5167	The Co-Lead Agencies must “rigorously explore and objectively evaluate all reasonable alternatives.” Id. at § 1502.14(a). The Co-Lead Agencies must also “include reasonable alternatives not within the jurisdiction of the lead agency.” Id. at § 1502.14(c). The Forest Service considered just two alternatives to the Land Exchange Proposed Action. The first, the “no action” alternative, is required by 40 C.F.R. § 1502.14(d). The second, Alternative B, “was derived from the Mine Site Exchange Only Alternative” developed during scoping and “would convey fewer acres of federal land for fewer acres of non-federal land.” SDEIS 3-166. ... This does not satisfy the Forest Service’s obligation to “rigorously explore and objectively evaluate all reasonable alternatives,” including “reasonable alternatives not within the jurisdiction of the lead agency.” The Forest Service must consider additional alternatives that have either been eliminated from further consideration or have not been considered at all.	ALT14, ALT23
5168	The SDEIS provides very little information about this suggested alternative [full exchange with restrictions], other than to state that it “is not substantially different from Alternative B ... The SDEIS does not provide a delineation of the One Hundred Mile Swamp, particularly not one with an overlay of the two Land Exchange alternatives. However, very little of the swamp is located in the additional land that is included in the Proposed Action as opposed to Alternative B. See SDEIS Figure 3.3-2.	ALT14, ALT23
5169	The SDEIS provides very little information about this suggested alternative [full exchange with restrictions]...The Forest Service could perhaps think more creatively about restrictions and requirements that could be placed on mining to ameliorate some of the impacts. ... As the holder of property rights that PolyMet must obtain in order to build a surface mine, the Forest Service has a significant amount of leverage that it could use to reduce the environmental impacts of this project.	ALT23
5170	One of the most disturbing things about the Land Exchange Proposed Action is that the lines have been drawn so that the Forest Service no longer owns riparian land along that portion of the Partridge River that is most likely to be affected by the proposed mine. The eastern “Mine Site” boundary does not extend to the river, but the land exchange proposal was structured to remove that stretch of the river from federal control. Land was also added to the Mine Site boundary south of the railroad track to the same effect – removing riparian land from federal control. See Figure 3.3-2. It is difficult to imagine that this was not deliberate, and we suspect that the reason is that the Forest Service did not want the headache of administering a polluted, degraded river. The SDEIS needs to include information about how the boundaries were drawn and why, and an explanation of the rationale for giving up these riparian lands. ... Putting the riparian lands in the mine owner’s hands is not likely to result in stewardship to prevent or address these impacts, and in fact the sketchy monitoring plan included in the SDEIS does not include monitoring of this stretch of the river. The difference in acreage between the Proposed Action and a Partridge River Alternative is not large, but it could make a significant difference to the river. The Forest Service should consider an alternative that leaves Partridge River riparian lands in federal ownership.	LAN06
5172	The Forest Service must consider an alternative that seeks appropriations from the Land and Water Conservation Fund (LWCF) to acquire the mineral rights underlying the Federal lands in the Land Exchange Proposed Action. This is the one alternative that would actually meet the purported purpose of this project, but was never considered. ... The Forest Service is authorized to acquire “interests in land or waters” with monies from the Land and Water Conservation Fund. 16 U.S.C. § 4601-9(a)(1).	ALT23
5174	Minn. Stat. § 116D.04(6). Under this statutory requirement, the DNR must deny the permits required for this project if the environmental consequences outweigh the benefits. ... Thus even if all other legal requirements are met, the three Co-Lead agencies must still consider whether harm to the environment outweighs the benefits of the project.	PER35
5176	Minnesotans are profoundly uncomfortable with the idea of creating a situation where contaminated water will need to be treated for centuries, with no predictable end date. Any benefits of the mine would accrue during a twenty-year period, with the detriments extending more than five hundred years into the future. ... The agencies have no basis to believe that any financial instrument, including cash, would remain viable for hundreds of years. They have not named or described an instrument that has ever maintained its value over more than five hundred years.	FIN01, FIN08

5177	This project would significantly increase greenhouse gas emissions. This factor alone should be the end of any consideration of permitting it.	AIR01
5178	Both mercury and sulfate levels will increase in the area wetlands, and this is where the greatest potential for harm exists. Furthermore, the increased load of mercury to the Embarrass River is strictly prohibited under the Clean Water Act.	PER10, PER11
5179	The probability of a spill (not an accident, but an accident that results in a release to the environment) is calculated as about 29%. This is deemed to be a “low” probability. SDEIS 5-537. ... Thus we have a greater than fifty percent chance of a spill of hazardous material just in the area between Duluth and the NorthMet site. ... Given the enormous impacts of many of these accidents, this risk is unacceptable.	HAZ06
5180	The local desire for a number of jobs that is insignificant in terms of the overall economy should not be given more consideration than either the long-term detriment to the economy or the many resources that would be destroyed or otherwise impacted by the project.	SO01
5464	Fifth, the SDEIS does not even mention the potential for contributions to waterquality impacts in the Partridge and Embarrass Rivers and tributary streams from air deposition.	AIR04, AIR05
5481	Finally, the SDEIS must disclose the predicted quality of surface water created by the Proposed Project. Water in the West Pit and the Tailings Basin is predicted to have elevated levels of many constituents. See Water Monitoring Data Package Vol. 1 and 2 (PolyMet 2013i and 2013j). Whether or not surface water quality standards apply to this water, the water has the potential to adversely impact wildlife, particularly birds. The predicted water quality thus must be considered and disclosed in the SDEIS.	WR107, WR141
5852	Agency has stated that water quality standards must be met at the “end of pipe,” before mixing with surface water. PolyMet 2013i at 7. This is the appropriate point for compliance for groundwater discharges as well, as the impact at the point of discharge is the same. If contaminants traveling through groundwater contribute to pollution of surface water, EPA and federal courts require a NPDES permit for the discharge. The EPA has stated that “the Agency interprets the Clean Water Act to apply to discharges of pollutants from a point source via ground water that has a direct hydrologic connection to surface water.” 66 Fed. Reg. 2960, 3015, Jan. 12, 2001.	PER05, PER09
5854	Regarding sulfur, in the context of Class I areas... We understand that this is essentially a screening standard for Class I areas, with no legal effect at the Mine Site. However, it also indicates a level at which an increase in sulfur deposition can be considered not to be a problem for an ecosystem. In other words, while this level of deposition may not be relevant to permitting, it is relevant to environmental review. If vegetation, soils, and water could be impacted at a particular level of deposition in a National Park, they could be impacted by the same level in other high quality ecosystems.	AIR09
5855	The SDEIS does not say what the sulfur deposition level will be at any location outside of Class I areas. In fact, it discusses only the increase in metals, and tells us nothing about sulfur.	AIR07
5856	Currently we have no information on whether occasional exceedances or elevated levels may be due to atmospheric deposition, although as explained below, we do know that storm events result in elevated concentrations of mercury in Northern Minnesota streams. In any event, the available information does not indicate that deposition of metals – or sulfur -- can be dismissed as insignificant for the Partridge and Embarrass Rivers.	AIR05, WR151

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5857	The SDEIS also provides no reference or explanation for its apparent position that “a general lack of definitive understanding of mercury dynamics” prevents any prediction of increased loading to the Partridge River through releases to groundwater...The SDEIS needs to provide an explanation as to why such an analysis is not possible at this site. Furthermore, if the analysis truly is impossible, the SDEIS should err on the side of caution and estimate a load based on the humidity cell test leachate, rather than dismissing this mercury source altogether. The conclusion that “mercury released from waste rock and ore at the Mine Site is not expected to be a constituent of concern in groundwater seepage,” SDEIS 5-202, is unsupported.	MERC04, MERC12, MERC16, MERC20
5858	The modeled length of time before untreated discharge would meet water quality standards is highly relevant information that must be revealed in the SDEIS. The fact that for some constituents the model indicates that water quality standards may never be met without treatment is absolutely critical to a reasoned decision, and to a determination of whether this project will reasonably be able to comply with other legal requirements. The actual quality of the water that will be released if treatment ends prematurely is just as critical, as is a discussion of what that water quality would mean for aquatic species, wildlife, wild rice, and human consumption. In the words of the CEQ regulations, this information is “essential to a reasoned choice among alternatives,” and it is thus incumbent on the agencies to provide it in the SDEIS.	WR036, WR038
5859	The SDEIS needs to take a “hard look” at each of the mitigation measures that is relied on to reduce impacts, provide an objective assessment of the likely effectiveness of each mitigation measure, and provide a range of potential impacts that corresponds with the range of potential effectiveness. These assessments must be based on actual, real-world experience with the mitigation measures as used at other mines, rather than on the theoretical possibility that a measure could be 90 to 100 percent effective. If the measures have not been used enough to allow a real-world assessment of their effectiveness, the SDEIS must say so, and provide an assessment that includes the range of potential outcomes.	PD05
5860	These reports have been extensively peer-reviewed and presented at major conferences, including: U.S. EPA’s Hardrock 2006 Conference in Tucson, Arizona; Society for Mining, Metallurgy, and Exploration’s 2006 Annual Meeting in St. Louis; and the Mine Design, Operations and Closure Conference in Fairmont Hot Springs, Montana, also in 2006. These reports and their findings and conclusions must be fully and objectively disclosed and considered within the EIS for the PolyMet mine... Clearly there is a significant risk that the SDEIS assumptions that all mitigation measures would operate as planned, that monitoring and “adaptive management” would take care of any problems, and that environmental standards would be enforced will prove untrue, just as they have proven untrue in other parts of the country (regarding sulfide ore mining) and in Minnesota (regarding mining in general). The SDEIS must include an objective assessment of the likelihood of success of mitigation measures, and that assessment must take account of this relevant information.	FIN01, WR023, WR130
5861	Regardless of EPA’s comments, the SDEIS’ analysis and disclosure of the relevant issues involving financial assurance remains woefully inadequate. The critical importance of financial assurance for this proposed project – as recognized in EPA’s earlier comments on the Draft EIS – has been repeatedly raised at the SDEIS public hearings, in the media, and even in a state legislative hearing that sought information beyond the very general discussion provided in the SDEIS. Moreover, the little information that is provided in the SDEIS demonstrates the compelling need for detailed financial assurance information, as it discloses that mechanical water treatment may be needed for at least 500 years, that initial closure costs will be as high as \$200 million, and that annual monitoring and maintenance costs are estimated at \$3.5 to \$6 million. SDEIS 3-138.	FIN01, FIN05, FIN13
5863	Furthermore, if the reduction in baseflow is measured by an average or mean measurement over the course of several years, it can be expected to fall at the median in regards to precipitation. This would mean that a twenty percent reduction from that median represents a forty percent variation in precipitation. Finally, a permanent drop in baseflow of twenty percent is not equivalent to a baseflow that drops by twenty percent in drought years. NEPA requires agencies to consider means to mitigate adverse environmental impacts. 40 C.F.R. § 1502.16(h); see also 40 C.F.R. § 1502.14(f); 40 C.F.R. § 1505.2(c). Without more information on the flow augmentation plan, it is impossible to tell whether and to what degree the adverse impacts of this project on the headwaters of the Embarrass River tributaries will be mitigated.	WR185

5864	Furthermore, the SDEIS provides virtually no information about monitoring or maintaining the variation in flow to maintain natural conditions. The statement that “Effects on the success of fish spawning in tributary streams would be addressed by maintenance of seasonal, bankfull flows over the life of the NorthMet Project Proposed Action,” SEDIS 5-391, seems to be the only mention of maintaining seasonal variation in either watershed. Just how this will happen in light of the lack of a monitoring plan remains a mystery.	WR185, WR186
5866	We were unable to locate a mitigation plan for greater-than-expected drawdown in the flow of the Partridge River. The SDEIS seems to provide no information on the point at which action may need to be taken to avoid impacts. However, the plan does anticipate allowing baseflow to drop gradually by a predicted 4 to 7 percent during the first eleven years. SDEIS 5-381. At what point would a decision be made to augment or take some other action to protect the flow? If PolyMet would not be required to take action until the baseflow has dropped by twenty percent, that is unacceptable for the same reasons that apply to the Embarrass tributaries.	WR185, WR186
5867	the drawdown metric for the Partridge River would apparently be based on modeled rather than measured data. See SDEIS 5-381. The modeled data shows a significantly lower base flow than indicated by empirical measurements. If the drawdown metric is based on modeling data, the river will likely be drawn down far more than twenty percent before mitigation measures are required. The SDEIS should reveal the ultimate levels to which flow would be allowed to drop before mitigation is required.	WR003, WR086, WR130
5868	The scant information given on monitoring indicates the likelihood that whatever the loss of flow in either the Partridge River or the Embarrass tributaries, nothing is likely to be done about it. According to Table 5.2.2-53, SDEIS 5-219, flow monitoring for the Partridge River will be done “at/near SW-004a and SW-006.” Monitoring at these locations is unlikely to reveal the impact on flows upstream. The greatest predicted drawdown to baseflows is at SW-004 (noting again that SW-003 was apparently not modeled). A reduction in flow at SW-002 is also predicted; this point is miles upstream from SW-004a. PolyMet must be required to monitor the flow at each of these locations, with a mitigation plan that reveals at what point action would be required, and what that action would be. Hydrology at the site is simply too uncertain to allow the conclusion that drawdown of the river will not be significant.	WR138, WR187
5869	The entire SDEIS is silent in regards to any impacts on or monitoring of Yelp Creek. As explained, it appears that this project will have an impact on the hydrology that supports Yelp Creek. This impact must be discussed in the SDEIS, and a monitoring and mitigation plan proposed to protect this creek.	WR186
5870	The apparent flow monitoring plan for the Embarrass River and its tributaries is even worse than that for the Partridge River. SDEIS Table 5.2.2-54 reveals that flow monitoring will occur “at/near PM-13 and PM-12.” PM-12 is presumed to be upstream of any impacts, and PM-13 is four to five miles down-gradient of the tailings basin as the crow flies, and nowhere near any of the tributary streams. The SDEIS conclusions as to impacts on these streams are not believable in light of the apparent lack of any plan to monitor them. Nor would this situation be corrected by a decision to monitor the streams at the first evaluation points used in baseline monitoring and modeling. Each of these points occurs at or near the property line, which would still leave more than a mile stretch of each tributary stream unprotected. The SDEIS must provide an assessment of and a monitoring and mitigation plan for stream flow in the upper reaches of the Embarrass tributary streams.	WR071, WR139
5871	We were unable to locate a figure that shows proposed changes in topography at the tailings basin. These figures do not provide adequate support for the conclusory statements in the SDEIS that groundwater would not seep from the tailings basin to Spring Mine Creek or Second Creek and/or their upstream wetlands pursuant to the Proposed Project. See 40 C.F.R. § 1502.24.	WR054, WR117

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5872	The SDEIS states that no water will flow to the east from the Tailings Basin because of high bedrock. SDEIS 3-117 and 4-99. However, all of the information presented in the SDEIS shows a break in the high bedrock in the area that forms the headwaters of both Spring Mine and Mud Lake Creeks. The Depth to Bedrock Figure, SDEIS Fig. 4.2.2-15, indicates that the depth to bedrock at this location is actually greater than it is around the north and west sides of the Tailings Basin. Based on satellite imagery, see Exhibit 34, and the wetland delineation map, SDEIS Figure 4.2.3-1, this area appears to consist of a string of wetlands and open water. It is difficult to discern the direction of flow, although possibly the roads and railroad tracks that cross the area currently act as the surface watershed divide. The groundwater flow pattern in this area is simply unknown. The SDEIS must make clear why, after years of work on this proposal, such directly relevant information remains unavailable. 40 C.F.R. § 1502.22.	WR102
5873	While PolyMet may be able to direct surface flow into the constructed swale, the SDEIS provides no explanation of why groundwater seepage will not flow to Spring Mine Creek...To comply with NEPA and to demonstrate compliance with federal and state discharge requirements, the potential for discharge to Spring Mine Creek must be assessed and disclosed in the SDEIS using accurate mapping and real data.	WR054, WR102
5874	it appears from the groundwater contour map that water from the East Pit is likely to enter the Partridge River above SW-003. The SDEIS insinuates as much when it states, "The dike located north of the East Pit would remain in place to minimize mixing of the Partridge River flows with the East Pit water." SDEIS 3-71. The text does not explain how the dike will prevent the outflow of groundwater in that direction, and the subject is not mentioned again in the assessment of impacts.	WR089, WR163, WR167
5875	the water quality impacts of the Proposed Project have not been assessed for this entire stretch of river – from Yelp Creek to SW-004. Rather, the model assumed that SW-003 would be unimpacted and that most groundwater inputs from the mine site would occur prior to SW-004. While this is valid for the purpose of comparing background water quality to impacted water quality at SW-004, it is not valid for assessing impacts on the rest of the river.	WR177
5876	The AECOM documents reference the document "Barr Engineering Company. 2007. Wetlands in the USFS Land Exchange Area. Memorandum dated 29 November 2007. Prepared for PolyMet Mining Company, Hoyt Lakes, Minnesota. Minneapolis, Minnesota." This document does not seem to be included in the SDEIS reference material.	NEPA07
5877	Table 4.3.3-2 was apparently included in order to compare the functions of the lands that will be lost to the federal estate to functions that exist on the property that will be gained by the federal estate. The accompanying discussion does not actually assess the functions that will be lost to the Partridge and St. Louis River watersheds. Such an assessment must be included in the wetland impacts section of the SDEIS, accompanied by an assessment of the degree to which the loss of those functions will be replaced by the proposed mitigation.	WET17
5878	The SDEIS provides no quantitative predictions regarding water quality impacts in the wetlands. It does state an assumption that water quality will change, but it does not discuss the potential degree of change or the consequences of those changes. Instead, it promises "consideration in future monitoring." SDEIS 5-283. Also, the SDEIS separately discusses air deposition, railroad spillage, and groundwater transport, but does not discuss the additive effect of pollution from all three sources. As explained below, significant changes in water quality are likely, to the point of violating water quality standards. These impacts must be disclosed and discussed in the SDEIS.	WET11

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5879	the level of water quality impacts in general as assessed in the SDEIS is based on a flawed model that most likely seriously underestimates the flow of groundwater. This underestimated flow could significantly affect the prediction of mercury increases in wetlands, particularly from the Overburden Stockpile and Laydown Area, the Category 1 Waste Rock Stockpile, and the East Pit. Similarly, the SDEIS is unrealistically optimistic about the amount of Tailings Basin seepage that will be collected, and the amount of mercury from that source is also likely to be greater than might be supposed based on the SDEIS.	MERC11, MERC20, WR018, WR019, WR052, WR054, WR058, WR060, WR061, WR064, WR087, WR090, WR091, WR099, WR108, WR158, WR165, WR179
5880	The SDEIS completely ignores potential impacts to the wetlands between the Category 1 Stockpile and Yelp Creek. If the water collection system is not 100 percent effective, Category 1 Stockpile leachate is likely to travel in that direction. East Pit porewater is also likely to travel north and east into adjacent wetlands. These areas need to be included in an assessment of water quality impacts on wetlands.	WR017, WR019, WR020, WR021, WR058, WR081, WR089, WR167, WR177
5881	the proposed PolyMet mine’s direct and long-term destruction of two square miles of designated lynx critical habitat, along with the mine’s adverse impacts to at least one of the few remaining travel corridors for lynx, would result in the “destruction or adverse modification” of critical habitat, which is prohibited by the ESA. 16 U.S.C. § 1536(a)(2). The conversion of the critical habitat at the Mine Site to an open-pit mine would destroy and adversely modify all of the primary constituent elements for Canada lynx identified by the U.S. Fish and Wildlife Service, including the destruction of boreal forest landscapes that support a mosaic of forest stages, sites for denning, and matrix habitat allowing for travel and habitat connectivity. See 74 Fed. Reg. 8616, 8638 (Feb. 25, 2009) (Final Rule designating Canada lynx critical habitat)...the SDEIS entirely fails to consider or address the impacts of the proposed mine project on lynx recovery. By significantly adding to the widespread cumulative impacts of mining projects and other development across this region, including contributing to the continuing decrease in available travel corridors, the proposed mine project is likely to appreciably contribute to the diminishment of the chances for the lynx population in this region to recover, and to be eventually taken off the list of threatened species. The SDEIS’s failure to consider this fundamentally important factor concerning lynx violates NEPA and the ESA.	WI01, WI02, WI03, WI11
5882	The SDEIS’s cumulative effects analysis for wildlife, for both the proposed mine and the proposed land exchange, entirely fails to even mention moose. SDEIS 6-50 to 59 and 6-122 to 126... The agencies’ failure to address such a fundamentally important factor in the SDEIS violates NEPA. See <i>Foundation for North Am. Wild Sheep v. U.S Dept. of Agric.</i> , 681 F.2d 1172, 1178 (9th Cir. 1982).	WI01
5883	Similarly, even though the SDEIS claims that the cumulative impacts analysis for wildlife is focused on potential losses to sensitive species and their habitat, including federally listed species, SDEIS 6-50, the cumulative impacts analysis for the proposed mine fails to mention or address Canada lynx. SDEIS 6-50 to 59. This is despite the likely presence of lynx in the area, its designation as a federally listed species under the ESA, and the formal designation of critical habitat for lynx across much of the region. As with moose, there will undoubtedly be cumulative impacts to lynx and lynx habitat as a result of widespread mining, mineral exploration, and other activities in this region, and the failure to address and disclose these cumulative impacts in the EIS violates NEPA.	WI01, WI02, WI11
5884	Remarkably, the SDEIS excludes any consideration of the Twin Metals proposal, claiming that it is a “speculative action.” SDEIS 6-13. From its 8,800 square-foot headquarters in Ely that was constructed in 2011, to its 2014 “mid-prefeasibility” update, to its past and ongoing exploration throughout the region, to its proposed hydro-geologic study, and the ongoing consideration of the environmental impacts of its proposed lease renewals by the BLM, many components of the Twin Metals proposal are far beyond “speculative,” and are instead ongoing or at least reasonably foreseeable.	CU02, CU07

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5885	Furthermore, the area of analysis and the sources that are considered should vary according to the nature of the resource and the impacts. The SDEIS cumulative impacts assessment names a certain set of sources, and then limits the analysis to contributions from those sources. This may be the current methodology used by the State of Minnesota, but it does not meet the requirements of federal law. Under the federal regulations, the cumulative impacts assessment must consider all sources, past, present, and future, that contribute to the impacts at issue. 40 C.F.R. § 1508.7. This requires a scope of analysis that will vary based on the impacts and resource that are being assessed.	CU03
5886	This improved and more detailed cumulative impacts analysis [developed by the Tribal Cooperating Agencies] must be carefully considered by the agencies and disclosed to the public in the final EIS.	CU12
5887	Nor should this facility be permitted if it will contribute to non-attainment of the 2018 goal...Even if mining and processing began before construction ended, it is highly unlikely that the primary sources of air emissions would be in operation before 2018. And even if they theoretically could be, not taking account of an immediately pending goal defies common sense.	AIR13
5888	PolyMet is now making the same arguments. It says the amount of true asbestos that can be found in the Duluth Complex is miniscule. It says only harmless cleavage fragments are involved. It is chilling that the same experts that defended W.R.Grace at Libby, Montana have been involved in preparing PolyMet's fibers analysis. Worse, PolyMet repeats some of the false claims these consultants have made at other sites – even though EPA has shown the claims to be incorrect.	AIR03
5889	The SDEIS also fails to acknowledge that under an underground mine alternative, a land exchange with Forest Service would no longer be needed to allow for a strip mine, and that therefore environmental sensitive areas such as the 100 Mile Swamp and lynx critical habitat, along with tribal historical and cultural resources, would remain in federal control. Moreover, because water quality and water quantity impacts would be reduced under the underground mine alternative, perpetual mechanical water treatment might not be necessary to meet water quality standards, as it would be for the open-pit mine alternative.	ALT01, ALT06
5890	We also note that these assessments [of the non-federal lands] were done by the same firm that did most of PolyMet's technical and scientific work. SDEIS at 5-578. We are not casting aspersions on Barr Engineering when we say that this firm has a conflict of interest and should not have been contracted for this work. This is simply a matter of professional standards and avoiding the possibility of unconscious bias.	LAN03
5891	We submit that the proposed land exchange does not promote opportunities for better management of Federal lands and resources. The land that will be lost is a large, unfragmented area of high biodiversity, with rare plants and hundreds of acres of high quality, pre-European condition wetlands. It is unclear why or how management needs to be improved over the manner in which this parcel has been managed until now. Once again, because the Forest Service has no real reason of its own to give up this land, there simply seems to be no need for "opportunities for better management." While we appreciate the use of the listed "indicators" to ensure that management opportunities will not in fact be less with the acquired lands, the way this exercise has been conducted is as a solution looking for a problem.	LAN07
5892	Furthermore, the local economic impacts of relying on mining for economic development are more likely to be negative than positive in the long term. The discussion of this issue above in the section on economic impacts is especially pertinent to the Forest Service's decision.	SO01
5893	The Land Exchange portion of the SDEIS focuses on losses to the federal estate; because the Forest Service is exchanging land for the Mine Site, those losses are minimized. But the public interest review is not limited to impacts on the federal estate; the question is, taking account of all the ramifications, would the public interest be well served. In addition, NEPA requires the Forest Service to consider all of the environmental impacts of its actions, which clearly include the impacts of the proposed mine.	LAN01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5894	Earlier sections of these comments explain the negative impacts of this project on waters and wetlands throughout the project area. These are all impacts of the Land Exchange Proposed Action, and should be considered in the public interest review. These impacts include increased mercury loads; increased sulfate in wetlands, which contributes to mercury methylation and the production of hydrogen sulfide; violations of the water quality standard for lead; and potential violations of other water quality standards. In addition, the Proposed Project will impact hydrology.	LAN01
5895	The Forest Plan also states that “wetlands will be managed to prevent the reduction of their water quality, fish and wildlife habitat, and aesthetic values. Management actions will not reduce water quality within a wetland, or upstream or downstream of a wetland, unless restoration of natural conditions is the primary goal of the activity.” USFS 2004b at 2-15. The Forest Service’s “management action” here, the Land Exchange Proposed Action, will most certainly “reduce water quality within a wetland, or upstream or downstream of a wetland.” As restoring natural conditions is not a goal of the activity – whether of the land exchange, or the mine – the Land Exchange Proposed Action does not conform to the Forest Plan, and must be withdrawn.	LAN04, WET16
5896	In addition, the federal lands appear to provide excellent moose habitat. The Superior National Forest is the last remaining refuge for moose in Minnesota, where the species is declining precipitously. The SDEIS barely mentions moose, and does not assess impacts of the Proposed Project on this species, which is listed as of special concern by the State of Minnesota. Finally, the project may have significant impacts on migratory birds; this issue has been insufficiently assessed.	WI01, WI02
5897	the exchange consolidates PolyMet’s land interests, but does not consolidate the Forest Service land interests. In fact, as explained above, the Forest Service will have less right to limit mining on the new lands than it had on the old. This does not well serve the public interest.	LAN04
5898	the outcome of this transaction would be to decrease protection across the forest landscape (under all types of ownership) from the ravages of strip mining. Relatively few of the parcels will be subject to the restrictions that are present in the Federal land, and the restrictions on the Federal parcel will be lost. Few of the non-federal parcels will have restrictions added to the current deed; most of the land will be no more protected from strip mining under Forest Service ownership than it is under private or state ownership. This loss of protection of surface property and all of the benefits it provides to humans and other species does not well serve the public interest.	LAN04
5899	Many of the criteria under Priority 2 also apply more strongly to the federal than the non-federal lands. In particular, this land is environmentally sensitive and ecologically rare, and the wetlands are very valuable. In general, while the non-Federal lands may be wonderful properties that the Forest Service would be happy to have, that does not alter the fact that the Federal land is also a wonderful property that the Forest Service was happy to have up until now. This criteria may be appropriate to use strictly for the purpose of deciding whether the non-Federal lands would be acceptable, but that should not be allowed to spill over onto the question of whether the Federal lands are appropriate to dispose of in the first place.	LAN04
5900	The Forest Plan includes many other provisions that the SDEIS completely ignores.	LAN04
5901	Many of the watershed provisions [i.e. D-WS-1, D-WS-4, D-WS-5, D-WS-6, D-WS-13, O-WS-1] in the Forest Plan dictate against facilitating the NorthMet project.	LAN04
5902	the Land Exchange Proposed Action would not well serve the public interest because it is contrary to several additional federal policies. Exchanging this land would result in a project that would be counter to many important environmental objectives of the federal government. Most of these issues are discussed in more detail in other sections of these comments. They include:• The mercury Zero Discharge goal for the Lake Superior basin;• The “broader program” to restore and protect the Lake Superior basin;• Efforts to reduce greenhouse gas emissions;• Efforts to ensure that the federal and state governments (and taxpayers) are not left with clean-up costs for polluted mine sites;• Protection of potable water and of drinking water wells;• The reduction of haze in Class I areas.	LAN01

5903	Finally, it is particularly troublesome that the Forest Service is exchanging some of its acreage specifically to accommodate PolyMet’s emissions. SDEIS at 3-173. One has to wonder whether the Forest Service would be giving up additional land if PolyMet was seeking higher emission limits. It is unclear what boundaries were changed on this basis, but it is particularly objectionable if the additional land includes the Partridge River, which will undoubtedly experience degradation from the deposition of air pollutants, an impact that is completely ignored in the SDEIS. At any rate, the policy of exchanging as much land as a polluter requires to attain ambient air quality standards at the property line surely does not well serve the public interest.	ALT23
5904	The agencies should honor the commitments the various governments around Lake Superior made to the people of the Lake Superior basin, and deny authorizations based on the failure to meet the Zero Discharge goals of the Binational Program to Restore and Protect Lake Superior.	MERC01
5905	Rather than permitting hydrological changes and the addition of pollutant stressors (which could include air deposition as well as discharges) to an already impaired system, the agencies should be identifying stressors and addressing already existing sources of impairments. Permitting this project would fly in the face of the wisdom that underlies the Clean Water Act in regard to impaired waters.	PER09
5906	The Mine Site is part of the Superior National Forest, which is open to tribal members for exercise of their treaty rights. The Co-Lead Agencies apparently believe that land is fungible for this purpose; replace it with access to other lands, and there has been no loss. This rationale follows the patronizing attitude of this country’s past, which has been devastating to native culture and interests. We suggest that it is the place of the Tribes – not the Co-Lead agencies – to determine whether the exchange of lands is acceptable in regards to the exercise of treaty rights. If in the Tribes’ judgment it is not, the land should not be traded to a private entity.	LAN05
5907	The Proposed Project would also impact historical and cultural resources that are important to the Ojibway Tribes and people of this region. This alone should convince the agencies to refuse to allow PolyMet to strip mine this land.	CR05
<b>Sender Name (Submission ID)</b> Northern Organizations (52184)		
5923	It is our concern that the cumulative impacts of current taconite mining, taconite expansion, mineral exploration, and proposed copper-nickel sulfide mining places the ecological balance of the lakes and wilderness region of northeastern Minnesota at risk.	CU11
5924	The opening of a sulfide mining district would displace existing jobs, and the potential for continued jobs that are based upon clean water and wilderness resources. Instead, we would be leaving future generations with a legacy of water contamination lasting for centuries.	SO02
5925	[Save Lake Superior Association was] formed in 1969 to stop the discharge of taconite tailings into Lake Superior by Reserve Mining Company. This waste material contains many of the same toxins such as mercury and asbestos fibers that would be generated by the mining and processing of sulfide ore by PolyMet Corporation as disclosed in their SDEIS on the NorthMet Mine. As stakeholders we are concerned about the potential destruction of natural habitat and the pollution of both air and water in the Lake Superior and its watershed that would be associated with this project.	AIR02, CU11, CU17, HU01
5926	Lake Superior and its watershed are downwind and downstream from current taconite and proposed sulfide mining both of which emit these toxic substances. Even now our members, friends and families, especially children, must limit their fish consumption due to the continuing pollution. Many are unaware of danger and continue to consume the fish. Other visitors to the local parks, streams, trails, shoreline and the lake itself, part of which Minnesota owns, are unknowingly exposed to these toxins. This is an ongoing environmental threat which would increase the pollution of the air we breathe and the water we drink.	HU03

5927	[T]he proposed NorthMet Mining Project and Land Exchange would result in the permanent destruction of high quality wetlands and wildlife habitat, and long-term water and air pollution. The [Center for Biological Diversity], its staff, and its members and the interests of its staff and members would be significantly harmed and injured if the proposed project is approved and allowed to be implemented.	COE04, SO02
6003	Children born in our region already show high levels of mercury, this is terribly dangerous and we do not support allowing more sulfate – which is widely known to make mercury more bioavailable – into our waters. Rivers in our region are not responding to decreased airborne mercury with correlating decreases of mercury in the water. Children’s intelligence and ability to communicate can be harmed by mercury exposure during development.	HU03, MERC03
6004	The Club’s particular interest in this case and the issues which the case concerns stem from this proposed project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, and cumulative impacts from mining.	CU14
6862	The Cu-Ni Study also set up an air-sampling network in northeastern Minnesota. It consisted of 6 sites located around the expected area of Cu-Ni mining. Peter Ashbrook compiled a report in 1978, which provides the details of the sampling program, including an analysis of wind directions and fiber concentrations. ...This analysis shows that 1) the source of amphibole fibers in ambient air samples was probably the mines at the eastern end of the Biwabik Iron Formation (Peter Mitchel Pit and Dunka Pit), and/or 2) a taconite processing facility in Silver Bay. The PolyMet mine will be adding another source in the same area, which will add to the current fiber levels.	AIR03
6952	We know there are amphiboles in the Duluth Complex in variable amounts. The SDEIS is supposed to provide data and an assessment of PolyMet’s proposed action. The TEM fiber analysis that was carried out by Barr is worthless for any quantitative assessment of the impact of amphibole fibers from PolyMet’s processing. The SDEIS is deficient in providing that information.	AIR03
6957	Amphibole minerals are present in the Partridge River Intrusion, the ore that PolyMet will be mining... In the SDEIS, a mining map shows they will be mining in Unit 1, an area of abundant inclusions and local ultramafic layers... Although all researchers agree that the incidence of asbestos in the Partridge River Intrusion is probably low (from the Stevenson Thesis), Barr Engineering did find an asbestos fiber when they did their analysis.	AIR03
6962	Wind directions are important for ambient fiber levels in the region. Fiber concentrations are highest when the wind blows from the northeast part of the Biwabik Iron Formation, that is, from the mines. Fiber levels were lowest when the mine was shut down by a workers strike. Additional data from the Minnesota Pollution Control Agency (MPCA) samples for Babbitt should be investigated for impacts from the mine.	AIR03
6975	The comment period was too short for a full analysis, but at least one relatively recent data point has the amphibole fiber concentration in Babbitt at 11,957 fibers/cubic meter on August 10, 2008 (MPCA Sample number 200829402). The wind was blowing from the south directly from the Peter Mitchell Pit. Additional mining in this area will only exacerbate the ambient air problem.	AIR03
6977	Cumulative effects from NorthShore Mining’s Peter Mitchell Pit should be considered.	CU02
6978	The tailings will contain amphibole fibers and should be considered as asbestos containing.	AIR03
6995	The TEM analyses performed to assess PolyMet’s potential to generate harmful mineral fibers is tainted by additional grinding of the samples, and produced results that cannot be used for assessment of health impacts from mineral fibers.	HU01

7310	The dose of fibers with an aspect ratio greater than three had the most explanatory power for tumorigenesis and in vitro response. Thus we cannot disregard short, thin fibers. The numbers of thin fibers of all lengths are a better predictor of carcinogenicity than the number of long fibers. Surface area may be as important as fiber length in assessing risk. Of course, long fibers have more surface area, thus length is highly correlated with surface area. However, short thin fibers might also be hazardous.	AIR03
15658	sulfide mining in all other regions of this country, as well as globally, has left behind a trail of Acid Mine Drainage or heavy metal contamination that can last for centuries. This contamination is especially hard to contain in water rich environments, such as those of northeastern Minnesota.	WR023
15662	It is already known that taconite mining is having an impact upon the St. Louis River watershed, which drains into Lake Superior. Lake Superior contains 10% of our nation's water supply. Because Lake Superior borders both the U.S. and Canada, any on-going pollution is a matter of international concern.	WR111
15670	The Polymet project would result in substantial pollution and requires significant human intervention for an indeterminate period of time to keep that pollution from flowing into the water. At a time when our nation is spending millions to clean up the St. Louis River it seems foolhardy at best to add any pollution upstream as it would do in at least one river as described in the SDEIS even if everything functions as well as hoped by planners.	WR035, WR037, WR107, WR108, WR111, WR115, WR128, WR129, WR158

<b>Sender Name (Submission ID)</b>	Oeljen Vicki (44636)	
12228	I believe we are trading short term financial advantages for irreversible environmental challenges for generations to come.	SO01
<b>Sender Name (Submission ID)</b>	Office of the Minnesota State Auditor (42929)	
3789	The financial risks to taxpayers from nonferrous mining are well documented. The United States Government Accountability Office (GAO) has issued a series of reports on the adequacy of financial assurances and hardrock mines, and found methods used to date inadequate... It is clear from both government and industry perspectives that Minnesota needs to proceed cautiously when it comes to protecting the taxpayers from having to assume any cleanup costs associated with the proposed mine.	FIN01, FIN08, FIN10
3793	The DNR is required to promote mining and regulate it at the same time. The promotion of mining is intended for the benefit of the taxpayers and should not in any way reduce or diminish protecting the taxpayers and their other valuable natural resources. Minnesota rules allow the Commissioner of the DNR to exercise discretion when determining the size and types of financial assurances that will be acceptable, with some guidance in the rules.	FIN03, FIN08
3794	In exercising the Commissioner's discretion, it is not acceptable to burden or degrade current or future generations of taxpayers. These risks should be taken into consideration when the Commissioner analyzes the financial assurances finally proposed.	FIN03, FIN08, FIN09
3797	Whether the financial assurance instrument is truly bankruptcy-proof may not be known until the judge issues the opinion. The very best legal experts with years of experience in corporate bankruptcy should be consulted when analyzing the details of any instrument. The financial risk with nonferrous mining is high and the taxpayers deserve nothing less than the best to represent them.	FIN01, FIN03, FIN08, FIN09
3808	financial assurance instruments are identified in the SDEIS, at page 3-139. Not all forms currently named in the SDEIS are necessarily bankruptcy-proof [i.e., surety bonds and trust funds]... Because Minnesota rules require the instruments be bankruptcy-proof, this information needs to be thoroughly, transparently, and satisfactorily addressed when determining if a surety bond will truly be bankruptcy-proof to protect the taxpayers... Unless the trust [fund] is irrevocable, it may not be bankruptcy-proof...	FIN01, FIN03, FIN08
3809	A Surety bond is obtained from an approved surety company guaranteeing that the obligation will be met. However, "[b]onding underwriters will not provide a surety bond if it is determined that a site will have long term pollutional discharges since it is clear that the bond will not be released."5 Another risk of bonds to the State and ultimately the taxpayers is that the Commissioner probably has little experience with them.	FIN01, FIN08, FIN09
3813	The DNR would need to monitor the [Irrevocable] letter of credit for the duration of the exposure to ensure that it has not expired. Another risk the Commissioner needs to consider and do further research on is what would happen if the bank that issued the letter of credit goes into receivership.	FIN01, FIN03, FIN08
3814	The above scenario falls into the "failure or limitations on the ability of third parties to pay reclamation costs" as identified on page 3-138, section 3.2.2.4.2 Financial Assurance Instruments. It is very probable that over the next 20 years, there will be more bank failures. The Commissioner needs to do further research to adequately assess the appropriateness and risks of this type of financial assurance instrument... PolyMet acknowledges these risks related to the financial markets in its financial statements...	FIN01, FIN03, FIN08

<b>Sender Name (Submission ID)</b>	Office of the Minnesota State Auditor (42929)	
3820	The risks related to cash and cash equivalents are low if the cash is within the custody and control of the State and is not available to pay creditors should a bankruptcy occur. This is a desirable form of assurance for the taxpayers.	FIN01, FIN03, FIN08
3821	One of the risks of a trust fund is the timing of funding required by the Commissioner. If the Commissioner allows a “payment plan” for PolyMet to fund the trust fund, there is a substantial risk to the taxpayers. If a trust fund is not fully funded and PolyMet goes bankrupt, or walks away because commodity prices drop, we have opened the ground, and water treatment will be required, but we will not have the funds to pay for it for the estimated 200-500 years. The burden then gets shifted onto the taxpayers.	FIN01, FIN03, FIN08, FIN09, FIN10
3822	There are risks for taxpayers associated with insurance policies, if PolyMet can even obtain one. The insurance company must be solvent. The insurance policy itself must be carefully reviewed by someone with sufficient expertise to verify it fully covers all anticipated claims. Use of an insurance instrument requires the DNR have an understanding of claims that should be made and the timing and procedures required to make them. The financial risk to government varies, depending on the specifics of the policy and the solvency of the insurance company.	FIN01, FIN08, FIN09
3823	Of particular concern are policies that are written by “captive” insurance companies, which are wholly-owned subsidiaries controlled by parent companies in existence to insure the parent company and its subsidiaries.	FIN01, FIN08
3824	In its Financial Statements for 2011, PolyMet identified a number of unanticipated risks and insurance exposures: [including that] PolyMet may not have adequate, if any insurance coverage for some business risks that could lead to economically harmful consequences to the Company.	FIN01, FIN08
3825	PolyMet is a Canadian “junior” company. It has never operated a mine, and has no experience mining. It has no track record, and has very few assets... There will be a greater chance of “unanticipated liabilities” with a Junior company (see 3.2.2.4.2 page 3-138 of the SDEIS). Because of this, the Commissioner should require a greater amount of financial assurances to adequately protect taxpayers from unanticipated liabilities.	FIN01, FIN02, FIN03, FIN09
3826	Glencore Xstrata is a major shareholder of PolyMet, giving it some control of the project. Glencore Xstrata is a large multinational mining company that does have assets from which to draw from if needed. If Glencore Xstrata could be put on the permit to mine for the project, their assets could provide some assurance to taxpayers.	PER02
3827	It is important to note that Minnesota’s surface and groundwater are valuable assets of the state...When determining the size of the assurances required, protection against degradation of other valuable commodities and resources is critical. Like the nonferrous minerals, this water belongs to all Minnesotans, and should be protected by larger assurances. This will help incent PolyMet to mine with care, and protect the taxpayers from being saddled with a large financial liability and/or degradation of a valuable commodity.	FIN05, FIN10
3830	The Commissioner is required to review the mine annually to see if assurance amounts need to be adjusted. This is acceptable to a point. There is great risk if the Commissioner, in “his discretion”, accepts only what PolyMet says they can afford, assuming the DNR can collect more later. The DNR has assured the public that they can pull permits from mining companies if they owe more in assurances and do not pay or have other violations. The risk with this approach is that it exposes the state and taxpayers to political will failure...Due to the political will risk, the Commissioner must get an adequate amount up front to protect taxpayers and not assume more can be secured later.	FIN01, FIN05, FIN08, FIN09
3831	In determining the size of assurances required, there is significant risk of settling for too little because of predictive failure. The ability of the Commissioner to determine how to calculate the cost for reclamation of the site is probably not a difficult task with the help of experts familiar with this type of work. However, the Commissioner’s or anyone’s ability to calculate the cost of water treatment for 500 years is probably impossible.	FIN05, FIN09, FIN13

<b>Sender Name (Submission ID)</b> Office of the Minnesota State Auditor (42929)		
3832	the State does not have the expertise necessary on staff to adequately protect taxpayers when assessing the types of assurance instruments and the size and adequacy of the assurances or the legal language in the assurances. The Commissioner of the DNR should hire top outside financial, legal and scientific experts who practice regularly in their respective areas and who have experience with nonferrous mining, to represent the State and the taxpayers' interests to fully mitigate the risks described herein.	FIN05, FIN08, FIN09, FIN13
3932	The amount of oversight and enforcement effort needed by the DNR for the duration of a specific financial instrument should also be taken into account. Special expertise may also be needed.	FIN08, FIN09
3950	Some of the risks identified [in Form 20F PolyMet submitted to the SEC]..., i.e., environmental hazards and pit wall failures should be covered by the financial assurance... If these risks are not insurable, alternative financial assurance arrangements must be found, or the project should not proceed.	FIN08, FIN12
3955	The probability of predictive failure should raise serious ethical and financial questions about whether Minnesota should be entering into a project where short term benefits are realized, but the potential pollution from waste rock will be in our state hundreds or perhaps thousands of years.	SO01
<b>Sender Name (Submission ID)</b> Oliver Garrison (39326)		
12788	I'm also of the belief that the short-term economic gain produced by mining will be lost many times over with long-term scarring of the countryside that we as Minnesotans hold to such high regard.	SO01
<b>Sender Name (Submission ID)</b> Olivia (Vivi) Grieco (57172)

