#### Abstract

A summer creel survey was conducted on Clearwater Lake from April 22, 2005 through October 31, 2005. The objectives of the creel survey were to provide information on fishing pressure, catch and harvest, angler demographics and satisfaction, and to document changes since the last summer creel survey in 1984. Angling pressure in 2005 was higher in summer ( $32.5 \mathrm{hrs} / \mathrm{acre}$ ) than in winter ( $8.6 \mathrm{hrs} /$ acre), but lower than in summer 1984 ( $57.4 \mathrm{hrs} / \mathrm{acre}$ ). Combining the summer and winter creel results gave a year-round pressure estimate of 41.1 hours/acre for the 2005 season. Angling represented $71.2 \%$ of all recreational use. Tournaments were an important component of the fishery, but many anglers voiced opposition to them. Sunfish had the highest catch (43.6/acre) and harvest (13.8/acre). Most largemouth bass (10.6/acre catch, 1.0/acre harvest) and northern pike (3.9/acre catch, $0.6 /$ acre harvest) were released, whereas the majority of black crappie (4.9/acre catch, 2.8/acre harvest) and walleye were harvested (2.4/acre catch, 1.4/acre harvest). Sunfish anglers had the highest catch and harvest rates among targeting anglers (3.26/hr, 1.04/hr). Largemouth bass anglers had the second highest catch rate ( $0.81 / \mathrm{hr}$ ), but a low harvest rate ( $0.08 / \mathrm{hr}$ ), likely due to the popularity of catch and release angling. Anglers primarily targeted walleye (40.5\%), sunfish (28.6\%), largemouth bass ( $24.9 \%$ ), northern pike (19.5\%), and black crappie ( $16.3 \%$ ). Walleye fry stocking has been successful and walleye represented a much larger component of the fishery in 2005 than in 1984. Walleye anglers supported the idea of a special regulation; however, more frequent creel surveys are needed before any management changes are considered and lake survey results show little need for change. Northern pike were abundant and small; a special regulation might increase pike size, but this would likely face opposition from spearers. Lower tournament use may be needed to alleviate user conflicts and overcrowding at public accesses.

## Introduction

Clearwater Lake is located in Wright County and Stearns County, 13 miles south of St. Cloud, Minnesota. Clearwater is the largest lake in the Montrose management area and has a popular multi-species fishery. Water quality has improved since the Clearwater River Watershed District was formed in the 1970s to address cultural eutrophication and the lake is popular for non-angling recreation. Walleye fingerlings were stocked for many years, although walleye were considered to be naturally reproducing until the mid-1970s. Walleye fry have been stocked every other year since 1998 and fall electrofishing surveys have consistently sampled fingerlings in years when fry have been stocked. Previous creel surveys include summer 1984, winter 19891990, and winter 2004-2005.

A summer creel survey was conducted on Clearwater Lake from April 22 to October 31, 2005. The objectives of the survey were to provide information on angling pressure, catch and harvest, angler demographics and satisfaction, and to document changes since the last summer creel survey. The summer 2005 creel survey completed a year-round creel survey of Clearwater Lake; combined with a summer lake survey in 2005, this provides a comprehensive picture of the Clearwater Lake fishery.

## Study Area

Clearwater Lake has a surface area of 3,121 acres (Table 1), maximum depth is 73 feet, and $45 \%$ of the lake is littoral. The lake has two distinct, but connected basins; the east basin is deeper and slightly larger. The Clearwater River flows through the west basin and Clearwater Lake is part of a chain of lakes along the river. Two public accesses are located on the west basin and each basin also has a private pay access. Clearwater Lake is classified as lake class 22 (Schupp 1992), is moderately eutrophic (combined Carlson's TSI=54, Minnesota Pollution Control Agency 2004), and has a watershed of 111,830 acres. Water quality has improved since the 1980s; mean annual secchi disk readings have increased from 7.2 (1980-1990) to 8.7 (19952005; Minnesota Pollution Control Agency 2005). Eurasian watermilfoil (M. spicatum) was found in the lake in 1989 and is currently widespread, but not abundant. The Clearwater Lake Association and individual landowners conduct herbicide treatments annually.

