plan or financial assurance information regarding the cost associated with closure of the Project. The failure of the NorthMet DEIS to include specific information regarding reclamation plans and the associated financial assurance which will be required to ensure that the reclamation will be completed is a fundamental inadequacy of the DEIS. By failing to include this information in the DEIS, the public is not able to assess the true environmental risks associated with the Project. The inclusion of information regarding financial assurance is critical to allow the public to fully understand and assess the effectiveness of reclamation and closure activities which serve to inform the public about the potential long-term environmental impacts of the mine and the potential risk to the public in the event the public has to assume responsibility for the cost of the reclamation.	PD12,G9
35	MCEA shares the concerns articulated by the tribal agencies regarding the impact from increased sulfate levels on wild rice stands	WR4F

Comment ID	Comment Text	Theme Codes
36	Assessments conducted by the Minnesota Pollution Control Agency in the late 1990's suggest that the Biwabik Iron Formation could be a sole-source aquifer. <sup>30</sup> These MPCA studies recognize the impact mining activity and mine pits can have on ground-water recharge and water quality of aquifers used for public water supplies. The MPCA specifically identified nonferrous minerals mining as a potential risk to groundwater and single source aquifer water quality. <sup>31</sup> The DEIS must identify and discuss the potential that the Biwabik Iron Formation could be a sole-source aquifer and the impacts from the NorthMet Project on water quality in this aquifer and related impacts on public water supplies	WR2A
37	The DEIS inadequately characterizes wetlands in the Project area. As a result, the DEIS also inadequately characterizes the environmental impacts from the proposed Project. With the actual types and numbers of wetland acres cast into doubt and the connectivity of these wetlands to groundwater, the selection and discussion of wetland mitigation sites, total acre, and options is left without basis in scientific fact and reasoned basis, and must be redone after proper wetland typing is conducted. <sup>33</sup>	WE1,WE2
37	In addition, the NorthMet DEIS should provide the public with information regarding special protections under federal law for sole source aquifers due to the significance of these water sources as sole or principal drinking water sources for an area. <sup>32</sup>	WR2A
38	The DEIS' wetland classification was, "based on a generalized, largely physiognomic scheme that was not effective for characterizing wetlands...." <sup>34</sup> To the extent that vegetative species data was collected from the mine site wetlands, much of it indicated serious conflicts between that botanical data (in which one can generally have a fairly high degree of confidence) and the wetland classifications that the DEIS assigned to those wetlands. <sup>35,36</sup> It is not possible to rely upon wetland replacement ratios that are based on the reported wetland classifications, because in light of the very strong conflicting information about the wetlands, the classifications lack a rational scientific basis. Due to the aforementioned flaws in the wetland classification, the DEIS does not contain sufficient information to allow the reviewer to determine whether the suggested wetland banking projects identified in the DEIS, are proper sites capable of mitigating for all wetland losses.	WE1,WE3
39	The revised DEIS must include a more careful field assessment so that a revised wetland classification of the Project area is based on sound scientific data. The classification should be reviewed carefully to ensure that classifications do not conflict with species data. The mitigation plan must also be revised to include a re-worked analysis of wetland acres and types necessary to provide proper mitigation. MCEA suggests that careful consideration be given to restoration of the Alborn fen-bog complex. <sup>37</sup>	WE1,WE3
40	The DEIS requires substantial improvement in several important areas, including: more complete lynx location data	WI1
41	The DEIS requires substantial improvement in several important areas, including: disclosure of low snowshoe hare numbers wher the ENSR 2006 winter survey was conducted	WI1
42	The DEIS requires substantial improvement in several important areas, including: failure to discuss the need for and proposed content of a habit conservation plan, in the even a federal-private land exchange convers the mine site to private ownership	WI1
43	The EPA's National Hardrock Mining Framework (hereinafter, "Hardrock Mining Framework") indicates that: "EPA should evaluate the adequacy of EISs for mining operations in predicting the long-term environmental impacts of mining operations. Assessment of financial assurance mechanisms that will be utilized to provide funding of required long term environmental management systems is critical to this analysis." <sup>1</sup> Including financial assurance information in an Environmental Impact Statement is becoming standard practice, especially for mining operations which are reasonably anticipated to require long-term water treatment. (See attached letters from EPA, Region 92, and Region 103, concerning mining operations in which the EPA sought financial assurance information as part of the environmental review process.)	PD3
44	The DEIS requires substantial improvement in several important areas, including: failure to include all current and reasonably foreseeable future projects in the required catalogue and analysis of cumulative impacts	WI5

|----|--|-----|
| 44 | A portion of the destroyed habitat, mainly representing the area covered by stockpiles of overburden and low-grade ore, will be destroyed and unavailable to lynx for a period of time lasting at least several decades. Roughly a decade after the mine closes and reclamation has been completed, the stockpiles may by then have become partially revegetated. Still, that partially-restored habitat will never regain the same quality it possesses now. Thus, the stockpile areas will be temporarily destroyed and permanently adversely modified by the Project. <sup>39</sup> The remainder of the destroyed suitable lynx habitat and designated critical habitat, mainly representing fenced areas, steep-sided and/or flooded mine pits, will be destroyed as lynx habitat, completely and permanently. <sup>40</sup>  | WI1 |
| 45 | Destruction and degradation of suitable lynx habitat (especially designated lynx critical habitat) causes habitat fragmentation. Habitat fragmentation has been called “the most serious threat to biological diversity,” and “the primary cause of the present extinction crisis.” <sup>41</sup> Fragmentation has other serious implications for lynx conservation, including <sup>42</sup> : (1) reduction of area and patch size of late-successional forest and of optimal snowshoe hare habitat; (2) creation of openings that facilitate access by potentially competing carnivores <sup>43</sup> like coyotes, which have been found near the Project area <sup>44</sup> and possibly bobcats; (3) increased densities of edges between early successional and other forest types; and (4) changes in the amounts and structural complexity of seral forest stands within landscapes. In addition: Although landscape-level studies have not determined how fragmentation affects lynx ecology and population persistence (Koehler and Aubry 1994), rare species associated with wilderness, such as the lynx, generally are considered most susceptible to fragmentation (Bright 1993). Likewise, habitat specialists with large individual spatial needs, including the lynx (Quinn and Parker 1987; O’Donoghue et al. 1998), are likely to be impacted by habitat fragmentation (Andr n 1994). This is so because generalist predators tend to dominate the predator guild in fragmented landscapes (Oehler and Litvaitis 1996). <sup>45</sup> In short, habitat loss in one location also has significant effects that extend to immediately adjacent and local surrounding habitat areas. | WI1 |
| 46 | In addition, the habitat loss and adverse modification resulting from the proposed Project would contribute to lynx critical habitat fragmentation on a regional scale. The Project would impair two of the rare remaining wildlife corridors through the 115 mile-long Mesabi Iron Range. <sup>46</sup> Wildlife corridors 11 and 12 (Barr denotes them as 16 and 17) are two of just 13 (18) wildlife corridors that connect suitable habitat to the north of the Iron Range with suitable habitat to the south of the Iron Range. Absent the few remaining wildlife corridors, the Iron Range would block direct travel between the northwestern third and the southeastern third of designated lynx critical habitat.  | WI5 |
| 47 | If and when the mine is established, the fenced mine pits and overburden stockpiles will eliminate some habitat permanently, narrowing the funnel leading to the corridors, and thereby making it less likely that lynx attempting to travel to the north or northwest would encounter the corridors.  | WI1 |
| 48 | During the life of the mine and for some time thereafter, the activity at the tailings pile and tailings basins (not to mention the possibility of tailings basin expansions to the east), will diminish the funnel of habitat approaching the corridors from the north and west.  | WI5 |
| 49 | The Project will leave large, wide-open, and for a long time unvegetated, expanses of tailings piles and settling ponds, steep rock stockpiles that are miles long. “[L]arge openings (greater than 100 m across) may create barriers to lynx movement and travel corridors are needed for cover for lynx.” <sup>4</sup>   | WI5 |
| 49 | Habitat fragmentation by loss of corridors also tends to facilitate competition by generalist predators, <sup>50</sup> including bobcats.  | WI1 |

1	Hydrological data at the mine site. The model of impacts to the Partridge River and adjacent wetlands is based on inadequate data. According to the EIS, ten single-well tests were done in the surficial aquifer at the mine site, which covers several square miles. The scarcity and quality of data are such that the assessment of impacts to the Partridge River and adjacent wetlands is virtually meaningless. Without this data, a determination of the potential acreage of impacted wetlands is impossible, as is a determination of the potential drawdown of the Partridge River. As the CPEIS concludes, “the potential for widespread drawdown of the water table within the surficial and wetlands deposits cannot be evaluated from the available study.” Monitoring wetlands and stream flow after the mine is built is not an alternative to collecting the data for the draft EIS. The whole point of the environmental review process is to reveal these impacts before decisions are made to permit the project.	WR1E
1	Bob Tammen, Soudan, Minnesota. I'd like to comment that the process should not have been changed for this meeting. In previous hearings we've had the opportunity to address the issues in public so we could hear what both supporters and opponents of the project have to say. It's good information for us to have, whether people support it or oppose it. And the format they have here tonight, nobody hears my comments here, I don't have the opportunity to hear anybody else's comments, and it's like having a trial where the prosecutor and defense don't get to hear the trial. And so I'd request that we have additional hearings on this issue, that they be held at least in Duluth and Rochester so other parts of the state can have input and that they can hear what the issues are. Thank you.	PRO6
2	Predicted mine inflow rates are provided as single-value numbers. As discussed above, there is not enough data to make these predictions with any level of certainty. This section should provide information on the degree of certainty in these predictions, which should then be carried over into the discussions of decreased stream flow and groundwater drawdown. While the agencies are not required to include a “worst case analysis” in the EIS, they are required to explain the degree of certainty of their predictions. To the extent that the predictions are uncertain, the EIS must provide more information on the consequences if the drawdown proves to be greater than predicted.	WR1E
3	All of the water quality analyses need to include aluminum. In some of the water quality modeling, aluminum was not modeled because it is already present above water quality standards. Yet it appears likely that the sources in question will increase the aluminum concentration in ground and surface water. The fact that background water quality already exceeds standards does not mean that an increase is not a significant impact. Just the opposite; once standards are exceeded, any additional amount is problematic.	WR3I
4	All of these impacts will cumulatively affect the Partridge River. In addition to be more forthcoming about each of the impacts individually, the DEIS needs to describe the cumulative impact.	WR5A
5	Lack of indirect wetland impact assessment, including delineation of wetlands in the Embarrass River watershed.	WE1,WE2

6	<p>The cumulative impact analysis of wetland impacts for the NorthMet project is fatally flawed. It is inappropriate to limit the analysis of cumulative wetland impacts to the Partridge River. GLIFWC staff reiterate that wetland impacts related to regional mining operations throughout the area as well as large wetland impacts of the proposed PolyMet project to the Embarrass River watershed must be included. In addition, the analysis must include impacts related to changes in wetland functional values, only impacts related to direct fill. At a local scale, PolyMet is likely to impact wetlands in the Embarrass River watershed as water that percolates through the bottom of the tailings facility enters that shallow aquifer. This water, which is likely to have degraded quality, will re-emerge at the surface within wetlands of the Embarrass River watershed. The high chemical load of this water will affect wetlands by degrading water quality and altering the wetland functional values. In addition, PolyMet air emissions may deposit contaminants in the watershed of the Embarrass River and further degrade wetland quality. The full extent of wetland impact resulting from 20 years of emissions from the proposed PolyMet project via air and water must be quantitatively characterized. This quantitative analysis should be done using model output (air, surface and groundwater). A quantitative assessment of changes to functional values should include an analysis of the effects of 20 years of surface and groundwater emissions along with the additive effects of air emissions for Embarrass River Wetlands. Finally, the PolyMet project as proposed includes a possibility of post-closure contamination of surface and groundwater. The wetland cumulative impact analysis must include a quantitative analysis of the long-term effects of mine effluent on wetlands of the Embarrass River. If mine related effluent is to be perpetual, this section must discuss the effects of perpetual mine discharge on wetlands. In regards to the Partridge River watershed, the analysis correctly focuses on 3 timeframes of analysis; Pre Settlement Resources, Existing Resources, and Future Resources. However, the cumulative impact discussion includes only wetland loss due to direct fill. There is no attempt in the document to assess cumulative impacts that result in changes to functional values. The issue of changes to wetland functional value has been highlighted to the Army Corps of Engineers (ACE) and the Minnesota Department of Natural Resources (MDNR) during technical meetings. The DEIS should provide a quantitative analysis of the cumulative changes in wetland functional values for the Partridge River. This analysis must include the functional value changes related to maintenance of features of the closed mine (e.g. changes in water quality of mine site wetlands, changes in water flow through mine site wetlands, etc.). At a regional scale, Iron Range taconite mining has impacted wetlands through direct wetland fill as well as indirect impacts due to air deposition of mine related contaminants, water quality degradation, and the flooding/de-watering of wetlands which lead to changes in wetland functional values. There are two additional geographic scales at which wetland cumulative impacts should be characterized: St. Louis River Watershed. The Fond du Lac band of Lake Superior Chippewa has identified this watershed as an area of concern. The cumulative impact analysis should quantitatively characterize the following: 1. The additive effect of PolyMet related air and water emissions to the Partridge and Embarrass River watershed wetlands and their impact on water quality of the St. Louis River. 2. The loss of wetlands and changes in wetland functional values in the St. Louis River watershed during the 3 timeframes, including a characterization of the potential for future mining impacts and the long-term maintenance requirements of the PolyMet mine as currently proposed. 1854 Ced</p>	WE1,WE5
7	<p>Lack of identified wetland mitigation for the amount of wetland impacts that are identified.</p>	WE3
8	<p>GLIFWC staff reiterate that the impacts to these wetland acres is significant. In addition, 475 acres of required mitigation has not been addressed. Finally, the DEIS should also indicate that this would be the largest wetland fill ever permitted by the St. Paul District of the Corps of Engineers.</p>	WE3
9	<p>The DEIS states that there is no current documented tribal use of resources in the area of the proposed project. GLIFWC staff stress that most band members do not report their harvest sites and therefore it is not surprising that no records are available. The DEIS should not assume that no tribal natural resource use has/is occurring. Army Corps consultation with potentially affected tribes had not been completed at the time of publication of this DEIS. Therefore, historic and current Tribal harvest has not been determined for either the Plant or Mine Sites.</p>	CR2

10	Mercury transport modeling. In several situations, mercury seems to have been deliberately left out of modeling and analysis presented in the (DEIS). Since all of the water bodies in the mining area are either known to be or can be assumed to be above the water quality standard for mercury, this is a curious omission. As an example, the discussion of water quality impacts on the Partridge River omits mercury because “predicted concentrations for mercury were not available for the liner leakage of the stockpiles (RS53/RS42, SRK, 2007a) and groundwater recharge from the East Pit and West Pit (RS31, SRK, 2007b).” These predictions “were not available” because PolyMet has not done them, despite doing equivalent work for a number of other constituents that are far less likely to result in violations of water quality standards. It is incumbent upon the DNR to demand that this work be done so that it can be included in the EIS. The failure of the DEIS to address mercury release and transport is discussed further below.	WR4A
11	Wetland delineation and field data. The impacts of mine dewatering are likely to extend to wetlands far beyond those that have been delineated and described in the (DEIS) and the wetlands permit application. The lack of information on the hydrology of the mine site cannot become an excuse for failing to identify the full extent of potential impacts on wetlands. All of the wetlands that may be impacted must be delineated and field surveyed.	WE1
12	The (DEIS) is very unclear about discharges to surface water. In the first of many disingenuous statements, the text reads, The NorthMet Project proposes a wastewater management strategy that would eliminate the need for a surface discharge of process wastewater, including mine pit dewatering, to surface waters of the state from either the Mine or Plant Sites. At the Mine Site, leachate from stockpiles and ‘contact’ storm water (i.e., storm water that has contacted the stockpiles) from disturbed surfaces would be collected and treated in a wastewater treatment system prior to being transferred to the tailings basin, where it would be stored for reuse in the processing plant. There would be no discharge from the facility with the exception of seepage to ground water from the tailings basin. This statement is misleading because the seepage to groundwater from the tailings basin will surface in wetlands and the Embarrass River. While it may be technically true that there will be no “surface discharge . . . to surface water” that does not mean that there will be no discharge to surface water. And yet that is exactly the impression that the above paragraph gives. The mining company and its supporters are already flagrantly misrepresenting the situation in the local press and to elected officials. It is incumbent on this EIS not to contribute to that campaign of misinformation.	EOO
13	The question of whether a NPDES permit is needed for the wastewater discharge through seeps is a question for the discharge permit proceeding. However, I think it is worth noting here that EPA and most federal courts require a NPDES permit where it is clear that a discharge to dry land or to groundwater is contributing pollutants to nearby surface water. The EPA has stated that “the Agency interprets the Clean Water Act to apply to discharges of pollutants from a point source via ground water that has a direct hydrologic connection to surface water.” 66 FR 2960, 3015. Most federal courts that have addressed the issue have agreed with this interpretation. Following an extensive review of the case law, one court concluded, “The logic of these cases is compelling: since the goal of the CWA is to protect the quality of surface waters, any pollutant which enters such waters, whether directly or through groundwater, is subject to regulation by NPDES permit.” <i>Washington Wilderness Coalition v. Hecla Min. Co.</i> , 870 F.Supp. 983, 990 (E.D. Wash. 1994). This conclusion is particularly compelling here, where discharges to the Embarrass River and its tributary streams and wetlands through groundwater seeps have been treated as surface water discharges for decades. There is no rational reason to treat seeps that reach ground level at a point that is covered by water differently than seeps that reach ground level in a dry area. PolyMet appears to be seeking to take advantage of what it sees as a loophole in permitting requirements, and this attempt must not be accepted by the permitting agencies. The paragraph quoted above is also untrue in that PolyMet plans to discharge mine pit overflow to surface water (the Partridge River) after the mine closes. It is incredible that because this discharge will not be happening within the current NPDES permitting cycle, the discussion of necessary permits treats it as if it does not exist. Once again, the public is led to believe that the mine will not discharge pollutants to surface waters, and this is completely untrue.	WR3I

14	(It is noted that) pursuant to the federal Endangered Species Act, the Army Corps of Engineers is required to consult with the Fish and Wildlife Service prior to issuing a 404 permit. The CEQ regulations state, To the fullest extent possible, agencies shall prepare draft environmental impact statements concurrently with and integrated with environmental impact analyses and related surveys and studies required by the Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.), the National Historic Preservation Act of 1966 (16 U.S.C. 470 et seq.), the Endangered Species Act of 1973 (16 U.S.C. 1531 et seq.), and other environmental review laws and executive orders. 40 C.F.R. § 1502.25(a). According to the statute itself, Prior to making any detailed statement, the responsible Federal official shall consult with and obtain the comments of any Federal agency which has jurisdiction by law or special expertise with respect to any environmental impact involved. 42 U.S.C. § 4332. As noted above, the draft EIS “must fulfill and satisfy to the fullest extent possible the requirements established for final statements.” Thus the draft EIS must include the comments and opinions of the Fish and Wildlife Service regarding impacts on lynx and lynx habitat.	WI1,PRO3
15	One of the greatest concerns surrounding the NorthMet project is the number of operations and activities that will need to continue for decades or centuries after the mine closes. When the avoidance of significant environmental impacts is dependent on closure activities extending indefinitely into the future, the EIS should say so, and explain the risks. To the extent that these operations and activities are described in the EIS, very rarely is a timeframe mentioned. We cannot tell from the EIS if a particular water treatment activity is likely to be needed for five years after mine closure, or for five thousand. At the very least, the EIS should identify the longest time frame that the activity might need to continue. This information is critical to evaluating environmental risks. Any activity that may be needed for years after mine closure presents significant risks that failures of the financial or regulatory systems will lead to a failure of the closure or mitigation activity. The longer the activity might need to continue, the greater the risk. In addition to a discussion of the potential length of time these activities might need to continue, the EIS should include a description of the potential impacts if the operation or activity ends prematurely. This is not a complete list, but some of these activities include monitoring and upkeep of wetland treatment systems; monitoring and upkeep of fencing around the pit lake; restricting tree growth on the top of bench areas in the waste rock stockpiles; pumping and piping drainage from stockpiles and the tailings basin; operation of the wastewater treatment facility; monitoring (and potentially treating) discharge to the Partridge River; pumping of water from Colby Lake to the tailings basin pond; monitoring and pumping drainage from the hydrometallurgical residue cells; and maintenance of the pit wall cover.	ALT8,WR1A
16	Liner integrity has not been established with any degree of confidence. Dr. David Blowes, Canada, UMD Geology Department lecture circa 2005, provided evidence that waste rock liners and acid mine drainage barriers inevitably fail. Considering the implications of toxic drainage from liner cracks into ground and surface water, the DEIS should include an in-depth study of liner designs and failures, especially from his research and development work in Canada. Per NEPA this evidence and information is available and cannot be ignored. Probable causes of liner failure are compressive and shear stresses combined with stress risers and aging of liner materials. These stresses could well exceed the limits of the liner material and must be reviewed as part of the DEIS in terms of safety factors. Potential seismic events during and after the full waste rock pile loading are also a factor in this type of risk analysis.	PD2,PD9,GT1

Comment ID	Comment Text	Theme Codes
17	<p>The (DEIS) states that impacts to groundwater will be assessed at the property boundary or the nearest discharge to surface water, whichever is closer. This is poor policy (as it assumes that groundwater under the site will be sacrificed to mining contamination) and does not comply with state law. Under Minnesota law, “waters of the state” include groundwater. Minn. Stat. § 103G.005(17). Minnesota law protects the quality of all groundwater, regardless of location. See Minn. R. 7060.0300(6) (“‘ Underground water’ means the water contained below the surface of the earth in the saturated zone, including, without limitation, all waters . . .” (emphasis added)). Groundwater is thus a public rather than a private resource. As such, impacts to that resource must be revealed to the public and considered in agency decision making regardless of where the groundwater is located. An impact to groundwater below the project property is an impact to resources of the state. Minnesota regulations provide that the highest and best use for all groundwater is as potable water. Minn. R. 7060.0400. Regulations forbid the deposit of waste “in such place, manner, or quantity that the effluent, or residue therefrom, upon reaching the water table, may actually or potentially preclude or limit the use of the underground waters as a potable water supply, nor shall any such discharge or deposit be allowed which may pollute the underground waters.” Minn. R. 7060.0600(2). The prohibition on discharges of pollutants to groundwater is not meant only to ensure that water quality standards are met, but rather “to preserve high quality waters.” Id. I am not aware of any law or legal precedent that allows property owners to contaminate the water under their property as long as water quality standards are met at their property boundaries. The (DEIS) states that groundwater compliance points will be determined in the discharge permit process. According to the groundwater regulations, the compliance point is at the point of contact with the water table. Although variances are available, to my knowledge no such variance has been applied for, and the (DEIS) says nothing about the need for a variance. The (DEIS) should not assume that a variance will be granted, or that compliance points will be located no closer to the project than the property boundary.</p>	WR2J
17	<p>It appears that the assessment of water quality impacts from the tailings basin will be based on a comparison with water quality at groundwater monitoring well GW002. The well appears to be located at an industrial dumpsite and well within the area that has been disturbed by previous mining activity. A more pristine, upgradient site should be identified for baseline water quality data.</p>	WR1E
18	<p>Minnesota and federal law both recognize that the degradation of water quality in high-quality waters can be significant even if the impact does not reach the level of violating water quality standards. The permitting regulations that apply to discharges to both surface water and groundwater thus include “nondegradation” requirements. Minn. R. 7050.0185 (all waters); 7052.0300 (surface waters of the Lake Superior basin); 7070.0500 (groundwater). The discussion of impacts to water quality should thus not be limited to constituents for which water quality standards may be violated. The increased level of all pollutants over background levels should be assessed and disclosed.</p>	WR3I
19	<p>The (DEIS) states that for wetland impacts, “a threshold of 1- foot of simulated water level change will be used when evaluating numerical model results.” Aside from the problems of insufficient data to determine this threshold with any degree of accuracy, many wetlands are sensitive to drawdown of less than one foot. No citation or rationale is given in the (DEIS) as the basis for this cut-off.</p>	WE2

Comment ID	Comment Text	Theme Codes
20	Unfortunately, the (DEIS) gives no citation, table, or figure by which a reviewer can compare the outcomes of the deterministic and probabilistic models. Specific discrepancies are indicated in the text (i.e., for cobalt, copper, and fluoride for the Category 1/2 waste piles), but no specific information is given for the majority of constituents from the majority of the sources. Numbers given in tables and figures are based only on the deterministic modeling; despite an occasional footnote saying as much, these table and figures are misleading. The numbers presented do not represent the full range of water quality impacts predicted in modeling. The problem is exacerbated in additional text that provides deterministic results with no mention of the degree of uncertainty or the results of probabilistic modeling. In sum, the (DEIS) presents somewhat arbitrary numbers as to what the water quality might be, rather than revealing the full extent of the potential impacts on water quality. As a subsequent portion of the text states, “Presented with ranges for values, the decision on what effect constitutes an “impact” then become a decision for the managing State or Federal agency.” However, the (DEIS) does not present ranges of values. I have heard that the DNR has requested additional design work on the tailings basin, and expect that a new round of modeling will be done to predict impacts, and thus I have not reviewed this section of the (DEIS) in detail. I would like to note, however, the (DEIS) text that reads, In any case, similar to the conclusions from the limited uncertainty analysis for the Proposed Action, it is considered that a thorough uncertainty analysis for the Mitigation Design is likely to indicate that solute concentrations could range between several times higher and several times lower than these [deterministic] predicted values. It is absolutely critical that the uncertainty analyses be done before the DEIS is put on public notice, and that they be included in the DEIS.	WR1E
21	It is unclear from the discussion whether the water quality impacts presented in the CPEIS incorporate the assumptions that discharge water will be treated passively in the East Pit wetland prior to discharge and that the wall rock cover will remain perpetually sound. It appears from the CPDEIS that the DNR is not yet convinced that these assumptions are warranted. If that is indeed the case, the estimate of potential water quality impacts should be revised accordingly.	WR3L
22	Similarly, section () states, “The proposed Category 1/2 stockpile liner system does not appear to provide adequate containment.” It is unclear whether water quality predictions took account of this inadequacy. Is the efficacy of the proposed liner reflected in the “high liner leakage” scenario, or will leakage potentially be even greater than assumed in that scenario? If it might be greater, once again the water quality impact predictions should be revised. The absence of an adequate slope stability assessment for the waste rock stockpiles is also noted. Although this discussion does a slightly better job describing impacts, it needs to provide some sense of how large an impact a slope failure might have on water quality.	EOO
23	The (DEIS) states that under the no action alternative, “Natural dissolution, mobilization, and transport of PCOC’s would still occur at current rates due to past mining and milling activities.” Similar statements are made in other sections. Hopefully they are untrue. Much of the plant and tailings basin site is subject to ongoing efforts at remediation. As described in the CPDEIS, the facility has been out of compliance with its discharge permit for many years. Mobilization and transport of PCOCs will not continue at current rates if the owners and permittees of the property are required to comply with state and federal laws.	ALT8,WR3I
24	In regards to the Dunka Pit stockpiles, the (DEIS) states, “Although monitoring of the site has produced a detailed long term record of stockpile drainage chemistry, uncertainty in rock composition and drainage pathways led to elimination of this drainage chemistry as an analogue for stockpiles proposed at NorthMet.” Although I understand that it might not be appropriate to use this data in quantitative modeling, the experience at the Dunka Pit is extremely pertinent to the NorthMet project and at the very least should be qualitatively described. The Dunka Pit is geographically much closer to the NorthMet site than other sites from which data was used, and illustrates the uncertainty of predictions and the problems with addressing impacts that turn out to be greater than expected. In several other sections, the authors of the (DEIS) cite professional judgment and experience to downplay other types of potential impacts. For instance, insufficient data on area wetlands is excused by stating that experience at taconite mines indicate that wetlands in areas adjacent to mines are often not affected. The experience at Dunka Pit is at least as relevant to decision makers as other experience on the Iron Range that is incorporated into the (DEIS). I believe it would be of value to decision makers to describe the situation at Dunka Pit and the difficulties MPCA and the DNR are having in dealing with it.	PD3

Comment ID	Comment Text	Theme Codes
25	The statement “Depending on the customer’s requirements, two methods would be considered for loading the dried concentrate into storage containers and unloading the concentrate from those containers into rail cars for shipping:” implies that processors other than PolyMet would be either contracting for concentrate from PolyMet or having their ore processed at this plant. In either case the analysis and recommendations on this DEIS would be altered and need in-depth review per NEPA and MN rules. The movement of concentrate with 20% sulfur content itself has serious environmental consequences. Would contract processing affect the projected volume of material being processed in the benefaction and waste management areas?	PD2
26	Despite indications from humidity cell tests that leachate from waste rock will have a mercury level five times the surface water quality standard, PolyMet did not include mercury in its water quality model, and the (DEIS) gives no data on the potential impact of leakage and discharge from the stockpiles and pit lakes on mercury levels in the Partridge River. Given that mercury is known by everyone involved to be one of the most sensitive issues for any industrial facility in the Lake Superior Basin, it is difficult to interpret this omission as anything other than an attempt to avoid the prohibition on new discharges of mercury to Lake Superior tributaries.	WR4A,WR4B
27	It may or may not be true that the ground that the stockpile leakage passes through on its way to the Partridge River will adsorb mercury to the extent that it will meet surface water quality standards where it discharges to the river. It is beyond belief, however, that PolyMet (and apparently the DNR) do not believe that that any further analysis is needed to make that determination. Both during and after mining, stockpile leakage containing mercury will discharge to groundwater in close proximity to the Partridge River. The Category 1, 2, and 3 stockpiles are located less than one-eighth of a mile from the river. Unlike other constituents, the Category 1 and 2 stockpile might be the largest source of mercury releases, as mercury leaching is not dependent on sulfur content. A mile-long stretch of this stockpile is located about one-eighth of a mile from the Partridge River headwaters.	WR4B,WR4B
28	The (DEIS) is equally lacking in information about mercury discharge from the tailings basin. While I understand that percolation through taconite tailings is likely to reduce the concentration of mercury originally present in the discharge, PolyMet needs to present something more than conclusive statements that the mercury level will be below the surface water quality standard when it discharges to surface water. The company has not provided scientifically defensible justification for this conclusion. A very high volume of water will travel through the basin, some of which will flow under the collection system and emerge in surface waters. Some of these waters (such as Trimble Creek and several lakes) are considerably closer to the tailings basin than the Embarrass River, and have been ignored in the analysis so far.	WR4A,WR4B,WR4B
29	In light of this statement, the DNR’s failure to require the same analysis of mercury release and transport as was performed for other constituents is incomprehensible. The Draft EIS must provide a quantitative analysis of the discharge of mercury to the Partridge and Embarrass River from these pathways during and after mining, and from direct surface discharge from the West Pit after mining.	WR4A
30	A mitigation plan that covers all wetland impacts needs to be available at the time the DEIS is put on public notice. The (DEIS) estimates indirect impacts at 328 acres, and states that 300 of these acres are not yet included in the mitigation plan. First, given the lack of information on hydrology, this number is a very rough estimate. Information on uncertainty needs to be included, along with some disclosure of what the largest impacted acreage might turn out to be. Second, mitigation plans must be identified prior to release of the Draft EIS and included in that document. Because replacement of wetlands is regarded as reducing the significance of wetland destruction, it is impossible to assess the significance of wetland impacts without knowing what the mitigation will be.	WE3

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
31	<p>The federal and state wetland mitigation requirements are unequivocal regarding the preference for mitigation within the watershed. It is not up to the permittee to decide that the opportunities for mitigation within the watershed carry too high a price. The DNR and Army Corps of Engineers should insist that PolyMet restore wetlands within the St. Louis River watershed if an appropriate location can be found, regardless of the added cost. The very size of the wetland impact in this case is going to make the purchase of additional land appear unreasonable, but it is actually the size of the wetland impact itself that is unreasonable; the cost of mitigation follows directly from the size of the impact. Similarly, if a number of smaller mitigation locations are available within the watershed, the fact that it is more difficult to undertake several smaller projects than one or two large ones cannot be used as an excuse to go outside the watershed. The enormity of the impact seems to be creating a situation that makes it easier to receive permission to mitigate the impact outside of the St. Louis River watershed, and that is unacceptable. The policy should be just the opposite; the greater the impact to the watershed, the greater the need to keep compensation within the watershed. If permitted, an entire subwatershed of one of the St. Louis River's main tributaries will be sacrificed to this and past mining projects. The least that can be done in mitigation is to improve conditions in other subwatersheds of the St. Louis River if locations are available. The Aitkin and Hinckley mitigation sites are a long way south of the PolyMet project, and virtually none of the values and functions of the wetlands at the mine site can truly be compensated for there. In addition to the hydrological and water quality values of these wetlands to the Partridge and St. Louis Rivers, the PolyMet site provides habitat for a number of wetland species, including lynx, wolves, moose, and a number of bird species that are not found as far south as the Aitkin site. In addition to the difference in climate, tree and plant species that are heavily affected by deer density may have more difficulty at the mitigation sites, and it is questionable whether comparable ecosystems can be established there. For too long, the mitigation rules have been used to ignore the actual impacts of wetland destruction. The National Research Council report that led to the new federal wetland mitigation rules found that while as a nation we may have halted the loss of wetland acreage, we have by no means halted the loss of wetland value and function.<sup>2</sup> The new Army Corps of Engineers rules<sup>3</sup> were supposedly designed to change this so that the wetland permitting process actually identified the specific values and functions that were being lost and designed mitigation geared specifically to replace those losses. My understanding is that this would be the largest wetland loss ever permitted in the St. Paul region. The Corps has the opportunity on such a large project to use its new regulations to usher in a more responsible era of wetland mitigation. PolyMet needs to be sent back to the drawing board to design one or more mitigation projects that actually compensate for the functions and values lost.</p>	WE3
32	<p>The impacted wetland acreage from this project is so large that it will significantly impact at least the North Branch of the Partridge River. That impact cannot be ameliorated by restoration of wetlands in any other watershed, and yet there isn't a site large enough to replace the wetlands within the North Branch watershed. As a result, this project proposes to sacrifice the North Branch of the Partridge River to mining. I do not believe this is a legally permissible outcome regardless of the mitigation rules. Portions of the (DEIS) downplay the impact by focusing on a higher watershed level (e.g., section 4.2.7.4 on cumulative impacts); the DEIS should more consistently describe the degree to which the North Branch of the Partridge River will be destroyed by this project.</p>	WE2,WE3
33	<p>Wetlands that will be created at the mine site after closure as mitigation wetlands are listed. Many of these wetlands are also slated to provide treatment of water that may not meet water quality standards after closure of the mine. Wetlands that will receive discharges of water that does not meet standards and that are used as a passive treatment system cannot be counted as wetland mitigation.</p>	WE3,WE6

34	<p>The (DEIS) gives no information about the extent of surveys for rare plants or wildlife, nor the time of year when surveys were conducted. I cannot be sure from the information I have, but the only reference I have found regarding multi-species plant surveys appears to be to the data from a single survey, apparently conducted in August of 2004. If this is actually the case, more work needs to be done before concluding that there are no additional rare plant species present on the site. The (DEIS) makes several statements that lead me to believe that the site has not been extensively surveyed for wildlife. For instance, the (DEIS) states “Significant populations of Wood Turtle, however, are unlikely to be found at the Project.” It is unclear if anyone has actually looked for Wood Turtles at the project site. Similarly, “the Heather Vole has not been recorded within 10 miles of the Project by the Minnesota Natural Heritage Program (NHP). It was also not found in nearby surveys of small mammals on the Chippewa National Forest (Christian 1999) and in Cook County (Jannett 1998).” It is unclear if anyone has looked for the Heather Vole at the project site. The text does provide a reference to a survey by “ENSR,” but no information is given about the extent of that survey or its findings. It would help to have this basic information included in the DEIS text.</p>	WI2
35	<p>Assumptions concerning hydraulic conductivity in the bedrock beneath the Tailings Basin and the general direction of groundwater flows beneath and surrounding the Tailing Basin are inadequate to form a basis for assessing the need for an NPDES Permit for the Tailings Basin. Outflows to surface waters of the Partridge and Embarrass rivers from both identified and unidentified seeps plus the resurfacing of polluted groundwater have not been identified. Lack of specific hydrologic subsurface flow data from the Tailings Basin in itself makes the DEIS inadequate. From the Ref. “Groundwater Sensitivity and Solid Waste Disposal in Minnesota” by Stuart Grubb, PG; U of Minnesota, 5.7.2009, in Igneous and Metamorphic Aquifers, “...localized flow patterns can be unpredictable”. Further, “Groundwater flow from such sites is typically via one or more conduits and the probability of intersecting the relevant conduit with any rational number of monitoring wells is vanishingly small. Contaminants routinely are not detected in these site monitoring wells but show up in off-site wells or springs long distances from the site. However, the springs may be inaccessible, for example, beneath lakes or rivers.” The same paper concludes, “Tracer tests are the established and preferred method of documenting groundwater flow velocities and directions in Karst and fractional flow aquifers. And, “time of travel is a good surrogate when accounting for other factors might reduce contaminant concentrations and groundwater sensitivity, such as sorption and chemical reactions.” Since no such data exist for this Tailings Basin area, predictions of pollutant discharges would need to be made long after the fact of construction and operation. The DEIS does not account for this problem with respect to NPDES permitting justification or need. NEPA requires a detailed explanation of this issue. Per “Kuipers-Maest et al, 2006, “Comparison of Predicted and Actual Water Quality at Hardrock Mines”, 100% of existing mine plans predicted compliance with water quality standards before operations began and over 75% exceeded (failed) water quality standards after the fact. The mine being in a wet environment such as that found at this proposed Project site makes potential of preventing acid mine drainage and metals leaching very low. Modeling of Mine and Plant site hydrology comments in the DEIS admit to pollution problems with leakage from storage heaps and cells. For example in Section 4.1.3.1, Environmental Consequences, Proposed Action, Post-Closure , After year 65, “the surface seepage to Second Creek (Seeps 32-33, Figure 4.1-14) is expected to continue indefinitely based on experience after closure of LTVSMC Cell 1E”. And from section Effects on Groundwater Levels, Evaluation Methodology, P. 4.4-57, “The MnDNR believes that actual hydrogeologic characteristics of the Project site do not fit the model assumptions of homogeneous porous media flow (uniform vertical and horizontal conductivity) for the bedrock and till layers.” The potential for acid generation from the 394,082 tons of waste rock (Table 3.1-7) is huge. Using the MnDNR chemical mass balance equation <math>4\text{FeS}_2 + 15\text{O}_2 + 14\text{H}_2\text{O} = 4\text{Fe}(\text{OH})_3 + 8\text{H}_2\text{SO}_4</math> (Lapakko, 2009) indicates that tens of thousands of tons of acid generation potential exists in the waste rock from the proposed Project. Apparently the seeps are expected to continue indefinitely. NEPA requirements are not satisfied by satisfied by proceeding with long term water pollution assured. The consequences must be addressed in the EIS.</p>	WR2A,WR3I