<b>Sender Name (Submission ID)</b> Pam Backstrom (4272)		
10735	There will be up-front monetary guarantees for the monitoring of water, air, wetlands, etc. after the mine closes. The mine closure plan is sufficient to maintain all the water quality standards that are now in place.	FIN16
10736	I would like to encourage the US Corps of Engineers, USFS, and the DNR to publish a final EIS in a timely manner. I also want to urge the Commissioner of the DNR to declare the EIS adequate, and everyone involved to move the permitting process forward.	NEPA16
<b>Sender Name (Submission ID)</b> Pam Fischer, RN (34976)		
13281	Sulfur mines pollute EVERYTHING! They send toxins into the waters, the air and the land.	GEN03
<b>Sender Name (Submission ID)</b> Pam Frink (17511)		
1976	[The SDEIS] does not provide details as how up to 500 years of operating, maintenance and monitoring will occur and be paid for water treatment facilities. ... What will happen if Polymet and its backers decide they want to abandon this project in say 50 years? What guarantee is there that someone will continue to monitor and treat polluted waters for the remaining 450 years?	FIN01, FIN05, FIN11, WR035
1977	Another reason I feel the SDEIS should not be approved is the inaccurate water flow model that was used in the impact statement. This error causes many of the assumptions about future mercury levels to be questioned. This data must be corrected and resubmitted for further study by the public.	MERC11, WR003, WR086, WR091
1978	I did not see where any study was made of an underground mine instead of an open pit mine was considered. ... I believe an underground mine would be less destructive than the proposed open pit mine.	ALT01
1980	only some (912.5 acres) of the wetland affected is covered by the SDEIS. What about the more than ten square miles of other wetlands that are indirectly impacted by the toxic minerals and water use by this open pit mine? Bogs and swamps are very difficult to restore or rebuild.	WET01, WET05
1981	The area has been classified as a 'High Biodiversity Significance' area by the Minnesota Biological Survey and the SDEIS considers the impacts to be insignificant which I find impossible to believe. How can they claim over a dozen species of plants or animals as insignificant?	VEG02
<b>Sender Name (Submission ID)</b> Pam Larson Nippolt (7181)		
535	I believe that the water sources in Minnesota, and the surrounding watershed, are being put at extreme risk.	WR111, WR115
536	There is no precedence for this being an effective approach and the long term maintenance suggested (500 years) is preposterous.	PD03
<b>Sender Name (Submission ID)</b> Pam Leland (16707)		
2063	Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR071, WR107, WR108, WR195
2064	the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003

<b>Sender Name (Submission ID)</b> Pam Leland (16707)		
2065	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.	MERC02, WR041, WR115, WR189
2066	•The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures.	WR010, WR012
2067	•The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
2068	•The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	HU03, WR020
2069	Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.	NEPA09, WR195
<b>Sender Name (Submission ID)</b> Pam McLaughlin (34221)		
13244	I have canoed in the Boundary Waters Wilderness Area, that whole area is so beautiful and absolutely irreplaceable. And the contamination of one area of these waterways will affect the whole region, not just that specific area in Minnesota.	WILD02, WR111
14025	We have got to start thinking of the larger picture when we make decisions and let the good of all living things for generations to come, guide our decisions, and not the desire for short term money gain.	SO01
<b>Sender Name (Submission ID)</b> Pamela Arnold (39439)		
7726	An alternative use for the proposed mining site has not been considered, including economic and environmental projects for an alternative use. The "NO BUILD" alternative should be given its due position among the considerations.	ALT06
7753	The long term consequences of any undisclosed potential for error, contamination to ground water, ambient air pollution, dredging peat bogs cannot be measured against the very few proposed economic benefits to the local economy.	SO01
7763	A comprehensive EIS should include a state-wide economic and environmental overlay, with an alternative scenario for comparison. As it stands, the SDEIS truly benefits the applicant. It does not fulfill our expectations for a complete picture including alternatives. Because the consequences could be so costly to the environment region-wide, the SDEIS should be challenged, and if no revisions are offered to support an alternative, it should be rejected in perpetuity.	ALT01, ALT06
13221	All we have is hope that the DNR and State of Minnesota will have the courage to reject this proposal, against local enthusiasm for it. And, using it's lobbying effort, find an economic alternative for this region, which clearly needs an economic boost.	SO02

<b>Sender Name (Submission ID)</b> Pamela M and Frederick J and Alexandra R Thompson (54691)		
17819	"Jobs, jobs, jobs" is the hue and cry in favor of a copper-nickel mining boom. Environmentally and financially sustainable family businesses like ours are always wished for, but often not supported by policy. My family has spent a great deal of time, money, energy and education to start and maintain Giving Ground. We will be forced to close and move away in an atmosphere of mining noise, dust, heavy equipment on country roads, blasting and temporary population influx.	SO02
17820	Noone mentions the many long-term, sustainable economically viable over- the- longterm jobs, which will disappear, · coppe -nickel mining environment. Tourist lodges, resorts, dog-sled and skiing and other wilderness adventure firms, cannot hold against this onslaught of quick-buck, ·n-and-gone mmg	LU06
17822	What happens after in-and-then-gone mining operations? Planned bankruptcy, which is always built right into the lans of the mining companies.	FIN01
17824	Neither can potable water hold against such an amoral, if not outright immoral, corporate onslaught. Potable water is Minnesota's treasure. Th only water we have is that within our atmosphere's bubble. There is no more. Someone at the recent hearings asked, "Are we insane?" (to trade a possible 20 year mining boom for 500 years of drinking water??)	SO01, WR111
17825	The corporate owners of the minining companies will neve settle in our communities. They will come in by private plane an leave by private plane. The engineers will be brought in by the companies, under contract, and then they will leave. None ofthese mining companies have any long-term commitment to ANY of our communities in any way.	SO06
17827	Frank Ongaro says we should trust the environmental laws on the books, but what of all the recent lrain explosions, massive toxic storage tanks leaks into national waterways and drinking water reservoirs, coal ash avalanches? .. . . Companies don't care what happens to communities m t e long run because they don't live in any of them; the state and federal governments are already overburdened and can't possibly oversee carefully enough.	SO02
17828	Recycle copper and nickel and rare earths and so any other resources from the dumps and landfills we already have. The Chinese are mining our landfills for much of their resource needs.	NEPA06
17829	Leave the copper and nickel in the ground here until a time when technology makes mining them safer. They won't go anywhere in the meantime.	ALT16
<b>Sender Name (Submission ID)</b> Pamela Skaar (31784)		
13851	Water supply systems, personal and public, may be impacted, requiring more expense to process to meet regulatory standards.	WR041
<b>Sender Name (Submission ID)</b> Pamela Thinesen (14735)		
1747	I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-- information that is necessary to decision-makers.	FIN01
1748	Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02
1749	I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St. Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk.	WI13

<b>Sender Name (Submission ID)</b> Pamela Voigt (15616)		
15637	The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. [As you revise the SDEIS, please] require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project.	WI02
15638	Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635)... [As you revise the SDEIS, please] recognize the changed status of the moose as a species of "Special Concern"...	WI01
15639	despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose...	WI01, WI02
<b>Sender Name (Submission ID)</b> Pat Rogowski (47794)		
11610	I believe the mine should not be built as described. It is our job to protect irreplaceable wetlands and fresh water resources in the Lake Superior Basin for generations to come	WET24
14151	Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters.	COE04
14153	Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality [including]: Underground mining, looking at the full ore deposit and PolyMet's real costs	ALT06
14155	Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality [including]: Putting a liner under the Category 1 waste rock stockpile;	ALT07, ALT10, ALT13
14157	Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality [including]: Placing all tailings on a new completely lined facility;	ALT10, ALT13
14158	Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality [including]: Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres;	ALT03, ALT06
14159	Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality [including]: Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.	ALT13
14160	Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.	COE01
14161	Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.	COE01, COE02
14162	Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.	COE03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Patti Schuman (38514)		
14677	the SDEIS shows that the project can be built and operated in an environmentally safe manner. The technology exists to mine non-ferrous minerals in the right way and the state has years of experience regulating mining. As well, the quality work done on the SDEIS to identify potential impacts and alternatives for mitigation provides the foundation for proper permit development.	PER34
14678	Minnesota also has substantial and clear financial assurance rules that will further help to ensure permits have the proper financial backing as they are issued. Given that this is the first non-ferrous project to be permitted, I applaud the DNR's decision to seek outside input to assist its process of determining appropriate financial assurance for the Polymet Project.	FIN16, FIN17
14679	[Mining's] economic and employment presence draws a very highly educated and highly skilled work force and it supports the presence of high quality educational facilities, teachers, community leaders and other people and experiences in Northeastern Minnesota. ... Minnesota will benefit from mining's economic impact in terms of taxes and royalties and also the positive social and environmental impact of adding good jobs outside of the increasingly congested Metro area.	SO10
14680	The DEIS shows that we can competently take leadership and responsibility in Minnesota for regulating the production of non-ferrous minerals that all of us rely on to support our way of life	PER34
<b>Sender Name (Submission ID)</b> Patty Flynn (10722)		
12236	Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.	WR195
<b>Sender Name (Submission ID)</b> Patty Lange (44858)		
8030	It has been brought to my attention that the maps outlining the drainage area around the proposed mine in the environmental study for the Polymet mine are incorrect.	EDIT01
8035	The fact that the incorrect maps outline the swamp with a dashed teal line on satellite maps with green backgrounds makes it extremely difficult to see. This discrepancy between the environmental impact statement maps and US government maps makes this environmental impact study inadequate.	EDIT01
<b>Sender Name (Submission ID)</b> Patty Mac (43471)		
15549	Despite their best laid plans; what would happen if a truck with sulfuric acid overturned near the water? What about the weather? Horrible tornadoes? Another winter like this one (or two or three)? What about fires? What about human error?	PD22, PD36
15550	If any of the things that happened at their Mapani mine happen here it would be devastating--environmental problems, health hazards, death of miners. And that mine is just a small part of the trail of environmental hazards, human hardship and financial costs it leaves in the local communities it does "business" in.	FIN10, HU04
15551	Not too mention the big gaping hole the mining leaves in the earth--have you seen the pictures of current copper mines? They are horrid!	LU04
15552	If it's jobs you are trying to bring to that area of the state--there has got to be a better way. There are new (and green) technologies being developed all of the time--invest your time, effort and money into one of these technologies that can benefit all groups, now and in the future.	SO06

15553	who is paying for [other corporate environmental disasters] now -- in dollars, health and stress? Freedom Industries has filed chapter 11, so they will be minimizing their payouts--so it's not them; the weight of the crisis falls on the citizens, as it will when something happens at a copper mine in northern Minnesota.	FIN01
<b>Sender Name (Submission ID)</b> Patty Moses (43017)		
11501	The SDEIS should identify all the currently foreseeable cumulative effects of sulfide mining in Northern Minnesota [and the entire Great Lakes basin] , so that citizens have the opportunity to evaluate each proposal within the larger context of the overall eco-system.	CU18
<b>Sender Name (Submission ID)</b> Patty Moses and Tom Haller (43017)		
12191	A responsible plan must address how its systems will react to inevitable leaks, spills, accidents or other failures – indeed, the SDEIS seems foolhardy in its optimism and failure to plan for contingencies. ... To fully assess the environmental impact of the mine, contingency planning for unexpected failure must be addressed up front and not wait until well into the permitting process.	HAZ01, PD22, WR130
12204	The mine plan shows that millions of gallons of polluted water will seep off site, untreated, during the 20 years of operation. The SDEIS does not address how this untreated water will be kept from flowing into the Partridge and Embarrass Rivers, to the St. Louis River and into Lake Superior. Excessive rainfall and flooding will only exacerbate this unaddressed problem.	WR070, WR107, WR128, WR130, WR156
12216	PolyMet has not adequately explained how runoff and seepage from the permanent waste rock pile and tailings piles will be prevented. It proposes to store tailings in the former LTV tailings basin, on top of tailings that are already leaching contaminated water. Where membrane liners and geosynthetic covers are used, there is no evidence showing that they will last for centuries. How is it possible to assure sufficient maintenance and monitoring over such a period of time?	PD16, WR017, WR018, WR090, WR127
12221	PolyMet’s “base flow” underestimates the amount of water potentially flowing into the Partridge River a tributary of the St. Louis River, which flows into Lake Superior...The water model is based upon a single year’s data.... Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Accurate groundwater flow rates are critical to any realistic prediction of pollution and seepage from PolyMet’s mine pits and waste rock piles to the Partridge River. Baseflow must be recalculated after additional data is collected – PolyMet’s assumptions and promises are all based upon a seriously flawed model and therefore must be rejected.	WR003, WR047
12224	PolyMet assumes that the bedrock under the mine will not allow seepage and runoff to flow into groundwater and elsewhere. However, the bedrock in this area has multiple faults, fractures and fissures, through which water will flow to unknown locations... the effects of repeated blasting on underground rock formations, and these faults and fractures, is unknown—it is certainly possible that they will become larger or more numerous, changing the flow patterns of contaminated water. It is simply too risky to move forward with the SDEIS and PolyMet project without clear understanding of the underground faults and fractures that could transmit contaminated water to places unknown.	WR010, WR012, WR016, WR120
12235	PolyMet does not explain, because it cannot, how polluted water could be retracted. If there is leakage or a spill of contaminated, acidified water, it goes into the watershed, seeps into the groundwater, killing plants, fish, leaching metals and mercury into the environment and endangering human health. What are reclamation costs – can water that has been acidified even be reclaimed? The SDEIS does not adequately address these questions.	HU03, PD03, PD09, PD35, VEG06, WI04, WR128, WR130

<b>Sender Name (Submission ID)</b>	Patty Moses and Tom Haller (43017)	
12297	sulfates have a known role in facilitating mercury methylation, a toxic form of mercury that may cause brain and kidney damage and bio-behavioral disorders in humans. The mercury level in fish in the lakes and rivers in the area is already a health concern and yet this proposal would almost certainly increase the health and safety risks posed by mercury concentrations. The SDEIS should include detailed and cumulative impacts of potential mercury increases in fish as related to the NorthMet project and other nearby pollution sources, including mercury methylation as well as discharge and emissions.	MERC02, MERC10
12307	PolyMet should be required to provide financial assurances in the SDEIS before any permitting process gets underway. Considering that it is taxpayers who will bear the burden in the future for inadequate financial assurances, the public should be able to examine and comment on a financial assurance plan.	FIN10, FIN13
12459	The boom-and-bust cycle of most mining means any economic improvement will be short-lived.. Construction is ...expected to “marginally reduce the unemployment rate” in the study area...many of the more highly skilled and technical jobs will most certainly go to people who come to the area temporarily and send their incomes back to their permanent residences. Upon closure of the mining operations, far fewer people would be employed, the remaining jobs being in closure and reclamation activities. ...In the end, relatively few jobs, created for a short period of time, is certainly not worth the massive risk to the ecosystem of the St. Louis River watershed and Lake Superior.	SO02
12463	While acknowledging that an indirect effect on tourism and recreation might occur due to noise, dust, water pollution and other disturbance, the SDEIS does not examine or estimate the loss of recreation and tourism-related jobs in the area or examine the effects of the loss of those jobs. The displacement of other economic activity, including jobs and income related to hunting, fishing, eco-tourism, outdoor recreation, and the destruction of habitat for many species is ignored. Of course, contamination of the waterways over time will deeply impact the tourism industry, property values. ... Before the process moves forward, an entirely new analysis of the economic impact of PolyMet’s proposal in the context of both short-and long-term environmental, economic, and fiscal impacts must be undertaken.	SO04
12550	Sulfate pollution is detrimental to sustaining the growth of wild rice so important to Minnesota Tribal communities and other Minnesotans. ...PolyMet claims that it can meet the current sulfate standards, but its promise does not address the untreated, contaminated water that will seep or flow from the sites...The SDEIS is inadequate because it does not address the sulfate accumulation from untreated contaminated water... PolyMet’s assertion that it will meet current sulfate standards assumes that all the engineering controls, including the seepage capture system, the cap and liner system, the discharge controls, as well as the wastewater treatment system will all function perfectly for hundreds of years.	VEG04, WR128, WR156, WR157, WR160, WR162
12554	The SDEIS ...ignores the potential cumulative environmental impacts of current mining activity, new exploration and potential mining and processing throughout the region. Rather, it restricts the cumulative effects assessment area (CEAA) to the Embarrass and Partridge River watersheds, and does not include the St. Louis River or Lake Superior.	CU01, CU02
16557	the proposed solutions to handling toxic contaminants have not been tested or proven to protect water quality, human health and wildlife. Considering the extreme risks, PolyMet’s projections are inadequate both in the protection of water quality initially and in the proposed remediation. Once sulfuric acid is released, the damage is done.	WR023, WR115, WR141, WR143
16559	While there are scattered comments throughout the SDEIS concerning potential effects on human health, the document is largely silent on this most profound danger of the proposed mine.	HU01
16579	The SDEIS considers only the PolyMet proposal, not the other sulfide mining exploration efforts already underway in Northern Minnesota in anticipation of developing mines. It ignores the potential cumulative environmental impacts of current mining activity, new exploration and potential mining and processing throughout the region. Rather, it restricts the cumulative effects assessment area (CEAA) to the Embarrass and Partridge River watersheds, and does not even include the St. Louis River or Lake Superior.	CU01, CU02, PER35

<b>Sender Name (Submission ID)</b>	Patty Moses and Tom Haller (43017)	
16799	Minnesota Statutes Section 116D.04, subd. 6, provides in part: "No state action ... shall be allowed, nor shall any permit ... be granted, where such action or permit ... is likely to cause pollution, impairment, or destruction of the air, water, land, ... so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air, water, land and other natural resources from pollution, impairment or destruction. Economic considerations alone shall not justify such conduct." ... I submit that the SDEIS falls far short from meeting the above standards and permitting should not go forward.	PER35
16807	The SDEIS states that for 45 to 2000 years after closure of the mine, pollutants will be discharged into the Partridge River and exceed water quality standards for nickel, sulfate, cobalt, copper and mercury. The SDEIS acknowledges that rock liners may fail to contain contaminated drainage and liners may degrade with contaminated seepage expected to exceed standards for aluminum, antimony, arsenic, fluoride, iron, manganese, sulfate, dioxin, and perhaps beryllium and thallium. Aluminum may exceed water quality standards for 500 years. Concentration of such toxins in fish that can be eaten by humans presents major implications for human health.	HU03, WR107, WR127
16811	Given the projected pollution with these human toxins and the myriad of uncertainties surrounding long- term management of environmental pollution over hundreds of years, the SDEIS is highly deficient on the risks to public health. Before proceeding with the SDEIS, the lead agencies should consult with experts such as the Institute of Medicine, U.S. EPA, American Public Health Association, and other health science - based organizations to examine the implications of sulfide mining on human health, safety and well-being.	HU01
16814	Minnesotans should be absolutely assured that sufficient money has been set aside up front to cover all the costs of remediating the damage, or better yet, retracting it. The current SDEIS does not provide adequate information on 1) the reasonably anticipated costs of foreseeable problems, 2) the costs of currently unforeseen events, and 3) the duration of remediation efforts. Much more information is needed before granting any permission for mining interests to proceed.	FIN05
16815	Among factors that must be addressed are: •The costs of contingency plans, for foreseeable events and for the worst-case scenarios. These include the costs of monitoring to immediately identify leaks, spills, breaks, etc.	FIN05, FIN11
16817	Among factors that must be addressed are: •The cost of financial assurance to protect Minnesotans if PolyMet/Glencore and their investment backers go out of business or run into financial problems and cannot provide additional resources, as has happened repeatedly in the western United States.	FIN05
16818	Among factors that must be addressed are: •The actual costs of monitoring, maintaining, and replacing treatment equipment over many decades or even centuries.	FIN05, FIN11
16819	Among factors that must be addressed are: •The costs of long-term maintenance and management of wetland mitigation sites in addition to the mine and plant sites.	FIN05, FIN11
16820	Among factors that must be addressed are: •The costs of retracting damage. These costs are not addressed in the SDEIS. No one has explained how damage can be retracted. The SDEIS must include the details of how the contaminated water that seeps or spills will be neutralized before it causes damage to flora and fauna and leaches heavy metals including mercury into the watershed.	FIN05
16821	Lead agencies need to restore the public comment period before proceeding further with the review process. PolyMet's estimate of closure costs of \$200 million and annual maintenance costs of \$6 million are far lower than estimates of the Grand Portage Band of Ojibway that concluded the set-aside for financial assurance at the outset should be approximately \$90.5 billion. Such glaring discrepancies must be reconciled and public comment would help inform the issues.	FIN05, FIN13

298	It is only reasonable to require that Polymet provide adequate financial assurance prior to the beginning of any permitting process.	FIN13
301	Permitting cannot proceed based on inaccurate predictions of water quality.	PER09
302	The cumulative effect of blasting ore, or vibration, has not been mentioned in the SDEIS, or even considered.	N04
304	The impacts of multiple envisioned future mining ventures should be expected to have a cumulative effect on the health of the sensitive ecosystems comprising the overall environment of northeastern Minnesota. This larger context must be an important consideration affecting the granting of any permits for Polymet's proposed action.	CU04
307	It is not reasonable to believe such accidents or unforeseen negative impacts cannot occur in connection with Polymet's proposed action.	PD01
308	Possible benefits to local, state, and national economies, as well as potential damages to the sensitive ecosystem within which this venture is proposed to occur, should be understood as considerations secondary to Polymet's primary interest.	SO01
309	Any assurances given either about future economic benefits or about limiting, preventing, or repairing future environmental damages can only be estimated, not proven.	PD25
310	I believe a choice must be made between any sulfide mining project and the health of the environment upon which we depend for the quality of our lives and the welfare of our local economies.	PD01
<b>Sender Name (Submission ID)</b> Paul Arhur Fleming (54531)		
19053	This sulfide mining activity does irreparable damage to the water, wildlife and people living in the vicinity and outreaching areas. It always comes down to the bottom line. Making wealthy people wealthier, and besides they won't have to live here.	SO01
<b>Sender Name (Submission ID)</b> Paul Bauer (43586)		
12306	I have full confidence that the Minnesota DNR, the U.S. Army Corp of Engineers, the U.S. Forest Service and all other involved agencies can, and will, provide the needed oversight and regulation to allow safe, successful mining of the NorthMet Mining Project.	NEPA16
15130	We need the minerals. We need the jobs. And, we need the project to be done correctly.	SO10
<b>Sender Name (Submission ID)</b> Paul Benwell (4514)		
1835	I have reviewed the SDEIS and am confident that everything has been addressed to the best of everyone's ability and that the permitting process should take place	PER34
9888	I have followed Polymet Mining for a few years and after visiting the site and listening to and questioning management I am very confident in their ability to move forward in a safe and secure manner.	NEPA16
<b>Sender Name (Submission ID)</b> Paul Doffing (45180)		
8772	The Environmental Impact Statement is deficient in that it inaccurately portrays the effects of the mine/ watershed on the 100 Miles Swamp Area.	WET19

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Paul Doffing (45180)		
8773	Maximizing profits at the cost of human health and the environment is a short sighted, self serving choice	SO01
8775	If Polymet cannot give financial and scientific assurance that our environment will not be damaged by their mine, they should not be allowed to mine.	FIN05
<b>Sender Name (Submission ID)</b> Paul Erdmann (41883)		
2131	Even if PolyMet “mitigates” or “replaces” wetlands that are destroyed or damaged by this proposed mining activity at a ratio of 1 acre wetland loss to 1.5 acres of wetland “creation,” studies and experience have shown that these newly created wetlands have only a portion of the biological and water quality value of the natural wetlands. The state of Minnesota, federal agencies, and local government units that regulate these activities do not have adequate staff, funding, or time to ensure that these mitigation wetlands provide as much value as the natural wetlands that took thousands of years to evolve.	COE01
2361	The SDEIS does not adequately address many of the environmental ramifications that would occur if the mine is approved, in a critical area of our country’s National Forest- the headwaters of a watershed that many people are working to address environmental damage that has already taken place.	CU11
16506	The SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures.	WET01, WET04, WET07
<b>Sender Name (Submission ID)</b> Paul F. Tanghe (11242)		
727	Any potential benefits of this project, which will be largely captured by the PolyMet corporation, simply do not justify potential environmental impacts whose cost will be born by the residents of Minnesota as well as the surrounding US and Canadian regions.	SO01
<b>Sender Name (Submission ID)</b> Paul Finsness (35444)		
13251	There is no guarantee that the PolyMet mine will be open for its projected twenty year life-span. The taxpayers of Minnesota will be required to protect the watershed for 500 years for a mine project that may not be viable for more than 5 years. Again, look to Arizona for the effect of fluctuating copper prices on the viability of copper mines controlled by foreign owners.	FIN08, FIN10
<b>Sender Name (Submission ID)</b> Paul Forsman (57339)		
18440	everybody says, "Oh, save the wetlands," and it is okay for to save the wetlands, and, "The mining company is going to pay, it doesn't matter," but you are going to have to think about the big picture though. All of the extra carbon that was burned to satisfy a wetland that really wouldn't have been more affected anyways.	WET13
<b>Sender Name (Submission ID)</b> Paul G Jorgensen (54522)		
18733	Are the citizens of Minnesota going to pay for cleanup after Polymet has left the state?	FIN01, FIN10

<b>Sender Name (Submission ID)</b>	Paul Nelson (41962)	
2152	The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that...during a typical year of operation the federal government would receive \$17.3 million and the state and local governments would receive \$14.5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4.10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503).	SO04
2153	Table 5.2.10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15.6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2.0 of the PSDEIS, Table 5.2.10-3 shows annual estimates of \$3.12 million of state taxes and \$12.8 million in federal taxes, increased by 500% to \$15.6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet.	SO04
2155	the SDEIS [should be revised] to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies	SO04
2156	the SDEIS [should be revised] to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates.	SO04
5061	As a Minnesotan, I regularly travel to the Boundary Waters and northern Minnesota for camping, fishing, and outdoor activities. It would be a terribly short-sighted plan to risk one of the only truly natural environments that Minnesota has left for the sake of a few hundred jobs.	SO01
5064	To think of potentially ruining an environment, or at least making it a place that requires constant clean-up, for the next 500 years so that a business can make a profit is not a responsible use of our state's resources.	SO01
5065	[The PolyMet mine] would establish a dangerous precedent of allowing new mining interests into Minnesota nature.	CU04
7606	We as a state are not in a good position to trust that Polymet and its associates will be able to provide us with the environmental and financial assurances that we absolutely need to have before a permit to Mine is granted.	PER03
7619	Saying that this will be the first copper sulfide mine that won't contaminate the watershed and pollute the air is unacceptable.	AIR11
7622	There is little in this for the state of Minnesota or its workforce... it is very likely that many of the jobs created wouldn't be filled by locals.	SO06
7625	I think that they will not be able to guarantee 200-500 years of financing for monitoring and treating the water at both the plant and mine sites.	FIN01
7634	The only thing I would consider guaranteed by them as that they will maximize profits for their shareholders...Jobs will be kept at an absolute minimum.	SO06
7636	I have yet to see an economic impact statement that wasn't created by the company itself in a best case scenario sensibility.	SO02
7641	The PolyMet mine plan is riddled with problems that must be fixed: PolyMet would destroy thousands of acres of habitat used by threatened moose and lynx	WI02

<b>Sender Name (Submission ID)</b> Paul Roth (7046)		
453	Preserving and protecting Minnesota’s natural environment is more important than the profits of a mining company.	SO01
454	Clearly, no one knows what will need to be done, and how many hundreds of years it will need to be done, to keep the witch’s brew of effluent from poisoning water, soil, and air.	PD01
673	The mining company will cease to exist long before the site loses toxicity and the ability to ruin the environment. The state of Minnesota will be left with an environmental train wreck, and the citizens of the state will have no choice but to pay for containment and remediation.	FIN01
<b>Sender Name (Submission ID)</b> Paul Sanford (22073)		
3341	The sooner we get the Polymet project going the sooner we are not dependent on foreign powers for our badly needed copper used In clean energy production.	NEPA05
<b>Sender Name (Submission ID)</b> Paul Schlaefel (39726)		
7009	It is my opinion that mining in this area with present technology is risky to the water quality. Clean water is the states most important asset and we need to be assured that future generations can drink it safely.	WR128, WR195
7010	More work needs to be done on the environmental impact of storing poluted waste safely in this fragile area.	PD15
14888	Like any big corporation, Polymet's primary concern is profit for it's shareholders.	SO02
<b>Sender Name (Submission ID)</b> Paul Schurke (18075)		
3187	Most prominently, I feel, are the graphs and tables, particularly those, if I might cite from the report, Table 4.2.2-9 and others that compare the flow into Partridge River with which they have projected through their computer modeling and it is fatally flawed and the DNR has acknowledged that and it's a significant serious error and how well this SDEIS is going to give us a picture of what's can become of the water quality in these lakes and streams in the future to come.	WR003, WR086, WR091
3188	Grand Portage Band and the Bois Forte Band, have been telling the scientists working on this project for years that the groundwater data on the flowage of the Partridge River is seriously flawed, that they're off.	WR003, WR086, WR091
16619	the PolyMet SDEIS is inadequate and... this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance.	SO01
16623	The SDEIS contains no cost/benefit analysis of the PolyMet mine.	SO01
16626	The SDEIS does not say whether wages paid to mine employees will stay inMinnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota.	SO06
16628	The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: “Mining-related employment is volatileand fluctuates from year to year due to the market price of commodities being extracted.” SDEIS, 4-325—4-326	SO02

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Paul Schurke (18075)	
16633	The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment.	SO04
16638	The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees.	SO01
16639	What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear.	SO01
16646	PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years.	WR037
16647	Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water.	WR070
16648	The computer model used by PolyMet may understate the actual[water] pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site.	WR049
16649	The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate... the SDEIS does not tell us how the costs of responding to such failures will be covered.	FIN05
16651	The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged.	HU03, WI04
16652	The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for Many Centuries -Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment.	PER04
16653	526 acres of land, covered by more than 167 million tons of waste rock, would be covered by a plastic sheet and surrounded by a system that would supposedly collect contaminated seepage. All would require monitoring and maintenance constantly for hundreds of years to fix leaks, repair perforations, and remove deep-rooted plants.	PD01
16663	A mining pit “lake” would require pumping to prevent the toxic brew of acid and heavy metals from spilling into the nearby Partridge River, and a tailings basin pond would require pumping to prevent spillage into tributaries of the Embarrass River.	WR037, WR131
16666	The polluted water collection system, which includes miles of pipes, would require monitoring and maintenance for centuries.	WR131
16668	The SDEIS contains no credible information about the actual cost of monitoring, maintaining, and replacing the equipment needed to treat polluted water for 500 years or more. It provides no details about the nature or guarantees of a financial assurance scheme that would remain viable for 500 years, yet it does acknowledge, disturbingly, the possibility of events such as “unanticipated liabilities” and “failure or limitations on the ability of third parties to pay.” It does not attempt to explain how a corporate entity could realistically be held accountable over such an absurdly long period of time.	FIN01, FIN05, FIN11

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Paul Schurke (18075)		
16669	even though the SDEIS admits that water pollution will last for a minimum of 500 years, its financial assurance section is an exercise in generalities. The actual cost of water treatment, monitoring, maintenance, repair, and reclamation is completely unknowable.	FIN01, FIN05, FIN11
16670	The SDEIS says that PolyMet estimates initial closure costs of up to \$200 million, with post-closure monitoring and maintenance costs of up to \$6 million annually. The Grand Portage Band of Ojibway concluded that PolyMet's numbers are vastly below the actual amounts required. The Grand Portage Band calculates that the minimum amount that should be set aside for financial assurance at the outset, assuming a 3% return on the amount, is \$90-5 billion.	FIN05
<b>Sender Name (Submission ID)</b> Paul Stolen (54517)		
19189	The Final EIS should contain content that at least attempts to reassure both skeptics and projects proponents	NEPA15
19191	methodological defects in the SDEIS: Inconsistencies in clearly describing potential impacts should there be failure of controls. Many of the conclusions about potential impacts (or lack thereof) are based on esoteric models that conclude there will be no impact. The SDEIS authors seem to have then decided there is no need to describe what kind of impact is being avoided.	NEPA09
19192	methodological defects in the SDEIS: The SDEIS replaces proper impact analysis with a narrowed analysis geared to existing MPCA, COE, and DNR permit authorities and post-construction monitoring. It is proper and necessary to include detailed analysis of permit topics in the SDEIS. What is missing from this SDEIS, however, is adequate analysis of impacts not covered by permits.	NEPA05
19193	The use of ambient mercury/methyl mercury levels, fish mercury content, and fish consumption advisories as the main indicator of mercury impacts and mitigation of impacts rather than analyzing ecosystem/watershed factors potentially affected by the project.	MERC04
19195	SDEIS section on indirect impacts to wetlands narrows the wetland analysis to topics related to COE and DNR permitting authority over wetlands. This is spite of the overwhelming evidence that wetland disturbance can cause high mobilization of both new and legacy mercury into methyl mercury from wetlands. Some of the disturbance factors used in the wetland analysis are the very ones that can cause such mobilization, making the absence of an analysis of mercury methylation in the wetlands even more puzzling.	MERC09, MERC23
19196	There is a narrow focus on the influence of sulfate deposition on increases in methyl mercury mobilization rather than other factors such as water level and ecosystem effects. Such deposition can be controlled to some extent-within Minnesota that is-by MPCA permitting authority. This is another result of the narrow focus on permitting issues.	MERC08
19198	The SDEIS thus sets a poor example of how to address such a mine review. The narrow focus on permit topics hampers public access to key information in the review. Permit decisions are highly technical decisions based on models, deep technical knowledge, and so forth. The result is a public review document whose substantive content is nearly inaccessible.	NEPA07
19199	Reliance on post-construction monitoring to this degree has major problems.	PD01
19200	The Polymet SDEIS, with profound implications for its content, doesn't do an analysis of impacts for the 200+ time period. Instead, it says the project will be monitored and actions taken should impacts be detected. As mentioned, this method of "kicking the can down the road" greatly detracts from the proper EIS content, and may have legal problems.	PD01
19201	The very nature of the North Met project, and its location in a very wet and sensitive environment, necessitates description of potential impacts during at least the 200 year period. A monitoring approach might be more defensible in a dry environment, but it raises enormous red flags in a wet environment.	PD01

19202	The use of modelling for highly important aspects of the impact analysis-such as those that can influence whether a project permit is granted-needs to be thoroughly explained in the final SEIS.	PD03
19203	The SDEIS should not rely on complex models that remain opaque to the public. There are major adverse consequences to public trust when this is the case.	NEPA07
19204	Inclusion of clear descriptions of all potential impacts of a mine such as this, based on what has happened elsewhere. This need is based on the fact that controls could fail, and is necessary for transparency for the public. These discussions are needed even though conclusions may be reached that the impacts are unlikely to happen.	NEPA09
19205	Inclusion of a description of whether failures of project controls can be controlled, and at least a rough estimate of costs of control.	FIN05
19206	[Include] A clear discussion of the degradation of modelled outcomes as time passes.	NEPA06
19207	[Include] A clear discussion of model assumptions, including what happens to conclusions if important assumptions are changed.	NEPA06
19208	An explanation of the factors that would pertain that would result in a permit denial, given the further information requested for permitting decisions. This description is needed, given the very high level of public and political interest in this project, and the need to transparency.	NEPA06
19209	[Include details of the following in the SDEIS:] Toxicity of Mercury. Mercury-and methyl mercury-is a very dangerous and toxic material that has caused and is causing more and more concern among governments around the world, including in the United States. It's sub-lethal costs are more and more understood, and economic costs have been estimated in loss of life-long earnings from people because of lowered IQ. It also causes sub-lethal effects in fish and wildlife that can lead to population effects.	MERC03
19210	[Include details of the following in the SDEIS:] Status of research on mercury. Scientific understanding of the biochemical/chemical/ecosystem processes that lead to effects in people, fish and wildlife has progressed to the point where there are a number of methods available to analyze mercury impacts in a water-rich environment-methods beyond and better than mercury content in fish. Also, inadequate literature reviews of mercury issues as seen in the SDEIS has contributed to erroneous conclusions, as noted in the specific comment section of this review.	MERC03, MERC04
19211	[Include details of the following in the SDEIS:] Relationship of new deposition of mercury and "legacy" mercury.	MERC04, MERC17
19212	[Include details of the following in the SDEIS:] Watershed/ecosystem approaches. Mercury/methylation processes are a function of the watershedand ecosystem, and "hot spots" for mercury are common. Analysis of impacts of mercury must use this approach.	MERC10
19214	[Include details of the following in the SDEIS:] Role of fluctuating water levels in mobilizing/de-mobilizing legacy or new-deposited mercury.	MERC11
19217	[Include details of the following in the SDEIS:] "Impoundment effects" on mercury methylation.	MERC10
19220	[Include details of the following in the SDEIS:] Climate change...This is because of the established relationship of drying and wetting of organic soils and sediments, and increased temperature causing increased methylation.	MERC20
19221	[Include details of the following in the SDEIS:] Mercury/mercury methylation relationship with sulfate and sulfate deposition. Addressing the potential for increased impacts from mercury involves more than controlling air emissions of sulfates. This point is made here because the SDEIS puts too much emphasis on such a strategy.	MERC08

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Paul Stolen (54517)	
19223	[Include details of the following in the SDEIS:] Significant-but qualified-findings about advantages of reducing sulfate in emission and other controls...Research needs to be focused on watershed differences, and on developing other program actions to reduce output of methyl mercury from legacy deposition are very much needed.	MERC08
19225	[Include details of the following in the SDEIS:] Cultural impacts, environmental justice, and differential impacts to Native Americans. As noted in Appendix A, these are important impacts that need more thoughtful consideration in the SDEIS. In addition, the FEIS needs to provide a summary of these issues so that others besides Native Americans can fully understand why cultural and consumption issues are so significant.	CR01, CR05
19227	Relying on methyl mercury content in fish-and consumption advisories-is an inadequate tool for addressing mercury impacts.	MERC02
19230	Bioaccumulation factors complicate other mitigation measures. As noted especially in Reference 17, Appendix A, river restoration, dam removal, and wetland restoration can mobilize methyl mercury in some situations.	MERC03
19234	Summary of water resources impacts, Page 5-8, mercury discussion. This section relies entirely on forecasts regarding mercury increases from the project based on mass balance and analog models of the specific mining facilities. This summary does not adequately describe potential impacts, based on the multitude of issues regarding off-site disturbances to rivers, wetlands, and downstream water resources as described in Appendix A.	MERC08
19235	Mercury evaluation criteria, p. 5-20 and 5-21. This criterion is based on an erroneous interpretation of the scientific literature regarding the relationship between ambient mercury content in streams and methyl mercury in fish.	MERC02
19237	Mercury section in water quality section, p. 5-201 to top of 5-207. (5.2.2.3.4). This discussion seriously understates the scientific understanding of mercury, methyl mercury, and impacts to people and fish and wildlife	MERC02, MERC03
19247	Comments on Section on "enhanced mercury methylation," and "mercury summary", pages 207-210 (7 comments.) This section of the SDEIS erroneously describes up-to-date scientific findings, and indeed even ignores other parts of the SDEIS.	MERC04
19248	First paragraph after "enhanced mercury methylation" p. 207: As noted, modelling does not equate with analyzing impacts. In this section of the SDEIS, there are four citations to mercury studies-but they are 23, 22, 22, and 15 years old. Leaving out all the recent studies again calls into question the objectivity of those preparing the SDEIS.	MERC04
19249	Second paragraph [after "enhanced mercury methylation" p. 207]: This paragraph notes that there are 6 factors that "appear" to influence mercury methylation, and that the proposed action is expected to have little or no effect on "most of those things," but that two, sulfate concentrations and hydrologic conditions warrant further discussion. This paragraph is seriously deficient because all four of the other factors are applicable to this project, especially given the downstream and potential indirect wetland effects described in other parts of the SDEIS.	MERC02, MERC10
19250	Sulfate loadings, p. 5-207 to 5-209. The review of literature in the first paragraph in this section is not really wrong, but doesn't fully reflect the scientific literature, especially recent literature. The comprehensive approach in the 2012 book on mercury in the environment (Reference 1 in Appendix A) is much more appropriate.	MERC04
19251	Sulfate loadings, first full paragraph on p. 5-208. This paragraph contains an inadequate review of the scientific literature in reaching the conclusion that mercury methylation occurs primarily in wetlands rather than in stream channels, and that methyl mercury is flushed into streams during storm events.	MERC08

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Paul Stolen (54517)	
19252	Sulfate loadings, reference to MPCA (2006), p. 5-208. This MPCA document is quoted in Reference #42 in Appendix A of these comments. This MPCA document refers primarily to sulfate permitting issues rather than impact assessment, and is also outdated in enough respects to question its utility for this EIS.	EDIT01
19253	Hydrologic changes and water level fluctuations, p. 5-210. This paragraph is woefully inadequate with respect to the scientific literature regarding water level fluctuations-it only says such fluctuations " ... probably accounts for some of the elevated methyl mercury concentrations observed in wetlands during releases from high flow events." "Probably?" See the numerous studies throughout Appendix A regarding impoundment effects, experiments adding water to wetlands, high flow events, etc.	MERC09
19254	Mercury summary. This statement is entirely inadequate because it claims negligible hydrologic changes, and confines itself to sulfate loading issues.	MERC11
19255	North Met project design changes and fixed engineering controls. (p. 5-21- to 5-212.) The SDEIS is not adequate with respect to the ability of these measures to control mercury/methyl mercury impacts.	MERC15
19266	The SDEIS needs to include the following in order to be adequate: An adequate analysis and assessment of mercury/methyl mercury issues	MERC02, MERC04
19268	[The SDEIS needs to include the following in order to be adequate:] An assessment of the effectiveness of these measures in controlling mercury/methyl mercury-as well as assessing whether any of the measures will exacerbate mercury problems	MERC06, MERC15, MERC21
19269	[The SDEIS needs to include the following in order to be adequate:] An assessment of the adequacy of these measures over the 200+ project life, and the ability of the measures to respond to unusually large and sudden precipitation events such as have been recently seen in Minnesota and in the project area. This needs to include a forecast of whether the features will handle changes caused by climate change.	FIN05
19270	Storm water ponds and stormwater runoff on any of the site. (in engineering/design controls, p.5-212, etc.) According to a number of studies, stormwater ponds are sources of methylation, especially if they use organic soils. They usually have such soils, because they enhance vegetation growth that that helps trap nutrients. There is therefore a conflict between the need to reduce methylation, and contain nutrients. This needs to be resolved in the SDEIS.	MERC20
19273	Since the SDEIS is deficient in providing an impact analysis of up-to-date research on mercury transport and methylation, including indirect effects of this project, these plans and designs need to be thoroughly looked at after this analysis is completed to determine whether they are adequate with respect to mercury impacts and prevention thereof.	MERC04, MERC10
19274	Page 5-223 says that" .... the proposed North Met Project Proposed Action would result in direct and indirect impacts to wetlands along the Transportation and Utility Corridor, at the Plant Site, and around the mine site (Area 1) and north of the plant site (Area 2.)" (my emphasis added.) The wetland section later goes on to describe potential impacts to wetland hydrology, and to drawdown of wetlands . Clearly, such effects can cause mobilization of methyl mercury . This conflicts with other sections of the SDEIS	MERC09
19278	it is not acceptable to state that hydrologic and elevation effects on wetlands will be monitored after project construction, or that actions such as post-construction wetland mitigation should impacts become evident. (As is done on p. 5-273 which refers to the 404 wetlands permit.)	COE02
19279	there is an existing "tried and true" method of determining functional wetland damage and thus proper mitigation under 404 permit regulations and practices, and this is not the case with increased mercury impacts	COE01

<b>Sender Name (Submission ID)</b>	Paul Stolen (54517)	
19280	a finding of risk of export of new and legacy mercury from the large acreage (according to the SDEIS) of indirect wetland impacts may enter into the decision as to whether to permit the project at all and so needs a pre-project analysis.	COE02
19281	Indirect effects to wetlands in general. It is unclear as to whether this analysis took into account climate change in the 200+ year project life.	WET07
19284	Wetland re-establishment during reclamation period. Page 5-224 says that 102 acres of wetland will be re-established during reclamation, and that this is not part of the mitigation credits for direct impacts. According to many references in Appendix A, this part of the proposed plan is a red flag regarding a potential site for increased mercury methylation. Perhaps I am missing such a reference; however, the potential for methylation of mercury stored in this material needs to be assessed in the SDEIS, as well as any outlet for such a wetland.	MERC09, MERC20
19287	Pages 5-224 through 5-229 talk about the methods for determining indirect effects on wetlands. Six potential causes of indirect effects are discussed. Any of these could be causes for increased methylation of mercury that could lead to impacts downstream or to fish and wildlife species that are found in these wetlands. Especially significant are the hydrologic effects. However, water quality changes could also have an effect, should they increase methylation. The SDEIS needs to analyze the impacts of these causes of indirect effects with respect to potential for increasing mercury methylation, transport, and impacts to fish and wildlife.	MERC08
19288	Indirect effects on wetlands abutting Partridge River and four creeks. Page 5-228 refers to these 5 waterbodies. Page 5-273, however, says there will be no such indirect effects on the Partridge River because of augmented flows from the project will be within average flow (and stage) without the project. Page 5-299 refers to the other creeks, but reaches the same conclusion. The SDEIS needs to clarify if these conclusions are based on potential added drying out of adjacent wetlands and rewetting- since using averages can mask such events.	WET12
19290	Results of the analysis of effects to wetlands, Pp. 5-233 through 5-310. This extensive section of the SDEIS projects different likelihoods of both direct and indirect impacts to wetlands and lists six potential causes of indirect effects. . .The analysis does not mention mercury methylation effects even though all six causes of indirect effects could lead to increases in methylation and export from at least some of the wetlands to downstream waters. This could cause fish and wildlife impacts, and increase mercury levels in fish. Estimates are made as to acreages affected with low to high risk, two different methods of estimating impacts are used, and types of wetlands impacted are included.	AQ12
19295	Subsequent pages in the SDEIS go into permitting authorities responsibilities and jurisdictions with respect to direct and indirect impacts to wetlands. This discussion needs to be expanded to include authority regarding permit decisions and mitigation regarding mercury-both new deposition and outputs from legacy mercury in these wetlands. Note that there is an implication that there is some clarification of EPA authority regarding mercury.	PER11
19296	Sulfate deposition from dust. P. 5-302 indicates that 194 acres of wetlands will potentially be impacted by dust deposition that includes sulfates. The SDEIS needs to address whether this will result in increased mercury methylation, and what will be done to control such affects, should they occur.	WET11
19297	Wetland description in Volume I, wetlands description. This section begins on p. 4-135. This section needs to include an assessment of the sensitivity of these wetlands to mercury methylation and export, including newly deposited mercury and legacy mercury. This would include clear statements as to outlets of these wetland, there susceptibility to "bounce", and descriptions as to whether they are currently disturbed.	MERC09
19298	Cumulative effects downstream with respect to mercury. Pp. 6-18 and 6-29 appears to tie its conclusions regarding mercury to changes in sulfate loading. If so, this conclusion is not supported, since based on current science, there are other significant landscape factors-and potentially changes caused by the project-that increase mercury levels. The statement on p. 6-33, the conclusions summary regarding mercury, needs to be redone based on the additional analysis recommended in these comments.	MERC10