## Methods

A stratified, random, roving creel survey was conducted from April 22 to October 31, 2005 using a full-time creel clerk. The survey was stratified by month, day type (weekday, weekend/holiday), angler type (boat, bank or dock, and bowfishing for carp), and basin (east, west). Only 5 bowfishing parties were interviewed and these were combined with angling for analysis. For individual sampling days, one of two non-overlapping, eight hour periods ( 6 AM to 2 PM, 2-10 PM) was used and half of each period was spent on each basin. Three weekdays and both weekend days were sampled during each week, along with the Memorial Day, July 4th, and Labor Day holidays. All weekdays, sampling periods, and starting basin were randomly chosen.

The creel clerk roved the lake by boat and interviewed as many anglers as possible. Interviews were taken at public and private accesses when weather conditions were unsafe for boat travel and at other times to facilitate recording complete trip interviews. During the interview, the clerk recorded party size, start and end times, angler demographics, and catch information. Bank anglers were always interviewed individually. Fish were measured to the nearest 0.1 inch; length of released fish was estimated by anglers. Angler demographics were recorded individually, whereas all other data were recorded for the party. Anglers were also asked a series of questions regarding satisfaction with their fishing that day and in general:
1.) "On a scale of 1 to 10 , with one being poor and ten being excellent, how would you rate your fishing success today?"
2.) "Have you been interviewed before on this lake?"
3.) "On a scale of 1 to 10 , how satisfied are you with the number of (targeted species) you catch on Clearwater Lake?"
4.) "On a scale of 1 to 10 , how satisfied are you with the size of (targeted species) you catch on Clearwater Lake?"
5.) "Do you have any suggestions for improving the fishery?"

Only one answer to questions 1-4 was allowed per party and previously interviewed parties were not asked questions 3,4 , or 5 .

Angling pressure was estimated from instantaneous counts at randomly selected times. Two counts were made during each sample period for each basin (4 counts per shift). Bank anglers were always counted as individuals. Data were analyzed with the General Creel Survey Analysis Program (GENCREEL, version 2; Bindman and Mach 1997).

A number of tournaments were held on Clearwater Lake during the creel survey. A DNR permit is required if there are more than 30 participants, or if the entry fee is greater than $\$ 25$, or the total prize value is greater than $\$ 25,000$. Data from tournaments requiring a permit were excluded from the creel analysis and reported separately. Angler counts initially included all boats, due to the difficulty of identifying tournament anglers. The number of participating boats was provided by event organizers afterwards and subtracted from angler counts during the event.

## Results

## Angling Pressure and Recreational Use

A total of 133 days were sampled for the season, including 74 weekdays and 59 weekend or holiday days and 531 angler counts were made (Table 2). A total of 2,502 interviews were conducted, of which $39 \%$ were complete trip interviews. Few bank interviews were conducted; $98 \%$ of all interviews were boat anglers. The mean number of anglers per boat was 1.89 for the season with a mean completed trip length of 4.04 hours. Bank anglers had a mean completed trip length of 1.83 hours and were always treated as individuals, not parties.

Total estimated angling pressure was 101,340 hours or 32.5 hours/acre (Table 3 ). This is well above the historical mean for lake class 22 ( $17.8 \mathrm{hrs} / \mathrm{acre}$; Cook and Younk 1998), but below the 1984 summer creel estimate ( $57.4 \mathrm{hrs} /$ acre). Angling pressure during the 2005 winter creel survey was $8.6 \mathrm{hrs} /$ acre (Minnesota Department of Natural Resources 2006a), resulting in a year-round estimate of $41.1 \mathrm{hrs} /$ acre. Monthly summer pressure ranged from a high of 8.53 $\mathrm{hrs} /$ acre in June to a low of $1.26 \mathrm{hrs} /$ acre in October (Table 3). Angling pressure was also low during April 22-30 ( $0.5 \mathrm{hrs} / \mathrm{acre}$ ). Pressure on the east basin ( 37,359 hours, $23 \mathrm{hrs} / \mathrm{acre}$ ) was lower than on the west basin ( 63,981 hours, 42.7 hours/acre; Table 3A). Angling represented $71.2 \%$ of all recreational use (Table 2).

Non-fishing recreational use ( 40,997 hours, 13.1 hours/acre) was primarily observed from late June through August (Table 3). Pontoon boating ( $6.92 \mathrm{hrs} /$ acre) and pleasure boating (3.23 hrs/acre) were the most common types of non-fishing recreation.