36	<p>I found the treatment of state endangered, threatened, and special concern species quite problematic. Despite the fact that a very significant percentage of the statewide populations several species will or may be affected by this and other foreseeable projects, the (DEIS) dismisses each one as insignificant. For instance, the (DEIS) first determines that 17% of the state’s known populations of pale moonwort, a state endangered plant, may be destroyed by this and other projects. It then dismisses the significance of this percentage by insinuating that the plant is not “really” endangered but probably just has not had many of its populations identified, and that because it is found on disturbed sites, these projects are unlikely to affect its presence in Minnesota. If only 64 populations have been found in Minnesota thus far, however, it is clear that tolerance for disturbed sites does not correlate with widespread presence. It is completely unclear why impacting more than one-sixth of all of the known populations is not a threat to the presence of the species in Minnesota, regardless of tolerance for disturbed sites. The discussion of floating marsh marigold is particularly troubling. Half of the state’s known occurrences of this plant occur on or closely downstream from the mine site. According to the text, eight of the thirteen populations at the mine site “are believed to be sufficiently removed from potential direct and indirect affects [sic] of the Project so as not to be affected.” The document does not reveal how far downstream these populations are, but given the lack of knowledge about hydrology in the area and what the actual indirect impacts on wetlands, streamflow, and water quality will be, the DEIS should treat these populations as potentially impacted by the project. Furthermore, even if “only” five populations of this species are impacted, this is 20% of the state’s populations of a state-listed endangered plant, and has to be treated as significant. Similarly, impacts on 21% of Minnesota’s known populations of neat spike-thrush, a state-listed threatened species, has to be considered significant. The speciousness of this entire discussion is reflected in a statement regarding the clustered burr-reed: “Enforcement of existing wetland regulations, which require avoidance and minimization of wetland impacts, reduces the likelihood that known populations of this species would be significantly affected over the long term.” If enforcement of existing wetland regulations is not going to avoid impacts on nine percent of the known state populations under discussion here, at what point will the wetland regulations begin to be effective?</p>	WI2
37	<p>The (DEIS) states, “Water quality modeling of the potential for [groundwater discharge] to impair water quality indicates that predicted concentrations of the modeled parameters in the Partridge River will meet Minnesota water quality standards, and therefore is expected to be protective of aquatic life.” As explained earlier in the text, the range of potential levels of many of the constituents of concern is very broad. There is no certainty that leakage from the stockpiles and pit lakes will not violate water quality standards where it discharges to the Partridge River. The range of uncertainty needs to be discussed here, along with the potential impacts on aquatic life if acid drainage turns out to be more significant than PolyMet expects.</p>	WR2F,WR2F
38	<p>Furthermore, what the text does not tell us is that mercury is not one of “the modeled parameters.” We have been given no predicted concentrations of mercury and do not know if it will meet Minnesota water quality standards. The conclusion that water quality “is expected to be protective of aquatic life” is thus unwarranted.</p>	WR4A,FM2,FM5
38	<p>As discussed below, I have found no support for this statement in the record. Deposition and run-off of metals and sulfur needs to be modeled to determine whether this statement is true.</p>	WR3M,AQ4A
38	<p>One of the significant impacts of this project that is virtually certain to occur is the reduction in base flow in the North Branch of the Partridge River. The (DEIS) acknowledges this (“Reduced habitat quantity resulting from this reduction in flow may be of sufficient magnitude to appreciably alter the structure and function of biotic assemblages in the Partridge River in the vicinity of SW002 and to a lesser degree in the vicinity of Stations SW003 and SW004 further downstream”), but hides the acknowledgement three-quarters of the way through a page-long paragraph. It is thus unlikely to be noticed by any but the most persevering reader.</p>	WR3E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
39	Another likely impact on the North Branch of the Partridge River is the rising of temperature due to reduced groundwater discharge. As groundwater begins to flow toward the mine excavation, a greater percentage of water in the stream will stem from precipitation and surface flow. In addition to reducing stream flow, this water generally has a higher temperature than groundwater. Particularly in mid- to late summer, streams are dependent on groundwater inflow to stay cool enough to serve as fish habitat. Reducing the groundwater discharge to a stream presents the double-whammy of raising temperatures due to less volume and slower movement, and also due to the temperature of the source water. The DEIS should provide an assessment of the likely impact of the project on temperatures in the Partridge River.	WR2A
40	The single most likely form of impact from air emissions is the local deposition of sulfur and metals, and their ultimate run-off into local water bodies. This issue does not appear to be covered by any of the criteria listed for the impacts analysis. The (DEIS) lists the various emissions calculations and modeling that were performed, and then concludes “Considering the composition and magnitude of fugitive and stack emissions, airborne deposition is not a likely pathway of contamination leading to significant impacts on fish or macroinvertebrates in local streams and lakes.” No scientific support for this statement is given here or in any of the supporting documents. According to the (DEIS), the project will emit up to six tons of nickel per year. In a similar mine permitting proceeding in Michigan, deposition modeling indicated that most metallic emissions are deposited in close proximity to the mine. <sup>4</sup> The emission of 1300 pounds of copper per year at that site led to the prediction that a nearby stream that is similar in size to the North Branch of the Partridge River would exceed the water quality standard for copper due to run-off of deposition, particularly during snowmelt. PolyMet prepared an analysis of the potential deposition of sulfur and nitrogen in Class I areas, twenty miles away or more. It also prepared an analysis of the impact of the emissions of metals on air quality in the project vicinity. Clearly the means are available to model local deposition of these same substances. MPCA staff are well-versed in estimating the run-off of deposition into surface waters from their studies of mercury deposition. The impact on local water quality from deposition is potentially significant and must be studied.	WR3M,AQ4
41	The discussion of the loss of access to resources retained by Ojibwa tribes under treaties with the United States demonstrates the problem with preparing a DEIS before important aspects of the project have been determined. It is stated, “A potential land exchange is currently being considered by the USFS for National Forest System lands proposed to be used by the Project; should this occur, access to natural resources on the additional land by 1854 signatory tribes may be made available, although it is unknown whether or not this would compensate for or result in a net loss of access rights to ceded territory.” This lack of information on impacts that are critical to local tribes is unacceptable. As explained above, it is not sufficient to say that these impacts will be assessed in a separate EIS. All of the impacts of the project must be reviewed together in one document. 41 The position that this Project area emissions are below “major source” thresholds for the PSD Increments for PM10 has not been sufficiently supported by data or modeling. There are no correlations given to show that the Annual Point Source Criteria Air Pollutant Emissions for PM10 and PM 2.5 (Table 4.6-5) meet the Allowable Class II Increments for PM10 in Table 4.6-3 on either the PM10 24-hour or the annual averaging period. The units are incompatible and it should not be left to the reviewer to make this determination. What is the equivalent of tons per year in micrograms per cubic meter in this comparison? Further, based upon the rationale for selecting coefficients and constants for algorithms used in modeling each individual air pollutant emission source, the calculated values are subject to a great deal of individual interpretation. For instance in the mine site section a great deal of discussion is centered on subjective justification for picking a value for a constant out of a reference book. For example, on P. 42, RS57A, 3.2.4 Dunka Road Sources, “...site specific silt content data is not available. Therefore, the “most representative value” from AP-42 Table 13.2.2.1 was used. This was “taconite mining and processing, service road” with a mean value of 4.3%.” Why was the mean value selected rather than another value? Modeling errors have significant negative consequences in a case involving irreversible pollution. On P. 39, section 3.2.1 Raw Material Handling, a “mean wind speed” of 9.3 mph was obtained from “climates of the States” Vol. II, Water Information Center, 1974 for International Falls, MN. This dated data was used to calculate lb/hr emissions of PM and PM10. How would this method of selecting coefficients provide a range or degree of confidence scenario for generation of PM or PM10 at this location? The coefficient for high winds applied to the calculation would produce a much higher value for PM10 and PM in any case. These constants are usually tabularized or written into a higher order equation for use in modeling. With these examples in mind, the projected emission for PM10 (3t/y) and PM 2.5 (1 t/y) appear very low for an “upper bound” calculation. There are no ranges or confidence intervals expressed for any of these numeric values which is unusual in cases where subjective selection of modeling coefficients and constants occurs. The degree of confidence in these modeling results is very important since pollution control strategies for both this and future projects would depend upon the size of this Increment. The maximum Increment value would determine the PSD source designation. This Project could very well be a “major source”. Ambient monitoring data from open pit metallic sulfide mines exists and in most cases demonstrates that air quality in the vicinity of the open pit mines and processing plants is impaired beyond NAAQS, MAAQS and PSD increments. Evaluation of this project on a partial plant capacity basis does not meet NEPA criteria requiring that all potential scenarios for generation of air emissions be evaluated.

AQ4

41 The discussion of socio-economics must include detrimental aspects of mining economies. Socio-economics cannot be reduced to the amount of money and jobs the project will ostensibly bring to the area.

SE3

41 As someone who (along with many others involved in reviewing the PolyMet project) has been very involved in fighting for reductions in emissions of pollutants like mercury over the years, it is disheartening to find that rather than resulting in permanent reductions, our efforts are being used to allow new emissions. The cumulative mercury emissions analysis indicates that statewide reductions and additions will result in a statewide emission level of 2,337 pounds by 2015, down from 3,638 in 2000. The state goal is 789 by 2025. Simply to state those numbers is to understand how unlikely it is that we will meet the goal if these new emissions are permitted. The (DEIS) repeats the tired excuse that most of the mercury deposited in Minnesota comes from somewhere else. Yes, and the mercury emitted in Minnesota falls somewhere else, creating problems for others. The Minnesota mercury reduction goals were chosen to reflect the degree of reduction that everyone will have to make before Minnesota waters will become “fishable” again. If we do not meet our goal, we have no business asking anyone else to meet that goal, and yet we need them to meet the goal to make our fish edible. By permitting these increases in mercury emissions, we are likely contributing to a worldwide failure to reduce emissions to a level that would clean up Minnesota’s water in the foreseeable future. Global climate change is perhaps the ultimate cumulative impacts issue, and yet the (DEIS) omits this from its discussion of the cumulative impacts of air emissions. The DEIS should include a cumulative impacts analysis similar to the ones done for other pollutants and issues. Furthermore, I disagree that the amount of CO2 this project will either emit or be responsible for (due to electric production and transportation) is insignificant. By stating the amount as a percentage of worldwide emissions, of course the amount appears miniscule. A better indicator of significance would be comparison to total U.S. industrial emissions, along with a discussion of reduction targets and what they would mean for the State of Minnesota.

42	The (DEIS) does provide numbers that reflect the fact that historically, mining has had more of a negative than a positive impact on communities. According to the (DEIS), East Range communities, most of which are mining-based, have lower education levels, lower median income, and higher poverty rate than St. Louis County and the State of Minnesota as a whole. It is indicated that of the selected East Range cities, Tower is the only one with less than 10% of its workforce employed by the mining industry; It is indicated that while Tower has a lower median income than some of the cities that are heavily affiliated with mining, it also has a much lower poverty rate and a higher percentage of employed adults. This makes intuitive sense. Virtually anyone in Northeastern Minnesota who pays attention understands that mining jobs pay comparatively well, but are not stable over the long term. These statistics are also in line with studies of economic conditions in mining communities. <sup>5</sup> Rather than simply list statistics, the DEIS should provide some interpretation to make the numbers meaningful.	SE3
43	The (DEIS) ignores the volatility of the mining industry, assuming that jobs will continue uninterrupted for the predicted life of the project. It has no more to say about mine closure than “Unless new industry is developed in the East Range area prior to completion of these activities, it is assumed that 95 percent of working-age people formerly employed by the NorthMet Project would need to secure alternative local employment or would leave the area after this time.” This complete lack of concern for the impacts of mine closure is particularly galling given the fact that the taconite industry is currently suffering yet another downturn, and miners are being laid off as the DEIS is written. The DEIS discussion of socio-economics needs to include a discussion of the impacts of relying on a cyclical industry as the major economic driver of a community.	SE3
44	In addressing environmental justice it is concluded that because the affected community does not have a significant Native American population, Native Americans are not disproportionately affected by the project. However, members of local tribes do have a disproportionate interest in the resources at risk; their culture is dependant on continued access to such resources, and their current access to resources at the mine site is protected by treaty. In contrast, the destruction of plants and wildlife habitat may mean little to the majority of the European-American population. The impacts of the proposed project would thus fall disproportionately on tribal members. One of the points behind environmental justice concerns is that a more privileged segment of society often makes decisions that disproportionately affect less privileged segments of society. This is exactly what appears to be happening here. The majority non-native population is making a decision to permit the destruction of resources that are of particular interest to the native population. Tribal members, who will be most affected by the loss, are apparently being given little or no say as to whether that loss will be permitted. This is precisely the type of situation that environmental justice is meant to address.	SE2
45	The PolyMet project is likely to have impacts on several receptors and from several sources that are not included in the (DEIS). These include water quality in local wells at residences downgradient from the tailings basin; the impact of pit water quality on wildlife; mercury and sulfate impacts downstream from the tailings basin and mine site; and impacts from the generation of electricity used by the project. All of these should be added to the draft EIS.	G7A,G8
46	Based upon previous comments herein, the assumptions that this project would not be considered a “major source” for PSD considerations is not supported by the modeling analysis pursuant to PSD regulations. Being the first metallic sulfide mine in the State of Minnesota and the DEIS not having been supported by data from equivalent projects elsewhere, the Project is experimental in nature at best. A hydrometallurgical metals separator of this size has never been built. The business model as well as the pollution modeling is designed to need post-build calibration if the Project were permitted. Use of uncalibrated, site specific modeling results to set “upper bounds” for assessing potential impacts does not meet NEPA criteria. Irreparable damage would occur from this experimental approach to a major Project design. Also, potential mine expansion and contracting for processing material from other similar mines must be assessed in the EIS per NEPA. These would be “indirect effects” and must be considered in analyzing air quality impacts. We support and hereby incorporate by reference all comments submitted by Tribal cooperating agencies, as set forth in Appendix D to the Draft EIS, and also set forth within footnotes throughout Volume I of the Draft EIS. This includes comments concerning the effects of releasing reactive waste rock dust into wetlands. This would contribute to increased methylation of mercury and must be evaluated in the DEIS.	AQ1,AQ4,AQ4B

Comment ID	Comment Text	Theme Codes
47	As stated, fugitive emissions are expected to occur from the Tailings Basin. Dust control mechanisms described include the use of wet tailings, floatation slime and existence of capillary action at the water and tailings interface. In no other known instance in MN or elsewhere have these mechanisms prevented huge peak releases of fugitive dust during high winds. The shell game of identifying previously captured PM10 and PM2.5 material transported from the Plant to the Tailings Basin as fugitive dust and excluding it from being included in the determination of a major source must be addressed under NEPA. This is an “indirect source” of criteria pollutants directly connected to Plant emissions. Modeling fugitive emissions using average wind velocities of (9.3 mph) from International Falls grossly underestimates the emissions of these PM10 criteria pollutants. Selection of coefficients for modeling is also affected by both the alteration of the nature of tailings material and non-linear effects of friction coefficients. As discussed earlier herein, there are no confidence limits given on the data presented. The projected PM10/2.5 emissions from the mine site appear very low based on fiber monitor data from the Babbitt, Silver Bay and Beaver Bay sites. The effects of increased PM2.5 emissions and impacts must be stated in the criteria pollutants summaries per NEPA rules.	AQ1,AQ4
48	• There is no data showing sampling methods and data to verify that amphibole mineralization does not occur either at the Northmet deposit or at other deposits that would feed the 2/3 plant capacity not being included by PolyMet in the DEIS assessments.. • The Stevenson Thesis (Amphiboles at the Base of the Duluth Complex, Minnesota, Robert J. Stevenson 12/1982 University of Minnesota) and other technical observations indicate that intrusions of extremely toxic ferroactinolite and other amphiboles occur at and in close proximity to the Northmet mine site. Stevenson analyzed ten samples from South Kawishiwi and Partridge River intrusions including the Inco Spruce Road and Maturi sites plus the Dunka Pit Site. Amphibole content varied from zero to 13.1% by volume with a median value of .43% by volume. Samples were taken from both overburden material and at varying underground site depths. Hornblende, actinolite and cummingtonite fiber concentrations were found at high levels. • Recent (1/7/2008 through 10/26/2009) fiber monitoring data from Hoyt Lakes and Babbitt, MN demonstrate that amphibole fibers are present in the ambient air in the vicinity of the Northmet mine and LTV ore processing sites on a continuing basis. Amphiboles were detected in 14 of the 61 samples or 34% of the time at the Hoyt Lakes monitor site. The comparable value at the Babbitt site was 75% indicating that the ambient air in the entire area is currently filled with toxic amphibole fibers. Adding the proposed project would result in a cumulative toxic effect not described in the DEIS. Peak levels of 8175 fibers per cubic meter in Hoyt Lakes and 12023 fibers per cubic meter of air in Babbitt should be cause for concern even before considering adding a new source in this area. • Fiber monitoring at scientifically defined sites should continue on a regular schedule as long as there is any activity at this Project location since the amphibole intrusions occur randomly and would not be identified by other means. This is a public health issue on-site and in surrounding areas. • Scientific work regarding the toxicity of ferroactinolite, cummingtonite-grunerite and other asbestos-like fibers has been conducted since the early 1980s at the EPA’s Duluth Water Quality Laboratory by experts familiar with material from this area. (e.g. Ref. “Interpretation of the Carcinogenicity of Amosite Asbestos and Ferroactinolite on the Basis of Regained Fiber Dose and Characteristics in Planned Class II increment analysis shows 24 hour PM10 predicted concentrations just under the PSD increment of 30 micrograms per cubic meter. No confidence or statistical bounds are given to support this data. Similarly, the review for compliance with NAAQS shows that the expected 24 hour PM2.5 predicted total ambient impact plus the background to be just under the 35 microgram per cubic meter NAAQS for PM2.5. NEPA requires a more detailed study and justification of the conclusion that this data validates the claim for designation as a minor source for PSD. As supporting evidence for a major source PSD designation, the recently completed fiber monitor tests by MPCA at the Babbitt, MN, a site close to the proposed Project, show that the air is filled with amphibole fibers of the PM10 and PM 2.5 class in this area. True BACT would be appropriate for the PolyMet Project especially in view of the potential for both sulfide and amphibole fibers filling the air. The Plant Site Projected Actual Emissions for PM10/PM2.5 potential in Table 4.6-5 may also be understated. Adding bag houses on the front end of the processing plant is desirable. However, the waste from the filters is sent to the tailings pond and its potential for emission is not included in the emissions calculations. These are highly concentrated sources of P10/PM2.5, amphiboles and asbestos-like fibers. This should be considered for major source PSD increment definition and pollution abatement practices. There are numerous examples of serio	AQ4A,AQ4C

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
49	Staff remain, as they have for many months, primarily concerned about two issues: 1) that the draft EIS cannot withstand NEPA scrutiny because it does not meet the requirements for a federal EIS, and 2) that the project, as proposed, cannot be permitted by either the state of Minnesota or the Army Corps of Engineers. The following issues have the potential to fall into one of these categories and are more fully described in the attached comments: C the applicant has not proposed sufficient mitigation acreage to cover identified wetland losses caused by the project; C the structural stability of the waste rock stockpiles has not been demonstrated; * the effectiveness of the wetland treatment system has not been demonstrated given the predicted water quality; * the technical feasibility of a 95% capture efficiency required for the tailings basin alternative has not been demonstrated; * the draft EIS does not contain sufficient detail regarding financial assurance, particularly if very long term water treatment is needed; and * the draft EIS fails to reasonably predict indirect hydrologic impacts to wetlands. * the draft EIS is flawed in that it predicts substantial improvements to groundwater quality through the addition of sulfide mine waste to an existing tailings basin.	G8
50	GLIFWC staff reiterate that the method presented in this section (Figure 4.2-8) is inadequate to assess indirect wetland impacts. This method ignores the fact that there is an area of uplands north of cell 2W which has constrained the movement and direction of tailings basin seepage. Therefore, using the northern extent of wetland impacts of 2W for 2E, north of which there are no uplands, is unjustified. Ignoring the presence of the upland area north of cell 2W creates an underestimation in the extent of wetland impacts due to seepage. Tribal cooperating agencies have suggested a more conventional method for indirect wetland impact estimation to the lead agencies (Methods for evaluating indirect hydrologic impacts to wetlands, March 26, 2009, Attachment #8). This method could be applied at both the mine site and the plant site. The method proposed by tribal cooperating agencies was based on work by a consultant for the Army Corps for use in another sulfide mine project EIS (Attachment #7). In addition to having been developed by the Army Corps, this method has been presented by tribal technical staff at professional conferences (Society of Wetland Scientists Conference, 2009 and 55th Annual Meeting of the Institute of Lake Superior Geology, 2009). Tribal cooperating agencies do not agree that the unconventional method described in the DEIS can produce defensible results for indirect hydrologic impacts to wetlands. A more robust method should be used and the analysis presented in the DEIS so the public can review a science-based assessment of potential impacts.	WE1,WE2
51	GLIFWC staff reiterate that there is a serious inconsistency between this wetlands section and information presented in Section 4.1.3.1 of this document. Section 4.1.3.1 page 4.1-65 states: "Therefore, future impacts to the hydrology of the aquifer and wetlands downgradient of the Tailings Basin were estimated by comparing predicted seepage rates for the Proposed Action (Hinck 2009) with the estimated groundwater flux capacity of the aquifer (155 gpm)(Technical Memorandum: TB-2 and TB-14: Tailings Basin Seepage Groundwater Quality Impacts Modeling Methodology). The current seepage rate toward the Embarrass River from the Tailings Basin (Cells 1E/2E and 2W) is estimated at 1,795 gpm, which continues to result in the upwelling of seepage water into the wetlands as the seepage rate exceeds the aquifer flux capacity by over 1,600 gpm. Under the Proposed Action, the unrecovered seepage rate is predicted to increase to a maximum of approximately 3,800 gpm in Year 20, over 2,900 gpm of which would be attributable to PolyMet (Hinck 2009). Therefore, under the Proposed Action, a significant increase (>100%) in groundwater upwelling relative to existing conditions would be expected. Some of this seepage water would drain to existing streams, but because of the generally flat topography and extensive wetlands, much of this water would be expected to form ponds and inundate wetlands." GLIFWC staff reiterate that the latest relevant information developed for the water resources section has not been incorporated into the wetland impact section. The presentation of two different methods is confusing and does not provide an adequate assessment of wetland impacts. A thorough hydrologic impact analysis that incorporates actual seepage rates from the tailings facility should be conducted. In addition, these seepage rates should be used, in conjunction with tailings basin water chemistry information, to assess the effects of this untreated discharge to the biota and functional values of the Embarrass River watershed wetlands.	WR2A,WE2

Comment ID	Comment Text	Theme Codes
52	For the DEIS to state that "The aerial extent of this impact (degraded groundwater) is unknown due to the lack of a monitoring well network, but based on the limited data available, no offsite contamination has been documented" would appear to be disingenuous. Private wells north of the basin show high levels of constituents found in basin water and well GW009, north of the property boundary, demonstrated high levels of the same constituents found at the toe of the basin. Should it receive permits for its project, PolyMet will assume responsibility for all legacy contamination caused by the tailings basin to surface water, groundwater and wetlands. Therefore, tribal cooperating agencies take the position that the current exceedances both on-site and off-site, which are the result of decades of untreated discharges from the tailings basin, must be addressed by PolyMet as part of its closure plan.	WR1E,WE2
53	As previously stated, GLIFWC staff disagree with these conclusions and take the position that that acreage totals for indirect impacts are underestimated. GLIFWC staff reiterate that data from the wetland delineations indicate that bogs are not the most prevalent wetland type. In fact, it appears that wetlands that require groundwater inputs: forested rich peatlands and poor fens are the most prevalent.	WE1,WE2
54	GLIFWC staff note that potentially impacted wetlands that are part of the 100 Mile Swamp were identified by the forest biologist in 1997 as "lacking ecosystem representation in protected areas." (SNF 1997, January) Interest in protecting the unique character of these wetlands was based on their "watershed integrity, the presence of riverine ecosystems, and large amount of interior forest present." This information was further substantiated in a report by the MNDNR titled "Evaluation of Selected Potential Candidate Research and Natural Resource Areas." (SNF 1997, December) This document describes the 100 Mile Swamp wetlands as "these sites represent the highest quality remaining examples of characteristic ecosystems in each ecological Landtype Association on the Superior National Forest." Tribal cooperating agencies take the position that this information must be included in the functional assessment for this project and included in the development of mitigation requirements for this project.	WE2,WE3
55	GLIFWC staff reiterate that the additional delineations needed for this project should occur for inclusion in a revised DEIS so that the public can review a complete set of potential impacts from the project.	WE1,WE2
56	GLIFWC staff believe that the large acreage of wetlands to be directly impacted and the high quality of the wetlands warrant a mitigation ratio of greater than 1.5:1	WE3
57	The DEIS does not identify sufficient wetland compensation for the impacts that have been identified. This omission is compounded by the likely underestimation of the acreage of wetlands that will be impacted. GLIFWC staff reiterate that the mitigation for the additional 475 wetland acres be identified in the DEIS. If this information is not available, impacts to these 475 acres must be considered as unmitigated impacts.	WE3
58	GLIFWC staff object to the unilateral editing of tribal position statements by the DNR in this section of the DEIS.	EOO
401	We want to keep our water clean in Buck Lake and all affected areas	G7
19615	The DEIS states that there is no current documented tribal use of resources in the area of the proposed project. GLIFWC staff stress that most band members do not report their harvest sites and therefore it is not surprising that no records are available. The DEIS should not assume that no tribal natural resource use has/is occurring. Army Corps consultation with potentially affected tribes had not been completed at the time of publication of this DEIS. Therefore, historic and current Tribal harvest has not been determined for either the Plant or Mine Sites. In addition, GLIFWC staff note that if species of tribal concern 'relocated' to other lands and these other lands were private lands, there would be a loss of opportunity to harvest.	WI3,CR2,CR4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19616	GLIFWC staff note that this list of impact criteria is incomplete. This section should also analyze the effects of the project on species harvested and gathered by tribal members on public lands. An example of the analysis that is missing from the DEIS, Recent studies from the MN DNR, the Natural Resources Research Institute at University of Minnesota-Duluth and Tribal natural resource management staff indicate that preservation of wetlands may be one of most important factors in maintaining the moose population in Northeast Minnesota (Attachment 9). The loss of moose habitat associated with this proposed project should have been assessed and the impacts to tribal harvest opportunities described. Finally, the Corps did not complete the consultation process with the potentially affected tribes prior to the release of the DEIS.	WI2,WI3,CR1,CR2,CR4
19617	GLIFWC staff reiterate that the conclusion that the effect on statewide lynx populations would be insignificant is not based on complete information. This analysis does not consider the possibility that the Mine Site might include critical components of lynx habitat present, such as den sites. In addition, the restoration of 'lynx habitat' described in the DEIS ignores the fact that good bobcat habitat will be created first. Bobcats are superior competitors to lynx and thus may prevent lynx from returning to the site.	WI1
19618	The DEIS states that no impacts to bald eagles are expected to occur. GLIFWC staff disagree with this conclusion because impacts to Bald Eagles could result from eagle feeding sites within or adjacent to the project area. Contaminants from the mine site, specifically mercury and heavy metals, could affect prey species thus having secondary impacts on eagle reproduction.	WI1
19619	In the impact discussions for lynx and wolf, the DEIS assumes that these animals would move to other suitable habitat in response to the disturbance at the mine site. This conclusion is overly simplistic and incorrect. GLIFWC staff maintain that displaced wildlife tend to suffer higher mortality just by having to leave familiar territory. This mortality is caused by a lack of knowledge of the new territory, lack of knowledge of the available food sources and competition with animals that are already occupying the area. A complete analysis of the effects of habitat loss on lynx and wolves is required for this project.	WI1
19620	GLIFWC staff note that the discussion regarding pit water quality is misleading. The DEIS states that water quality will improve over time. While technically true, the DEIS should note that pit water quality is expected to exceed standards for hundreds or thousands of years.	WR3C,WI2
19621	· Lack of demonstration of the effectiveness of the wetland treatment system given the expected water quality.	WR3L,WE6
19622	GLIFWC staff strongly disagree with the conclusions presented in the wetlands section. As detailed in comments and tribal positions for section 4.2, the methodology used to predict the acres of wetlands indirectly impacted by dewatering are not adequate to assess indirect wetland impacts. Therefore, any conclusions in this section that are derived from the flawed wetland analysis are invalid.	WI2,WE2
19623	GLIFWC staff reiterate that the loss of mature forest is a significant impact, and note that the activities on the mine site will prevent more forest acreage from reaching this mature community state, representing a nearly permanent loss of habitat.	WI2
19624	GLIFWC staff note that the Emmons and Oliver report (Attachment 10) provides a well researched and clear summary of the expected impacts to travel corridors. However, the DEIS provides greater weight to an analysis provided by the consultant for the applicant (Barr Engineering). GLIFWC staff concur with the Emmons and Oliver report in stating that Corridor 11 is currently a poor and obstructed corridor pending the long term success of a proposed revegetation corridor, and #12 will likely be degraded as a corridor by the Project. We agree with the Emmons and Oliver report that these impacts should be considered significant.	WI5
19625	GLIFWC staff reiterate that per Emmons & Oliver (Attachment 10), any new impacts to the existing wildlife migration corridors is by definition significant, and should require mitigation. For the entire time period (decades) of mine development and operation, Corridor 12 would experience a significant direct loss or fragmentation of wildlife habitat, and impact the ability of many wildlife species to migrate throughout their ranges. Also, until the Section 106 consultation process between the USACOE and the tribes is complete, it is not possible to determine the potential impacts to treatyprotected wildlife.	WI3,WI5

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19626	GLIFWC staff reiterate that noise contour maps should be developed for inclusion in this DEIS. Noise contour mapping would allow reviewers to assess the impacts of noise to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the mine site (See figure 4.9-1). An assessment of noise impacts to all public access lands is important information for assessing cultural impacts to tribes with hunting, fishing and gathering rights in the 1854 ceded territory.	N1,CR2,CR4
19627	GLIFWC staff reiterate that this document does not estimate the potential degree of disturbance to tribal members who may be involved in traditional natural resource harvests on national forest lands. The Corps had not completed the consultation process with the affected tribes prior to the release of the DEIS. Finally, the data included in this section does not permit a characterization of noise impacts to lands that tribal members can access in the vicinity of the proposed project.	N1,CR2,CR4
19628	The DEIS states that the continuous generation of noise at the Plant and Mine Sites would have an insignificant effect on the noise environment during mine operations, Closure, and Post Closure. GLIFWC staff reiterate that this document does not present enough information to make this claim.	N1
19629	GLIFWC staff do not believe that an adequate cumulative impact of noise impacts analysis has been done. Meeting ambient noise standards is a different question than assessing impacts. Impacts should be fully characterized in this document and contour maps showing overlapping noise pollution from different projects provided. Without this information, it is not possible for the public to review the cumulative impacts of noise. In addition, the cumulative impacts of mine related vibration have not been assessed.	N3
19629	GLIFWC reiterates that to fully describe the no action alternative, this section should include discussion of the remediation that would occur at the site under this alternative and it's compatibility with the MFRC Landscape Management Plan.	CPLU1
19629	GLIFWC staff note that the project depends on the successful completion of a land swap with the USFS. This land swap and the NEPA process required for it are clearly linked actions to this DEIS. The DNR should not proceed with this DEIS without fully exploring all issues related to the land exchange process.	PD8,CPLU4
19630	· Lack of incorporation of results of the mercury methylation study and an assessment of the adequacy of said study.	WR1E
19631	GLIFWC staff are concerned that this section does not provide a complete picture of mine related socioeconomic consequences. This section as a whole fails to acknowledge or account for any negative social impacts associated with the loss of natural features that will occur as a result of the Project. It also fails to adequately assess the economic and social impacts to local communities at and postclosure, or as a result of a temporary shutdown. The tribal cooperating agencies note that a recent report by Dr. Thomas Powers entitled "The Economic Role of Metal Mining in Minnesota: Past, Present, and Future," (Attachment 11) addresses some of the impacts that are inadequately addressed in the present draft and should be used in developing this section for the DEIS.	EOO,SE3
19631	GLIFWC staff reiterate that any impacts to natural resources will disproportionately affect tribes due to their subsistence consumption of wild rice, fish, and other wildlife within the 1854 Ceded Territory. We note that the Army Corps had not concluded the consultation process with the affected tribes prior to the release of this DEIS.	SE1

Comment ID	Comment Text	Theme Codes
19632	GLIFWC staff reiterate that the use of a few visual receptors to assess PolyMet related visual impacts is not adequate. Using this method means that the conclusions presented in this chapter apply only to those visual receptors and do not apply to any other publicly accessible area in the vicinity of the proposed project. Tribal cooperating agencies have requested that a more complete Visual Impact Assessment (VIA) be developed for inclusion in this PDEIS (GLIFWC Comment letter of June 30, 2008 and GLIFWC comment letter of February 6, 2009). Methods for a complete VIA were developed and used for other mine proposals as part of the Army Corps federal EIS process (Crandon Mine EIS Preliminary Draft Technical Memorandum: Visual Resources Section of Draft Chapter 3, November 2002). Despite these comments and Corps precedent, a complete VIA has not been included in this iteration of the PDEIS. A complete VIA would allow the public to review the impacts of project features to all publicly accessible lands in the vicinity of the project which include large sections of the Superior National Forest immediately adjacent to the mine site (See figure 4.9-1). A VIA of all public access lands is important information for assessing cultural impacts to tribes who have retained the right to hunt, fish and gather on national forest lands.	VI1
19633	GLIFWC staff reiterate that the impact criteria are incomplete. The Army Corps had not completed consultation with potentially affected tribes prior to the release of the DEIS. Therefore, this document does not estimate the degree of disturbance to tribal members who may be involved in traditional natural resource harvest harvests on national forest lands.	CR2
19634	GLIFWC staff reiterate that a cumulative impact of visual impacts analysis is needed. A thorough VIA following past Army Corps practices has not been conducted for this project and tribal consultation regarding cultural impacts was not completed. Therefore, this conclusion is premature. Finally, the Tribal cooperating agency position is that the introduction of non-native, invasive species as a revegetation measure may have long-term visibility impacts to the site.	VI2
19635	GLIFWC staff strongly disagree with this approach and note that it is not consistent with the federal EIS process. The purpose of this document is to provide information for all reasonably foreseeable impacts. The lack of a stability analysis for the stockpiles is a serious data gap given the serious environmental consequences of a structural failure of a stockpile.	GT1
19636	GLIFWC staff reiterate that the structural stability of the tailings basin has been a serious concern since the Polymet project was first proposed. This concern has led to the development of at least 3 different tailings basin designs that have been presented in various draft documents. Contractors reviewing these designs have expressed serious concerns with both the short-term and the long-term stability of the facility. Given the history of design problems, a serious analysis of the structural integrity of the latest tailings basin design must not be postponed until the permitting stage. A complete stability analysis must be included in the DEIS to comply with NEPA and so that the public can review a complete set of possible environmental impacts associated with this project. The DEIS acknowledges that there are stability concerns related to the proposed tailings basin. The DEIS deals with this concern by postponing a serious stability analysis until the permitting process. GLIFWC staff strongly oppose this approach as it is not consistent with the federal EIS process. The hydrometallurgical residue facility would contain the most hazardous waste materials produced by this project that, if released to the environment, would cause serious and long lasting contamination. The unknowns listed in this section of the DEIS are a serious data gap and GLIFWC insists that the analysis should be conducted and included in the DEIS to comply with NEPA and so that the public can review a complete set of possible environmental impacts associated with this project.	GT1
19637	As previously stated, GLIFWC strongly disagrees with waiting to conduct a serious stability analysis until the permitting process. This approach is not consistent with the federal EIS process. The EIS must identify alternatives and mitigation methods that address potential problems with the project. Sufficient data must be collected so that a complete structural integrity analysis can be performed and included in the DEIS.	GT1
19637	As previously stated, GLIFWC strongly disagrees with waiting to conduct a serious stability analysis until the permitting process. The purpose of an EIS is to identify mitigation measures that address potential problems in the project. The analysis described in this section must be conducted prior to permitting and included in the DEIS.	GT1
19637	GLIFWC reiterates that the structural stability analysis must be conducted prior to permitting and included in the DEIS.	GT1

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19639	GLIFWC staff strongly state that given the lack of confidence in the structural integrity of the tailings basin, the dam break analysis and risk assessment must be conducted prior to permitting and the results included in the DEIS so that the public can be fully informed about the risks associated with this project. This position is supported by the following comments that were provided by the DNR Dam safety section to the Pre Draft EIS (DNR comments are available on the DNR FTP site): “Dam safety is concerned that the DEIS pushes addressing potential environmental impacts into the permitting process because the chapter is vague about what the final plan will be and it seems that all potential mitigation measures are on the table. It would have been better to review a conservative design with safety measures possibly deleted during permitting than the current design that may require possible additional safety measures to be added during permitting. The permitting process should smoothly flow from the EIS, but this chapter does not address the environmental impacts of potential changes to the design during the permitting process or provide good guidance for the dam safety permitting process. It would seem difficult to determine the environmental impacts without knowing the final plan. We are concerned that the responsibility for addressing the potential environmental impacts of any changes to the design will fall on the dam safety permitting process.” We agree with DNR technical staff and reiterate that stability analysis of the stockpiles and tailings basin are vitally important in the impact analysis for this project and must be performed prior to permitting.	GT1
19639	· Lack of tailings basin stability analysis.	GT2
19640	· Cumulative impacts to plant and animal species that are not listed as threatened or endangered. The focus of the EIS on listed species is understandable but other species that are important to tribal and non-tribal members would likely be impacted by mining projects. Moose, for example, are likely to be impacted through disturbance along the few wildlife corridors remaining along the Mesabi range and through wetland impacts of this project. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should be done as part of this EIS.	WI5
19640	· Cumulative impacts to wild rice. Wild rice is a valuable tribal resource that has been declining throughout the 1854 ceded territory. Mine effluent is often associated with levels of sulfate that has impacted wild rice and hydrologic changes from pit dewatering and seepage from tailings basins can also impact wild rice, which is dependent upon a relatively stable hydrologic regime. The cumulative impacts to wild rice have not been assessed.	WR5C
19640	The Cumulative effects of noise and vibration. These issues have not been analyzed although they were raised by the public during scoping.	N3
19640	The Cumulative risk analysis of transportation of hazardous materials. This issue has not been analyzed.	HM3
19640	· Climate Change implications of the proposed project. The project would disturb extensive areas of peat (Section 4.2) Peat is known to be an important carbon sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife will seek refuge as the climate warms. Changes in the frequency and intensity of precipitation events are expected to occur within the next 50 to 100 years. Increased severity of storm events and increased intensity of rainfall events have already altered the way in which municipal stormwater collection systems are designed. The tailings basin and stockpile designs, for which stability concerns remain, are designed assuming that the traditional climate normals still apply. This assumption is incorrect and further increases the likelihood that these facilities will fail in time.	AQ3
19640	The Cumulative risk analysis of transportation of hazardous materials. This issue has not been analyzed.	HM3
19640	GLIFWC staff believe this analysis is overly simplistic and contains numerous flaws. In general a qualitative analysis is attempted but important factors are often omitted or left uncharacterized. Furthermore, the qualitative analysis is carried forward in the document even where data are available to conduct a more robust quantitative analysis.	G8