19300	Other references to mercury in cumulative impact assessment. Pages 6-59 and 6-63 and 6-64 discuss mercury effects, including on fish. These statements are deeply flawed, in that they limit the discussion to sulfate deposition. In addition, p. 6-63 erroneously states that increased sulfate deposition causes a directly proportional increase in mercury in fish.	AQ28
<b>Sender Name (Submission ID)</b>	Paul T Mullen (57267)	
17409	There will be safer extraction methods in time if we still need these minerals.	PD32
<b>Sender Name (Submission ID)</b>	Paul Tine and Sherry Phillips (42883)	
6844	The water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions.	WR065
6845	Revise the NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment comply with Minnesota Rules requiring that mines be "maintenance free" at closure.	WR036
6846	Include a cumulative impacts analysis that examines the impact on moose, recognizes the changed status of the moose as a species of "Special Concern," and requires NorthMet to mitigate the habitat loss for the moose caused by the NorthMet project.	WI01, WI02
6850	Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-6). The mine plan does not meet this test	VEG04, WR024, WR083, WR109, WR158, WR162
6853	Conduct a health impact assessment for the NorthMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health.	HU01
6855	Require that the NorthMet SDEIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet.	PER02
6857	the review period for this document is inadequate...The SDEIS was released during the holidays when many people were on the road and commenting on this was not easily done. The public meetings were scheduled right away before most people really had time to look at this document and understand all the ramifications of what is being proposed.	NEPA07
17522	Considering the intention of the Weeks Act to protect watersheds, the exchange of this large, single 6,650 acre parcel of forests, floodplains and wetlands with high biodiversity for smaller, scattered parcels of non-federal lands should not be considered an equal exchange.	LAN02
17523	Acquiring lands in exchange to protect watersheds - such as the Hay Lake area - are important. But 6,000 plus acres in the Partridge River drainage- with functioning wetlands - should not be a candidate for exchange out of public ownership.	LAN01
17525	How can an equal exchange of lands be made without being able to compare the actual health of the systems being proposed for exchange?	LAN03
17526	Studies should be done of the water quality in areas proposed to substitute for the exchange lands in the Partridge River watershed.	WR199
17528	While smaller areas of high to moderate biodiversity may be gained, they do not compare to the intact, large area in question.	VEG02

<b>Sender Name (Submission ID)</b>	Paul Tine and Sherry Phillips (42883)	
17529	Rankings should be provided for the lands proposed for exchange.	LAN03
17530	All appraisal information for the proposed land exchange should be disclosed.	LAN03
17531	The NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures.	WET04
17532	Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting.	WET20
17533	Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be.	WET07
17534	Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage.	FIN05, FIN08, FIN11
17535	Redo the GoldSim water model using assumptions based on adequate and accurate field data.	WR052, WR165, WR189
17536	Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013.	WR004
17537	Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance because of the issues with the model assumptions.	FIN05
17538	Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity.	WR065
17539	The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule [Minnesota Rule 6132.3200].	WR037
17540	Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS.	WR036
17541	Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment.	WR036
17542	Revise the SDEIS to address Minnesota Rules 6132.3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free."	PER04, WR036
17543	Despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS...The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Appendix C, Attachment 3, pp 45-46).	CR01, CR03
17544	The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. The SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142).	WR107

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Paul Tine and Sherry Phillips (42883)		
17545	The SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters.	WR154
17546	The NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal.	HU01
17547	NorthMet’s plan does not study any risks to on-site workers and does not include a Health Risk Assessment of the effects of mercury, manganese, lead, arsenic, and other pollutants on people living downstream.	HU02, HU04
17548	The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the NorthMet mine and plant site. A health impact assessment (HIA) to fully analyze the public health implications of NorthMet’s proposed mine should be done.	HU01
17549	The NorthMet project could affect human health in many ways. Some of these effects are direct – for example, exposure to air and water pollutants like mercury, asbestos-like fibers, manganese, and arsenic. Others are indirect, such as the impact on local communities from traffic accidents and strains on local health and social service infrastructure.	HU03
17550	Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the NorthMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length	HU01
17551	Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure.	AIR03
17552	The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site.	FIN01, FIN02
17553	The NorthMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs.	FIN01, FIN02
17554	Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate.	FIN01, FIN02
17555	Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine.	PER02
<b>Sender Name (Submission ID)</b> Paul Underland (18165)		
3879	The amount of groundwater flow that has been added to the Partridge River this was originally measured at .5 cubic feet per second. New data now shows that (inaudible) between 1.3 and 1.6 cubic feet per second....this new data is not likely to change the assessment of the project relative to the project's ability to meet water-quality standards.	WR003
3881	The models were actually designed to determine the impacts to water quality at key reference points in the watershed, not the length of water treatment...and [the SDEIS] shows that even 500 years from now water-quality standards will be met.	PD28, WR190

<b>Sender Name (Submission ID)</b> Pete Stauber (18111)		
3358	I'm tired of hearing the untruths from the anti-mining crowd that the water treatment will be required for 100 years and cost billions of dollars. From what I read in the SDEIS that is a gross exaggeration. On pages three and four of the SDEIS it states, "It is uncertain how long...It does not say, "treatment will be required for 500 years." It says "treatment will be determined using measured results." Which is the way the law is designed to responsibly handle it. Isn't that logical?	PD28, WR190
3359	The SDEIS shows that PolyMet built and operated a piling reverse osmosis water treatment plan to show that it can successfully treat the kind of water it will have on the project. The plan worked. It's proven technology that's been used in lots of other municipalities and industrial applications.	PD28
13475	PolyMet has been working with regulators for nearly 10 years to ensure compliance. Any holes that were discovered during the EIS have been addressed in the SDEIS. The SDEIS is a clear reflection of PolyMet's and the agency's work to develop a successful copper-nickel mine bringing an important investment to St. Louis County.	NEPA16
<b>Sender Name (Submission ID)</b> Pete Wohlers (15001)		
356	If that [permitting] process is followed and a business provides all necessary information the permits should be approved. Polymet has gone above and beyond what they should have to.	PER34
<b>Sender Name (Submission ID)</b> Peter Berridge (40615)		
6253	Bottom line, regardless of the specifics above, this type of mining is unsafe, detrimental to our ecology - which we value highly in Minnesota - and is not worth the small number of jobs that are produced for such a limited period of time.	SO01
<b>Sender Name (Submission ID)</b> peter bormuth (43002)		
11415	Water that has contacted surfaces disturbed by mining operations (including the stockpiles) as well as seepage from the Tailings Basin would be captured in containment systems and treated at wastewater treatment facilities located at the Mine and Plant sites by treatment methods that have never previously been used on mining wastewater, nor is there demonstrable evidence that they will be effective.	WR128, WR143
11423	This proposed mine also fails to meet the standards set by Minnesota Rules 6132.2200 (Reactive Mine Waste) which states as policy that: "reactive mine waste shall be mined, disposed of, and reclaimed to prevent the release of substances that result in the adverse impacts on natural resources." The rules further specify that the permit applications mining and reclamation maps must show "detailed drainage patterns for waters that may contact reactive mine wastes." (Minn. Rules 6132.100, subpt 7(C)). Since the filed maps show Lake Superior is part of the drainage basin for this proposed mine, this permit must be denied.	PER35
11427	the Swiss Company Glencore has a significant financial stake in PolyMet and the proposed NorthMet mine...Glencore has been implicated in environmental disasters, labor violations, and human rights abuses around the globe	SO02
15278	Because this proposed mine (and other future sulfide mines) threaten Lake Superior, approval of this mine would violate the International Boundary Waters Treaty of 1909, the Great Lakes Charter of 1985, the Great Lakes Charter Annex of 2001, and the most recent regional water agreement, the Great Lakes Compact of 2005 which holds "As trustees of the Basin's natural resources, the Great Lakes States and Provinces have a shared duty to protect, conserve, and manage the renewable but finite Waters of the Basin for the use, benefit and enjoyment of all their citizens, including generations yet to come."	PER27

15279	The Public Trust Doctrine embodies the time honored concept that the State holds all navigable waters in trust for the public...The Minnesota Supreme Court has recognized the public trust doctrine in all navigable waters, including Lake Superior. The Minnesota Court has also declared that “[a] riparian owner’s rights are qualified, restricted, and subordinate to the paramount rights of the public,” which include such uses as “commercial navigation, the drawing of water for various private and public purposes, recreational activity, and similar water-connected uses.” (see <i>Nelson v. DeLong</i> , 7 N.W.2d 342, 346 (Minn. 1942)).	PER35
15280	...the tailings and waste rock from this proposed mine will produce acidic discharge and metal-laden leachate that will irreparably damage the St. Louis River and turn Lake Superior into a large polluted tailings pond.	WR001, WR111
15281	16 communities draw their drinking water directly from Lake Superior...The drinking water of all these communities is threatened by this project. Minnesota has enacted a citizen suit provision that grants the right of a person to bring a lawsuit to protect the air, water and natural resources from pollution or impairment (see MINN. STAT. § 116.B.03 (1971) and this statutory provision will be used to stop this proposed mine.	PER04
15282	This proposed mine also fails to meet the standards set by Minnesota Rules 6132.2200 (Reactive Mine Waste) which states as policy that: “reactive mine waste shall be mined, disposed of, and reclaimed to prevent the release of substances that result in the adverse impacts on natural resources.” The rules further specify that the permit applications mining and reclamation maps must show “detailed drainage patterns for waters that may contact reactive mine wastes.” (Minn. Rules 6132.100, subpt 7(C)). Since the filed maps show Lake Superior is part of the drainage basin for this proposed mine, this permit must be denied.	PER04, WR060, WR071, WR081, WR111
15283	A basic tenet of the Minnesota Environmental Protection Act is to prohibit any governmental action, approval or permit of an activity that may cause significant harm to any part of the environment where there is a feasible or prudent alternative available. (see Minn. Stat. § 116.04(d), subd 6). Since there has never been a sulfide mine anywhere in the world that has not produced acid mine drainage and heavy metal contamination, a prudent alternative is not to allow mining in any drainage that flows into Lake Superior.	PER35
15284	The mine pit will overflow. The tailings basin will leak into surface water. The waste piles will leach into wetlands. This proposed mine will release fugitive dust, leachate, heavy metals, sulfide compounds, and unrecovered processing chemicals and other substances that irreparably harm wild rice, fish, and other natural resources and by statute this permit must be denied.	AQ05, WR151, WR156
15285	Minn. Rules 6132.3200 states that after closure a mine must be “maintenance free”. ... But every other sulfide mine has been an ongoing source of pollution when it is closed.... [The flooded pit] will most certainly overflow into the Partridge River releasing contaminants into the St. Louis watershed and Lake Superior. Every year the U.S. Environmental Protection Agency tracks pollution releases in the United States. The Mining Industry has always been the largest source of pollution in the country since they started reporting discharges in 1998, releasing 41% of all polluted discharges	PER04, WR023, WR037
<b>Sender Name (Submission ID)</b> Peter Branca (54165)		
16065	this company has no financial backbone to mine safe or for cleanup cost.	FIN01
18422	how can they meet the cost of a consequence, a negative consequence or pending lawsuits? Since this is a very risky and expensive operation and has inherent dangers over the years, I feel very uncomfortable having a company come in to -- since I am a stockholder in the State of Minnesota -- come into my state, with little or no financial reserves to back them up.	FIN01

18788	siting a sulfide operation amidst well-established public recreation areas crosses the threshold from poor public policy to profligate and ill-considered mismanagement of public resources.	LU06
18795	Any form of sulfide mining in highly aquatic and sensitive areas is a recipe for degradation, and likely, severe degradation.	WR107, WR108
18798	PolyMet's proposed North Met Project, siting a gigantic open-pit copper mine at the door of Minnesota's wilderness, its environmental impacts, and unintended, indeed, unknowable environmental consequences, represents a savage reversal of Minnesota's long-standing recreational strategy, will prove to be an unconscionable waste of public monies and rises to a violation of Minnesotan's basic trust in public leadership.	LU06
18801	Indeed, why have a, "Department of Natural Resources" at all, if natural resources are judged but merely "equal" to pursuits like manufacturing or resource extraction?	PER42
18802	There are several areas in the current SDEIS that surpass the level of "acceptable risk" to the State's Public Trust regarding our lands and water.	NEPA15
18805	First, as you and MDNR staff are well aware, the biggest potential negative impact of sulfide-type mining is the risk of massive water pollution, brought on by exposure to oxygen of the underlying rock ... because of these risks that open pit copper mines are typically sited AWAY from dense water environments, not WITHIN them.	WR001, WR023
18812	The modeling conducted by your agency significantly underestimated stream flows in the Partridge River, thus leading to a severe underestimate in potential downstream damage from sulfide pollution.	WR003
18814	The bentonite soil curtain that is supposed to keep contaminated water from leaching and seeping beyond containment zones has not been adequately field tested in Minnesota's harsh northern climate, nor independently verified for integrity under analogous conditions.	WR057
18815	The likelihood of extreme storm events rupturing, overtopping and otherwise defeating NorthMet's containment strategy are dangerously high given the increased frequency of 500-year storms in the age of climate instability.	PD22
18819	A single accident involving such a large resource extraction site would likely result in tens of millions of dollars of clean up, and millions of dollars in forfeited revenue from tourism and job losses.	SO02
18820	I dispute such job estimates as wildly inflated, as they always are, and in this case, dramatic overestimate -- even leaving aside how many of the positions are sourced internal to PolyMet, with minimum benefit to the local economy.	SO01
18829	it does bring up a second unacceptable aspect to PolyMet's proposal: the independent bonding requirement, or so called "financial assurances" required by the State of Minnesota. ... The ultimate and most important question is this: Will PolyMet itself ever have to use the profits they make at the North Met Facility to pay for the environmental degradation they cause?	FIN01, FIN08
18831	Due to this SDEIS's lack of investigation and discussion about the likelihood of widespread pollution, the State will require minimal financial assurance from PolyMet, leaving the citizens of Minnesota to essentially pay the balance between PolyMet's profits and the costs of its pollution.	FIN01, FIN10
<b>Sender Name (Submission ID)</b>	Peter Krause (11584)	
2243	500 years!!! even if it's 200 yrs future generations will not be happy to be paying for nor working to clean up the mess that is most likely to be left behind. With the only social constant to be change they may very well not be able to maintain the clean up program nor systems.	FIN01, FIN10

2243 500 years!!! even if it's 200 yrs future generations will not be happy to be paying for nor working to clean up the mess that is most likely to be left behind. With the only social constant to be change they may very well not be able to maintain the clean up program nor systems.    FIN05, FIN10

2874 500 years. Even if it's only 200 years, future generations are not going to be pleased to be committed to cleaning up this mess.    PD01

3249 It's the Boundary Waters and the Great Northwoods, not a poker chip to lose.    WILD02

3249 It's the Boundary Waters and the Great Northwoods, not a poker chip to lose.    WILD02

14723 This is a great risk and the Boundary Waters we are gambling with. We are playing with high stakes for short-term gain. I strongly encourage rejection of this plan.    SO01

**Sender Name (Submission ID)**    Peter L. Gove (9618)

228 I noticed on the Figure I map, there is a category for "national park" and a portion of Voyageurs National Park is noted on that map. However, Isle Royale National Park is not on the Lake Superior map and while several of the Apostle Islands are on this map, the Apostle Islands National Lakeshore is not noted. While the Grand Portage reservation is on the map, Grand Portage National Historic Site is not. I also question why the several state parks located on Lake Superior are not on this map....given the potential impact to Lake Superior from surface and groundwater sulfide pollution from this project, I suggest these designated federal and state protected areas be included    WILD01

**Sender Name (Submission ID)**    Peter M Leschak (42785)

6795 However, should the project be permitted, I believe some modifications should be implemented. The West Pit backfill appears to have been rejected on the basis of future exploitation of mineral rights, that is, for the sake of law and politics, as opposed to environmental concerns. Properly backfilling the pit with waste rock would be a good means of mitigating potential ecosystem damage- as is planned for the other pit....Regarding the 1585 acres of wetlands that would be destroyed or severely compromised, and given the overall loss of Minnesota's wetlands over the past century due to various types of human activity, a project of this nature should be required to replace such acres at a 2 to 1 ration; in other words, PolyMet should be mandated to replace 3170 acres. If such is impractical in the local region, there are many other locales in the state where wetlands creation and /or rehabilitation would be welcome and beneficial....Unless I missed it, I see nothing about contingency plans for a rail accident ... Over the course of 20 years, a railroad mishap is almost inevitable- for example, over the years there have been several such local episodes involving the rail transport of taconite. Is there a mitigation plan for that?    HAZ06, WET04, WI10

6799 Everyone admits the hazards implicit in mining and processing sulfide-bearing ore- that's why there's a 2000-page report. No one denies that such mines have caused severe, and essentially permanent, damage in places like Butte, Montana, Sudbury, Ontario, locations in Arizona, and all around the globe. There is no assurance the result will be different in NE Minnesota, and yet for a 20-year mine employing 360 people ( an almost ephemeral project compared with the area's iron mines), its proposed that complicated and expensive monitoring and treatment processes must be in place and functioning for 200 to 500 years. Given the typical vagaries and unpredictability of politics, technology and human nature, it is highly unlikely that such a regime will be, or even can be, maintained. (For example, a hundred years ago the MNDNR didn't exist. Will it exist 200 years from now?)...most of the profits (benefits) of which will almost certainly leave the borders of Minnesota.    FIN01

<b>Sender Name (Submission ID)</b> Peter M Leschak (42785)		
6802	the proposed Pebble Mine in the Bristol Bay region of Alaska has meant stiff opposition. An Alaska Congressman is opposing the project on the grounds that the health of a renewable resource (in that case, a salmon fishery) should trump the one-time extraction of dangerous sulfide ore. That should also pertain here in NE Minnesota: water, wetlands, and wild rice resources are more important, long term, than a temporary and destructive mining operation...Concerning the potential effects on water quality, on of the fact sheets that I picked up at the Aurora meeting[,] states that sulfate, copper, nickel, and mercury could be released. Based upon my experience in the fields of water treatment and natural resources, that should read will be released. Computer modeling was employed to determine a “90 percent probability” that no pollutants would cause an exceedance of the water quality criteria. Given the inherent assumptions that must be made in any modeling program, that seems highly overly optimistic. Furthermore, it’s noted that “PolyMet would monitor water quality during operations, reclamation, and closure at water discharge points and downstream.” ... It’s seems inadvisable to depend on the company to perform such a critical function, especially when it is potentially hurtful to their bottom line.	PD24, SO01, WR115, WR139, WR141, WR192
6807	The final product from the plant is presumably copper concentrate, mixed nickel/copper hydroxide, and PGE precipitate, in amounts of tens of thousands of tons per year. If I’m not mistaken, this is all reactive and hazardous material, and apparently will be transported from the region via railroad. T?	HAZ06
<b>Sender Name (Submission ID)</b> Peter Mattson (38610)		
14065	Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk.	WI13, WR115
<b>Sender Name (Submission ID)</b> Peter Mitchell (54814)		
18347	I am writing in opposition to copper-nickel mining proposed for the arrowhead region of northern Minnesota. The region, so beautiful, must be preserved for future generations free of harm by pollution that ALWAYS accompanies mining.	LU04
<b>Sender Name (Submission ID)</b> Peter Molenda (44668)		
6944	creating a limited number of local jobs for a limited period of time, is not nearly enough to counterbalance the long term negative environmental impact such mining would have on that area.	SO01
6945	such mining would probably have a detrimental effect on the tourist trade that Northern Minnesota relies upon to help keep the area economically viable for those who currently live there.	SO02
<b>Sender Name (Submission ID)</b> Peter Murphy (42475)		
7070	It would [be] extremely reckless to allow a mine such as this to threaten the pristine environment of the North Shore.	WR195
7073	There won't even be that many jobs in automated operations like this.	SO02
<b>Sender Name (Submission ID)</b> Peter Oja (38356)

<b>Sender Name (Submission ID)</b> pharmbw tds.net (46569)		
9134	I believe there is no way that PolyMet can mine for 25-35 years and then guarantee there will be funds available to cleanup any pollution spill up to 500 years in the future.	FIN01
<b>Sender Name (Submission ID)</b> Phil Bergh (42706)		
8593	I never heard of a company cleaning up after themselves for 500 years. Has any company in the world ever lasted that long? This sounds like a bad deal. It'll be the taxpayer who will have this albatross wrapped around their necks.	FIN01
18804	PolyMet says it has a "reverse osmosis" that will solve all our problems. They aren't saying what it is or how it works nor does the media ask these key questions.	WR143
18807	[PolyMet] will get in, make their billions, and then get out or go defunct. Why should they be responsible? I've never heard of other Superfund sites taking such a long time to clean up. It'll be on the backs of the taxpayers.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Phil Hogan (45263)		
9106	what happens to the pollutant contained in the final concentrate stream in which the total amount of pollutant has been concentrated but not reduced, . How is the concentrate stream processed? In what form will it be? How much will there be?	WR143, WR145
<b>Sender Name (Submission ID)</b> Phil Larson (42998)		
9238	Purpose and Need: ...35% of apparent [copper] demand is met by imports...In the case of nickel...there is no domestic mine supply and our net import reliance is 49%. In the case of platinum and palladium, our net import reliance is 91% and 54%, respectively.	NEPA01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Phil Larson (42998)	
9239	Purpose and Need: As a matter of policy, the US government has promoted development of renewable energy technologies to promote energy security and reduce greenhouse gas emissions. As a general rule, renewable energy technologies are more intensive in their use of metals such as copper and nickel.	NEPA01
9241	Copper prices in 2012 were just under \$8000 per metric tonne, giving the apparent 600,000 metric tonnes of net copper imports a value of around \$4.8 billion. This accounted for little more than half a percent of the \$735.3 billion trade deficit.	NEPA01
9242	...the NorthMet project is projected to produce 72 million pounds of copper, 15 million pounds of nickel, and 106,000 ounces of palladium, platinum, and gold per year... NorthMet will therefore meet only 5.5%, 6.2%, and 1.5% of our net import reliance on copper, nickel, and platinum group elements, respectively. The modest influence the NorthMet project will have on our import reliance for these critical minerals speaks ... to magnitude of our dependence...Even the relatively small increment of production NorthMet entails will measurably improve our trade deficit, increase economic activity, increase our diplomatic influence, and improve our national security.	NEPA01
9245	Geology of the Mine Site: The observation is made that “the surficial till is a heterogeneous and laterally discontinuous zone with a composition ranging from very dense clay to well-sorted sand.” This statement seems to use the term ‘heterogeneous’ to refer to the poor sorting and wide particle size range of what is likely a relatively homogeneous till. The lateral discontinuity in the till referred to in this case is likely its thickness, not its sedimentological heterogeneity. Here, and elsewhere in the document, well-defined, consistent, and judicious application of the terms ‘heterogeneous’ and ‘homogeneous’ when describing tills is advised.	EDIT01
9259	The analysis of greenhouse gas emissions for the NorthMet project apparently fails to consider the net positive effect on global greenhouse gas emissions reduction in import reliance for copper and nickel will produce.	AIR01
9271	Groundwater drawdown adjacent to the Canisteo Mine is cited as a predictive analog to groundwater drawdown adjacent to the Mine Site. This analog approach is likely to significantly overestimate the extent of pit drawdown [because of] the thicker drift and higher hydraulic conductivity bedrock at the Canisteo Mine site relative to the NorthMet Mine Site...A better analog ...may be drawdown associated with the Soudan Mine in Soudan Underground Mine State Park [which is] overlain by till similar in thickness and composition to that found at the NorthMet Mine Site.	WR023, WR119
9272	Reference is made on page 4-328 to the potential unreliability of employment and wage data reported by the U.S. Census Bureau data for 2009. It needs to be emphasized how anomalous mining employment in St. Louis County was during this year; the Minnesota iron mining industry produced the lowest amount of iron ore in 2009 since 1937...updating with more recent Census data is advisable.	SO04
9276	It is important to note that the Powers study was commissioned by two advocacy groups – Minnesota Center for Environmental Advocacy and the Sierra Club – with the specific intention of making an economic case against further mining development in Minnesota	SO04
13902	However, there is also an aspect of the need of the project...PolyMet is projected to produce -- just doing the calculations on my calculator, so correct me if I'm wrong; but they are projected to produce about 72 million pounds of copper a year. The number of people who have come into our country in the last 10 years, more than -- will more than consume the additional production that PolyMet will bring to the market.	NEPA05

15243 GlossaryThe glossary contains a number terms whose definition is inconsistent with standard usage. These include:Drift: Material such as sand, clay, gravel, and rocks transported and deposited by a glacier or glacial process.Glacial deposit: A collection of various-sized rocks and debris that is deposited by a glacier as it advances or recedes across a landscape. There are many types of deposits, including till, drift, erratics, and moraines. (Note: sediment deposits of glacial origin are termed ‘drift’, less commonly ‘glacial drift’. Erratics refers to individual clasts, while ‘moraines’ refer to a landform, not a sediment type.)Glacial till: Direct glacial deposits of rocks, gravel, or boulders that are unsorted and unstratified. (Note: all till is by definition glacial in origin; there is no need to include the modifier ‘glacial’.)Surficial glacial deposit: A collection of various sized rocks and debris deposited by glacial activity that is left on the earth’s surface after the glacier recedes. (Note: ‘surficial glacial deposit’ is not used in the text of the SDEIS.)Till: see Glacial tillThese definitions should be revised to conform to accepted usage. The following definitions are taken from the Glossary of Geology (5th Edition) :Drift A general term applied to all rock material (clay, silt, sand, gravel, boulders) transported by a glacier and deposited directly by or from the ice, or by running water emanating from a glacier. Drift includes unstratified material (till) that forms moraines, and stratified deposits that form outwash plains, eskers, kames, varves, fluvioglacial sediments, etc.Outwash Stratified detritus (chiefly sand and gravel) removed or "washed out" from a glacier by meltwater streams and deposited in front of or beyond the end moraine or the margin of an active glacier. The coarser material usually is deposited nearer to the ice.Till Dominantly unsorted and unstratified drift, generally unconsolidated, deposited directly by and underneath a glacier without subsequent reworking by meltwater, and consisting of a heterogeneous mixture of clay, silt, sand, gravel, and boulders ranging widely in size and shape. In addition to adapting these definitions, I recommend that the definition of ‘surficial aquifer’ be modified to indicate that the aquifer is hosted by unconsolidated sediment, including drift.

15244 Notes on NomenclatureThe text of the SDEIS contains a number of inconsistent usages of terminology:•The text mentions ‘glacial till’ 33 times, and ‘till’ alone 29 times. ‘Till’ should be used in all cases.•The text mentions ‘glacial drift’ 6 times, and ‘drift’ alone 7 times. ‘Drift’ should be used in all these cases.•The glossary does not define ‘outwash’. The text mentions ‘glacial outwash’ 5 times, and ‘outwash alone 3 times. ‘Outwash’ should be used in all these cases.•The text uses the term ‘surficial deposits’ 25 times, although the term is not defined in the glossary. The usage suggests that this refers to all unconsolidated sediments lying above bedrock, including drift (till and outwash), peat, and other sediment.In a number of cases, usage of the term ‘till’ is confused or inconsistent:•Page 4-95 – “several soil borings into the surficial till identified the composition as layers of clay and sand, plus cobbles and boulders”. In this case ‘till’ is the sediment type, and by definition contains particle sizes ranging from clay to boulders.•Page 4-151 – “The depth of soil and till overlying the bedrock”.•Page 4-367 – “areas of glacial till (typically silty sand)”. Either the sediment is till, or silty sand. By definition it cannot be both.•Page 4-376 - “native till material that ranges from clay to gravel”. In this case ‘till’ is the sediment type and by definition contains particle sizes ranging from clay to gravel.In several instances, the term ‘till soil’ is used. Till is a sediment type. A soil may develop at the surface of a till deposit, however the entire thickness of the till is not soil. ‘Till’ alone suffices in these instances.In a number of other cases, convoluted sediment descriptions are given, when it is likely the sediment is simply till. In these cases, the non-specific and complex description gives the impression of extreme heterogeneity in sediment deposits, rather than a relatively homogeneous till deposit. For example:•Page 4-45 – “The overlying surficial sediments at the Mine Site are poorly sorted and range from very dense clay to well-sorted sand with boulders and cobbles”. This sediment is highly likely to be simply till.The term ‘overburden’ as defined in the glossary appears to be inconsistently applied. Although it is defined as all unconsolidated sediment and waste rock overlying the mineral deposit, in most places it appears to refer to only the unconsolidated material overlying bedrock. For example:•Page 3-15 – “overburden and waste rock”•Page 3-17 – “overburden and waste rock”•Page 3-37 – “use of waste rock, overburden, and peat”In other cases, ‘overburden’ clearly refers to only the unconsolidated sediment overlying bedrock. For example:•Page 3-44 – “Three types of overburden are present at the site: unsaturated overburden, saturated overburden, and peat.”The term ‘soil’ is not defined in the glossary. In most cases, the term is used in a manner referring to unconsolidated materials at the surface, containing organic matter, and capable of supporting life. In other cases, it appears to be used in a geotechnical sense, referring to unconsolidated sediment overlying bedrock, equivalent to usage of the term ‘overburden’. In these cases, the term appears to be applied to the entire thickness of drift or till overlying bedrock, similar to usage of ‘surficial deposits’ noted above. For example, •Page 4-149 – “lateral flow that is either on the surface or within the subsurface soil.” Soil used in this sense refers to either drift or the surficial aquifer.•Page 5-201 – “mercury stored in rock, soil, peat, and vegetation.” Soil used in this sense refers to drift.•Page 5-227 – “The Mine Site contains localized heterogeneous vertical and horizontal hydraulic conductivities within each soil unit.” Soil used in this sense refers to drift.A clear distinction need to be made between soil referring to the shallow surface layer containing or

EDIT01

15260 Note on usage of Unified Soils Classification System (ASTM D 2487-83)The USCS was used to describe unconsolidated sediments recovered from boreholes drilled in support of the NorthMet Project. It is important to note that this system is designed to best describe and name relatively well-sorted unconsolidated sediments with a unimodal particle size distribution. As such, poorly sorted sediments with potentially multimodal particle size distributions (e.g. till) are not well-described using this classification. Relatively minor changes in the relative proportions of clay-silt-sand-pebble-boulder may lead to application of multiple group symbols and the perception of significant heterogeneity within what is in actuality a relatively homogeneous till sequence. In cases where USGS group symbols and nomenclature are utilized in the SDEIS and supporting documents, it is advisable that sediment identified as till be explicitly name as such, e.g. GC (till).

EDIT01

15268 ...extensive drilling by Duluth Metals and its joint venture Twin Metals Minnesota of the Maturi Deposit in the SKI has demonstrated ...no evidence of the extensive faulting and fracturing ...[therefore] Groundwater flow within faulted and fractured bedrock is likely to be minimal at the NorthMet Project Mine and Plant sites.

9282	I would like to propose that a decision like this (permit or not) should be made by the majority in a voting procedure. In addition to this we need to make sure that the voters are informed about pros and cons of the issue.	PER01
11580	My concern is that all this is just based on modelling software and does not state any real world experiences! Who ran those models and how reliable are they?	WR189
11582	How is Polymet held responsible to the long term water treatment?	FIN01
11585	Is it not true that Polymet has formed recently and actually has not earned any money yet and is likely to file bankruptcy after the proposed mine site closes (no more income)?	FIN01
<b>Sender Name (Submission ID)</b> Phillip A Lermon (7447)		
772	This proposal is not economically feasible when the future costs are added to the picture.	SO07
<b>Sender Name (Submission ID)</b> Pho Lay Thao (54207)		
17643	Mining near it will be bad because the water will be contaminated with acid and will kill all the animals there.	WR113
<b>Sender Name (Submission ID)</b> Phyllis Annoni (54707)		
17756	It is discouraging to find that governmental agencies which: we depend on to protect our waters are encouraging a sulfide mining project that will seep pollutants into the St. Louis River watershed, leading into Lake Superior.	GEN01
17757	This proposed mining project will require water treatment for hundreds of years in northern Minnesota, while giving the mining company tax breaks, at the expense of those living in this area. Our taxes should never be used to support a business that pollutes anything! !	SO02
17758	Folks in the area do surely need jobs, but this proposed sulfide mine is only offering 300+ jobs for about 20 years, and many of those jobs will be construction type, with the actual mining jobs being much lower as modern technology improves. It would be more useful to use tax dollars to help Minnesotans create businesses that are sustainable and would benefit the areas economy for many, many years to come.	SO01
17759	The proposed mining operation would also put asbestos-like materials into the air leading to exposure to cancer possibilities to employees and the local community. Has this been considered in your plans? Otherwise, a study of health risks needs to be required in the supplemental draft.	HU05
17760	It is also unclear who will pay for the ongoing testing and water treatment after the closure of the proposed PolyMet Mining Project. In the news we hear about mining sites failing and pollution ending up in communities fresh water supply. When this proposed mine closes, it would require up to 500 years of testing and water treatment. It is also a tremendous concern of mine that the taxpayers in Minnesota are going to be paying this entire bill. The long-term costs of this mine operation and closure must be added to the cost benefit analysis for the plan.	FIN01, FIN05, FIN10
17761	HAS ANYONE LOOKED INTO PUTTING THIS MINE UNDERGROUND!	ALT01
17762	PolyMets Sulfide Mine Project must be rejected and needs to be rewritten to include all of the negative long-term costs and health impacts from an open-pitsulfide mine.	NEPA08

<b>Sender Name (Submission ID)</b> PolyMet (47832)		
3480	The third paragraph states that the United States Army Corps of Engineers (“USACE”) and the Minnesota Department of Natural Resources (“MDNR”) studied “the original NorthMet Project Proposed Action” between 2005 and 2009. Use of the defined term “NorthMet Project Proposed Action” in this context is confusing because the proposed action studied in the Draft EIS was substantially different than the proposed action being studied in the SDEIS. To avoid confusion over the nature of the alternatives studied in the two documents, PolyMet recommends changing the language to state that “Between 2005 and 2009, the USACE and MDNR evaluated PolyMet’s original mining proposal.”	EDIT01
3481	The terms “NorthMet Mining Project” and “Land Exchange,” rather than the defined terms “NorthMet Project Proposed Action” and “Land Exchange Proposed Action,” are used on these pages. To avoid confusion, PolyMet recommends consistent use of the defined terms.	EDIT01
3482	Under the heading “Cooperating Agencies,” the SDEIS describes USEPA’s responsibilities to review and comment on an EIS under Section 309 of the Clean Air Act. USEPA does this for all Environmental Impact Statements, even when it is not acting as a cooperating agency. USEPA has formally participated in the preparation of the current SDEIS as a cooperating agency, which is not the same thing as fulfilling its responsibilities under CAA Section 309. PolyMet recommends clarifying this point by adding a sentence to this paragraph that explicitly notes EPA’s status as a cooperating agency.	EDIT01
3528	The first sentence on this page indicates that completion of mining in the East Pit will occur in “approximately year 11” after the start of mining. By contrast, the first sentence in the paragraph following the three bullet points states that mining in the East Pit will end “by year 11” after the start of mining. The second statement is inaccurate. Mining in the East Pit will end approximately 11 years after mining, but not necessarily by year 11.	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3529	In the last paragraph of the Mining Operations Section on page ES-23, the SDEIS defines “process water” in connection with the Mine Site. On page ES-24, the SDEIS refers to “Plant Site process water.” To clarify and define terms, page ES-23 should be changed to refer to “Mine Site process water,” and “Plant Site process water” should be defined by adding a sentence (see bold text below) to the last paragraph of the Processing Operations Section on page ES-23: “Water seepage from the Tailings Basin would be collected by the groundwater containment system and sent to either the Tailings Basin pond or the Plant Site WWTP. All other water that is collected at the Plant Site, such as water used during processing, and water that contacts the plant site facilities (collectively referred to as Plant Site process water) will also be treated at the Plant Site WWTP. Treated water would be used to augment flows in the streams that would otherwise receive reduced flows because of the Tailings Basin groundwater containment system.”	EDIT01
3531	PolyMet recommends that the Executive Summary explicitly state that aluminum concentrations in the water, or the lowering of the hardness caused by storm water, represent natural or background concentrations and/or are the result of natural processes, not process water from the NorthMet Project.	EDIT01
3532	The SDEIS indicates that the NorthMet Project could potentially “affect water quality by increasing solute concentrations above Class 2B (aquatic life) standards.” This appears to refer to the aluminum and lead exceedances discussed earlier in the Executive Summary. As explained in Comment 6 above, PolyMet recommends that the Executive Summary explicitly state that any such exceedances would be the result of background and/or naturally occurring concentrations or processes, not process water from the NorthMet project.	EDIT01
3540	The second full paragraph beginning with the phrase “natural resources” does not accurately summarize the discussion of cultural resources in the SDEIS. PolyMet recommends that the paragraph be replaced with the following: “Cultural resources under NEPA can also include natural resources of cultural importance to the Bands. The Co-lead agencies have considered the effects of the Proposed Action on such resources, including 1854 Treaty resources, under NEPA. The Co-lead agencies have concluded that, while the Proposed Action has the potential to have effects on 1854 Treaty resources, construction and operation of the Proposed Action is not likely to significantly reduce overall availability of 1854 Treaty resources that are typically part of subsistence activities in the 1854 Ceded Territory.”	EDIT01
3551	In Table 1, the Land Use effects of the Proposed Connected Actions are described in the first bullet point as “[n]o effects on land use that would require changes in ordinances or comprehensive forest plans.” This language is confusing, given that the NorthMet Project Proposed Action would involve the construction of an open pit mine. PolyMet proposes changing this language to say: “Changes in land use would occur after the Land Exchange Proposed Action and would not require changes in ordinances or comprehensive forest plans.”	EDIT01
3555	Although the co-lead agencies have concluded that a segment of the Beaver Bay to Lake Vermilion Trail is an eligible historic property, the SDEIS alternates between referring to the “BBLV Trail” and the “BBLV Trail Segment.” To ensure consistency with the co-leads’ eligibility determination, PolyMet recommends that the agencies consistently refer to the property as the “BBLV Trail Segment.” This comment applies throughout all Cultural Resources sections in the SDEIS.	EDIT01
3556	PolyMet recommends that the section of the chart dealing with “Cultural Resources & Historic Properties” be referred to simply as “Cultural Resources” since that term is inclusive of historic properties.	EDIT01
3559	The second sentence in section 1.4.5, “Financial Assurance,” explains that financial assurance instruments covering the estimated costs of reclamation must be submitted to and approved by the MDNR. As discussed elsewhere in the SDEIS, Minnesota nonferrous mining rules also require that that financial assurance estimates be updated annually. PolyMet recommends noting that fact here.	FIN01, FIN08

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3561	The first sentence in Section 2.3.2.2, “Revised Proposed Action and Alternatives,” states that the NorthMet Project Proposed Action has “changed greatly since the release of the DEIS.” The use of the phrase “changed greatly” is ambiguous. The modifications to the proposal studied in the DEIS are described in detail elsewhere in the SDEIS. PolyMet accordingly recommends revising the first sentence in Section 2.3.2.2 to read: “As a result of input from the public, Cooperating Agencies, and the Colead Agencies via the workgroups, and additional modeling and impact analyses, PolyMet’s mining proposal has been modified since the release of the DEIS.”	EDIT01
3564	The second bullet point in Section 2.4.2, “Adequacy Determination/Records of Decision,” states that the USACE will issue a ROD “[f]ollowing a 30-day comment period.” Under NEPA, the 30-day period following issuance of a Final EIS is not a “comment period.” Rather, under 40 C.F.R. § 1506.10(b), agencies are simply prohibited from making a decision on the proposed action until 90 days after publication of a notice of availability for a draft EIS, or 30 days after publication of a notice of availability for a final EIS. The Council on Environmental Quality regulations do not require agencies to solicit comments on the FEIS during this 30-day waiting period.	EDIT01
3567	The first bullet on this page does not specify which permits would be transferred to PolyMet. The Minnesota Pollution Control Agency has stated that the NPDES permit for the Tailings Basin would not be transferred. Instead, a new permit would be issued.	EDIT01
3568	The south seepage management system is not mentioned at all in this section. This is a relatively new engineering feature that was constructed as part of the Consent Decree. It should be listed as part of the existing infrastructure, since it is already in place.	PD13
3569	The fifth bullet on this page refers to temporary features that will be removed and reclaimed before or at closure, including roads. It is important to note, however, that not all of the roads will be removed or reclaimed, as some are needed for the post-closure period.	PD36
3570	The fourth bullet on this page refers to a “bentonite layer on top of the Tailings Basin to restrict oxygen and water infiltration with pond.” PolyMet recommends clarifying that there is a bentonite layer on the outer dam slopes during construction and that, during closure, a bentonite layer will be added to the top of the Tailings Basin. As currently written, the reader may incorrectly assume that a bentonite layer will be added at construction, below the new tailings.	EDIT01
3572	Reclamation of the Category 1 Stockpile is scheduled to begin in Year 14. As currently written, reclamation of the Category 1 Stockpile is included only in Years 16-20. It should also be included in Years 11-16.	EDIT01
3575	The movement of waste rock from the Category 2/3 stockpile to the pit will be completed by the end of operations (Year 20). As currently written, the SDEIS incorrectly indicates that this activity will occur after year 20.	EDIT01
3576	The transmission lines are not shown correctly on these figures [Figures 3.2-5 through 3.2-9]. The figures should show a connection between the transmission line south of the Central Pit and the line south of the Category 1 stockpile.	EDIT01
3577	[On Figure 3.2-9] The process water piping from the Category 1 Stockpile should connect to the WWTF. The drainage from the Category 1 Stockpile Groundwater Containment System will be treated at the WWTF.	PD15
3579	This table [3.2-7] is titled “Key Characteristics of Overburden and Waste Rock Management.” However, it does not include any information about overburden management. The Category 2/3 and 4 stockpiles will be used to store saturated overburden; however, there is no indication of this in these sections and the “Maximum Volume” listed for these stockpiles only includes the volume of waste rock, not the maximum volume of the stockpiles. The peat and unsaturated overburden will be stored in the Overburden Storage and Laydown Area (OSLA), which is also not included in this table. Recommend either changing the table title to “Key Characteristics of Waste Rock Management” or update the table to include maximum capacity of the stockpiles for overburden storage, as listed in the Rock and Overburden Management Plan (v5) Section 6.2 (Adaptive Management) and information about the OSLA.	PD15

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3584	The Category 1 Stockpile category [on Table 3.2-7] shows that the maximum footprint of 526 acres is reached in year 6. However, the Category 1 Stockpile will reach the maximum footprint of 526 acres in Year 21, after it is reclaimed for the cover. The stockpile footprint is 508 acres at the end of Year 6, when the footprint is built with slopes at an angle of repose. The stockpile is regraded to a 3.5:1 slope prior to placement of the stockpile cover, which makes the final footprint 526 acres in Year 21.	PD16
3585	The Phases of Development section for the Category 4 Stockpile category [on Table 3.2-7] shows waste from the Category 4 Stockpile being transferred to the East Pit in Years 11-20. However, the Category 4 Stockpile will be moved completely by Year 11 to allow for mining of the Central Pit to start that same year.	PD15
3587	The second paragraph on this page states that unsaturated overburden use would require MDNR approval. This is not accurate. Unsaturated overburden should not require approval from the MDNR.	EDIT01
3588	The fourth sentence of the third paragraph on this page should state: "Applications for saturated overburden would include those where water contacting the construction material would be collected or drained to the mine pits, where it would be placed back below the water table or above a membrane liner system." There should be an 'or' in this sentence.	EDIT01
3590	For clarity, PolyMet suggests editing the second paragraph and the beginning of the third paragraph in this section as follows: "Figure 3.2-11 shows the containment system that would consist of a cutoff wall (a low permeability hydraulic barrier extending down to bedrock) combined with a drainage collection system surrounding the perimeter of the stockpile near its toe. The cutoff wall would have a hydraulic conductivity specification of no more than $1 \times 10^{-5}$ centimeters per second (cm/sec)."	EDIT01
3591	In the first paragraph, the description of the Category 1 Stockpile groundwater containment system does not adequately describe the sumps. There are two sumps: one at the northeast corner and one on the south side, along the center of the stockpile. To more accurately describe the system, PolyMet recommends making the following changes: "From the sumps, it would be pumped to the WWTF."	PD16
3592	The last sentence in the paragraph under the heading "Reclamation Planning" correctly states that PolyMet will submit an annual Contingency Reclamation Plan pursuant to Minnesota Rules 6132.1300. In the interest of completeness, the paragraph should also note that the rules require PolyMet to provide financial assurance sufficient to carry out that reclamation plan.	EDIT01
3594	The second paragraph inaccurately refers to disposal of material (remaining ore and sediment from ditches and process water ponds) in the West Pit. This material would be disposed in the East Pit, as described in Section 2.1.2 of the Reclamation Plan (v3) (Rail Transfer Hopper).	EDIT01
3625	The fifth sentence of the second paragraph on this page refers to the overburden sloping as "height-to-vertical ratio of 2.5:1." Height and vertical mean the same thing (i.e., both refer to the vertical plane). PolyMet suggests changing this to read either "horizontal-to-vertical" or "length-to-height".	EDIT01
3626	On page 3-64, the SDEIS states: "The WWTF would be upgraded to include RO treatment to achieve an effluent with a sulfate concentration of less than 10 mg/L." Similarly, the SDEIS states on page 3-123: "The WWTP would be constructed south of the Tailings Basin near the coarse-crusher and would include a RO unit designed to achieve a sulfate concentration of 10 mg/L in effluent. The design of the WWTP could be adjusted to accommodate varying influent streams and discharge requirements." It is not clear when reading the two statements copied above that the water treatment goal for the effluent sulfate concentration of 10 mg/L is based on meeting the current 10 mg/L sulfate standard for waters used for the production of wild rice (Minnesota Rule 7050.0224, Class 4A water quality standard). To clarify, and because that standard is subject to adjustment, the statement "to achieve an effluent sulfate concentration that meets the sulfate standard for waters used for the production of wild rice" should be used instead of "to achieve an effluent with a sulfate concentration of less than 10 mg/L."	EDIT01