## Catch and Harvest

Anglers caught an estimated 220,365 fish (70.6/acre) during the season and harvested 62,367 fish (20.0 fish/acre; Tables 4, 5). Among species, sunfish had the highest catch (136,009, 43.6/acre) and harvest (42,725, 13.8/acre). Most largemouth bass (10.6/acre catch, 1.0/acre harvest) and northern pike (3.9/acre catch, $0.6 /$ acre harvest) were released, whereas the majority of black crappie (4.9/acre catch, 2.8/acre harvest) and walleye were harvested (2.4/acre catch, 1.4/acre harvest; Tables 4, 5). Sunfish had the highest yield (12,898 pounds, $4.13 \mathrm{lbs} /$ acre ), followed by walleye ( 5,682 pounds, $1.82 \mathrm{lbs} /$ acre ) and northern pike ( 5,411 pounds, 1.73 $\mathrm{lbs} / \mathrm{acre}$; Table 6). The fishing season opened May 14 for walleye and northern pike and on May 28 for largemouth bass. The season is continuous for black crappie, sunfish, and other panfish.

Catch and harvest were higher overall on the west basin (98.5/acre, 28.5/acre, respectively) than on the east basin (45.1/acre, 12.1/acre, respectively), likely due to easier access on the west basin and a resulting increase in angling pressure (Tables 4A, 4B, 5A, 5B). Among species, the catch was higher for most species on the west basin, but walleye catch was higher on the east basin (2.95/acre) than the west basin (1.74/acre; Tables 5A, 5B).

Sunfish anglers had the highest catch and harvest rates among targeting anglers (3.26/hr, 1.04/hr, respectively; Table 7). Largemouth bass anglers had the second highest catch rate $(0.81 / \mathrm{hr})$, but a low harvest rate $(0.08 / \mathrm{hr})$, likely due to the popularity of catch and release angling for bass. Black crappie anglers had the third highest catch rate $(0.44 / \mathrm{hr})$ and the second highest harvest rate ( $0.26 / \mathrm{hr}$ ). The catch and harvest rates for common carp were high $(0.60 / \mathrm{hr}$, none released), but only 5 parties targeting carp were interviewed.

Mean length of harvested black crappie (9.6 inches, Table 8) was lower than mean length from the winter creel survey (10.2 inches, Minnesota Department of Natural Resources 2006a) and the statewide historical mean for summer creel surveys on all lakes (10.3 inches, Cook and Younk 1998). Largemouth bass had a mean harvest length of 13.3 inches, above the statewide creel historical mean of 12.7 inches. Mean harvest length of northern pike was 23.2 inches, above the statewide mean of 21.8 inches, but below the 2005 winter creel mean of 24.2 inches for angling. Sunfish had a mean harvest length of 7.2 inches, equal to the statewide historical average, but above the 2005 winter creel mean of 6.9 inches. Mean length of harvested walleye ( 15.3 inches) was similar to the statewide historical mean ( 15.2 inches), but above the 2005 winter creel mean (13.1 inches).

Most anglers targeting sunfish harvested at least one fish (62.3\%) and 16.1\% harvested 10 or more per angler (Table 9). In contrast, the majority of anglers targeting other species harvested no fish; $63.8 \%$ of crappie anglers kept none and $2.3 \%$ kept a limit of 10 per angler. For largemouth bass, $84.5 \%$ of targeting anglers harvested no fish and only $0.6 \%$ kept 4 or more per angler. For northern pike anglers, $72.6 \%$ harvested no fish and $3.2 \%$ kept 2 or more per angler. For walleye anglers, $67.6 \%$ harvested no walleye and $2.3 \%$ harvested 4 or more per angler.

Other species caught during the summer survey included: bigmouth buffalo, bullhead spp., bowfin, channel catfish, common carp, rock bass, smallmouth bass, and yellow perch. Of these species, nearly all were released and not identified by the creel clerk. No channel catfish or smallmouth bass were seen by the clerk and none found in the lake survey; these may have been misidentified by anglers.

## Angler Demographics and Interview Questions

Anglers primarily targeted 5 species during the summer season: walleye (40.5\%), sunfish ( $28.6 \%$ ), largemouth bass ( $24.9 \%$ ), northern pike ( $19.5 \%$ ), and black crappie ( $16.3 \%$ ); parties could identify up to two species when interviewed (Table 10). All parties targeted crappie (97.9\%) or sunfish (52.1\%) in April during the closed season for bass, pike, and walleye, but very few targeted either species in October. In contrast, the highest percentage of anglers targeted walleye in October (69.5\%), whereas September was the highest month for largemouth bass ( $34.9 \%$ ) and northern pike ( $27.8 \%$ ).