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19643	GLIFWC staff reiterate that even though cumulative effects to groundwater, vegetation (other than threatened and endangered species), visual and noise effects, hazardous materials, and cultural resources weren't considered during the initial scoping period, they were identified later in the process and therefore should have been made a part of the cumulative impacts analysis and incorporated into the DEIS. As previously indicated, the scoping period for a federal EIS does not end until the issuance of the DEIS. These topics must be properly analyzed in order to comply with NEPA.	G9
19644	The spatial scale described for loss of wetlands in table 4.14-1 is too small to properly assess the cumulative impact to wetlands. Decades of taconite mining have destroyed thousands of acres of wetlands. These previous impacts by mining activity should be part of the cumulative impact analysis. In addition, the temporal scale is too short. The proposed project includes a number of components that will last for thousands of years. Therefore, the temporal scale for wetland impact analysis should also last for thousands of years. As previously stated for wetlands, the temporal scale of habitat fragmentation cumulative impact analysis should also last for thousands of years given the duration of post-mine treatment and maintenance needs.	WE5
19645	· Lack of stockpile stability analysis.	GT1
19646	The DEIS states that “ The Project and future actions would add new mercury emitting sources; however, the implementation of mercury reducing legislation will cause a reduction in existing mercury emissions in the region. This reduction will serve to off-set the new mercury sources and result in a net decrease in mercury emissions. Therefore, there would be no cumulative impact to fish from mercury deposition and bioaccumulation.” GLIFWC staff strongly disagrees with this conclusion. Section 4.1 describes the potential for increased mercury methylation associated with this project on the St. Louis River Watershed. The conclusion presented is speculative at best and is not based on quantitative methods.	WR5A,AQ4,AQ6A
19646	GLIFWC staff strongly disagree with the estimates of wetland loss and the potential impacts of that loss in table 4.14-2; see discussion in Section 4.2 for further detail. A cumulative impact assessment should be conducted after the flaws in the wetland section have been addressed.	WE2,WE5
19646	GLIFWC staff reiterate that the DEIS fails to adequately analyze cumulative impacts to either the Partridge or Embarrass Rivers. Cumulative impact analysis is hobbled by lack of baseline data. In Colby Lake, the community water supply for the city of Hoyt Lakes, aluminum, iron, copper, and mercury concentrations already exceed Minnesota Water Quality Standards (“WQS”). The existing large number of water-quality exceedances and the suite of constituents, particularly trace metals, exceeding WQS shows the site has not been remediated from previous mining activities. Additionally, amphibole or asbestos-like mineral fibers, known to cause digestive tract cancers in high concentrations, have been identified as existing pollutants in the Hoyt Lakes community water supply and their presence should be identified in the DEIS. Related cumulative-impacts issues such as groundwater drawdown or mounding due to multiple mine projects, water quality in aquifers impacted by previous and existing other mine projects, and surface waters such as the Partridge and Embarrass Rivers and Second Creek that are impacted by multiple mines need further analysis.	WR1E,WR5A,WR5C
19647	Regarding streamflow and water quality information presented in table 4.14-2. GLIFWC has commented extensively on the fatal flaws of section 4.1. GLIFWC staff strongly reiterate that there is no scientific basis for the conclusions presented in this cumulative impact section. This analysis should be done after adequate data has been collected and after a proper analysis has been done for section 4.1.	WR5A
19647	GLIFWC staff strongly object to the unilateral removal of tribal position statements submitted for this section by the DNR. Watershed GLIFWC staff strongly object to the unilateral removal of tribal position statements submitted for this section by the DNR. Hydrology GLIFWC staff reiterate that it is not possible to write a cumulative impact section because there is no credible data on the hydrologic impacts of this project.	G8C

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19647	GLIFWC staff disagree with the conclusions in table 4.14-2 that impacts to wildlife corridors would be minimal. Regarding the cumulative impacts of mining on wildlife corridors, section 4.4.5.3 states “These impacts should be considered significant” . The significant nature of the impacts is clearly stated in the Emmons and Oliver report (Attachment 10). GLIFWC staff are concerned that the analysis in the report has not been carried forward to the cumulative impacts section.	WI5
19649	GLIFWC staff reiterate that this is not an adequate cumulative impact assessment for water quality impacts. An adequate cumulative impact analysis would have quantitatively assessed the impacts of the multiple projects in the Embarrass and Partridge River watersheds for all parameters and not just sulfate and mercury. Data are available for the existing and predicted water quality impacts of Mesabi Nugget Phase I and II, the existing water quality discharges of Laskin Energy, and the legacy water quality for pit lakes for the other projects in the watershed. Predicted air quality emissions from NorthMet and Mesabi Nugget Phase II have also been developed. None of these data appear to have been used in the cumulative impact analysis. The tribal cooperating agency position is that a complete cumulative impact analysis should be conducted.	WR5A
19650	In addition to the methodological flaws mentioned above, GLIFWC staff reiterate that factual errors remain in this section. This section states that the NorthMet project is expected to meet all water quality standards. GLIFWC staff disagree. Sulfate, mercury, and specific conductance are already being exceeded in both the Partridge and Embarrass Rivers. Aluminum is being exceeded in the portions of the Embarrass River below the old LTV tailings basin and area Pit 5NW, as stated in the Water Resources section. Colby Lake (the Hoyt Lakes community water supply) already has several constituents including aluminum, iron, copper, and mercury in concentrations that exceed Minnesota Water Quality Standards. The existing large number of water-quality exceedances and the suite of constituents, particularly trace metals, exceeding WQS shows the site has not been remediated from previous mining activities. Therefore, this Project will have a cumulative effect on the waters in Colby Lake, the Partridge River and the St. Louis River.	WR31,WR5A
19652	· Lack of full analysis on the underground mining option (as required by the final scoping document).	PD1
19652	The Emmons and Oliver report on the cumulative impacts on travel corridors states that impacts are significant. This section also states that cumulative impacts are significant but then attempts to minimize that conclusion by stating that the NorthMet contribution to these impacts would not be significant. This last statement is irrelevant because it is the cumulative impact that is being discussed in this section. Furthermore, GLIFWC staff disagree with this final statement and we do not believe that it is supported by the available data	WI5
19653	GLIFWC staff reiterate that the Proposed Action has a number of serious flaws that must be addressed, both from the perspective of the substantive environmental impacts of the Proposed Action and from the perspective of presenting an adequate assessment of the potential impacts that the Project may cause. These include the likelihood of structural failure at the tailings facility, the lack of structural integrity information for the proposed stockpiles, and the need for perpetual water treatment and perpetual synthetic cover replacement to avoid contamination to surface and groundwater resources.	EOO
19654	GLIFWC staff reiterate that the tailings basin alternative is also seriously flawed due to the lack of accounting for the interaction between basin seepage and the existing tailings and the long-term water quality treatment that would be needed to prevent significant environmental impacts. The Permeable Reactive Barrier (PRB) that is proposed to be pilot tested during operations may require periodic recharging/replacement that would last for as long as water treatment is needed. The length of time that water treatment would be needed for tailings basin effluent has not been defined in this document but is likely to last centuries. In addition, it is likely that the proposed discharge of untreated tailings basin water to the Partridge River that is part of this alternative would further exacerbate water quality violations already occurring.	ALT4

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19654	As previously stated, GLIFWC staff believe that the environmental impacts associated with the mine site alternative have not been adequately defined. It is not possible to completely evaluate the environmental impacts of this alternative to surface water, groundwater, or wetlands due to the lack of baseline water quantity and quality information, the lack of knowledge on groundwater flow and the lack of understanding of the interconnections of groundwater and the extensive wetland complexes in the area. What data is available for the mine site, suggests that water treatment would be needed for an unspecified period of time (likely centuries) in order to avoid contamination to the Partridge River. It is the position of the Tribal cooperating agencies that these serious data and knowledge gaps should have been addressed prior to the release of the DEIS.	ALT2
19655	GLIFWC staff believe that this section is flawed. The DEIS mentions in several areas that analysis vital to impact assessment will be postponed until the permitting process (closure plan, tailings basin stability analysis, etc.). This lack of information does not allow for the development of adequate mitigation measures. GLIFWC staff do not see how a complete list of mitigation, that address reasonable and foreseeable impacts can be developed if the impact characterization is incomplete.	ALT9
19656	GLIFWC staff object to the way in which monitoring is used in this DEIS. As previously stated, the DEIS does not include vital information needed for impact characterization. Instead, the DEIS proposed to substitute monitoring of the project for an analysis that can be included in the DEIS. For example, the complete extent of indirect wetland impacts have not been determined. The DEIS acknowledges that some indirect wetland impacts will occur in addition to those impact identified in the document. The DEIS states that a wetland monitoring system will be used to detect impacts after the project is underway. This method is not acceptable to GLIFWC and does not meet the intent of NEPA.	ALT5
19657	This section states that monitoring program for the project operations and closure is included in RS 52. RS 52 is the applicants closure plan that was extensively reviewed and determined to be inadequate by state and tribal technical staff. In addition, RS 52 was produced in 2007 and there have been numerous changes to the project, including new tailings basin designs, new alternatives and new mitigation measures. There have also been changes to the proposed monitoring and it is unlikely that the original closure plans are valid. Finally, vital monitoring information regarding indirect impacts to wetlands are still being developed by the Corps. These plans should be finalized and included in the DEIS.	PRO3
19658	GLIFWC staff reiterate that the existing rail cars would spill ore along the length of the rail line the replacement of outdated rail cars should be added to the mitigation measure table.	ALT5
19659	· Lack of demonstration of the technical feasibility of the 95% capture efficiency required for the tailings basin alternative.	PD3
19659	· Lack of demonstration of a mechanism for the addition of Polymet tailings to cause ground and surface water quality improvements in the Embarrass River watershed.	WR1E
19659	The DEIS does not adequately asses the impacts of the proposed project to surface and groundwater quantity and quality. The analysis in the DEIS is based on faulty assumptions and inadequate data. The DEIS relies on professional judgment in areas where empirical data are needed to properly assess impacts. Finally, the DEIS does not characterize existing contamination of groundwater, surface water, and wetlands surrounding the existing LTV tailings basin. Without characterizing baseline contamination, it is not possible to properly assess future impacts and mitigation needs. The fatal flaws in section 4.1 are detailed below.	WR1E
<b>Sender Last Name:</b> Tammons		<b>Submission ID:</b> 1187
1302	Considering that this project will mine less than 1% copper, I believe that the waste, destruction, and pollution that this will cause is not worth the price we must pay. Wetlands will be destroyed (6700 acres) in our Superior National Forest is another negative regarding. Will our future generations be thanking us for what we let you (Polymet) do to our water, streams, lakes, and wetlands. Please think about this and say no to Polymet.	EOO,G7B,G7C

3180	We need to make sure our water and air are protected, so before we give anyone permission to do anything, it needs careful evaluation.	G2B,G7
<b>Sender Last Name:</b> Tepp <span style="float: right;"><b>Submission ID:</b> 2303</span>		
2745	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. It is disheartening that companies can continue to abuse our natural resources for the benefit of a few. Please stop this now!	EOO
<b>Sender Last Name:</b> Terwilliger <span style="float: right;"><b>Submission ID:</b> 3631</span>		
3913	Thank you for your work on behalf of the Polymet DEIS. I have read quite a bit of it and have paid special attention to the issue of water quality. I have a graduate degree in biology which includes work in both liminology and geology, so the DEIS is comprehensible for me. The site for waste rock appears to be designed adequately for the relatively short term and for most probable situations. The long-term however, appears to be not the case. The decades following the likely active life of this mine are the most threatening in the DEIS: the volumes of rock will be greatest, the surface area exposure will be greatest. All materials will be at or near the limits of their containments, and he mine company will have lost the incentive to comply with regulations. I herby request that you consider "over-engineering" the site for this phase of the mines life; it's when we who live here and our children, will have the most to lose.	EOO
<b>Sender Last Name:</b> Teselahl <span style="float: right;"><b>Submission ID:</b> 3373</span>		
3663	I think the proposals to mine this beautiful area of wilderness is absurd. This is an area that people from all over the world come to enjoy and get away from every day life. Mining this structure is not worth the reward or [illegible] of this area. Destroying the Boundary Waters area for this project would be very unethical. A solution needs to be proposed to protect this area from the devastation and loss that mining would cause this great place.	G2,G11
<b>Sender Last Name:</b> Tessneer <span style="float: right;"><b>Submission ID:</b> 2197</span>		
412	Has there been adequate public input on this issue? No. The public comment period needs to be extended until at least March, more hearings need to be planned in order to get an accurate perspective of public input.	PRO6
413	pollution. We must extend the public comment period so that Minnesotans have the opportunity to weigh in on mining proposals that will hurt Minnesota's great outdoors. Thank you.	PRO6
2006	Is there any way to ensure that the pollution will be cleaned up? No. At this point any cleanup would be the responsibility of the State, paid for by the taxpayers, and in the past has cost tens of millions of dollars.	PD3,PD4
2007	Taking all of this into consideration, we must require that the mining companies proposing projects that I will negatively impact Minnesota's environment prove that they have financial resources to clean up waste and	PD3,PD4
2604	Are there precautions to be taken to protect the environment? The mining company says yes. The technology is too new to have any guaranteed effect.	G6

2605	Has this type of mining been done safely elsewhere? The mining company again will say yes, but 89 percent of the mines that have said that they would not pollute actually have.	G6
<b>Sender Last Name:</b> Tewes		<b>Submission ID:</b> 314
328	I am writing to you today to show my strong support for PolyMet Mining's NorthMet Project in Hoyt Lakes, Minnesota. I am an Architect in the Duluth, Minnesota, and the spin-off jobs from this mining operation will bring needed construction that would require Architecture and Engineering Services. I attended an American Institute of Architects (AIA) conference in Minneapolis last week and I heard sobering news from my colleagues. The architects in Minnesota are at an unheard of unemployment rate of 40-50% (a quote from the AIA-MN Executive Vice President). If you include architects at reduced hours this number could be as high as 54%. The work by PolyMet would provide new design opportunities for Architects in Northern Minnesota, and ease these troubling unemployment statistics. Our firm seeks to benefit directly from this work in that we have been contracted by PolyMet to provide Architectural Services in the form of code analyses on a number of existing buildings at the PolyMet site. We have not had a chance to start this work because we are waiting the results of the \$20 million, 5-year EIS. Once this process is complete, we will be able to begin work on our portion of the site in Hoyt Lakes. Beyond my firm's direct contractual obligations with PolyMet, this work will mean jobs for my colleagues ranging from the design of new business buildings, updating existing buildings, designing housing and upgrading/new school buildings. PolyMet has shown due diligence in preparing the EIS. It is a complete, clear and concise document that definitively shows that PolyMet will protect the air, water and land of the Hoyt Lakes region. Thank you for taking the time to read my letter of support for the PolyMet Mining's NorthMet Project. I believe that this work will provide a huge economic impact to Minnesota, the Minnesota Arrowhead region and Architectural/Engineering firms in Northern Minnesota.	EOO,G6
<b>Sender Last Name:</b> Thastin		<b>Submission ID:</b> 1129
104	I request that a public hearing be scheduled for Duluth as it is the largest population center near and shares a watershed of the proposed mine area.	G10
105	I request that the comment period be extended to 180 days, the existing comment period is inadequate for professionals much less the general public.	PRO6
1237	I oppose the Polymet/Northmet project due to a high risk of serious environmental damage that may be impossible to control.	EOO
<b>Sender Last Name:</b> Thell		<b>Submission ID:</b> 1636
2059	Thank you for taking the time to read these concerns that everyone is sending. The Boundary Waters are not just a wilderness land, but an escape. They are there to remind people of what was here before humans. It is a peaceful retreat that brings people together. The Boundary Waters is a symbol of teamwork and unity because without that people could not survive. Polluting the Boundary Waters just shows that humans cannot keep anything pure. Efforts to try to clean the Boundary Waters will arise, but the Boundary Waters will never be the same. It will have the essence of being touched by man. The escape will not be a full escape.	EOO,G7B,G11
<b>Sender Last Name:</b> Therbjornseu		<b>Submission ID:</b> 1146
1258	400 jobs for 20 years is not worth permanent environmental damage.	EOO

3144	I support the no-action alternative in the EIS. The mining should NOT be allowed to proceed. I do not believe it can proceed without adverse affects to water and air quality. This is an area too close to the BWCA to tamper with in such an extreme way.	EOO
<b>Sender Last Name:</b>	Thomas	<b>Submission ID:</b> 1200
1315	I have been coming to the BWCA since 1971. I am a high school teacher and I regularly bring students to the BWCA for a week-long canoe trip. I am concerned that allowing open pit mining will contaminate the water of a large area of Minnesota, causing permanent damage. I strongly oppose allowing PolyMet Mining to proceed with their proposed mine.	EOO,G7B,G11
3187	I'm a conservative and support economic development in our state. I am also a sportsman and boater. I attended the PolyMet/DNR meeting Dec 10 in Blaine. It was clear to me by the bus-loads of union people there are folks needing jobs and it's natural they support this project. I came away from that meeting with many more questions than answers. There's a finite timeframe this mine will be useful. What happens to the land and water after PolyMet has their profits? What assurance do we have this technique is safe in the long-term? Don't screw up a treasure like the Boundary Waters Canoe Area because some Canadian company wants to make money or because we've got people on the iron range that need jobs.	EOO,G1,G2,G4
<b>Sender Last Name:</b>	Thomason	<b>Submission ID:</b> 2920
3254	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. For what will only be about 20 years of mining operations generations of possible natural destruction is too high of a price.	EOO
<b>Sender Last Name:</b>	Thomey	<b>Submission ID:</b> 1322
1543	Very concerned of the environmental imput. We are cabin owners on Laolette Lake. It angers me to see how blindsided [illegible] can be. The potential for environmental disaster is great while polymet will be generating a small number of jobs. I realize this is a desparate economic [illegible]- time to move on people. Healthy vs. wealthy	G11

365	After review of the NorthMet EIS, I believe that a major positive impact should be a domestic source of strategic precious metals. Based on USGS statistics, 90 percent of palladium consumed in the US is imported, primarily from Russia and South Africa. Canada has one PGM mine source. The United States has two small PGM mines, both in Montana. Most of the remaining ten percent was recycled from originally imported sources. Based on 2005 USGS data, there are no Nickel producing mines in the US, even though there were 221,000 metric tons of nickel consumed in the United States. At least 55 percent of the world's production came from third world or emerging markets. Some of the major producers are countries that do not have the best interest of the United States in mind, such as Venezuela, Indonesia, Cuba and Russia. I will let you decide the environmental considerations that the major PGM and nickel mining countries have when it comes to the mining and refining of these products. A major positive impact should be a domestic source of strategic precious metals. It is an issue of national security.	G1
366	Furthermore, I believe that the primary objective of not all, but many of the environmental groups is to eliminate mining in the United States. Civilization cannot survive without mining.	EOO
397	It is my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials - but that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	GT2
661	Concerning impacts on water quality, I understand that the water leaching from waste rock piles at the site is expected to exceed water quality standards for up to 2,000 years. This is unacceptable to me. It is unreasonable to expect that mining companies will be able to maintain water treatment facilities for that amount of time and it is an unfair burden to pass on to future generations of Minnesotans who will inevitably be left to pay for these operations. Additionally, it will be all but impossible to calculate sufficient financial assurance for a mining operation that is going to require such long-term care. In fact, a possible "mining moratorium law" such as in Wisconsin should be considered.	PD2,PD4
704	In addition, the DEIS predicts contaminated waters to be discharged from the mine site into the Partridge River after the mine's closure, as well as tailing's basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR4B,FM1
1248	Clean water for our future please...	G7B
1597	I am writing to you as a citizen of Minnesota concerned about the PolyMet NorthMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Please accept these comments on PolyMet's Draft Environmental Impact Statement. I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	EOO,G10
3467	While all of us are concerned about the economy and the needs for jobs for Minnesotans, relaxing environmental standards to meet a short term goal is not wise in the long term. Minnesota's natural resources are one of its prizes, and the priority we Minnesotans give to protecting our natural areas is something that makes our quality of life the envy of so many. Please do not approve licensing to PolyMet, or any other company with a like project, unless it can be proven safe, as Wisconsin has insisted.	EOO,G1,G2
3708	Furthermore, the continued operation of Polymet or other companies involved is not guaranteed. It is paramount that money be paid up front to pay for correcting any pollution or accidents that may occur and for clean up, restoration and environmental maintenance when the mine closes. This money should stay with the mine in case the mines ownership changes.	PD4
3709	There should be on going testing of air and water quality by a third independent party near the mining site. If there is any pollution exceeding federal or state regulations, remediation should be immediate or the mining process terminated. Timetables should be established with fines being given on a daily basis for foot dragging.	EOO

3783	I am currently of Madison, Wisconsin, but I plan to return to Minnesota to live within the next 5 years. With many fond memories and hope for future expeditions, I am very distressed by the environmental threats posed by potential new mining operations up in Superior National Forest so close to the BWCAW. Such mining has a shown history of destruction, and only after a thorough evaluation and approval by the public should the public's lands and natural heritage be put at risk. Everyone who stands to lose should have a voice	EOO,G11
3791	I believe more needs to be done to determine the total carbon footprint of this mining project to assure there won't be an increase in CO2 emissions for the region. Consideration needs to be given to needs to be made for electricity needed to mine and process ore, transporting ore and other materials into and out of the mining/processing site, destruction of forest, bog and wetland areas that currently take CO2 from the atmosphere and any other potential carbon emissions that could occur because of activities of the mining operation and/or other businesses that could develop to compliment the activities of Polymet.	G2B,G8
3893	I enclose a copy of my brochure my husband and I and my 3 part time workers have worked very hard for over 10 years to make this a sustainable business in northern minnesota. It is not compatible with H2SO4 mine drainage into our Laurentian Divide water courses and wetlands. Most businesses which have been built up even for generations in this region wil not thrive with the mine drainages, noise, particulates in the air, and even "ambience" of Cu-Ni mining. If Cu-Ni mining is allowed in this area you will be exchanging established jobs in tourism with sustainability and built-up good will over a long period if time, for the "premise" of jobs which will suffer every recession in the same downward curve as iron mines. Is my buisiness/job of so much less value that the "premise" of some cu-ni mining job?	G11

2555	As a Minnesota native, I appreciate the many lakes rivers and streams that makes our state beautiful and attractive to visitors. Protecting these resources is more valualbe than the jobs that minning would create. Please carefully consider the long term affects of this project	G7
<b>Sender Last Name:</b>	Tomassoni	<b>Submission ID:</b> 34
31	I've got 35 years in the mining industry, and mining has taken a quantum leap since I started working back in 1974. Companies today employ employees not only to be good workers but also to become safety professionals, quality inspectors, and environmental stewards in our business. Employees receive extensive training in the environment. And I just feel strongly that PolyMet is a great project for Northeastern Minnesota and with training, that people will become good environmental stewards and will make PolyMet a company that will set benchmark standards for other companies.	EOO
367	I am writing in full support of the Polymet Mining Project for Northeastern Minnesota! After being in the mining business for 35 years, I've seen many major and positive changes in the mining business. By far the top three improvements have been in the safety, quality and environmental fields! A business can no longer remain profitable (and in business) if these goals and values are not in line with all governmental rules and regulations. Being in the mining business at both Minntac and Keetac, United States Steel Leadership drove these values to each and everyone of us! Our top management team which included former USS employees, Joe Scipioni, Jim Swearingen, Paul Brunfelt, Jim Teiberg, Dave Draves and Latisha Giezten are now working at the Polymet and lead our team to run a very successful and environmental friendly business! They lead our team not because they were told to do so, but because they truly cared about the area and the people that call this area our home! Doing the right thing, being safe, having a quality product and being a great environmental steward were goals that these people held close to their hearts and minds! Some people in the state and from around the country are trying to drive fear, false information and the idea of uncontrolled pollution into uninformed minds. With the help of the State of Minnesota's mining and environmental permits along with federal and state guidance, the dedicated Polymet management team (along with its future 400 plus employees and countless vendors) will do the right thing and make Polymet a reality! A reality that I know in my heart and soul will be a flagship and a trend setting operation that will be used to bench mark other operations not only in the state, but in the rest of the country! We badly need these jobs in northeastern Minnesota now! We need these precious metals to strengthen and build our country now! I know the Polymet team will deliver on these promises to us in a safe and environmentally responsible manner! I also hope that the State of Minnesota and the U.S. Army Corp of Engineers will help Polymet succeed by giving its full support! I support the Polymet Mining Project 110 percent and hope that you will approve this project and help get our country working again! Together we can help the State of Minnesota and the United States diversify its economy and become a leader in a new precious metal mining business!	EOO

1117	<p>We appreciate the opportunity to participate in the public comment process on the Draft Environmental Impact Statement (DEIS) for PolyMet Mining Company and to add our voices to the thousands of Minnesotans who want to create jobs and produce metals that we all use every day and protect our environment for future generations. PolyMet Mining Company offers the State of Minnesota a win-win-win opportunity that we cannot afford to pass up. PolyMet is an economic win. It will create jobs at a time when the unemployment rate is more than 7% and as high as 14% in some cities on the Iron Range. During construction, PolyMet will require 1.5 million hours of labor so skilled workers will be on the job and not on the bench. Once fully operational, PolyMet will provide jobs to more than 400 workers at good salaries that families can live on. In St. Louis County alone, the spinoff jobs are anticipated to be more than 500. PolyMet also will generate millions of dollars in state, local and federal taxes each year. PolyMet is a strategic win. The copper, nickel, platinum, palladium, gold and cobalt that PolyMet will produce are essential to our way of life. They are found in electrical wiring, hybrid cars, wind turbines, stainless steel, jet engines, cell phones, computers, blood sugar test strips, artificial joints, catalytic converters and a myriad of other products, but the United States imports from 40% to 90% of these metals. We import them from countries that don't follow our stringent environmental laws, that subject miners to unsafe working conditions and that contribute to the global pool of pollution circulating in our atmosphere. Then, we contribute to greenhouse gas emissions by shipping them to another country for processing before we ship them to the U.S. And PolyMet wins by demonstrating environmental safety - not only because it is more environmentally sound than importing metals but also because PolyMet has shown that it will operate in a way that protects our air, our water and our land. The DEIS is an impressive review of the project and all its potential impacts -- along with alternatives that make it even better than originally proposed. The DEIS documents the many steps the company will take to operate in an environmentally sound manner -- from being a minor source of air emissions to the exhaustive waste rock stockpile management efforts. When mining ceases, financial assurance will be available to pay for closure if, for some reason, PolyMet is unable to do so. As elected officials representing the Iron Range, we are confident that after more than four years of PolyMet working with scientists and biologists and spending upwards of \$20 million, that the DEIS is covering all the bases. The products that will be mined are extensively used in our society. The data shows, a safe mining operation, one that has the controls to address the environmental concerns. We want mining to take place in Minnesota, where we know that the regulations are stringent and that regulators are tough on enforcement. We want mining to take place in Minnesota so that we can call upon our long tradition of mining excellence and show the world how nonferrous mining can be done the right way. Finally, we want it done in Minnesota so our country has its own supply of precious metals and will not have to rely on foreign dictators or polluting countries to make the products our green economy will need to be successful. The DEIS should receive an adequacy determination. Permitting on this win-win-win project should begin immediately.</p>	EOO
<p><b>Sender Last Name:</b> Tomonowich</p>		<p><b>Submission ID:</b> 3616</p>
3895	<p>Yes, after mining this country for over a hundred years other streams, rivers, mountains and lakes are in [illegible] shape. Compare this with the other half of the globe and you have concerns that are a hundred times greater than any risk we will take with mining. Our mining companies are environmentally sound. At this point in time they have strong safety regulations and environmental concerns. As far as I know there is nothing to keep the environmentalists from going to the other parts of the globe to clean up the environment in mining and health issues.</p>	EOO
<p><b>Sender Last Name:</b> Tomsich</p>		<p><b>Submission ID:</b> 3717</p>
1	<p>Because there is much more to indicate these projects will be pursued to environmental review, permitting, and likely construction, the exclusion of these three sulfide-metal mine projects, among others, from cumulative effects analysis is a major failing, and it must be corrected during the DEIS's revision.</p>	WI5

Comment ID	Comment Text	Theme Codes
1	Accurate and up-to-date lynx mortality numbers and locations must be included in the DEIS revision. An estimation of undetected lynx mortalities, in absolute numbers or in relationship to confirmed mortalities, must be included in the DEIS revision, along with a direct discussion of the data, assumptions, reasoning, and supporting scientific analysis underpinning an expanded treatment of lynx mortality.	WI1
1	As already discussed, the DEIS omits available and reliable data showing that at least one lynx, L11, has occupied the Project Area. <sup>60</sup> It may have been for a day, a week, or longer, depending upon the frequency with which locations were determined for L11.	WI1
1	In addition, the DEIS fails to discuss when, i.e., at what point in the lynx-hare population cycle, the 2006 winter tracking survey was conducted. The winter 2006 survey of the Project area may have occurred at or near a low in the Canada lynx population cycle. Because lynx populations cycle, an accurate determination of lynx usage should not be based on surveys conducted during a population low, but rather when lynx populations are high, or possibly in the first winter postpeak. The matter of timing in the lynx population cycle should be addressed in the DEIS revision.	WI1
1	These three sulfide-metal projects must be considered along with the Project, in analyzing the Project's cumulative effects on wildlife. Specifically, the three sulfide-metal mining projects would widen the Mesabi Iron Range substantially in the vicinity of Polymet and Teck Cominco, and would lengthen the Mesabi Iron Range to the northeast by approximately 10 miles. The cumulative effects on lynx movement would include significantly more impairment in an area where there are a lot of lynx being detected. The 115-mile long Mesabi Iron Range would be lengthened by nearly 9%, and significantly more designated lynx critical habitat would be destroyed. More habitat would be adversely modified in a permanent way, and still additional habitat would experience adverse effects lasting many decades.	WI5
1	These failings in the DEIS must be addressed by incorporating and considering the significance of all existing lynx location information, including at a minimum the confirmed lynx scat sample location data now being collected by the U.S. Forest Service, <sup>59</sup> and lynx location data collected by the Canada Lynx Project during its east-side lynx capture-collar-track study.	WI1
1	The NorthMet DEIS inadequately describes the wind direction and conditions at the Project site. The NorthMet DEIS, Volume II, provides a wind rose for Hibbing, Minnesota, implicitly suggesting that the Hibbing wind rose is relevant to determining wind conditions at the Project site. More detailed wind roses for two other locations - Ely and Virginia-Eveleth - are readily available but were omitted from the DEIS.	AQ4
1	Ely and Virginia-Eveleth are nearer to, and bracket, the Project site. Their wind roses also differ from the wind rose for Hibbing. First, the Hibbing wind rose is an annualized wind rose, meaning that a single diagram depicts the entire year's averaged winds. <sup>66</sup> The Ely and Virginia-Eveleth wind roses present monthly wind rose data. <sup>67</sup>	AQ4
2	Moreover, in order to be capable of providing more definitive conclusions about lynx presence and use of the Project area, the DEIS should have included winter lynx tracking data from several consecutive years, but it did not. The DEIS states that it is based on the 2006 winter tracking survey, and other general wildlife summer surveys. Summer surveys are not of value in determining lynx presence or absence. The fact that summer surveys at the Project area in 2000 and 2005 detected no lynx carries no probative value in answering whether lynx were present in the Project area at the time, because it is far rarer to sight an uncollared lynx in the summer than it is to encounter lynx tracks left in the snow. Any conclusions about lynx presence or absence based on summer habitat studies are suspect for lack of data. <sup>61</sup> For that reason, any suggestion of reliance on summer wildlife surveys to conclude that lynx were not present in the Project area at the time, should be qualified accordingly or deleted in the DEIS revision.	WI1

Comment ID	Comment Text	Theme Codes
2	Second, the Hibbing wind rose provided in the DEIS indicates that winds from the northwest and from the southeast predominate; southwest winds are far less common in Hibbing. This is significant, because it is southwest winds that are far more likely to blow pollution into the Boundary Waters Canoe Area Wilderness (BWCAW). In comparison, it is evident from looking at the wind roses for Virginia- Eveleth and for Ely that during many months of the year, southwesterly winds are among the most common. June, July, August, and September, when southwesterly winds are most common in Ely and in Virginia-Eveleth, are also the months when visitors to Minnesota's Class I areas (the BWCAW and Voyageurs National Park) is at its highest. In other words, from the perspective of human enjoyment and perception, the Project may be sending more of its pollution more often into the BWCAW than the DEIS reflects. It is not clear, from reading the appropriate sections of the DEIS, whether predictions of haze and visibility impacts from the Project on the Class I areas, were based on the wind data from Hibbing.	AQ4,AQ8
3	The DEIS should have included site-specific wind data, and the absence of that data is a meaningful flaw and could easily have been avoided. The DEIS must include better wind rose data, preferably from the processing plant and mine sites within the Project area. The DEIS should explain exactly how the Hibbing wind rose data was used, and must re-do whatever work incorporated the Hibbing data, using the Ely and Virginia-Eveleth data if site-specific data is not collected.	AQ4
3	The DEIS contains no recommended mitigations for the Project's negative effects on lynx, other than post-closure mine site reclamation. <sup>62</sup> The DEIS should have included mitigation measures that eliminate or minimize adverse effects on lynx. The mitigations for lynx suggested in this comment would also mitigate the Project's effects on other wildlife known to move through the Project area including, among others, wolf, moose, and herpetofauna.	WI1
4	DNR and ACE have not provided a sufficient basis or explanation for being unable to estimate financial assurance requirements associated with reclamation. If the adequate "detailed level of design" is not available for financial assurance purposes, how is it available for determining the extent of significant environmental impacts of the project, whether during operation or following operation? The DEIS offers no reasonable distinction between the amount of design detail required for financial assurance and the amount of design detail to evaluate the project's environmental impacts. If PolyMet has not yet offered a level of design detail to allow the agencies to evaluate end-of-life impacts, reclamation and financial assurance, then it also have not offered a level of design detail to allow the agencies to adequately evaluate the project's significant environmental effects.	PD3,PD4
4	The Forest Service specifically noted that emissions from the NorthMet Project over the course of each year are anticipated to cause a 10% change in light extinction for one day and a 5% change in light extinction for 36 days as compared to natural background. <sup>71</sup> The significance of the Project's contribution to visibility impairment in the BWCAW can be illustrated from the fact that the Haze SIP recognizes that a significant contribution to visibility impairment from an entire state equals a contribution over five percent. The fact that the NorthMet Project, by itself, is anticipated to cause a 10% change in light extinction for one day and 5% change in light extinction for 36 days as compared to natural background conditions is significant when considering that a five percent contribution towards visibility impairment from an entire state is considered significant by the MPCA.	AQ6
4	It is particularly troubling that the preliminary closure cost estimate summary which was included in the NorthMet DEIS fails to include projected costs for long-term water treatment. The NorthMet DEIS includes the following preliminary closure cost estimate summary, indicating that "[t]he costs provided were primarily intended only to provide an indication of the scale of the task and therefore were very rough estimates." <sup>8</sup> [See table in comment document] Notably, this preliminary closure cost contains no mention of the costs of long-term water treatment upon closure. The information included in the Closure Cost Estimate Summary misleads the public and creates the appearance that closure costs will be significantly less by leaving out the closure cost for what the EPA has identified as one of the most significant environmental issues associated with the NorthMet Project. The failure of this cost estimate to include costs associated with long-term water treatment leaves out what promises to be the most significant cost associated with the closure of the NorthMet Project.	PD3

4	Post-closure reclamation will neither bring back the permanently-destroyed habitat, nor make up for the three- to four-decade-long, up-front loss of reclaimable habitat. Post-closure reclamation also cannot compensate for the degraded condition of reclaimed land compared to the original habitat condition, pre-mining. But other mitigation strategies and opportunities exist and should have been explored. For example, in addition to post-closure reclamation at the Project area, the DEIS could and should have considered requiring PolyMet to begin immediate reclamation and revegetation on old mining areas that were never appropriately reclaimed and revegetated. Areas could be selected for reclamation and revegetation, so as to improve and expand existing wildlife corridors through the Mesabi Iron Range. Starting large-scale reclamation and revegetation in wildlife corridors beyond the Project area, concurrently with mining operations in the Project area, would likely improve (to some extent) habitat conditions for lynx in half the time required for post-closure reclamation.	WI4
4	Another example of mitigation that could have been considered is the purchase and retirement of conservation easements on lands adjacent to the north and south of wildlife corridors. Simple land management changes designed to benefit lynx and snowshoe hare could yield improvements in the value and function of wildlife corridors, simply by revegetating and creating larger blocks of core habitat connected to the corridors.	WI4
4	The DEIS should provide additional documentation to justify the elimination of these mitigation measures from consideration. Specifically, the DEIS indicates that the use of waste heat from the autoclaves to assist in the space heating requirements could ultimately achieve a 65% reduction in the overall NOx emissions. However, the DEIS eliminates this mitigation measure from consideration, “due to concerns over possible changes to the Project water balance,” <sup>75</sup> without providing any information or supporting documentation regarding these concerns to allow the public to weigh the potential benefits to air quality in relation to the changes to water balance. Considering the significant reductions in NOx emissions which could be achieved through the use of waste heat from the autoclaves for interior work space heating requirements, the DEIS should provide additional documentation to support the elimination of this mitigation measure from consideration.	AQ5
5	A second category of negative effects on lynx is the increase in expected lynx mortality resulting from the Project. The 4,000 miles of daily vehicle traffic between the mine site and processing plant site will make wildlife corridors ## 11 and 12 more deadly to lynx. The Project area is an area that currently experiences very little traffic, particularly in the corridor between the processing plant site and the proposed mine site. Increased rail and road traffic in that corridor will increase expected lynx-vehicle collisions and mortalities. <sup>63</sup>	WI1,WI5
5	To mitigate the on-site effects – increased chances of lynx-vehicle collisions and mortalities – the DEIS should have considered requiring the Project proponent to remodel the haul road and railroad line, so as to install bridges and wildlife underpasses in likely places, like stream valleys and vegetative funnels. In conjunction with the bridges and over/underpasses, wing-fencing (a.k.a. “drift” fencing) must be installed, inspected, and maintained so as to funnel wildlife to the safe crossing areas. Due to the funneling of wildlife to certain crossing areas, trapping on the property would have to be prohibited for as long as the road and/or rail corridor remain in use. When the Project is closed and reclaimed, the road and rail corridor should be obliterated and the fencing removed.	WI1
5	The proposed reductions in emissions included in the Haze SIP fail to meet the visibility goals of the Regional Haze Rule. Addition of new sources prior to a determination that visibility goals can be achieved, should not be permitted.	AQ6
5	The NorthMet DEIS does not adequately explain how the goals of the Regional Haze Rule will be met, notwithstanding the additional emissions from the NorthMet Project. The NorthMet DEIS needs to include an analysis and explanation of how the goals of the Regional Haze Rule will be met if the Project is built.	AQ4,AQ6
5	Further, the DEIS indicates, “that discussions are currently in progress with PolyMet, MPCA, and the FLMs to evaluate additional potential control measures that may be applicable to the Project,” that, “mitigation options exist that are being considered and could be evaluated in the Final EIS,” and that, “[t]he investigation is expected to be completed during the permitting process with MPCA and the FLMs.” <sup>76</sup> Information regarding additional mitigation measures that could be used to improve visibility conditions in the BWCAW and other Class I areas should be provided, to allow the public an opportunity to review and comment on mitigation measures which could help Minnesota achieve the visibility goals of the Regional Haze Rule.	AQ5

5 Mitigation measures should include, but not be limited to, actions that improve habitat post-closure, inside the Project area. If mitigation consists only of actions within the Project area, then the mitigation will come too late in time to be as effective as is possible. The mine will operate for 20 years, after which another 10, 20, or more years will be needed before vegetation re-growth may yield lynx-friendly habitat on the less-productive mined landscape.

WI4

6 The NorthMet DEIS failed to include an analysis of the cumulative impacts of all reasonably foreseeable activities on visibility in Minnesota Class I areas. Specifically, for example, the NorthMet DEIS failed to include an analysis of cumulative impacts on visibility from hardrock mineral exploration in the Superior National Forest, and entirely omitted the three additional sulfide-metal mines that are currently in advanced stages of exploration and development, in the assessment of cumulative impacts on visibility. The cumulative impact from these activities should be included in the NorthMet DEIS.