3627	The last sentence inaccurately states state the Category 4 Stockpile would be completely removed by year 12 to allow mining in the Central Pit. The Central Pit mining begins in Year 11, as stated earlier in the SDEIS (such as Table 3.2-4). Therefore, the Category 4 Stockpile would be completely removed by year 11.	EDIT01
3628	The second paragraph describes reclamation of the Ore Surge Pile as "...any remaining material would be relocated to the West Pit after operations cease." However, no material will be disposed of in the West Pit. As described in Section 7.2.2 of the Rock and Overburden Management Plan (v5), any material remaining in the Ore Surge Pile at the end of operations will be transported to the Process Plant for processing or disposed of in the East Pit.	EDIT01
3629	The fifth paragraph on this page, which lists all ponds that would be either filled or converted to wetlands, should include the Rail Transfer Hopper Pond.	EDIT01
3630	The fourth paragraph under the heading "Water Management" states that "[b]ased on the current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site . . . ." This statement is inaccurate and inconsistent with the discussion of the GoldSim water quality modeling elsewhere in the SDEIS.	EDIT01
3631	This section inaccurately describes both the existing Cliffs Erie railroad and Dunka Road as being "within the Transportation and Utility Corridor (see Figure 3.2-20)." Cliffs Erie railroad actually is not within the Transportation and Utility Corridor, as Figure 3.2-20 accurately shows.	PD36, PD38
3632	The bulleted list on this page should include construction of approximately 5,750-foot connecting track between the Cliffs Erie track and the existing PolyMet track that serves the Coarse Crusher Building at the Process Plant. This new track is accurately shown on Figure 3.2-20 as a new construction "Railroad Connection," but it is not described in this section's text.	PD36
3639	The SDEIS states: "Throughout operations, the average annual makeup water drawn from Colby Lake would vary between 20 and 810 gallons per minute (gpm), with an average annual demand of 275 gpm." These numbers are inaccurate. The sentence should be revised to show a variation between 120 and 860 gallons per minute (gpm), with an average annual demand of 320 gpm. This section should also acknowledge that additional Colby Lake water would be needed for stream augmentation.	EDIT01
3640	In the second full paragraph on this page, PolyMet recommends providing additional details on the probable maximum precipitation (PMP) to make it clear that the likelihood of the emergency overflow channel being used is extremely low. PolyMet suggests editing the text to read: "Pond elevation would be controlled by pumping any excess FTB pond water to the WWTP. An emergency overflow channel would be constructed as a backup means of controlling pond elevation, but discharge from the emergency overflow is not expected. The emergency overflow is provided for protection of the dams in the rare event that freeboard within the FTB is not sufficient to contain all stormwater. Such instances have the potential to occur in the event of a probable maximum precipitation (PMP) rainfall event or some fraction thereof. PMP rainfall events are rare and such an event has a low likelihood of being experienced during the life of the basin. The PMP does not have an assigned return period, but it is usually assumed by hydrologists to be on the order of 100 million to 10 billion years. Based on extrapolation of 72-hour rainfall depth data from US Weather Bureau-Office of Hydrology Technical Paper TP 49, and the assumed return period of the PMP of 100 million years, a 1/3 PMP event could occur roughly once in 1,000 years and a 2/3 PMP could occur once in 500,000 years. On this basis, even though there is a low likelihood of overflow, it is standard practice in dam design to accommodate even low probability overflows in a manner that protects the integrity of the dams. Given the low likelihood that there would ever be flow in the emergency overflow channel, it is not considered in the impact analysis."	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3641	The third paragraph in Section 3.2.2.3.12, “Reclamation and Long-term Closure Management,” contains a list of “reclamation objectives” and “post-reclamation activities.” These terms are not used consistently with the applicable Minnesota Rules. Under the non-ferrous rules, there are two distinct periods during reclamation: closure and post-closure. “Closure” is a “process” that begins when mining ceases, and ends when the reclamation standards identified in the reclamation plan have been achieved. Thus, while it may be reasonable to describe “reclamation objectives” for the NorthMetProject Proposed Action, it would be more accurate to indicate that these objectives will be achieved during the closure process. “Post-closure maintenance” activities are defined in the applicable rules as activities necessary to “sustain reclamation.” Postclosure maintenance activities begin when the closure process is complete, and end when active reclamation (e.g., water treatment plants) is no longer necessary to sustain reclamation standards. Thus, the activities described in this paragraph as “postreclamation” are more accurately described as “post-closure maintenance activities.” The same comment applies to text on page 3-137.	EDIT01
3645	The first sentence of the third paragraph in Section 3.2.2.4, “Financial Assurance,” states that the engineering design and planning needed to calculate financial assurance “is typically made available during the permitting process and was not available at the time that this SDEIS was prepared.” While this statement is generally accurate, it leaves a misleading impression that something is missing from the SDEIS. The paragraph should specify that NEPA and MEPA regulations do not require a discussion of financial assurance, and that PolyMet has voluntarily provided as much information as possible at the present time.	EDIT01
3648	The first sentence in the second full, non-bulleted paragraph on this page indicates that a final Reclamation Plan and Contingency Reclamation Cost Estimate will be based on studies “finalized through permitting (pursuant to the EIS process).” This reference to permitting pursuant to the EIS process is confusing and should be clarified. PolyMet is not certain what the SDEIS is trying to convey about the relationship between the permitting and EIS processes, but it should be noted that those are separate processes and that information gathered during the EIS process will be used when agencies make permitting decisions.	EDIT01
3675	Table 3.2-16 on page 3-147 provides a comparison of DEIS and SDEIS proposed actions. The table cell corresponding to the first row/first column of the table should state that “Category 1 and 2 waste rock would be stored in a permanent lined/ soilcovered stockpile (Category 1/2 Stockpile) north of the west pit (years 1-11).” This edit makes clear that the SDEIS proposed action (described in the second column of the table as including “a geomembrane cover system”) will include a significantly improved cover system relative to the cover described in the DEIS. The third column of Table 3.2-16 should also acknowledge the other improved outcomes related to the addition of a geomembrane cover system to the Category 1 Stockpile. For example, the following additional bullet could be added to column three: “Substantial reduction of stockpile seepage volume that will need to be collected and treated at the WWTF and significant improvement in West Pit water quality in closure.”	EDIT01
3677	General comment on all Cultural Resources Sections in Chapters 4, 5 and 6. The SDEIS often references consultation with the Bands and SHPO, but fails to include PolyMet in these references. When discussing consultation under Section 106 of the NHPA, PolyMet, as the project proponent, should be identified as a consulting party and should be included in the explanation of the Section 106 process. Examples of where PolyMet should be noted/included as a consulting party include: the third to last sentence on page 4-259 (Section 4.2.8.3); the last full sentence on page 4-262 (Section 4.2.9.2.1); the second to last sentence in Section 4.2.9.2.2 on page 4-263; the second to last sentence in the second to last paragraph on page 4-264; the second to last paragraph on page 4-302; the last full paragraph on page 4-303; the third paragraph on page 4-555; the second and third paragraphs on page 5-479; the first full paragraph on page 5-482; the second to last full paragraph on page 5-483; the last paragraph on page 5-673; and the first paragraph on page 6-89.	EDIT01
3678	This table lists the mercury TMDL target date for Sabin Lake, Esquagama Lake, and Colby Lake as 2015. The target date for those water bodies is 2025. (source: MPCA 2013. Minnesota’s Final 2012 TMDL List (Section 303(d) Impaired Waters List. List approved by USEPA, July 25, 2013).	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3679	The monitored mercury concentration at PM-13 (Embarrass River) is inaccurately stated as 4.0 ng/L. In fact, PolyMet’s evaluation of the Plant Site at PM-13 used a background concentration of 3.1 ng/L. The same comment applies to Table 4.2.2-4, and the cumulative impact discussion at p. 6-33.	MERC04, MERC07
3683	The first two paragraphs of this section characterize the Tailings Basin mercury samples as “consistent with baseline levels.” This is not consistent with the later conclusion that the Tailings Basin acts as a sink for mercury. Data from locations “in and near the existing LTVSMC Tailings Basin” is actually lower than concentrations observed in the Partridge River and Embarrass River. This same comment applies to the second paragraph under “Direct release of mercury to the Embarrass river watershed from the tailings basin” in Section 5.2.2.3.3 on page 5-205.	MERC06
3685	In the first sentence of the second paragraph, the order of Duluth Complex and Partridge River intrusion should be switched. The Partridge River intrusion is part of the Duluth Complex.	EDIT01
3686	In the second sentence of the second paragraph, the use of "Mesabi Iron Range" is misleading, as it could give the impression that the Duluth Complex is in direct contact with the Biwabik Iron Formation, which is not the case. PolyMet recommends listing a geologic unit (Virginia Formation) here, rather than the more vague term "Mesabi Iron Range." In addition to the cross-section shown on Figure 3.2-10, it would be helpful to include a plan view bedrock geology map to illustrate the geometric relationships between the various bedrock units.	EDIT01
3687	The second sentence of the second full paragraph states: “Based on limited MDNR well records within the NorthMet Project area, natural groundwater levels in the glacial till vary seasonally between 3 and 10 ft bgs.” This sentence incorrectly states that the data is limited. Site-specific data on seasonal water level fluctuations is found in the Water Modeling Data Package Volume 1 – Mine Site (referenced in the SDEIS as PolyMet 2013i). PolyMet 2013i provides information on water level fluctuations observed in 24 wells completed in the glacial till at the Mine Site, some with over nine years of water level measurements. Water level fluctuation varies between wells, but the overall range observed in a single well is typically less than 4 ft.	EDIT01
3691	The range of dates cited in the bullets listed under “Baseline Groundwater Quality” is inconsistent with the groundwater data used for water quality modeling. For example, 2012 data from MW-05-02, MW-05-08, and MW-05-09 were used for the modeling. PolyMet recommends removing the dates from these bullets or revising the list so that range of dates is consistent with data used to develop Table 4.2.2-6. The range of dates for groundwater data used for the water quality modeling is as follows: -Three older wells in the surficial aquifer, sampled from March 2005 through June 2012. -21 newer wells in the surficial aquifer, installed in November 2011 – February 2012, sampled following installation through June 2012. -Five observation wells in the upper 100 ft of the bedrock, sampled from 2006 to 2010 (current SDEIS text is correct for this bullet). -Four large-diameter bedrock wells, sampled during aquifer testing in 2005 and 2006.	EDIT01
3692	It is not clear how the baseline values that are shown in Table 4.2.2-6, and used for comparison with the site-specific data, were selected. The Northeast MN baseline data appear to be derived only from the "unconfined buried Quaternary aquifer" category. However, the MPCA study also includes data for “buried Quaternary artesian aquifers” and “Quaternary water table aquifers.” Either the range shown in Table 4.2.2-6 should reflect data from all Quaternary aquifers in the MPCA report or the Final EIS should provide an explanation as to why only a certain subset of data presented is provided.	EDIT01
3693	The first paragraph describes USGS gage 04015475 as the flow record most representative of the Project area. However, this section also should acknowledge the presence of the recently-installed (for Teck American) flow gage at the Dunka Road crossing near the southeast corner of the proposed Mine Site (monitoring location PM-3/SW003) and note that, while closer to the Mine Site, the short period of record is insufficient for use in the SDEIS. This gage also should be shown on Figure 4.2.2-1.	EDIT01

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3694	The first paragraph discusses why the use of the lowest expected baseflow is conservative with respect to impacts to surface waters. The paragraph should acknowledge that the use of a higher modeled baseflow would lead to higher recharge into groundwater, which would translate into faster solute transport times in groundwater (although not necessarily significantly varied peak concentrations). In addition, higher recharge would increase the expected groundwater inflow into the dewatered mine pits.	WR005
3695	In the first paragraph, the text describing existing upper Partridge River water quality should mention mercury and aluminum concentrations exceeding water quality standards. The text also describes dissolved oxygen at SW002 as the only consistent exceedences. PolyMet reads the term “consistent” as meaning that all samples at that location exceeded the standard, but that should be made more clear the text. The term “consistent exceedences” also appears in section 4.2.6.1.2 (page 4-220), and it should be used in the same way in that section.	EDIT01
3696	There are multiple inaccuracies in Table 4.2.2-14 that should be addressed:1. The average concentrations presented in Table 2.2.2-14 should include 2012 data. The 2012 data is included in Large Table 10 of theWater Modeling Data Package, Volume 1 – Mine Site v12.2. The number of samples at SW004a and SW004b in footnote 5 is incorrect and should also include 2012 samples. The 2012 data omitted from the number of samples is included in Large Table 10 of theWater Modeling Data Package, Volume 1 – Mine Site v12. The number of samples at SW004a and SW004b should be 12 samples for each location.3. The ranges of concentrations presented in Table 4.2.2-14 do not include the 2012 data and, therefore, may be inaccurate if maxima or minima occurred in 2012.4. The range provided for mercury concentrations (<0.0025 ng/L to 0 ng/L) is not accurate; mercury concentrations provided in theWater Modeling Data Package – Volume 1 Mine Site v10 range from <0.5 ng/L to 18.5 ng/L.	EDIT01
3697	Section 4.2.2.2.2, p. 4-77, Table 4.2.2-14, Section 4.2.2.2.2, p. 4-80, Table4.2.2-15, Section 4.2.2.2.2, p. 4-87, Table 4.2.2-18, Section 4.2.2.3.2, p. 4-123, Table 4.2.2-29, Section 4.2.2.3.2, p. 4-132, Table 4.2.2-35The minimum values in constituent concentration ranges shown in these tables are presented as less than half the minimum detection limit. Minimum concentrations (when not detected) should be presented consistently as either less than the minimum detection limit (e.g., “ < 10 mg/L”) or as a numeric value equal to half the minimum detection limit without a less than symbol (e.g., “ 5 mg/L”). If the latter approach is used, the footnotes should note that minimum values represent one half the detection limits.	EDIT01
3698	The third sentence of the fourth paragraph presents a recharge rate of 0.3 in/yr, which is inconsistent with the mean value of 0.61 in/yr used in the GoldSim model. As discussed in Sections 5.2.1.3.1 and 5.2.1.3.2 of this document, average net recharge in the Embarrass River watershed is estimated at 0.61 inches per year. A recharge rate of 0.3 in/yr represents the minimum value used in the GoldSim recharge distribution (PolyMet, 2013j; Section 5.2.1.3.2); however, it would be more appropriate to use the average value, rather than the minimum value, for the groundwater flow discussion in the SDEIS.	EDIT01
3699	Data for the Cell 1E pond should be included in this table. Cell 1E pond data are shown in Large Table 7 of the NorthMet Project Water Modeling Data Package, Volume 2 - Plant Site, Version 9, March 1, 2013.	EDIT01
3700	Regarding the first sentence, PM-13 is not “just downstream of the Heikkila Lake tributary.” It is more accurate to say PM-13 is downstream of the Unnamed Creek tributary.	EDIT01
3701	In the second sentence, it is unclear what “low flows” refers to. Based on the low flows presented in Table 4.2.2-27, PolyMet assumes the co-leads are referring to “baseflow.” This should be clarified.	EDIT01
3702	In the third paragraph, the text describing the number of samples collected at PM-12.2, PM-12.3, and PM-12.4 should include data from 2012 (2012 data appears to be included in subsequent Table 4.2.2-29). The 2012 data is included in Large Table 4 of the Water Modeling Data Package, Volume 2 – Plant Site v9.	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3703	The row for PM-12 should reflect that data was collected in 2012 at this location.	EDIT01
3704	Data for PM-11 should not be presented in Table 4.2.2-34, which is titled “Summary of Surface Water Quality Monitoring Data for the Tailings Basin Surface Seeps.” Monitoring location PM-11 is located downstream of the Tailings Basin on Unnamed Creek and is not representative of a seep. Data for PM-11 should be included in Table 4.2.2-35 (which includes tributary streams) instead.	EDIT01
3705	In the second to last sentence of the first full paragraph, it should be clarified that seepage and dead spruce trees are not a cause-and-effect relationship. There are many beaver dams in the area that likely play a role in the presence of dead spruce trees.	EDIT01
3706	The last sentence under “National Hierarchical Framework of Ecological Units” reads: “Inclusion of the One Hundred Mile Swamp would likely complete representation of prominent ELTs in LTA 212Le11.” Polymet suggests clarifying by revising this sentence is to say: “The One Hundred Mile Swamp and the two other sites surveyed provide a complete representation of the prominent ELTs present within LTA 212Le11.”	EDIT01
3707	Footnote 1 indicates it is a State standard, but the listed value is federal standard. The State 1-hr standard is 0.5 ppmv.	AIR12
3710	Regarding the entry for sulfur dioxide 3-hour, the table could be misunderstood as saying that the state and Federal secondary standard is 0.5. In fact, the state primary standard is 0.5, and state secondary state standards are as indicated by footnotes. This should be clarified in the “Standard Type” column and the footnotes.	AIR12
3711	The third sentence of the third paragraph suggests that PolyMet will submit a revised wetland permit application. In fact, PolyMet has already submitted a revised wetland permit application, which appears as “PolyMet 2013q. NorthMet Project Revised Wetland Permit Application, Version 1. Issued August 19, 2013” in the references.	EDIT01
3712	The first sentence of this section references three figures for the location of the Mine Site, in relation to Iron Lake and the Laurentian Divide. However, none of the figures show Iron Lake or the Laurentian Divide. The text should be revised to account for this or the figures should be edited to include Iron Lake. This issue occurs in other sections as well, such as the first sentence of Section 4.3.3.1.	EDIT01
3713	The third sentence of the first paragraph should cite the USACE memo (USACE, May 2013) in addition to the baseline wetland type evaluation.	EDIT01
3714	The first sentence of the third paragraph reads as though vegetation types are indicative of pre-settlement conditions. However, this is misleading, as there has been a significant amount of logging disturbance throughout the mine site.	EDIT01
3715	The new Minnesota ETSC list became effective (August 19, 2013). Botrychium pallidum (pale moonwort) is not a state-endangered species anymore. Botrychium rugulosum (St. Louis grapefern) and Eleocharis nitida (neat spikerush) are not state-threatened anymore. All three plant species are now special concern, which means they are not protected under Minnesota’s Endangered and Threatened Species Statute (MN Statute 84.0895). Sparganium glomeratum (clustered bur reed) is not a special concern species anymore, and has been removed from the Minnesota ETSC list. The text and Table 4.2.4-4 should be revised to reflect the new Minnesota ETSC list.Changes should be made throughout Section 4.2.4.2.3, including the Species Life Histories discussion, to make the information current and accurate.	VEG01
3716	General comment in Sections 4.2.4, 4.3.4, 5.2.4 and 5.3.4 Scientific and common names are used inconsistently throughout these sections. PolyMet recommends using consistent terms throughout the document for clarity.	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3717	On page 4-170, there continues to be an inconsistency between the first paragraph under “Habitat Types and the first sentence of the first paragraph under “Plant Community Surveys.” The first paragraph under “Habitat Types” states that upland-conifer mixed forest types are among “the least represented cover types.” This is further supported by Table 4.2.4-1, which shows upland conifer-deciduous mixed forest as <1% of the Mine Site acreage for cover types. However, under “Plant Community Surveys”, the first sentence following Table 4.2.4-1 states that “the primary cover types at the Mine site are mixed pine-hardwood forests on the uplands.” “Mixed pine-hardwood forest” is an “upland conifer-deciduous mixed forest cover type.” PolyMet recommends resolving this inconsistency by using MIH data in the table, rather than GAP.	VEG09
3718	The first sentence of the second paragraph under “Invasive Non-native Plants” states that a survey was conducted on mine sites along the Mesabi Iron Range, and that “some species are currently present.” The text should clarify where (i.e., the Mesabi Iron Range or on the NorthMet Mine Site) these species are present.	VEG09
3719	The first paragraph text states that no invasive species inventories have been conducted within the Transportation and Utility Corridor. However, the paragraph later discusses field survey data. This could be confusing. The text should clarify that the field survey data discussed was not a quantitative survey (i.e., not an inventory), but rather is part of a broader ETSC and qualitative vegetation survey conducted by Barr.	VEG09
3720	The text on page 4-192 names three ETSC species in Transportation and Utility Corridor, but Table 4.2.4-7 only lists one of these species. This inconsistency should be resolved.	EDIT01
3722	General Comment to Sections 4.2.5, 4.3.5, 5.2.5, 5.3.5[:] PolyMet recommends either substituting the word “bat” for the term “Myotis” or adding “(bat)” after “Myotis.”	EDIT01
3723	The Canada lynx is a Minnesota special concern species effective August 19, 2013.	WI01
3724	In the fifth paragraph, the statement that lynx critical habitat “includes most of northeastern Minnesota” is imprecise. PolyMet recommends adding the clarification that the USFWS designated critical habitat does not include most of the Iron Range.	EDIT01
3725	The last sentence of the third paragraph references “forest and brush habitats” but parenthetically cites MIHs 1 to 14. PolyMet believes the citation was intended to be MIHs 1 and 14.	EDIT01
3726	Regarding the last sentence of the third paragraph [(under Bald eagle heading)], there are no standing dead trees in the existing LTVSMC Tailings Basin.	EDIT01
3727	In the third paragraph, it should be noted that the northern Myotis ( <i>Myotis septentrionalis</i> , Northern long-eared bat) was proposed as a federally listed endangered species by the USFWS on October 2, 2013.	WI01
3728	The second paragraph should reference Moose zone 3, not Moose zone 30.	EDIT01
3729	The fourth sentence of the second paragraph incorrectly states that the Tailings Basin is “unlikely to be heavily used by wildlife.” The Tailings Basin is a local refuge for herds of deer, small mammals and wolves.	EDIT01
3730	The first sentence in the first paragraph references the Longnose, Wetlegs and Wyman creeks as surface water features in the Upper Partridge River Watershed. However, there is no discussion on these creeks or a reference to a previous discussion in the SDEIS. PolyMet recommends either providing a similar discussion of that provided for Mud Lake, Yelp Creek, and Second Creek on page 4-214 or explaining why such analysis is not provided.	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3731	The second sentence uses the term “watershed” while the third sentence uses the term “larger watershed.” PolyMet suggests explaining the difference between a "watershed" and a "larger watershed."	EDIT01
3732	The first sentence of the third paragraph should be revised to add Yelp Creek to the list of streams where “no fish or macroinvertebrate community or habitat characteristics could be documented . . . .”	EDIT01
3733	The source of data for these stream surveys should be revised as “Source: Breneman 2005, Barr 2011b, and MPCA 2011c.” Barr 2011b is the source of the information for the PM sites.	EDIT01
3734	PolyMet recommends that the introductory paragraph state that the NHPA process is proceeding on a parallel path to the NEPA process, and that effects on cultural resources have also been considered and analyzed under NEPA.	EDIT01
3735	The last sentence of the introductory paragraph states: “Cooperating agencies have not participated in production or endorsement of any components of the EIS or the NorthMet Project.” This statement is not entirely accurate, since the tribes have participated in the production of components of the EIS relative to cultural resources as well as the Major Differences of Opinion. The EIS should describe the tribes’ participation in the development of the EIS.	EDIT01
3736	The second-to-last paragraph is unclear, both with respect to whether it is discussing groundwater and/or surface water, and with respect to how that discussion fits into the APE analysis. Figure 4.2.9-5, which is not referenced in this paragraph, is a groundwater quality APE, but most of the paragraph discusses surface water quality. PolyMet recommends revising this paragraph to explain how groundwater and surface water affect the APE.	EDIT01
3739	The discussion of the NorthMet Project’s impacts upon visual resources notes that tribal members exercise rights to hunt, fish, and gather on Superior National Forest lands near the Mine Site. However, it also states that “[t]he frequency with which tribal members exercise these rights in portions of Superior National Forest with views of the Mine Site is not known.” In particular because the Bands are cooperating agencies, they have had every opportunity to provide evidence of frequency. Accordingly, PolyMet recommends adjusting this language to state that “there is no evidence that tribal members regularly exercise their rights in this portion of the forest.”	CR01, CR05, CR06
3742	The term “Sensitive Fines” is used on the Figure, yet neither Geotechnical Data Package, Vol. 1, Version 4, nor preceding versions use the name “Sensitive Fines.” April 12, 2013 Geotechnical Data Package, Vol. 1, Version 4 uses the name “Fine Tailings/Slimes.” This material type is missing from the Legend on the lower left corner of Figure 4.2.14-3.	EDIT01
3746	Units and labels are missing from axes [of Figure 4.2.14-3] (e.g., elevation in feet amsl and distance in feet) and the dashed lines in the figures are not in the legend (layers of material).	EDIT01
3748	In the first full sentence [of Section 4.3.3.1.1, p. 4-434], floodplains should be clearly defined, and PolyMet recommends including a figure showing mapped floodplains with wetlands.	EDIT01
3752	The table combines coniferous bogs and coniferous swamps. PolyMet recommends separating these two wetland types here, in the same way that they are separated for discussions of the federal lands. This is also an issue in Tables 4.3.3-6, 4.3.3-8, 4.3.3-10, 4.3.3-12.	EDIT01
3754	The table contains inaccurate acreage for open bog and shallow marsh. Open bog should be 2.1 acres, and shallow marsh should be 84.1 acres. In addition, the third sentence under Table 4.3.3-6 should also be edited from: “Large bogs dominate much of the east-central portion of Tract 1” to the suggested “Shrub swamps dominate much of the east-central portion of Tract 1.” The current sentence is inaccurate because there are only 2 small bogs (2.1 acres total) on the Hay Lake parcel.	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3755	The first sentence states that non-native invasive species on the federal lands are the same as the Mine Site because “they occupy the same area.” This is not accurate. The Mine Site is smaller than the federal lands.	VEG09
3756	In footnote 2 [of Table 4.3.4-5], PolyMet suggests deleting the phrase “additional populations may be present in more marginal, secondary habitat that was not surveyed, or in wetter areas.” There is no evidence (no survey) of additional populations in marginal, secondary habitat, and the SDEIS should make that clear.	EDIT01
3767	The second paragraph appears to suggest that there is a correlation between the acreage of a given MIH cover type and the likelihood that an RFSS species that prefers that cover type will actually be present. This is not entirely accurate. The paragraph fails to take into account other qualitative factors that influence the likelihood of an RFSS species being present. PolyMet recommends revising the paragraph to state that the presence of RFSS species would be further influenced by the quality of the habitat available, not just the quantity.	VEG09
3773	Sections 4.3.5.2.1 and 4.3.5.2.5[:] In both of these sections, there is a contradiction between text under “federal and state-listed species” and the text under “RFSS.” The text under “federal and state-listed species” says that northern myotis and eastern pipistrelle are potentially present on Tracts 1 and 5. The text under “RFSS” states that only northern myotis is potentially present. This inconsistency should be resolved.	WI01
3775	This section [(4.3.5.2.1)] discusses “species of tribal concern.” This is not a legal category. PolyMet recommends deleting this phrase.	EDIT01
3777	The first sentence in the second paragraph should be revised to read “Some of the non-federal lands... .” Not all of the non-federal lands have streams, creeks, rivers, or lakes on them.	EDIT01
3781	General Comment on all Land Exchange sections[:] The Land Exchange analysis must review FEMA floodplains. Therefore, the Land Exchange sections should define whether the floodplains are FEMA or non-FEMA. For example, the first sentence of the second paragraph in Section 4.3.6.2.1, p. 4-522, should be revised to read “approximately 376 acres of non-FEMA floodplain.” This change should be reflected throughout the Land Exchange sections.	WET14
3791	This paragraph incorrectly compares Coyote Creek with Stony River. These are not comparable systems. The Stony River is a higher order, more diverse aquatic system than the first order, headwaters Coyote Creek. It cannot be assumed that the conclusions drawn from the studies for Stony River are applicable to Coyote Creek.	EDIT01
3796	The second paragraph is one sentence and cites “MIH 14.” PolyMet recommends that this paragraph first provide some description of the MIH 14 before making the statement it currently contains.	EDIT01
3798	The first sentence of the second full paragraph states that the “groundwater containment system would capture at least 90 percent of seepage from the Tailings Basin.” This is incorrect. The system will capture 100% of surface seepage and upwelled water, and at least 90% of seepage that remains as groundwater flow. Overall, 99% of seepage from both surface and groundwater will be captured. The sentence, as written, implies that the system will be less effective than it will be.	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3807	The 4th paragraph states: “With the proposed design modifications and engineering controls, the water quality model predicts that the NorthMet Project Proposed Action would not cause or increase the magnitude of an exceedance of the groundwater and surface water quality evaluation criteria at the P90 level for any of 28 solutes at 29 groundwater or surface water evaluation locations within the Partridge River and Embarrass River watersheds...”PolyMet proposes the following language: “With the proposed design modifications and engineering controls, the water quality model predicts that the NorthMet Project Proposed Action would not cause or increase the magnitude of an exceedance of the groundwater and surface water quality evaluation criteria at the P90 level for any of the 27 solutes and mercury (further addressed below) at 29 groundwater or surface water evaluation locations within the Partridge River and Embarrass River watersheds...”	EDIT01
3817	The 3rd paragraph states: “Within the water quality modeling, estimated concentrations for these six metals are compared to hardness-based standards at each model evaluation location and each model time step to determine compliance with the evaluation criteria.”PolyMet proposes the following language: “Within the water quality modeling, modeled concentrations for these six metals are compared to hardness-based standards at each model evaluation location and each model time step to determine compliance with the evaluation criteria.”	EDIT01
3829	The 4th paragraph states “Methylmercury is much more of a problem than inorganic mercury, in that it can accumulate to concentrations of concern in the aquatic food chain, it is more bioavailable than inorganic mercury, and it can bioaccumulate in fish, wildlife, and humans.” The term “problem” suggests a conclusion, when this sentence is actually describing concerns. PolyMet proposes the following language: “Methylmercury is more of a concern than inorganic mercury, in that it can accumulate to concentrations of concern in the aquatic food chain, it is more bioavailable than inorganic mercury, and it can bioaccumulate in fish, wildlife, and humans.”	EDIT01
3833	The first sentence at the top of the page reads: “Research suggests that total mercury concentrations in streams and methylmercury content in fish are roughly proportional within individual watersheds (USGS 2010), such that, for example, a 5 percent increase in total mercury in water would be expected to result in about a 5 percent increase in mercury content in fish within that watershed.”This sentence should be changed to clearly state that the potential incremental change in fish mercury concentration is an evaluation criterion and that MPCA’s Mercury Risk Estimation Method (MMREM) was used to assess the potential changes in fish mercury concentrations in nearby lakes. The MMREM is a method that relies on empirical fish contamination data, combined with the principle of proportionality between mercury in fish and atmospheric deposition (MPCA 2006, MMREM guidance document).	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3834	In the references section to the SDEIS, the USGS 2010 reference cited above links to the following web page: Some Ecosystems Will Respond to Reductions in Mercury Emissions. USGS July 29, 2010.1 The first sentence on this webpage states: “An international team of scientists investigating mercury cycling in an experimental watershed in Ontario, Canada, conclusively demonstrated at the ecosystem scale that changes in mercury loadings are expected to result in proportional or near proportional changes in mercury bioaccumulation in fish.” PolyMet believes this conclusion of proportionality is not applicable to this project for at least three reasons. First, the cited website summarizes the results from a study referred to as the Mercury Experiment to Assess Atmospheric Loading in Canada and the United States (METAALICUS) study, which was conducted on a headwater lake, not in a stream. The METAALICUS study itself cites that runoff dominated lakes (flow through systems) would not respond the same as a precipitation-dominated headwater lakes (Harris et al., 2007). Because a stream can also be thought of as a flow through system, it will not respond in the same way to increases or decrease in atmospheric deposition as a precipitation-dominated headwater lake. In other words, for a run-off dominated lake (flow-through system), the contribution of ambient (pre-existing) mercury from the watershed to the lake is much greater than the contribution of new mercury to the water surface. The same would be true of a stream wherein the new mercury from atmospheric deposition would be minor compared to the contribution of ambient mercury. In addition, Minnesota’s Statewide Mercury TMDL (MPCA 2007, Section 4.1) states that “... The primary source of mercury to the state’s water bodies is atmospheric deposition, which is approximately uniform across the state. Mercury concentrations in fish, however, vary widely on both large and small scales. ...”. Nutrient loadings, hydrology, presence/absence of wetlands and other factors contribute to different fishmercury concentrations in lakes that are relatively close to each other. Therefore, using the concept of proportionality is expected to result in an overestimate of the potential incremental change in fish mercury concentrations due to an individual project’s mercury air emissions as the concept of proportionality does not seem to be supported for individual streams or lakes based on the available data. Second, steady state was not reached during the 3 year METAALICUS study. Ghorpade (2010 thesis) identifies that 8 years after the study started, steady state was not reached and the researchers are not able to predict when steady state might be reached. Therefore, the assumption of proportionality based on the METAALICUS study is uncertain. Third, there are several USGS reports that indicate a relationship between filtered methyl mercury concentration in stream water and fish mercury concentration. However, likely because of the watershed specific factors affecting methylation of mercury, there is not a USGS report, 2010 or otherwise, that identifies a statistically significant relationship between total mercury in surface water and fish mercury concentrations.	MERC02
3835	Modeling results for location UC-1 are not presented in the SDEIS. Therefore, this location should not be shown in Figure 5.2.2-6 as a model evaluation location.	EDIT01
3836	The 3rd and 4th sentences of the first paragraph should be clarified to reflect that the Plant Site MODFLOW model was not calibrated to baseflow in the Embarrass River, nor was the model used to estimate baseflow.	EDIT01
3837	Regarding the last sentence on the page, the regional MODFLOW model calibration was not updated to the revised baseflow estimates from XP-SWMM. The Mine Site Water Modeling Data Package Attachment C provides: “The regional model calibration was not updated because the original calibration did not incorporate a baseflow estimate and previous sensitivity analysis indicated that the local-scale model results were not sensitive to the lateral boundary conditions that were defined by the regional model (Barr, 2007). Therefore, the perimeter boundary conditions for the local-scale model remained unchanged.”	EDIT01
3838	The footnote on the “Specific yield” column of the table [(5.2.2-9)] only applies to the surficial deposits, not the entire column in the data table.	EDIT01
3842	The 1st paragraph states: “GoldSim was programmed with a suite of complex algorithms to estimate the release of contaminants from mine facilities (i.e., “sources”) and their transport to groundwater and surface water evaluation locations.” PolyMet suggests the following language: “GoldSim was programmed with a suite of algorithms to estimate the release of contaminants from mine facilities (i.e., “sources”) and their transport to groundwater and surface water evaluation locations.”	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3846	The 1st paragraph states: “The onset of acidic pore water is also problematic, as these conditions cause the rate of sulfide oxidation to increase and the concentration of metals to increase as precipitates dissolve.” PolyMet suggests the following revision: “The onset of acidic pore water is also of concern, as these conditions cause the rate of sulfide oxidation to increase and the concentration of metals to increase as precipitates dissolve.”	EDIT01
3849	The bulleted list near the middle of the page provides slightly incorrect sulfide sulfur ranges for the waste rock classification criteria, as well as an incorrect reference for this information. The sulfide sulfur classification criteria for the categories of waste rock should be revised as follows:- Category 1 – sulfur content less than or equal to 0.12%.-Category 2 – sulfur content greater than 0.12% and less than or equal to 0.31%.- Category 3 – sulfur content greater than 0.31% and less than or equal to 0.60%.-Category 4 – sulfur content greater than 0.60%.Categories 2 and 3 are combined to produce Category 2/3 with sulfur content greater than 0.12% and less than or equal to 0.60%.This information can be found in Section 4.4.1 of the Waste Characterization Data Package v10 (PolyMet 2013)	EDIT01
3851	The first sentence of the last paragraph on page 5-53 states that “the GoldSim model simulates constituent release from waste rock based on assumptions that either extrapolate from conditions observed under field-scale weathering of similar rock (Category 1 waste rock) or in laboratory tests (Category 2, 3, and 4 waste rock, and ore).” This should be revised to indicate that constituent release for all categories of rock is based on data from laboratory tests. Constituent release rates for all categories of rock are estimated by applying a scaling factor to lab rates to account for likely differences between field and lab conditions. The scaling approach differs between Category 1 and the other categories of rock, but release rates for all categories of rock are based on laboratory data.	EDIT01
3853	The second paragraph states: “The 80 percent rate is used because seepage from the south side of Tailings Basin is likely higher than the flow contribution to Second Creek that would occur from the Basin footprint for natural ground conditions (i.e., if the Tailings Basin were not present)”. This statement is not correct. The 80% is to limit the project impact on flow to +/- 20% of existing conditions, as is recommended by MDNR on Page 5-14.	EDIT01
3854	PolyMet suggests revising the third full paragraph as follows: “WWTP effluent that would be used remaining after flow augmentation to Second Creek would be discharged to the three Embarrass River tributaries (Unnamed, Trimble, and Mud Lake creeks), as partial or complete fulfillment of required augmentation to maintain downstream hydrology and wetland function in Second Creek and the three Embarrass River tributaries (Barr 2013a). Pumping from Colby Lake would be used to meet any remaining augmentation requirement.”	EDIT01
3856	The second paragraph states: “Tailings seepage bypassing the containment system (approximately 19.4 gpm) would continue... .” On page 5-8 (Section 5.2.2) and in Table 5.2.2-36, the flow bypassing the containment system is said to be “about 21 gpm.” PolyMet recommends revising for consistency.	EDIT01
3858	The active source period for the Category 4 Stockpile is incorrect. The stockpile will be removed during the development of the Central Pit and will be entirely removed by the end of Mine Year 11.	EDIT01
3860	The last full paragraph should acknowledge that the pH in the East Pit backfill will be monitored and adjusted by the addition of alkaline water from the WWTF as backfilling progresses in order to maintain circum-neutral conditions in the backfill pore water.	EDIT01
3861	The SDEIS states: “The quality of this aquifer inflow would reflect the quality of the pit lake water, which would gradually improve over time due to cycling through the WWTF.” However, the West Pit water will not be cycled through the WWTF during reclamation. PolyMet suggest revising the text to: “The quality of this aquifer inflow would reflect the quality of the pit lake water, which would gradually improve over time due to the effectiveness of the reclamation activities at the site.”	EDIT01

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3867	The SDEIS states: “Cobalt was generally used to illustrate groundwater transport at the Mine Site because it is not attenuated and would enter the surficial flowpaths at concentrations higher than baseline groundwater.” This statement is misleading. PolyMet suggests rewording to the following: “Cobalt was generally used to illustrate groundwater transport at the Mine Site because the model did not account for attenuation, and would enter the surficial flowpaths at concentrations higher than baseline groundwater.”	EDIT01
3868	The first paragraph incorrectly states that flow augmentation must be at least 145 or 180 gpm, which is 80% of capture flow rate of the current south-side seepage. Table 5.2.2-40 shows 400 gpm, which is the correct rate for augmentation (see The Water Modeling Data Package – Volume 2 Plant Site v9). The same error is made in the last paragraph on Page 5-153 (Section 5.2.2.3.2).	EDIT01
3869	The first paragraph of this section only discusses quantities of seepage during closure and not operations. The paragraph below could be added to discuss these aspects during operation: “During operations, the Category 1 Stockpile would be uncovered. Infiltration would percolate to the bottom of the stockpile and be collected by the surrounding groundwater containment system. As the stockpile footprint is expanded, the total seepage during operations will increase up to a maximum annual flow of between 290 gpm and 440 gpm. Most of this seepage would be collected and sent to the WWTF for treatment; an estimated peak flow of 20 gpm to 30 gpm would pass below the containment system and be drawn by gravity into the dewatered West Pit.”	EDIT01
3872	This table [(5.2.2-28)] is consistent with what was provided in the AWMP, but the corresponding text on Page 5-125 leaves the inaccurate impression that the effluent targets were what was modeled as effluent concentrations. The text should be modified to match the table.	EDIT01
3873	The use of the term “non-contact stormwater” in this table [(5.2.2-29)] and elsewhere in the text is somewhat confusing, as it seems to imply that this is water being managed by PolyMet. PolyMet recommends using the more appropriate term “unimpacted watershed runoff.”	EDIT01
3874	The first paragraph on this page should acknowledge that there is a low probability for exceedances caused by the project.	EDIT01
3875	Unnamed Creek should be included in the discharge locations for the WWTP effluent. SD006 is the location for Unnamed Creek, not Second Creek. The table organization contradicts language found in the last paragraph of page 5-177, which states “augmentation flow to Unnamed Creek would be via a single discharge near the current SD006 discharge.”	EDIT01
3876	The text states: “The rate at which contaminants would move through the groundwater would be the same as the groundwater seepage velocity downgradient of the containment system for all but four constituents (arsenic, antimony, copper, and nickel).” ... Because no attenuation values are used for the constituents – other than arsenic, antimony, copper, and nickel – the modeled rate of groundwater transport will be faster than the actual rate of transport in the ground. PolyMet recommends noting this fact in the text.	EDIT01
3878	The last sentence of the last paragraph states: “Transport of other non-attenuated solutes should be similar to lead, but the change in concentrations is not always as visually noticeable as it is for lead.” This statement is misleading. Lead is the only solute of interest where loading to the environment is predicted to increase as a result of the project, which is why it is the only solute to show a visible concentration front moving through groundwater down gradient of the tailings basin. Thus, other solutes do not show a similar behavior as lead.	WR082
3880	The second to last paragraph states: “...the concentrations of these metals in the WWTP effluent would be significantly higher than the concentrations in the current Tailings Basin seepage...” This sentence should be revised to use the term “modeled concentrations...” The modeled effluent concentrations from the WWTP are higher than the values reported in pilot testing of the proposed treatment systems for the WWTP, but were selected to be near, and slightly below, the potential effluent limit for the modeled constituents to provide a conservative assessment of potential consequences related to downstream water quality. PolyMet also recommends making this adjustment in Table 5.2.2-47 on page 5-188.	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3882	The second to last paragraph states: "...the average aluminum concentration in the WWTP influent and effluent would be about 10 mg/L..." This should be 10 µg/L.	EDIT01
3883	The first paragraph following the bulleted list states: "This dilution effect is demonstrated by the increase in measured aluminum concentrations from upstream tributary locations (UC-1, TC-1, and MLC-3) to downstream locations (PM-11, PM-19, and MLC-2), where upstream locations would average less than 100 µg/L compared to downstream locations averaging about 142 µg/L." It is unclear whether this refers to observed or modeled conditions. The use of the term "measured" implies reference to actual, observed data, but stating that upstream locations "would average less than..." implies model results. It also is unclear whether the 100 µg/L and 142 µg/L figures are modeled or observed.	EDIT01
3884	There appears to be inconsistency in the chromium standard that is used in this chapter. The referenced pages state: "Among the six constituents with hardness-based evaluation criteria (cadmium, chromium (III), copper, lead, nickel, and zinc),..." and Table 5.2.2-4 lists chromium (III), as the evaluation criteria with a hardness based standard. However, later in the document, the standard for chromium (VI) is used in Tables 5.2.2-30 and 5.2.2-42 for example. Please clarify which standard was used for chromium, and why.	EDIT01
3885	The number of pit lakes should be 16, not 21 as reported in this table [(5.2.2-49)].	EDIT01
3887	The third paragraph states "...precipitation, which averages about 9.8 ng/L based on average volume-weighted mercury in precipitation as measured at the Marcell Experimental Forest deposition site in Itasca County (NADP 2013)." Barr's analysis, consistent with the table on the next page, is based on 13 ng/L deposition based on the Fernberg Road site. PolyMet recommends citing the Fernberg Road concentration of 13.2 ng/L instead of the Marcell concentration of 9.8 ng/L. This comment also applies to the SDEIS's cumulative impact discussion in the first paragraph of p. 6-31 and second paragraph of p. 6-33 (Section 6.2.3.3.4).	EDIT01
3888	The second full paragraph on page 5-204 states: "The NorthMet Project Proposed Action is predicted to result in a net decrease in mercury-loading to the Partridge River from 24.2 to 23.0 grams per year." The basis for these numbers is not indicated and not consistent with data provided by Barr 2012b. The loading memo indicated a net decrease from 12.1 to 10.8 grams per year. Similarly, the first paragraph on page 5-207 states: "The NorthMet Project Proposed Action is predicted to result in a net increase in mercury loading to the Embarrass River of up to 0.6 grams per year (from 22.3 to 22.9 grams per year), about a 3 percent increase." The loading memo indicated a net increase from 18.5 to 19.1 grams per year. These same comments also apply to pages 6-31 and 6-34 discussing cumulative impacts (Section 6.2.3.3.4).	MERC04
3889	The second bullet, when explaining the predicted increase in mercury loading to the Embarrass River, states: "Tailings Basin containment system, which would collect seepage from the Tailings Basin, with an estimated mercury concentration of 1.1 ng/L, and route it to the WWTP, which would discharge with an assumed mercury concentration of 1.3 ng/L, for a net increase of 0.2 ng/L of mercury as a result of wastewater treatment, which is a conservative assumption." PolyMet suggests explaining that the reason this is conservative is because the WWTP would reduce mercury concentrations, and any additional mercury removal from installing a greensand filter, are not accounted for.	EDIT01
3890	The SDEIS states: "Overall, mercury loadings are predicted to increase slightly in the Embarrass River (3 percent) as a result of the NorthMet Project Proposed Action, but would be offset by a larger decrease (5 percent) in the Partridge River, resulting in a net decrease in overall mercury loadings (0.6 grams per year) to the St. Louis River as a result of the NorthMet Project Proposed Action." The basis for these percentages is not indicated and not consistent with data provided (Barr, 2012b). According to the loading memo analysis, the increase at the Embarrass River would be 0.2% and the decrease at the Partridge would be 0.9%. This comment also applies to page 6-18 in Section 6.2.3.3.4.	MERC18

