Stream Access and Easement

Many lakes along Lake Superior and North Shore streams are privately owned. Anglers should check with those areas to inquire about fishing permits before entering private property. The stream information tables indicate which streams have easements.

The DNRF purchases trout stream easements from private landowners willing to provide permanent fishing access to the public. Easement correction on strip of land along a stream that generally runs 64 feet from the stream center line in other directions, the easement on permit.—if the land ownership changes, the easement remains. Landowners interested in the Trout Stream Easement Program should contact the Area Fisheries Office.

In addition to easement lands, access to streams within State Parks and Forest Refuges is permitted. On State-owned and forested lands access is generally available when a permit is available in the upper reaches of North Shore streams.

Duluth Area Landings

A Victory for Fish Management

Minnesota’s North Shore fishery is truly a special one to cherish. For many years, Lake trout have virtually vanished from Minnesota waters of Lake Superior, the result of predation by the sea lamprey. Wildlife and commercial fisheries still benefited from the Lake Trout population, but the species was not dominant prior to the sea lamprey infestation. All species of Great Lake trout are still found in Minnesota waters, but much of the Lake Trout population has been lost due to sea lamprey predation.

In the early 1960s, the Minnesota Department of Natural Resources (MDNR) began a sea lamprey control program. In 1962, the Lake Trout fishery was closed in accordance with the lamprey control program. However, in 1955, the state was able to control lamprey infestation to the point where the Lake Trout population has been able to rebound.

Today, the Lake Trout population is healthy and sustainable. The Lake Trout fishery is open to anglers during the ice-out and ice-out seasons. The species is also protected by the state and federal governments, and the Lake Trout fishery is managed to ensure the health and survival of the species.

Sports Fish

- Lake Trout
- Brook Trout
- Brown Trout

Experimental Regulations

Portions of selected streams are set aside for experimental regulations. Refer to the current fishing regulations for a list of these streams and type of regulations.