AQ4B

6 As noted elsewhere in this comment letter, the DEIS fails to include any discussion about three reasonably foreseeable, likely to be developed, sulfide-metal mines, among other projects. *Infra*, pp. 59-63. The DEIS cumulative effects review, consequently, fails to include these projects in its cumulative effects analysis.

180 I support PolyMet mining North Met Project. At this present time of 15% unemployment in the area, Polymet will significantly contribute to the State and Local economy when we really need jobs and economic benefits. Based on the extensive documentation as outlined in the DEIS, I am confident that impacts to the air and water will be minimal, if any. The EIS should be clearer; PolyMet is not in the Boundary Waters watershed. Mining these metals in one country, processing them in another and then transporting them to the U.S. creates unnecessary greenhouse gas emissions. I represent two hundred seventy two members of the International Brotherhood of Electrical Workers that live and work and play in Northern Minnesota.

EOO

3898 To whom it may concern my name is Travis Topel and I am a laid of union electrician out of local 292 Minneapolis, mn. I also was raised and graduated from Hibbing High School on the Iron Range. I have lived in the twin cities metro for about three and a half years now, but I still manage to travel home to see family and friends. Even though I live a ways away from this area of where this project is going to be built it will still impact me in many ways if the project proceeds. A direct way it will impact me is that I will probably be able to get back to work so I can make a good honest living to pay for my house. Many other ways it will impact me is that the economy with start to thrive again for the area so my family and friends can also find jobs to pay for things. Plus with the new people moving into town to work at the plant after it is up in running the town “where I grew up at” will start to grow again and put kids back in the schools so they will stay open. On an environmental note I do not see where this is going to cause a problem with the environment. We have the technology in the world today to properly excavate and build a clean efficient running facility that should meet or exceed the EPA regulations. PolyMet has already shown this by wanting to use an existing site and renovating the facility that is already there. They have done extensive research to show there wanting ability to build a great facility and still keep a clean environment for the northeast area of Minnesota. The even better thing about the facility being built here in Minnesota is that it will provide domestic minerals for the United States. Which in return will hopefully help more of the United States economical problem get better. I believe that if you do not let this facility proceed that it could mean even greater loss for Minnesota families and friends with that lack of a good economy with good paying jobs, which none of us want in these hard times.

1311 I'm very concerned about the proposed PolyMet mine in northern Minnesota, particularly about water contamination and threat to eco-tourism economy. Minnesota waters should not be polluted with heavy metals and sulfates, especially not waters protected as wilderness & essential to our quality of life as Minnesotans. Water from waste rock piles will be polluted for up to 2000 years, and we can't expect mining co's, to be responsible for water treatment & clean-up. Taxpayers, no doubt, will bear the brunt of this debt & loss of our water quality.

3582 I understand that copper sulfide mining is being considered in our bioregion. I'm just writing to say what a wonderful idea this is for the long term future of the economy, especially when considering the health of our natural resources that future generations will depend on. I think it's great that large multi-national corporations (that have no interest in the long term well being of the area) would turn a huge short term profit (moving natural wealth out of the area) by extracting large amounts of natural resources. I'm sure the future generations will appreciate both the clean up costs and environmental impacts they will have to deal with. Pardon my sarcasm. Looking at the environmental and economical track records of large mining operations makes it obvious that allowing this mine would be a bad decision overall for the long term interests in our region. I have also looked into the particulars of this specific type of mining and I am very concerned with Polymet's plan. Thank you for hearing my concerns.

3182 Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. The impacted area is one of my favorite vacation areas. I can't believe that such a toxic enterprise is even being considered anywhere in Minnesota, let alone such a beautiful portion of the state. Even if there were no associated health risks, to allow such environmental degradation in this area not only robs tax-paying citizens and future generations of the opportunity to enjoy the high-level natural resources currently present, it will also impact the local tourism industry, mitigating any financial benefits from the proposed mining activities. However, the health risks cannot be understated, both to humans, flora, and fauna. We should follow the lead of the State of Wisconsin and ban this type of mining. Please deny this proposed mine.

151 I just want to say: Is it worth 40 years of jobs to pollute the environment forever? That's all I want to say. I'm sorry. It's not. To me it's not worth 40 years of working to pollute the Great Lakes with the salt, with the run-off down the St. Louis River ultimately to get into the Boundary Waters. It's not worth it to me. And I have financial interests in the area.

1600	I am writing to you as a citizen of Minnesota concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest. Clean water is the most valuable resource that Minnesota has. Future wars will probably be fought over water rather than oil. As a chemistry major and long time chemistry teacher, I know how difficult it is to control even small simple reactions in the lab. If you think back on your lab experiences, you will concur. To believe that massive reactions with extremely heterogeneous materials can be controlled is wishful thinking. Sulfide mining would be new to Minnesota. In other locations, sulfide mining has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Often, taxpayers have been stuck with the costs. Please think long term. Before this sulfide mining project is even considered for permits, please fill these gaps:	G2A,G4A

1674	As a lifelong Minnesotan, I've come to enjoy the bountious unspoiled natural settings that our state has to offer. This mining plan as currently presented poses serious and dangerous impact to the environment and everyones enjoyment of our great outdoors. I understand the value of the metals that are the goal of this mine, and I am sure I benefit from their use everyday. This does not outweigh in my mind the value of our clean water and fish populations. We are the caretakers of this earth, and I see it as our duty to not create scars on it that it cannot heal in our own lifetime or even the lifetimes of our children and grandchildren. Please take all measures necessary to ensure that this plan does not go forward without proper measures in place to ensure the safety of the water, wildlife and all nature surrounding the area. 285	I am a resident of Hibbing, MN and am in support of the PolyMet / NorthMet project. I have briefly read through portions of the draft EIS, and have followed some of the news coverage of the project. I realize this is a complicated issue that requires thoughtful consideration of societal and economic benefits weighed against the environmental consequences. It seems to me like the planned environmental impacts are mitigated and very small in comparison to the benefits of the project. I realize that mining is a dirty business, but PolyMet seems to have an environmental plan in place to mine these ores in a more environmentally friendly manor that almost any other similar mine in the world. 416	e. The DEIS did not adequately characterize the potential for possible contaminants from the closed mine and tailings basin to reach the Partridge River and Embarrass Rivers through the groundwater flow systems. There was no consideration of possible migration of contaminants in bedrock under the Partridge River or Embarrass River or whether the river constitutes a no-flow boundary for anything but the surficial materials. I recommend that DNR do appropriate field studies to show whether both rivers hydraulically connect to bedrock aquifers beneath it, and whether groundwater flow paths move under the river in the bedrock.	WR2A

**Comment ID**    **Comment Text**    **Theme Codes**

416 d. The DEIS did not adequately address the degree to which groundwater and associated potential contaminants might leak from the tailings basin because of uncertainties in material properties of the porous media along the flow path and other assumptions used. Here, the tailings pond has been in place through prior operations for decades. I recommend that DNR obtain direct measurements of head and water chemistry either by GeoProbe or piezometer nests downgradient and perpendicular from the existing basin to provide ground truth with respect to the degree that leakage and solute transport may occur, including possible approximation of probable retardation rates for metals.    WR2C

1 The DEIS, as currently written, is inadequate by the standards of NEPA and must be significantly improved if a responsible accounting of the environmental impacts of the proposed project is to be developed. The following general comments detail several fatal flaws of this DEIS.    G8

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2	<p>Baseline. The baseline data for both the mine site and the tailings basin are sparse. A comparison of hydrologic data that was collected for two other projects in the region (GLIFWC letter to Jon Ahlness and Stuart Arkley, February 6, 2009, Attachment #1) demonstrates that the PolyMet project is datapoor in the area of basic hydrology. The use of flow data on the Partridge River from a site twenty years and seventeen miles distant from the proposed project does not provide sufficient information to allow a adequate assessment of the hydrologic and environmental impacts of the project on the Partridge River. The lack of groundwater level data in the surficial aquifer and in the bedrock, except in the immediate vicinity of the mine pits, does not allow for a full or complete characterization of the watertable or the potentiometric surface in the bedrock or the surficial aquifer. The current bedrock groundwater model calibration to shallow wetland pizometers cannot be justified. The lack of groundwater level data at the tailings area except in the immediate area of the tailings piles prevents any characterization of water tables, potentiometric surfaces, and groundwater flow in the surrounding wetlands and uplands. The dramatic scarcity of hydrologic data for the PolyMet project, both at the mine site and at the site of the tailings basins has been repeatedly recognized by hydrologists at technical meetings. Limited data collection to fill in the data gaps has recently been conducted and in general has not been incorporated into the DEIS's hydrologic analysis of the mine or plant site. Analysis. Hydrologic characterization using MODFLOW models was done for the immediate area of the mine pit and the tailings pile only. There are no groundwater models that were designed to characterize the watertables, the potentiometric surface in the aquifers, fluxes to rivers and streams or to predict impacts to the water tables or surface waters. The MODFLOW groundwater model at the tailings area is restricted to the tailings pile and cannot be used to characterize groundwater flow direction, the watertables, the potentiometric surface in the aquifers, fluxes to rivers and streams or to predict mounding impacts to the water tables or surface waters. Data driven models need to be developed and these impacts need to be predicted and evaluated. The view that mine pit dewatering impacts will be very limited or non-existent (Adams, John and Michael Liljegren. 2009 "Additional PolyMet peatland data / information." email communication to Stuart Arkley. February 1, 2009) is based on the assumption that there is little or no connection between the bedrock and surficial aquifers (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009, Attachment #2). However, the scant data that does exist characterizing mine site hydrology suggests that there may be substantial connection between the bedrock and surficial aquifers. Such a connection would mean that dewatering of the mine pits could cause significant drawdown of the watertable in the surficial aquifer. Data presented in technical document RS02 indicates that ammonia can be found in deep boreholes. Section 3.3 Analytical Results, Pg.10 of RS02 states: "The water sample from boring 05-407M exceeded the criteria for ammonia (1,900 ug/l)"; and goes on to state, "The sample from boring 05-401M exceeded criteria for ammonia (610 ug/l)."; and "Water quality criteria were exceeded for ammonia, aluminum, copper, and silver in both boreholes."; and concluded that, "The presence of ammonia in the deep boreholes may indicate that the water in the borehole came from the shallow surficial deposits. Ammonia is not typically found in deep bedrock systems but is common in wetland environments." Similarly, technical document RS10 concludes: "The presence of ammonia nitrogen in the samples likely indicates that there is a hydraulic connection bet</p>	WR2A

3	<p>PolyMet project would use some of the degraded areas of the old LTV site to develop the mine plant site and re-use the tailings basin. Groundwater contamination from the previous mining activities is still an issue near the LTV tailings basin more than twenty years after operations ceased. Because of the limited distribution of monitoring wells, the extent of the contaminant plume is not known. However, recent well data show that the plume extends in some areas at least as far as private wells along the Embarrass River. In the wells that do exist near the tailings basin, pollutants including iron, sulfate, manganese, aluminum, and fluoride exceeded drinking water standards. Recent wells near the northern property line show substantial contamination of the groundwater aquifer (Barr 2009, Memorandum: Results of Tailings Basin Hydrogeological Investigation. June 2, 2009, Attachment #3). The baseline data on which to base estimates of the impact of the proposed project on water quality at the mine site and the tailings basins is insufficient. The existing analysis for the PolyMet project calculates the additional constituents that the project will add to groundwater but is unable to realistically estimate what the resulting water quality will be because background water quality has not been incorporated into the estimates. Private domestic wells lie between the tailings basin and the Embarrass River where tailings basin discharge water is expected to ultimately discharge. Some of the sampled private wells have contaminants at levels several times the drinking water standard (Results of residential well sampling north of LTVSMC tailings basin. January 27, 2009, Attachment #4) Samples from these wells show exceedances of manganese and close to exceedances of the arsenic standard. Once a groundwater flow model is developed that would show the direction and rate of groundwater flow, that pattern of flow should be used to plan a groundwater sampling scheme that would map the extent of the existing contaminant plume. This data and analysis should then feed into estimates of how the proposed project would interact with existing contamination. The combination of existing conditions with impacts due to the proposed project would show what groundwater quality can be expected during and post project. Surface water quality at the project has been poorly characterized or left uncharacterized. The limited data that exist suggest that surface waters are already adversely impacted by mining activity. Mercury, sulfate and specific conductance have exceeded Minnesota surface water criteria in surface water samples collected near the tailings basin proposed for use by PolyMet, at nearby Area Pit 5, and mercury exceeds surface water criteria in the Partridge River downstream of Colby Lake. However, no water samples have been collected from lakes near the tailings basin (Hiiekillia, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings pile have caused contamination of those waterbodies. Contaminant transport modeling suggests that the PolyMet project will cause manganese, aluminum and sulfate to exceed standards. Proposals to collect data and monitor groundwater appear to have stalled. These would allow for identification of potentially significant groundwater and surface water impacts.</p>	WR1E
4	<p>This section should clearly state that under the proposed project, the wastewater treatment facility and pumping stations will need to operate for hundreds or thousands of years to avoid contamination to the Partridge River. This statement is a simple part of describing the project (i.e. length of time the project will last) and must be included.</p>	PD5
4	<p>This section should describe expected leakage rates as well as the long-term effectiveness of both the liner and cover systems. Given that the applicant has not proposed any long-term maintenance of these systems, these parameters should be described in this section and taken into account in section of the EIS that predict long term surface and ground water quality. This information is a simple part of describing the project (i.e. length of time the cover systems are expected to last) and must be included. Furthermore, table 3.1-9 is misleading. It indicates that the stockpile duration is permanent, while that is true, the liner systems on which the integrity of the stockpile and the water quality of the stockpile effluent depend are not permanent. The EIS should not selectively omit pieces of information. The life expectancy of the liner and cover systems must be included, regardless of the fact that such information may put the project in a negative light.</p>	PD4

Comment ID	Comment Text	Theme Codes
5	<p>GLIFWC staff disagree that the amount of ore that could escape from rail cars would be “small.” Taconite pellets currently litter the railroad right-of-way between the plant site and the proposed mine site, confirming that spillage from rail cars does occur (attached Figure 1). Second, fugitive dust escaping through these gaps is also a concern. Given the duration of this proposed project and the large quantity of materials to be moved, approximately 228 million tons of ore and 394 million tons of waste rock, there will be tracking, dusting, and spillage of material that has been demonstrated to leach contaminants when exposed to air and water. Even a loss of only one thousandth of one percent (0.001%) of the extracted material to tracking, dusting or spillage would result in 6,220 tons of fine leachable material being released into the environment. Our experience with a much smaller, shorter duration, sulfide mine in Wisconsin (Flambeau Mine) indicates that tracking and dusting of ore and waste rock, even at a level that is unnoticed during operations, can result in soil and runoff contamination that exceeds standards. Transport of ore between mine site and processing plant will be done by rail using the rail cars previously used by LTV. These cars are not sealed and will readily spill a fraction of the approximately 228 million tons of ore they are transporting. Attached are pictures of the cars proposed for transporting the sulfide ore (attached Figures 2 and 3). The rail line between the mine and the processing plant is approximately 8 miles long, 1 mile of which is over wetlands, and crosses over at least 3 creeks. The current proposal to use existing rail cars for ore haulage raises concerns about impacts to biotic endpoints along the rail corridor. Given the design and current condition of the rail cars proposed for transport an ecologically significant amount of spillage could occur into these streams, wetlands and their watersheds. Because transport will deposit some level of ore and ore dust along the rail line, methods for control of contaminated runoff from along the rail line must be developed and implemented in the mine plan. During the operation of the mine, ore dust from haul trucks and from haul roads and waste rock dust from trucks and stockpiles will escape into the adjacent wetlands and uplands. All lands within the mine site and in a buffer around the mine site can be expected to receive metal contamination from dusting and tracking. All waters collected from within the perimeter of the mine site should be considered contact water and retained until treated or until the water is tested to demonstrate that the water has not been exposed to mine derived contaminants . Within the footprint of the proposed mine, good baseline data on the chemical characteristics of runoff must be collected prior to mining so that changes in runoff water chemistry can be detected. The DEIS states that rail maintenance crews can collect spilled debris along the rail track. The material of significant concern would be too small to pick up. GLIFWC staff are unsure how ore debris can be visually distinguished by rail track maintenance crews from other rocks and ore that litter the embankments. In addition, spillage of fine ore pieces and dust (the most leachable sizes) into the wetlands and creeks that are located along the rail line could not be easily identified and recovered. It is reasonable to assume that some acid drainage and metal leaching would occur along the waterbodies located along the rail line. GLIFWC staff do not believe that the method described in the DEIS to segregate fines in the center of the rail car is practical. In addition, DNR technical staff commented on this approach in a previous version of the DEIS (December 2009)” “Spillage of fines has occurred at other mine sites through gaps in railcars. The mitigation method proposed by PolyMet includes a plan to place fines in the center of the railcar, with the</p>	PD5
5	<p>GLIFWC staff object to the unilateral removal of the tribal position statement for section 3.1.4 by the DNR. We reiterate that the section should state the Polymet will assume responsibility for these legacy contamination issues if it is granted operating permits for its proposal.</p>	PD2
6	<p>GLIFWC staff object to the unilateral removal of the tribal position statement for section 3.1.5.3 by the DNR. We reiterate that this section should describe expected leakage rates during operations as well as the long-term effectiveness of the liner system. Given that the applicant has not proposed any longterm maintenance of this system, these parameters should be described in this section and taken into account in sections of the EIS that predict long term surface and ground water quality. In addition, this section should describe expected leakage rates during operations as well as the longterm effectiveness of the cover system. Given that the applicant has not proposed any long-term maintenance of this system, these parameters should be described in this section and taken into account in sections of the EIS that predict long-term surface and ground water quality.</p>	PD7

6	GLIFWC staff object to the unilateral removal of the tribal position statement for section 3.1.7 by the DNR. We reiterate that the existing Closure Plan is insufficient to allow an adequate assessment of post-closure impacts and does not comply with NEPA requirements. The Proposed Action has changed significantly since the development of the Closure Plan, and additional detail is needed to appropriately inform post closure impacts, since those impacts depend on the specific plans and methods used to close the mine. For example, the conclusions of the West Pit Lake Uncertainty Analysis (DEIS page 4.1-84) state that "As indicated in Table 4.1-45, some of the waste rock stockpiles have the potential to leach solutes to groundwater for long periods (i.e., at least 2000 years), so these effects would be significant." In order to adequately assess the environmental impacts of the Proposed Action, additional detail on the specific environmental impacts of this leachate and information about the remediation activities that would be needed to avoid damage to surrounding waters should be included in the Closure Plan.	PD7
7	GLIFWC staff object to the unilateral removal of the tribal position statement for section 3.1.7.2 by the DNR. We reiterate that this section should acknowledge that the pit lake will remain at the site in perpetuity and will exceed water quality standards, and should discuss its status as a "water of the state." This section should describe the long-term effectiveness of the geosynthetic membrane that is proposed to cover the Virginia formation rock wall. Given that the applicant has not proposed any long-term maintenance of this system, expected long-term leaching rates should be described in this section and taken into account in sections of the EIS that predict long term surface and ground water quality. This section should list the potentially significant environmental impacts of a stockpile failure, a slope stability analysis must be performed and included in the DEIS. For more information, see section 4.13 of this document.	PD2,PD3
8	The DEIS does not include a preferred alternative. This omission creates serious problems because development of financial assurance and closure information become more difficult. We believe that at this point in the project, there are no permittable alternatives in the DEIS. It is possible that a permittable project could emerge with the incorporation of several of the identified mitigation options, however, the environmental impacts of the various measures have not been fully characterized and therefore the DEIS is inadequate.	PD1,PD3,CR1

19670	GLIFWC staff object to the unilateral editing of the tribal position statement for section 3.1.7.3. The positions included in the DEIS are not what the tribes submitted and were modified without our consent. We reiterate that in order to adequately assess post closure impacts, this section should estimate the length of time that seepage collection would be required at the tailings basin. The pumping and water treatment activities described in this section would have to be conducted in perpetuity, and the cover and liner would require perpetual maintenance. This perpetual maintenance requirement is a basic descriptive fact of the project and should be included in this section. The cover and revegetation paragraph in this section should indicate that the applicant has not demonstrated that vegetation can be sustained without perpetual inspection and maintenance of the vegetative cover. This data gap should be addressed in this section of the DEIS. This section indicates that ponded water from the top of the hydrometallurgical residue facility and drainage from the bottom of the facility would be collected and transported to the WWTF for treatment and discharge to the wetland treatment system. This section should state that the WWTF may need to operate for an extended period of time (hundreds of years) and the feasibility of this has not been determined. Furthermore, DNR technical staff and GLIFWC staff have repeatedly indicated to DNR managers that the ability of the treatment wetland to treat water in the long term is in doubt and no analysis of the effectiveness of the treatment wetland has been provided. Finally, it should be indicated that the pumping of drainage from the bottom of the hydrometallurgical facility cells would be required in perpetuity to avoid a “bathtub effect” in the cell which would lead to a catastrophic failure of the cell. These issues are basic descriptive facts about the project and should be included in this section. The Cover and Surface Runoff Control paragraph indicates that the turf cover would need to be mowed “once a year”. The section should note that this would need to occur in perpetuity in order to permanently inhibit tree growth. This is necessary in order to prevent root damage to the cover system. The DEIS should discuss the feasibility of this plan. Finally, the section of cost estimate indicates that the complete amount of financial assurance for this project “cannot be estimated until these actions are understood at a deeper level of design detail”. While this may be sufficient for the state process, it is inadequate in the view of the USEPA, as described above.	PD2,PD5,PD6
19671	GLIFWC staff object to the unilateral editing of the tribal position statement for section 3.1.7.3. The positions included in the DEIS are not what the tribes submitted and were modified without our consent. We reiterate that the applicant has not demonstrated the effectiveness of the secondary wetland treatment system. In addition, the section should note that the long term impacts of the project and the potential need for post closure activities would continue for hundreds or thousands of years. The applicant and the DNR have not addressed how this very long term maintenance plan meets the stated goal of Minnesota’s reclamation statute.	PD2
19672	GLIFWC staff disagree with the assumption that the proposed project would only result in social and economic benefits. The environmental impacts of the project on the 100 Mile Swamp, an undisturbed and very high quality wetland complex, would constitute a social impact. Furthermore, economic development that is not centered on heavy industry (tourism for example) would be adversely impacted by the project. At the end of the project life, there would also be negative economic impacts as the surrounding communities deal with the loss of primary employment and economic revenue streams that were dependent on the Project. It is important that the DNR present a balanced picture of the impacts of this project. A one-sided presentation of social and economic impacts does not fulfill the need for full disclosure in a DEIS.	PD3

19672 Section 3.2.3 is misleading to the reader because it omits several important facts. First, the section indicates that 95% of Polymet tailings water would be captured. However, this 95% number is only true if one ignores the existing tailings water seepage. This seepage, which violates groundwater quality standards and which Polymet would assume responsibility for if permits are granted, has already contaminated the groundwater and wetlands between the tailings basin and the Embarrass River. The section should explicitly state that existing discharges from the basin are not included in the 95% number and therefore, contamination north of the tailings basin will continue into the foreseeable future. GLIFWC staff believe that water treatment of the discharge would be required to comply with the Clean Water Act and the wild rice water quality standard. GLIFWC staff are skeptical of the accuracy of the predicted 95% water capture efficiency. Information presented by Barr Engineering (PolyMet consultant) for capture efficiency at the Minntac tailings basin, which is also a taconite tailings basin of similar design as the LTV basin, stated that 59% was the maximum possible water capture efficiency. Minntac (USS) is currently proposing a seepage capture system with an estimated 40% capture efficiency because of excessive cost and infeasibility of the 59% efficient design. GLIFWC staff note that 95% is the capture efficiency that would needed to occur to prevent sulfate from entering the high risk methylation area north of the tailings basin. However, GLIFWC staff are not aware of any study that demonstrates that the 95% capture efficiency is technically feasible. This demonstration should be performed and included in the DEIS. Finally, GLIFWC staff believe that Figure 3.2-2 is incorrect. The extent of the wells evaluated by Barr Engineering (Polymet's consultant) for the tailings basin alternative only extends along the north of cell 2E. Figure 3.2-2 is instructive in that it shows the extent of capture wells that are needed to deal with historic sulfate discharges from cell 2W as well as 2E. This is the extent that should be proposed by PolyMet. GLIFWC staff note that although they participated in the identification of potential mitigation measures for the tailings basin, they did not participate in the development of the tailings basin mitigation design. In addition, it is the position of the tribal cooperators that an untreated discharge of contaminated tailings basin water to the Partridge River in order to dilute and dispose of tailings basin water would have environmental impacts that must be avoided in order to adequately protect the environment and meet water quality standards. GLIFWC staff are also concerned about project dependence on the testing of the Permeable Reactive Barrier. This type of treatment has not proven effective at treating sulfate in tests conducted at the MINNTAC taconite mine (Table 3.2-3) The effectiveness of such treatment is very speculative at this time and we believe that the "periodic recharging" of the barrier would need to occur in perpetuity. GLIFWC staff disagree with the rationale for eliminating the underground mining alternative presented in Table 3.2-4. We reiterate that this alternative was eliminated prematurely and without sufficient consideration. Staff note that analysis of unquantified environmental impacts, values, and amenities have not been evaluated as required by CEQ regulations. A study of this particular deposit was performed by U.S. Steel. At that time they recommended underground mining. In addition, this site is identified as an underground project in Figure 37 of the Siegel and Ericson Copper Nickel Study. By examining cross-sections showing the distribution of ore by depth (Figure 4.1-2), it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine . The ecological costs of open-pit mining and above-ground dispo

PD5,G1

19672 As previously indicated, GLIFWC disagrees with the rationale used to eliminate underground mining as an alternative.

PD5

19674 The assumption that the wetlands in the area are perched and receive no groundwater inflow is based on incidental observation and the analysis of aerial photography, which is by its nature imprecise (Adams, John and Micheal Liljegren. 2009 "Additional PolyMet peatland data / information." email communication to Stuart Arkley. February 1, 2009, Attachment #2). GLIFWC notes that, contrary to Figure 4.3-1, the wetland delineation conducted by Polymet (RS14, 2006), indicates the presence of several hundred acres of cedar swamps and tamarack wetlands. These vegetation types, by definition, rely on an influx of groundwater to support them. In addition the wetland delineation does not encompass all wetlands that are likely to be affected by the project. Because no initial determination of the projects area of influence (AOI) on wetlands was made, the site field surveys of wetland and other vegetation was limited to little more than the area within the project fence. The existing characterization of wetland and other vegetation does not cover even one-half the area that might reasonably be expected to be impacted by secondary impacts of the mine due to disruption of the existing hydrology. Around the tailings basin virtually no wetland delineation has taken place although wetland impacts from inundation are likely to occur.

368	Thank you for the opportunity to provide my opinion and comment on PolyMet Mining Company’s draft environmental impact statement currently under public review. As a geologist who spent much of his career exploring and assessing the Duluth Complex, I am well acquainted with the potential this deposit holds and the cautions that must be employed should the ore body be mined. I am pleased that PolyMet has taken the unique challenges of sulfide mining into account, as documented in the draft environmental impact statement. In general, my greatest concern for the environment when mining a sulfide ore body is the potential to create acid mine drainage when the sulfide in the ore reacts with oxygen and water; this is of particular concern with stockpiles. PolyMet clearly is cognizant of this potential and has proposed a rigorous and robust system of controls to manage its waste rock stockpiles, as well as other portions of its operation. For example, PolyMet has characterized its ore body thoroughly and will manage waste rock according to its potential to generate acid mine drainage. Stock piles will have liners and sturdy, engineered foundations with a drainage systems built to collect any water that percolates through the stockpiles during operations. When mining is complete, plans call for covers designed according to the waste rock’s potential to generate acid; these covers, which ultimately will be vegetated, will minimize the water that is able to come into contact with the waste rock. Additionally, PolyMet will use the sulfide in the ore as fuel in its hydrometallurgical processing – maximizing the use of the ore extracted from the ground and minimizing the use of greenhouse gas-producing fuels. As a geologist, I have had the opportunity to examine how mining practices are conducted in other parts of the country and the globe. Frankly, Minnesota’s environmental protection requirements are the most stringent I’ve seen, and I am confident that state and federal regulators will help ensure that PolyMet conducts its operations in an environmentally sound manner that protects our natural resources. I use the minerals that PolyMet will mine and process—as does every person in Minnesota. I prefer to “buy local” when it comes to my minerals whenever possible – from mines that will be overseen by regulatory authorities I trust to protect the environment. I do not share the same confidence in regulatory authorities in other jurisdictions. While mining and processing ore in an environmentally responsible fashion, PolyMet also will be creating jobs – more than 400 full-time jobs at full operation and a minimum of 500 spinoff jobs. Construction of the plant will require 300 construction workers to work 1.5 million hours over three years – an economic injection our local economy desperately needs. I believe that the draft environmental impact statement does what it was designed to do – to look at the issues identified in earlier public comment periods and to assess the impact on the environment. The draft demonstrates that, with some modifications, the project can move ahead without harming our environment. Please acknowledge this demonstration by determining that the draft is adequate so that permitting can begin.	EOO,G2A
<b>Sender Last Name:</b>	Ulmen	<b>Submission ID:</b> 344
369	I have reviewed the Polymet Mining Draft Environmental Impact Statement as posted at the site of the MN DNR. It should be noted that environmental concerns related to any mining operation also are present with the Polymet project, however, most if not all of these conditions pre-date Polymet during the era of iron ore and taconite mining in the area. Polymet Mining Corporation proposes to reclaim non-ferrous resources in areas of Minnesota where the environment already suffers major pollution concerns from the iron ore days when environmental quality was not a significant issue with permitting.	G2

370	Polymet will enter a polluted area, mine it for 20-plus years for copper, nickel and platinum group metals, and upon completion of the mine life, will restore the mined area to a level of environmental quality far in excess of the current level. In addition, according to Polymet news releases, the reclaimed mine area will meet or exceed all standards for environmental quality. When mining is completed, the environment will be restored to a level significantly improved over its quality at present. Polymet has proven it can and will act as a responsible steward of the environment and has committed the financial resources to carry out this promise. Polymet has access to Platsol, a proven technology to economically reclaim non-ferrous minerals from the mine site. Polymet has the resources, both technological and financial, to do what it says it will do. Extensive testing has shown that using Platsol technology will have a major positive impact on that area of the state by providing jobs, payroll, and taxes which will significantly improve the economics of the State of Minnesota. This proposal is a win-win situation to all concerned- the state, the economy, the local labor pool on the old iron range, and the reuse of existing resources such as the Erie plant which has already taken place. Resources from the mine have been consistently estimated at very conservative levels. Even using these conservative levels, Polymet has proven that it can mine these resources at far less than the world prices for these resources. Polymet will make a significant profit over the life of the mine, and already has a buyer under contract to purchase the resources mined. This project proposal is a no-brainer. Issue the mining permits as soon as possible and let this project move forward.	EOO
371	As silver is a bi-product of the mining of copper, Polymet should be encouraged, and authorized by permit, to extract silver from the proposed Polymet project if it is economically and environmentally feasible to do so.	EOO
372	Legislators should enact special legislation authorizing purchase of shares of Polymet mining stock by the state of Minnesota with subsequent sales of these shares dedicated to bringing the state retirement funds of Minnesota governmental employees closer to the level of being fully funded. Further, that these funds are in trust for the above purpose and are immune from future reclamation and redirection by the legislature, and that such retirement funds becomes an entitlement to retired governmental employees by law.	EOO
<b>Sender Last Name:</b> Ulrich		<b>Submission ID:</b> 137
128	My name is Joann Ulrich, I live in Hibbing, Minnesota. I am supporting the PolyMet project. We need more jobs on the Iron Range and more kids in our schools. I believe the state government will do their job and protect our environment. I guess that's it for me.	EOO
3156	In every other case these mines have severely polluted the environment in which they were developed. Once polluted the Boundary Waters will never again have the value they have now. The mine will be blip on the economic scene but the physical damage will be permanent.	G2,G7
<b>Sender Last Name:</b> Ulseth		<b>Submission ID:</b> 1073
1177	I am writing in support of the PolyMet mining project. I am an engineer and engineering instructor both at Itasca Community College and in the new Iron Range Engineering bachelors of mechanical engineering program. I have studied the process and personally have no concerns regarding negative impact on our environment. I believe due diligence has been given to protecting our natural resources and producing these metals in an environmentally sound manner. Economically, the PolyMet project will have substantial impact on the northeastern Minnesota region and the entire state as has been fully established. In closing, I fully support this project.	EOO

3598	As a college student at Carleton College, I've heard about how precious the Boundary Waters are from all my native Minnesotan peers. I went to the screening of "previous Waters" to learn more about the Boundary Waters region, and I am absolutely horrified as to the type of mining you wish to introduce to the region. Minnesota is so lucky to have the Boundary Waters; it provides such great resources (clean water, fresh air, healthy food, etc.) and activities (fishing, canoeing, etc.) to so many families and wildlife. Why are you taking away this gift to us? You know the negative environmental impact it'll have. Why are you doing this?	G2
<b>Sender Last Name:</b>	Unger	<b>Submission ID:</b> 3098
3483	I am writing to you as a Minnesotan concerned about the PolyMet sulfide mining project proposed on 6,700 acres of public land in the Superior National Forest, where I live. Please consider that 20 years of jobs for a very small percentage of the northern Minnesota workforce DOES NOT equal the total devastation of areas of the Superior National Forest, the expected destruction of the Boundary Waters, and Lake Superior! It has been proven that this type of mining will destroy this largest fresh water lake in the world, along with any number of small lakes and rivers in the watershed. While the sagging economy seems overwhelming to some at the moment, someone needs to stand up to defend the "jewels of Minnesota" as Tom Rukavina recently called our lakes during the gubernatorial debates last week. Further, I believe the emphasis of job creation seems to be overstated, given the technological and automated advances in the industry. The Superior National Forest should be treated with the same respect as the National parks in the United States. This Forest is also a national treasure, to be protected, not ravaged, for short term corporate gains and short term job creation. This environment and clean water are given to us only once! There would be no way to reclaim the fresh water devastation of acid leaching, if PolyMet cannot show that, without a doubt, their waste rock and tailings can be contained. The lakes and rivers that support natural habitat, including humans, would be gone, if our waters were contaminated!	EOO,G1,G2,G7A
3495	If this type of mining becomes inevitable in Minnesota, at the very least, in the permitting process, these companies should be mandated to set aside, up front, in a secure institution, money (not stock!) for any land cleanup and restoration after operations are shut down or abandoned, as the US EPA suggests. Don't make others responsible for the shortsightedness of PolyMet and current lawmakers!	PD4
19677	GLIFWC staff reiterate that the data used in this section are inadequate. In numerous letters, meetings and conference calls to the lead agencies we have requested that additional data be collected. As previously discussed, GLIFWC staff maintain that the flow patterns are not representative of the Partridge River near the mine site. The gauging station is seventeen miles from the mine site and the data from that station are more than twenty years old and therefore, unlikely to be representative of current conditions at the mine site.	WR3J
19677	GLIFWC staff reiterates that the existing LTVSMC tailings are contributing substantially to the level of constituents observed in the groundwater. Unfortunately the modeling of PolyMet contaminants at the basins does not take these or other existing constituents adequately into account (RS74 and TB-14). The result of this oversight is that the contaminant modeling done by PolyMet comes to the illogical conclusion that seepage water from PolyMet, after passing through both LTVSMC and PolyMet tailings, will be cleaner than the existing seepage that is passing only through the LTVSMC tailings. According to PolyMet's consultant "the predicted concentration of seepage from the PolyMet basin is lower than the actual measured concentration of existing seepage" (TB-14, page 9). It is unclear how the addition of mine waste to the basins would cause seepage water quality to improve.	WR1E

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19677	GLIFWC staff reiterate that additional legacy issues exist. Over the many decades of operations at the tailings basin, thousands of gallons per minute of tailings basin water have been discharged through the bottom of the basin, into groundwater. This water has then moved down gradient and into surrounding wetlands and as stated in the water quality section, ultimately reaches the Embarrass River. It is the tribal cooperating agencies' position that despite very limited recent groundwater sampling that shows groundwater contamination at the property line and at private wells north of the basin, the full extent of the contaminant plume and the existing contamination to groundwater has not been defined. Finally, the DEIS claims that elevated constituents at the private wells north of the tailings basin are explained by background. Suggestions that high manganese and aluminum concentrations in the private wells are background are not adequately justified. A more logical explanation is that the groundwater plume from the tailings basin has reached those wells and has degraded their water quality. It is clear by recent hydrologic data (Barr Engineering Technical Memorandum: Results of Residential Well sampling North of LTVSMC Tailings Basin, January 27, 2009, Attachment 4) that the seepage from LTV tails has saturated the aquifer to the north. It seems unreasonable to assume a natural cause for the highly elevated constituents at the private wells when an obvious mechanism for those values is available in the existing tailings basin.	WR1E
<b>Sender Last Name:</b>	Unsworth	<b>Submission ID:</b> 2003
2483	Don't be remembered for being the one to destroy the Boundary Waters. It is the jewel in our crown for our state and should not be destroyed for short term gain. We are guardians of this rare beauty and must pass it on, unspoiled, for future generations. There has not been an example of a pit of this kind, anywhere in the world, including the USA, that has not created a serious pollution problem. Why would you risk that here?	G14
<b>Sender Last Name:</b>	Upton	<b>Submission ID:</b> 1987
2478	We are already well into the SIXTH MASS EXTINCTION....man-made. or "Madman made" if we allow this... PolyMet is another soul-less corporation consuming our planet for filthy lucre... The extinction RATE for plants, animals, insects, etc, continues at over 1,000 TIMES the historical rate. Minnesotans, we stopped public pollution of air by smokers.... now let's stop the corporate polluters and destroyers.	EOO,G2C
<b>Sender Last Name:</b>	Urban	<b>Submission ID:</b> 2264
1853	Ultimately the release of chemicals in the waste rock from PolyMet mining will seep into the watershed. The exposed rock, being transported from the mine to the processing facility, may fall off the railroad cars onto the land and eventually start leaching chemicals into the soil. These toxins will eventually find their way into Lake Superior. This pollution of Lake Superior will defy Article N of the Boundary Waters Treaty of 1909 which states: "It is further agreed that the waters herein defined as boundary waters and waters flowing across the boundary shall not be polluted on either side to the injury of health or property on the other."	WR1D,WR3D
1854	In the absence of hard data, the DEIS often uses professional opinion. This is a common practice but it has its limitations and hazards. The assumption expressed by John Adams and Michael Liljegren to Stuart Arkly that there is little or no connection between bedrock and surficial aquifer may not be corroborated by the fact that water from boring 05-401M "exceeded the water quality criteria for ammonia, aluminum, copper, and silver in both boreholes". Because this flies in the face of professional opinion it demonstrates the clear need for a data driven approach. You simply do not have the necessary facts to proceed responsibly. The DEIS is again forced to use professional opinion to conclude that release of water from tailing ponds and water used in processing of ore will not impact water levels in the Partridge River. This opinion had to rely on data that is over 20 years old and well downstream of the proposed operation. It should be noted that the reason there is not current data on stream flowage is because the monitoring station on the Partridge River was decommissioned 20 years ago as part of budget trimming. Trimmed budgets for the same agencies that are projected to monitor the new operations.	WR1E