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3891	The second bullet under NorthMet Project Proposed Action Design Changes states: “The location of the Category 4 Stockpile was shifted such that seepage would be captured in the Central Pit and East Pit and would minimize effects on surficial groundwater.” The terminology and locations used here are confusing. PolyMet suggests the following instead: “The location of the Category 4 Stockpile was shifted such that water contacting the stockpile would be captured in the East Pit and would minimize effects on surficial groundwater.”	EDIT01
3892	The sixth bullet states: “Refined Hydrometallurgical Flowsheet – A single (rather two) autoclave would be fed with nickel concentrate and produce copper concentrate produced with beneficiation refinements. The production of hydrometallurgical residue would be cut approximately in half with this design change. Residual copper would be recovered by cementation (contacting the leach solution with copper concentrate) to further upgrade the copper concentrate and to further reduce the production of hydrometallurgical residue.” To be more precise, the last phrase should be changed to: “... and to potentially further reduce the production of hydrometallurgical residue.”	EDIT01
3893	The first bullet discusses subaqueous disposal of reactive waste rock, but it does not mention subaqueous disposal of some of the Category 1 waste rock. Although Category 1 waste rock is considered the least reactive waste rock, it should still be mentioned here.	EDIT01
3894	The fourth bullet discusses the use of side dump cars to haul ore and states: “Ore Transport – PolyMet proposes to use side-dump rail ore cars that would minimize ore spillage (PolyMet 2013c).” Side dump rail cars were proposed as part of the DEIS, as documented in DEIS Section 3.1.3; therefore, this is not a design change and should not be included in this section.	EDIT01
3906	The last bullet discusses the WWTP and states: “A WWTP would be added at the Plant Site to treat Tailing Basin seepage through operations.” Treatment at the WWTP will not end at the end of operations. The WWTP will actually treat this water through operations and closure.	WR035
3907	The seventh bullet discusses the tailings basin containment system and refers to it as being “on the western, northern, and northeastern sides of the existing LTVSMC Tailings Basin.” The containment system is not located along the northeastern side of the tailings basin; it is located on the western and northern sides of the tailings basin, as described appropriately on SDEIS Page 3-116 (under Engineering Water Controls).	EDIT01
3908	The first bullet, as part of a tabulation of fixed engineering controls, states: “Process water management, including pipes, pumps, and process water ponds that would be used to separate and control stormwater and process waters.” This statement does not account for the fact that the process water ponds are lined. Accordingly, PolyMet recommends inserting “lined” before “process water ponds.”	EDIT01
3909	The flow monitoring for stormwater has footnotes stating that flows would be monitored continuously. There are no pumps associated with this infrastructure, so continuous flow monitoring is not proposed for stormwater flows. Flows are proposed to be monitored on a monthly basis as specified in the Water Management Plan – Mine (v2) Section 5.2.	EDIT01
3910	table [5.2.2-53] includes water level monitoring for Whitewater Reservoir. This was not included in the Water Management Plan – Mine and has never been discussed with the agencies.	EDIT01
3911	The fourth bulleted item is misleading and should be clarified by changing the text in parentheses to say “within Area 1.”	EDIT01
3912	The first paragraph states “The analog approach was based on similar mine settings (e.g., within the glacial till region).” PolyMet proposes the following revision: “The analog approach used observations of groundwater response adjacent to iron range mines characterized by moderate to high hydraulic conductivity glacial and fluvial deposits overlying lower hydraulic conductivity bedrock.”	EDIT01
3913	The third sentence of the first full paragraph should be clarified by identifying the source and rationale behind using 675 square meters of watershed area per meter of track in the contributing watershed as the method for identifying potentially impacted wetlands.	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3914	In the second sentence of the third paragraph, it is an overstatement to suggest that wetlands represent pre-European settlement conditions, as the area was likely logged several times since settlement.	EDIT01
3915	The second bullet should read: “In-kind mitigation means the replacement of the impacted aquatic site with the same wetland plant community type.” See USACE, 2009, II.D.3.	EDIT01
3916	The third bullet should read: “Out-of-kind mitigation means the replacement of an impacted aquatic site with a different wetland plant community type.” See USACE, 2009, II.D.3.	EDIT01
3917	In the second paragraph, the rule citation is incorrect as is the interpretation of the rule. The second paragraph should read: “The Federal Mitigation Rule also states that “difficult-to-replace” aquatic resources include bogs (33 CFR 332.3(e)(3) and Preamble, page 19633). The majority of the wetlands that would be affected by the NorthMet Project Proposed Action would be “difficult-to-replace” (coniferous bog and open bog) (USACE 2013). The Federal Mitigation Rule includes a provision for a case-by-case determination of mitigation ratios higher than the minimum 1:1 where necessary to account for the difficulty of restoring or establishing the desired aquatic resource type and functions.”	EDIT01
3918	The third sentence of the third paragraph is not supported by the data collected for the project. None of the wetlands proposed to be affected by the project were rated as having exceptional vegetative diversity/integrity ratings.	EDIT01
3919	The second to last sentence in the fourth paragraph should read: “For effects on wetlands with rare or exceptional functions or difficult-to-replace bogs, the USACE may require additional compensation in accordance with District Policy and the Federal Mitigation Rule.”	EDIT01
3920	The first sentence of the second to last paragraph should read: “If none of these incentives are met, the minimum mitigation ratio required is 1.5:1.”	EDIT01
3921	The third paragraph states that base compensation ratios could be increased to 2:1. There is not rationale or reference provided for this statement, which is not specifically stated in the District Policy or Federal Mitigation Rule. The same comment applies to page 5-316 and page 5-321.	EDIT01
3922	In the fourth paragraph, it is stated that Minnesota Rules 8420.0552 requires financial assurances to ensure successful wetland replacement. This provision only applies to wetland replacement that is not in advance. In addition, the local government unit may waive this requirement if it determines the financial assurance is not necessary to ensure wetland replacement.	FIN11
3923	The first paragraph states that because the compensatory wetland mitigation is planned in advance, that financial assurance would not be required under Section 404. This may not be true because the purpose is to ensure successful completion of the mitigation, and it may not be possible to determine success within one year of wetland mitigation construction.	FIN11
3924	The 6 rows [in Table 5.2.3-17] beginning with “<50%...” and “<80%...” are not relevant to the PolyMet project and could be removed in order to maintain clarity.	EDIT01
3925	The first paragraph after the list should read: “The financial assurance requirements would be part of the WCA permitting process for the NorthMet Project Proposed Action. Wetland replacement for the NorthMet Project Proposed Action is expected to be approved and constructed in advance of any authorized wetland effects (under the WCA approval) and, therefore, would not require financial assurance.”	EDIT01

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3926	No reference is provided for the statements made in the fourth paragraph. Justification for why the wetland mitigation opportunities discussed in this paragraph were determined to not be practicable was provided in “Wetlands Mitigation Plan Supplement – Wetland Mitigation Planning and Siting Documentation,” RS20T Draft-04, PolyMet, June 1, 2008. One additional difficulty with such wetland mitigation opportunities that was not discussed in the reference provided is the presence of severed mineral rights on many of those lands. In order to place restrictions on the land, as required for wetland mitigation, those mineral rights would need to be controlled.	EDIT01
3927	In the last paragraph, the third sentence should read: “The mitigation would be considered in advance if the initial phases of restoration on all of the proposed off-site wetland mitigation sites would be completed at least one full growing season in advance of the authorized wetland effects provided initial performance standards are met for which the mitigation would compensate.” Also, in the last paragraph, 939.4 acres is stated with no reference. That number should be referenced to Tables 5.2.3-19 and 5.2.3-20 of the 404 permit application.	EDIT01
3928	In the fifth paragraph, the first sentence should read: “The minimum replacement ratio that would be allowed by the USACE is 1:1 (USACE, 2009) for those wetlands that would be replaced with the same wetland type, and at least one full growing season in advance of the authorized wetland effects provided initial performance standards are met; however, base compensation ratios could be increased to 2:1 (add reference) for effects on wetlands with rare or exceptional functions or difficult-to-replace bog wetlands.”	EDIT01
3929	The first sentence in the last paragraph (before the bullet), should read: “Under the Minnesota WCA, the replacement ratio that would likely be allowed is 1.5:1, because the Aitkin Site wetlands are out of the NorthMet Project area watershed (see Tables 5.2.3-18 and 5.2.3-20).”	EDIT01
3930	The first sentence in the second paragraph should read: “The minimum replacement ratio that would be allowed by the USACE is 1:1 (USACE, 2009) for those wetlands that would be replaced with the same wetland type, and at least one full growing season in advance of the authorized wetland effects provided initial performance standards are met; however, base compensation ratios could be increased to 2:1 (add reference) for effects on wetlands with rare or exceptional functions or difficult-to-replace bog wetlands.”	EDIT01
3931	The first sentence in the third paragraph should read: “Under the Minnesota WCA, the replacement ratio that would likely be allowed is 1.5:1, because the Hinckley Site wetlands are out of the NorthMet Project area watershed (see Tables 5.2.3-18 and 5.2.3-20).”	EDIT01
3933	The first sentence in the last paragraph should read: “The minimum replacement ratio that would be allowed by the USACE is 1:1 for those wetlands that are replaced with either the same wetland type, or at least one full growing season in advance of the authorized wetland effects provided initial performance standards are met; however base compensation ratios could be increased to 2:1 for effects on wetlands with rare or exceptional functions or difficult-to-replace bog wetlands.”	EDIT01
3934	The first sentence on the page (continuing from the previous page) should read: “For low- to moderate-quality wetlands, the recommended base ratio of 1.5:1 would be reduced to 1.25:1 for in place and could be reduced to 1:1 if also either in-advance or in-kind.”	EDIT01
3935	The section on the Zim Site does not include any description of restoration methods and sequencing, which is included in the descriptions for the Aitkin and Hinckley sites. See “Zim Sod Wetland Mitigation Site Wetland Mitigation Plan” (PolyMet, November 2011) for an appropriate description.	EDIT01
3936	A footnote should be added to the table [5.2.3-18] describing why there is 101.8 acres of on-site wetland mitigation shown in the second to last column but no associated wetland credits in the last column. Similarly, the same acreage is shown in the “On-Site (acres)” column, but no associated credits are shown in the “Total Credits” column.	EDIT01

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3937	The last paragraph states, “Approximately 72 percent of credits proposed would be located outside of the watershed.” This statement is misleading because all of the proposed credits are above the minimum 1:1 replacement ratio. In fact, 48 percent of the proposed impacts are proposed to be replaced in-kind, in-place, and ahead of time. If the on-site wetland mitigation were factored in, approximately 56 percent of the wetland impacts would be replaced within the watershed.	EDIT01
3938	The last paragraph states that the Federal Mitigation Rule places additional emphasis on replacing coastal wetland losses within a coastal watershed. However, the Rule simply states that unavoidable wetland impacts within a coastal watershed should be replaced within a coastal watershed, where practicable. The Federal Mitigation Rule states that when sufficient bank credits are not available, permittee-responsible mitigation is the only option. It further states that, where practicable and likely to be successful and sustainable, permittee-responsible mitigation should be determined using the principles of a watershed approach (33 CFR 332.3 (b)(4)), which should be used to the extent appropriate and practicable. Therefore, the approach for compensatory mitigation for unavoidable wetland impacts within coastal watersheds appears to match the approach for wetland impacts in other watersheds.	COE01
3939	The numbers in the second sentence of the second paragraph are inaccurate. In this sentence, 7,350.7 acres should be 1,771.5 acres (based on Table 5.2.3-3; excluding the “no effect” acres) and 6,498.1 acres should be 587.1 acres (based on Table 5.2.3-4; excluding the “no effect” acres).	EDIT01
3940	In the third paragraph, the third sentence should read: “At The Mine Site, an additional 16 monitoring locations are proposed and are planned within all wetlands that have received effect factor ratings of 3, 4, or 5 near the North Met Project area features and in several wetland with effect factor ratings of 1 or 2 located throughout the areas of potential indirect wetland impacts.” This is consistent with the information provided on page 5-336, second paragraph of the SDEIS.	EDIT01
3941	The last sentence of the first full paragraph states: “Indirect effects were estimated by comparing the proximity of the NorthMet Project area infrastructure footprints to existing natural features.” Polymet suggests revising the text to read: “Vegetation communities can be affected by more than one of these types of indirect effects. For this reason, indirect effects on vegetation cannot be precisely quantified, as this would result in double-counting of vegetation community acreage where multiple indirect effects are manifested. The relative magnitude of indirect effects on vegetation communities can, however, be estimated. Typically, indirect effects are more likely to occur and/or are more likely to be evident in vegetation communities that are closer to Project components and other infrastructure (e.g., roads). Indirect effects tend to diminish with increasing distance from Project components and other infrastructure.”	EDIT01
3942	In the discussion of the NorthMet Project’s effects on culturally important plants, the SDEIS discusses wild rice but notes that that “a distinct list of plant species important to the Bands is not available.” The Bands were cooperating agencies in preparation of the SDEIS, and accordingly had every opportunity to provide a distinct plant species list. If such a list is not available, PolyMet recommends stating that the Bands have not identified culturally important plants not already identified and discussed in the SDEIS.	EDIT01
3943	The text describes indirect effects as a certainty, when there is no basis for determining the likelihood and/or magnitude of indirect effects. Where the text makes statements such as “[Species name] may be indirectly affected by changes in hydrology”, the word “potentially” should be inserted (“may potentially be indirectly affected”) to more accurately reflect the uncertainty over the likelihood and/or magnitude of indirect effects.	EDIT01
3944	The eighth sentence of the second paragraph states: “Disturbance-tolerant species may, in some cases, actually be disturbance-dependent.” PolyMet recommends providing a citation for this claim or removing the sentence.	EDIT01
3945	The last sentence makes an assumption about how impacts to a state-listed species could be mitigated through the purchase of an unprotected site. PolyMet recommends noting in this section that appropriate, acceptable mitigation will be determined by the MDNR.	VEG01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3946	The last sentence of the second paragraph assumes that the non-federal lands rank lower for biodiversity because no studies have been conducted to designate Sites of Biodiversity Significance and native vegetation communities. This is speculative and inconsistent with the data that demonstrate similarities in the cover types between the federal and non-federal lands. On that basis, it is reasonable to assume that, once the non-federal lands are surveyed, Sites of Biodiversity Significance will be designated, and native plant communities will be mapped.	VEG09
3947	In the second sentence of the eighth paragraph, it is misleading to state that “an average of 2,066 miles per day of vehicular traffic” would contribute to potential lynx impacts. The majority of those miles would be traveled within the pit/mine site and not along outside roads where lynx encounters would be far more likely.	EDIT01
3952	Second paragraph: The Transportation and Utility Corridor runs both parallel and perpendicular to the identified wildlife travel corridors.	EDIT01
3954	The last paragraph states: “Effects on aquatic biota from the lead exceedance due to changes in hardness are not well understood, but would likely increase the potential to adversely affect aquatic life.” This statement does not acknowledge that the modeling results predict increased potential for a lead exceedance (due to the use of a probabilistic model); rather, the statement incorrectly implies that there will inevitably be a lead exceedance.	EDIT01
3956	In the second paragraph, it should be noted that most of the floodplain on the federal land is outside of the Project Area.	EDIT01
3957	The right-most table column heading should be renamed “Non-FEMA regulated floodplains.” A column should be added for “FEMA-regulated floodplains.” This comment also pertains to Table 5.3.3-7.	EDIT01
3960	Table 5.3.3-5[:] The subtotal for open bog on non-federal lands is not accurate. The number should be 7.1 acres.	EDIT01
3961	The second sentence of the third paragraph lists “lean ore” as a handled material. However, lean ore has been eliminated from the Mine Plan.	AIR13
3962	The last sentence of the third paragraph refers to the proposed monitors at the Mine Site as “ambient air quality monitors.” This may be confusing because they are not intended to assess compliance with NAAQS/MAAQS, but to provide information for fugitive dust control. PolyMet suggests using “PM10 monitors” instead.	AIR12
3965	[In] Table 5.2.7-4... The Plant site emission totals include some double counting for natural gas and propane combustion emissions and do not reflect potential to emit or estimated actual emissions. The column heading (and text) using “Projected Controlled Emissions” may be confusing. PolyMet recommends using standard air permitting nomenclature: potential, actual, allowable, etc.	AIR12
3966	Table 5.2.7-6[:]... Plant site emissions are estimated actuals. The controlled potential would be more appropriate to compare to major source level. The Mine Site max single HAP emissions in table are for Mn. Max Plant +max Mine Site single HAP emissions are for Ni at 5 tpy. PolyMet suggests removing “...Prevention of Significant Deterioration-regulated...” from table title. Major source determination under NEAHAPS includes fugitive sources; PSD for non-listed source category does not.	AIR12
3967	The first two sentences of the first paragraph indicate that emissions in Table 5.2.7-7 are potential emissions. However, they are not for the Plant Site as these totals reflect some double counting for natural gas and propane combustion emissions (see Comment 204 above). Although the SDEIS distinguishes between potential and maximum potential emissions, it is not clear what the difference is. PolyMet suggests providing an explanation of the use of short tons in Table 5.2.7-7 and metric tons in Table 5.2.7-8.	AIR12
3968	[Regarding] Table 5.2.7-7[:]... Plant site emissions are not PTE or estimated actual emissions or proposed limited emissions.	AIR12

3970	The bulleted items require revision. The Northshore Mine does not consume increment. It was included in the increment analysis in that it was considered and eliminated as an increment consuming source (constructed before applicable baseline dates). The same comment applies to the text on page 5-410.	AIR12
3976	In the second to last sentence, Polymet suggest clarifying that the other sources were also modeled at maximum emission rates to show the modeling essentially constituted worst case scenario.	AIR12
3977	The text implies that mobiles sources were modeled for Class II criteria pollutant modeling. However, they were not (per EPA guidance and the approved modeling protocol). They were included in AERA and Class I modeling.	AIR12
3979	In the third sentence of the first paragraph, the increment result of 18 µg/m <sup>3</sup> is for the cumulative analysis. The accurate result is 27 µg/m <sup>3</sup> , as shown in table 5.2.7-11.	AIR09
3980	The first sentence of the second paragraph is incorrect. All sources were modeled together.	AIR09
3981	The second sentence in the first paragraph states that "...modeling analysis included the entire NorthMet Project area and nearby sources." The Plant Site results with nearby sources are in Chapter 6.	AIR09
3982	[In] Table 5.2.7-13... The figures for 2002 should be 0.001 and max 0.001.	AIR09
3983	[In] Table 5.2.7-22... "Inhalation only acute" and "chronic non-cancer HI" should be displayed with 1 significant figure – i.e. 1 not 1.0.	EDIT01
3984	In the second paragraph, PolyMet suggests noting that if metals are obtained from projects elsewhere, the projects are likely to be subject to much less overall environmental regulation.	AIR14
3988	In the last paragraph, the incremental risk at Wynne Lake for a recreational fisher should be as 0.07 in Plant Site AERA report, not 0.08.	EDIT01
3989	The third sentence of the first paragraph inaccurately states that H2SO4 was "screened out." The estimated risk was added to the other chemicals evaluated to obtain the total.	EDIT01
3991	The third sentence of the last paragraph lists "NO2 from natural gas combustion" as an acute risk driver. However, natural gas is not available at the Mine Site. Rather, NO2 is from diesel fuel combustion.	AIR12
3992	The sixth sentence of the first paragraph inaccurately states that H2SO4 was "screened out." The estimated risk was added to the other chemicals evaluated to obtain the total.	EDIT01
3993	The second sentence of the third paragraph inaccurately states that the risk assessment was refined by considering where maximum concentrations occur in space. The results were acceptable without this refinement. This comment also applies to text on page 5-426.	AIR09

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
3994	The first paragraph in this section states: “The science, policy, and regulatory frameworks regarding GHGs are continually evolving and are often subject to differing interpretation. For the purposes of the SDEIS, the information presented below is intended to provide the current understanding through June 15, 2012 with subsequent information regarding climate change updated in the FEIS.” PolyMet supports the SDEIS’s stated intent to supplement the GHG analysis with recent analysis and developments on the topic of climate change and greenhouse gases. PolyMet believes two recent developments in particular warrant acknowledgement in the FEIS. The first is President Obama’s directive to the EPA last summer to promulgate carbon pollution New Source Performance Standards (NSPS) for existing electric utility generating units by June of this year, adopt a final standard by June 2015 and require state implementation plans be submitted by June 2016. The second is the 2013 Minnesota law that will require Minnesota Power to generate at least 1.5% of its electricity through solar by 2020. These initiatives are expected to decrease the amount of indirect, power-production-related greenhouse gas emissions by the utilities that are expected to supply electricity to the NorthMet Project.	AIR01
3995	The first sentence of the first paragraph says: “If, during permitting, it is determined that mitigation measures are necessary, the measures described in this section could be considered.” However, most of the measures described are already an integral part of the proposed Project. PolyMet suggests deleting first sentence.	AIR13
3997	PolyMet recommends deleting the second to last sentence in the second to last paragraph on the page, which reads: “At the time this review was conducted, PM2.5 was not regulated under PSD and” at the beginning of the sentence and starting with “[T]he NorthMet Project Proposed Action is not subject to PSD...”	AIR13
3998	In the second paragraph, PolyMet recommends adding a statement that PolyMet agreed to apply more rigorous dust control procedures for unpaved roads at the Mine Site to also reduce fugitive emissions.	AIR07
4006	The text in the above two sections [(i.e., Section 5.2.10.2.6, p. 5-509; Section 6.2.3.11, p. 6-101)] makes reference to a potential Environmental Justice (EJ) impact for Band members and other subsistence consumers of fish due to increased mercury concentrations and associated increases in mercury bioaccumulation in fish tissue. This conclusion is reportedly based on the analysis presented in Section 5.2.2.3.4 and relates specifically to the Embarrass River and downstream chain of lakes. Page 5-509 states: “Operations could affect individuals who consume fish harvested from nearby water bodies... (see Section 5.2.2.3.4).” The discussion in Section 5.2.2.3.4 states that there would be a slight increase of “up to 0.6 grams per year (from 22.3 to 22.9 grams per year), about a 3% increase.” Although not directly referenced in Sections 5.2.10.2.6 or 6.2.3.11, text in the first paragraph on Page 5-21 is the only attempt in the document to correlate mercury concentrations in a water column to mercury content in fish. This is a critical connection if one attempts to suggest there is a potential EJ issue... PolyMet does not believe this relationship is substantiated by either site specific data or more general research presented in the literature. The statement that there is a potential EJ impact due to increased mercury concentrations and associated increases in mercury bioaccumulation in fish tissue is unsubstantiated by fact.	SO04
4007	The third full paragraph inaccurately states that PolyMet will be required to develop a risk management plan for HCl. Only HCl at a concentration of 37% or greater is subject per 40 CFR 68.130. PolyMet will be required to develop a risk management plan for liquid SO2.	HAZ01
4008	The third paragraph states: “Conceptual designs of the waste rock stockpiles, Tailings Basin, and Hydrometallurgical Residue Facility have been developed and shown by PolyMet, through an iterative design and model process, to meet the minimum safety factors and water quality criteria (see Section 5.2.2) acceptable to the Co-lead Agencies. PolyMet suggests changing the word ‘conceptual’ to ‘preliminary’.	EDIT01
4012	The required and computed Slope Stability Factors of Safety for the stockpiles are not presented. Stockpile Slope Stability Safety Factors are reported in Tables 2, 3 and 4 of Attachment G of the May 29, 2012 Geotechnical Data Package, Vol. 3, Version 2.	GT04

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
4015	The second bullet under Design Criteria states: "Factor of safety greater than or equal to 1.3 for short-term, undrained strength conditions for soils that are not prone to static liquefaction using undrained strength conditions." This sentence should be revised to indicate that this analysis does not include static liquefaction. Liquefaction is addressed subsequently.	EDIT01
4017	The second paragraph uses the phrase "bulk tailings." PolyMet recommends defining "bulk tailings" to limit potential confusion. LTVSMC Coarse Tailings are proposed for use in dam construction but since the Coarse Tailings may have occasional inclusions of fine tailings and slimes, the term "Bulk Tailings" has been used by PolyMet to describe the planned tailings borrow. The same comment applies to page 5-562, which states: "The proposed dams would be constructed from mechanically placed and compacted bulk tailings taken from the existing LTVSMC Tailings Basin as needed to produce the desired dam lift height and geometry. LTVSMC bulk tailings are currently defined as a mixture of tailings from the existing LTVSMC Tailings Basin."	EDIT01
4021	The eighth paragraph states: "As dams are constructed, exterior slopes would be covered with bentonite and vegetated. Upon reaching....." This statement is not completely accurate. On the exterior face of new dams, bentonite will be integrated into the near-surface layer of tailings. The dams will not be "covered with bentonite."	EDIT01
4022	The second sentence states: "The predicted Factor of Safety values for Cross Section F at various stages of development of the Tailings Basin are summarized in Table 5.2.14-1. All slope stability factors are designed to meet the factors of safety required by the NorthMet Geotechnical Modeling Work Plan (PolyMet 2013n, Attachment A)." It is more appropriate to say that the slope stability factors are designed to meet the "applicable requirements of Minnesota Rules 6115.0300 through 6115.0520 and the factors of safety required by the Co-Lead agencies in the NorthMet Geotechnical Modeling Work Plan (PolyMet 2013n, Attachment A)." The first paragraph under Design Criteria on p. 5-556 contains similar language.	EDIT01
4023	The third paragraph states: "Modeling was undertaken to predict the long-term stability of the Tailings Basin. As shown in Table 5.2.14-1 and Table 5.2.14-4, the long-term closure slope stability Factors of Safety are above the minimum value required under the Work Plan." It is more appropriate to say that the slope stability Factors of Safety "are above the minimum value deemed acceptable to the Co-lead Agencies and required under the Work Plan." There is similar language in the last paragraph on p. 5-566.	EDIT01
4024	The second paragraph states: "Where monitoring or model updates indicate that the Factor of Safety for the Tailings Basin no longer meets design criteria, appropriate modifications to the Tailings Basin would be considered, modeled, and, if necessary, undertaken." This sentence leaves doubt that prompt action will be taken if Factor of Safety values fall below design requirements. PolyMet recommends clarifying that mitigating measures will be explored and implemented as needed if at any time it is determined that Factor of Safety values have fallen below design requirements.	EDIT01
4025	The first paragraph states: "PolyMet took the steps listed below in order to demonstrate that the design of the Hydrometallurgical Residue Facility would meet the respective geotechnical requirements and would be in accordance with the NorthMet Geotechnical Modeling Work Plan (PolyMet 2013n, Attachment A):" PolyMet recommends revising the sentence to read: "PolyMet took the steps listed below in order to demonstrate that the design of the Hydrometallurgical Residue Facility would meet the Co-Lead Agencies respective geotechnical requirements and would be in accordance with the NorthMet Geotechnical Modeling Work Plan (PolyMet 2013n, Attachment A) which was reviewed by the Co-Lead Agencies."	EDIT01

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
4026	The third item under the first paragraph states: “Developed seepage and stability models using Geo-Slope International, Inc. modeling software (i.e., SLOPE/W, SEEP/W and SIGMA/W as necessary) for maximum facility dam height with minimum and maximum pond elevation, and post-closure – cover effective with minimum pond elevation the maximum.” The last phrase is poorly written and confusing. PolyMet suggests using the following revised text: “Developed seepage and global stability models using Geo-Slope International, Inc. modeling software (i.e., SLOPE/W, SEEP/W and SIGMA/W as necessary) for hydrometallurgical residue facility dam lifts 1, 2 and 3; each with maximum pond elevation, and an infinite stability model to analyze facility liner stability.”	EDIT01
4028	The text describing the figure [5.2.14-6] (see paragraph under “Identification of Design Cross Section” on p. 5-571) makes reference to Node A. Yet, Node A is not shown in the figure. There also is a blue dashed line (presumably denoting the phreatic surface in surrounding materials) that is not defined in the figure legend nor is the dashed line labeled in the figure.	EDIT01
4029	This Section [(5.2.14.2.3)] does not clearly distinguish between (1) the settlement of the Hydrometallurgical Residue Facility (HRF) foundation materials and resulting movement of the HRF liner system and (2) future consolidation of the residue deposited within the HRF and resulting movement of the residue surface. PolyMet recommends more detail to provide clarification.	EDIT01
4030	The first paragraph states: “The results reported in Geotechnical Data Package Volume 2 Version 3 indicate that the proposed design of the Hydrometallurgical Residue Facility would meet all respective factors of safety as required (PolyMet 2012a). The modeling undertaken and results are summarized below.” PolyMet suggests revising the statement to say that the design “would meet all of the Co-Lead agencies’ respective factors of safety as required (PolyMet 2012a).”	EDIT01
4031	The first paragraph states: “Analysis of the new dams (i.e., those not supported by the existing LTVSMC Tailings Basin or natural topography) at their greatest height (at year 20) resulted in a computed Factor of Safety for the ESSA of 2.32, which is greater than the required minimum of 1.5.” The sentence should be revised to state that the resulting Factor of Safety is “greater than the Co-Lead Agencies’ required minimum of 1.5.”	EDIT01
4032	The fourth sentence of the first paragraph states: “The minimum infinite slope stability safety factor for all Hydrometallurgical Residue Facility liner system components is 1.5.” It would be more appropriate if the sentence was revised to read: “The Co-Lead Agencies’ required minimum infinite slope stability safety factor for all....”	EDIT01
4033	The third sentence of the third paragraph incorrectly states that the “Land Exchange alternatives were not analyzed in the Biological Assessment.” These alternatives were analyzed in the Biological Assessment (BA). This sentence should be revised to state “Land Exchange alternatives were analyzed in the Biological Assessment for the Proposed NorthMet Mining Project and Land Exchange (USACE and USFS November 2013)”.	WI11
4034	The last sentence in this paragraph is inaccurate because Coyote Creek and Stony River on Tract 3-Wolf Lands are not comparable systems. The Stony River is a higher order, more diverse aquatic system than the first order, headwaters Coyote Creek. It cannot be assumed that the conclusions drawn from the studies for Stony River are applicable to Coyote Creek.	EDIT01
4036	The fifth paragraph states: “The only two reasonably foreseeable actions with the potential to significantly affect flow within the Partridge River and Embarrass River are the Mesaba Energy Project East Range Alternative Site and the Mesabi Mining Project, which would result in a net increase in Lower Partridge River flow as a result of pit dewatering for the foreseeable future.” This statement seems to ignore the eventual closure of the Northshore Peter Mitchell Pit (which is recognized elsewhere in the SDEIS). When that pit begins filling, Northshore will stop dewatering discharge to the Upper Partridge River. This would be a net decrease in flow relative to existing and modeled conditions. This action is anticipated within the modeling period but is not incorporated into the GoldSim model because the actual date of when this change would be made is not known. However, the potential for no discharge from Northshore to the Partridge River was considered in the sensitivity analysis conducted for the Project.	EDIT01, WR024

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
4042	Table 6.2-6 lists cumulative sulfate loadings to the Embarrass River by activity and includes NorthMet uncaptured groundwater seepage and NorthMet WWTF effluent. Table 6.2-6 does not include NorthMet augmentation flow from Colby Lake to Embarrass River tributaries. This source has a higher sulfate concentration than the WWTF effluent, and should be included in the Table.	WR124
4043	The introduction to Section 6.2.3.4, “Wetlands,” on page 6-34 states that the cumulative effects analysis “focuses on direct effects” on wetlands. Page 6-43 indicates that there will not be indirect cumulative effects on wetlands because water flows will not be changed. This discussion is in some tension with the effects analysis in Chapter 5, which anticipates the potential for some indirect effects on wetlands. PolyMet recommends referencing the discussion in Chapter 5 as part of the cumulative effects discussion.	EDIT01
4044	Regarding the third sentence of the third paragraph, no federally-listed plant species would be affected by the project because there are no federally-listed plant species in all of St. Louis or Lake Counties. PolyMet recommends re-phrasing the sentence to read, “No federally-listed plant species are known to occur on the NorthMet Project site.”	EDIT01
4045	The text states that least grapefern ( <i>Botrychium simplex</i> ) is most likely to occur in lowland deciduous cover types. However, least grapefern has a broader habitat range than the text implies. The MDNR Rare Species Guide provides: “ <i>Botrychium simplex</i> var. <i>simplex</i> occurs primarily in open sites, including prairies, wetlands, and abandoned mine sites. <i>Botrychium simplex</i> var. <i>tenebrosus</i> prefers forest interiors, especially low moist spots in mesic hardwood forests” (Source: MDNR Rare Species Guide: <i>Botrychium simplex</i> ). <sup>2</sup> The text also conflicts with Table 6.2-14, which lists both “Disturbed” and “lowland deciduous” as the likely habitat types. Finally, the section underestimates the range of least grapefern. The Preferred Plant Species Habitat column for least grapefern should include habitats other than lowland deciduous types, as discussed in the MDNR guide. <sup>2</sup> Available at <a href="http://www.dnr.state.mn.us/rsg/profile.html?action=elementDetail&amp;selectedElement=PPOPH010E0">http://www.dnr.state.mn.us/rsg/profile.html?action=elementDetail&amp;selectedElement=PPOPH010E0</a> .	VEG01, VEG09
4046	In the final paragraph below Table 6.2-13, the qualifying statement regarding the lack of precision and the degree of uncertainty inherent in the evaluation methodology should be stated up front in Sections 4.2.4, 5.2.4 and 6.2.4.	EDIT01
4047	In the second sentence, it is unclear what is meant by “MDNR minerals division data” and how this data pertains to ETSC or RFSS plant species. PolyMet recommends clarifying and explaining why this data is used in this section, but not in Sections 4.2.4 or 5.2.4.	VEG09
4048	The last paragraph states that “forestry management offers a greater range of options for ETSC plants to co-exist with the practice, as it can mimic natural disturbances.” This statement seems to be based on the previous statement in Section 5.2.4.2.1, p. 5-348, that “Disturbance-tolerant species may, in some cases, actually be disturbance-dependent.” As stated in a prior comment, PolyMet believes this statement is misleading and that it is inaccurate to suggest that ETSC plants favor and/or are increased by disturbance regimes.	EDIT01
4050	In the last sentence of the last paragraph, the increased percentage from the NorthMet Project Proposed Action alone should be 0.2 to 1.6 percent, not 0.2 to 1.8.	EDIT01
4051	PolyMet also recommends adding the following additional sentence at end of the paragraph at the top of the page: “This potential change is not likely statistically measureable and does not have any effect on the background fish Hg concentrations nor the current fish consumption advisories for the respective lakes.”	EDIT01

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
4052	In the first complete paragraph, the description of how the HQ is calculated does not reflect the calculations in the MMREM spreadsheet. To estimate the potential incremental HQ, the incremental methyl mercury exposure in mg/kg body weight per day and the reference dose are accounted for in the calculation. The derivation of the incremental HQ can be described as noted below: The incremental HQ calculation in the MMREM Spreadsheet uses the following methodology: -Incremental daily mercury consumed (mg) = estimated incremental increase in fish mercury due to the Project (mg/kg) x the amount of fish consumed (e.g. 0.142 kg for a subsistence fisher) -Incremental methylmercury exposure (mg/kg BW – day) = Incremental daily mercury consumed x 1.07945 / adult body weight (70 kg) -Incremental HQ = Incremental methylmercury exposure (mg/kg BW –day) / Reference Dose of 1.00E-04 mg HgCH3/kg bw-day (i.e., the ratio of the incremental methylmercury exposure divided by the reference dose in the same units).	EDIT01
4053	The cumulative emissions modeling includes NorthMet, so adding this result to the Project impacts includes some double counting of impacts. See also second to last sentence in paragraph under Section 6.2.3.8.4 header on p. 6-64. PolyMet suggests the following text changes and note additions to Table 6.2-19: [See PolyMet comment letter, page 66 of 70, Comment 258 for revised table]	AIR09
4054	Regarding the last sentence of the first paragraph, the cumulative analysis included both the Mesabi Nugget Large Scale Demonstration Plant and the Mesabi Mining Project.	AIR09
4055	[In] Table 6.2-22... The incremental result for Mesabi Nugget noncancer acute should be 0.03. The percentages at the bottom should be 9% for Cancer and 7% for Noncancer Chronic.	EDIT01
4057	Regarding the third sentence of the first paragraph, dry deposition, as well as wet deposition, was in the cumulative assessment.	AIR09
4058	PolyMet suggests editing the header of Point 4 to read: "15 percent of 2018 visibility impairment projected to be due to northeast Minnesota emissions and 70 percent of visibility impairment due to out of state emissions"	AIR08
4059	PolyMet suggests the last sentence of Point 4 be revised to read: "Emissions from Minnesota are the single largest contributor to regional haze and its own Class I areas; however, most of the visibility impairment in these areas is due to out of state emissions."	AIR08
4060	PolyMet recommends adding language to Item 5 that indicates national emission reductions are likely to drive further improvement of visibility in MN Class I areas.	AIR08
4061	The third paragraph under the heading "1854 Treaty Resources" states that the NorthMet Project Proposed Action could affect treaty resources through the bioaccumulation of mercury in fish tissue. This statement is inconsistent with the SDEIS's evaluation of cumulative effects on aquatic resources, which states that there will not be a significant increase of mercury in fish tissue. Because the subjective belief that such an effect may occur does not qualify as an effect under NEPA, the statement on page 6-95 should be removed from the SDEIS.	EDIT01
4062	The statement on hazardous materials in Section 6.2.3.14 indicates that "there could be a small likelihood of cumulative effects associated with increased traffic carrying hazardous materials." This is a mischaracterization of the potential cumulative effect. The sentence should state that the small increased risk associated with traffic carrying hazardous materials is not a significant cumulative effect.	HAZ06
4063	PolyMet recommends clarifying whether acres are reported in GLO or GIS throughout the entire [Land Exchange Proposed Action] section.	LAN06
4064	The text in the last paragraph is somewhat misleading by stating that there would be a decrease to MBS Sites of High and Moderate Biodiversity Significance. The nonfederal lands have not been surveyed for MBS sites yet. Therefore, you cannot accurately say that there would be a decrease; the surveys could potentially indicate that there would be an increase, or an even exchange.	VEG09

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
4066	The final sentence in Section 7.3.1 indicates that the federal lands contain certain natural resources that are “culturally important” to the Bands. While it is accurate that these resources would be lost if the NorthMet Project Proposed Action moves forward, it is also true, and should be noted, that there is no evidence of the Bands accessing any resources at the Mine Site.	EDIT01
4075	The third sentence in the third paragraph of Section 7.3.1, “Irreversible or Irrecoverable Commitment of Resources,” states that while cultural resources may be adversely affected, those effects would be “minimized through avoidance.” Under Section 106 of the National Historic Preservation Act, avoidance is not the only means of addressing adverse effects on historic properties, including the cultural resources identified in the SDEIS. Agencies may also choose to adopt minimization or mitigation measures. Those options should also be recognized in this paragraph.	EDIT01
4076	The final sentence in the first paragraph of Section 7.3.3, “Unavoidable Adverse Effects,” states that effects on water quality would remain after the implementation of mitigation measures. The paragraph should note that these effects would be minor, and not qualify as significant environmental effects.	EDIT01
4078	The first paragraph of Section 7.4, “PREFERRED ALTERNATIVE,” states that CEQ regulations do not require agencies to select a preferred alternative in a Draft EIS like the SDEIS. The same paragraph states that the USACE’s NEPA regulations (Appendix B of 33 C.F.R. Part 325) supersede the CEQ regulations’ “requirement to identify an agency-preferred alternative.” This description of these requirements is confusing. Neither the CEQ regulations nor the USACE regulations require the selection of a preferred alternative in the SDEIS.	EDIT01
4080	Appendix B, p. 1, 1.2 Assessment of Material[:] In the first sentence, “semi-qualitative” should be changed to “semi-quantitative.”	EDIT01
4081	Appendix B, p. 4, 2.2 Availability[:] The last sentence of this section should be changed to: “Notwithstanding economic considerations the underground mining alternative is available at the NorthMet Deposit.”	EDIT01
4082	Appendix B, p. 5, 2.4.1 Mineralization at the NorthMet Deposit[:] With respect to the bullet list of metal prices after the first paragraph, the referenced price for cobalt should be \$17.69 per pound.	EDIT01
4083	Appendix B, p. 7, 2.4.2 Underground Mining Costs[:] In Table 2, the Pre-production Capital Costs (\$ million) of 300 should be changed to 250. The Profit: Metal Value – Costs (\$ million) of -\$193 should be changed to -\$192 and -\$364 should be changed to -\$314.	EDIT01
5357	in Table 4.2.4-2, it is unclear how two of the three species with the highest percent occurrence are estimated to be “uncommon” on the site, while three of the five species with the lowest percent occurrence are estimated to be “common” on the site. This inconsistency should be corrected or explained. The EIS should also explain how estimated abundance at the Mine Site was determined, since the text says that no inventories of non-native invasives were conducted.	VEG09
5384	PolyMet suggests revising the first sentence in the second full paragraph on page 5-6 to read: “...PolyMet proposes a containment system that would capture about 99 percent of seepage from the Tailings Basin...”	EDIT01
5390	The first sentence on page 5-54 states that for Category 1 rock, “...instead of using lab tests, the rate of oxidation and constituent release was estimated from studies of seepage release measured in Dunka Mine rock....”. PolyMet suggests revising the first sentence to read “... instead of using lab tests, the rate of oxidation and constituent release in the field was estimated from lab release rates that were scaled using the results of studies of seepage release measured in Dunka Mine rock....”	EDIT01