Male anglers represented $85.6 \%$ of all anglers and most anglers were between 26 and 55 years old (Table 11). Many Clearwater Lake anglers came from outside the local area; about half of all anglers traveled more than 25 miles from home to Clearwater Lake (Table 12) and only $23.6 \%$ of angling parties were lakeshore residents. The creel clerk noted that many anglers seemed to be frequent users of the lake; $37.9 \%$ of anglers had been previously interviewed, compared to $29.7 \%$ during the winter creel survey.

When asked to rate their fishing success for that day on a scale of 1 to $10,41.3 \%$ of all parties gave a response of 1 or $2,5.4 \%$ gave a response of 9 or 10 , and the mean response overall was 3.88 (Table 13). Among targeting anglers, mean responses ranged from a high of 4.3 for sunfish anglers to a low of 3.5 for walleye anglers. Walleye anglers seemed most dissatisfied; $49.8 \%$ gave a response of 1 or 2 versus $31.2 \%$ of largemouth bass anglers and $34.7 \%$ of sunfish
anglers. In contrast, $24.7 \%$ of sunfish anglers and $20.0 \%$ of largemouth bass anglers gave a response of 7 or greater (Table 13).

Angler satisfaction with the size and number of targeted species indicated higher satisfaction with the number caught of the species ( 6.30 out of 10 for all species) than with size (5.48; Table 14). The highest satisfaction ratings were 7.29 for number of sunfish caught and 6.14 for size of black crappie. Walleye had the lowest ratings for both number (5.07) and size (5.00).

When asked for suggestions for improving the fishery, a total of 665 suggestions were given with multiple responses allowed per party (Table 15). Responses varied, but among categories, angling regulations were most often suggested; 154 were in favor of some type of special regulation, especially for walleye. Slot limits were often mentioned, but anglers frequently confused a slot limit with minimum length or other regulations. Many anglers suggested increasing walleye stocking; this is not surprising, given the low satisfaction rating for walleye numbers. Public access was also a concern; many anglers desired increased parking or additional accesses, particularly on the east side, where no public access exists. Many anglers disapproved of tournaments and suggested reducing or eliminating them. Vegetation concerns were also frequently given; most anglers want less vegetation (particularly Eurasian watermilfoil), though some prefer existing or increased levels of vegetation.

## Tournaments

A total of 11 tournaments were held under a DNR permit on Clearwater Lake between May and October, 2005 (Table 16). Data from these events were collected from organizers afterward and not included in the creel analysis, but are reported here separately. Including tournament data would add 6,803 hours of angling pressure or $2.18 \mathrm{hrs} /$ acre to the creel results, a $6.7 \%$ increase. Most tournaments targeted largemouth bass and bass anglers released $99 \%$ of fish weighed in. Bass tournament anglers had a mean catch rate of 0.413 fish/hour based on fish weighed in, but the actual rate is likely higher due to culling; the same may be true for crappie and pike catch rates. Most pike anglers released their fish after weigh-in, whereas most crappies were harvested (Table 16).

The creel clerk interviewed many anglers who were part of fishing leagues or smaller tournaments not requiring a permit; these data are included in the creel analysis. A total of 17 such events were identified by the clerk with an approximate total of 200 boats. Many of these
events were held on weekday evenings and it is probable that more were held outside of the creel clerk's scheduled shifts and therefore not encountered. Without more data, angling pressure and other measures cannot be calculated, but may be a substantial addition to the overall impact of tournaments on the fishery. The summer creel survey in 1984 did not distinguish tournaments from other angling, preventing comparison with the current survey.

## Economic Value

One method for estimating the average amount of money spent by an angler (non-Great Lakes) on a day of fishing was reported in the 2001 National Survey of Fishing, Hunting and Wildlife-Associated recreation data (US Department of the Interior 2003). An angler trip to Clearwater Lake was considered an angler day. A total of 101,340 angler hours and 4.0 hours per trip equals 25,335 trips during the summer creel season. Using the 2001 rate of $\$ 26$ per trip (a year-round value for food, lodging, transportation, fuel, oil, bait, tackle, and licenses), the estimated value of the summer fishery was $\$ 658,710$. Fuel and other costs have risen since 2001, so the true value is presumably higher.