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
1855	I want to close by pointing out the obvious. This area is unique. It is unique in that it is the kind of environment that is most vulnerable to the pollution inherent in hard rock mining. Such mining is safest in areas with minimum water exposure. Our beautiful Northeast Minnesota is full of lakes, rivers, streams, and wetlands. It has been described as a swamp on rock. By definition it is the worst place to do hard rock mining. But what is even more unique is the fact that water in this area does not come from others but rather flows to millions. Our unique area is at the pinnacle of three water sheds. The plaque at the rest stop on Hwy 53 says it all. When it rains here, the water flows into Lake Superior and the Great Lakes, into Hudson's Bay through the Rainy Lake water shed, and to the Gulf of Mexico through the Mississippi watershed. For the citizens of Minnesota and for the millions of people who must have clean water to survive, this unique area deserves unique protection. Do not permit this type of mining until scientific and historical data, not professional opinion, not political pressure, not short term profit-indicate it can be done safely.	EOO
2048	Again according to the DEIS (table 4.1-45) water from waste rock piles will be polluted for 2,000 years. Can PolyMet forecast financial assurance for that long? Can this contaminated water be protected from record rain falls, forest fires, tornados or blow downs or other natural disasters? Is there any worse case scenarios in the DEIS? I didn't see any.	PD3,PD4
2676	I am a citizen of the USA. I grew up in Minnesota, as did my parents. I graduated from Macalester College in 1968. My husband and I chose to raise our family in St. Paul. My grandparents raised their families in Minnesota. In 1933 my maternal grandparents bought property and built a cabin in Crow Wing County. I spent all my summers there. I taught children 3-10 years old and their families in public and private schools and at Warner Nature Center. I have three grandchildren. My husband and I retired and moved to Eagles Nest Township near Aurora in 2004. We own a small log cabin on a lake. I am extremely fearful and worried about the DNR and the U.S. Army Corp of Engineers giving a permit to the PolyMet Project for nonferrous mining in Minnesota. I am aware that Minnesota has many resources. I know that some of the oldest lands in the world are here. (D. E. Willard, The Story of the North Star State, 1922) Minnesota has many natural resources of soil, rocks and minerals, rivers and lakes, bogs, forests, plants, animals, fish and birds. We all live here together. The protection of these resources should be of concern to all of us! I have studied the issue of the PolyMet Project. In 2008 I helped organize a forum on this issue in Ely, and I went to the public meeting in Aurora on Dec. 9,2009. I read press releases, editorials, and much of the DEIS.I talked with former and present taconite mining employees. Now I have come to the conclusion that non-ferrous mining should be prohibited in Minnesota. I plead with you--do NOT permit this PolyMet project! Our Minnesota laws governing the protection of the environment are not strong enough. Our laws governing the runoff and clean up of mine projects are not adequate. PolyMet's technology is not proven anywhere and certainly not proven to work in the habitat of St. Louis and Lake Counties. Examples: 1. The former L TV site used by Cliff Erie is seeping sulfates into the St. Louis River watershed. Also, residents between this LTV site and the Embarrass River have arsenic levels in their wells that exceed Minnesota water quality standards. 2. The Minntac Tailing Pond, 30 miles away from Lake Vermilion, is draining sulfides into that lake. That should not be happening. 3. The Dunka Pit is still polluting the area years after the company has ceased operation there. Where are those financial assurances?	G4,G7

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
2677	<p>There are already advisories and beaches closed in and near Duluth on Lake Superior because bacteria levels exceed water quality standards. Add the chemical runoff from the proposed PolyMet site to Lake Superior. I say NO. I understand that the precedent and common procedure in Minnesota and the United States is to allow companies and industry to go ahead--be given permits. Then if some problem happens, some pollution occurs, some hazardous waste fowls the water, air, or land--clean it up. I implore your agency to put an end to this policy. Allow companies a permit only when experience shows safe procedures are in place and when proof that these procedures are safe has been provided. Already there is a \$475 million budget proposed to clean up the Great Lakes. Our Eagles Nest Lakes Association received a DVD titled Minnesota's Lakes at Risk. This production was funded by the Minnesota Pollution Control Agency. We cannot afford to add more risk to our lakes and rivers. The Minnesota DNR should be working with the Minnesota PCA to assure that our fresh water stays unpolluted. I do not want lakes and rivers here devoid of all life like some rivers in Montana where mining runoff destroyed all life for miles. The impact on wildlife -- birds, fish, animals, plants, trees--on or near the mine site will be severe. The rare species found (DEIS pages 147-149, table 29-1) within or near the PolyMet mine site will be jeopardized! The impact on tribal wild rice habitat in and near the St. Louis River is unforgivable (4.1-94) My family eats and depends on Native wild rice for our diet. My grandparents taught me to value Minnesota. I choose to live here because I am proud of our state. My grandparents left me a legacy: Clean water Clean air Forests Birds Fish The Seasons I want desperately to leave that same legacy to my children, my grandchildren, and their descendants. In the preamble of our U.S. Constitution it says: "We the people" are insured "justice, domestic tranquility, promotion of the general welfare, and to secure the blessings of liberty to ourselves and our posterity". NOWHERE does it say that foreign companies or corporations have that liberty. Clean water and air have been and must continue to be guaranteed to all of us in Minnesota. Please do not give a permit to PolyMet.</p>	G2,G7
2678	<p>Because of my appreciation of the necessity of clean water I have been closely following the PolyMet mining proposal. I have read much of the DEIS, attended the public meeting at Mesabi East H.S., spoken with neighbors, asked questions, and attempted to become as informed as possible. It would take volumes to address everything I find problematic in the DEIS but I feel compelled to call your attention to several areas that I find critical. My overall objection to the DEIS is that while it is full of data, it is lacking in scientific method and logic. In short its data is presented to support theory, not demonstrate a proven system. The DEIS admits that the critical problem of hard rock mining is the large amount of waste material that may produce acid runoff when exposed to air and water. It then admits that such acid runoff has been a major environmental catastrophe in other operations (eg Montana and Colorado). It further explains the steps that will be required of PolyMet to insure that this pollution does not take place in Minnesota and we are given data about lined holding ponds, air exposure rates, etc.</p>	G7,G8
2679	<p>But the most important data is missing. Where are the reports of other mines in similar environments that have successfully operated and achieved little or no pollution? The maps I have seen shows hundreds of similar mines all across Ontario. Recently the Canadian Federal Court has required Environment Canada to make the mining industry annually report the toxic waste accumulating in tailing ponds and waste rock piles. Since 1998 the United States has required mining companies to report all pollutants under the Toxics Release Inventory (TRI). In 2005, the 72 mines in the U.S. reporting to the TRI released more than 500 million kilograms of toxic substance to mine tailing and waste rock. This accounted for 27% of all U.S. pollutants reported. So my question--and what ought to be your question-- is where is the data that shows operation of such mines can, in fact and not in theory, be done in a way to protect the environment. Requiring proof that such catastrophic pollution would not occur would be the scientific way to proceed. Without such evidence the proposed PolyMet operation is nothing more than a gambol.</p>	G8
2680	<p>The DEIS asserts that the safety of this kind of mining operation is insured because MN has such strict environmental regulations and standards. The argument by Rep. Rukavina at Mesabi East H.S. and others in editorial comments is that Minnesota should take the moral high ground by allowing hard rock mining here in a well regulated environment rather than forcing the mining industry to operate in states and countries which have low environmental standards and protection. This kind of logic is problematic on several accounts. First, according to the DEIS on various pages (4.1-113) the West Pit will discharge water the exceeds water quality standards for arsenic, cobalt, selenium, copper, nickel, and high sulfate concentrations. What good are high standards if groups are permitted to exceed them. Has the mining industry any history of lobbying to reduce standards or seeking variances in order to exceed standards? The answer is yes.</p>	G5

286 I am writing this letter to support the proposed NorthMet Project as presented for consideration by the PolyMet Mining group. I have been interested in mining most of my adult life being involved through the service sector - worked for the DM&IR railroad, and have followed this particular project with a keen interest. I have attended two of their open houses and have seen in person the community interest and support that has been generated for this project. I have also attended other presentations given by the PolyMet management group and have been very impressed with their due diligence and dedication to do this mining environmental safe! The economic impact for Northern Minnesota is easily understood and assumed by the citizens who live and work in our region. For those Minnesotans who do not live and work here, these jobs also will have a significant contribution to the state both in taxes and economic benefits which will benefit all! I believe that with the new technologies developed and other environmental safe mining practices, that this new opportunity will be a win win for all of us living in Minnesota. The metals that PolyMet will mine represent a huge portion of the need for these metals as they will be used in such things as wind turbines and hybrid cars and are necessary for pollution prevention devices such as catalytic converters for our cars & trucks. I know they are committed to providing a good work environment as they are looking to use both rail and mining equipment which will meet the most stringent EPA emissions requirements. Their commitment to use Gen Set Locomotives is a great example of this. It is time for the permitting and then the building process to begin. Northern Minnesota need the jobs, all Minnesotans need the opportunities and benefits that will result from this project.

3900 This is written as a letter of support for PolyMet Mining Company's proposed NorthMet Project. This project would create needed economic development in Northern Minnesota and produce valuable metals in an environmentally safe manner. I was born and raised in Northern Minnesota and am aware how important it is to have stable employment in the area, and maintain and care for the environment. I now live in Superior Wisconsin but often work and vacation in Northern Minnesota, and get to visit my parents in Hibbing. The proposed mine will add several hundred permanent jobs along with adding support industries and construction jobs. The taxes generated from PolyMet and the workers will help support the state and local communities with needed funds for education and improvements to infrastructure. The environment will be protected as detailed in the draft environmental impact statement. There has been a four-year long review process for this proposed mine, and the review has been very thorough. PolyMet has detailed their plans to use some existing facilities at the former LTV Steel Mining site, and will follow Minnesota's strict environmental requirements. With the necessary controls in place to protect the environment, the permits for the project should be granted, and Minnesota can start producing some metals not found at this time in the U.S. that we use in our everyday lives. Thank you for your review of the project, and for seeing that Minnesota's environment is protected. Thank you also for not delaying in issuing the permits so the project can get started.

EOO

1872 A place I have come to love and will continue to visit for the rest of my life is immediately downstream from the proposed mining. Nobody wants to part with the products these minerals provide and it can be said that people are O.K. with these mining practices until it's in their backyard. As a person who fishes and swims in the waters this mine we be affecting, I ask that you do your absolute best to insure the best practices and planning are implemented, as I can only hope that their integrity may be maintained in the face of such an invasive project.

3155	I know most of the messages you receive are not cleverly thought out like the beginning and end of my Email are, so I hope this part of the email has a little more effect of your decision. Since the young age of 5 or so I have always gone up to the Boundary Waters Canoe area. This area of natural beauty is of great importance to me and thousands of minnesotans. The thought of, in my opinion, the best part of Minnesota being polluted and destroyed is extremely upsetting. I guess the questions that I hope you are truly asking yourself are; Is Acid Mining really worth destroying Minnesota's crown jewel? How much money is worth the cost of what Sigered Olson worked so hard to accomplish? Will you regret this action in the long run? And is this really for the better of everyone? I hope you vote in a manner you feel best represents you as a Minnesotan and reflects the views of your constituents. Thank you for your time if nothing else, -Leif	G2,G7,G9
3576	I realize that everything following this is just an overwhelming amount of card stacking. But it does not do an adequate job of explaining how important this region of Minnesota is to thousands of Minnesotans. I have spent every summer since I was five years old in the remote wilderness of the Boundary Waters. From this area I learned to respect the land in all its natural beauty. I love every single part of the Boundary Waters: huge lakes, luscious skys, bitter winds, the abundance of wildlife, and even the mucky little ponds with Beaver dams. If I were to not voice my opinion, I would be ignoring every responsibility that I have gained and letting down myself and the thing that I love and cherish the most; Minnesota Thank you for your time Leif Gavin Vandersteen. 211	2) Corridors. The PolyMet mine will obstruct at least 2 of the remaining 13 corridors where wildlife can cross the 120 miles of the Mesabi Iron Range. These corridors are important not only for mammals like moose and wolves but also for the northward migration of the deciduous forest and all its components in the face of climate change. The DEIS ignored the mine's impact on wild corridors.	WI5
527	1) Mercury. Increased levels of sulfates leached from the PolyMet Mine will increase mercury accumulated in fish tissues, causing harm not only to the fish but to animals and people who eat the fish. The DEIS did not adequately analyze the potential impact of the mine on mercury levels in surrounding waters and fish.	WR1E,WR4B,FM1
528	3) Wild Rice. The PolyMet Mine will result in enormous sulfate releases that will exceed the state standard for wild rice, which is sensitive to sulfates. These sulfates will likely eliminate wild rice in the Partridge and Embarrass Rivers, and diminish the famous wild rice beds in the St. Louis River estuary near Duluth, which is 100 miles away from the mine. The DEIS did not adequately analyze impacts on wild rice and the associated health and economic impacts.	WR4F

1224	I am concerned about the impact on fish and wildlife of the proposed PolyMet Mine in Superior National Forest and urge you to better analyze the proposed mine. Of particular concern are the following issues, which were not adequately explored in the Draft Environmental Impact Statement (DEIS):	G2C,G8A
<b>Sender Last Name:</b>	Verderame	<b>Submission ID:</b> 2790
3191	Many thousands of us use this area for recreation because of its unspoiled natural beauty. Not many places remain that are so wild, pristine and accessible.	G11
<b>Sender Last Name:</b>	Verstegen	<b>Submission ID:</b> 3115
3491	Polymet's proposed mining in northern Minnesota is out of control. The lack of government oversight and public input on this very important environmental issue is a scandal of epic proportions. We the people have a right to know that the purity of the Boundary Waters Wilderness and the Lake Superior water shed are being safe guarded. These national treasures are facing one of their greatest threats from this form of sulfide mining. No amount of economic growth in worth the long term, permanent ground water pollution threatened by this process. Please reconsider this permit, please seek further environmental studies. It is our responsibility to protect this most wonderful natural resource.	G7
<b>Sender Last Name:</b>	Vesper	<b>Submission ID:</b> 3117
29	Polymet advertises that they will create a certain number of jobs. The jobs argument is very short-sighted. Lawmakers right now are under tremendous pressure to show that jobs were created on their watch. It is assumed that job creation will have a positive effect on the local economy. However, we cannot assume that these jobs will go to local people. Make no mistake: Polymet will hire the most qualified workers who apply, even if it means relocating workers from outside of the area. When mining ends after twenty years, these people may want to stay in the area. Then we will still need more jobs in Northeastern Minnesota. I would like to see Polymet be mandated to hire as many people as possible who already live in the local area, even if it means devoting extra training resources to these workers.	SE7
3492	Polymet was mandated to study alternatives to mining. I would like to see this project put on hold until we develop a better nationwide metals recycling program. It is estimated that one third of our copper resources are currently in landfills. This problem needs to be addressed. It would be irresponsible to mine new copper when we dispose of copper that could be re-used. I am not advocating that we mine existing landfills for copper; I'm sure that would be impractical. However, we need to do a better job of reclaiming metals out of the waste stream. Many countries in Europe already reclaim metals. In Scandinavia, for example, paper and plastic garbage is mixed together with slash and other wood waste from logging operations and incinerated to provide district heating, even in small communities. Because municipal waste is burned, it is illegal to mix metal objects into the waste stream. Virtually all metals are recycled for use in rebar and other products. We would be well-served to emulate such programs. If the Polymet project is permitted, I would like to see a portion of the company's profits go toward developing a state-wide metals reclamation program. I am also concerned about the effect of this mine on the Boundary Waters Wilderness. I have been a guide in the wilderness for eight years, and I currently work as a seasonal ranger with the US Forest Service. The integrity of the Boundary Waters Wilderness is extremely important to the regional economy. I recognize that this mine is not projected to directly affect the Boundary Waters. However, the Polymet would set a dangerous precedent for other mining companies to follow. Duluth Metals, for example, recently partnered with a South American mining company to bring a mine to within the watershed of which the Boundary Waters is a part. The Boundary Waters is the most visited wilderness area in the country. The local economy would certainly suffer if wilderness waters incurred long-term damage. If the Polymet mine is permitted, it may set a precedent which becomes grounds for other mining companies to bring a lawsuit to insist on their mining rights.	G2,G8C,G11

3837	_Our land is all we have to pass on to future generations and I feel that this mine would destroy the purity of our land for economic advancement. Our land is sacred and once it is polluted can never be restored. Please do not destroy our land. There has got to be another way	EOO
<b>Sender Last Name:</b> Viken	<b>Submission ID:</b> 2511	
428	There should be another review period provided to the public once these additions are made.	PRO6
1112	Finally, PolyMet must be required to show that its waste rock and tailings piles won't collapse and dump uncontrolled pollution into nearby waters and that they will not create water pollution that lasts for thousands of years.	GT2
2337	DEIS needs to have stronger language that will ensure the citizens of Minnesota/United States/both will not be left paying 100% or even a portion of the cleanup cost. In addition, any land swap needs to protect endangered species, make sure lands exchanged have equal ecological value, equivalent or greater area while not fragmenting habitat.	PD4
2383	Even if precautions in the DEIS for preventing water acidification are somewhat effective it won't matter because a pH change of only one or two point(s) will kill many fish and will not be required for leaching of mutagenic, carcinogenic and lethal doses of heavy metal. The danger in mine waste rests in the fact that rock containing the precious metals (gold, platinum, copper, zinc, titanium, cobalt, silver and palladium etc.) and hazardous materials (acidifying sulfide and heavy metals such as lead, mercury, aluminum, cadmium, copper and arsenic) goes from a form that has low surface area (bedrock) to a form that has infinite surface area (fine powder) which allows the low level of leaching of these hazardous materials, that occurs naturally, increases infinitely with increased surface area. Nothing in the DEIS addresses the need to "lockup" the waste by decreasing the surface which may be accomplished through encasing it in a concrete/epoxy slurry or melting it. It may be possible to both lock up the mine waste and reduce CO2 that causes global warming (see the following link). Sulfide mining waste needs to be disposed of as carefully as nuclear waste. Even nuclear waste will decay over tens of thousands of years to a safe product whereas sulfide mine waste will pose a hazard to future generations until geological time and plate tectonics subducts the waste in the interior of the earth.	G2B
2413	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. The state of WI had two mines of this kind where they both leaked into the rivers after the mines closed. After this happened, the state of WI passed a law in 1997 Wisconsin Act 171 where mining companies have to have 10 years where the mine did not leak acid drainage into groundwater or surface water, and the mine had to be shut down for 10 years where acid drainage didn't leak into ground water nor surface water. Minnesota should have the same restrictions if we want to preserve the largest fresh water lake, Lake Superior, and its watershed areas, as well as the BWCAW which is next in stake.	G7A

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3061	I am a Duluth resident and I am concerned about the proposed PolyMet sulfide/non-ferrous/hardrock mining (SM) project south of Babbitt in the St. Louis River watershed on 6,700 acres of public land in the Superior National Forest. PolyMet mine is just the first SM mine that is being proposed (Franconia Mineral Company and Duluth Metals are among others in process) so this will set the bar that subsequent SM proposals will have to meet. Given large amount of interest in SM in the state and the historical fiasco of SM around the world and the country we have to be flawless in how the mining is carried out or we will suffer severe financial and environmental consequences. The draft environmental impact statement (DEIS) for the PolyMet SM project must be insured by the mining company with sufficient assets that would pay for perpetual cleanup. This is important because history tells us that most SM have troubles with acid mine drainage. These mines include the Berkley Pit Mine, MT, Argo Tunnel, CO, Iron Mountain Mine, CA, Zortman Landusky mine, MT, Monday Creek, OH, Thompson Creek Mine, ID, Gilt Edge Mine, SD, Britannia Creek, BC, Summitville Mine, CO, Elizabeth Mine, VT, Hughes Bore Hole, PA, Flambeau mine, WI and many others in the US and other countries such as Tinto River, ESP, Aznalcollar Mine, ESP, Tasmania, Wheal Jane, UK,. The public has been stuck with the cleanup many times before one of which is the Summitville Mine that costs \$30,000/day to cleanup in perpetuity. Eagerness to mine for the sake of jobs without an eye on long term cost is foolish. Colorado could pay 365 people or companies \$30,000 a year for some service or product and get something tangible rather than pay for cleanup in perpetuity. 365 people is similar to the number of people that PolyMet expects to have under long term employment. The problem is, the PolyMet mine will only employ these people for approximately 30 years.	G4A
3062	The real costs of sulfide mining should not be subsidized by government risk taking. If society needs these metals the cost for these metals should be high enough so we either recycle them, after all they are finite resources, or extract them from the ground in such a way as the waste is locked up for a period of time measured on a geological time scale. We need to protect the integrity of our land in the future, NOW, because just like the financial institutions that irresponsibly gambled with our money, mining company officers will do the same if they are allowed to for short term gain.	G1
3063	I hope you see that what I, the Indian tribes and the United States Environmental Protection Agency have pointed out are serious inadequacies in the precedence setting PolyMet DEIS. Before PolyMet AND other SM can be considered for permits these issues need to be addressed so Lake Superior (the largest lake in the world in terms of surface area threatened by the PolyMet project) and the Boundary Waters Canoe Area Wilderness (the most used wilderness area in the United States threatened by Franconia and Duluth metals projects). Waters in the northeast part of the state are already being threatened by acid rain, in part, because of the low buffering capacity of the soil in this region. We have to be sure we are not going to pressure the ecological services that the environment already produces. Please take the time to add supplements to the draft EIS and give people in Minnesota a fair chance to know what impact the PolyMet project would have on our State	G8

3216 I am writing to you as a citizen of Duluth, MN and very concerned about the proposed PolyMet sulfide mining project on 6700 acres of public land in Superior National Forest. The PolyMet site is located on the Patridge River near Hoyt Lakes, MN, which is a part of the Superior watershed. Lake Superior is the largest freshwater lake in the world, which provides drinking water to people in MN, WI, MI and Canada. The St Louis River will bring any waste from this mine project into Lake Superior. The state of Minnesota needs to guarantee that this watershed is not irreversibly damaged by the sulfide mine being proposed by PolyMet. Money to clean up the project is not sufficiently guaranteed for the people of Minnesota. Assurances that the Superior watershed will not be polluted in perpetuity by sulfide mining byproducts are necessary for this project to be approved. PolyMet is going to use old taconite tailings which have air gaps and will not provide adequate containment of the sulfide mining waste from seeping into the groundwater and nearby surface waters. The Tailings Basin design does not meet minimum safety standards to prevent catastrophic failure and uncontrolled release of waste into the Embarrass River. The state of Wisconsin has had experience with sulfide mining in its history. There was a sulfide mine called the Flambeau Mine, south of Ladysmith, WI and a proposed site in the Crandon mine which caused the state legislature to pass WI Act 171 where any mining company must operate a sulfide ore body mine for 10 years without seepage into groundwater or surface water; and the mining company's sulfide ore body mine shall be closed for 10 years without seepage into groundwater or surface water. No mining company has been able to meet the new standards in WI set forth by this law passed on April 22, 1998. These regulations seem to be so minimal when one thinks that it would allow for complete failure of containment at year 11. Failure would be catastrophic to the environment. The main reason the Crandon mine was defeated was the opposition of the local Indian tribes unable to guarantee the water quality in the wild rice lakes. Sulfates created by sulfide mining will affect wild rice lakes in the area of the PolyMet project. Mercury levels will increase affecting local fish, creating human health risks above the current levels. PolyMet is going to use thousands of acres of wetlands in the St Louis River Basin in St Louis County, and is replacing it with wetlands in the Mississippi River Basin in Aitkin County. Doing this will erode the capability of the St. Louis river watershed to buffer flooding into wetlands and result in increased flooding risk and decreased ability of the St. Louis watershed's ecological services. It also can increase flooding in the Mississippi River by adding a lot of wetlands in Aitkin County. All wetlands removed in St Louis River Basin should be replaced in the same river basin. Lastly the major issue with sulfide mining is the environmental effects of the sulfide found in the pulverized rock, when exposed to water and air, forms sulfuric acid. Sulfuric acid found in water can dissolve harmful heavy metals out of the surrounding rock, including mercury. These metals would be carried by the river system near the mine to the St Louis River, eventually making its way into Lake Superior. Due to the important issues that I have raised above, I would strongly discourage a permit being given to PolyMet at this time as these critical issues must be addressed first. The state of Minnesota legislature should have hearings on the proposed mine, and pass laws to ensure the environmental standards are preserved, and living wages and health care benefits are to be legally bound by Polymet.

Comment ID	Comment Text	Theme Codes
19678	State Agencies communicated to tribal cooperating agencies and the Army Corps that the proposed action is not permissible because of the high probability of failure at the tailings basin. This statement was made at a meeting held on April 30, 2009 to develop mitigation alternatives for the tailings basin. The tailings basin alternative, presented in section 3.2.3, originated as a way to address this problem. However, GLIFWC staff do not believe that the alternative is permissible because it is a perpetual pump and treat proposal [see section 3.2.3(1)]. In addition, this alternative has not been evaluated adequately. For example the claimed capture efficiencies of 95% have not been demonstrated at any other site and seem improbable. The alternative would capture tailings basin water and discharge it at the Partridge River. This capture would need to continue until the tailings basin effluent meets standards in the Embarrass River watershed. This is not expected to occur in the foreseeable future. Finally, water treatment would be required prior to discharge into the Partridge River because the section of the river currently exceeds the applicable sulfate standard.	ALT8,PD2,PD4,PD5
19679	GLIFWC staff are concerned with the attempt to avoid applying the state wild rice standard to this project. As stated in Minn. 7050, the 10 mg/l of sulfate standard for wild rice applies for waterbodies where wild rice is found. The PCA has used this approach in past permitting activities (MINNTAC Schedule of Compliance, 2008). The 10 mg/l sulfate standard also applies to the Partridge River below Colby Lake and to the Embarrass River below Trimble Creek where wild rice is located.	WR4F
19679	The proposed stockpiles have the long term potential to leach metals into the environment. As indicated in the Executive Summary of the Copper – Nickel study (Siegel and Ericson 1979) “There is some evidence to suggest that revegetated piles may not always have the expected positive effect of diminishing the leaching of heavy metals. Seasonal cycles of wetting and drying caused by seasonal photosynthetic activity have been suggested as the cause of increased leaching in sanitary landfills and would have similar effects on waste rock.” This information suggest that the source terms used for stockpiles that are proposed to have an evapotranspiration cover system have the potential to increase the amounts of metals that are leached over time. This increase in the source term is not accounted for in the modeling. Therefore, water quality impacts to the Partridge River are likely underestimates.	WR1E,WR2L
19682	State approved water quality standards specifically state that 10 mg/l of sulfate is the standard for wild rice waters. There is no language in the standard that allows for the standard to be ignored when it is inconvenient. It is the expectation of GLIFWC staff that state law will be followed and the wild rice sulfate standard applied accordingly.	WR4F

19682 GLIFWC staff reiterate that the contaminant modeling for the project has not been adequately vetted and consequently produces results that are illogical. For example, the contaminant modeling for the tailings basins (RS74B and TB-14) proposes that adding PolyMet tailings to the existing LTVSMC tailings will improve the quality of seepage coming from the basins for some parameters. The assumption (TB-14 of July 2, 2009, page 9) that PolyMet seepage water from the basins will be of better quality than the current seepage water results is a modeling result that requires some explanation. The modeling proposes that the more PolyMet seepage that PolyMet releases from the basins, the better the water quality will be for Al, Mn and Fe in the Embarrass River (see Tables in TB-15 of June 24, 2009). It appears that the modeling at the basins does not appropriately account for leaching from the LTVSMC tailings when predicting future seepage quality. Table 4.1-53 summarizes maximum predicted concentrations of several constituents in the groundwater north of the tailings basin at several evaluation points (Fig.4.1-26). One of the evaluation points is the property boundary. The currently observed levels (average of 2007-2009 data from Barr memo TB02-14 of June 24, 2009, similar values seen in DEIS Table 4.1-7) of these constituents are substantially higher at locations both closer to, and farther from, the basin. The current levels are the result of discharges to groundwater through LTV tailings. Two wells (GW009 & GW001) are on, or very near, the modeled flowpath and bracket the model evaluation point at the property boundary (Fig. 4.1-7). The high levels of Al, Fe, and Mn observed both closer to, and farther from, the basin than the modeled evaluation point suggest that the modeled predictions have little relation to reality. These unexpected, and presumably illogical, modeling results help to explain the equally puzzling conclusion of the surface water modeling; that is, that adding Polymet tailings to an already contaminated site will improve water quality in the Embarrass River. As demonstrated by the illogical modeling results above and others noted in previous comments, the contaminant modeling at the Polymet site does not appear to provide useful predictions.. Comment letters describing these illogical model results were submitted to the lead agencies prior to the release of the DEIS. GLIFWC staff still await a response.

RFI,WR1E

19682 GLIFWC staff reiterate that the MODFLOW model does not provide credible data outside the footprint of the mine pits. As previously indicated, GLIFWC staff have reviewed the Adams and Liljegren 2009 email and do not consider the methods used to be adequate (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009, Attachment #2). The evidence presented in the email can be interpreted to indicate substantial impact of the Peter Mitchell Pits on adjacent lakes. However, it is the tribal cooperating agencies' position that aerial photography, without ground verification and georeference is an exceedingly imprecise method for determining water levels in lakes and wetlands. Finally, vegetation data (e.g. the presence of extensive cedar swamps) suggest that a significant groundwater-surface water connection exists which directly refutes the Adams email. It is the tribal cooperating agencies' position that a more robust groundwater model must be developed for this project in order to adequately characterize the potential impacts of the various project alternatives to natural resources. GLIFWC staff maintain that in order to adequately predict potentially significant environmental impacts, hydrogeologic data must be collected that can be used as input to a MODFLOW model. Tribal cooperating agencies contracted with the United States Geological Survey (USGS) to review the uncertainty of the MODFLOW model and provide recommendations on how the model could be improved. The USGS report was submitted to the lead agencies in February of 2009 (USGS 2009, Letter Report reviewing PolyMet ground-water model. January 29, 2009, Attachment #5). Tribal cooperating agencies organized meetings between USGS staff and participants in the EIS, including the applicant, to openly discuss all issues related to the USGS report, the MODFLOW model and the implications for the proposed project. The conclusions of the report and the meetings should be implemented so as to produce a useful model of project site hydrology. We believe that impacts to surface waters, groundwater, and wetlands for a project of this complexity demand a scientific, data driven approach rather than one based solely on professional opinion. Finally, GLIFWC staff reiterate that a robust groundwater model must be developed for this project in order to adequately characterize the potential impacts of various project alternatives to natural resources.

19682	GLIFWC staff reiterate that there is no mechanism to accurately develop the data needed for impact analysis. The impact criteria listed in this section require robust modeling of the hydrology of the area that is developed on the basis of adequate field data. Neither of these vital tasks have been performed for this project. Field data collection is spotty or non-existent and the numbers used in this DEIS are derived from the MODFLOW groundwater model and XP-SWMM model. It is important to note that the MODFLOW model was developed to assess the rates of mine pit inflow and as such, the results it gives for areas outside the mine pit footprint are unsupported. The XP-SWMM modeling is based on stream gage data that is 17 miles and 20 years distant from the proposed project. Therefore, the listed parameters calculated for the Partridge River have little data to support them. Finally, the lack of impact criteria for groundwater levels is troubling. The DEIS recognizes that groundwater drawdown around the mine pits and groundwater mounding around the tailings basin will occur, however, no attempt is made to characterize the existing conditions or reasonable foreseeable impacts. This data gap constitutes a fatal flaw in the DEIS.	WR1E
19682	There are several serious oversimplifications in the water balance discussions of this section. First, GLIFWC staff reiterate that the 34 year timeframe for hydrometallurgical cell drainage collection is unlikely to be correct. Because all cap and liner systems leak, some pumping of water that enters the hydrometallurgical residue cells would be needed in perpetuity. This would be particularly true as the cap ages and develops additional leaks. Second, stockpile leachate is predicted to not meet water quality standards for thousands of years (Table 4.1-45). Third, the section should note that water quality and hydrologic impacts to wetlands and the Embarrass River under this proposed alternative would be perpetual.	WR1E
19685	GLIFWC staff reiterate that the property boundary has not been defined for this project. Therefore, It is the tribal cooperating agencies' position that the Dunka road should be used as an evaluation point. On multiple occasions PCA assured cooperators that the Dunka Road would be used as a water quality evaluation point (GLIFWC meeting notes from the Tribal/State meeting on mining issues held in Hinkley, MN on April 17, 2008). In addition, meeting notes provided by Knight Piesold (DNR Contractor) for a meeting held in St. Paul on September 29th 2008 state: "Richard Clark: Dunka road point was selected as indicator of impacts, but it is not necessarily a "compliance point" for permitting." Furthermore, Barr Engineering, October 9, 2008 meeting notes list as an action item: "7. Barr to provide tabular data on concentrations at the Dunka Road." However, this data does not appear in the DEIS. Information for the Dunka Road evaluation points must be included in Table 4.1-39 and 4.1-45.	WR1E
19685	GLIFWC staff strongly disagree with the assumptions used in the groundwater quality modeling for the mine site. We reiterate that relying on the effectiveness of a technology with highly variable outcomes (limestone treatment) in calculating long-term water quality is not a conservative approach. The DEIS should provide a range of water quality results including the groundwater quality under a scenario where lime treatment and covering the Virginia Formation wall is ineffective.	EOO
19686	As previously stated, it is unclear how the applicant would segregate particle size in the rail cars. Furthermore, dust emissions from transportation of ore have caused contamination issues at other mines. The paragraph assumes that because the volume spilled along the rail line is small when compared with the total ore transported, then the contamination would be insignificant. This assumption is not based on any analysis. The DEIS should include more than unsubstantiated guesses on the significance of impacts.	WR1D
19687	The DEIS does not include a detailed closure plan. This serious information gap is a fatal flaw that prevents the full disclosure of environmental impacts for this project. Tribal cooperating agencies and technical staff from the lead agencies reviewed the initial closure plan (RS-52) and submitted extensive comments to the applicant. The applicant did respond to a portion of those comments but the closure section refers only to RS-52 which was determined to be inadequate. A detailed closure plan that analyzes the feasibility, effectiveness, and cost of closure methods of a preferred alternative and all feasible alternatives / mitigation measures must be provided for the EIS to be adequate.	PD5
19687	GLIFWC staff reiterate that little or no baseline data was collected to provide inputs to the XP-SWMM modeling described in this document. Therefore, it is the tribal cooperating agencies' position that the model results cannot be used with confidence and do not allow an adequate assessment of environmental impacts.	WR3J

Comment ID	Comment Text	Theme Codes
19687	GLIFWC staff reiterate that the available data do not support the conclusions presented in this section. The impacts predicted by technical reports (RS73B) to the Partridge River are primarily reduction in base flow due to mine pit dewatering and those impacts are predicted by the MODFLOW model. MODFLOW modeling in (RS22-Appen.B) forms the foundation for the predicted impacts. The MODFLOW model (RS22 Appen.B) is not calibrated to a data set representative of the area and predicts fluxes to the Partridge River based on a non-unique solution. A differently formulated and calibrated MODFLOW model would predict much higher inflow to the PolyMet pits and therefore, show greater impacts to stream baseflow. The surface water model (XP-SWMM) used for predicting impacts is calibrated to Partridge River flows from 1978 to 1988, seventeen mines downriver of the mine site. During the period of record, the Peter Mitchell pits were dewatered with unknown effects on the river flow data. According to technical documents (RS73A, page 21) the flow record at the Partridge River gage above Colby Lake (USGS #04015475) may have been impacted by mine discharges on the north branch. The monthly average flow recorded at this gaging station during 1978-1988 varied between a minimum of 1.3 cubic feet per second and a maximum of 454 cubic feet per second. The discharges from the Peter Mitchell Pit could account for up to 34 cubic feet per second. Since the timing, duration and location of mining discharges may be different now than during 1978-1988, the present hydrologic regime of the Partridge River is unlikely to be well represented by the period of record at USGS #04015475.	WR1E
19688	GLIFWC staff reiterate that there will be surface water discharge to the Embarrass River. Aerial photography and state Public Waters inventory maps indicate that there is currently a direct surface water connection between the northwest corner of cell 2W and the Embarrass River (attached Figure 4). Aerial photos show that water discharging from the tailings basin currently follows a natural channel westward, through existing wetlands and intersects a channel that leads directly to the Embarrass River.	EOO
19688	Tribal cooperating agencies believe the characterization in this section is misleading. First, as previously indicated, the WWTF would need to operate for 2000 years or more in order to treat leachate from the stockpiles. Second, the effectiveness of the passive wetland treatment system has not been demonstrated and it is likely that the wetland treatment system would not function as the applicant has suggested, due to eventual shortcircuiting. Finally, the long term water quality of the pit lake is a concern. It is unlikely that this water would ever meet surface water quality standards. It is the tribal cooperating agencies' position that the DEIS should discuss the implications of leaving a polluted pit lake at this site in perpetuity.	WR3C,WR3G
19689	GLIFWC reiterates that because the Embarrass River already exceeds water quality standards, it would be difficult to permit the addition of additional contamination from new or expanded sources. Compliance with the clean water act should be demonstrated in the DEIS. Water quality for the project has been poorly characterized or left uncharacterized. The limited available data suggest that surface waters have already been impacted by mining activity. Mercury, sulfate, and specific conductance exceed Minnesota surface water criteria near the tailings basin and at Area Pit 5. Mercury also exceeds surface water criteria in the Partridge River downstream of Colby Lake. However, no samples have been collected from lakes near the tailings basin (Heikkilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings pile have caused contamination of those waterbodies. The contaminant transport modeling suggests that the project will cause manganese, aluminum, and sulfate to exceed standards. Despite these results, the DEIS indicates that the proposed project complies with all water quality standards for the Embarrass River. This is misleading and must be corrected.	WR1E,WR3I
19689	GLIFWC staff strongly disagree with the approach presented in this section. All waters of the state are protected by Minnesota water quality standards and using this unnamed water as a mechanism to dilute mine related contamination is not appropriate. In addition, no flow information for this unnamed water is available. In addition, the DEIS should more clearly state that water quality standards at the Partridge River would be expected to be exceeded. GLIFWC staff reiterate that because of continued inputs from the stockpiles, the tailings basins, and the pit walls, the pit lake could exceed surface water quality standards for thousands of years. We also note that 20 feet of pit wall will never be submerged and as such constitute a perpetual source of mine related contaminants.	WR3C