5393	It is important to note that the Central Pit will not exist until after the Category 4 Stockpile has been decommissioned and the Category 4 waste rock has been relocated to the East Pit for subaqueous disposal. The most apparent benefit of relocating the Category 4 Stockpile as part of the Proposed Action Design Changes is that by locating the stockpile over an area that will be subsequently engulfed by the Central Pit, the overall area of surface disturbance (including vegetation, wetlands, etc) of the NorthMet project will be reduced.	EDIT01
5427	The second to last sentence should read: "Compensation proposed at the Aitkin Site would be expected to meet in-kind compensation, resulting in a compensation ratio for effects to wetlands with rare or exceptional functions or difficult-to-replace bogs of 1.75:1, and if in advance, the ratio would be reduced to 1.5:1."	EDIT01
5432	The second to last sentence in the second paragraph should read: "Compensation proposed at the Hinckley Site would be expected to meet the in-kind incentive, resulting in a compensation ratio for effects to wetlands with rare or exceptional functions or difficult-to-replace bogs of 1.75:1, and if in-advance, the ratio would be reduced to 1.5:1."	EDIT01
5434	The last full sentence on the page should read: "Compensation proposed for the Zim Site would be expected to meet both in-kind and in-place incentives, thereby reducing the compensation ratio for effects on wetlands with rare or exceptional functions or difficult-to-replace bogs from 2:1 to 1.5:1."	EDIT01
5442	The relative magnitude of indirect effects on ETSC or RFSS species would vary between ETSC/RFSS species and between locations of individuals or populations of a given ETSC or RFSS species. The potential for indirect effects on ETSC or RFSS species cannot be quantified, but can be estimated. Typically, indirect effects are more likely to occur in ETSC or RFSS populations that are closer to Project components and other infrastructure (e.g., roads). Indirect effects on ETSC or RFSS species tend to diminish with increasing distance from Project components and other infrastructure.	VEG07
5963	Section 3.2.3 of the SDEIS would be improved if it better reflected the thoroughness of the Co-lead agencies' alternatives review, including review that occurred during scoping and the 2009 DEIS.	ALT22
5967	instead of three action alternatives, the SDEIS contained just one action alternative—the NorthMet Project Proposed Action—which effectively combined the three alternatives studied in the 2009 DEIS, in addition to making other improvements and including a number of new mitigation measures.	ALT22
5968	The SDEIS also reconsidered in more detail certain alternatives that had been eliminated by the analysis in the 2009 DEIS. Those reconsidered alternatives included alternatives for a cover system on the Tailings Basin, one of which PolyMet ultimately adopted (SDEIS p.3-149); an underground mining alternative, which the SDEIS again rejected (id. p.3-150 & App. B); and a West Pit backfill alternative, which was likewise eliminated from further consideration (id. p.3-151).	ALT22
5969	the FSDD, 2009 DEIS and SDEIS contain a careful, thorough review of numerous alternatives to the NorthMet Project Proposed Action that fully satisfies the requirements of both NEPA and MEPA. It is unnecessary to discuss all the details of that review in the SDEIS.	ALT24
5970	PolyMet recommends explicitly referencing and incorporating into the SDEIS those portions of the FSDD and the 2009 DEIS that address alternatives. This should increase understanding of the iterative process of alternatives review that the SDEIS already references in several places... these changes should also be reflected in the Executive Summary, which tends to focus on the SDEIS alternatives review process, without fully acknowledging the role played by alternatives review in the FSDD and the 2009 DEIS.	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
5971	PolyMet recommends including an updated version of Table 3.2-4 from the 2009 DEIS somewhere in the Final EIS, either directly in the discussion of alternatives or as an appendix. This would provide context for the discussion of alternatives review and the elimination of alternatives that are not discussed as part of the SDEIS process... [these changes should also be reflected in the Executive Summary, which tends to focus on the SDEIS alternatives review process, without fully acknowledging the role played by alternatives review in the FSDD and the 2009 DEIS.]	EDIT01
5973	The SDEIS properly acknowledges that the U.S. Forest Service (USFS) decision on the Land Exchange Proposed Action must be based on applicable USFS standards. But the SDEIS could more clearly state that the Land Exchange Proposed Action can proceed if those standards are met, regardless of what happens with the NorthMet Project Proposed Action. Accordingly, consistent with the discussion in the 2009 Draft Environmental Impact Statement (DEIS), PolyMet recommends that the Final Environmental Impact Statement (Final EIS) clarify that the Land Exchange Proposed Action may occur independently of the NorthMet Project Proposed Action.	LAN08
5974	The Final EIS accordingly should clearly state that the Land Exchange Proposed Action can proceed entirely apart from the NorthMet Project Proposed Action, so long as the USFS determines that the land exchange is in the public interest and the regulations governing land exchanges are satisfied.	LAN08
5975	The Final EIS accordingly should clarify that the alternative of proceeding with the Land Exchange Proposed Action in the absence of the NorthMet Project Proposed Action was considered but eliminated from detailed analysis in the SDEIS because it is represented by the combination of “no action” on the NorthMet Project Proposed Action and Land Exchange Proposed Action Alternative A. This could be accomplished by adding a brief description of the Land Exchange Proposed Action as a “stand alone” action in Section 3.3.3.3. The alternative would not be eliminated as unreasonable, but rather it would not require further analysis because its impacts were already revealed and evaluated in the SDEIS detailed evaluation of other alternatives.	EDIT01
5976	the USFS “purpose and need” statement in the Final EIS should clearly state that the Land Exchange Proposed Action is intended to consolidate and enhance the functional boundaries of the Superior National Forest, improve public access to National Forest System lands, and implement the overall goals of the Forest Plan for the Superior National Forest. This language will expand on the SDEIS’s accurate statement that the USFS will observe the regulatory requirements for land exchanges.	NEPA04
5977	PolyMet further recommends adding to the front of the Final EIS a discussion of the regulations that require the USFS to ensure there is equalization of exchange values between the federal and non-federal lands, and more clearly linking these regulations with subsequent discussions of this topic in the record. In doing this, the USFS should make clear moving forward that Polymet intends to transfer all of the non-federal lands to the United States, whether they are needed for the Land Exchange Proposed Action exchange or not. At the same time, the USFS can highlight the possibility of a cash equalization if the offered non-Federal lands are deemed insufficient to provide an equal value exchange.	LAN03
5978	PolyMet recommends that the USFS ensure that the Executive Summary is updated to conform to any changes made in the Final EIS. The independent grounds for undertaking the Land Exchange Proposed Action should be particularly clear in the revised Executive Summary, because many readers likely will rely on the Executive Summary to understand the contents of the EIS.	EDIT01

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
5979	Section 1.1.2, Land Exchange, uses the phrase “depending on the results of the environmental analysis and real estate appraisals” to mean that the USFS will comply with applicable regulations and Executive Order (EO) 11990 and 11988 to require equalization of exchange values for the federal and non-federal lands, both in terms of market value and acreage of wetlands. As the USFS is aware, Section 3.3.1.1 (among others) discusses the applicable regulations in 36 CFR Part 254 and EOs 11990 and 11988. Discussing these applicable orders and regulations in Section 1.1.2—when the Land Exchange Proposed Action is first introduced—and stating expressly that the USFS will require equalization of exchange values, would help to clarify subsequent uses of the phrase. In addition, modifying this phrase (each time it appears) to say something more along the lines of “depending on the results of the environmental analysis and real estate appraisals, and in order to ensure equalization of exchange,” would also improve understanding of this issue.	LAN03
5980	Section 1.3, Purpose and Need, would be strengthened by a more robust discussion of the purpose of the Land Exchange Proposed Action, which clearly incorporates the relevant regulatory and public interest factors. While the discussion in Section 1.4.3, Land Exchange Requirements, identifies the regulatory and public interest factors that the ROD will need to address in determining whether the Land Exchange Proposed Action should go forward, it should be made clear that the phrase in Section 1.3.2.2, “meet desired conditions in the Superior National Forest Land and Resource Management Plan (Forest Plan),” includes the regulatory and public interest factors discussed later in Section 1.4.3. Thus, PolyMet would recommend the Final EIS specifically identify these factors in the initial discussion in Section 1.3, and include a cross-reference to the more detailed discussion in Section 1.4.3.	NEPA04
5982	the Final EIS should be clear that the land exchange will be justified under governing regulatory and public interest standards. Fundamentally, the Land Exchange Proposed Action will allow for the consolidation of lands within the Superior National Forest in a manner consistent with governing authorities. Section 1.3.2.1 accordingly should highlight this consolidation of lands as a primary purpose of the Land Exchange Proposed Action, instead of focusing on the elimination of the potential conflict.	LAN11
5984	In various places in Section 3.3, Land Exchange Proposed Action Detailed Description, PolyMet recommends clarifying that the Land Exchange Proposed Action may proceed even if the NorthMet Project Proposed Action does not.	LAN08
5985	The “Background” discussion in SDEIS Section 5.2.7.5.1 rightly recognizes that “[r]egulatory definitions for classifying fibers vary.” In fact, Minnesota statutes and regulations do not define the term “amphibole mineral fibers.” The description of “[t]he State of Minnesota’s definition” of amphibole mineral fibers in the “Background” discussion appears instead to be a reference to the permit-specific definition of “fibers” included in Northshore Mining Company’s Title V permit. That definition does not have general applicability. It is also important to note, as background, that neither the U.S. Environmental Protection Agency (EPA) nor the Minnesota Pollution Control Agency (MPCA) has ever promulgated an ambient air “fiber” standard, level or limit.	AIR12
5986	Although the SDEIS indicates that ERM conducted a literature review in 2009, it does not appear that review included the studies resulting from the 2003 International Symposium on the Health Hazard Evaluation of Fibrous Particulates Associated with Taconite and the Adjacent Duluth Complex (International Symposium). ... The purpose of the International Symposium is highly relevant to much of the discussion in Section 5.2.7.5 of the SDEIS ... The conclusion of these risk assessment scenarios was that “calculated risks were found to be trivial even after it was assumed that all mineral fibers were as carcinogenic as amphibole asbestos.” Id.... Those studies, and that conclusion, are not adequately reflected in the SDEIS [see full comment letter for articles].	HU01
5987	[The International Symposium’s] peer-reviewed analysis of the risks associated with ambient “fiber” emissions associated with the nearby Peter Mitchell Mine should be incorporated into the Final EIS’s discussion of amphibole mineral fibers. For example, where the SDEIS mentions that the Peter Mitchell Mine and the Silver Bay processing plant have been “associated” with releases of amphibole mineral fibers (5-438), it should be noted that peer-reviewed risk assessments of those releases indicate that they present a trivial risk to human health.	AIR03

<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
5989	The SDEIS properly acknowledges the ongoing University of Minnesota-led Taconite Workers Health Study (TWHs), including its finding that worker mortality is primarily due to commercial asbestos exposure, rather than exposure to the minerals being mined. (5-439, 5-440).	AIR03
5993	Based on the evidence from the International Symposium and the TWHs, it is also accurate to state that, in the extremely unlikely event of an amphibole mineral fiber release, those fibers would present a trivial risk to human health.	AIR03
5994	The SDEIS appears to have used the Forest Service regulations as a model for its definition of a reasonably foreseeable action. PolyMet agrees with this approach and believes that the Forest Service regulations provide an accurate description of “reasonably foreseeable” that can be applied easily and understandably to the cumulative impact analysis for the NorthMet project.	CU20
5995	In several places throughout the Chapter 6, the SDEIS concludes that the NorthMet project will have “no cumulative impact” on a specific resource. However, the corresponding section evaluating that resource in Chapter 5 shows a small, but insignificant, impact. In these situations, it is confusing to state that the NorthMet project will have “no cumulative impact,” which suggests that the project will not have any cumulative impact at all. Rather, it is more appropriate to state that the NorthMet project will not have a significant cumulative impact.	CU03
5996	on page 6-29, the SDEIS states that “[s]ince the NorthMet Project Proposed Action and other cumulative projects’ contributions would not cause or increase an exceedance of the water quality evaluation criteria, cumulative effects are not expected.” However, finding no exceedance is not technically the same as finding no impact. Here, it would be more accurate, and in keeping with the analysis in other parts of the SDEIS, to conclude that there would be no significant cumulative impact on water quality.	CU03
5997	the SDEIS concludes that there will be no cumulative impact on recreational and visual resources. It bases this conclusion on the fact that there are no significant cumulative impacts on individual specific resources that factor in to the assessment of recreational and visual resources (such as air quality, wetlands, etc.). The phrasing used implies that the co-leads have analyzed the effects on recreational and visual resources from impacts to these specific resources individually, rather than collectively. PolyMet suggests clarifying that the agencies have analyzed whether the impacts on these resources, although insignificant when considered individually, would have any impact on recreational and visual resources when combined and has concluded that there would be no significant impact.	EDIT01
5998	In Section 6.2.2, the SDEIS states that “[e]xisting conditions that may be related to past or present actions on the specific environmental resources are fully described in their respective section in Chapter 4 and the direct and indirect impacts of the NorthMet Proposed Action are described in Chapter 5.” ... PolyMet recommends providing references to the specific sections or subsections in Chapter 4 and Chapter 5 where the reader can find the basis for the conclusions made on each specific resource in Chapter 6. This relatively simple change will increase readability and make clear the basis of the conclusions in Chapter 6.	NEPA07
5999	The SDEIS should also use consistent language regarding the scope of the cumulative effects assessment areas throughout Chapter 6. On page 6-2, the SDEIS states: “For all resources, future temporal boundaries are the expected service life of the mining activities, including closure (years 20 to 40) and post-closure restoration (year 40 and beyond).” PolyMet recommends removing this sentence, which is not an accurate description of the temporal boundaries for all resources. Indeed, the very next sentence on page 6-2 rightly states that “temporal boundaries for each resource are defined within the respective resources’ sections of this analysis.” That sentence should remain as the sole, accurate explanation of temporal boundaries.	EDIT01
6000	PolyMet recommends, however, more clearly providing the basis for the geographic and temporal scope in each resource-specific section within Chapter 6.	CU05

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	PolyMet (47832)	
11134	The SDEIS includes ample information demonstrating that the Land Exchange Proposed Action independently satisfies applicable regulatory standards.	LAN11
11153	The statement of purpose and need should not suggest that the sole purpose of the Land Exchange Proposed Action is to avoid a disagreement over PolyMet’s right to mine under its minerals lease.	NEPA03
11170	Polymet is committed to transferring all of the nonfederal lands to the United States under the Land Exchange Proposed Action for management within the Superior National Forest, regardless of the results of the analysis of equalization of the exchange. If the USFS determines that all of the non-federal lands are not needed for an equal exchange under the Land Exchange Proposed Action, PolyMet would transfer title on a voluntary basis. Conversely, if the non-federal lands are not sufficient for an equal exchange, Polymet would make a cash payment as authorized under governing regulations.	LAN03
11230	Section 1.3.2.2 should identify the fact that PolyMet does not agree with the USFS legal position. This could be done by cross-reference to the appropriate sections in the 2009 DEIS that discuss this issue in greater detail than the SDEIS. For example, a simple cross-cite to Section 1.3.2.2 of the 2009 DEIS would ensure that the reader is aware that additional information on this topic is contained in the 2009 DEIS. PolyMet notes that the SDEIS repeats the USFS position (i.e., that mining cannot occur within the Federal Lands) in many places; as a result, it would be appropriate to note that PolyMet does not agree in most of the places where this issue is described.	EDIT01
11324	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:—Current workplace dust exposure levels—which by their nature would be higher than community ambient levels—are considered safe. Minnesota Taconite Workers Health Study: Annual Report to the Legislature, dated April 19, 2013 (TWHS 2013 Report), Executive Summary, p. 5; Minnesota Taconite Workers Health Study: Public Presentation, Mountain Iron, Minnesota, April 12, 2013 (TWHS 2013 Presentation), slide # 21.	AIR03
11326	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:—Mesothelioma and lung cancer rates among iron ore workers in Zone 4—the easternmost portion of the Iron Range, which includes the NorthMet Project area—are comparable to rates within the far western Zone 1. The highest rates for mesothelioma and lung cancer are found in Zone 2, which is also far west of the NorthMet Project, outside the Duluth Complex. TWHS 2013 Report, Section II, Table 4, p. 30; Section III, Tables 1 and 2.	HU08
11328	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:—A respiratory health study found no increased rates of mesothelioma or lung cancer among the spouses of iron ore workers. Because “spouses would likely have more exposure than those in the communities,” this finding suggests “individuals living in the communities in close proximity to the mining operations would not be expected to have higher amounts of dust-related respiratory disease” TWHS 2013 Report, Section IV, p. 45 (Emphasis added). See also TWHS 2013 Presentation, slides # 20, 47.	HU08
11330	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:—Ambient air samples taken at five Mesabi Iron Range (MIR) communities, including Babbitt and Silver Bay, registered total particulate matter (TPM), PM10 and PM2.5 levels that averaged one-to-two orders of magnitude less than the applicable national or Minnesota ambient air quality standard for those pollutants. TWHS 2013 Report, Section V, pp. 50, 54; TWHS 2013 Presentation, slides #23, 65, 66. The community averages for TPM and PM2.5 are particularly significant because they remained one-to-two orders of magnitude below the applicable ambient air quality standards, even during active taconite processing or mining. TWHS 2013 Report, p. 54.	AIR03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> PolyMet (47832)		
11333	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:…-Particulate levels (PM1, PM2.5, PM10 and TPM) increased slightly during plant or mine activity, but the increase was not statistically significant as compared to times of plant or mine inactivity. TWHS 2013 Report, p. 57; TWHS 2013 Presentation, slide #69.	AIR03
11336	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:… -No asbestiform Elongate Mineral Particles have been identified to date in any of the MIR communities, including Babbitt and Silver Bay. TWHS 2013 Report, p. 57; TWHS 2013 Presentation, slide #65.	AIR03
11338	The TWHS also contains several other findings that support the conclusion [in the SDEIS] that ambient “fiber” emissions pose no threat to the health and safety of mine workers or the general public:… -Particulate matter concentrations in the MIR communities were comparable to those of the two northeast Minnesota background sites (Ely and Duluth), and were lower in all cases compared to concentrations in Minneapolis. TWHS 2013 Report, p. 56; TWHS 2013 Presentation, slides #23, 65.	AIR03
11351	PolyMet recommends removing from the Final EIS statements indicating that the “release of amphibole mineral fibers . . . Could propose a potential public health risk of uncertain magnitude” (SDEIS at 5-439) or that “there remains an uncertain level of potential health risk from airborne amphibole fibers for the NorthMet Project Prosed Action” (SDEIS 5-440). Those statements ignore the evidence discussed above. It would be more appropriate to state that the available scientific evidence, including the evidence from the International Symposium and the TWHS, indicates that amphibole fibers from the NorthMet Project will not present a significant risk to human health.	AIR03
11370	Section 6.2.2.1.21 (Speculative Actions) should reiterate that these actions have not been considered in the cumulative analysis because not enough information is available at this time to allow for meaningful consideration of impacts. In addition, the basis for the determination that each of these projects is speculative should be stated clearly. For example, where the SDEIS states that a company is proposing a project, it should also clearly state that either funding has not been procured or that an application has not yet been submitted to the relevant federal or state agencies.	CU02
11371	the criteria [defining reasonably foreseeable projects and speculative projects] should be applied consistently throughout the cumulative impacts. For example, the SDEIS states that the United Taconite expansion/Highway 53 relocation is a speculative action. However, the SDEIS also acknowledge that a DEIS for the relocation is expected in the next several months. Because the Highway 53 relocation appears to meet the “reasonably foreseeable” criteria, its impacts should be considered in the FEIS.	CU02
<b>Sender Name (Submission ID)</b> Prospect Hill Friends (54689)		
17834	Although the mandate of the Minnesota Department of Natural Resources includes both protection and utilization of the diverse natural resources of this state, the highest priority should be protection. Once a natural resource is lost, restoration may be impossible. We are deeply concerned about the extent of damage that is likely to occur from extracting and processing this hazardous ore.	PER35
17835	The potential timeframe for post-closure maintenance is breathtaking. We reflect on the changes that have occurred in governance, commerce, society, and the environment of the US since 1814, the time span used in the model simulations at the mine site. It is illogical and unjustifiable to expect that treatment could be guaranteed over that time frame, even ignoring projected climate instability.	PD01
17836	We firmly believe and attest that clean water is more important to current and future human generations and the rest of creation than the metals that can be recovered. How can you approve a project that has a high probability of contaminating huge amounts of fresh water and the ecosystems this water supports?	SO01

<b>Sender Name (Submission ID)</b> Prospect Hill Friends (54689)		
17837	We are concerned that approval of this proposed mine will set a precedent for permits to mine the many other ore bodies located in the Duluth Complex, extending into the Boundary Water Canoe Area watershed.	CU04
17839	Even iron and taconite mining of relatively innocuous ore have caused significant environmental damage; the current plan as described in the SDEIS to mine the far more hazardous copper-nickel ores is unacceptable.	PD27
17840	We also disagree with this project on the basis of equality, equity, and social justice. The parties involved should not be tempted to trade temporary benefits for the loss of land that has cultural, spiritual, or historic significance to Native peoples.	SO02
17841	The employment projected by Poly Met for this project is not sustainable, and would draw many if not most employees from outside the region. In contrast, the more diversified activities that have been developed during the past two decades provide good incomes and a reasonable tax base. The region needs new, sustainable industries to support renewable energy, sustainable forest products, and other creative, non-extractive ventures.	SO06
<b>Sender Name (Submission ID)</b> Protect our Manoomin (42976)		
4074	Although Mesabe Widjiu is addressed in the SDEIS, we feel that the SDEIS is inadequate in addressing the issues; namely, reserved treaty rights and the health and well-being of the tribes involved.	CR01
4077	tribal members can exercise their usufructuary rights outside the property lines of PolyMet, but can't exercise those rights within PolyMet's property lines. However, as the SDEIS indicates, the effects of PolyMet's mining operations will extend well beyond the operation sites, and affect both cultural and natural resources in the 1854 Treaty Area.	CR01, CR02, CR03
4084	Under NEPA, the human environment includes the natural and the physical (e.g., structures) environment, and the relationships of people to that environment. A NEPA review must address the cultural context in which the project effects would occur... Although cultural resources under NHPA are covered and assessed in the SDEIS, we feel that documentation and evaluation of traditional cultural properties is inadequate. We don't feel that the NorthMet Project adequately balances development that will protect the 1854 Treaty Area.	CR01
4086	By its own admission, the SDEIS states in several sections (the two above are examples) that Mesabe Widjiu is essentially an NRHP that will be affected by PolyMet mining operations. The question is why is this project moving ahead considering the many mitigating factors associated with mining operations?	CR05
4088	Although the Bois Forte elders were speaking about the whole of Mesabe Widjiu, the Cultural Landscape Study, NorthMet Project, Final Report conveniently breaks it down to five geographical locations... The SDEIS overlooks the fact that Mesabe Widjiu, the cultural resources of which are protected under the 1854 Treaty, is not limited to five geographical locations.	CR05
4089	Protect Our Manoomin concurs with the tribal position regarding the CEAA [of the Partridge and Embarrass River watersheds being too small]. We are greatly concerned about the impact on not only the 1854 Treaty Area, but the impact of Anishinaabeg-gichigami, the Great Sea of the Anishinaabe, also known as Lake Superior.	CR01, CR03
4103	How will these toxins [from mining operations, including aluminum, arsenic, manganese among others (i.e., mercury, Fugitive air particles)] impact the waters, the air, plants, animals, fish, and human beings? What is to prevent the release of these toxins into Lake Superior?	AIR09

<b>Sender Name (Submission ID)</b> Protect our Manoomin (42976)		
4105	Protect Our Manoomin believes that there are a number of mitigating issues regarding reserved treaty rights that are impacted by the NorthMet Project. Reserved treaty rights are protected under the 1854 Treaty. Fond du Lac and Grand Portage have additional protections under the Environmental Protection Agency's Treatment-As-State status... In sum, the 1854 Treaty Area and Mesabe Widjiu are subject to precedent federal Indian case law regarding reserved treaty rights.	CR01, CR05
4108	Protect Our Manoomin feels that there are simply too many inadequate assurances that the 1854 Treaty Area and Mesabe Widjiu will be protecting from mitigating factors associated with the NorthMet Project. Our cultural, natural, and spiritual resources will be placed in harm's way.	CR01, CR05
4109	We feel that the NorthMet SDEIS marginalizes treaty rights and, in particular, reserved treaty rights. And, in doing so, the ancestral connections that Ojibwe people have in relation to the land are on one hand recognized but on the other hand denied.	CR01
4110	A total of 7 Anishinaabe elders were interviewed and their information was used to develop the framework for Cultural Resources... we question of why the interviews with Fond du Lac elders and Grand Portage elders were excluded from the SDEIS. Surely those interviews provide viewpoints that are pertinent to Cultural Resources, and strengthen the Anishinaabe connection to the 1854 Treaty Area and Mesabe Widjiu.	CR01, CR05, CR06
4130	What kind of assurances do we have that our eco-systems, our environment will be protected 20 years from now, 200 years from now, 500 years from now?	FIN01
4142	As cited in the SDEIS, the 1854 Treaty Area is properly recognized, and the usufructuary rights, i.e., reserved treaty rights, to hunt, fish, and gather are noted. Also noted is the exercise of those rights on public lands, although those rights are excluded from private lands unless permission is granted.	CR07
4146	The cultural landscape in question is specifically Mesabe Widjiu or the Historic Tribal District. Under NHPA guidelines, this entire area is covered under Traditional Cultural Properties.	CR02, CR04, CR05
4148	Protect Our Manoomin concurs with the tribal position regarding the impact on native plant communities [i.e., that there will be a net loss to the federal estate of these MBS communities that would not be compensated with equivalent MBS land exchange parcels gained through the USFS land exchange].	VEG02, VEG08
4152	Protect Our Manoomin concurs with the tribal position regarding Minnesota Wild Rice/Sulfate Water Quality Standard and the impact of sulfates on wild rice [i.e., the State's application of the wild rice standard is not in compliance with the Clean Water Act].	WR163
4154	The 137 manoomin lakes and rivers in St. Louis County are within the boundaries of the 1854 Treaty Area. Although the Minnesota Pollution Control Agency have specified that certain wild rice producing waters are protected under the Wild Rice/Sulfate Water Quality Standard, the rights of Ojibwe people gather wild rice on off-reservation land was affirmed by the U.S. Supreme Court in 1999. Therefore, all wild rice waters in the Ceded Territory are protected under 1864 Treaty.	WR163
<b>Sender Name (Submission ID)</b> Quinn Kilanowski (44306)		
14865	this mine could effect the aquatic life which would snowball into hundreds of problems including eagle populations, wild rice harvest, and the quality of the overall environment for tourists visiting the area.	AQ05
14866	While you claim the mining project would last a while, the park could last forever. FOREVER! That is definitely more economically sound than employing near a hundred people for a short amount of time.	SO01

14867	It does not matter how many steps are taken to prevent ecological damage, damage will be done. And seeing as this would be your first mining project I'm sure it will be damaging beyond what you estimate.	PD01
<b>Sender Name (Submission ID)</b> R Rita Caruso-Santamaria (20748)		
1937	Is it worth risking polluting the environment for 500 years and the subsequent health effects in exchange for any kind of profit?	SO01
16109	Is it worth risking the lives of thousands of people and mass environmental contamination for profits that are not going to remain in the USA?	SO01
16112	We need to balance environmental and economic interests, renewable technology to produce energy that is not going to take humanity and the world to self-destruction.	NEPA15
<b>Sender Name (Submission ID)</b> R Scott Thiem (54704)		
17773	Computer models show that water from the mine and the processing plant will be contaminated with heavy metals and sulfates. PolyMet says that they can capture all of the contaminated water on the site and treat it before it's released into the environment. But their own mine plan shows otherwise, admitting that millions of gallons of polluted water will seep off site, untreated. Even when the mine closes after twenty years, this will continue for hundreds of years.	WR115
17774	The EIS states that the DNR officials say it isn't known how long treatment could be needed. That uncertainty and concerns about how much long-term pollution would cost casts serious questions as to the adequate protections. The EIS estimates \$200 million a year are needed as a damage deposit. Has this damage deposit been calculated out over the 500 years it may take for soils to neutralize? What if cost exceeds the damage deposit set aside? It will be the state taxpayers that will end up with the bill?	FIN01, FIN05, FIN10
17775	PolyMet doesn't have a contingency plan for unforeseen problems like difficulties with water treatment plants, leakage from tailings ponds, and pipeline breaks need to be accounted for in a mine plan.	PD22
17776	At issue is the amount of water that flows through the area affected by the proposed mine, which sits near the headwaters of the Partridge River, a tributary of the St. Louis River. In determining the mine's effects on water quality, the "base flow" rate for the river is a key variable, but it's one for which agencies like the Department of Natural Resources do not have reliable data.	WR003, WR111
17777	No mining operation like this should be allowed to leave waste piles and tailings in a huge open hole in the ground that will fill with water and eventually overflow. A mine like this needs to be reclaimed. ... If the PolyMet people don't want to spend the money to reclaim the right way, then their permit should be denied.	PD01
17778	It is said that the PolyMet project will only produce 360 permanent mining jobs. That is very low for a project of this size. ... Minnesota should not be exploited for the profit of a foreign company that would destroy our environment, take a proportionally small amount of metal and leave the state and take with it all the profits with them.	SO01

14745	With pollution and industry affecting so many of our natural places, our public lands need to stay public, and not be given away for the benefit of a few in industry. Please keep these lands protected for public enjoyment rather than private benefit and reject the open pit sulfide mine.	LAN01
<b>Sender Name (Submission ID)</b> Rachel Christensen (48303)		
13120	The SEIS already makes it clear that wetland "restorations" will not take place in the Lake Superior watershed and are highly unlikely to replace bogs. The wetlands at the site have been rated as "having high wetland quality." How can they possibly be "replaced?"	WET03, WET05
13121	It's questionable that a company that plans to mine the proposed site for 20 years, could possibly provide "financial assurance" to cover the expensive costs of water treatment for 200 years or more into the future. Can such treatment truly control all the sorts of pollutants that will come from the mine site?	FIN01, WR037
13122	A large portion of the proposed PolyMet site has been designated by MN DNR as "Sites of High Biodiversity Significance" that support 11 state-listed species of plants. How can destruction of such an area be rectified?	VEG01, VEG02
<b>Sender Name (Submission ID)</b> Rachel Eckert (57970)		
19852	Save the beautiful boundary waters. They are one of the most beautiful places in Minnesota that more people deserve to enjoy.	LU04
<b>Sender Name (Submission ID)</b> Rachel Garwin (41913)		
2132	The SDEIS considers actions related to the taconite industry and public sector in this [cumulative effects] section. The SDEIS, however, fails to account for any additional copper-nickel sulfide mining activity related to the NorthMet project, and it is thus inadequate... The co-lead agencies should properly study the cumulative impact of all related copper-nickel sulfide mining projects facilitated by the approval of the NorthMet project.	CU04
2133	The SDEIS should include estimates for the length of time and amount of money necessary to treat the water in order to meet Clean Water Act standards... Waiting until the permitting stage of the process is too late, as so much momentum will have built behind the NorthMet project that it will almost necessarily go forward at that point. The co-lead agencies should revisit this question and give the public a reasonable estimate of the estimated time and cost associated with treating the pollution associated with the NorthMet project.	FIN05, FIN13
2135	SDEIS uses a low-quality, unreliable study to support its socioeconomic impact analysis. The Bureau of Business and Economic Research (BBER) 2009 & 2012 studies are inadequate to the task of informing public policy, as they only consider assumed benefits of expanded mining activity in the region and do not assess costs.	SO04
2136	The SDEIS fails to provide an adequate cost-benefit analysis, as well, as neither report assesses the extent of the effects of a growing sulfide mining industry on the already robust tourism and recreation industry built around the SNF, Lake Superior, and BWCAW.	SO01
2138	Additionally, the IMPLAN model was not designed to consider economic impacts as the inputs change over time.	SO04

14207	With a proposal like this, the state has to look long term, fully weigh the potential negative impacts and protect one of Minnesota’s most precious assets.....the environment	GEN01
<b>Sender Name (Submission ID)</b> Randy Holland (43243)		
11710	Thus it's certain that Polyment and other mining companies won't exist in their present form centuries from now so restitution seems unlikely in case of disaster, leaving future generations to pay for the benefit of existing Minnesotans.	FIN01
11712	It's been pointed out that generic water flow assumptions are being used that may underestimate required site-specific treatment facilities.	WR003, WR091
15806	given that sulfide mining may require the longest water treatment plan in history, it's shocking that there is little scientific basis for the estimates of 500 years or more of treatment.	WR035
15808	it is truly stunning to me that the mining job estimates don't factor in the risk to the much larger tourism industry.	SO02
15811	Given the Arrowhead region's total mineral deposit potential, spending another 6-12 months to inject more science and facts into this discussion would show that short-sighted greed by both the state's budget and mining special interest won't trump the risk of polluting the Boundary Waters, Arrowhead region, and Great Lakes watersheds.	NEPA15
<b>Sender Name (Submission ID)</b> Randy Lasky (38851)		
5160	We feel the project has demonstrated via credible economic impact modeling, that it will deliver a significant economic impact over the 20 year planning period and beyond.	SO10
5161	It’s about jobs and the environment and with the addition of 360 new, quality skilled mining jobs as well as over 600 indirect, valued-added, living wage jobs that can support families; this is significant in a region dependent on our natural resources for upwards of 50% of our regional Gross Domestic Product (GDP). If we look at direct financial impacts on the schools statewide and in the region, as well as tax revenues to local, state and federal government of approximately \$55 million annually, this is a win-win for us all.	SO10
5162	Second, in terms of financial assurances, we understand laws currently exist to provide permitting agencies the flexibility needed to make sure that the State and all of us are not forced to deal with a bankrupt situation and major environmental problems should something happen to PolyMet and this project. Those safeguards for non-ferrous mining can and will be imposed by Minnesota Department of Natural Resources (MDNR) during the permitting stage.	PER03
5163	In terms of flexibility to hold PolyMet accountable, appropriate assurances can be determined and implemented; under the law, MDNR could select from any number of financial assurance tools including trust funds or escrow accounts, surety bonds, letters of credit, certificates of deposit or insurance policies. Whatever instrument is selected, we agree it has to be bankruptcy proof, held in title by the State, continuously in place, annually updated and readily available to regulators to safeguard the State’s interests.	FIN01, FIN05, FIN08

7935	The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them...The impact to Northern Minnesota's environment will be minimal.	NEPA16
7937	The land post-closure will be reclaimed to protect natural resources over the long term in compliance with the law and enough money is designated to ensure that this process is achieved...Poly Met will provide financial assurance to cover all closure costs.	FIN16
7939	Poly Met's planned mine layout minimizes impact to wetlands, and its reclamation and mitigation plans will replace the wetlands that are lost due to mining.	WET25
7941	PolyMet will control and manage stockpile water with proven technology such as foundation liners, water collection systems and cover systems.	WR190
7942	PolyMet will not discharge process water to the environment that has not been treated with reverse osmosis.	WR190
7944	Poly Met will be a minor source of air pollutants.	AIR14
<b>Sender Name (Submission ID)</b> ray (3424)		
210	I support Polymet for the following reasons[...]Controlling the existing pollution from the old LTV operation and refurbishing the plant and area.	PD28
646	The project will bring in tax dollars and boost the economy in support of future development in the state.	SO10
840	My concern is in the comment process, and the ability of the DNR to remove the political pressure based on the number of comments.	NEPA06
856	The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations.	PER34
857	I'd also like to address some misinformation ... It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time [200-500 years]. It also shows the project will still meet water quality standards even that far out.	WR115, WR189
859	This [groundwater flow] model demonstrates that PolyMet's plans comply with Minnesota's laws.	PER34, WR190
860	We cannot afford to miss this job opportunity.	SO10
861	Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.	NEPA16
878	I believe that the ... eventual operation of the reverse osmosis water purification [used for the NorthMet Project] will provide a research platform for future pollution control other than mining. Minnesota could become a leader in solving water pollution problems worldwide.	WR190
879	the Polymet process to control water pollution is a perfect platform for learning and moving Minnesota into the world stage of this type of pollution control. I believe that eventually it could be a new industry for Minnesota above and beyond mining world wide.	SO10, WR190

17902	As a Minnesota resident, I am greatly concerned by the lack of clarity in the report, in particular in regard to the long-term cumulative impact of the mining on Minnesota's moose population and other habitat destruction.	WI01
17904	efforts to help protect and revitalize Minnesota's moose population cannot be forgotten or altered by the proposed Poly Met NorthMet mining.	WI01
17906	If the PolyMet plan is approved without further study of the impacts on the moose population, the current concerns of the DNR towards Minnesota's moose would not only be exacerbated, but it could alter the significant efforts already being made by DNR to understand the complex, important and potentially devastating problem at hand.	WI05
<b>Sender Name (Submission ID)</b> Rebecca Stoner (54837)		
18756	Based on the Minnesota Environmental Rights ACT, I have a statutory right to object to any pollution, impairment, or destruction of the environment and I'm asking you all to uphold that right...I feel strongly that we are all stewards of the [BWCAW] area and I will fight any type of pollution of these waters	PER35
18757	Because we have 1/5 of the world's fresh water in Lake Superior ... and the Boundary Waters Canoe Area Wilderness ( BWCAW) is the most visited wilderness area in the country because of it's fairly pristine conditions so far, I DON'T THINK THERE IS ANY REASON ON PLANET EARTH THAT ANYONE SHOULD BE ALLOWED TO POLLUTE ANY OF THIS.	WILD02
18760	[PolyMet] want us to believe that they wouldn't harm the water of the BWCAW or Lake Superior (LS) any more than anyone else is. Just because the current EPA standards are not being met by other mining operations on the Range doesn't mean that others can come in and do it also and on a much larger scale that would compound the problem.	CU01
18765	Research is showing that a statistically significant percentage of babies born on the North Shore already have high levels of mercury in them. This mining effort would worsen that also. Nobody is doing a health evaluation of the pollution of not only the runoff but also the air and groundwater pollution and I feel that should be included in any EIS that affects this many people in an already-polluted area. I join with the Duluth Medical community in protesting this aspect of it also.	HU03
18787	[PolyMet] want us to believe that their proposed sulfide-laden waste rock pile and their "Proposed Engineering Controls" wouldn't leak thru the liner they'll have on the ground for the more than 500+ years it'll take for it to all leach out. That's about the amount of time it's been since Columbus discovered America. They must think us all fools....They say that their proposed injected clay barrier wall under the waste pile and liner that attaches to the bedrock there won't leak ever.	PD15
18789	[PolyMet] state that there are no cracks in the bedrock underneath their waste rock pile that might allow for drainage to run into underground water sources there. They didn't even address it in their proposal as a possibility.	WR007
18790	They say that their "fugitive dust" that contains many pollutants including more mercury than they are willing to add up won't add anything to the pollution there so they didn't even include it in their EIS for all to read. They considered it "not an issue" but it will contain copper, nickel and mercury. Not really harmless, is it? ... It is NOT an insignificant amount and would harm everyone locally and downstream /downwind of their operations.	AIR04
18791	they say they can adequately collect and treat ALL of their wastewater during mining operations AND for 500+ years and not leave us with a Superfund area subsidized by our descendants. This is a multinational corporation, formed on purpose that way so they can skirt our laws and none of them will take the blame and pay the cost of treating anything when they've taken what they want and left the area...Their Financial Assurance that's published is flimsy at best and the whole permit should include their major funder Glencore or it should not move any further.	FIN01, FIN02, FIN10

<b>Sender Name (Submission ID)</b> Rebecca Stoner (54837)		
18792	For their proposed "Water Evaluation Criteria", they used small site-specific area testing of each area, which they extrapolated out for the whole area that allowed the whole area of water there be degraded to the small site specific criteria. ...Basically they're saying that since this area is already polluted, we should be able to continue to pollute it to the tested amounts.	WR064, WR078, WR177
18794	When testing for solutes, they conveniently ignored and didn't publish any testing on mercury which I feel is illegal and unethical at least. They also had 2 exceptions to that list, including lead and aluminum which will also be a factor in their mining efforts and are toxic in our water supplies. Copper is another metal not in their EIS and it goes on forever way above the standards.	WR038
18796	They'll be using Colby Lake water for some of their operation and because that lake is already polluted with mercury and aluminum, and they don't need a permit to use it, they don't have to filter it or treat it. Not a good idea.	WR123, WR184
18797	Models for the mine site for base flow of the Partridge River don't match the low flow measurements. So we can't believe any of their predictions for long-term treatment. Redo the study or don't permit it.	WR003
18799	In this age of climate change, they did not address excessive rain events and what they would do to mitigate that with their systems.	PD22
18800	All of their pollution could end up in Lake Superior. Who will want to come here for tourism if our water is polluted, undrinkable, unswimmable, etc.	WR111
18803	They have not addressed mitigation for indirect impact on wetlands or wildlife travel corridors and that would need to be done before permitting. There would be destruction or degradation of >1700 acres of MN bird survey sites of High Biodiversity Significance and the land exchange proposed doesn't even come close to replacing all that will be lost.	WET01, WI02, WI03
18806	How would their product get safely to Canada from the mine? They haven't addressed that anywhere and the route would probably go thru more wilderness area.	WILD01
18808	The money received for the privilege of removing the minerals of the Arrowhead might help with our schools and the estimate is about one textbook per student. NOT worth it by any means. I understand that the DNR needs the money pretty badly so there may not be any money for schools come out of this fiasco at all. It would hire 0.012% of all MN workers for maybe 1 generation total. It would create 0.1% of MN GOP. We don't have an unemployment problem in Minnesota that is worth all this destruction.	SO07
18809	How can the DNR both protect our environment and be required to make the most money off the same land as they possibly can. These 2 mandates are contradictory and should be fixed.	PER42
18810	To substitute fairly low number of temporary jobs on the Range for probably 1 generation only, with the potential to destroy some of the most precious and abundant water resources in our country and the many thousands of tourism jobs that are here because of that water, makes no sense to me...Tourism is OUR business .. Our ONLY business. It is our livelihood and our way of life. OUR economy.	SO01
18813	Recycle valuable metals now. Reuse. Encourage international conservation of these precious metals so we can't have to destroy our local land by digging up more of them.	ALT09, ALT16

14941	Its more common than not unfortunately that after mankind starts to mine, log and destruct the natural habitat that horrible catastrophic effects on Mother Nature and all of her inhabits.	SO01
<b>Sender Name (Submission ID)</b> Red Cliff Band (42974)		
3899	As this project negatively affects wetlands that are protected under our treaty rights, which reserves our right to hunt, fish, and gather within ceded territories in the 1854, 1847, and 1842 Treaties between the Lake Superior Chippewa and the United States government, we object to the destruction of such a large amount of wetlands... [in the case] that the project may still be permitted, [there is a]... need for more stringent measures to project the wetlands, particularly those wetlands sites of High BioDiversity Significance.	CR01, WET19, WET23
3902	While there is no policy or requirement to mitigate effects on the MBS sites of High Biodiversity Significance and that the mine reclamation may allow such BMS sites to reestablish, we believe that it would be in the best interest of the company and the state to establish mitigation plans for these wetlands. They are unique and of value to the Red Cliff Band of Lake Superior Chippewa and all other Chippewa tribes. Considering their uniqueness and value, there should be mitigation in place that properly reflects the uniqueness and extreme sensitivity of these areas.	CR01
3903	Red Cliff would like to reiterate that the water flow hydrology has been inadequately characterized, and would like to see the XPSWMM's projections be recalibrated with more recent and more local data. The current projections used data from 1978-1987 and from a site over 17 miles away. This results in a low estimate of baseflow and results in data that are not only inaccurately, but underestimates the potential for negative hydrological effects caused by the project.	WR003
3904	We also feel that it is reasonable to plan for higher levels of precipitation than historical records have shown due to the unfathomably long duration of this project and potential impacts of climate change, 100 year floods, and the potential of extreme weather events.	WR077, WR180, WR189
3905	The IMPLAN Study is based on study that was developed in the 1970s. Many in the academic community considered it obsolete. This IMPLAN Study only measures positive impacts and not negative impacts. Thus we feel that the potential socioeconomic factors of the NorthMet project are not being properly related to the public.	SO04
4001	Another problem with the analysis is the lack of distinction between full time, part time, seasonal, and permanent positions. It also does not make a distinction between which jobs will be available during certain periods such as how many employees during opening, full operation, closure, and reclamation. These are important distinctions to be made to determine the value of the jobs that are being offered by NorthMet and this project.	SO04
4004	no trade union agreement was mentioned [in the SDEIS], making the possibility of non-local (out-of-state) workers to make up the majority of the positions.	SO06
4005	The proposed private land being offered in exchange is problematic. It is not contiguous and some parcels are located in other counties. This would complicate the manner in which the US Forest Service cares for these tracts and likely be a greater financial burden to the agency. The parcels in question include the Lake County Land Tracts in Lake County and the McFarland Lake Tracts in Cook County.	LAN07
4016	The tribe feels that the underground mine shaft could be a potential alternative that is less destructive and would remove the need for the proposed land exchange... The underground mine shaft would reduce many of the problems that the Red Cliff Band of Lake Superior Chippewa has with this SDEIS. The underground mine shaft alternative would have a positive impact on ambient air quality, wetlands and the need for wetland mitigation, and likely reduce the reclamation period.	ALT01

4019 [The underground mining] alternative was dismissed as being economically infeasible, but a more in-depth analysis into the economic feasibility has not been released into the public... We believe that the environmental benefits, cultural uses, and historical properties outweigh the socioeconomic costs [of the underground mine alternative] and that the NorthMet Company should reassess how much they may save in reclamation/closure costs, taxes, employee wages, and potential fines from violated permits. Lastly, it appears extremely unrealistic that NorthMet can expect several centuries of treatment of their facility after closure, but cannot afford the underground mine shaft alternative. ALT01

4091 Other problems with the economic aspects of the SDEIS include the absence of a minimum/maximum budget for paying employees' salaries and where these jobs will be located. The highest paid employees for many mining operations and similar projects are lawyers and engineers who do not live in the immediate area of the actual project themselves, therefore are not directly contributing to the most immediate local economy. SO04

**Sender Name (Submission ID)**    Regan J Scuffy (54647)

17994 I feel that PolyMet, The State of Minnesota and the federal agencies have done a great job on drawing up the second EIS draft and making sure that they are totally in compliance with the regulations. NEPA16

17997 I also feel that the project would be a huge economic benefit to the Iron Range and also for the State of Minnesota. The job opportunities alone that would be created from this project would be a plus for the families that live and want to stay in Northern Minnesota. ... I have been a resident of Northern Minnesota for 40 years and I can't see this mining process being any worse than other mining that is or has taken place across the Iron Range, especially with today's regulations. SO10

**Sender Name (Submission ID)**    Reginald Defoe (19511)

14823 why would we further damage the area, the watershed, by opening up the sulfuric mining operations and to damage it any further when we're spending millions and millions of dollars on cleaning up an area that once used to be pristine with thousands and thousands of acres of wild rice. WR111, WR115, WR162

**Sender Name (Submission ID)**    Reid Carron (11540)

2491 ..... "allowing private surface mining would be inconsistent with USFS legal mandates for acquiring and managing these lands" [under the Weeks Act.] The SDEIS fails to address adequately the socioeconomic cost of the loss of intact, contiguous existing habitat at the mine site or to assess the relative value of the non-contiguous lands to be acquired in exchange. The SDEIS does not explain how the USFS can abandon its responsibilities to manage Weeks Act land for habitat and watershed protection and thereby inflict harm upon the socioeconomic well-being of citizens through the simple expedient of a land exchange that does not even pretend to replace lands lost in the Lake Superior Basin. LAN02