## Discussion and Management Implications

Angling pressure on Clearwater Lake was higher in summer 2005 than winter 2004-05, but lower than in summer 1984. Summer 2005 pressure was $32.5 \mathrm{hrs} /$ acre, for a total of 41.1 hrs/acre year-round; summer angling represented 79\% of the total pressure (Table 3; Minnesota Department of Natural Resources 2006a). The summer survey season was longer (191 days) than the winter season ( 91 days), but summer pressure was also higher on a daily basis; mean daily pressure was $530.6 \mathrm{hrs} /$ day in summer and $296.1 \mathrm{hrs} /$ day in winter. The 1984 creel survey estimated summer angling pressure to be $57.4 \mathrm{hrs} /$ acre, despite lasting only 130 days (Minnesota Department of Natural Resources 1985). Non-fishing recreational use was similar-13.1 hrs/acre in 2005, versus 15.4 hrs/acre; however, in 1984 fishing boats which were moving but not fishing were included in this category. This underestimates angling pressure compared to 2005, when all fishing boats were considered to be angling. A possible reason for higher pressure in 1984 is that more anglers traveled farther to the lake; $58.5 \%$ traveled over 50 miles in 1984, compared to $18.9 \%$ in 2005.

Walleye represented a much larger component of the fishery in 2005 than in 1984. Anglers harvested 1.38 walleye per acre in summer 2005, compared to $0.16 /$ acre in 1984, but mean weight decreased from 1.6 pounds in 1984 to 1.3 pounds in 2005 (Minnesota Department
of Natural Resources 1985). The catch rate for anglers targeting walleye was $0.235 / \mathrm{hr}$ in 2005 and only $0.03 / \mathrm{hr}$ in 1984 , so it is not surprising that $40.5 \%$ of summer anglers targeted walleye in 2005, compared with $4.7 \%$ in 1984. Lake survey results since 1985 have also shown an increase in walleye catch rate and a decrease in mean weight (Figure 2). However, walleye mean weight from the 2005 summer lake survey was 1.6 pounds - an acceptable size for anglers and in the expected range for lake class 22 (Minnesota Department of Natural Resources 2006b).

Angler success did not correspond well to lake survey catch data for walleye. Success and satisfaction ratings were slightly higher in the summer creel than in winter, but were the lowest among targeted species in both seasons. Results from the 2004-05 winter creel survey showed a low harvest rate for walleye ( $0.08 / \mathrm{hr}$ ) by targeting anglers and a mean harvest weight of only 0.77 pounds (Minnesota Department of Natural Resources 2006a). A possible reason was an abundance of age one yellow perch for forage; these were frequently caught during lake survey shoreline seining, but were not large enough ( $\bar{x}=89 \mathrm{~mm} \mathrm{TL}$ ) to be sampled effectively in gill nets or trap nets (Minnesota Department of Natural Resources 2006b).

Northern pike harvest was much lower in summer 2005 than in 1984 ( 0.60 /acre vs. 4.54/acre, respectively), likely the result of higher angling pressure and catch rate for targeting anglers in 1984 ( $0.39 / \mathrm{hr}$ vs. 0.27/hr in 2005), and a higher proportion of released fish in 2005 ( $84 \%$ released vs. $44 \%$ in 1984; Minnesota Department of Natural Resources 1985). Mean weight of harvested pike changed little ( 2.9 lbs in 2005, 3.0 lbs in 1984), but lake surveys since 1984 have shown increasing pike abundance and decreasing mean weight (Figure 3). The size threshold for what anglers think is an acceptable pike to harvest has probably changed little since 1984, resulting in many small pike being caught and released and fewer large pike harvested. Another factor is that only $19.5 \%$ of anglers targeted northern pike in 2005 and many pike were caught and released by anglers targeting other species; among all anglers, pike catch and release rates were nearly equal. Winter creel results in 2004-05 also showed a low pike harvest of 0.22/acre (Minnesota Department of Natural Resources 2006a).

Sunfish harvest (13.8/acre) in summer 2005 was higher than the winter creel (3.3/acre), but far lower than in summer 1984 (54.6/acre; Minnesota Department of Natural Resources 2006a, 1985). Lake survey results for sunfish show a decrease in size since 1985, but no trend in abundance (Figure 4). Some of the decrease in harvest is likely due to lower overall pressure in 2005, but sunfish catch and harvest rates were also much lower in summer 2005 (3.26/hr and
1.04/hr, respectively) than in 1984 ( $6.66 / \mathrm{hr}$ catch, $3.36 / \mathrm{hr}$ harvest). Harvested size decreased from $1984(0.39 \mathrm{lbs})$ to $2005(0.31 \mathrm{lbs})$, but reasons for the decrease are unclear.