Comment ID	Comment Text	Theme Codes
19689	Based on the uncertainties in the performance of the constructed wetland treatment system (DEIS page 4.1-112 to 113), GLIFWC staff reiterate that primary water treatment at the WWTF would need to continue for thousands of years. This does not meet the Minnesota goal for maintenance free closure.	WR3L
19691	The discussion on the potential effects of wild rice ignore the applicability of the Wild Rice sulfate standard. Because the lower Partridge River, Embarrass River, Embarrass Lake, Lower Embarrass Lake, Unnamed Lake, Cedar Island Lake, and Esquagama Lake already exceed the applicable wild rice sulfate standard, any new emission of sulfate would constitute a violation of the clean water act. The DEIS should explain how those exceedances are to be regulated.	WR4C,WR4F
19692	This section indicates that there is little opportunity for sulfate-wetland interactions at the mine site. This statement is incorrect and is contradicted by the previous paragraph. The constructed wetland is designed to be directly between the pit overflow and the Partridge River. As indicated in the DEIS, wetlands are a prime area for mercury methylation and the situation created by using a wetland to treat water that is also high in sulfate, creates a high risk situation for mercury methylation. In addition, the Upper Partridge River does have a set of extensive riparian wetlands which may also contribute to methylation. The full extent of this impact should be analyzed and described in the DEIS. GLFWC staff agree that additional work is needed to properly characterize the mercury dynamics in the area surrounding the tailings basin. However, we note that the sampling plan that was developed may not lead to conclusive results because of the small sampling effort. The data obtained from this effort should be fully peer reviewed and vetted before any conclusions are used in the DEIS.	WR1E,WR4B
19692	There is a great deal of uncertainty in this section. Much of that uncertainty could be resolved with further analysis of the functioning of the treatment wetland. This wetland, while intended as a passive water treatment facility, is likely to also be a source for methylmercury. As the DEIS indicates, there is no reliable method proposed for eliminating mercury. This oversight is unacceptable. A variety of Mercury removal technologies are available, but none of them have been included in the design of the proposed project or any of the alternatives/mitigation features listed in the DEIS. This oversight constitutes a fatal flaw in the DEIS because not all reasonable alternatives for protecting the environment have been explored. The DEIS recommends additional analysis on this issue. GLIFWC staff reiterate that further analysis must be conducted and incorporated in the DEIS so that environmental impacts can be predicted and reviewed by the public. As described in comments for section 4.1.3, modeling done for mercury emissions give results that are illogical. The DEIS proposes that the more PolyMet seepage that PolyMet releases from the basins, the better the water quality will be for mercury. Model results for Hg in seepage from the tailings basin is predicted to be 0.9 ng/L (DEIS, page 4.1-124) yet the average mercury concentrations at the existing tailings seepage is in the range of 1.5 to 2.0 ng/L (DEIS Table 4.1-31). As with other parameters, it appears that the modeling at the basins does not appropriately account for the effect of the LTVSMC tailings when predicting future water quality.	WR4A,WR4B
19693	The DEIS does not include detailed financial assurance information. This information gap is particularly important given the potential for very long-term/perpetual treatment, maintenance and monitoring that may be needed for the Proposed Action. Because of its experience in expensive cleanups of contamination from many defunct or bankrupt sulfide mines, EPA Region 9 has strongly urged other Regions over the past two years to require financial assurance disclosure in the NEPA process. New national rules for financial assurance are under development by EPA, because "Given the history of adverse environmental effects resulting from some hard rock mines, and the expenditure of public funds used in some cases to address environmental problems caused by mining, EPA believes it is necessary to analyze these factors in the DEIS." (from InsideEPA.com, Tuesday, August 25, 2009). GLIFWC staff believe that the Polymet DEIS should follow this directive. The tailings basin alternative includes a perpetual pump and treat system that would require the capture of large quantities of water. This system would be expensive and the applicant must demonstrate the ability to be financially responsible for that alternative. As stated above, a preferred alternative must be developed which includes a detailed closure plan. Once these missing pieces of information have been developed, detailed financial assurance information can be included in the EIS.	PD3,PD5

19694	GLIFWC staff reiterate that there are no reliable data on water level fluctuations for the Partridge River. The data used in the DEIS were obtained from the MODFLOW model that has been deemed unreliable outside of the mine pit area by all participants in the DEIS process. GLIFWC agrees that characterizing water level fluctuations in the Partridge River is important and have repeatedly suggested that appropriate data be collected and modeling be conducted.	WR3J

3710	I'm concerned about what appears to be lack of a way to meaningfully hold this company responsible for recovery costs. Shouldn't they have to escrow at least *some* of the estimated clean up cost? It sounds to me like they're going to make a mess. If that's deemed acceptable, I surely want to have their money in the bank to clean up when they move on!	PD4
<b>Sender Last Name:</b> Voss		<b>Submission ID:</b> 261
274	We are residents of Hoyt Lakes. We fully support the opening of the Poly Met facility formally LTV Steel. We also feel the EIS draft very adequate in looking at the safeguards for our area and other concerns. First and foremost in our minds is the job situation in our area and the help this could bring to us. With so many families struggling please don't let another opportunity go by that would not simulate the economy of this area. We love the outdoors, and if anyone had a convincing argument as to why this would do more harm than good we would be on that side, but frankly we have seen nothing to indicate that. It's always been interesting to us that as people debate the pros and cons of the environment; they do not seem to take into account the health of our families as it relates to social problems that are created in these hard economic times. Please provide all the help you can to move ahead on this project.	EOO

3153	I am concerned about the proposed sulfide mining for a few reasons. Many Minnesotans have no idea who Polymet mining is, what they do, and why they do it. What the mined materials of previous mines produce must be widely known. With an already suspicious public about energy sources like coal and nuclear, its scary so have another extraction company creeping in unnoticed by the public and starting their operation before enough people know about it. If mines are developed, whatever plans for development in ecotourism of the area will be neglected. Canoe and boundry water opportunities will always be able to grow as long as the boundry waters are pristine. That means the northern minnesota economy depends on this habitat. The mining may bring larger profit in a shorter ammount of time, but once the mining has happened we can't be sure if we'll get the boundry waters back to their prisitne condition. I don't think this is worth the risk. Money and efforts could be placed in sustainable development and eco-tourism instead of mining. Efforts could be placed on making products without these dangerous mined metals, allowing alternatives to come to the market and decrease the demand for such mining. The longer we postpone the marketing of more environmentally friendly products that don't require extensive mining and metals, the longer it will take to get them into the mainstream. A new mining site is a setback the alternatives that lead to a sustainable future. I hope the utmost seriousness is taken into consideration before any actions are taken in the boundry waters. I also hope that the long MN tradition of boundry waters canoing gets first priority in the issue. Please see past the temporary economics of the issue. I would love to see this area remain how it is undeveloped and unmined, to ensure the safety of our critical habitat and clean water.	G11

2220	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Lets not forget what Reserve Mining did to Lake Superior at Silver Bay. We trusted their response and look what we got in return. This is not a good thing for Minnesota and it's citizens so lets put a stop to it.	G9
<b>Sender Last Name:</b>	Wakonabo	<b>Submission ID:</b> 3382
3672	As a student of higher education, pushing for more sustainable development of our natural resources. It is amazing to see public treasure and an ecological wilderness area face the possibility of exploitation. Not only is the land for all peoples it should be for all time. The wildlife are under enough stress like the moose, from environmental impact. Archaeological degradation of potential sites are often overlooked as well. Northern Minnesota has been hacked over before in the past and it has taken this long to recover. An open pit mine and it's operation will never recover. The wounds of our time will be the scars of our children.	EOO,G2C
<b>Sender Last Name:</b>	Walker	<b>Submission ID:</b> 1283
1472	#N/A	G2C,G7B
2624	Okay. My name is Greg Walker. I live at Savage currently. I spent 24 years on the Iron Range, and I know the people up there, I know the culture, I understand mining, and at least I'm in favor of the PolyMet project. Certainly, the economic benefit is going to be great, very beneficial to the Iron Range, and we support it primarily for that reason. We feel that the consulting effort with Barr and other consultants and the engineering effort to assess the environmental aspects of the project have been well done, well undertaken, and I feel very confident the engineering is there, and this project should be at least as good as Flambeau in Wisconsin, the Flambeau mine in Ladysmith, Wisconsin. I think it will be another benchmark in sulfide mining and environmental mediation. And, let's see. That's about it. I think I can speak on behalf of my family, my wife -- probably can't legally do that -- but we're in favor of that project. We do own property in Itasca County, so although we're going to be remote from the actual mine location, again, we favor the project.	EOO,G6
<b>Sender Last Name:</b>	Wallace	<b>Submission ID:</b> 3479
1114	Further, the PolyMet NorthMet project will result in total loss of 1,454 acres of federally designated critical habitat for two endangered species known to be in the vicinity of the mine site: the Canada lynx and the gray wolf. Finally, cumulative impacts must address the loss	WI1
1320	has already banned sulfide mining due to the unacceptable environmental risk it presents. It is also my understanding that PolyMet proposes to use an existing mine tailings basin for the disposal of its tailings and toxic materials despite the fact that the basin already has stability issues making it unsafe. Any failure of this basin to hold its contents would result in long-lasting and serious contamination. PolyMet should complete a stability analysis of the basin and devise an acceptable design before being able to proceed with this project.	GT2

3124	Please do not allow the same mistakes to be made over again by allowing Sulfide mining in areas where the run off will permanently affect the ground water FOREVER. The proposed Polymet of mine just south of Babbit Mn. is a very dangerous idea and also a very bad precedent for other areas in your beautiful state. Water quality and the recreation economy will be seriously and negatively impacted. I am an avid outdoors man, a canoeer, a scientist and a chemistry teacher - sulfide mining has been banned in several states due to the ground water contamination issues that last forever. Your recreational resources in Minnesota are superb and should not be subjected to this type of threat - your economy can not afford to loose recreational \$\$ in the long run. This type of mining follows the typical "boom and bust" program that disrupts communities socially and environmentally - I just returned from the Upper Peninsula of Michigan where the economy has suffered greatly from the "bust" part of the sulfide mining cycle. This type of mining also left tailings ponds with no funding to monitor and abate future problems - that work was left to the already burdened people of the state of Michigan.	G7A,G11
3134	I am glad that I have visited northeastern Minnesota before these mines are to be developed. I don't believe for one second that these sulfide mines can be developed in such a way that they will NEVER pollute the adjacent waterways. Once they are opened, there is no turning back and the inevitable stain on the environment will remain for tens of thousands of years. Given the numbers of proposed sulfide mines in the area, it is almost certain that many lakes	WR3G
3233	waters to be discharged from the mine site into the Partridge River after the mines closure, as well as tailings basin discharges high in sulfate concentrations. High sulfates can turn mercury into forms that make fish dangerous to consume. This has serious human and wildlife health implications. It is unacceptable to proceed with a mine that already predicts these kinds of pollution outcomes.	EOO,WR4B,FM1
3682	well known history within the U.S. of causing severe and long lasting environmental impacts. Despite industry assurances, there are no new technologies which are capable of preventing this environmental damage. Water quality impacts remains a top concern. How is it acceptable to allow for up to 2,000 years of environmental impact for the short term gain of one company? Who will pay for the long term water treatment and clean up efforts which will be required? PolyMet has few assets and little financial history. The DEIS fails to address where the funding will come from to pay for post-closure treatment, monitoring and maintenance. As a result, it seems likely that Minnesota taxpayers may have to pay millions of dollars to clean up after PolyMet has gone. In addition, the DEIS predicts contaminated	PD2,PD4
3753	of revenue to the Boundary Waters Canoe Area Wilderness and Superior National Forest tourist industry as part of a sulfide mining district. While I fully understand the need for natural resources in our society, we also need to be responsible in our decisions. Certain types of mines should simply not be permitted in places where the risk to the environment is too great, as is the case for sulfide mining in northern Minnesota. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These serious long-term negative consequences outweigh the limited short-term economic gains this proposed mine might provide. Sincerely, Liz Wallace	G2

3529	To whom it may concern, I would like to voice my opinion on the matter of developing a copper/nickel mine in the vicinity of not only some of Minnesota's most precious natural wilderness, but also that of a treasure of the world. This area is one of the most important sources of fresh water in the western hemisphere. To risk the negative impact that is inevitable from such a project would be to continue adding strain to the limits of our resources and harm not only our immediate natural landscape and all the creatures that depend upon it, but also endanger the futures of our coming generations. I understand that this kind of development would bring some jobs to the north (those who may have the education to work within the operation) and meet demands for our current society's needs, but it is also a short-term salvation with a long term impact that can never be repaired. I value on a much larger scale the protection of our fresh bodies of water and the essential life-sustaining and soul-sustaining gifts that come with interacting with this area's natural beauty. It is the last outpost that we have in the state. The more we eat at its edges the quicker the erosion of its beauty and the erosion of the laws that protect it. Let us learn from history for once! Once it is gone, we cannot get it back! I, as a Minnesotan, as a citizen of the United States, as a human being upon this earth who invests and contributes to our society and to my children's futures, do strongly oppose the plan to develop a copper/nickel mine near the boundary waters wilderness area. Thank you for your time, Nicholas Waller	EOO,G2,G7

316 I am writing on behalf of PolyMet Mining, Inc. I would like to see this project move forward and personally feel frustrated with the State's delay in producing the draft EIS. I further understand that PolyMet is the first Copper, Nickel mine to seek approval in the State, thus review is prudent. However, I remain disappointed in my perception of the State's lack of project attention that PolyMet should have commanded. Why should the State of Minnesota approve this project? • Jobs that pay a livable wage, and taxes generated to pay off the State's deficit. • PolyMet's facilities and mine site are located in the middle of the Mesabi Iron Range – not in the heart of the BWCA. • Is it not true that PolyMet will be the only domestic source of nickel – a national interest by definition? • Through the EIS, PolyMet has proven it can produce critical base metals while adhering to the State's incredibly strict environmental standards. • PolyMet utilizes existing structures, tailing basins, rail, power and road structures. As a result, no new damage to the environment occurs. I am expecting a prompt conclusion to the public comment period, and a direct movement into the permitting process.

3903 WATER LEGACY CHARGES DRAFT EIS IS WHOLLY INADEQUATE SAINT PAUL, MN, November 3, 2009 – WaterLegacy, a non-profit organization formed to protect Minnesota's waters and the communities who rely on them, learned today that their effort, in collaboration with nine other environmental and faith-based groups, to obtain a 90-day public comment period (legal requirement is 45 days) for the PolyMet strip mine project in Minnesota has succeeded. Members of the public will be able comment to the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers on the proposed copper sulfide strip mine draft EIS through February 3, 2010. WaterLegacy attorney, Paula Maccabee, stated, "The good news is that members of the public will have at least 90 days to comment on the PolyMet strip mine draft EIS. The bad news is that the proposed strip mine is likely to result in thousands of years of acid mine drainage, increase mercury contamination of fish, destroy wetlands and habitats, and put Minnesota taxpayers at risk for hundreds of millions of dollars in Superfund liabilities." WaterLegacy pointed out that both the United States Environmental Protection Agency and the Indian tribal experts involved in the process as cooperating agencies believe that the draft EIS is inadequate. Key issues include: 1) use of fatally flawed water quality analysis; 2) perpetual water pollution inconsistent with state mining laws; 3) failure to address the risk of catastrophic collapse of tailings dumps; 4) failure to include an environmental and economic analysis of the land exchange needed to proceed with the strip mine; and 5) failure to discuss financial assurances to protect taxpayers from footing the bill for future strip mine water pollution. Public hearings on the PolyMet draft EIS will be held in Aurora, Minnesota on December 9 and in Blaine, Minnesota on December 10, 2009. See [waterlegacy.org](http://waterlegacy.org)

3102 I live on the shores of lake superior, the sulfide mining proposal made by PolyMet is EXTREMELY likely to do irreparable damage to the Boundary Waters and the water quality for anyone in the same watershed. Regardless of what humans think, this is not our planet anyways and we should be conscious of our effects on other beings that we share this planet with. Do NOT allow this project to go through, Our future generations will be deeply effected by this decision

1 My support is for more jobs in Mn & surrounding areas. the work will go somewhere it might a well be here. I believe there are enough standards to prevent over polution. If they do not exist now, they will be passed sonner or later. Plants can comply then. There are our jobs. Iron workers 512 Duluth.

2	Is it worth some jobs to ruin the Lake Superior and Great Lakes with the ultimate sulfide run-off. Jobs last maybe 40 years – resulting pollution lasts forever. Where is Polymet’s proof of their “new” sulfide treatment??	EOO
3	I feel the need for the mines are essential for economic reasons, so we are not so dependent upon foreign imports of minerals. It is my opinion that PolyMet will mine these minerals in a manner as to not hurt the environment.	EOO,G1
4	We very much need the industry in Northern MN. Polymet has done their homework, they are not asking for handouts. This industry, starting with this project can help sustain the Iron Range and Northern MN economy – I firmly support this project.	EOO,G1
4	The question is: “Why hasn’t this project gone through yet?” It seems to me the only issues here are the environmental issues, which are issues I can see, but from what I have observed, Polymet mining company have been compliant with any and all obligations in order to ensure this mine runs environmentally safe. Mercury in our water & soils is a serious issue indeed, but when their precautions are presented and they are up to standards by DNR & other companies controlling the issues. Why are we still debating whether or not it would be a good idea to create 400+ jobs? Northern MN was boring & is sustained by the mining companies. They mines are what made the Iron Range. This meeting may be procedure but it is being used only to better inform its supporters & only make their decision more concrete. Obviously MN needs this mine & so does our economy. This mine won’t only help the ones employed at Polymet, but w/the boost of economy it’ll boost other businesses as well. The environment is important & so is the health of the people that surround it, but this mine has the financial capabilities of making it an environmentally friendly one, so get it started already!	EOO,G2
4	Dave Bozicevich, Virginia, Minnesota. I'm in full support of the PolyMet project. I'd like to give reasons or...I mean, what do I do, other than say that? Okay. Some of the reasons that I feel this project is worthwhile, I think it would be -- first and foremost, it would be an economic boom to the Iron Range. I think it would be the next step in the taconite process. We had the red ore, then we had the taconite, then we have, you know, Magnetation, and PolyMet, and now we should take it to the next step. I really believe that the world needs these elements that the PolyMet project wants to harvest. I believe that after 7 years, PolyMet Mining still does not have their permits. I think that is a travesty. Why should it take 7 years to not get their permits? I also believe that the world needs the commodities. You know, we've all seen what's happened with the price of gold in the last few months. Unfortunately, this Obama Administration is going to turn this frickin' country upside down, but you see why gold has increased, because the value of the dollar is decreasing. And it's not only gold, but it's platinum, palladium, silver, copper, nickel; all the other elements that we could possibly extract from the area here, I think it's done. I think it has been done with a lot of insight and a lot of resource, a lot of information, a lot of thought has gone into this situation. And, you know, it's not like copper mining was a hundred years ago where you dig a hole and you extract it and who really cares about, you know, the remaining situation; what it's going to do to the environment. You know, the main concern with these leaf-licking, granola-crunching left-wingers is, you know, the acid runoff, but....that might have happened a hundred years ago, but I think things are in place now where we can prevent these so-called travesties so that couldn't possibly happen. Would you rather have the world use these precious metals in an environmentally-controlled situation, or would you like to have a third-world country harvest these commodities with no care for the environment at all? And something else that I'd like to state about the opposition is: Most of the opposition that is coming are from the environmental wackos; you know, the left that really, you know, they're against progression. If we have our thinking like they think, we would still be going to work on horses instead of cars, because what they're really doing is stifling progress. And I really believe that the world needs this commodity, our area needs this to take it to the next level; the next step, like I had previously mentioned. And I think that it's -- that it's really unjust that the State of Minnesota, the EPA and whatever, why it takes so long to get the permits. You know, why does it take 7 years to not get your permit? Why can't it be, like, 6 months? You know, what do you have to study and what do you have to look at after 7 years? Don't you think that everything has -- all the issues have been addressed? I think it's a travesty, I really do. And I have 100 percent support behind this. I hope that it goes through. And we need the commodity.	EOO,G10

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
5	10-15% unemployment, massive state budget deficit, huge trade surplus. How can we not allow the project to proceed? Northshore mining is proof that mining operations can be performed in environmentally sensitive areas. The state of Minnesota has the regulations to enforce compliance.	EOO,G1
5	Seems like the independent studies have been done this isn't a quick approach...looks good. Need jobs. MN needs this.	EOO
5	As a person who/lives work/plays/in Northeast Minnesota, I support Polymet mining project. It will significantly contribute to the state and local economy at a time when we really need the jobs and economic benefits.	EOO,G1
5	I feel Polymet has done a very complete job researching and planning this project. I'm in full support of this.	EOO
6	I am a pipefitter that is currently laid off. I enjoy and want to preserve the outdoors as much as anyone else. I believe PolyMet has a safe and environmentally friendly process for processing the ore. People opposed to this project are using false information to scare people into stopping this project. I think this project would benefit the Iron Range, Minnesota, and the entire country. It would provide good paying jobs both during production and during construction. We would also have another source of these metals in this country instead of importing them. Good jobs are the backbone to a good economy. I think the PolyMet project completion would encourage even more growth in the mining field in this state. I just can't understand why people would try to stop such a good project for economic growth.	EOO,G2
7	I am writing in support of the PolyMet NorthMet Project.	EOO
7	As a former resident of Hoyt Lakes, I recognize and support the NorthMet project in terms of its much needed contribution to the iron range.	EOO
7	it would be beneficial for the EIS Summary to address the fact that if PolyMet did not continue there would still be detriment to the environment due to the fact that there would still be a demand in this country for copper (and the other metals PolyMet would mine).	EOO
8	Steven Thums, Isabella, Minnesota. I'd say that I think this is a good thing for the economy around here and for people working. I believe in protecting the land and water, but there's an old plant there already. They've done damage. I can't see this place overdoing that much damage to the area with the days and how we protect things nowadays. So I think this is a very good thing for this area up north.	EOO
8	I am for the project it will help the economy.	EOO
8	I am for this project. I think it will be a great way to get some of our guys back to work.	EOO
9	I still have many questions and concerns about the environmental impact of the proposed mine, and ask that you extend the public comment period to allow us to better study + respond to the complex issues that this project raises.	PRO6
10	I'm a Union Ironworker who supports Union work in Minnesota. I currently have a family to support and could use the work.	EOO
11	Think globally act locally. That's conservation with common sense!	EOO
12	Lets approve this mine "In my backyard". Our nation needs the metals that will be produced by this mine. The operation as proposed by Polymet will be more environmentally friendly than almost anywhere in the world. Minnesota with the approval of this project would create jobs in Minnesota, get the tax revenue and supply our country with safely and cleanly produced important metals. This would be a win, win, win situation for Minnesota!	EOO
13	I also think that he was telling me that they need to do a lot more stochastic modeling on what the storm surge kind of things are going to be at the -- at the tailings basin, because he said they have a whole bunch of new eleventh-hour data that's just come in about how that works, so they need to do -- run another stochastic model on that. They haven't really done a good job there.	EOO,WR1E
14	The public meeting was for the purpose of informing people about the EIS process not a debate of mining or not mining. This was no more a one sided event than the Precious Waters meeting held by the Friends of the Boundary Waters.	EOO,G10

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
14	He also said there's eleventh-hour data that's come in on wild rice, and there's a Minnesota Wild Rice Standard that says there can only be so many parts per million of sulphate in the water, and clearly, that hasn't been taken into account fully in this, he tells me, so that needs to be added to the analysis, because that's a crucial thing that affects 1854 Treaty rights to some extent, and those are -- probably trump the U.S. Constitution. Of course, it should be U.S. Constitution Treaty Rights are the law of the land, so given that, that needs to be in there. It hasn't been done. There hasn't been good modeling on it. They thought there was no wild rice in the Partridge River. Now they're saying that they have confirmed reports on that, but they haven't worked that into all the different alternatives and scenarios, so clearly, there is a lot more sort of modeling work and analysis that needs to be done that hasn't been done yet.	WR4A,WR4F
15	I think it is an absolute shame, if not criminal, to allow a public meeting that was meant to inform concerned citizens on both sides of the issue to become a one-sided political rally. I came here tonight to listen to subject matter experts, not politicians making stump speeches.	EOO
16	The -- I think there's a real potential for some serious pollution that's going to negatively affect the city of Hoyt Lakes' drinking water supply, water supply for people's wells all up and down the reaches of the Embarrass and the Partridge River, going down all the way to St. Louis, and I -- or St. Louis River drainage, and I think that cumulative -- they say that there is no cumulative water quality impacts, and I'm -- I'm pretty dubious about that, because I just don't see how, with possibly more plants like this going in all up and down the Range, the East Range, that there's not going to be cumulative water-quality impacts, at least further down the St. Louis River drainage way. I just don't see that not being an issue. You know, at some point, you're going to -- you know, pH is not a linear thing. It's a -- it's a loga -- logarithmic, exponential thing, and when it gets past certain quality thresholds, it starts changing more rapidly.	EOO,SE3,WR3B
17	I support Polymet and their project. It is safe and we need jobs in northern Minnesota.	EOO
18	So I was just talking to the water quality specialist from the consulting firm, and he was just telling me that there is a number of analyses that they haven't completed yet regarding sort of financial assurances, what -- what the correct levels of financial assurances are for the correct levels of financial assurances are for this, because, for example, if PolyMet shuts down or goes bankrupt, either -- you know, before or after the 20-year thing and there's not enough money in the fund for monitoring or whatever bond assurance they put forward, the state's going to get stuck holding the bag, and I think that's a really critical piece that needs to be in the Environmental Impact Statement, because that really affects what the -- the possible public impacts are.	PD4
18	1) Polymet spent \$20 million on a study 2) Science is good and the environment cost is really in the execution of the "good" engineering. Conclusion: let them have their mine. Let good men and women have their good jobs. Let the environmentalist know that Polymet play by the rules and the liberals from St. Paul do not (Rep. Houseman wants to introduce laws to change the rules)	EOO
19	I am very supportive of the proposed Polymet mining proposal. I am satisfied that the engineering team from Barr Engineering and the staff of the DNR and Army Corp of Engineering have identified a responsible plan to develop this mining operation with an acceptable/minimal impact on long term water quality. The benefit of economic development is very powerful for our state and it's people. I think the other mineral deposit adjacent to the Polymet site should be consolidated into this operation over time to minimize any added environmental impact to the area and this provides a sustained economic engine for Minnesota that would last for 50-100 years. I would also like to see the floating bog wetlands produced by BROTEX used as part of the remediation. This product is more from recycled carpet fibers (nylon) and lasts forever.	EOO,G14
20	I'm very concerned about the destructive nature of this project. Acid mining was rejected by Wisconsin and ultimately banned because of the LT harm that would have been caused by sulfide mining. Now, with the economy in rough shape, PolyMet is preying on an economically vulnerable area & asking them to accept even more contamination in exchange for a few years of jobs.	G2,G12
20	The mining itself will produce toxic leachate, and so will the tailings. What will this do to drinking water & groundwater?	RFI
20	There are so many things that this EIS doesn't even begin to cover. I'm especially interested in hearing from native peoples about the real affect on them & their land. What was this treat that was mentioned -- more on that.	CR2

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
21	How many species of animals will be affected?	RFI
21	Where are the Elk?	RFI
22	I'd like to see in the next presentation exactly the affects of these toxins on fishm on other wildlife, in swamps – our earths filter systems, the rice, the air etc., maybe in the form of photos.	G2,G14
23	I have lived in NE MN all my life & feel that I have allways been concerned about the balance of the economy & the environment in which I have lived worked & raised my family (8 children). We have lived on Big Sturgeon Lake & draw our drinking water from a well for the last 19 years. I have paid close attention to the process undertaken by Polymet and am confident in their expertise & the systems they will be employing in extracting the various minerals they are seeking. I support the issuance of the permits necessary to proceed.	EOO
23	Also, the drainage that would occur into the Embarrass & the Partridge River.	WR3D
24	I THINK THIS COMPANY SEEN TO BE DOING THINGS BY THE BOOK AND THE BENIFETS OF JOBS WOULD BE GOOD FOR FAMILYS	EOO
25	Being a resident of Northern Minnesota, I am in full support of the PolyMet Mining NorthMet Project. My support is based on the following reasons: PolyMet Mining has invested significant resources in terms of time and money in developing the Draft EIS to ensure that all questions and concerns are brought to light and are being addressed prior to the start of the project. The tax contributions to all levels of government, the direct jobs at the mine and the spin-off impact are tremendous and are needed to help level the economic swings of the region. As a person who resides, works, plays, pays taxes, and votes in the region, I am greatly aware of environmental impacts. The resources of time and money spent to make sure all environmental issues are address prove to me that the project is economically viable while working within the current environmental regulations. The metals that PolyMet will be mining and refining at the NorthMet Project are essential to all of the modern conveniences that Americans desire in their every day lives. Many of these metals are not produces in the United States, thus requiring importation. The countries that produce these metals in many cases do not have the safe guards in place to protect the environment that will be required of the NorthMet Project. Thank you for the opportunity to submit a comment on this project that is essential to the State of Minnesota and to the United States of America.	EOO
26	I support the Polymet project. It will provide long term mining employment and short term construction employment. It will boost the economy of the iron range and improve the quality of life. In the bigger picture copper mining in Minnesota will reduce imports of metal and contribute positively to the trade balance.	EOO
26	I'm Joni Stutzman with the Hoyt Lakes IGA, and I would like to address to -- I'd like to address the -- if nothing happens, let's say that PolyMet is turned down and nothing happens. The impact that that would have of not allowing jobs to come to the area, young people to come to the area, would be a continuing deterioration of services for the area, including retail, including school, including churches, including the hospital, because we need those jobs in order to maintain our retail environment. And if we do not have those jobs, we will continue to lose our retail environment, we will deteriorate the school, because there will be less kids available, the school will have a difficult time paying for the new school, and I just think the -- and then allowing the importation of the needed minerals will cause a bigger problem environmentally than having them locally and under a controlled circumstance.	EOO
26	Tourism and the precious natural resources will be affected for the short term gain of jobs.	EOO,SE4
26	I think the environmental studies are adequate and I sure would welcome more jobs around our area. So I'm strongly for this project.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
27	I support the PolyMet Project for there ability to mine the minerals needed without doing damage to our environment new processes that will reduce drainage to rivers and lakes and air. and support the project for the economic impact it will have in the Iron Range. 400 new jobs close to 500 new jobs from spin offs improve the tax base more income for our schools and cities on the iron range precious metals more accessible to US companies provided with damage to air water.	EOO
27	It would take our grandchildren's children before it would be cleaned up and the metals mined would have been used up 15 years after it was mined.	PD3
27	This company seems willing to do what is right, and with all the people out of work, what a help to the area.	EOO
27	I believe PolyMet's project should move forward as it will provide good paying jobs & taxes not only for Northern MN, but also for the state on Minnesota. Based on the time & labor spent on the project so far it's fine to approve it and move on.	EOO
27	I support Polymet for tax's + jobs It will also support my job + company.	EOO
28	How can you gurantee that the tax payer won't be picking up the clean up costs?	PD4
29	This project would be a positive for all Minnesotans. Build it!	EOO
29	How can you prove that the wastes will remain clean?	RFI
29	Wonderful project! I love the idea of mining ore industry in the northern part of the state. This region has such a history of production and significance to not only the state but the region. Please move forward with this project and get Minnesota's economy back on track.	EOO
29	Worse yet, the Fon du Lac tribe is situated downstream from the proposed site, and not only would the river flowing through the reservation be affected, the upstream wild rice stands already recognized as threatened would likely disappear.	G14,WR3D,EOO
29	William Moraski, and I don't have a middle name. I live in Hoyt Lakes, Minnesota. And I have lived up in the Iron Range now for 50 years, and 40 of these years, I worked for LTV Steel Mining Company. And I have sat through several meetings with PolyMet with telling about how the process was going to work and I was absolutely impressed at the changes from the old mining, what they have to do to meet the standards of mining copper. And I am totally convinced what I have seen, that they will meet any pollution standards at the highest level. I certainly would like to see this project go forward. And I think it's a wonderful company -- PolyMet -- as I see it, from all the discussions we've had. And, again, I got grand kids that live up here, and if there's anything I sensed that would hurt them, I certainly would not support it. I think, again, living here all these years, I have the utmost confidence in PolyMet. Thank you.	EOO,G5
29	This proposed mine is surrounded by rivers which flow into the St. Louis and ultimately into Lake Superior. The water and wetland scientists at tonight's talk even readily admitted that the leachings could spill over the lagoons and into Partridge creek. Why then should this mine project be considered? I have fished and canoed the St. Louis River for many years now, and it sickens me to think that this pollution will likely limit my ability to do these things.	WR3D
30	I fully support the PolyMet project. I believe after going to a number of meetings explaining the process that yes in fact they have covered all bases from an environmental stand point and will do even more if required by permit. I live and work in northern MN. The economic vialbility of the region is at stake. I believe that a environmentally feasible project which will still create jobs can be achieved. The most important economic impact is obviously the job creation which diversifies the industry in NE MN and stabilizes the area. The taxes paid will benefit the whole state.	EOO
31	Creation of the Polymet Project will allow the creation of jobs that will provide a hiring wage. It will also help retain and possible help return young people to Northern MN. I believe that the state of MN has and will continue to safe guard the environment of MN and that the management of Polymet had committed to, and will continue to protection of the environment.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
32	Chpt. 5 16-16-Monitoring of the proposed budget Currently there is no explicite monitoring information – it is critical for explicite monitoring information to be included in the final draft. For instance, what happens when agency budgets are cut & funding is not available to continue monitoring? Who will monitor? Certainly not the company – must be independent monitors who report to PCA, DNR, AC of E, throughout the life of the project and with power.	ALT5
33	We need the jobs in Minnesota. We can't rely on tourism alone. Mining has been a way of life in Northern Minnesota for a long time. Polymet is going to revive a pellet plan, which means the area already has buildings on it and there are a lot of mines the area already. I don't think there will be much of an impact on the environment.	EOO
34	I think the PolyMet Project should be allowed to move forward. The project would provide needed jobs to the area. It also appears to use best available technology to minimize the environmental impact to the area. In addition, it will reduce our dependence on metals mined out side of the country.	EOO
34	We have thousands of people out of work with the economy and all. We have the technology to keep a safe and clean environment I don't see any reason we cannot put everyone to work and also keep a clean environment which is also important.	EOO
34	I fully support this project for the creation of construction jobs, permanent jobs and the tax base that it will create in the state of MN.	EOO
35	I SUPPORT POLYMET'S NORTHMET PROJECT This project will contribute to state and local economy significantly at a time when we need it and the jobs that it will bring. This project will be done in an environmentally sound and safe manner. The metals that will be supplied by this mine are useful in green energy projects and inhance our ability to provide the supply we need instead of depending on offshore supplies.	EOO
35	John Martin, Talmoon, Minnesota. I was just thinking that this project would be real good for us people in the community living in the northland, just to kinda jump-start the economy. And, you know, we'd be bringing all these jobs up here and....not the permanent jobs, but the construction jobs too; having the people come into the area spending money at motels, restaurants. I think it would just be really good to put the northland back to work. I guess that's all I really have to say about that.	EOO
35	The St. Louis River flows less than a mile behind my home and through the piece of this earth most dear to me. But the area so close to my heart is threatened – by a lack of economic opportunities. I've watched so many of my peers downtroddenly head “south” to earn a living wage. PolyMet would bring 400 jobs to the area directly along with an exponential number of spin off jobs. The copper and nickel they hope to mine are metals that the world needs especially in the creation of green technology. With the technology in place so much better than years ago and the Iron Range ethic, we could safely and cleanly provide them to the world and diversify our economy at the same time. It's ethical to our region, state, and country that we keep some industrial focus and not look entirely to tourism & strive to service to sustain us. The agencies and industries in this project are people I trust. They are people who, like me, grew up in Northern Minnesota, live there, breathe the air and drink the water. I'm sure they will do nothing to sacrifice the land we all love, including my dear St. Louis River.	EOO,G7
36	I think the PolyMet Project should be permitted to provide working wage jobs to families with new technologies in place to protect the environment new regulation for safe mining for the Northern Minnesota area – there is no reason not to mine more metals in a mining enriched area.	EOO
36	I believe in strong union representation. I have a family up here, and so far have made my living and support for my family by working union jobs. This PolyMet job is security for my job and for my family in the upcoming years.	EOO
36	I support for more jobs in MN for the community & contractors. I believe that the standards to keep the environment clean and give back in profit what it will trade.	EOO

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
37	There has never been a sulfide mine yet that hasn't polluted & I don't believe that Polymet can run a sulfide mine without polluting our waters. Minnesota is the land of over 10,000 lakes and it is one of our biggest and most important assets. I don't think that our environment should be jeopardized for any promises that haven't been proven. What good do jobs do in a polluted landscape. H2O is life we need to protect our Minnesota waters at all cost!	WR3D
37	Inadequate consideration has been given to the impact of noise and light, both on wild life and on land owners throughout the region.	PD12
38	I very much support Polymet and its jobs it will create. Minnesota specially Iron Range (N.E. Minnesota need job. Polymet will not only put people to work put will also have many spinoff jobs. Also it is better to use our own resources instead of using foreign material. It not only keeps our money here but also keeps people working.	EOO
38	The mining company has exaggerated the employment that this project will generate in order to create political support. Equipment and technology have advanced & will continue to advance, reducing the numbers employed.	SE3
38	Inadequate consideration has been given to the long-term impact of the mine. For example, waters will exist for centuries. No consideration has been given to how protection can be economically maintained for these centuries, especially in view of the impact of potential climate change on water, storm, security & wildlife.	EOO,G1,EOO
38	I support Polymet. I support the continuation of effective mining in the U.S.A. If we can do it here lets do it! We can do it right and improve our economy and the environment. I support Polymet.	EOO
39	I think that this project would be an excellent company to begin on the range. We need the jobs in this depressed economy. Also I think that Polymet on a whole has tried to cover all the bases as far as the environmental issues. I've done my homework on the company and the process they use for separation of the ores eliminate the sulfur and acid levels once the metals are separated to a very small amount!! They are trying to be environmentally safe and are being very professional in the way they are trying to get this project started. I think in my opinion that this would be very beneficial toward the range.	EOO,G2
40	Please build Minnesota need this project.	EOO
41	I support this project. I think the DNR Agency did a great job of compiling the report. I think the reward outweighs the risk. We need job & state revenue. Please let the project proceed. Thanks.	EOO,G1
42	I support the employment opportunities an also support the environment – Lets get our people back to work.	EOO,G2
44	I am in favor of the Polymet Project. The Northern MN area has been hit unusually hard by the economy over the past several years. This project would provide much needed high paying jobs for a young generation. If this project is not approved, these young people will be forced to move away from the area they love. They would move their young families with them forcing more school closing, more layoffs and less money into an already struggling area. I believe there are safety measures in effect to do this project safely today & for generations to come. The research and the studies must be trusted. The experts must be heart. This is a good, solid project that must be approved.	EOO,G1
44	On a scientific basis, I am as soil scientist, and I am extremely astonished that such a project would even warrant the consideration of a permit if the tailings basin does not have a liner and as designed will allow polluted water to leave the basin, enter the adjacent wetland, and consequently our state water resources. The health of our children, families, wildlife, and our environment will be in peril.	PD5
44	On concerns over the agenda of the public meeting, a DNR employee informed me that politicians were informed that they had 5 minutes of time to talk and no position statements. There insuring time on the stage lasted at least 10 minutes a piece and were nothing more than campaign speeches to win the roles of Polymet supporters who clearly outnumbered the opposition (most likely because they were bussed in). I am also concerned that these sales pitches given by the legislators will influence the resultant comments on the EIS and, taking into account that DNR says all comments will be considered, this is a problem.	PRO1,PRO6