2491 ..... "allowing private surface mining would be inconsistent with USFS legal mandates for acquiring and managing these lands" [under the Weeks Act.] The SDEIS fails to address adequately the socioeconomic cost of the loss of intact, contiguous existing habitat at the mine site or to assess the relative value of the non-contiguous lands to be acquired in exchange. 3534	At and near the mine site, the project would destroy 913 acres of unique wetlands, plus many hundreds of additional acres of lands of high biodiversity significance, including imperiled and vulnerable plant communities.	VEG02, VEG03
3535	These lands [at or near the mine site] are currently owned by the U.S. Forest Service in the Lake Superior Basin; virtually all of the wetlands mitigation is outside that Basin, at substantial distances from the habitat that would be fragmented and destroyed by the mine.	WET03, WET15
3536	The project would indirectly affect thousands of acres of other wetlands in the Partridge and Embarrass River watersheds by pollution and changes in hydrology; the SDEIS fails to address any mitigation of the great majority of this wetlands damage except to say that damage would be “monitored” after permitting and additional compensation may be required	WET01
3537	The SDEIS fails to address adequately the socioeconomic cost of the loss of intact, contiguous existing habitat at the mine site or to assess the relative value of the non-contiguous lands to be acquired in exchange.	SO04
3538	The SDEIS does not explain how the USFS can abandon its responsibilities to manage Weeks Act land for habitat and watershed protection and thereby inflict harm upon the socioeconomic well-being of citizens through the simple expedient of a land exchange that does not even pretend to replace lands lost in the Lake Superior Basin.	LAN02
3539	the SDEIS is inadequate because of its failure to acknowledge that the proposed project ignores basic socioeconomic rights to a clean environment guaranteed by Minnesota law.	PER35
3543	The SDEIS fails to use a credible calculation of the groundwater flow in the Partridge River watershed. Tribal hydrologists and Minnesota Department of Natural Resources staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS	WR003, WR086, WR091
3546	The SDEIS must be revised to disclose, with objective data, how much water would go where; the pollution levels that would exist at each pond, sump, waste pile, waste facility and seep; and the actual field experience alleged to demonstrate that the PolyMet plan would meet water quality standards	WR023, WR060, WR181, WR182, WR195
3547	The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to assert that threats to wild rice, fish and human health from tailings basin discharge will be minimal	HU01
3548	The SDEIS must be revised using accurate and complete predictions about the effect of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures.	WR010, WR069
3549	The SDEIS is inadequate because it does not provide a comprehensive cost-benefit analysis of the proposed project. The industry-financed University of Minnesota-Duluth/Skurla report that features prominently in the SDEIS inflates the alleged benefits of sulfide-ore mining and fails to address significant short-term and long-term negative environmental and economic impacts of such mining.	SO04
3550	The SDEIS is inadequate with respect to its treatment of the alleged economic output of the proposed project. Job numbers and economic activity numbers are not credible. The widely-discredited IMPLAN model that Mr. Skurla used in the UMD study generates pie-in-the-sky numbers—hundreds of millions of dollars—in alleged economic output. At page 5-496, the SDEIS admits that the IMPLAN numbers amount to creative writing... The SDEIS also states that IMPLAN does not model the impact of changes in mining technology.	SO04
3552	The SDEIS fails to address adequately the staggering costs of NorthMet. The UMD report admits that it ignores those costs.	SO04

3553	The SDEIS fails to address adequately the negative impact of mining on other economic activity.	SO04
3554	the SDEIS simply speculates, without using any comparative data on the effect of mine closure on real estate or the effect of mining on recreationists, tourists, and retirees.	SO04
3557	the SDEIS appears to be silent on the effect of the permanent destruction of thousands of acres of wetlands and other habitat on wildlife populations.... Without baseline population studies and comparative data, the SDEIS assertions are not credible.	WI02
3560	the SDEIS fails to define the human health effects of increased mercury emissions, arsenic, and exposure to asbestos-like mineral fibers.	HU01
3565	The SDEIS fails to clearly state the expected amounts of mercury that will be released into surrounding watersheds over time, and does not estimate the amount of mercury likely to affect significant water bodies downstream from the project, particularly the St. Louis River and Lake Superior Basin.	MERC19
3566	The SDEIS does not examine the possible health impact of dust containing asbestos-like amphibole fibers.	HU05
4248	The SDEIS does not attempt to correct the effects of the proposed exchange of Superior National Forest lands and of the destruction of wetlands with the protection provided to citizens by the Federal WEEKS Act, the National Environmental Policy Act, the Minnesota Environmental Rights Act, and the Minnesota Environmental Policy Act.	LAN02
4249	The mine site project would destroy 913 acres of unique wetlands, plus many hundreds of acres of lands of high (inaudible), including (inaudible).These lands are currently owned by the US Forest Service in the Lake Superior Basin. Virtually all of the wetlands in mitigation in that site and basin are substantial distances from the habitat that would be fragmented and destroyed by the mine.	WET03, WET15
4250	The project indirectly affects thousands of acres of other wetlands in the Partridge and Embarrass River Watershed by pollution and changes in hydrology. The SDEIS fails to address any mitigation of a great majority of this wetlands exchange except to say that they have to be monitored after permitting and additional compensation may be required.	WET01
4251	The SDEIS admits that allowing private surface mining would be inconsistent with the US Forest Service legal mandate for acquiring and managing these lands.	LAN02
4252	The SDEIS fails to address adequately the socioeconomic cost of the loss of intact contiguous existing habitat at the mine site or the relative value to non-contiguous lands to be acquired in exchange.	SO04
4254	The legislature declared in Section 116B4 of the Minnesota Environmental Rights Act that the state has a paramount concern for the protection of its air, water, land, and other natural resources from pollution, impairment, or destruction. The statute explicitly states economic considerations alone shall not constitute a defense to violations of the Environment Rights Act.	PER35
6739	The SDEIS fails to address adequately the staggering costs of NorthMet. The UMD report admits that it ignores those costs. Appendix B of that report says, at page 67:"Readers are encouraged to remember the Bureau of Business and Economic Research is providing an economic impact analysis. Policy recommendations should be based on the 'big picture' of total impact, and a cost-benefit analysis would be needed to assess the environmental, social, and governmental impacts of ferrous and non-ferrous mining in the State... [A]detailed cost-benefit analysis is beyond the scope of this report..."	SO04

7444	The SDEIS does not attempt to correct the effects of the proposed exchange of Superior National Forest lands and of the destruction of wetlands with the protection provided to citizens by the Federal WEEKS Act, the National Environmental Policy Act, the Minnesota Environmental Rights Act, and the Minnesota Environmental Policy Act. the proposed project ignores basic rights to a clean environment guaranteed by Minnesota law. It acknowledges that the project will destroy or impair thousands of acres of land, pollute the water for at least hundreds of years.	LAN02
7444	The SDEIS does not attempt to correct the effects of the proposed exchange of Superior National Forest lands and of the destruction of wetlands with the protection provided to citizens by the Federal WEEKS Act, the National Environmental Policy Act, the Minnesota Environmental Rights Act, and the Minnesota Environmental Policy Act. the proposed project ignores basic rights to a clean environment guaranteed by Minnesota law. It acknowledges that the project will destroy or impair thousands of acres of land, pollute the water for at least hundreds of years.	LAN02
7446	The project indirectly affects thousands of acres of other wetlands in the Partridge and Embarrass River Watershed by pollution and changes in hydrology. The SDEIS fails to address any mitigation of a great majority of this wetlands exchange except to say that they have to be monitored after permitting and additional compensation may be required.	WET01
7446	The project indirectly affects thousands of acres of other wetlands in the Partridge and Embarrass River Watershed by pollution and changes in hydrology. The SDEIS fails to address any mitigation of a great majority of this wetlands exchange except to say that they have to be monitored after permitting and additional compensation may be required.	WET01
15471	The SDEIS is inadequate because it does not provide a comprehensive cost-benefit analysis of the proposed project. The industry-financed UMD report that features prominently in the SDEIS inflates the alleged benefits of sulfide-ore mining and fails to address significant short-term and long-term negative environmental and economic impacts of such mining.	SO04, SO07
15476	The SDEIS is inadequate with respect to its treatment of the alleged economic output of the proposed project. Job numbers and economic activity numbers are not credible. The widely-discredited IMPLAN model that Mr. Skurla used in the UMD study generates pie-in-the-sky numbers – hundreds of millions of dollars – in alleged economic output. At page 5-496, the SDEIS admits that the IMPLAN numbers amount to creative writing; the SDEIS states that employment depends on metal prices, that mining is boom and bust, and that although "this boom and bust phenomenon is often present in mining communities, IMPLAN does not model this phenomenon" because it is unpredictable.	SO04, SO08
15484	The SDEIS also states that IMPLAN does not model the impact of changes in mining technology. At minimum, the SDEIS should provide historical data with regard to the economic impacts of boom-and-bust in existing copper-mining areas, and with regard to the relentless drive toward mining automation that has caused dramatic output increases per employee and has drastically reduced mining employment in the United States.	SO04, SO08
15496	The SDEIS fails to address adequately the negative impact of mining on other economic activity. Objective studies and the reality of the Iron Range show that time and again mining drives out other economic activity. The reasons are the environmental degradation, boom-and-bust disruption, and political bullying – think about the Highway 53 re-route – that follow the billionaire mining companies, as the night follows the day. Mining results in less overall employment and poorer communities.	SO04
15501	At 5.2.10, the SDEIS says this:"Housing: Reclamation and Closure: (During this period) ... it is likely that demand for housing would drop as workers migrate from the area ... However increases in housing demand spurred by the strength of the tourism industry and the increasing popularity of the study area for retirement could obscure any such declines."The SDEIS is inadequate because it fails to analyze the effect of increased mining industrialization and the associated environmental degradation on the desirability of the area for recreation, tourism, and retirement; the SDEIS simply speculates, without using any comparative data on the effect of mine closure on real estate or the effect of mining on recreationists, tourists, and retirees.	LU06, SO01

15507	With regard to wildlife and the prospects for hunting and wildlife viewing (both of which are key attractors for recreationists, tourists, and retirees) in the surrounding area if the project proceeds, the SDEIS blithely states at page 5-513 that "overall opportunities for hunting and wildlife viewing on public lands in the region are not expected to change substantially." While admitting that the mine might cause game to avoid the area, the SDEIS appears to be silent on the effect of the permanent destruction of thousands of acres of wetlands and other habitat on wildlife populations. It is nonsensical to assume that populations will remain robust in surrounding areas in the face of the loss of thousands of acres of high-quality habitat for breeding, forage, and shelter. Without baseline population studies and comparative data, the SDEIS assertions are not credible.	LU06
17075	the SDEIS is inadequate because of its failure to acknowledge that the proposed project ignores basic socioeconomic rights to a clean environment guaranteed by Minnesota law. The SDEIS acknowledges that the project will destroy or impair thousands of acres of land, that it will pollute the water for hundreds or thousands of years, and that it will create other harmful environmental impacts such as air and noise pollution.	PER35
17133	At and near the mine site, the project would destroy 913 acres of unique wetlands, plus many hundreds of additional acres of lands of high biodiversity significance, including imperiled and vulnerable plant communities. These lands are currently owned by the U.S. Forest Service in the Lake Superior Basin; virtually all of the wetlands mitigation is outside that Basin, at substantial distances from the habitat that would be fragmented and destroyed by the mine.	WR107, WR108

17138	The legislature has declared in Section 116B.04 of the Minnesota Environmental Rights Act that the state has a "paramount concern for the protection of its air, water, land, and other natural resources from pollution, impairment, or destruction." Section 116B.02 Subd. 5 says that " 'pollution, impairment, or destruction' is," among other things, "any conduct by any person... which materially adversely affects or is likely to materially adversely affect the environment." The statute states explicitly that "economic considerations alone shall not constitute a defense" to violations of MERA. The Minnesota Environmental Policy Act, at Section 116D.04 Subd. 6, uses similar language to prohibit the issuance of any permit for any action where the action would cause "pollution, impairment, or destruction of the air, water, land, or other natural resources.... Economic considerations alone shall not justify such conduct." Accordingly, the SDEIS is inadequate with respect to these important points.	PER35

11341	after the NorthMet mine closes... “mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site) (SDEIS, 5-7)...there is no plan laid out for ensuring that PolyMet fulfills the water treatment requirements after mining operations have ceased...In the event that PolyMet, for whatever reason is unable to keep up the requisite water treatment before the 500 years is up at the mining site, what safeguards would be put in place to ensure that water treatment would continue?	WR035
11349	... it is very possible, even likely, that the PolyMet Mining corporation will not be around in 200 to 500 years to supervise, much less pay for, the extended water treatment required by this proposed short-term mining project. In the event the PolyMet Mining declares bankruptcy, who will pay for the cost of water treatment?...The public is then left to conclude that the cleanup will become part of the public tax burden	FIN01
11355	The public is then left to conclude that ... Minnesota's landscapes and wildlife will be abandoned to badly acidified waters and crippling levels of heavy metal contamination	WR107, WR108
11361	the SDEIS states in several places that the most effected bodies of water would be the Partridge and Embarrass rivers in the St. Louis River watershed, and that both the Boundary Waters Canoe Area and Voyageurs National Park will be spared any adverse effects. However, the prospective processing of the copper-nickel sulfide ores has the potential to release enormous amounts of sulfur dioxide into the atmosphere; these emissions would bring acid rain to the entire region, not just to the St. Louis River watershed.	AIR09
17425	the SDEIS suggests that, “[t]he sulfide sulfur (S) concentrations of the NorthMet waste rock would be relatively low compared to many other mines,” but no evidence is provided in support of this assertion (SDEIS, 2013).	PD15
17426	The mine proposal has been updated to allow for subaqueous disposal of...waste rock, in order to minimize oxidation of sulfur into sulfur dioxide, the cause of acid rain, and the mobilization of heavy metals. However, safely transporting the tailings to the mine pits will be expensive, and there is no clear strategy for how the company will fund subaqueous disposal of all sulfide-bearing waste rock accumulated during the operational life of the mine.	PD25
17429	the release of sulfur during ore extraction, transportation and processing, which is potentially the most destructive and immediate source of SO <sub>2</sub> , is not addressed at all in the SDEIS. There are no proposals in the document for trapping sulfur dioxide resulting from the smelting or ore conversion processes. These emissions...would cause acid rain ... [which would have] detrimental effects on forested areas due to mobilization of ... heavy metals within the watersheds...the effects of the sulfur emissions would likely extend beyond the waters of the St. Louis River watershed and would have negative and long-lasting consequences for the entire northern Minnesota region	AIR02, MERC08
17430	In addition to threatening waters beyond the St. Louis River watershed, acid rain would cause direct damage to flora and fauna, endangered and otherwise across northern Minnesota	VEG06
17431	The SDEIS fails to adequately address the potential for acid rain as a result of the NorthMet copper-nickel mine and fails to present strategies for capture and mitigation of oxidized sulfur...there is no mention at all of the potential for acid rain due to mining or processing in either the SDEIS chapter entitled “Environmental Consequences,” or the chapter, “Cumulative Effects.”	AIR11
17433	the trade-off of a couple of decades of mining for several centuries of water treatment combined the lack of a fall back plan should PolyMet fail to meet its commitment to treat water contaminated by the mine are all indications of the inadequacy of, and important gaps in, the mining proposal and its environmental review.	NEPA15

568	They will produce needed metals and create hundreds of jobs that can support families and sustain communities.	SO10
569	PolyMet is committed to utilizing the best available emission control devices possible on all their mobile mining equipment.	AIR14
<b>Sender Name (Submission ID)</b> Renee Valois (21574)		
10093	The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for	FIN01, FIN08, WR035, WR128, WR144
10097	In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream.	AQ05, WR156
10100	Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02
10102	A paltry twenty years of profit for that company could create hundreds of years of toxic runoff and water pollution!	SO01, WR115
<b>Sender Name (Submission ID)</b> Rep David Hill (18082)		
3205	But [the Iron Range Delegation of Legislators] are here tonight as a group to tell you people that we unilaterally and unequivocally support the development of non-ferrous minerals in Minnesota until such time it is proven by the data-driven outcomes that it cannot be done, and then we are unilaterally against it until such time that we can prove that it is feasible, environmentally and financially.	NEPA16
<b>Sender Name (Submission ID)</b> Rep. Barb Yarusso (42916)		
3847	From the point of view of a chemical engineer, the SDEIS does not adequately account for all of the material outputs of the project. Amounts consumed by the process are listed for a variety of process chemicals, but there is no description of where they will end up. They can't just disappear. Will they degrade (into what?)? End up in the tailings, concentrate, sludge disposed of offsite, discharged water?	PD30

<b>Sender Name (Submission ID)</b> Rep. Barb Yaruso (42916)		
3848	The assessment of the probability of a spill of potassium amyl xanthate (PAX) during transportation to the site is judged to be “moderate”. According to the modeling estimate, there is approximately a 1/60 chance of a spill due to a highway accident over the 20 year working period of the mine... Are local communities prepared to handle these specific hazards?	HAZ06
3850	Will there be residual PAX on the copper concentrate which is to be shipped out by rail? Will this cause an odor issue as it degrades and gives off hydrogen sulfide?	HAZ04, HAZ06
3852	The bedrock under the tailings basin is assumed to be a “no flow boundary”. What effect will the possible lowering of the pH in the basin over time due to the addition of acid-producing tailings be on this? Will it have any effect on whether small fissures grow, or on the integrity of the boundary between the bedrock and the bentonite barrier at the walls?	WR001, WR099
3855	Is there any historical data or anecdotal information to indicate that well water quality in the area changed after the start of previous mining operations at the site?	WR041
3857	Descriptions of the use of reverse osmosis to treat water for discharge focus on sulfate concentrations. Will the process also remove copper, nickel, and other heavy metals?	PD03, WR131, WR143
3859	What is the potential environmental impact of concentrate spilled along the railway when it is shipped out for processing? The area between the plant and Lake Superior has several trout streams. How close are the tracks to these or other streams or rivers, do tracks cross any of them, what would the cumulative impact of spills be on aquatic life?	PD36, WR151
3862	Is there ever going to be a time when the potential of environmental harm from the tailings and other materials left behind will cease? The modeling did not address this question, but Minnesota law doesn’t allow for perpetual harm. There should be modeling of the long term time evolution of the concentrations of components of interest.	PD29
3863	There is the hope (but not a guarantee) of development of a passive, biological system – is this to address sulfate issues? I can’t see how it could help with heavy metals, because you can’t make them go away.	WR137
3864	Would it make more economic (and environmental) sense to use a system that increases rather than minimizes oxygen contact with the tailings in order to exhaust the potential for sulfate formation, while treating the water, to eliminate the indefinite treatment of polluted water at the site?	PD32, WR029
3865	Is there any point along the Embarrass, Partridge, or St. Louis Rivers where heavy metals would tend to precipitate (due to local chemistry) and accumulate?	WR197
3866	What is the oldest facility that has a liner of the type to be used for the hydrometallurgic residue facility? What does the manufacturer say about the expected lifetime?	PD17
<b>Sender Name (Submission ID)</b> Rep. Diane Loeffler (44962)		
8470	It is noted that exceedences on lead levels can be expected during times when there is a lot of natural runoff in addition to that created on site...Why should exceedences on this known dangerous pollutant be in any way acceptable and why were these not flagged as unacceptable and in need of lasting prevention and mitigation?	WR082

<b>Sender Name (Submission ID)</b>	Rep. Diane Loeffler (44962)	
8480	The recent studies of wild rice impacts of the expected pollutants threatens a historic and cultural resource to the Native Americans and all residents of our state and a valueable source of food and habitat for key Minnesota species. Insufficient assessment of alternatives that would preserve, not mitigate this unique historic, cultural, diet, and habitat resource are noted and deserve specificity and the honoring of Treaty rights. Why has this area not been more sufficiently analyzed?	WR156
8490	Not enough science and successful modeling has been presented to give confidence to the public on the scientific basis on which to assure sufficient protection of the waters of northern Minnesota. The limited availability of proven models supports a more cautious approach that requires demonstration sites and laboratory demonstrated sustainability. Why have small demonstration sites and implementation models of the proposed processes not been required as part of the establishment of a scientific analysis of the validity of the proposed protections?	WR189
8491	There is no demonstrated capacity for the state to develop and implement models of financial assurance that will adequately enable continuous monitoring and environmental response for many centuries... Given that the company proposing the mine has international ownership, is U.S. and MN law sufficient to enforce actions against that entity and or its successors? Should the "no action" alternative be adopted until such time as there is established scientific confidence that risks can be managed and funded within a time period of less than 75 years?	FIN01
8496	A better alternative would be to challenge our University and others to develop and test safer approaches to mineral extraction that present dramatically less long term risk to the waters, natural habitat, cultural traditions, and long term economic sustainability of the diverse economy of the state.	ALT16
8499	Impact of the proposed land transfer on the value of the US Forrest for recreational use, continuous large lots for natural wildlife communities to prosper, and the air and water quality of the area are insufficiently analyzed. How has it been determined that the proposed tracks for swapping are in any way able to replicate the same environmental values to all species and wetland and forest benefits?	LAN03
8504	Fragmentation and decrease of large contiguous, undisturbed critical habitat threatens a variety of species, particularly the lynx but also at least four other species. The Superior Forrest is a unique habitat not replaceable by scattered site acquisition of alternative lands... Based on this, the proposed land swap does not adequately preserve the natural heritage of Minnesota and should be rejected.	WI01, WI02
8511	It is noted that it is not "practicable" to replace all impacted wetlands types with equivalent in kind wetland areas. Practical is not an acceptable standard... All kinds should be mitigated with at least the same amount and type in similar areas surrounded by large tracks of natural forested habitat. What other habitat and ecosystem mitigation can be required to achieve the same ecological benefit in diverse natural wetlands?	WET05
10024	The Minnesota Constitution clearly limits the purposes and processes for long term obligations of the state. Can the need to maintain, monitor, and fund risk related activities for periods measured in centuries be defined as a ongoing financial obligation of the state? If so, under what authority other than specific, direct legislative act can authorize such longterm obligations and is that able to be delegated? How is that supported by recent Supreme Court rulings?	FIN01, FIN14
10025	Minnesota has a long history of "pollutor pays" even for clean up of environmental risks that were not known or identified at the time of the polluting event or processes. How can that be enforced against pollution risks not identified or anticipated at this time? How will that added potential risk and obligation be accomodated in financial assurance?	FIN01
10026	What testing evidence is available that the proposed liners, membranes, and other containment and protection materials are sufficient to last through 500 or more centuries without deterioration, cracks, or other material failure given the wide range of geologic, climate and other stressors it may be subjected to in addition to the passage of more time than any man made synthetic material of this type has existed?	PD22

<b>Sender Name (Submission ID)</b> Rep. Jean Wagenius (42977)		
3870	PolyMet placed monitoring wells without an understanding of the groundwater hydrology. Further, it only placed wells on the mining site. DNR needs to ensure that it understands how ground water is moving in, off and around the site before it determines when PolyMet’s monitoring is sufficient.	WR007, WR008, WR071, WR079
3871	PolyMet’s would like to have two waste rock storage sites without liners on the bottom. That proposal does not meet Minnesota Statute section 103H.001 or Minnesota Rules Chapter 7050. Liners can be practically achieved in 2014. Moreover, PolyMet prides itself on wanting to mine minerals for the next generation of productions while meeting the last generation standard for its own landfills. That is not acceptable. If the DNR were to permit a landfill without a bottom liner, then the financial assurance/damage deposit would need to be sufficient to remediate the contamination of the groundwater.	FIN14, PD02
3877	DNR must also require enough financial assurance/damage deposit to compensate for any loss of our native wild rice stands. While we have science to support a 10 parts per million sulfate standard, that standard alone may not be strong enough to protect wild rice over time.	FIN11, WR160
7948	PolyMent is seeking to mine in an area of the state that doesn't yet have a Geologic Atlas. As a result, little is known about the groundwater hydrology of the area. The borings that have been done were designed to understand mineral deposits and not for understanding the hydrology in the area.	WR007, WR008, WR071
7949	In order to develop an intelligent monitoring system, it is critical to have an understanding of how groundwater moves in, off, and around the project site before placing monitoring wells to track groundwater hydrology.	WR007, WR008, WR071, WR139
<b>Sender Name (Submission ID)</b> Rep. Jim Swiderski (42886)		
3607	The NorthMet project and land exchange is being proposed at a time far removed from mining ventures of the distant past... Regulations are in place today insuring not only that every environmental impact is monitored and regulated, but that companies responsible have strong financial assurances guaranteeing that sufficient resources are available to restore mining sites and prevent future environmental damage.	FIN16, FIN17
3740	The land exchange negotiated between PolyMet, Inc., the proponent of the NorthMet project, and the USFS, will enhance the overall resources of the Superior National Forest, and enable the USFS to better meet its long term mission. There will not be an environmental degradation to these existing forest lands, as the project is designed.	LAN11
3741	Overall, there will be an increase in forest lands available for management, and the expansion of public recreation areas, which will complement and enhance the attractions for tourism and recreation, a vitally important business of Northeastern Minnesota.	LU07
3743	The SDEIS has demonstrated that the NorthMet Project can achieve an unprecedented goal of sulfate emissions of less than 10 mg/1, a standard that will in fact improve the water quality of the nearby Embarrass River.	WR190
3744	The NorthMet project will re-use the former LTV taconite mine and plant, cleaning up this site and recycling valuable infrastructure.	PD28
3745	[T]he plan for site reclamation will restore both the mining and project site to a natural environmental state, encapsulating the waste rock and preventing acid rock drainage into the foreseeable future. I believe the NorthMet Project will set a standard for excellence that will pave the way for future responsible mineral development in this region.	PD28

<b>Sender Name (Submission ID)</b>	Rep. Jim Swiderski (42886)	
3747	The NorthMet Project will produce over 500 construction jobs for this region and 350 permanent jobs over the life of this mine. However, there are many thousands of additional jobs at stake in the future development of the Duluth Gabbro Complex which, if done correctly, promises an economic opportunity for the next 100 to 200 years. Not unlike the past 132 years of iron ore and taconite mining that have sustained the economy of this region, environmentally responsible mining in the Duluth Gabbro Complex can be an economic boon for residents.	SO10
3750	One must also take into account the secondary jobs created as well. There will be businesses supplying materials to the copper-nickel mining industry in this region. There will be businesses providing food, clothing and shelter. Transportation, health care, education: all economic sectors of the economy will receive a positive impact from the mining activity proposed in this region.	SO10
3753	Beyond the direct and indirect jobs created, responsible development of the copper-nickel reserves of the Duluth Gabbro is also a serious strategic national priority. Today the USA imports 100% of the nickel and over 1 j 3 of the copper needed in modern industry, critical to our national economic development as well as to our national defense. In addition, platinum and a host of other strategic minerals appear to exist in significant enough quantities to be extracted economically.	SO10
3761	To those who say we can get these minerals from other sources, I would argue that is a short sighted alternative.	PD28
3764	The metals that will be mined in this region are critical and essential to our modern computer, electronics, and communications industries. In addition, these metals are essential for the development of green technologies that will improve our air quality, create energy independence for our nation, and reduce carbon emissions that threaten our climate worldwide.	SO10
3766	Without these metals, we cannot have a green future. Without American production of these minerals we put our nation at risk in a dangerous world. These factors must be taken into consideration when weighing the costs and benefits of the NorthMet Project, and it would be irresponsible for us to do otherwise.	SO10
3769	While the environmental review process for the project is still ongoing, I am convinced the plan put forward for the NorthMet Mining Project and Land Exchange will result in a productive mining operation that will produce minimal environmental impacts and will advance the technology of mining. It will set a high standard for additional mining proposals that may follow.	NEPA16
3771	The SDEIS represents a plan, however, and execution of the plan will requirevigorous monitoring and enforcement of the project features set forth in thisdocument, and a solid Financial Assurance package that will enable the mining site reclamation to be completed if the project should fail or be abandoned at any point in the process going forward.	FIN16
3772	I also insist that Cultural Impacts be carefully protected in the plans going forward, before the Final Permit to Mine is issued by the Minnesota DNR.	CR05
<b>Sender Name (Submission ID)</b>	Rep. Phyllis Kahn (37929)	
3839	In chapter 3, pages 136 to 138, you list information that includes the preliminary cost estimate of closure. The source cited is "Foth 2013." I've looked at the cited memo in the SDEIS. The Minnesota DNR has simply copied information from PolyMet's hired consultant without confirming or fact checking their work. If the Minnesota DNR and its co-lead agencies are unable to even fact check the work they presented on financial assurance, how are we to expect that you are capable of adequately protecting the citizens of Minnesota?	FIN05, FIN09

<b>Sender Name (Submission ID)</b> Rep. Phyllis Kahn (37929)		
3840	This project should not go forward unless a reputable third party insurer, such as Lloyd's of London, can be found to back the issued bonds. Private insurers have expertise in managing risk that the State of Minnesota can't match. Additionally, policymakers could tap the assurance funds for other purposes. Private insurance is clearly superior to a state managed approach in this case. The simple fact is, if a third party private entity will not take on the financial risk posted by PolyMet, the state shouldn't.	FIN08, FIN09
3841	In the SDEIS you say that financial assurance will be done in the Permit to Mine stage. Looking at the most recent MinnTac Permit to Mine document, there is one short paragraph on financial assurance. This project shouldn't go forward without robust public debate, and the opportunity for legislative hearings, if what we can expect is a paragraph from the DNR in the Permit to Mine phase. You must ensure that the public, including financial experts and those elected to represent the citizens of Minnesota, have a chance to weigh in on financial assurance. It has not been your practice to do so in the past, will it be in this case?	FIN13
<b>Sender Name (Submission ID)</b> Rev. Charles Flynn (57341)		
18428	I would like to have something like PolyMet come in that could possibly reverse that and resuscitate our communities that are dying. ... I looked up the environmental review statement. It seems to be very much in accord with preserving God's creation and making sure that nothing bad happens to it. ... the whole thing seems like it is going to preserve our clean water, preserve our environment and keep everything the way it should be.	SO10
18430	I have no fears that that [environmental degradation] will happen because the long arm of the law is out there.	PER34
<b>Sender Name (Submission ID)</b> Rev. Wendy Jerome (51615)		
13197	Our watersheds are huge porous underground resources that sustain a world-celebrated wilderness. 100% of sulfide mines leak toxic carcinogens and sulfuric acid. The ancient Greek and Roman mines around the Mediterranean are still leaking today.	WR023
13199	We can count on the death of aquatic life and the terrestrial life - including human beings- dependent on it, if sulfide mining is allowed in Minnesota.	HU03
13200	Some think that sulfide mining would bring jobs to MN. On the contrary, it would bring a few hundred part time and full time jobs, that would be intermittent, given world ore prices. The mining would last 20 years. Minnesota would lose a slowly, but steadily growing recreation economy - and wilderness that is a world treasure for the world.	SO01
<b>Sender Name (Submission ID)</b> Rhoda Drake (38447)		
13618	The potential pollution problems and destruction of the environment are my main concerns. The clean water and natural environment should be protected. Please do not permit the Polymet project.	GEN01
<b>Sender Name (Submission ID)</b> Rhonwen Tas (39715)		
14884	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17

17400	a reverse osmosis system...is a high maintenance system computer controlled with pumps constantly running and filters to be changed once a week. The Polymet water treatment plant would have to be manned 24 hours a day with at least 4 full time employees... I would suggest at least 500 million guaranteed up front bond tied to the consumer price index. The labor expense alone needs to be calculated. I would estimate at least \$250,000 per year in operator wages.	FIN05
17401	I would also suggest that we pass a law similar to Wisconsin's that requires citing a similar mine that has operated at least 10 years and has showed successful closure for ten years any where in the world before applying for a permit to mine.	PER25
<b>Sender Name (Submission ID)</b> Rich Sill (43686)		
15455	I feel strongly that if we, as Americans, are going to continue to demand gold, copper, platinum, paladium, etc we need to be responsible for mining those minerals here and be willing to take ownership of the problems associated with that mining. It seemed unethical to throw our demand on other counties, many of which do not have adequate environmental or labor laws to protect either their land or their people.	NEPA05
15458	After reviewing the SDEIS I am becoming increasingly concerned about the mines effect on wild rice. The latest report shows the 10 parts per million limit as probably a sensible amount of sulfite in the water. I am seriously concerned that their will be an aggressive action by certain parties to increase that greatly (in some reported cases to as much as thousands of parts).	WR160
15459	Wild rice is a sacred grain to the Ojibway people of this area and is protected by treaty. If the permit is granted I would strongly feel very strong ongoing monitoring be required. Wild rice is a valuable resource in itself and should not be sacrificed in order to extract other resources such as copper.	CR01
15460	I am deeply troubled by what I am currently hearing regarding the fact that nearly all the copper is scheduled for transport to China. I supported the mine originally because I believed we would be using these minerals primarily for domestic use.	PD25
<b>Sender Name (Submission ID)</b> Rich Staffon (11626)		
7397	What will happen to the ownership of the land at the mine site? When the site has been reclaimed and rehabilitated, after mining is completed, would it be possible for the land to be returned to public ownership as part of the reclamation process? It would be great if a commitment could be made to return our public land after the project is completed	PD24
7397	What will happen to the ownership of the land at the mine site? 17926	Sulfide mining has a terrible history of water and air pollution and adverse health effects.	PER23
17927	Experimenting with new mine technology at the height of one of the world’s great watersheds seems like a really bad idea.	WR128
17928	The claim is 30 years or so of jobs and 200 and 500 years of abatement and water monitoring. Will people 200 years from now thank us? Will they say “Those people helped to make our lives so much better by mining here”? I doubt it.	SO01
17930	Considering the nature of the jobs it seems clear the main beneficiaries of the project will be the shareholders and not the public.	SO06
17931	The proposed fund for the 200 and 500 years of monitoring is really some kind of fantasy. Can the legislature be depended on to be acting in the public interest? Surely lawyers for the company won’t be. Will some future legislature or governor find a way to raid the fund for their own purposes? Think of the tobacco fund.	FIN01, FIN08
<b>Sender Name (Submission ID)</b> Richard Daly (16240)		
10313	MN has the capability and resources to move ahead with this very important economic development project using available advance technology and techniques that provide adequate safe guards to the environment!	SO10
<b>Sender Name (Submission ID)</b> Richard Decoster (14900)		
13804	We live on the western end of the Mesabi Range and have been living with and still are, the remains of what the mining companies left, a mess for us all.	FIN10
13805	We want pure water for now and for the future and our clean environment left intact.	WR195
<b>Sender Name (Submission ID)</b> Richard Flesvig (18067)		
3180	By express admission in the SDEIS significant water pollution will last for 200, 500 or longer in terms of years; and will require perpetual water treatment. Not all of the polluted water will be treated.	WR035, WR115
3181	The 90 percent capture rate of polluted water bears no scientific proof or substantiation. So the SDEIS must be rejected.	WR018
3182	...And the state's paramount concern for the protection of it's air, water, land, and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct."No such conduct is provided – no such alternative is provided in the SDEIS.	ALT13
3183	The SDEIS indicates that the details of the financial assurances required to sustain a 200- or 500-year period will not be disclosed until the permitting process commences. This is unfortunate as I seriously question how anyone can properly calculate the staggering dollar amount let alone provide a financial assurance for this long term of a period.	FIN01, FIN05, FIN13
17475	PolyMet "thinks" its actions will contain 90%+ of the runoff from the mine tailings. There is no science that confirms this prediction. If we assume that 90% of the highly toxic runoff is contained and "treated" through a highly questionable reverse-osmosis method, the 10% that is non-treated and leftover is significant to our environment. By acknowledgement in the SDEIS (see pages 3.5 of section 3.1.1.7 in the SDEIS), the term of treatment may be 200 to 500 years or longer.	WR018, WR035, WR108

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Richard Flesvig (18067)		
17556	The environmental and human relations performance of this parent company is horrible. To think either PolyMet or Glencore will be a viable company beyond the twenty-year life of the mining operation, let alone throughout the long period of clean up and remediation, is highly questionable. Please review the annual report of PolyMet and you will be very concerned about its viability and experience.	FIN01
17557	There are no reasonable examples of environmentally safe sulfide mining in the world. None. There are no reasonable examples of environmentally safe water treatment using reverse osmosis technology on a large scale in the world. None. Why would we let PolyMet experiment at this location? It is one of the most important watersheds in the Northern Hemisphere.	PD03, PD23
17558	Economic considerations should not be the primary determinant in the decision making regarding the SDEIS. How can twenty years of mining jobs be traded for decades and perhaps hundreds of years or more of environmental contamination and the destruction of our precious water resources?	SO01
<b>Sender Name (Submission ID)</b> Richard Fuller (7673)		
51	It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells	HU01, WR041
52	It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands.	ALT13
53	It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish.	AQ28
814	PolyMet SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity."	WR037
1827	The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes.	CR01
1828	The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining.	LAN04
1829	The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade.	LAN03
1830	The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St. Louis River and tribal resources.	CR01, WR115, WR189
1832	Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice.	CR01
<b>Sender Name (Submission ID)</b> Richard H Hudelson (54892)		
18827	I attempted to read the summary part of the SDEIS and found it difficult.	NEPA07
18828	I am worried about the great uncertainties regarding this project. Cost estimates, time period, reliability of technology, and unusual weather events all open room for bad outcomes. The risks seem too great.	PD01, PD22

<b>Sender Name (Submission ID)</b> Richard Watson (3687)		
9647	We are just beginning to understand how badly we have fragmented the forest here [through mining]...	VEG03
9648	We are just beginning to understand ... how impaired our waters are already [from mining]....	WR109
9651	Our efforts should be put to cleaning up what we have already mucked up and not trying to determine just how much more pollution we can tolerate.	NEPA15
9652	The myth of "strong regulations" in Minnesota must be scientifically evaluated, mining company variances denied, and corporate polluters held totally accountable before we embark on further pollution of this region.	PER06
9655	I strongly suggest we need to hold off on sulfide ore mining in this region until we have a much better plan in place than offered by Polymet.	PD01
12089	Real life understanding of the effect of the proposed mine on the BWCA requires determining the split of waste drainage in the swamp that goes to the St. Louis River and BWCA watersheds by hydraulic conductivity testing which has not been done.	WR024, WR071, WR080, WR081, WR111, WR167, WR175
12090	Ongoing protection of the BWCA requires periodic water testing for mine waste at Langley Creek and the Dunka River which is not provided for in the uncorrected SDEIS.	WR024, WR071, WR080, WR081, WR111, WR175
13053	SDEIS requires clarification as it is incomplete....The chemical and physical characteristics of the low grade ore crushing and grinding should be tested and defined for appropriate and specific design of the emission control system for the low grade sulfide ore crushing and grinding operations and not rely on taconite plant designs....	NEPA09
13055	SDEIS must include a consideration of all sources of Ultra Fine Particles' (UFP), quantities of UFP's generated by each source, and a method for controlling such particles to eliminate human exposure to UFPs....Ultra Fine Particles are toxic due to their size and not necessarily their chemical makeup. Nano Particles or Ultra Fine Particles which may be present in crushing and grinding operations are definitely produced when high explosives are used to blast rock and are present in diesel exhaust. Testing for UFP's at all physical handling stages, blasting, crushing, grinding, and transport should be standard. And, elimination or control of UFPs, a known health hazard, must be accomplished.	HU01
13058	The SDEIS modeling of what happens in the tailings basin is incomplete and misleading. in studying the Beneficiation Process, we discover that there is a list of chemicals that are listed as "Consumed." This list amounts to a total of 29,738.5 tpy (tons per year) of additional chemicals, of varying degrees of toxicity, that will be added to the tailings basin according to a reply I received from the DNR....This is problematic in itself, a large quantity of varying degrees of chemical toxicity that have essentially been unaccounted for and is not included in modeling and could have a significant impact on chemical interaction in the tailings basins.	HAZ03, WR025, WR057
<b>Sender Name (Submission ID)</b> richardbradford@mchsi.com (6686)		
1204	We need what Polymet will mine and this mining can not be done more safely in any other part of the world	ALT16

6271	Section 5.2.2.3.1 of the EIS. Common sense tells you that the aquifer in the area and in the pit will be affected by such an operation. There is no way the current compaction levels can be redone to seal off any contaminants from entering the aquifer.	WR005, WR088, WR171
6273	500 years plus [of water pollution and treatment] is a long time with prohibitive costs that will be a burdon on future taxpayers.	FIN10, WR115
6277	To allow [the backfilling of the East Pit after year 11] would lead to a direct injection of sulfides and heavy metals into the aquifer.	WR088, WR171, WR173
13569	The plan calls for pumping water back in it including "treated water" from the WWTF. The word limit is in the EIS. Limit to me means not quite as much. There should be no oxidation of the sulfide minerals.	PD03
<b>Sender Name (Submission ID)</b> Rick Brandenburg (54658)		
17936	The 900 acres of wetlands this project would destroy and the thousands of additional acres that would be degraded by pollution, drawdown and drainage include a mosaic of many different communities with an incredible range of biodiversity that could never be replaced by proposed mitigations measures.Replacement wetlands just don't work. There is insufficient analysis of the loss of ecosystem functions that would result if the permit is issued. This wetland loss is unacceptable.	WET05
17938	The decision the USACE must make as to whether to allow Poly Met to go ahead with its plans, pits the permanent chemical, physical, and biological destruction of all these special places, at the headwaters of a thegreatest river on the US side that flows into Lake Superior, against the worth of not very many jobs that will last for maybe 20 years. The Poly Met Section404 Permit should be denied.	SO01
17941	The [Land] exchange would be senseless from the Forest's point of view, since it would not enhance forest biodiversity and other values, and it would not benefit the public who use the Superior National Forest and want to see it protected.	LAN01
17942	The tremendous volume of this waste rock, as well as distrubed peat, mine pits, and tailings that the minue would generate is stupendous, and mercury is giong to be seeping away from all of it.	MERC20, MERC21
17943	The SDEIS looks at the impacts of mercury deposition on area lakes--why not streams and rivers? The predicted mercury loads to the Partridge River from the Embarrass River is underestimated because of this oversight.	MERC08, WR044, WR045
17946	If PolyMet is allowed to carry out its plans, sulfates, lead, copper and probably other pollutants are going to be poisoning the St. Louis River, its estuary, and Lake Superior for hundreds of years, because perpetual treatment is never going to happen.	FIN01
17947	The jobs touted by the mining companies will come at the expense of natural resource and tourism occupations that depend on pristing northwoods.	SO01
<b>Sender Name (Submission ID)</b> Rick Cannata (18203)		
13436	We need the jobs in Northern Minnesota, not just the construction jobs and the mining jobs, but it's all here, the manufacturing, all the spinoff jobs	SO10
<b>Sender Name (Submission ID)</b> Rick Olson (44693)		
7210	The risk to water quality, wild rice, fish, birds, other wildlife, and other segments of the environment are too high to permit sulfite mining in northern Minnesota.	VEG04, WI01

<b>Sender Name (Submission ID)</b> Rick Putnam (39076)		
16674	[I am] very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country.	SO02
<b>Sender Name (Submission ID)</b> Rick Skoog (57347)		
18397	I guess my main point is I really find it hard to believe that a for-profit company, who is a foreign corporation, is going to put up the money, and they fully admit that it is probably going to be for 200 years' worth of water treatment. I really find it hard to believe that a for-profit corporation is going to put up that amount of money and guaranty that amount of money. And I find it hard to believe that that amount of money can be put in a safe place, without some politician stealing from this, "We have got a big fund here and it is just sitting here and it is not doing anything, so we better borrow from that fund."	FIN01, FIN08
18398	no compelling reason to have 20 years' worth of mining that is going to end up producing 200 years' of pollution.	SO01
18401	They are not treating the problem [with water treatment]. They are just treating the runoff from the water.	WR195
18743	One big bad idea is for the Federal government to trade land for this deal. Over 1000 acres of wetland will be lost forever. They are not trading wetland. It is federal land not Minnesota land or Hoyt Lakes land, but this does not protect or enhance the federal position it only puts the federal tax payer on the hook with the toxic chemicals leach from the tailings pond.	LAN01
<b>Sender Name (Submission ID)</b> Rita Ann Youngs (9591)		
220	There is nothing more important than our most precious resource, clean water. We cannot leave future generations of Minnesotans strapped with polluted water.	WR195
1132	We need to do more recycling and reusing materials versus digging into this precious land.	ALT16
<b>Sender Name (Submission ID)</b> Rita Bauer (39325)		
12783	We need to seriously consider the impact on wildlife and the environment as well as humans. I do not feel this is too much to ask. It is the minimum !	WI01
<b>Sender Name (Submission ID)</b> Rita Jarrard (20706)		
16104	The proposal by Polymet to trade acreage in the Superior National Forest for other land in northeastern MN sounds unlawful and dangerous... These other lands include those "protected" by treaties with Ojibwe Indians. How many more times will people of power vote to disrespect our early Americans?	LAN05
16105	Pollution from such mines would destroy the land for hunting, fishing and growing of crops by the Ojibwe, and create untold health hazards for ALL future generations of Americans.	HU03

