

HOW TO PLANT A BAREROOT SEEDLING

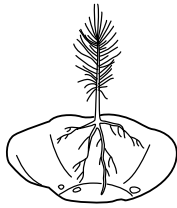

- 1** Keep roots moist at all times, but not saturated. Dry roots die.
- 2** Dig a hole twice as wide as and slightly deeper than root length.
- 3** If hole cannot be dug deep enough to fit entire root system, trim roots with scissors to same length as seedling's above ground height or 8 inches, whichever is longer.

CUT ONLY IF NECESSARY.

STEPS 4 - 9 →

4 Place roots in hole so top of first root is slightly below surface level.

5 Distribute roots evenly, making sure roots are straight and not doubled over or “J” rooted.

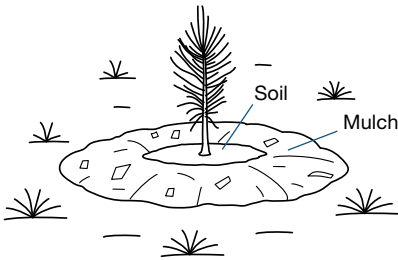

6 Backfill hole to slightly above top of first root.

DON'T CREATE A “J” ROOT.

7 Remove air pockets from soil by pushing down firmly with hands or feet.

8 Water entire area until water stops soaking in.

9 When feasible, place mulch around seedling, keeping mulch away from trunk.

DON'T CREATE A MULCH VOLCANO.