44	This project is important to me due to the new process involved for extracting precious metals. I also like the fact that we will be recycling an existing plant instead of mothballing resources. Any process that keeps products coming out of America helps this recession we have found ourselves in. Lets talk about one of the most important thing about this project, putting Americans back to work with American products.	EOO
45	This process (Polymet) is a very complete environmentally friendly process. We need to keep our jobs in MN. We all have family in N.E. MN. Please support our communities and jobs.	EOO
45	Diane Krueger-Pirnat, Zim, Minnesota. My opinion: I feel that the PolyMet project is a great business for our area. It should create well-paying jobs. It should enhance our economic situation up here. They've been in business a long time. And I know the effects of having employees and how it boosts the economy in many many phases, so I don't have anything to say against it. That's it.	EOO
45	I support this PolyMet concept, the ability to harvest our natural resources to support the needs of U.S. businesses. Some resources need to remain available in this country to protect our national security. The proposed PolyMet site is an existing brownfield with a long history of iron ore & taconite mining. Utilizing existing land, buildings, tailings delta, etc support limiting our carbon footprint. Coincidentally it also saves the company enough money to make the project financially feasible allowing the owners to take the risk that has viable for many generations. The jobs, both primary & secondary are important to diversify the economy of NE Minnesota. Finally, from the testimonials I have heard the new technologies for extracting the ore(s) are designed to be safe to protect our natural assets for generations to come.	EOO
45	Northern Minnesota, the Iron Range and rural communities of Northern MN is an important economy for our state. It can often be overlooked as just a vacation spot. Polymet employees and officials are responsible leaders that live and raise their families in our communities. They have put together a viable and one of the most environmentally responsible plans for a new generation of mining in Minnesota. I believe they will raise the bar and hold high standards in environmental responsibility. This an important long term project that will support local economies as well as produce important tax dollars for the state of MN. Polymet will also be setting an example and setting new standards for more projects like it that will follow. Northern Minnesota is in a depressed state of economy and would benefit greatly from 400 permanent jobs as well as supporting as even greater number of spin-off jobs. Polymet has the ability to be a leader or set the example for similar operations around the globe by encouraging and motivating other potential operations to being both profitable and lucrative while producing very low impact to the environment which we all live, work, and raise our families in.	EOO
46	I support Polymet! I am a boilermaker and am currently laid off. My family depends on projects like Polymet to keep me working.	EOO
46	Sulfide mining in Northern MN also has the potential to jeopardize the long standing tourism business of the area.	G11
47	Like it or not tourism is the only way Northern MN can be economically stable for the long term. Destroying portions for a ritual forest and an intact ecosystem will only harm in the long run.	SE4
48	I have lived in the Northern MN area all my life. I have seen people leaving our area steadily for years due to lack of work. I love our wilderness and utilize our hiking/biking and lakes as much as I can. I am always concerned with the environment and hiking as "green" as I can. From what I have read & researched I believe Polymet will be a good thing for our area. They have covered all aspects in their development of this project. Minnesota has touch guidelines for pollution control & environmental issues. I think Polymet is working well within the guidelines of safety and a clean environment for this project.	EOO,G2
48	These minerals are essentials. They will be mined whether or not this project is approved. We should build it here, make it here so that it is done safely and our citizens benefit from the jobs. MN has an opportunity to benefit from this project in many ways. Minnesotans need the jobs. Permit the damn mine.	EOO
48	I wish to express my support for Polymet mining. I believe all aspects of their operations can and will be done in an environmentally safe and responsible manner (including reclamation). Also, the resulting jobs and taxes are badly needed. Please approve this project ASAP.	EOO

Comment ID	Comment Text	Theme Codes
48	I'm here to support Polymet and the spinoff jobs that will occur when this project is finally started. Polymet will be a great economic boom that the state of Minnesota needs. Northeastern MN needs this project. I'm a laid off painter in the Duluth Bldg trades and many of my union brothers and sisters need this project to happen. Lets look to the families and the growth MN will have with this project.	EOO
48	As a cabin owner & a home owner in St. Louis County I am definitely in favor of this project. Technology & enforcement of codes = success. PolyMet will pay needed tax revenue for our schools & provide needed jobs for our citizen without polluting our environment.	EOO,G2
49	In these times we need the work & this company seems to be making all the right moves to keep our land water & air clean.	EOO,G2
49	This is something that's going to be done somewhere, so it might as well be here. I fit is here we have control over the environmental impact. Also in todays economy we can't afford to give away all the jobs and revenue this will generate locally! I see no benefit in not pushing forward with this project.	EOO
49	The bottom line is for jobs to be created for us and our downlines in our area.	EOO
49	I support this project mainly for the reason of jobs. I, in the last 2+ years, have worked extensively on the Mesabi Nugget sight for my employer. This has given my family the chance to continue our quality of life and not have to move away like many other that I know. The "Iron Range" is a dying area & we need these types of jobs to keep the area on the map. These sights are done professionally, efficiently & with the environment in mind. I am a proud union member of local 49 and fully support this Polymet, Mesabi Nugget & other projects. Thank you.	EOO
49	I 100% support the Polymet project. I am a laid off painter and we need jobs in the area. These are good high paying jobs. Our region in Northeastern MN needs these kinds of jobs. It is time to put people back to work. I hope I will have a chance to work on this project.	EOO
49	My name is Norm Voorhees and I live in Duluth, Minnesota. And I'd just like to say I support the PolyMet project 100 percent. I'm a construction worker, I'm a representative for Ironworkers Local 512, and I represent members in northeastern Minnesota. We feel that it -- I feel that it would be a huge economic benefit if a project like this moves forward. I also believe that PolyMet is going to be a responsible partner in the mining process here. And I also think that globally, this project would be much better off being done here in this country than somewhere else in the world where there's not as strict of standards to follow. So I feel it's important globally and I also think it's a matter of national security for our country to be able to produce these precious metals in-house and not have to depend on foreign-mined products. That's about it.	EOO
50	In these poor economic times it is important to move ahead with the products and technology to generate jobs, material, and state income to keep the quality of life for hard working Minnesotans. We need this and more projects to get moving ASAP.	EOO
50	As a resident and person who believes that economic and environmental concerns can and must be a balance for the long term viability of our state, I absolutely support the project!	EOO
50	My name is Anne Clayton from Aurora, Minnesota. My father came up here in '56 with Erie Mining Company, and I was raised here a good portion of my childhood when I was in 5th grade and returning the 9th grade; left when I was just right after graduation. I always loved this area. I came -- lived in Texas and Mississippi until I was 50, returned to the Range and now live in Aurora. It's a beautiful place to live. I think that it would be wonderful if the people would support PolyMet, let it return to what it once was. I feel like -- just in checking with some of the people, that the amount of lead that was let out when it was LTV in the -- you know, a year was, like, 83, and this would be only 8; and that's 1/10th. I think that the majority of the environmental damage has already been done and I would just hope that this would be passed. And I guess that's it. Thank you.	EOO
50	On behalf of trades people everywhere I say "Lets build this facility". The pros greatly outweigh the cons. Northeastern Minnesota has not had anything to celebrate lately. Lets give the Arrow head a real economic boost. Changing subjects, regarding nuclear power, I feel we are about thirty years overdue for the nuclear power industry to show signs of life again. End the congressional grit lock, lift the moratorium in nukes and get this country going again. America cannot afford any more banking scams, the last one just about did us in.	EOO

*Alphabetical by sender's first name*

50	I am in full support of this project. With the economy is people of Northern MN need this project to support their families plus all the other jobs that will be created by this mining operation, not just Northern MN, but the whole state will benefit with Polymet paying taxes. More people employed with good paying jobs.	EOO
51	I am an owner of Wayne Transports We need to put our drivers to work. We have drivers that are laid off. We need industry to support our drivers.	EOO
51	I am in support of the Polymet Project. All rules have been followed. Efforts have been made to identify and minimize impacts. Monitoring requirements are defined. All human activity results in impacts on the environment (air, water, soil). The issue is NOT whether there will be impacts, but rather, are the impacts reasonable. If we attempt to seek 100% guarantees of no impact, nothing would happen and any part of human activity. That is an unacceptable requirement (100% perfect).	EOO,G2
51	Am 21 and love hunting & fishing but I can't find a decent job in my favorite area of Minnesota. If this facility was built, I'd move back in a jiffy.	EOO
52	Put Minnesota back to work. Jobs Jobs Jobs	EOO
52	I am absolutely in favor of issuing a permit for this project. Jobs, revenue, safe mining, progress. Let's take advantage of this project. Our children will thank us.	EOO,G1
53	I grew up in Northern Minnesota so I'm naturally an outdoorsman. I also remember how hard it was to earn a decent living on "the range". From what I've learned tonight	EOO
54	at the open house (12-10-09), I believe that this project should be allowed to proceed as long as Polymet us help accountable for all waste products for the long term.	PD4

19705	GLIFWC staff disagree with the information presented in Table 4.1-68. The column "Effects of the Proposed Action" should be rewritten to reflect the serious data gaps that prevent an adequate characterization of the environmental impacts of the proposed action. The discussion of the uncertainty analysis for the West Pit water quality indicates that groundwater evaluation criteria would be exceeded for antimony, manganese, nickel and sulfate and that those impacts would be significant. Despite this assertion, Table 4.1-68 indicates that initial water quality exceedances would be reduced over time. First, the table should indicate that the impacts are significant and that water quality may not meet evaluation criteria for 2000 or more years. Groundwater downgradient of the tailings basin already exceeds standards for multiple parameters. Therefore, the statement in Table 4.1-68 seems puzzling.	WR3I
19705	This section states that violations of Great Lakes Initiative Water Quality Standards would be discovered as part of a monitoring program. GLIFWC disagrees with this approach. The reasonably foreseeable impacts of sulfate and mercury discharges from the west pit, WWTF, and constructed wetland should be included in the DEIS so that potential water quality impacts to Lake Superior can be characterized.	WR3I
19705	The paragraph describing the closure plan for the LTVSMC is misleading. GLIFWC staff reiterate that there is no up to date closure plan for the proposed project. A closure plan is needed to evaluate long term environmental impacts and to inform calculations of financial assurance that would be needed for the project. For more information refer to our comments on section 3.1.7.	ALT8
19705	GLIFWC staff disagree with relying on monitoring to assess the effectiveness of lime treatment. The effectiveness of lime treatment is very important in the final water quality of mine effluent. Therefore, this analysis should be conducted prior to the construction of the facility and the results included in the DEIS. Monitoring is a purely reactive approach which runs contrary to the intent of the NEPA process which is to characterize all reasonable and foreseeable impacts.	WR1E

Comment ID	Comment Text	Theme Codes
19705	An important part of any EIS process is to identify and fully describe the existing conditions of areas that would be affected by the project. Surface and groundwaters north of the tailings basin have been contaminated by decades of LTV tailings effluent. Data collected in 2009 show that private wells north of the basin have been impacted by this historic tailings basin effluent. Although two additional groundwater samples north of the basins collected in 2009 indicate that exceedances exist at the property boundary, the full extent of the contaminant plume has not been defined. Defining the contaminant plume is of vital importance to this project because the contaminant plume will be augmented by the deposition of PolyMet tailings. The additional contaminants will interact with the existing plume and create a new set of water quality and quantity conditions. Unless the existing condition is properly defined, the impact of the proposed project cannot be properly assessed. Finally, discharging contaminated water into an aquifer that is already contaminated is a clear violation of the clean water act.	WR1E
19707	GLIFWC staff reiterate that the effectiveness of the evapotranspiration caps has not been demonstrated. Tribal cooperating agencies have requested that this analysis be done (GLIFWC Comment letter of June 30, 2008 and GLIFWC comment letter of February 6, 2009, Attachment #1). This analysis must be performed and included in the DEIS. In addition, GLIFWC staff reiterate that the effectiveness of the wetland treatment system is in doubt. Finally, GLIFWC staff reiterate that the effects on groundwater levels at the mine site are unknown for both the proposed project and the mine site alternative because of insufficient analysis.	WR1E,WR2L
19708	Another issue of concern is the lack of discussion of the need for an NPDES permit for the west pit. Under all mining scenarios, PolyMet would leave behind a polluted pit lake which will exceed surface water quality standards for thousands of years. It is the position of GLIFWC staff that an NPDES permit will be required for this facility and that additional discussion on the implications of this pit lake must be included in the DEIS.	WR3C
19708	GLIFWC staff reiterate that all waters of the state are protected by surface water quality standards and using the unnamed water to dilute the contaminants of the West pit is not appropriate. The DEIS should discuss the impacts of the project on this unnamed stream. GLIFWC staff are not aware of any biological or cultural resource surveys done on this stream. If this unnamed water is to be destroyed, a thorough accounting of the natural resources present in the stream must be provided. Furthermore, tribal cooperators note that the pit lake is predicted to not meet surface water quality standards for hundreds or thousands of years. Therefore this section is misleading when it says that water quality effluent will improve over time. A full assessment of the environmental impacts of the west pit discharge is needed.	WR3C
19709	As previously discussed, GLIFWC staff believe that additional analysis on the possible exceedance of the Great Lakes Initiative mercury standard must be included in the DEIS.	WR3I
19710	We observe that in several areas, the DEIS excludes previously established information that depicts the project in an unfavorable light. Previous versions of the DEIS indicated that the proposed tailings basin design is not adequate and likely to fail. While this is still the case, the DEIS that was released to the public has omitted that language. The DEIS is inconsistent in the application of water quality standards. Wild Rice waters have a 10 mg/l standard for sulfate which is an approved state standard. However, the DEIS is vague about where the standard is enforced or whether the standard applies at all. The position of GLIFWC staff and of tribal cooperating agencies is clear and unequivocal. The wild rice sulfate standard is a state water quality standard and applies where wild rice is growing. All available information on the presence of wild rice in the waters surrounding the proposed project must be included and a robust analysis of the compliance of the proposed project to those standards must be developed.	EOO,WR3I,WR4F,PD3,PD
19710	GLIFWC staff disagree with the information presented in Table 4.1-77. This summary is misleading because the conclusions are based on insufficient data and faulty analysis. Furthermore, we note that the section on water quality in the Upper Partridge River is untrue. GLIFWC staff note that the west pit is predicted to exceed standards for all years for which predictions were made. These inconsistencies must be corrected.	WR3C
19711	The analysis presented in this section is misleading. The conclusion that groundwater evaluation criteria are met is only true if the contamination of the existing aquifer is ignored. If the existing contamination is considered the conclusions are likely to be different. Any analysis assuming a receiving aquifer with zero constituents is unrealistic.	WR2E

19711 GLIFWC staff note that pumping could be needed for hundreds or thousands of years if the Permeable Reactive Barrier (PRB) is not effective. The PRB is untested and has not been demonstrated to work in any similar situations. In addition, the PRB would need periodic recharging/replacement which would need to occur at regular intervals for as long as water treatment is needed (hundreds or thousands of years). It is GLIFWC staff's position that this long term maintenance is at odds with Minnesota's goal of maintenance free closure.

WR2D

19711 GLIFWC staff reiterate that an untreated discharge of tailings basin water to the Partridge River will exceed water quality standards and violate the Clean Water Act. In particular the wild rice standard will be exceeded.

WR3I,WR4F

19714 GLIFWC staff reiterate that discharging untreated tailings basin water to the Partridge River will have significant adverse impacts.

WR3A

19714 The DEIS states that Aluminum is the only constituent that may exceed standards. However, As stated in TB-14 "Manganese: The concentration of manganese in groundwater is predicted to be above the groundwater standard and the MCL at all four of the evaluation locations."

WR3I

19716 GLIFWC staff reiterate that wild rice grows on the lower Partridge River and that the 10 mg/l standard for sulfate applies. This standard would be exceeded by the PolyMet discharge. Furthermore, there are other projects (Mesabi Nugget Phase II and Laskin Energy) that are discharging water with elevated constituents. Given these existing sources, it is unlikely that PolyMet discharge would be able to discharge their untreated tailings basin effluent without violating the clean water act.

WR3I,WR4F

**Submission ID:** 3718

1 The DEIS inadequately addresses mercury air emissions from the autoclaves. First, the mercury projections used in the DEIS are based on specifications from the autoclave manufacturer and not based on field testing. Historical data indicate increased mercury levels associated with the use of autoclaves. Accordingly, in the absence of data from field tests of this type of autoclave process, significant uncertainty remains in regard to the actual mercury emissions from the autoclaves.<sup>77</sup>

AQ6A

2 In order to minimize the amount of hazardous fibers emitted to the air in surrounding communities, the proposed mining operation should implement Best Available Control Technology (BACT). If BACT is indeed unenforceable at this site as stated in the DEIS, MCEA supports a fiber emissions control scheme along the lines of that described on DEIS pages 4.6-61 through 4.6-63, i.e., one in which Polymet has agreed to install "the most stringent level of fine particulate matter control possible with current technology."

AQ5

3 MCEA conditionally supports the idea of an amphibole fiber air monitoring scheme such as that described briefly in narrative form on page 4.6-63. When a more detailed monitoring plan is provided, MCEA will comment further and determine whether full support is warranted.

AQ5

4 In the meantime, the narrative description raises at least two questions: 1) Will airborne fiber monitoring continue beyond the one-year operational period described in the DEIS? 2) How much higher would operational concentrations have to be, relative to baseline concentrations, to trigger enforcement action?

AQ5,AQ6

5 To protect public health, MCEA recommends enforcement of an ongoing airborne fiber monitoring program akin to the one already in place at the nearby Northshore Mining Co. operation.

AQ5

6 The plant site Air Emissions Risks Assessment (AERA) which begins on page 4.6-22 provides concentrations of various carcinogenic metals and volatile organic compounds (VOCs) that are expected to be released either at the plant site (Table 4.6-16) or from the proposed mine (Table 4.6-17). It is encouraging that aside from the farmer scenario described on page 4.6-27, the population excess cancer risk caused by the mining operation is not expected to exceed the current MDH threshold of 10-5. However, MCEA believes that it would be prudent for Minnesota government agencies to follow the lead of other states (e.g., MA, VT, NC, NY) and apply the more protective standard of 10-6 when protecting the general public from carcinogenic air pollutants.<sup>82</sup>

EOO

Comment ID	Comment Text	Theme Codes
7	The failure of the NorthMet DEIS to analyze the potential negative socioeconomic impacts associated with the Project is a serious shortcoming of the DEIS. Historical trends clearly show that the mining industry in Northeastern Minnesota and elsewhere is predictably characterized by a boom and bust cycle with short-term increased employment followed by decreased employment and associated socioeconomic costs experienced by communities overly dependent on the mining industry for employment. <sup>89</sup>	SE4
7	A rigorously health-protective approach to carcinogenic air emissions control is especially important in areas where cancer rates are already elevated. Northeastern Minnesota has the highest overall cancer incidence rate of any of the state's eight cancer surveillance regions. <sup>83</sup> As noted above, Northeastern Minnesota also has higher rates of both lung cancer incidence and lung cancer mortality than elsewhere in Minnesota. <sup>84</sup> This target organ is of particular relevance because many of the metals and VOCs expected to be emitted from the proposed mining operation have been found to cause lung cancer and/or other respiratory system cancers when inhaled. Metallic emissions listed in the DEIS, including chromium VI, cadmium, and inorganic arsenic, are known human carcinogens that cause lung cancer. <sup>85</sup> Other chemicals listed in the DEIS, such as the VOCs naphthalene, acetaldehyde, and formaldehyde, are classified as known or probable human carcinogens, and are associated with cancers of the lung and/or respiratory system. <sup>86</sup> Health risks of these and other carcinogenic emissions (e.g., PAHs) from this site should be assessed using the 10-6 risk threshold, in order to ensure that the proposed operations do not contribute to a regional excess of relevant cancer types.	EOO,AQ6
8	In addition, the NorthMet DEIS fails to recognize the socioeconomic risks associated with the impact on other employment sectors as a result of the environmental degradation and destruction accompanying the Project. Specifically, the NorthMet project and the reasonably foreseeable development of additional sulfide mines in the region creates a significant risk to sustainable economies in Northeastern Minnesota which rely on wilderness, recreational and access to unspoiled public lands.	SE3
9	Further, the NorthMet DEIS mentions nothing about the fact that the mine processing site appears to be or may be planned to be in a JOBZ zone, or the implications for this on Minnesota revenue and the social and economic effects of the project. <sup>90</sup> According to information provided by the Minnesota Department of Employment and Economic Development (DEED), if the NorthMet Project is or becomes a JOBZ location then it will receive incentives likely to have an impact on the social and economic benefits assumed to be associated with the project, possibly including projected Minnesota tax revenue from the project. <sup>91</sup>	SE3
9	In addition, the lifestyle and economies of tribal communities, from wild rice harvesting and reliance on other cultural and natural resources, are also threatened as a result of the NorthMet Project and reasonably foreseeable sulfide mining activity in the region.	SE3
10	Second, the DEIS does not indicate what type of monitoring will be required for mercury emissions from the autoclaves. In light of uncertainties associated with mercury emissions from the autoclaves and historical data indicating increased mercury levels associated with the use of autoclaves, and considering the significant environmental impacts associated with emissions of mercury, continuous emissions monitors ("CEMs") should be required for the autoclaves. CEMS would ensure an accurate and complete record of mercury emissions from the autoclaves, and ensure that the autoclaves are operating within the manufacturer's specifications.	AQ5,AQ6A
11	The fact that these deadly cancers already occur more frequently in northeastern Minnesota communities necessitates a high level of caution when a new source of potentially carcinogenic and asbestoslike particulate air emissions is under consideration.	AQ4C

*Alphabetical by sender's first name*

**Comment ID    Comment Text** **Theme Codes**

11 We believe that it is difficult to exclude fibers of a particular dimension from a role in causing disease within the lung or extrapulmonary sites when one accepts that both the exposure and tissue burden have fibers of varying lengths and widths. In contrast the experimental models are limited by the simple fact that fibers of very limited length distributions were tested. A telling point remains that when the appropriate analytical techniques are utilized it becomes apparent that in most tissues the overwhelming majority of the asbestos fibers are less than 5 Ym in length. Based on the lack of scientific certainty as to what would constitute a “safe” amphibole fiber, and the established presence of amphibole mineral at the site of the proposed mine, it is critical that Minnesota state agencies are vigilant in their efforts to protect public health. As a key component of this effort to protect the general public, who may be exposed to these air emissions 24 hours per day, 365 days per year, MCEA supports the continued application of the MDH/MPCA definition of a “regulated fiber” as any amphibole particle with AR Z 3:1. As long as the precise relationship between fiber characteristics and pathogenicity remains unclear and hotly disputed, this screening threshold is a reasonable method of ensuring that communities are protected from the risk of diseases caused or exacerbated by fiber inhalation.

AQ4C

12 In comments regarding the NorthMet Project – Preliminary Draft Environmental Impact Statement, dated August 25, 2009, the EPA specifically recommended that the NorthMet DEIS include information on financial assurance. The EPA indicated that inclusion of financial assurance information in the DEIS was recommended “because one key component to determining the environmental impacts of a mine is the effectiveness of reclamation and closure activities” and that “EPA has found the amount and viability of financial assurance are critical factors in determining the effectiveness of closure and reclamation and therefore the significance of environmental impacts.”<sup>9</sup>

PD4

1573 This project does not create enough jobs to justify the large cost of cleanup. Do not approve!

EOO

3769 After following the polymet project for several years I think it is time to start building the plant and provide employment for our area. Northern MN is not just the PLAYGROUND for the metropolitan population. We live here, we are proud our our lakes, hunting, and fishing and I know that polymet will take care of the land as it should be. kris watson

EOO

3770 I attended the meeting Dec 9th in Aurora and am all for the Polymet project. I believe that they have done what is required and far beyond to be sure of an enviromentaly and economicly sound project. I have been following this project from the begining and it's time to move forward. thank you, jim watson

EOO,G6

3549 I have been to many meetings over this project. I have read a lot if information also. This would be a great project for the State of Minnesota as well as the Iron Range area. The permit processing has been handled well by the State but it is time to permit this project. PolyMet has shown due diligence on the design of this project as well as the State. From everything I have read this project would be a great addition to our area. The good paying jobs on both the construction and running of the plant will bring in enormous tax dollars to the area and the State at a time of need. By adding 700 permanent jobs to our depressed area would let a lot of our young people stay home. This would be good for our schools with what has been a steady and slow decline in students. As far as the construction it would add hundreds of new apprentices and employ hundreds of tradespeople throughout the State. In my estimationthis project is a win for the whole State. Thank you for your time. Scott Weappa

19717 The statement that the tailings basin alternative will not exceed and surface water quality standards is incorrect. As previously indicated, this conclusion is based on faulty modeling assumptions, incomplete data, incorrect reporting of the analysis conducted and an apparent lack of understanding of basic hydrology.

WR3A

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19717	GLIFWC notes that the predicted concentrations in TB-15 represent dissolved aluminum (see TB-15, page 1) and not total aluminum as stated in the DEIS. TB-15 presents the most recent water quality predictions for the Tailings Basin Proposes Action and Alternatives. TB-15 predicts exceedance of standards by dissolved aluminum under the Proposed Action and the Alternatives. This section should be corrected	WR3H
19718	The assertion in the DEIS that all parameters are expected to meet surface water quality standards is incorrect. GLIFWC staff reiterate that the wild rice sulfate standard applies (10 mg/l) and would be exceeded. In addition, GLIFWC reiterates that the results in TB-15 (see page 1) represent dissolved aluminum. TB-15 predicts exceedance of the aluminum standard.	WR3A
19719	The DEIS is written under the assumption that the mining company owns the land where the mine pits would be located. However, that is not the case, the land is currently owned by the public and administered by the United States Forest Service. Any land transfers that may occur in the future between the Forest Service and the mining company are a connected action to this DEIS. Therefore, additional information of the details of the land transfer must be included in this document to comply with NEPA.	PD5
19720	GLIFWC staff reiterate that wild rice grows on the lower Partridge River. Therefore, it is the tribal cooperating agencies' position that the wild rice sulfate standard applies and would be exceeded by the proposed PolyMet discharge.	WR4F
19721	The discussion in this section is incorrect. The section states that all surface water quality standards will be met, However, GLIFWC staff note that the Embarrass River exceeds the sulfate standard. Modeling (TB-15) also predicts exceedance of surface water standard for dissolved Aluminum. GLIFWC also reiterates that the wild rice sulfate standard applies in waters where wild rice is growing. The Embarrass River contains several wild rice stands that may have already been impacted by sulfate discharges from the LTV tailings basin. These sulfate emissions will continue under all alternatives proposed for the NorthMet project and the applicant will assume responsibility for those discharges if they receive permits. The effect of this sulfate in the methylization of mercury in the Embarrass River should be mentioned in the DEIS.	WR3I,WR4A,WR4F
19721	This section states that "The NorthMet project is expected to meet all surface water quality standards under all flow conditions for all mine years in the Partridge River." This statement is incorrect for the tailings basin alternative. That alternative would discharge untreated tailings water directly into the Partridge River below Colby Lake. This section of the river will also be impacted by the Mesabi Nugget Phase II discharge and is currently impacted by the Lasking Energy plant. The cumulative impact analysis does not provide a quantitative analysis of water quality impacts of the three projects even though data exist to conduct this analysis. Finally, wild rice grows in this stretch of river. As the DEIS indicates, the Lower Partridge River already exceeds the applicable wild rice sulfate standard of 10 mg/l. GLIFWC staff believe that additional discharges of sulfate from the NorthMet project are not permitted under the clean water act.	WR1E
19721	GLIFWC staff believe that treatment of the tailings basin effluent that is captured by the vertical wells must be an integral part of the tailings basin alternative. This treatment could occur in the WWTF already proposed for this project or in a second facility closer to the discharge point. Tribal cooperating agencies strongly oppose an untreated discharge of tailings basin water to the Partridge River. In addition, there are other existing facilities and mine proposals (Laskin Energy, Mesabi Nugget Phase II) that discharge, or are proposing to discharge water at this same location. Finally, water quality of the discharge would exceed the wild rice sulfate standard that applies to the lower Partridge River.	WR1E
19721	As previously discussed, there is very little data on which to base any discussion of hydrology for the mine site. Therefore, the conclusions in this section are not reliable.	WR1E
19723	This section states that the NorthMet Project would not have any surface water discharges to the Embarrass River. This is incorrect. Aerial photos clearly show a surface water connection between the toe of the tailings basin and the Embarrass River, as do state maps of public waters (attached Figure 4). Polymet will assume responsibility for this and all other LTPV discharges if they receive mining permits. Therefore PolyMet would be responsible for a NPDES permit required at this location.	EOO

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
19723	GLIFWC staff disagree that an untreated discharge of contaminated tailings basin water to the Partridge River would not have impacts. The area of the Partridge River that would receive the discharge already receives contaminants from Laskin energy and the Mesabi Nugget Phase II project is proposing a discharge at the same location. This discharge should be included in the analysis. Finally, wild rice grows on the Partridge River below Colby Lake. GLIFWC staff and the tribal cooperating agencies insist that the 10 mg/l sulfate standard be discussed in the section and be applies as indicated by state law.	WR1C,WR4F
19723	This section states that “The tailings basin alternative would redirect most tailings basin seepage away from the high risk areas and discharge it to the Partridge River.” This statement is incorrect. As currently proposed, the alternative would capture only some of the seepage from the NorthMet project. High sulfate seepage from the existing 2W cell would not be captured. Therefore, emissions of sulfate into the impacted wetlands and aquifer north of the basin would continue for the foreseeable future. PolyMet would assume responsibility for these historic discharges if the receive mining permits. Therefore it is not proper to exclude a discussion of these existing discharges from the DEIS impact analysis.	WR2E
19723	GLIFWC staff note that NorthMet effluent will be discharging through the bottom of the tailings basin into an aquifer and wetland systems that have already been impacted by decades of LTV mine effluent. Additional data is needed to fully characterize the extent of the contaminant plume. Only then, can a proper cumulative impact analysis be conducted for the area north of the tailings basin.	WR1E
19724	GLIFWC staff reiterate that the current wetland delineation does not encompass all wetlands that may be affected by the Project. Because no initial determination of the Project’s area of influence (AOI) on wetlands was made, the site field surveys of wetland and other vegetation were limited to little more than the area within the Project fence. The existing characterization of wetland and other vegetation does not cover even one-half the area that might reasonably be expected to be impacted by disruption of the existing hydrology. Around the tailings basin virtually no wetland delineation has taken place although wetland impacts from inundation are likely to occur. Since 2008 the Army Corps has been developing a workplan to assess impacts to these additional wetlands but this workplan has not been finalized or implemented. This serious data gap must be addressed for the DEIS to be considered adequate.	WE1
19725	Tribal cooperating agencies take the position that the approximately 5,700 (RS13B) gallons per minute of tailings water released by past mine waste disposal activity has likely had a far greater influence on the hydrology of the area than beaver dams or transportation features.	EOO,WR3A
19725	· Lack of Closure Plan.	PD2
19726	GLIFWC staff reiterate that the work needed to properly assess indirect wetland impacts at the mine site and at the plant site has not been completed. The wetlands work group and the Army Corps have developed a workplan to collect the data needed to assess indirect wetland impacts. The results of that investigation must be included in the DEIS to allow a full public review.	WE2
19726	GLIFWC staff reiterate that the wetland classification available for this project is not detailed enough to fully assess wetland impacts. The information available in the wetland delineation provided by the applicant is not detailed enough for wetland functions and values to be determined and does not identify important species level information needed for impact analysis. GLIFWC staff have commented that a more robust field characterization of the wetlands is needed. Wetland Plant Communities of the Crandon Mine Site (Attachment #6) provides an example of the types of field data that are needed for the PolyMet project. In addition, the DEIS does not fully incorporate the data that is available. The wetland delineation study (RS14, Appendix A) identified over 390 acres of wetland community with a significant white cedar component. For example, wetland ID-48 (Table 4.2-3) was identified in delineation reports as dominated by white cedar. White cedar is an indicator of mineral rich waters. Renaming wetland ID-48 as a coniferous bog, as was done in Table 4.2-3, does not make that community a bog. Cedar dominated wetlands are cedar swamps, not bogs. The significance of this is that, bogs tend to be precipitation fed while swamps tend to be groundwater fed. Data from the wetland delineations (RS14) suggest that bogs are not the most prevalent wetland type. In fact, it appears that wetlands that require groundwater inputs: forested rich peatlands and poor fens are the most prevalent.	WE1,WE2

Comment ID	Comment Text	Theme Codes
19727	As detailed in comments provided for section 4.1, there is no reliable groundwater model for groundwater drawdown impacts of the proposed project. The estimates of groundwater drawdown are currently based on anecdotal observations and analysis of historical aerial photography. Therefore, there is no quantitative assessment of mine related drawdown of the regional water table. This serious data gap has prevented an adequate indirect impact assessment for wetlands from being conducted.	WR2A,WE2
19727	GLIFWC staff strongly object to the assumption that wetlands at the mine site are primarily bogs. This assumption is contrary to the field data reported in RS-14. GLIFWC staff reiterate that the methodology used in Adams 2009 is not adequate for characterization of pit dewatering impacts to wetlands (GLIFWC 2009, Memorandum to Jon Ahlness and Stuart Arkley: Photographic evidence for pit impacts to wetland hydrology. April 24, 2009, Attachment #2)). Problems with the methodology used in the opinion paper include: 1. Lack of recognition that aerial photos are a very imprecise measure of surface water level. 2. Photographs presented in the paper show that the Peter Mitchell pits are mostly flooded. Therefore there is little or no stress on surrounding wetlands at the time. 3. Lack of consideration of the topographic relationship of the landscape features including the depth of the Peter Mitchell Pits (P-M Pits approximately 80 feet deep, PolyMet pits approximately 800 feet deep). 4. Lack of recognition that some changes in groundwater hydrology would not be evidenced by the changes in surface water level detectable by aerial photography. 5. Dependence on wetland soil conductivity values that are extremely low and for which supporting source citation in the professional literature cannot be found. The PDEIS appears to rely on “best professional judgment” for estimating impacts due to hydrologic disruption without incorporating specific knowledge of the ecological requirements of culturally significant wetland vegetation such as cedar, and without requiring sufficient background data regarding groundwater. A “best professional judgment” approach is being used as a replacement for data-based scientific analysis of potential impacts. Quantitative methods for estimating the impacts of drawdown and inundation on wetland hydrology exist (e.g. Attachment #7), have been used at other mine sites, and can be used in addition to professional judgment.	WE2
19728	It is unclear how the 83.3 acres was calculated since all participants in the DEIS process have agreed that the groundwater model results are invalid outside the area of the mine pits. Therefore, it is impossible to know how far hydrologic impacts will extend at this time. GLIFWC staff believe that conclusions in the DEIS should be based on actual data and not on speculation. Finally, GLIFWC staff reiterate that, based on the vegetation data collected from wetland delineations (RS-14) it appears that groundwater supported wetlands are common in the Project area. Indirect impacts to communities that require groundwater inflow have not been determined, but would likely be significantly different than expected impacts from the Project to perched bogs.	WR2A,WE1,WE2
19729	GLIFWC staff do not agree that mitigation ratios and mitigation sites should be determined during permitting. Indirect impact acreages would be greater if data and quantitative analysis of mine induced drawdown had been conducted. Waiting until the impacts have occurred to characterize them runs contrary to the intent of NEPA and is not a responsible way of informing the public of the environmental cost of a project. Finally, this wait and see approach makes it more difficult to determine adequate financial assurance for the project.	WE3,WE4,PD3,PD4
19730	The conclusion that additional indirect impacts are unlikely at the mine site is faulty. As previously discussed, there are insufficient data to support that conclusion. Based on the vegetation data collected from wetland delineations it appears that groundwater supported wetlands are common in the Project area. Indirect impacts to communities that require groundwater inflow have not been determined, but would likely be significantly different than the expected impacts from the Project to perched bogs. Ultimately, the DEIS conclusion is not based on data but is based on the Adams 2009 opinion paper. GLIFWC staff reiterate that the methods used in the opinion paper are insufficient for prediction of indirect impacts to wetlands. For example, the Iron Range projects mentioned are located in upland areas of the range and are not proper reference sites for potential impacts at the PolyMet mine site. The Peter Mitchell Mine, although in close proximity, is very shallow compared to the proposed mine pits (Peter Mitchell pit is approximately 80 feet deep, PolyMet pit is approximately 800 feet deep).	WE2
19731	GLIFWC staff reiterate that no analysis has been done to support this conclusion. As indicated in section 3.1.3 it is likely that ore dust would spill from rail cars and be deposited in wetlands adjacent to the rail line. No analysis of any type has been conducted to determine if such impacts would be significant.	WE2,PD3

19732	EPA determined that the project will result in unacceptable and long-term water quality impacts, which include exceeding water quality standards, releasing unmitigated wastewater discharges to water bodies (during operation and in the post-closure period), and increasing mercury loadings into the Lake Superior watershed.	WR3B,WR3I
19732	Based on our review of the DEIS, EPA has rated the DEIS as Environmentally Unsatisfactory - Inadequate, or EU-3. Environmentally Unsatisfactory (EU) indicates that our review has identified adverse environmental impacts that are of sufficient magnitude that EPA believes the proposed action must not proceed as proposed. The numeric portion of the rating indicates the DEIS does not present adequate information for the EPA to fully assess the environmental impacts that should be avoided in order to fully protect the environment or EPA identifies reasonably available alternatives which could reduce the environmental impacts of the action. This rating applies to the Proposed Action, the Mine Site Alternative and the Tailings Basin Alternative. Our summary of ratings definitions is enclosed. EPA has assigned the EU rating because our review of the DEIS determined that the proposed action will result in environmentally unsatisfactory water quality impacts. Specifically, EPA believes that the project will exceed water quality standards because of discharges during the life of the mining operation and on a long-term basis, including the post-closure period. These water quality impacts are largely related to water that contacts acid-generating waste rock and mine faces and to wastewater escaping the tailings basin through seeps and in groundwater. EPA also finds the wetlands mitigation plan environmentally unacceptable because it does not provide mitigation for all impacts to wetlands, particularly for indirect impacts. EPA has assigned the Inadequate (3) rating to the DEIS because EPA believes that the analyses of the hydrogeological profiles at both the mine and processing sites are inadequate to determine the full extent of impacts or to justify mitigation options. Consequently, we believe that the DEIS likely underestimates water quality impacts and that the project is likely to have additional unmitigated long-term discharges. EPA has identified information gaps relating to groundwater impacts, groundwater-surface water interaction, tailings basin stability and containment, and groundwater discharges to surface water. EPA believes the DEIS should evaluate alternatives to avoid mine pit overflow and explore additional mitigation for discharges and waste rock management, some of which are identified briefly in the document. Furthermore, EPA does not agree with the compensation described for wetlands impacts and proposes alternative mitigation ratios. The DEIS did not provide information on financial assurance, which EPA believes critical to the decision-making process when long-term impacts and mitigation are involved. We have enclosed detailed comments outlining our issues more completely and offer recommendations as a starting point for discussion. Our main issues are summarized below.	ALT8,PRO3,PD1,PD2,PD3,
19732	GLIFWC staff reiterate that based on the existing available contaminant modeling, that seepage capture would be needed for hundreds or thousands of years to avoid water quality and quantity impacts to wetlands.	WR3I,WE2

390 I am writing today in support of Polymet Mining's NorthMet project. Our firm, KrausAnderson @ Construction Company, is over a hundred years old and is one of the most respected general contracting/construction management organizations in Minnesota. As a business development person and someone who is concerned about the environment, I took a serious look at the draft EIS. My evaluation indicates that it is far better to mine and process these minerals, that are so strategically essential to the American economy, right here in Minnesota with sound environmental practices, than rely on foreign sources that often operate free of oversight and regulation. We at Kraus-Anderson are extremely proud of our safety record in an inherently dangerous industry. I feel that worker safety at the NorthMet project can also be assured operating in Minnesota, a state with strong worker safety regulations and an exemplary worker safety record. Finally, the NorthMet project is exactly the kind of natural resource based manufacturing that is the foundation for a host of other industries that utilize these metals in their own products. This is the kind of economic stimulus that Minnesota and the United States needs right now. This project will provide many good paying jobs, with benefits, and tax revenue that will keep our State and local governments providing the basic services and education for our children. I see no reason to further delay the permitting necessary to proceed with the NorthMet project. Living in Northeastern Minnesota I know we need this project now and for our children's future.

1201 The City of Biwabik Mayor and Council would like to express our support for the Polymet Mining project. PolyMet has the potential to create hundreds of jobs in non-ferrous mining, while utilizing an area previously used for taconite production. We acknowledge that PolyMet has spent millions of dollars and countless hours on environmental study and has gone to great lengths to minimize any impact on the local environment. The copper, nickel, platinum, gold and cobalt that will be extracted from the land vacated by LTV Steel Mining are necessary components in thousands of items used everyday. As evidenced by the large turnout at the public meeting held on December 9th at Mesabi East High School, we are not alone in supporting this much needed project.

181 My understanding is there are currently no nickel mines in North America. This being the case, nickel is most certainly a strategic metal to the US government; an absolute necessity in case of a military or other related emergency. The environmental standard should be comparison of impacts of this project to other existing mining and refining projects; not the best attainable or least objectionable environmental impact because the cost of minimizing environmental impacts is prohibitive and contrary to any perception of equity; a cornerstone of the US system of government.