Black crappie harvest was also much lower in summer 2005 (2.75/acre) than 1984 (22.4/acre), although mean harvest weight was similar ( 0.51 lbs in 2005; 0.48 lbs in 1984, Minnesota Department of Natural Resources 1985). Targeting catch and harvest rates also declined sharply in 2005 ( $0.44 / \mathrm{hr}, 0.26 / \mathrm{hr}$ respectively), compared to 1984 ( $2.09 / \mathrm{hr}, 1.26 / \mathrm{hr}$ respectively). A higher proportion of anglers targeted black crappie in 1984 (23\%) than in 2005 (16\%) and overall angling pressure was higher in the 1984 survey. This suggests that crappie abundance has decreased since 1984; however, lake survey data from mid-summer is difficult to compare across years for crappie, so changes in relative abundance are unknown.

Crappie anglers in winter 2005 had a higher harvest rate $(0.35 / \mathrm{hr})$ and mean harvest weight ( 0.63 lbs ) than in summer $2005(0.26 / \mathrm{hr}, 0.51 \mathrm{lbs}$; Minnesota Department of Natural Resources 2006a), whereas catch rates were similar. Surprisingly, summer crappie anglers gave a higher mean success rating ( 3.7 out of 10 ) than in winter (3.1) and higher overall satisfaction ratings for number (6.3) and size (6.1) than in winter (5.4, 5.3, respectively; Minnesota Department of Natural Resources 2006a). It may be that angler expectations differ seasonally or perhaps different anglers use the lake in summer.

Fewer largemouth bass were harvested during summer 2005 (0.98/acre) than in 1984 (3.95/acre), despite a higher percentage of anglers targeting bass ( $24.9 \%$ vs. $12.6 \%$ in 1984; Minnesota Department of Natural Resources 1985). Higher overall pressure in the earlier survey can only account for part of this; it seems likely that most of the difference is due to the current popularity of catch and release angling for bass. Further evidence is provided by catch and harvest rates; in 2005, the catch rate $(0.81 / \mathrm{hr})$ was approximately ten times harvest rate $(0.08 / \mathrm{hr})$ for targeting anglers. In 1984, the targeting catch rate was $0.90 / \mathrm{hr}$ and harvest was $0.32 / \mathrm{hr}$ (Minnesota Department of Natural Resources 1985). Mean weight of harvested largemouth bass has remained nearly unchanged ( 1.4 lbs in both years). Spring electrofishing in 2005 found the population of bass to be relatively abundant, but growth and mean length were below average (Minnesota Department of Natural Resources 2006b).

## Management Implications

Anglers voiced support for stocking more walleye and for special regulations in general. However, there seems to be no need for higher stocking rates; walleye fry stocking has been
successful and lake survey net catches were in the expected range for the lake class. Higher stocking rates could even prove counterproductive, given the decreasing size of walleye in lake surveys and in the creel. The number of small walleye in the creel is a result of successful fry stocking and angler satisfaction seems likely to increase over time as these fish grow. A special regulation could be considered, but it is unclear why anglers have not been catching more walleye of desirable size, despite their presence in lake survey nets. More information is needed before any regulation change should be implemented.

Northern pike were abundant and small. A special regulation could be considered to protect larger pike from harvest and this may increase pike size structure. However, Clearwater Lake is popular for spearing in winter and any size-based regulation would likely face opposition from spearers. Every effort should be made to encourage selective harvest of smaller pike by anglers and spearers.

Small largemouth bass may be too abundant; if so, the population could benefit from increased harvest of smaller fish. However, there seems to be no shortage of small sunfish for forage, so other factors may be involved. Electrofishing is currently the best assessment tool for largemouth bass, but was not conducted in lake surveys prior to 2005 . More sampling is recommended to better understand the population prior to considering regulation changes.

Anglers seem mostly satisfied with the sunfish and black crappie fishery and no change in management seems warranted. The decrease in sunfish size is a concern, but it seems unlikely that this is due to angler exploitation. Spring trapnetting for black crappie in survey years could help determine if any change in relative abundance is occurring.