EOO

182 This environmental review has dragged on way to long without any other direct comparative measurements to other mining and refining projects; which would have ended this EIS review long ago. I urge immediate acceptance of the environmental impact statement for this project noting the minimizing environmental impact goals are impractical and unlawful. There is an above average chance the US NSA may intervene in any event to stop this obstructionist activity of this critical supply metal to the US economy. If the NSA does intervene, there is also the chance they will hold those personally responsible for the obstructionist activities of this project and its EIS.

145 Okay. I live in Hoyt Lakes, Minnesota. I'm very much in favor of the PolyMet Project. We have a lot to lose up there, so I've researched their project and I think it is very environmentally safe for us. Our water supply comes from Colby Lake which is fed by the Partridge River which runs next to the mine. And if I was concerned at all, I would be against the project. I also own land on the Partridge River and I'm still totally in favor of the mine. I guess that's it.

3834 I support the PolyMet Mining’s NorthMet Project. I feel it will have a positive economic impact for Minnesota and beyond. It will create much needed jobs both directly and indirectly. I feel all necessary environmental precautions will be taken with this project. Further, I feel it is important to mine these materials in a location that has strict environmental standards, such as Minnesota, rather than importing these materials in from overseas where environmental standards are lacking and a large amount of natural resources would be consumed simply in their transportation.

1 X. The Draft EIS Fails to Include Sufficient Information to Satisfy NEPA A primary purpose of NEPA is to “guarantee that the relevant information will be made available to the larger audience that may also play a role in both the decisionmaking process and implementation of that decision.” *Robertson v. Methow Valley Citizens*, 490 U.S. 332, 349 (1989). “[T]he broad dissemination of information mandated by NEPA permits the public and other government agencies to react to the effects of a proposed action at a meaningful time.” *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 371 (1989). Agencies must therefore “make information on the environmental consequences available to the public, which may then offer its insight to assist the agency’s decision-maker through the comment process.” *Dubois v. U.S. Dept. of Agriculture*, 102 F.3d 1273, 1285 (1st Cir. 1996). “Because of the importance of NEPA’s procedural and informational aspects, if the agency fails to properly circulate the required issues for review by interested parties, then the EIS is insufficient even if the agency’s actual decision was informed and well-reasoned.” *Id.* at 1287. As set forth above, for a number of issues including wetlands, water quality, cultural resources and financial assurance, the Draft EIS acknowledges that the agencies are still compiling information and that additional analyses have yet to occur, with much of this required analysis apparently deferred until later permitting. This includes, but is not limited to, directly relevant information pertaining to the proposed land exchange between PolyMet and the Forest Service, the results of consultation with the U.S. Fish and Wildlife Service pertaining to impacts to threatened and endangered species, the results of consultation with the affected Tribes and Tribal members concerning impacts to cultural resources, much more precise wetland delineation throughout the project area and beyond, a description and assessment of all required wetland mitigation/compensation, more detailed information pertaining to wild rice that may be affected by the proposal, and information pertaining to financial assurances. As expressed by EPA, “[w]e note instances where there is incomplete information about impacts and mitigation or where impacts were simply not evaluated.” July 31, 2009, EPA Comments, p. 6. EPA further states that the Draft EIS “appears to defer some impact assessments to a future permit stage,” and that therefore the Draft EIS “may not be entirely sufficient to meet federal expectations of impact assessment and disclosure.” *Id.* EPA’s examples of where additional information appears to be needed include mine site overburden, wild rice occurrence, predicted mercury concentrations in the West Pit overflow and whether the discharge meets the Great Lakes Initiative standard for mercury, whether overflow from the West Pit will exceed water quality standards and require treatment, and the discharge of wastewater from the Tailings Basin to the Partridge River either during operation or post-closure. *Id.*, pp. 6-7. Additionally, EPA notes additional issues in need of additional analysis, including storm water management, West Pit overflows, liner cover thickness for waste stockpiles, sulfate seepage, passive wetlands treatment at the West Pit outflow, stockpile amendment, and additional monitoring measures that should be included. *Id.*, p. 7-8. Indeed, releasing a Draft EIS for public review and comment prior to the completion of much of the required environmental analysis plainly violates NEPA. As set forth in the CEQ NEPA regulations: The draft statement must fulfill and satisfy to the fullest extent possible the requirements established for final statements in section 102(2)(C) of the Act. If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion. 40 C.F.R. § 1502.9(a). Similarly, the CEQ NEPA regulations fur

3484	I have read the Polymet mining study. After reading it, I have these comments to make about it. If there seems to be no other options available for this resource, than it seems it must be done. However, if it must be mined out of this particular area, concern for the generations of local business people, and the thousands of recreationalists, who frequent this area, must be taken into equal consideration. There are few areas that can offer the miles of almost untouched natural areas, that this place can offer. It would be a tragedy if it were jeopardized just for some minerals. However, if all the proper considerations are accounted for, and the mining is done in an almost, unnoticed, and non-damaging way. And it is determined to be that crucial for the advancement of mankind, than so be it.	EOO,G1,G11

505	The mining companies must put up and assure cleanup costs before mining.	PD4
1251	Where is an example of a nonpolluting mine?	RFI
1577	Dear Mr. Arkley, I fervently hope that the proposed open pit sulfide mining project can be prevented. Experience in other locations in the U.S. proves that this type of mining has short-term financial gains for the few, and long-term ecological loss for all. Please work to protect the fragile waters of Lake Superior, the BWCAW, and the entire Arrowhead region. Sincerely, Arlene West	EOO,G2A,G7B
<b>Sender Last Name:</b> Westcott		<b>Submission ID:</b> 2143
2540	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Sulfide mining is not something that should happen anywhere that it might impact any of the great lakes - especially Lake Superior. This is a critical resource that is of great importance not only to Minnesota, but to all states surrounds the great lakes. I may be living in Michigan, but this impacts all of us.	G7
<b>Sender Last Name:</b> Westfall		<b>Submission ID:</b> 1175
1290	The proposed PolyMet NorthMet project threatens Minnesota's water quality and wildlife habitat. We should not allow this type of mining in Minnesota. This project would not provide real long-term prosperity to Minnesotans and will most likely result in devastating pollution. We need sustainable economic proposals for Northern Minnesota – the NorthMet project is not sustainable. This proposed project is already threatening the tourism industry in the area of the proposed mining.	EOO,G2C,G7B,G11
<b>Sender Last Name:</b> Westholm		<b>Submission ID:</b> 3201
3130	The St. Louis river is one of the most important tributaries to Lake Superior, but for years has suffered from extensive industrial pollution. Fortunately, most of this degradation has been localized to areas downstream of Cloquet. If the Polymet mine fails to protect the Partridge River from acid-runoff, the St. Louis will become degraded from the start, endangering the entire river ecosystem.	EOO,WR3D

3331	I have serious reservations about the safety of this project and its potential impacts on Minnesota's natural resources. I believe the gravity of the environmental issues inherent in this project should require the permitting agencies to simply deny all permits. The mission of each of those agencies is to protect the health of the environment and the public's assets and resources. I believe that permitting this project would be contrary to their missions. Taxpayer-paid cleanups of similar projects have been required over the last several decades all over the country. There is no reason to continue this folly, and especially at a time where our country has just seen enormous public debts pile up due to the poor stewardship of resources, for only the personal and private gain of a few. It is time to change this trend in history. It is time to simply stop projects such as this one, which have such an enormous potential to pollute our waters and which have so frequently left a legacy of environmental degradation! I agree that there are serious and significant deficiencies in the DEIS, which have been explained in some detail by others, including the comments from groups including Friends of the Boundary Waters Wilderness and others. If this project is eventually permitted, even against the wishes of so many people who oppose this project, then I believe, at a minimum, the issues they have raised should first be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers.	EOO,G2,G4A,G7,G8
<b>Sender Last Name:</b> Wheelock		<b>Submission ID:</b> 2146
2545	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. After learning about this project, I have serious concerns about the impacts on Minnesota's natural resources, especially in the areas of water quality, affects on the sanctity of the BWCA and surrounding areas, the toll wildlife and fish will pay, and the pollution and general disruption of the natural cycle when a mine is built and operated. The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Please, let's think long-term here and make decisions for the benefit of all who live in and love Minnesota and her great wild and natural spaces. Creating a mind to obtain "limited" minerals and create some jobs is a short-term view. We owe future generations more than a short-term view.	G2,G7
<b>Sender Last Name:</b> White		<b>Submission ID:</b> 3154
34	If the BWCAW is preserved you may expect me and people like me to return year after year spending our dollars in your state. If the BWCAW is compromised by an ill-advised mining operation the tourism income will decrease. By contrast, the proposed mining operation will bring jobs and revenue for a only relatively short time - it is a finite resource.	SE4
709	I am concerned that the time period allotted for review of the PolyMet environmental impact statement is insufficient. Moreover, there need to be more open public meetings to provide adequate input and comment before this important decision is made. The public has neither budget nor lawyers to speak for it. The public voice will not be heard unless the Minnesota DNR and other regulatory agencies "go the extra mile" to ensure that more than enough time and opportunity is allowed for comment and discourse. I have spent several thousand dollars annually for a number of years on my visits to the BWCAW.	PRO6

1183	I'm writing in support of the PolyMet project in Hoyt Lakes. I am a local business owner who lives and works in northeastern Minnesota. I went to school and grew up living, hunting and fishing in what is now referred to as the "Boundary Waters" (to me it was simply home). Polymet is not in the "Boundary Waters" watershed. To be a true environmentalist one must consider that the health and welfare of people, and their environment, is directly linked to the successful utilization and stewardship of resources. I believe many so called "environmental groups" ignore the facts, falsify data, and resort to scare tactics to undermine our use of resources. It seems they would prefer that decisions be made based on opinion and emotion rather than the facts. We need to provide our own metals and materials to be able to survive economically, politically and socially. The POLYMET project meets our state and federal governments' stringent comprehensive environmental review and permitting process, and should be permitted. PolyMet has invested four years and more than \$20 million so far to comply with the EIS process. The people at PolyMet are mostly native Minnesotans, they are experienced and knowledgeable about mining in Minnesota, they value our life on what we fondly call "The Range", our home, and I am proud to call them my good neighbors and friends. The true unemployment rate for my area in Hibbing has been over 20% this year, and what many people see as unreasonable delays in permitting a mine on mine lands is a injury we can not afford. The facts speak for themselves, no more delays.	EOO
<b>Sender Last Name:</b> Whitmore		<b>Submission ID:</b> 229
235	Would this mining project have an impact on Birch Lake? With regard to water quality, mercury levels in fish, and noise levels? Would they mine 24/7?	G2
3533	Please do not allow Polymet to mine...the damage that would be done far outweighs any financial benefit. I spend my spare time paddling all the rivers up north in Minnesota and cannot fathom the damage that would be done. History has shown that tax payers usually end up cleaning up after these vultures. I count on you the DNR to be the defense against people like Polymet. Thanks for being there. Nora	EOO,G2,G4A
<b>Sender Last Name:</b> Wick		<b>Submission ID:</b> 1589
1971	The PolyMet DEIS describes significant environmental issues associated with this proposed mine. These issues should be resolved before this mine is approved by the Minnesota Department of Natural Resources and the U.S. Army Corps of Engineers. Please protect our Minnesota's precious resources.	G10
<b>Sender Last Name:</b> Wielinski		<b>Submission ID:</b> 1074
522	I want to express my deep concern over the proposed allowance of sulfide mining by Potymet. Suffide mining has a very poor track record when it comes to environmental impact, and permitting this type of operation this close to the Boundary Waters and to Lake Superior would , be a very bad thing. I am against it.	WR3B,WR3D
<b>Sender Last Name:</b> Wigley		<b>Submission ID:</b> 3207
3542	To whom it may concern, This project is needed if this country is to move to a greener future. The metals are absolutely necessary for green technology which is absolutely necessary for the well-being of future generations. Please give this company a green light (no pun intended). Thank you. 1553	I have very fond memories of spending some time during young adulthood in the BWCA of northern Minnesota. I would like my children and grandchildren to be able to enjoy those same waters in their future. I am writing today about the proposed sulfide mining project by PolyMet in the Superior National Forest. I am concerned about the impact that such a mine would have on northern Minnesota. We have all too often seen the damage years later of the mining industry and then we as citizens are burdened with the cost of cleaning up the pollution that is caused. And I question whether the damage can ever be truly cleaned up well enough to restore such a beautiful area. I understand that the Indian tribes in this area are also helping to provide helpful information for you, and they should be respected, and their information taken into serious consideration. Please take the time to scrutinize this project and if PolyMet can not insure that there will be absolutely no impact on this area, then please do not allow it to move forward.	G4A,G11
<b>Sender Last Name:</b> Wild		<b>Submission ID:</b> 3498
3692	permanent long term damage to Minnesota's water resources and to the local environment, an existing mine site. I would not believe any assurances from a company that stands to gain financially by starting this mining. Suppose they are wrong and gosh, we didn't think of that, or too bad, we were wrong. What protects Minnesota? All we have is our relatively clean environment and fine outdoor recreation. The few jobs that would be created do not offset the damage that will occur. The only way I would approve this mine is if the principals and the DNR staff would personally guarantee to protect Minnesota from harm and post a bond to do so - say \$1,000,000,000. If you would not do that, why would you expect anyone else, the citizens of Minneaota, to shoulder the risk?	PD4

2804	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. As someone who grew up close to the BWCA, I have serious concerns about the safety of this project and its potential impacts on Minnesota's natural resources.	G2
<b>Sender Last Name:</b> Williams		<b>Submission ID:</b> 183
175	We wish to comment on PolyMet's NorthMet project. As people who live and play in Northeastern Minnesota and have for a major part of our childhood and adult life, we understand the need to balance use of resources like minerals and preservation of resources such as water and air. We feel this EIS lays the proper groundwork for developing environmentally and economically a sustainable project and we wholeheartedly support it. The PolyMet project has been designed to minimize environmental impacts; reusing a brown field site, reusing existing infrastructure, minimizing disturbance of wetlands and utilizing multiple safeguards to protect the environment. Enough is enough. Let's get this project permitted and get people to work and help our part of the state do our part to make our economy reach the goals for being greener and less dependent on foreign energy and foreign metals.	EOO,G1
1235	Wisconsin has a moratorium on sulfide mining. I hope Minnesota will do the same.	G12
3195	Water is a finite resource period. There is no toleration of any pollution in any of Minnesota's fresh water resources. These mines must have thorough reclamation and site clean up plans with rigorous follow-up enforcement. Our lives, our future -children, grandchildren, plants, fish and animals depend on this. All of these costs must be borne by the mining corporation and it's owners, shareholders, investors, and financial interests.	G4A,G7

199	I have reviewed draft EIS summary and selected portions of the full draft EIS documentation. I appreciate the opportunity to express my support for an adequacy decision on the draft environmental impact statement for PolyMet Mining Company. It is my opinion that the statement provides a very comprehensive review of the project and all of its potential environmental and socioeconomic impacts. It documents what PolyMet intends to do to ensure that it can mine its copper-nickel-precious metal ore and process it without harming the environment. In particular, I am impressed with the waste rock management plans for the project. The segregation of waste rock based on its potential to generate acid runoff and engineering a set of foundations, liners, drainage collection systems and treatment options based on the rock's acid-generating potential appears to be a prudent method of mitigating the effects of metallic and acid leaching to me. Covers installed after mining ceases also helps ensure that a potential problem material is managed appropriately. PolyMet has offered a proposal that meets Minnesota's extremely tough environmental standards. And while it is meeting them, the project will be creating hundreds of jobs and hundreds of millions of dollars in economic impact – both things that are badly needed in our region. A quick adequacy determination will allow the timely development, review and issuance of permits and facilitate moving this critical project to the point at which permanent jobs will be created.	EOO,G5

3162	The Boundary waters are my favorite place on earth, and I'm sure I'm not alone. I've followed the issue closely, and it is apparent to me that the economic conditions in our state are a major factor in the decision-making process to this point. There are still plenty of unaddressed concerns, and I fear we are sacrificing one of nature's most beautiful places for money. At the very least, allow more time for research and discussion.	G2,G10

3145	Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. To Whom It May Concern: Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Draft Environmental Impact Statement. I have serious concerns about the project and the potential impact on the natural resources of Minnesota as well as public health. The following need to be given the utmost consideration: Water quality, loss of wetlands, wildlife, and what happens when the mine closes. These issues need to be addressed in behalf of future generations. The PolyMet DEIS describes serious environmental issues associated with their proposed operation. These should be addressed and resolved before this mine is approved by the U.S. Army Corps of Engineers and the Minnesota Department of Natural Resources.	G2

321	<p>I am writing this letter in support of the NorthMet (Polymet Mining) Project to be built at the old LTV mining site in Hoyt Lakes MN. As Mayor of Hibbing Minnesota, I understand and agree with the need to preserve and protect our environment and the many natural resources we have here in Northeastern Minnesota. However, it is also vitally important that we build and maintain an economy that can support and sustain the area as a viable economic region. It has been our goal from the day I became Mayor to diversify our economy to help cushion the natural ups and downs that occur in the iron ore mining industry and the markets for steel in the global economy. NorthMet will mine and produce several minerals not currently mined anywhere in the continental United States. Processing these minerals here also reduces the need to mine and ship them from somewhere else minimizing energy usage. This is the type of diversification we have been encouraging all along. Presently, Hibbing has the highest unemployment rate in the state. Polymet has projected 400 jobs and the spin off jobs they create will provide an important and needed economic boost to all of Northeastern Minnesota. Without jobs this area will lose population and the ability to sustain its future. Millions of dollars in tax revenues generated will be used to support local governmental and educational units. I have known the people involved with the project for years. They are local folks committed to making Northeastern Minnesota economically stronger. They live here. Their commitment is not only to the economic health of the region, but also to an environmentally safe future for an area where their families live and work. We appreciate the work that the MPCA does. The permitting process is a complete and thorough one I wish was copied by all companies throughout the world. I truly believe it is possible to strike the appropriate balance between the environment and the economy of a region. I believe that the review process has been thorough and addresses potential environmental issues and also the ways to mitigate them. I believe that Polymet will use the new technologies available to mitigate potential environmental impacts. Many of these technologies were not available previously. I have people in my own family that are unemployed. The hope of future jobs and industry is the only thing sustaining them. Polymet will provide these jobs which will be the cornerstone for a strong economic future for this region. Thank you for the opportunity to comment. The future of Northeastern Minnesota is tied directly to projects such as Polymet.</p>	EOO
2600	<p>MR. WOLFF: Hi. My name is Rick Wolff, and I am from Hibbing, Minnesota, and I am here tonight to talk or comment in support of the PolyMet project. I live and work in Northeastern Minnesota, and so I am very familiar with not just PolyMet, but a number of the large mining companies in Northern Minnesota. There is typically a commitment on their part to protect the environment, and I think that especially in PolyMet's case because it is a new type of mining that it's being experimented -- not experimented, but developed in the mines in Northern Minnesota that they have had to be extra careful in developing the environmental aspects of their project, and I think they have done a good job doing that. I think that essentially the fact of the economic viability of the whole region in the State has to be balanced with the environmental protection that needs to happen in a situation like this, and I think that realistically that can happen. I think that both the environment and PolyMet has indicated that the new technology they are offering to protect the environment is much more advanced than what was in place 10, 15, 20 years ago when these kind of projects were coming forward in different locations around the country. So I think that this new technology offers the environmental protection that is needed, and I think that in addition to that that creates an economic engine for Blaine Steno Kirby Kennedy A the region so that the jobs that Minnesota needs, not just Northeastern Minnesota, but the whole State of Minnesota needs are created by a project like this. Taking that one step further, obviously part of the problems that we face as a State is our revenue stream that we are deriving from our tax base in a project like this will pay million of dollars of taxes to the State of Minnesota on an annual basis, creating, you know, another revenue stream that can be used to help with the bunch of problems that they do have. So I think that kind of summing it all up is that I think it is very possible because I went through a number of these different hearings both with the SR Steel project, and the MPCA and their permit for SR Steel that there can be a common ground reached between both the developer of the project, PolyMet, and those folks that need to protect the environment. I think that realistically that can be established here. There has been a willingness and a flexibility on the part of PolyMet to do those things necessary that are brought forward that are felt to be needed to protect the environment. So I hope that people will continue through the process, work it through the MPCA permitting process, and we do get the permit, and this kind of a project is allowed to actually develop and become an entity in Minnesota and become a force not only in Northeastern Minnesota but a force in Minnesota period. So thank you.</p>	EOO

16 My name is Tony Yeley. I live in Mountain Iron, Minnesota. I just want to speak in support of PolyMet. I'm employed by Mesabi Nugget, which is also a new venture located about two miles from the PolyMet site. I know the hoops that we had to jump through and the standards we had to meet as far as air and water emissions, the constant monitoring as far as even things like dust collectors have to be -- we have to notify the State if they're down for more than one hour. I'm confident that PolyMet will meet the same standards and I just want to voice my support for them. I'm confident everything will be done in the right manner. I also know -- I assume, anyway, that from our environmental engineer's perspective, she will not let anything slide because the penalties that are involved with her personally, and I can't see PolyMet's environmental engineers allowing anything to slide under the table or be done incorrectly or be lied about. Just the -- it's not the right thing to do and the penalties are too severe. So I'm confident it will be handled forthright. That's all. Thank you. EOO

1595	We are responding to the Environmental Impact Statement for the NorthMet Project both as landowners who live nine miles north of Babbitt on CR 120 and as citizens who care deeply about the land and the future of our community. The EIS is quite frank in admitting, for example, that "relatively high sulfate concentrations in seepage from the Tailings Basin would be released to wetlands north of the Tailings Basin and lakes downstream on the Embarrass River ..." and that "it is clear that the Proposed Action would exceed groundwater criteria at the Mine Site for at least several parameters" that include wetlands, vegetation, wildlife, fish, air quality, etc., not to mention pure water. This is unacceptable! According to the EPA, copper-nickel mining often results in significant pollution problems. In fact, according to the Minnesota Center for Environmental Advocacy, mining of sulfide-metal ore has never been accomplished without causing eventual acid metal pollution of ground and surface waters. Even though the EIS offers several plans for "mitigating" the impacts on the environment, we don't believe, given this history, that these will be sufficient or that the public will not have to pay in one way or another. We believe that there should be a moratorium on mining of sulfide-metal ore until it can be proved that it can be done without endangering our environment and therefore the future of our community.	G7A,G10,G12

3802	Minnesota needs the tax money, so turn the company loose so that we can become a world leader in green mining technology. I would suggest linking the university of minnesota with polymet to form as research project in green mining technologies using the iron range as a test bed.	EOO
<b>Sender Last Name:</b>	Zakruistek	<b>Submission ID:</b> 1096
1200	I support PolyMet mining project. Northern Minnesota needs more jobs unless you want to pay welfare!	EOO
<b>Sender Last Name:</b>	Zelinskas	<b>Submission ID:</b> 3695
19733	EPA believes the information about the project's estimation of acid generation needs to be updated. The project's proposed operation and post-closure management plan for acid-generating waste rock and wastewater is inadequate and needs to be improved. The proposed approaches to manage acid generation are untested or unproven at the proposed scale. EPA believes the tailings basin will contribute to water quality impacts by leaking contaminants into groundwater that may be hydraulically connected to surface water. EPA believes the Environmental Impact Statement (EIS) needs to include adequate hydrogeological and hydrological analyses for the tailings basin and surrounding area and for the mine site. Tailings basin and mine site water management needs to be based on adequate hydrogeological/hydrological information.	WR1E,PD2,PD3,PD4,PD8

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
19734	EPA finds this project may have substantial and unacceptable adverse impacts on aquatic resources of national importance (ARNI). EPA believes the coniferous and open bogs, comprising a large percentage of the approximately 33,880 total wetland acres, within the Partridge River Watershed to be an ARNI due to the values they provide in terms of unique habitat, biodiversity, downstream water quality, and flood control specifically, to the Lake Superior Watershed and the Great Lakes Basin.	WE1
19735	With impacts to over 1,000 acres of wetlands, the DEIS provides incomplete and inadequate compensation for the loss of wetlands and their function. Indirect impacts to wetlands are not completely identified or compensated for in the mitigation plan. EPA also believes that some of the mitigation offered for direct impacts is inadequate, given that the type and function of wetlands impacted is difficult to replace. EPA's preferred mitigation ratios for the project's impacts are described in the attached detailed comments. Insofar as the DEIS for this project is the chief environmental document supporting the issuance of the USACE CWA Section 404 permit, a revised or supplemental DEIS should identify and describe mitigation for all impacts. It should also include wetland monitoring plans and adaptive management plans, especially related to indirect impacts to mine site wetlands. The Section 404(b)(1) Guidelines, 40 CFR Section 230.10(b), prohibit discharges that will result in a violation of the water quality standards. If water quality standards cannot be met in conjunction with this project as described within the DEIS, U.S. EPA would not support the issuance of a permit for this project. If our concerns are not addressed prior to the issuance of the Section 404 permit, EPA may elevate pursuant to Part IV, paragraph 3(a) and 3(b) of the August 1992 CWA Section 404(q) of the Memorandum of Agreement between EPA and the Department of Army.	WE2,WE3,WE4
19736	We have also identified discharges that may require National Pollutant Discharge Elimination System (NPDES) permit coverage in addition to the permit requirements listed in Table 1.1-1 (Government Permit and Approvals).	WR3I
19736	Long-term post-closure treatment will be necessary to protect water quality; therefore, EPA believes financial assurance information should have been included in the DEIS. The amount and viability of financial assurance are critical factors in determining the effectiveness of these activities, and EPA believes it is necessary to analyze and disclose financial assurance factors in the DEIS to determine the significance of the impacts and inform decisions about the project. Financial assurance information includes a description of State and/or federal agency requirements, closure costs, estimated bond amounts needed for each closure and reclamation activity, and how the bonds should be modified should additional temporary, long-term, or perpetual treatment and/or remediation needs be determined during operations.	PD2
19736	EPA believes that because of deficiencies in the DEIS, additional information, alternatives, and mitigation measures should be evaluated and made available for public comment in a revised or supplemental DEIS. EPA will continue to work with USACE and the cooperating agencies to resolve the issues we have identified. If we are unable to resolve our concerns, this matter may be a candidate for referral to the Council on Environmental Quality (CEQ) for resolution. We appreciate the opportunity to review the DEIS. Please feel free to contact me at 312-353-2000 or Kenneth Westlake of my staff at 312-886-2910 should you desire a meeting to discuss these comments.	PRO3
19736	Synopsis: The DEIS describes a proposed action that will exceed or have the potential to exceed surface water quality standards in the Partridge River, Embarrass River and downstream in Colby Lake (a drinking water source) and the St. Louis River. EPA also concludes that the DEIS underestimates the potential for waste rock and exposed pit faces to generate acid rock drainage (ARD) and the potential for this drainage to enter the environment. EPA believes that there are water quality impacts that have been unevaluated because of gaps in hydrogeological and hydrological site assessments. Since hydrogeology at the mine site is not well described, EPA is concerned that fate and destination of long-term drainage is unknown. We are concerned that mine operation and closure decisions will be made based on inadequate information. Neither the Tailings Basin Alternative nor the Mine Site Alternative would completely prevent or mitigate impacts to water quality.	WR3A
19738	Finally, due to the projected need for long-term water treatment, EPA does not agree with DEIS statements that the Proposed Action could achieve maintenance-free closure.	WR3I

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
776	LAND SALE Legislation was introduced in the U.S. Senate, and House that would have authorized the sale of these lands had the legislations passed. The transactions would have been apart from the Project EIS. The issue of lands to be bought, sold, or, transferred; belong in the EIS, not outside as a separate diversion.	PRO4
1085	WETLANDS: The project proposes to destroy a significant amount of wetlands. Over the course of the wetlands discussions, there have been a number of conversations, and meetings about location of wetland replacements, amounts, and types. As these discussions have evolved, it is becoming dear that the course outlined by the Wetland Conservation Act in Minnesota, especially the avoidance, mitigation, and replacement within the watershed; be followed. At one time it did appear there might be merit in using Poly Met as an opportunity to create significant replacement outside of the watershed. If this had merit, it was because it was perceived greater biological productivity would be a likely result; especially targeted toward wildlife in other Minnesota locations. This certainly would not apply for example; to Atkin County. Those discussions did not take into consideration the mercury sequestration capability of our northern peat bogs. This is the wetland type being lost to the project. Understanding that information puts forth the requirement that replacement, be of the same or very similar type of wetland within the watershed in order to minimize the loss of mercury sequestration in an area already known for mercury problems in fish advisories etc. Seeking out the most economical and readily available near by counties for wetlands mitigation may be economically attractive, and, politically available. And, the action could be justified in the WCA; but it is not in the original spirit and intent of the WCA that many of us worked to create. The wetland process should follow avoidance, minimization, and; when necessary replacement of amount, and, function, within the watershed of the existing wetlands impact.	WE2,WE3,WE4
1158	WILDLIFE CORRIDORS: The history of mining in the area of the proposed site has eliminated a significant number of wildlife corridors according to expert opinion. The estimate is; that thirteen such corridors remain in the area. It is also stated that the Project will eliminate two to three of those remaining corridors. There is no discussion of mitigation plans for this negative impact. The area is home to some of our most significant species, including some that are struggling, or, are generally acknowledged as rare. The EIS must indude such a discussion and proposed response.	WI5

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3328	MERCURY/ SULFATES : My read of the proposal suggests that mercury additions to the environment could occur sever a ways. First, in the wetlands destruction, we lose the sequestration science concludes is part of the capability of the bog type wetlands. Next we read that reservoir and stream areas may be exposed by draw downs and other manipulations of affected watersheds in the proposed operation of the project. The process of disturbing the land to procure the elements sought for the mining process will expose the mercury in soils; and, the waste remaining after processing presents long term potential exposure for mercury contamination. The EIS does not adequately deal with these additions, or, their prevention, adequately. The potential for mercury levels to impact the lower St. Louis River, and Duluth-Superior Estuary are troubling. The tax dollars invested in resource recovery; have varied from dramatic improvements, to more modest progress. Regardless, the millions invested must not be wasted by upper watershed mining. The economic value of the improvements must not be put at risk! There is a long and well documented history of the impact of sulfate levels on wild rice. Minnesota has worked to restore our original wild rice cultures. These efforts have had several objectives. One is the desire to support enhanced wildlife populations through the availability of this critical food source. And, these restorations aid native cultures as well as non native interest in rice harvesting and use. Several rivers, and or river segments show the degradation of wild rice beds as a result of mining impacts. It appears that this project has the potential to exacerbate this condition. I see no assurance in the EIS that adequately recognizes this problem. Nor do I se e where there is a requirement to identify a reference stream; and, the required actions to maintain the existing quality where natural conditions are desirable for rice, and, the operating requirements to allow TMDL attainment on segments not now meeting required sulfate level. Related to mercury, sulfates, and other pollutants; is the issue of drainage from tailings basins, or other project sources. I've read statements that there is no threat to places like the BWCAW, as potential waste flow is away from the Boundary Water Canoe Area. While these statements ignore the other concerns such as air transport; I am compelled to add that as a lay person, I am well aware that hydrology is a tricky subject indeed. I do not find any comprehensive modeling that attempts to assess for certain the drainage from waste rock storage during or, after mining. Confirmation of potential for flows behaving in a different manner than projected must be a part o f a more serious examination of area hydrology as a part of the EIS .	EOO,WR1E,WR3N
3329	ST. LOUIS RIVER & ESTUARY/ Reference Streams I have fished the St. Louis River, from the Duluth Superior Area upstream to the Eveleth area, for many years. I am well aware that over the years of my life this resource has slowly recovered from the impacts of logging, and, industry. As a result; from the estuary upstream fora significant stretch; until the impacts of taconite mining become more evident (wild rice etc.), the St. Louis River has improved as a recreational resource. This is reflected not only in the wildlife populations; and, in the numbers of recreation users; but it is also evident in the significant residential real estate development on both the WI and, MN side of the estuary. This physical recovery has been financed by the taxpayer. The ability to continue, and, maintain this recovery, is at least in part; predicated on the mitigation of the impacts of Poly Met; and, any projects to follow. To fail to adequately consider the potential impacts through out the watershed is unacceptable. The present EIS does not, in my opinion, satisfy that requirement. Given the water quality issues existing in the St. Louis River, and other area streams that have been impacted by mining, and, potentially impacted by this project; it is essential that a near by high quality stream segment, that is representative of generally understood post glacial plant and animal communities be used as a reference stream in order to objectively construe the treatment needed to protect St. Louis River and other streams; and, to prevent the Poly Met Project from creating a condition that precludes successful TMDL strategies over time.	WR3B
3758	The Minnesota Department of Natural Resources periodically notices bids for mineral prospecting and, knows full well the current relatively high rates of interest reflected in the sale o f lease bids offered. There is enough intellectual knowledge at DNR, along with the information on Poly Met, and present conditions to cause a discussion of the cumulative impacts. In fact a serious discussion of cumulative impacts and their potential for degradation of existing values, and, or preventing current attainment efforts from reaching their goals, is an imperative for the Poly Met EIS.	G9

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
3904	<p>I have lived in Duluth, Minnesota since 1955. I have long been active in the area of the proposed sulfide mining activity as an outdoor user with a variety of interest ; and for a very long time (beginning in the 1960's) as an active conservationist. I am also a retired business owner, and understand and support the need for a healthy and prospering economy. My interest' include, serving on the original board of the Western Lake Superior Sanitary District, an authority whose mission could potentially, be impacted by a Poly Met Mine. I have served on the Minnesota Pollution Control Agency, 1974-79 and have experienced very directly participation in applying the rules, and outcomes of PL-92-500 (Clean Water Act). I've served as National President of the Izaak Walton League of America . My experiences have included public lands management issues, watershed restorations, wetlands restorations, wildlife management issues, response to invasive species management challenges; as well as working to secure adequate funding for our natural resource restoration, protection and enhancement. I actively participate in outdoor recreation year round in the area near and adjacent to the proposed sulfide mining activity. I am not writing as a technical expert. However; I have maintained a very high level of citizen participation over more than four decades. As a result; I have experienced a great deal of education and practical experience. These combine to give me a significant historical context for expected outcomes and the likelihood that such a complex endeavor will cause unanticipated consequences; and the ability after permits are secured to effectively deal with unintended, negative results. Post permit mitigation, and, correction, if possible; will be very difficult technically, financially, and; politically. Getting it right now is critical. It is the only alternative. Understanding the truth in the paragraph above is as important as any technical detail about this project. I am going to comment briefly on the following relevant subject areas: 1. Mercury &amp; sulfate concerns 2. cumulative impacts 3. perpetual management 4. financial assurance 5. wetland mitigation including focus on mercury sequestration 6. wildlife corridors 7. potential impacts on St . Louis and other area streams, and, lack of identification of a reference stream in the area 8. land transfer/ sale issues My comments will be relatively brief as my emphasis will be on the importance of these project related issues; not on attempting to present a lot of technical data. Others are far more qualified to comment technically, than I am. I will say however, that given that it is acknowledged that the area of potential impact does not attain State or National goals in a variety of environmental policy areas, (fish consumption, clean water act TMDL attainment standards etc), that the EIS must describe mitigation outcomes that allow achievement of those goals, or at a minimum, not add to the inability of ongoing actions to achieve compliance. Finally I will state that while this proposed mine has support from those who believe the mine will create high paying long term employment of significant importance to Northern Minnesota, the final EIS must make it dear that the Project does not threaten existing resources of State, National and World significance, nor the jobs and economies associated with them.</p>	EOO,G2

3905 PERPETUAL MANAGEMENT/ FINANCIAL ASSURANCES If the Poly Met project goes forward, the conditions prescribing pre and post project environmental management, and; their financial arrangements are perhaps, as critical if not, the most critical environmental protection elements of the Project/ EIS . In order to understand the difficulty Minnesota faces in providing perpetual management of the site during and post mining, and with Poly Met and successor organizations; one must understand our world and business community today. One must look beyond the present proposal. In the last thirty to forty years corporate power and influence among very large global companies has increased by many magnitudes. Our society has encouraged this as a necessary response to required capitalization, and; global competition. The result includes corporations that in some cases are very ready to use their legal and political opportunities to avoid previous commitments. It is dangerous to generalize. But, it is a fact that modern global corporations appear, disappear, use bankruptcy; and, other options to avoid a wide variety of obligations resulting from previous agreements, agreements usually made in good faith at the time. Such a system often places the significant burden that remains, on two targets. First; the tax payer who had been promised jobs and tax income, is financing the obligations created by failure to fulfill previous promise' by someone else. Second, natural resources are harmed, new business' is precluded from using the site; and existing business' are often impacted negatively by the pollution impact. We need only to read the daily news about one aquatic invader after another in our Great Lakes to understand the impact on our quality of life, and our pocketbooks. ATV use is another point of instruction one needs to understand before, relying on the Minnesota regulatory framework as adequate in the matter of ensuring that Poly Met will be under appropriate regulatory protections and functions. A small group of users have been successful in denying the wishes of professional forest and fisheries groups, and the general public. The Legislature after a great deal of public in put, and, debate, passed a very compromised piece of legislation that was almost immediately weakened through an amendment that rewrote the rules "north of highway two". We must understand that our regulatory system will not succeed in correcting a project that may be inadequately described and analyzed in this EIS. Understanding these possibilities, (post project risk) should result in pre permit perpetual care arrangements that are adequate given the magnitude of the potential impact; and such arrangements are agreed to before permit issuance and; and the financial arrangements are delivered worked out before permit issuance as well . The EIS must at a minimum; recognize this critical need, and; set the direction for resolution.

3757 I would just like it to be known that I am utterly against any mining company doing sulfide mining in MN until it can be PROVEN safe (and not just on a computer model but in real life). Don't get me wrong, I would love it if some good paying jobs came to this area--I would love to have one myself!--but the short-term gains cannot possibly outweigh the forever to be lost if our beautiful, clean waters are destroyed. I don't choose to live in this area because of the great paying jobs-- my family and I eek out a living here because we want the clean air and the clean water. My well water is the best tasting water I've ever had and clean water is an absolute blessing to this whole area. Polymet Job: \$50,000 (give or take, and for how long?) Clean water: Priceless Please take Wisconsin's good example to heart and put a moratorium on this type of mining until the mining companies can GUARANTEE that no damage will be done. It's impossible to put the genie back in the bottle once degradation has occurred! Please do not be cavalier about this---think how your decision will affect generations to come! Thank you for your time and the opportunity to state my opinion.

200	I am writing in support of PolyMet’s NorthMet project. I would like to see the project given the green light to begin. It is clear to me that PolyMet has done everything that they have been asked to do and more to prove the environmental viability of the project. PolyMet has demonstrated that it can adhere to MN’s strict requirements when it comes to protecting the air, water, and land. Once allowed to proceed PolyMet will be a domestic source of these important metals which decreases our dependence on unstable foreign suppliers who may or may not practice sound environmental practices, more than likely they do not. This project will contribute significantly to both the State and to our local economy at a critical time. The plant will support 400 full time employees and most likely 2 to 3 times that amount in local jobs that are their to support the plant. PolyMet will also pay millions of dollars in local and state taxes also at a time that is critical to our government. I work and play in the area and I live just across the bridge in Wisconsin. I am very much looking forward to this project getting underway. I ask that you support the project as well.	EOO,G5

3147	I have visited the Boundary Waters area every summer for over a decade and want to plan on it's pristine beauty being available to me and other Minnesotans as well as many other Americans and international visitors. If this proposed mining is allowed, the Boundary Waters as we know it will no longer exist. If our good neighbors to the East have banned this mining until proven safe, then Minnesotan's should exercise our best judgement and do the same! I strongly oppose this proposal.	EOO,G7,G12