More frequent creel surveys should be conducted in conjunction with lake surveys. Given the importance of the Clearwater Lake fishery, more data is needed to assess trends and possible regulation changes. This would be helpful to determine if the lower pressure in 2005 is typical or unusual. Targeted sampling with trapnets or electrofishing would be helpful in between lake survey years. And creel surveys of limited intensity or duration, angler response cards, or other means could provide valuable information quickly without a large commitment of time or resources.

Stricter limits may be needed on tournaments. Non-tournament anglers were dissatisfied with the number and size of tournaments, and limited parking at the public accesses was a problem on tournament days. Also, the list of tournaments under permit may give a misleading
picture of tournament activity, given the number of non-permit events encountered during the creel survey. Allowing fewer permits or less entrants may help alleviate this problem.

## Acknowledgments

I would like to thank Josh Kendall for many hours on the lake, Karen Doroff for data entry and the Montrose area staff for their assistance with the creel survey and report.

${ }^{1}$ Data from completed trip interviews. The number of fish harvested per angler was determined by dividing the number (by species)
harvested by the number of anglers for each interview. ${ }^{2}$ Bag limits: crappie $=10$, bass $=6$, northern pike $=3$, sunfish $=20$, walleye $=6$.

Table 10. Percentage ${ }^{1}$ of parties targeting species on Clearwater Lake, Minnesota, April 22, 2005-October 31, 2005.

| Species | April | May | June | July | August | Sept. | October | Season |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Black crappie | 97.9 | 39.9 | 10.4 | 12.1 | 12.6 | 9.3 | 6.9 | 16.3 |
| Largemouth bass | 0.0 | 10.7 | 30.9 | 27.4 | 25.2 | 34.9 | 17.5 | 24.9 |
| Northern pike | 0.0 | 13.1 | 13.0 | 23.2 | 23.9 | 27.8 | 17.5 | 19.5 |
| Sunfish $^{2}$ | 52.1 | 21.6 | 28.5 | 37.0 | 40.0 | 17.6 | 6.5 | 28.6 |
| Walleye | 0.0 | 43.6 | 45.9 | 32.6 | 34.3 | 35.5 | 69.5 | 40.5 |
| Parties (N) | 48 | 328 | 501 | 521 | 507 | 324 | 246 | 2475 |

${ }^{1}$ Percentages do not total to 100 because anglers could target up to two species. ${ }^{2}$ Includes bluegill, pumpkinseed, hybrid and green sunfish. The season opened May 14, 2005 for northern pike and walleye and May 28 for bass.

Table 11. Percent distributions by age and sex of anglers, Clearwater Lake, Minnesota, April 22, 2005-October 31, 2005.

| Age in Years | Females | Males | Combined |
| :---: | :---: | :---: | :---: |
| $0-15$ | 122 | 339 | $461(9.4 \%)$ |
| $16-25$ | 56 | 408 | $464(9.5 \%)$ |
| $26-35$ | 72 | 665 | $737(15.1 \%)$ |
| $36-45$ | 153 | 830 | $983(20.1 \%)$ |
| $46-55$ | 157 | 852 | $1,009(20.6 \%)$ |
| $56-65$ | 72 | 579 | $651(13.3 \%)$ |
| Over 65 | 68 | 483 | $551(11.3 \%)$ |
| No age data | 7 | 33 | 40 |
| Total $(N=)$ | $707(14.4 \%)$ | $4,189(85.6 \%)$ | 4,896 |

Table 12. Approximate one-way distance traveled by interviewed anglers to Clearwater Lake, Minnesota, April 22, 2005-October 31, 2005.

| Distance $^{1}$ in Miles | Responses | Percent |
| :---: | :---: | :---: |
| $0-10$ | 696 | 14.4 |
| $11-25$ | 1,631 | 33.8 |
| $26-50$ | 1,582 | 32.8 |
| $51-100$ | 586 | 12.2 |
| $101-300$ | 173 | 3.6 |
| Over 300 | 151 | 3.1 |
| Total | 4819 | 100 |

${ }^{1}$ Distances are calculated in a straight line from center of zip code areas.

Table 13. Fishing success ratings ${ }^{1}$ from interviewed anglers, Clearwater Lake, Minnesota, April 22, 2005-October 31, 2005. One response was collected from each party, regardless of party size. Percentages are shown in parentheses.

${ }^{1}$ Response of anglers to the question, "On a scale of one to ten, with one being poor and ten being excellent, how would you rate your fishing success today on Clearwater Lake?". ${ }^{2}$ Some parties gave multiple responses.

Table 14. Responses to questions 3 and 4. One response was collected from each party, regardless of party size. Previously interviewed anglers were not asked.

Question 3: "On a scale of 1 to 10, how satisfied are you with the number of (targeted species) you catch on Clearwater Lake?"

| Species | Mean response | N |
| :--- | :---: | :---: |
| Black crappie | 6.31 | 180 |
| Largemouth bass | 6.86 | 315 |
| Northern Pike | 6.44 | 133 |
| Sunfish | 7.29 | 314 |
| Walleye | 5.07 | 415 |
| Total | 6.30 | 1,357 |

Question 4: "On a scale of 1 to 10, how satisfied are you with the size of (targeted species) you catch on Clearwater Lake?"

| Species | Mean response | N |
| :--- | :---: | :---: |
| Black crappie | 6.14 | 180 |
| Largemouth bass | 5.66 | 315 |
| Northern Pike | 5.36 | 133 |
| Sunfish | 5.56 | 314 |
| Walleye | 5.00 | 415 |
| Total | 5.48 | 1,357 |

Table 15. Summarized responses to question 5, "Do you have any suggestions for improving the fishery?" Multiple responses were allowed for a given party, but not duplicate responses. Previously interviewed anglers were not asked question 5 .
Number Response
133............Increase, continue or begin stocking
95. $\qquad$ .walleye
16. ...........unspecified 8 $\qquad$ crappie (6), unspecified panfish (2)
5 each ....largemouth bass, muskellunge (plus one opposed to stocking musky)
1 each ....northern pike, smallmouth bass, yellow perch, rock bass
58..............Regulations for walleye
17...........desire unspecified size or slot limit
10...........minimum length limit (range $=12-20$ inch minimum)
6.............maximum length limit (range $=14-20$ inches)
11...........slot limit (variety of harvest and protected slot range suggestions)
9.............lower bag limit
5.............other, e.g. harvest only 1 over 20 inches
24..............Regulations for northern pike
10...........desire slot limit (variety of harvest and protected slot range suggestions)
7.............minimum or maximum length limit (range $=24-27$ inches)
4.............other: less small pike, more pike, catch and release only
3.............no or less spearing
29..............Regulations for largemouth bass
12...........desire slot limit (variety of harvest and protected slot range suggestions)
5.............minimum length limit (range $=12-20$ inches)
1............. 16 inch maximum length limit

4 ............lower bag limit
7.............catch and release only or extended season with catch and release
12..............Regulations for black crappie
5............desire length limit: $10 "$ minimum (3), $7 "$ min. (1), $7 "$ maximum (1)
3.............slot limit, unspecified
4............. .change bag limit: lower (3), raise to 15 (1)
19..............Regulations for sunfish
9.............change bag limit: lower (6), higher (1), no limit on small sunfish (2)
7.............maximum size limit or slot limit, other unspecified regulation
3. $\qquad$ .shorter season
13.............Area closure for shallow bays and other spawning sites
18..............Other regulations, no species mentioned, e.g. higher/lower bag limits, season length
97..............Public access to Clearwater Lake
53...........desire larger public access/more parking
30...........desire additional public access, particularly on east side of lake
6.............repair accesses
3. $\qquad$ .desire fishing pier
1 each .... post boat ramp etiquette, create fish cleaning site, reduce number of accesses
99..............Tournament issues
93...........decrease or eliminate tournaments
6.............other, e.g. all live release, later start times, more enforcement, etc.
99..............Vegetation issues
64...........reduce vegetation, eliminate invasive species, e.g. Eurasian milfoil
21...........keep or increase Eurasian milfoil, other species
10...........eliminate or reduce herbicide use
4.. $\qquad$ other, e.g. less lawn fertilizer, tools for cleaning off vegetation at access, etc.
39..............Recreational use issues
24...........improve marking of shallow areas and hazards
7.............desire horsepower limit or slower boat speeds
6.............desire less (or no) personal watercraft, water skiers
2.............more no wake zones, better enforcement of no wake zones
7................Other species concerns: bowfin, bullhead, rock bass, tullibee
3...............Improve water quality
5................Control cormorants
10..............Other concerns: limit shore development, more angling regulation enforcement, etc.
665............Total number of suggestions