<b>Sender Name (Submission ID)</b> Rita Kovtun (43220)		
14215	When weighing the pros and cons of the project, it seems logical to discontinue the project as the number of years of profit are only a fraction of the number of years of treatment and rehabilitation of water and land.	SO01
<b>Sender Name (Submission ID)</b> Rita OConnell (47774)		
8202	Providing water quality treatment for 200 to 500 years (or more) is incomprehensible...can we really, in good conscience, even consider permitting a mining action whose wastewater discharges do not meet water quality standards without mechanical treatment at the time of or shortly after closure? Is it legal to permit a facility with such a long-term timeline?	PER04
8205	If the company is still in existence in 200-500 years, its own estimate of postclosure costs...is \$700 million to \$1.2 billion. Will the company's profits from 20 years of mining be sufficient to pay for that?...Or will they prepay those entire cost in an upfront manner	FIN01
8210	Reverse Osmosis...produces a concentrated waste product that must be removed to "appropriate off-site facilities" (page 3-72)...I'm concerned that these wastes are truly "treated appropriately" so they don't move the contamination problem to another location.	WR145
8219	I'm concerned, however about whether groundwater will move into fractures in the bedrock...I didn't find a description of what bedrock was present at the stockpile location, and then reading on page 4-46 that the upper 200-300 feet of the Duluth Complex is more fractured & jointed than lower portions. If the stockpile is located on that or other fractured bedrock, building a hydraulic barrier down to bedrock may still allow significant contaminated groundwater movement away from the site.	WR011, WR017
8228	Fig 3.2.10 shows the 20-year pit extending only into a small portion of Unit 1... [and] that Unit 1 is exposed at the land surface at the mine site, but is not part of the 20-year projected mine pit. It's hard to believe that the company won't expand further into that ore body.	PD30
11177	Do you really think the company will be around or responsible for that long? Will the state of Minnesota be around in 500 years? Look back at what was happening 200 years ago (1814) or 500 years ago (1514), and could people in those times accurately predict what would happen today? No, and no more can we predict our distant future.	PD24
11189	Another project is already well into their planning process - Twin Metals is proposing to mine at the Birch Lake, Maturi, and Spruce Road locations, the latter 2 of which are quite close to the BWCA.	CU02
<b>Sender Name (Submission ID)</b> River Gordon (16874)		
13933	I understand the short-term economic benefits of a project like this, but the risks to our abundant and beloved natural resources are just too great.	SO01
<b>Sender Name (Submission ID)</b> River Point Resort & Outfitting Co. (39586)		
6305	There is no comprehensive analysis in this SDEIS that incorporates short-term, moderate-term, long-term and very long-term (hundreds of years) estimates of costs and benefits.	FIN05
6306	there are no reasons given why other alternatives that could reduce pollution and impacts on wetlands were not analyzed.	ALT13

6308	everywhere on the Earth where this type of mining has occurred, heavy metal pollution and acid mine drainage is a result. Nowhere in the SDEIS was there any acknowledgement of this fact. Nor was there any data substantiating that the proposed PolyMet Mining Corporation's North Met mining project would be unique in preventing what history tells us happens at each and every sulfide mine site, and will occur at the PolyMet. How will this venture in Minnesota's water rich environment be done in such a unique manner, as to guarantee no pollution to our waters?	PD26, WR023
6332	The SDEIS does not address why, with modern technology and knowledge, these [Dunka Mine and LTV Tailings Basin] continue to have AMD runoff into our watersheds, threatening the health of our birds, our wildlife, our wells, and ultimately our human health. Failure to raise this issue of past history of AMD drainage in the SDEIS raises serious questions about the commitment of PolyMet, the MPCA, and other responsible agencies for protecting our environment and health both during and after mining operations.	PER06, PER18, WR023, WR029
6334	It is more important to have our natural resources protected for the good of the public now, and for the generations to come than to allow this flawed and inadequate PolyMet sulfide mine proposal to proceed to permitting. A mine cannot be permitted if it causes destruction of our natural resources. We Minnesotans have the right to protections of these natural resources.	PER35
6895	How does the USFS think the destruction of 1000+ acres of prime wetlands and thousands of acres of Superior National Forest through sulfide metal mining will serve the Public Interest? (...) The proposed land exchange goes against the Weeks Act and does NOT serve the Public Interest.	LAN01, LAN02
6899	1.Wetlands cannot be created. How will the USFS loss of the 1000+ acres wetlands and the loss of the "one hundred mile swamp" for the creation of the proposed sulfide metal mine of PolyMet be made up?2.How will the loss of wetlands and the loss of the 100 mile swamp affect and impact the water resources surrounding the proposed mine?3.How will the loss of wetlands and the loss of the 100 mile swamp affect sensitive and endangered or threatened species such as the wolf, moose, and lynx and their critical habitat, including noise and the destruction of winter denning or shelter?	WET14, WET19, WI01, WI02, WI05, WR112
6903	4.How will the loss of open space be made up? 5.How will the loss of forests be reconciled?	VEG03
6906	6.How can the USFS ignore the cumulative effects of mineral exploration?7.How can the USFS ignore the cumulative impacts regarding loss of and damage to wetlands?	CU02
6911	8.How can the USFS ignore the potential for environmental damage due to espouse of sulfide ores to air and water, and the potential leaching of toxic heavy metals into the environment?9.How can the USFS ignore contamination from the drilling process itself, including air quality degradation during drilling operations and potential for leakage of gas or oil from equipment and chemicals used in the process, and the auditory pollution from the noise of drilling and heavy machinery?	AIR10
6912	10.How can the USFS ignore the effects regarding water usage and water contamination as related to mineral exploration?	WR203
6914	11.How can the USFS ignore the lack of funding to monitor the extent of exploratory drilling and the necessary future monitoring of the sites for acid mine drainage (AMD)?12.How can the USFS ignore the acid mine drainage (AMD) that is occurring at the former INCO exploration site on Spruce Road, some 36 years after exploration was completed?13.How can the USFS ignore the perpetual nature of acid mine drainage and its very controversial aspects?	WR001, WR023, WR203
6915	16.How can the USFS ignore the degradation of US public lands by foreign companies?	NEPA02
6916	17.How can the USFS ignore the potential impact of mining on the present tourism and recreation industries, and forestry and fisheries as related to federal lands?	SO02

	<b>Sender Name (Submission ID)</b> River Point Resort & Outfitting Co. (39586)	
8766	PolyMet’s SDEIS has a flawed water flow model. And, now...it is apparent that the SDEIS also has another flaw – water seepage.	WR017, WR019, WR189
8769	the seepage collection system at Minntac had an approximate return rate of only 50 percent...50 percent is sure a lot less than the 99.38 per cent claimed in PolyMet’s SDEIS. Inaccurate, flawed information. And, from those hundreds of operating systems lauded by the SDEIS, only one could be found. Amazing.	PD03, WR020, WR023
10041	The SDEIS maps draw a much smaller swamp downhill from the mine compared to existing government maps. According to US Government maps, the One Hundred Mile Swamp downhill from the mine is 10.4 miles long and drains to both the Saint Louis and Rainy Lake (BWCA) watersheds but SDEIS maps show a shorter 5.5 mile long swamp that is missing the portion of the swamp that drains to the BWCA. Omitting the portion of the swamp that drains to the BWCA supports PolyMet’s conclusion that seepage of mine waste water to the BWCA watershed will not occur.	WR024, WR080, WR081, WR111, WR167, WR175
12067	The projected seepage from PolyMet’s tailings basin and the Mine Site Category 1 waste rock stockpile has been grossly underestimated.	WR017, WR018, WR060
12069	PolyMet does not propose to line the Tailings Basin, nor is the existing LTVSMC Tailings Basin Lines.” (SDEIS, p.5-161) ...a proposed tailings basin of approximately 2,900 acres in size, or four-and-a-half square miles, would be situated, unlined, on top of an existing, leaking, unstable tailings basin, also unlined, screams BIG TROUBLE.	PD07, PD10, WR105
12072	The SDEIS assumption of nearly perfect seepage collection is the critical foundation upon which all claims that PolyMet might comply with water quality standards downstream of the tailings piles rely. This assumption is unreasonable, unfounded, inconsistent with site conditions and inconsistent with the Modeling Work Plan methodology adopted by PolyMet.	WR018
12079	the only example the lead agencies had (of field experience with tailing seepage pump-back) was a study to estimate possible seepage collection at the Minntac tailings basin. And records obtained from the U.S. Army Corp of Engineers through a Freedom of Information Act Request indicate that the seepage collection system at Minntac had an approximate return rate of only 50 percent.” 50 percent is sure a lot less than the 99.38 per cent claimed in PolyMet’s SDEIS.	WR020
14601	Will the proposed benefits of the projected mining operations significantly outweigh the risks and harms to the environment, to population health and the economy?	SO01
14602	Environmental groups say the regulatory history of the Dunka Pit is an example of lax enforcement policy at the MPCA.	PER06
14603	There are reasonable foreseeable problems that may arise in this project that would adversely impact waste water treatment and tailings management which are not reviewed. ...Broken pipes, human error causing accidents, equipment malfunction, and severe weather related disasters.	WR021, WR127, WR128, WR144, WR202
14604	The SDEIS provides no factual assurance or details (only vague references and the need for “adaptive management techniques”) on the impacts to water quality, wildlife or human health if the treatment system fails or if there is a breakdown, which is inevitable. To be told by the agencies, and specifically by Jess Richards, “that emergency planning also will be included in the mine’s permitting” is irresponsible and inadequate, as there will be no opportunity for public comments at that step in the process.	PD01
14605	There is no Financial Assurance plan provided. This is an integral part of the EIS proposal; yet, lead agencies do not currently require it until after the EIS is approved. No public comment period for the public to weigh in on this crucial piece of the PolyMet NorthMet Sulfide Mine Proposal.	FIN13

Comment ID	Comment Text	Theme Codes
	<b>Sender Name (Submission ID)</b> River Point Resort & Outfitting Co. (39586)	
14606	Why are the same valid reasons to involve the public with comments related to the EIS not also critical to the public’s involvement and comments for the ‘permit to mine’ process? This is illogical and raises the red flag as to the validity, fairness, transparency, and credibility of the entire decision- making process.	PER01
14607	The SDEIS provides no credible information about the cost of monitoring, maintaining, and replacing equipment needed to treat polluted water for 500 years or more. No details are revealed about the nature of guarantees of a financial assurance scheme that would remain viable for 500 years or more....	FIN01, FIN05, FIN11
14752	[The SDEIS] water flow modeling was flawed. Definitely a big problem when the Minnesota Department of Natural Resources seriously underestimated the amount of water available to transport pollutants. Perhaps a show-stopping problem; the DNR is not talking. The Tribes have been saying for years that water flow numbers were wrong.	WR003, WR091
14753	The co-lead agencies have not only made incorrect assumptions for base water flow, they have made incorrect assumptions for seepage of contaminated water (uncaptured and untreated). Simply put, they do not know how much surface and groundwater flows through the area; how fast, far, and where it flows; or how much contaminated water is escaping.	WR003, WR019
14754	[The SDEIS claims] that 99.38 percent of total seepage from the tailings piles will be collected and treated...However, the implicit assumption that total groundwater seepage at the tailings site would be 209 gpm (thus, total uncaptured groundwater would be 21 gpm during PolyMet’s operations) is incongruous given the volume of water in the tailings system.	WR018, WR056, WR060
14755	the SDEIS also assumes that no seepage will be released into Second Creek and that no seepage will drain into groundwater beneath the vast, unlined tailings piles through fractures and historic streams or as a result of changes in topography as tailings are deposited. Each of these claims is unreasonable and unfounded.”	WR010, WR092, WR117, WR118
14756	The PolyMet SDEIS released to the public made no mention of fractures under the tailings basin—not one—even though the Preliminary SDEIS (PSDEIS) referred to “fractured bedrock” under the site. Even though, at a scale of 1:500,000, a 2011 statewide compilation of bedrock geology showed at least one long fault line running beneath the tailings site.	WR010, WR061
14757	It is reprehensible that crucial pieces of the PSDEIS never saw the light of day in the SDEIS, that a water treatment facility operating “for perpetuity” was redacted. Or that “fractured bedrock” under a tailings basin sank out of sight by the time the SDEIS was released. The EIS process is not supposed to be some kind of “hide and seek” game with the public.	NEPA05
14758	The co-lead agencies must reject the PolyMet SDEIS... make the company tell us how much pollution would occur and how nasty the results would be if the seepage collection was 50 percent effective, or maybe, on a good day, 75 percent effective. Have the courage and integrity to use field experience and science instead of wishful thinking and misdirection.	WR022, WR038
14982	Maps in the SDEIS released on December 6, 2013 make it appear that sulfuric acid and heavy metal containing mine runoff will drain only into the already impaired Saint Louis River watershed when in fact drainage can go to two watersheds, one of which includes the unspoiled Boundary Waters Canoe Area wilderness.	WILD01
14983	The downstream flow mapping feature of the <a href="http://www.nationalatlas.gov/streamer">www.nationalatlas.gov/streamer</a> map was used to show that the eastern portion of the One Hundred Mile Swamp drains via Langley Creek and the Dunka River to the BWCA, and that the drainage will also affect the Quetico Provincial Park along the US – Canada border.	WILD01

<b>Sender Name (Submission ID)</b> River Point Resort & Outfitting Co. (39586)		
14984	Real life understanding of the effect of the proposed mine on the BWCA requires determining the split of waste drainage in the swamp that goes to the St. Louis River and BWCA watersheds by hydraulic conductivity testing which has not been done.	WR024, WR071, WR080, WR081, WR111, WR167, WR175
14985	Ongoing protection of the BWCA requires periodic water testing for mine waste at Langley Creek and the Dunka River which is not provided for in the uncorrected SDEIS.	WR024, WR081, WR111, WR175
14987	Untrustworthy conclusions about sulfide mining pollution from PolyMet's proposed mine can't go unresolved. The incorrect mapping in the SDEIS is a huge issue. This DEIS is flawed and must be rejected.	PD29, PD38
19005	I believe that some serious common sense must prevail in this proposed land exchange between the US Forest Service and PolyMet Mining, Inc (PolyMet) with the purpose of allowing a foreign sulfide mining company to garner federal lands so that copper, nickel and other precious minerals could be extracted resulting in the ultimate degradation of U.S. public lands, wetlands, and the entire watershed leading into Lake Superior.	WR111
<b>Sender Name (Submission ID)</b> RJoa (3951)		
700	I don't believe wetlands are replaceable. The wetlands in the proposed mine area are imperative for wildlife of all kinds as well as migrating fowl. It is my understanding that there is proportionally only a small quantity of wetlands in the watershed of the area. Replacing this biologically priceless land with a larger chunk of essentially man-made wetland that has already been robbed of its wealth in another part of the state could never be a "fair" trade.	WET03, WET14
701	there are stories all over the country of mining companies not doing what they've agreed to do as far as pollution mitigation. They go for years without supervision or inspections from federal or state authorities. When they are finally held accountable they simply say it is too expensive to correct and will cut into profits for shareholders or company owners. They pay a small fine and continue business as usual. Profits are considered a good reason to destroy the health of local people and lands.	FIN01
<b>Sender Name (Submission ID)</b> roadrunnerkappes@netscape.net (36861)		
8782	200 permanent jobs!!! Just a number!...the 200 job number is probably high and it is probably in the 150 employment range.	SO06
<b>Sender Name (Submission ID)</b> Rob Davis (18136)		
13514	And it's a near certainty that there will be millions of dollars of cleanup.	FIN05
13515	PolyMet is not a Minnesota company. It's just not a good deal for Minnesota.	SO06
<b>Sender Name (Submission ID)</b> Rob Grunewald (47779)		
11964	The EIS should specify in detail the impact of a large flood or other extreme weather event on PolyMet's proposed water filtration process. Over a 500 year period there is high risk that an extreme weather event would happen in the proposed mine area, especially with the prospects for increased weather volatility in the context of climate change	PD22, WR176

<b>Sender Name (Submission ID)</b> Rob Grunewald (47779)		
11970	The number of jobs created by PolyMet's mine should not be considered a tradeoff for a clean environment. Minnesota can wait as long as it takes until mining and containment technologies are proven to be effective.	SO01
11974	The EIS should assess the risk and implications for the environment if PolyMet is sold or goes into bankruptcy...A buyout or a bankruptcy has environmental implications due to the 500 years or longer of time required to maintain clean water at the mine site and surrounding area.	FIN01
14142	The state can and should wait until the sulfide mine water filtration technology has been tested and used in a multi-year project with absolute perfection in another location before trying it in Minnesota.	WR143
14145	We need time to reduce risks that ultimately the taxpayers of Minnesota would have to pay if PolyMet's proposed environmental clean-up plans fail.	FIN01
14146	Granted as mining technology improves, the number of jobs could be smaller in the future, but in that case the jobs will likely be even higher paying and safer.	SO06
14148	Mining companies like PolyMet that get projects off the ground can be bought out by larger multi-national corporations that have less investment in the local community. There is risk that if PolyMet is purchased by a large mining firm that the new owner will not show as much good faith in adhering to promises to safeguard water sources from contamination.	PER02
<b>Sender Name (Submission ID)</b> Rob Simonich (38377)		
13659	Based on the impact statement, I have total confidence in Poly Met and our DNR to do the right thing. No one wants to destroy what we have. That's why we live here.	PD28
<b>Sender Name (Submission ID)</b> Robby Bragg (40586)		
8894	The affects of this mine will be detrimental to not only the environment but will not help the economy or jobs in the long run either...Since the mine is a temporary endeavor so would be the workers' contracts. Unless you are planning on the environmental destruction that would be caused by this mine and the jobs that would come of that. If so, I think that is a pretty hypocritical precedent to set for our children.	SO02
<b>Sender Name (Submission ID)</b> ROBERT A BRODIE (14782)		
172	the few FULL time jobs that will result in this endeavor will not be worth the likely leakage of heavy metals into the water.	SO01
1750	[there is] the likelihood of the mining operations disrupting the water tables and creating havoc to populations of people and wildlife in the future.	WI06
1751	It is in the foreseeable future that water shortages will become an economic reality, with talk of getting water supplied to other states from Lake Superior...our clean water is an important source of life, not only for Minnesota's people and environment, but also as a viable economic tool for the future.	CU11
<b>Sender Name (Submission ID)</b> Robert A Johnson (11573)		
2224	By doing sulfide mining in Northern Minnesota you will not only harm the air and water, you will eliminate the tourism to the area. The animal life will suffer and our children ill no longer have a healthy future.	SO02

<b>Sender Name (Submission ID)</b> Robert E McKlveen (42786)		
6864	The SDEIS fails to adequately and accurately account for the impact that the thousands of people like me have on the local economy, and the harm to the economy if the mine is built under the currently proposed conditions and restrictions. The current SDEIS fails to appropriately quantify the decrease in recreational economic activity that WILL occur if the mine is built. If the waters or air of the BWCAW and the surrounding area are damaged by this mine or its aftermath, fewer visitors (including myself) will come to the area. This would have a significant negative impact on the economy of the area that will outlast the productive life of the mine by decades or centuries. The SDEIS needs to account for this negative impact in a meaningful way.	SO04
12732	In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site, undermining confidence that it can accurately predict future water conditions.	WR049, WR091, WR189
14102	There is evidence that the current surface and groundwater flows in the Partridge River basin that were used in the SDEIS were flawed. Correction of those errors may significantly impact the conclusions of the SDEIS.	WR003
14103	History tells us that such system failures [e.g., pipeline] DO occur, with regularity. Failure to plan for such failures is a recipe for environmental disaster.	PD22
<b>Sender Name (Submission ID)</b> Robert E. McKlveen (43049)		
12258	The SDEIS fails to adequately and accurately account for the impact that the thousands of people like me have on the local economy, and the harm to the economy if the mine is built under the currently proposed conditions and restrictions. The current SDEIS fails to appropriately quantify the decrease in recreational economic activity that WILL occur if the mine is built. If the waters or air of the BWCAW and the surrounding area are damaged by this mine or its aftermath, fewer visitors (including myself) will come to the area. This would have a significant negative impact on the economy of the area that will outlast the productive life of the mine by decades or centuries. The SDEIS needs to account for this negative impact in a meaningful way.	SO04

13257	Sulfide mining in Minnesota threatens wetlands, rivers, lakes and streams.	WR115
<b>Sender Name (Submission ID)</b> Robert Johnson (11946)		
13735	I don't see any good reason for someone to rush into this beautiful area, pillage the minerals, provide a small number of jobs for 20 years, and then disappear, leaving Minnesotans with a few dollars for the minerals they have plundered, and an environmental mess for the taxpayers in the state to clean up. If it can ever be cleaned up...There is no way that anyone can forecast what the total cost will be to clean up the damage from the proposed operation.Please enforce the rules in the laws that Minnesota already has, and do not allow this mine to be permitted to operate!	FIN05, FIN10
14821	Sulfide mining is a very dirty process, and it should not be done in Northern Minnesota. It shouldn't be done at all. You know, we should save these pristine areas when the climate really gets bad. We don't know what the future holds. There could be a depression in the future.	SO01
14822	they expect the people of Minnesota to pay for the cleanup. Now, how is it that a foreign corporation can come into Minnesota, make profits off our land, leave, and leave us with the cost of cleaning it up?	FIN10
<b>Sender Name (Submission ID)</b> Robert Kaiser (13069)		
1713	We must be constantly reminded of all the water pollution questions that thisproject proposes, not how much money can be made from mining minerals.	SO01

17113	Problems:Elaws in the study re water flow200-500 year timeline = total irrationality – similar to nuke waste storage	WR035
<b>Sender Name (Submission ID)</b> Robert Lawrence Dryke (57149)		
16843	Will...PolyMet provide continuous insurance, bonds and monies for the future problems and effects the ore processing causes that are unknown?	FIN01, FIN08
<b>Sender Name (Submission ID)</b> Robert Lohman (18265)		
13879	But I think the PolyMet mining proposal ranks right up there with having a hazardous waste site and it is pretty close to having a nuclear waste site in Minnesota. I can't understand how anybody is willing to put Lake Superior, the Boundary Waters wilderness, various wetlands, plants and animals at risk. For what? 350 jobs, 500 jobs for 20 years?	SO01
13880	Another thing I can't understand is why would we even be talking to PolyMet, who has never operated a plant?..I was also thinking about Glencore...So, we're inviting corporations like this into Minnesota and we are going to take their word for the fact that they have state-of-the-art technology and nothing is going to happen?	PD23
<b>Sender Name (Submission ID)</b> Robert McKlveen (18388)		
12097	The SDEIS fails to adequately and accurately account for the impact that the thousands of people like me [tourists] have on the local economy, and the harm to the economy if the mine is built under the currently proposed conditions and restrictions.	SO02
12099	If the waters or air of the BWCAW and the surrounding areas are damaged by this mine or it's aftermath, fewer visitors (including myself) will come to the area. This would have a significant negative impact on the economy of the area that will outlast the pdocutive life of the mine by decades or centruies.	SO01
15239	[The SDEIS needs to account for the effects of reduced tourism] in a meaningful way.	SO02
<b>Sender Name (Submission ID)</b> Robert Nanti (7376)		
734	I am writing in support of the environmental review process in place that is evaluating the project, ensuring that the project will comply with existing regulations. Minnesota, for many years, has been a leader in protecting its environment. I have found the SDEIS process, although lengthy, to be a sound and detailed process, based upon scientific principles and not prone to political maneuvering.	NEPA16
<b>Sender Name (Submission ID)</b> Robert Risch (44099)		
8006	Sulfide mining... [has the] potential to create long term pollution as waste materials are exposed to water over the years. This will happen both from rain water and from the mine being located in an extremely high, water-rich environment.	WR001
14905	Financial assurances, to deal with this long term reality, would have to extend beyond the lifetime of anyone alive today...To my knowledge, no financial assurance, of this open ended duration, by a corporation, has ever been enacted and/or is still successfully being carried out.	FIN01

10110	For the few jobs created, the trade off of the water pollution for 500 years or more is unacceptable.	SO01
<b>Sender Name (Submission ID)</b> Robert Schmitz (50037)		
12994	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN10
12997	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN10
<b>Sender Name (Submission ID)</b> Robert Stevens (50086)		
13026	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN10
<b>Sender Name (Submission ID)</b> Robert Stodola (54835)		
18703	I'm extremely worried about the lack of human studies from PolyMet -- no epidemiological references to what long-term exposure to sulfation - sulfides, & toxic metals: mercury, cobalt, arsenic. MN EPA hasn't insisted on this information, so the effects will only become apparent if the proposal is approved -- with us as guinea-pigs.	HU01
18710	There will most certainly be long term degradation to the St. Louis Lower basin that dumps into Duluth bay from the surface and groundwater runoffs that will most surely happen.	WR111
<b>Sender Name (Submission ID)</b> Robert Tammen (54840)		
18832	As a firewall against excessive meddling by agency personnel, the mining industry hires retiring State employees to make sure that any "adapting" they must do is favorable to their bottom line. Our environment should not be exposed to the vagaries of adaptive management.	NEPA18
18833	Several documents refer to PolyMet and Poly Met (Two words). There must be a reason for having two different legal entities. The SDEIS should explain the difference and perhaps declare which will get dividends and which will have environmental clean up liability.	EDIT01
18834	Federal, state, and local taxes. The SDEIS does not quantify rebates traditionally given to the mining industry. Our history of rebates to the taconite industry should be documented and the probability of rebates to the sulfide mining industry should be acknowledged...5-503 Operations. IMPLAN discussion does not address the Minnesota policy of rebating taxes to themining industry. Disclose rebates.	SO05
18837	ES-40 IMPLAN. The November 2012 UMD Economic Impact Report and it's IMPLAN references are not credible. Page 4 declares that mining totals approximately 5.3% of Minnesota's Gross Regional Product but the same page lists Minnesota GRP as \$281.1 billion and mining GRP as \$4.5 billion. Mining is obviously less than 2% of Minnesota's economy.	REF01
18841	ES-41 "There is no legal access to the federal lands via land,... The SDEIS should acknowledge that the mining industry has the power to prevent American citizens from accessing Superior National Forest land and should resist efforts to give the industry even more power by facilitating a sulfide mining operation in Minnesota.	LU06

14526	3.The polluted contaminated water would increase arsenic into Hoyt Lakes drinking water by 38.5% above the level of concern in MN cancer risk rate.	HU05
<b>Sender Name (Submission ID)</b> Robin Raplinger (45883)		
11382	How could such an estimate of costs ever be accurate and guaranteed for 200-500 years or more? PolyMet does not have the resources to guarantee those immense liabilities and could be described as a "shell corporation" when the major investors, including Glencore, enjoy that protection.	FIN01
11386	What this proposal asks you to accept is 20 yrs of 200-300 jobs and promise that PolyMet will fund everything for 200-500 yrs.	SO01
12587	There is an alternative plan of an exchange of 4,901 acres. The SDEIS does not explain how the smaller land exchange would affect the project. With a different property boundary resulting from the alternative plan there is not analysis in the SDEIS of the affects of that change. The SDEIS does not explain the change in ground water seepage with the boundary closer to the category 1 waste rock pile, the West Pit, and adjacent creeks (Longnose). •The SDEIS must be rejected until it contains an analysis the effect of water and other pollution if that alternative is selected.	WR155
12595	No analysis of increase road fatalities to endangered species throughout the building or site preparation and mining or production phases. There are 11 state-listed Endangered, Threatened, or Special Concern (ETSC) plant species and six state-listed ETSC wildlife species known to occur within the project area. State-listed wildlife includes the gray wolf, bald eagle, wood turtle, eastern heather vole, yellow rail, and Laurentian tiger beetle. There is not much, in the PolyMet plans, about the effect on the already declining moose population.	VEG01, WI01
12608	The SDEIS must be rejected until a cumulative assessment of arsenic exposure and cancer risks for people including formula fed infants and people relying on fish and wild rice for food is completed and incorporated in future EIS's.The Minn. Dept. of Health should be included to analysis both workers and residents' effect on their health. Minn. Dept. of Health study must include the projects immediate and cumulative effects of arsenic on infants, children. Such Health Assessment is missing from the SDEIS and I ask that it be included	HU01
12618	...there are mistakes in the modeling of base water flow rate using the XP-SWMM modeling tool. XP-SWMM underestimated base flow rate by about three times the real base flow. The Cooperating Agencies believe that the XP-SWMM model to be inaccurate and they were correct. The Cooperating Agencies found that the GoldSim model similarly inaccurate for this project's conditions...•More appropriate models, or better yet on site testing and scientific hydrological observations, should be done to determine base and other flow rates.	WR106
12621	•The SDEIS must be redone to incorporate a 70yr "lifetime" , not the 30 yr. criteria use in the SDEIS (pages 5-421, 5-424 and 5-426) , for cancer exposures for workers and effected nearby residents as used by the EPA and the State of Minnesota .	HU01
12652	The PolyMet tailings basin is located on the old, 1950's, LTV tailings piles that cover about two square miles. On top of the old tailings PolyMet proposes to dump sulfide tailings leeching acid and metals. PolyMet claims they will collect, despite the increased seepage resulting from PolyMet's activities, over 99% of surface and ground water seepage. (SDEIS p. 5-159) They do not show any comparable collection from any unlined tailings pile. It is not realistic. There is no experiential basis for that collection percentage.	WR020, WR023
12660	The tailings pile is constructed over streams allowing drainage or seepage. This is a historic water flow pattern but is ignored in the SDEIS. The sub basin streams are in the Draft PolyMet EIS Figure 4.1.9. One stream flows to Spring Mine Creek which is already impaired. This flow evades the collection pumps.	WR056, WR092, WR096, WR104

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Robin Raplinger (45883)	
12662	The SDEIS does not address fractures beneath the tailings basin. They are known pathways of contaminant migration to ground or surface water. This is already happening as is shown in the SDEIS p. 4-12 area of concern #8.	WR010, WR012, WR061, WR071, WR099, WR168
12687	The alternatives considered in the SDEIS simply amount to the PolyMet plan, or a smaller amount of land exchange, or no action. There are no substantial or significant mining alternatives in the SDEIS. The SDEIS must be rejected until: Underground mining is considered or other substantial or significant mining alternatives are analyzed. Thousands of acres of wetlands could be saved with an underground option.	ALT01, ALT06
12690	The SDEIS [must] reflect the goals and requirements of Minnesota Administrative rule 6132.3200 CLOSURE AND POSTCLOSURE MAINTENANCE...It is clearly not the goal of the PolyMet SDEIS to be, upon closing, stable, free of hazards, minimizing hydrologic impacts, minimizing the release of substances that adversely impact other natural resources, and is maintenance free. Instead the SDEIS contemplates virtual perpetual maintenance. For a State Agency such as the DNR to ignore the law, and its goals, is a breach of that agency's duties, and that agency's commissioner's duty, to obey the laws of Minnesota.	PER04
12693	"financial assurance instruments covering the estimated cost of reclamation" is required. There is an estimation of 120-170 million dollars at closure and 3.5-6 million dollars per year after closure.... How could such a Financial Assurance estimate of costs ever be accurate and guaranteed for 200-500 years or more? We have no idea what changes in law and the economy could take place in 200-500 years.... Could anybody believe PolyMet or their "financial assurance" will be around hundreds of years after the mine operation, and its value, is gone?	FIN01, FIN05, FIN08
14328	The Cooperating agencies have been correct, as one co-lead agency MDRN now recognizes, in there objection to relying on the deficient and misleading reliance on XP-SWMM model used to extrapolate flow data. This model is flawed, as direct observation shows. The SDEIS must be reworked and revised concerning this aspect.	WR003
14329	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.	PD03, PD32
16868	PolyMet is receiving land that that will have a increased value, above and beyond the value of the separate rights or ownership interests, as they will have unified surface and mineral rights. The exchanged land that ends up in public ownership will have less value as a result of the divided nature of the surface and mineral rights. The land exchange must be rejected until bona fide appraisals are available for citizen taxpayer comment.	LAN02
16869	The sole reason for the proposed land exchange is to allow a private entity, PolyMet, to take lands that are now available for multiple uses including wildlife habitat, forestry, hunting, gathering and recreational uses and convert those lands into a single use, PolyMet's mining activities. This is an economic justice issue. The land in the proposed exchange will be used exclusively for the proposed project and all other uses will be eliminated for decades if not permanently. This does not serve the public interest.	LAN01
16870	One reason given for the land exchange is to unify ownership of the surface and subsurface mineral rights. The proposed land exchange attains that goal only for PolyMet. The exchanged lands that end up with the Forest Service will all have severed mineral rights. The exchanged lands that end up with the Forest Service will all vulnerable to future mining activities. This not an equitable exchange and the public receive less value in the exchange.	LAN04
16871	The remediation plans include introduction of at least two non-native plants.	VEG05

<b>Sender Name (Submission ID)</b> Robin Raplinger (45883)		
16872	The EPA rates arsenic as a Class A carcinogen. Colby lake supplies drinking water for the city of Hoyt Lakes . The SDEIS 5-145 states that arsenic levels will increase 38.5%. The EPA adopted rules with thresholds of unacceptable increases of cancer due to arsenic. The Colby lake increases in arsenic show in the SDEIS are above the EPA’S threshold (40 C.F.R. 131.36) and the Minnesota cancer risk.	HAZ02
16873	The SDEIS must be rejected until: Accurate scientific hydrological observations and findings can be made concerning mercury pollution and bio-accumulation in the St. Louis River and all its tributaries.	MERC19
16874	Many emissions the PolyMet mine and plant increase the risk of cancer for on-site workers and people living around the operation. Such emissions include nickel dust, dioxins and asbestos-like fibers in some rock near the PolyMet site. Mesothelioma is a known risk for Minnesota taconite workers. There have been calculations for similar cancer risks done by the Dept. of Health at the Prairie Island Nuclear Plant for on-site workers. Off site, arsenic increases in the drinking water are a cancer risk for inhabitants of Hoyt Lakes. The SDEIS does not analyze health effects on the workers.	HU02
16875	There is heavy reliance on collection and Reverse Osmosis water filtration. There is not Reverse Osmosis water filtration for up to 40 years into the project according to the SDEIS...RO WWTP should begin at the same time as mining.	WR143
16876	•The SDEIS must be rejected until [there is an] Analysis of the possibility of backfilling waste rock into one of the pits, instead of piling outside, to reduce runoff and other forms of pollution.	ALT03
16877	The polymet SDEIS addresses financial assurances basically to keep the RO pumps running, no plans for failure or unplanned expenses.	FIN05
16878	The SDEIS must be rejected until:•The SDEIS analyzes the long term cost to health, the environment and perpetual treatment of water pollution from this mine. •The SDEIS analyzes the possible, and probability of, failures or unplanned for expenses in the perpetual treatment of water pollution from this mine.•The SDEIS analyzes and designs funding mechanisms to fund those perpetual liabilities.	FIN05, FIN08

9542	The SDEIS states that the 1st priority for ground water is its use for domestic water but the SDEIS has several problems with this priority item. First, the SDEIS does not explain the models it used to predict ground water flow. Second, ground water flow can be independent of surface water flow and can flow in different directions from surface water. Third, the SDEIS presents information in figures that violate assumptions of the models and assumptions used to build the figures. Finally, contaminated ground water will not necessarily be stopped or directed by surface water drainages. Consequently, the material about ground water in the SDEIS untrustworthy at best and could endanger humans, or even cause death, if used by PolyMet to make decisions.	WR086, WR105

9558	The tables demonstrate clearly that the models of stream and river flow are grossly in error. For example, the 30 day maximum flow for a stream or river must, by definition, exceed the average flows of all 30 day periods, otherwise it would not be the maximum flow. Yet, the mean 30 day maximum flow for the Partridge River predicted by the model is less than the actual mean flow for April, showing that the model is simply wrong and should not be used. Similarly, the 1-month maximum flow must be less than the 1-time maximum pulse, the 1-month minimum flow must be less than the 1-month mean flow, and the 1-month minimum flow must be greater than the 1-time minimum flow. Yet, the flows predicted by the model and shown in the tables violate these requirements. Thus, these tables demonstrate that the model used to predict stream and river flows cannot mimic the natural system that it is supposed to model. If the model cannot replicate the system as it is, it cannot be used to predict water flow after mining starts. Thus, the modeling of water flow must be completely redone.	WR003, WR189
9558	The tables demonstrate clearly that the models of stream and river flow are grossly in error. For example, the 30 day maximum flow for a stream or river must, by definition, exceed the average flows of all 30 day periods, otherwise it would not be the maximum flow. Yet, the mean 30 day maximum flow for the Partridge River predicted by the model is less than the actual mean flow for April, showing that the model is simply wrong and should not be used. Similarly, the 1-month maximum flow must be less than the 1-time maximum pulse, the 1-month minimum flow must be less than the 1-month mean flow, and the 1-month minimum flow must be greater than the 1-time minimum flow. Yet, the flows predicted by the model and shown in the tables violate these requirements. Thus, these tables demonstrate that the model used to predict stream and river flows cannot mimic the natural system that it is supposed to model. If the model cannot replicate the system as it is, it cannot be used to predict water flow after mining starts. Thus, the modeling of water flow must be completely redone.	WR003, WR189
9572	On page 4-74, the last sentence states that water samples "generally met" standards. Had water samples always met the standard, the SDEIS would have stated so. Consequently, an intelligent person must deduce that at least some samples, if not many, did not meet the standards. Not meeting the standards is not acceptable.	WR071

9578	Table 5.2.13-1 of the SDEIS shows that deliveries of explosive and dangerous materials (just a portion of the Hazardous Materials) to the NorthMet Project site are projected to be about 5000 tons per year. The SDEIS states that the probability of a spill of some serious Hazardous Material is 12.5 %. PAX, one of the most hazardous materials to be delivered to the site, constitutes about 20% of the serious Hazardous Material to be delivered. PAX is spontaneously combustible and produces H2S, hydrogen sulfide, which is toxic. The SDEIS states that the probability of a spill of PAX is 2.5%. Deliveries of diesel fuel will total over 6 million gallons per year. The SDEIS states that the probability of a spill of diesel fuel is 40%. Thus, the total probability of a spill of diesel or of PAX or of some other Hazardous Material is about 50% or possibly greater. Given that PolyMet has no experience in handling serious spills of Hazardous Materials, the SDEIS must explain how PolyMer proposed to deal with the emergency of a serious spill and how PolyMet will clean up these serious spills if they occur. Otherwise, the public and future regulators cannot evaluate their proposed handling of spills.	HAZ01

9589	In many places, the SDEIS makes statements without providing adequate documentation. In other places, the SDEIS provides enough information to show that the models or evaluations used are inadequate or simply wrong. And in some places the SDEIS makes statements that contradict known ecological science. My conclusion is that the SDEIS is grossly inadequate. The SDEIS requires massive revising before it can be used to evaluate the potential Environmental Impacts of the NorthMet Project. Thus, it cannot logically be titled an "Ecological Impast Statement". It will be grossly irresponsible not to require revision of the SDEIS and not to have the revised SDEIS available for public comment before permitting is considered.	NEPA09

17911	This highly polluting type of mining has NOT been done anywhere in the world without severe consequences to the environment. Why on earth should we try out this unproven mining technology here in the fragile and pristinelakes and forest lands of Minnesota?	PD26
17912	The health of the area's human and wild inhabitants, and thousands of established tourism-based jobs would be traded away for hundreds of temporary local mining jobs. ... Our mined metal resources will mainly enrich a foreign corporation, while residents of the Lake Superior watershed are likely to experience degradation and loss of water quality, as well as the loss of the rare, irreplaceable wild rice wetlands of the Ojibwa people.	SO01
17913	Important forest habitat and wetlands will be lost for hundreds of years or more, and with them the wildlife that has survived on our dwindling and scattered habitat and corridors. Moose habitat loss would be especially tragic, as would the wetlands of Minnesota's also-dwindling duck populations.	WI01, WI02
17914	These wild places and their inhabitants have evolved for tens of thousands of years since the glaciers; whole ecosystems like this can't be replaced simply by planting trees or digging ponds, especially if the chemicals (including sulfuric acid) dredged up by mining will drastically alter the land and its living things.	WILD02
17915	Please listen to doctors, nurses and other medical experts who foresee serious and fatal health consequences from this pollution, and are speaking out.	HU03
17917	the SDEIS failed to include a cost/benefit analysis and specific provisions concerning amounts and sources of financial assurance. Accidents and failures are distinct possibilities during that time span. I don't know of any company that has that long a track record. If Polymet will not or cannot provide money up front to finance this pollution abatement, and/or if the company goes bankrupt or ceases to exist, we Minnesota taxpayers will be stuck with the clean-up tab, quite possibly for centuries. Add to that the fact that pre-financing cleanup is complicated by the changes our monetary system and values are likely to undergo in the next 500 years!	FIN01, FIN10
17918	The huge two-volume SDEIS is far too long for working people to digest in the short time allotted for comment. I urge you to change the comment deadline to allow more people to respond to this important, far-reaching issue.	NEPA07
17920	errors have been detected such as underestimations of the actual river rate of flow, and the questionable plan for wall barriers to be built down to bedrock to contain tailings.	WR003, WR019
17921	A new, alternative industry could provide jobs as well as precious metals for modern technology, such as recycling plants for old cell phones and other tech waste so that those items don't end up wasted and polluting the ground in landfills around the world.	NEPA06

13516	I think Polymet['s]...thoroughness is apparent, even if a minute amount of harvested wild rice is affected.	WR161
15094	Time and money is wasted with this long delay in allowing permits.	PER34
<b>Sender Name (Submission ID)</b> Ron Brodigan (39798)		
6985	The plan misrepresents or misunderstands the amount of wild rice waters within the St. Louis River/Lake Superior Watershed. MDNR should insert actual steps in a new DEIS to better identify and preserve wild rice waters in northeastern Minnesota. ... 100-mile swamp [will] undoubtedly will be affected via underground water exchange by a PolyMet open-pit mine and associated infrastructure.	VEG04
6990	The proposed precious metals mine and related infrastructure would possibly destroy moose habitat. With an already seriously declining population of these animals, there should be more analysis of the potential mine's effects on this remaining population in the SDEIS.	WI01, WI02
7002	It is known that some of the minerals to be mined have similar properties to asbestos and other harmful mineral fibers and can be causal to lung afflictions such as pleural plaque, pleural effusion, asbestosis, silicosis, lung cancer and mesothelioma...There needs to be serious and considered analysis of health effects to the human population for generous distances from the proposed industrial area.	HU05
7066	The proposed land exchange (for the sole benefit of PolyMet) between the mining company and the U.S Forest Service is not the kind of swap usually done by the latter agency. Forest Service rules may actually prohibit such a trade. This represents a one-sided giveaway of valuable wetland and upland forest that can never be replaced. The U.S. Forest Service must not forget they are giving to a corporation, parts of the Superior National Forest. More analysis and justification of this proposal by the Forest Service should be included in the supplementary DEIS.	LAN02
7092	There seems to be no plan in theory or in practice for remediation of future extraordinary weather or geophysical events that could release contaminants into air, streams, lakes and subsurface waters. This should comprise an entire new section in the revised DEIS.	PD22
7103	The DEIS contains inadequate data on existing water and air pollution throughout PolyMet's area as a direct result of 100-plus years of iron and taconite extraction and processing. PolyMet's potential activities would exacerbate existing pollution on a magnified scale.	AIR11

12188	I would argue that we need to focus on tangible issues; selling, trading land for fragments of lands in 900 places, trading wetlands, rather than unique ecosystems.	WET14
12914	...the SDEIS ignores the most significant cumulative impact, that is, the development of other copper/nickel mines in the region, by categorizing the development of additional cooper-nickel mines as "speculative".	CU02
12921	By definition, cumulative impact means, in part, "the impact on the environment that results from incremental effects of the project in addition to other past, present, and reasonably foreseeable future projects regardless of what person undertakes the other projects". The SDEIS dismisses the cumulative effects/impacts of other potential non-ferrous mine developments by subjectively listing them as "speculative".	CU02
12926	I argue that the future development of additional non-ferrous mines is not "speculative", but rather reasonably foreseeable and thus subject to evaluation in the SDEIS.	CU02
12945	...the State, including the MNDNR, specifically forecasted that non-ferrous mining in notheastern Minnesota was reasonably forseable to the point that it was willing to invest \$4.3 million (in1979 dollars) to study the regional impacts of said mining (3).	CU02
12952	...the MNDNR, as an RGU for the proposed Northmet/PolyMet project, cannot argue that the development of other non-ferrous mines is "speculative", and should be compelled under EQB guidelines to conduct a comprehensive analysis of the cumulative potential effects of other non-ferrous mines in the SDEIS.	CU02
12953	The fact that the Environmental Quality Board: Regional Copper-Nickel Study (1979) was not used as a reference in the development of the SDEIS seems to be a serious oversight of the SDEIS...In part, the study concludes that there will be cumulative impacts to various environmental components (i.e. hydrology, among others) if non-ferrous mining were to move forward	CU03
12956	The Attorney General's Office (2006) acknowledges that the interpretation of cumulative impacts under the EQB rules "has been the subject of a fair amount of litigation'. The majority of cases cited in their review found that cumulative effects/impacts of like projects needed to be considered and included in the respective EISs.	CU03
12964	while the wetlands that are to be restored will be re-vegetated, those efforts won't completely match the biological community of the wetlands that will be lost. It may take decades, or more for the restored wetlands to recolonize and aquilibrate with other biotic components (bacteria, fungi, invertebrates, etc.), and they are not likely to be the same as those that were lost.	WET05
12965	...the more southerly location of the mitigation wetlands will make [species such as the Lynx and the Moose] more vulnerable to the impacts of climate change and create an even larger differential in habitat types and aquatic communities from the current condition. The SDEIS does not take this disparity into consideration...	WET04, WI02
12970	..there is no substantive discussion concerning the removal of the forest plant community and the peatland/bog ecosystems as carbon sinks. The SDEIS needs to more extensively explore these issues to be a complete document.	VEG03, WET13
12973	mine development will create disturbances that could facilitate the distribution and abundance of invasive species...(for example: earthworms) in the heart of a large forested area...The role of site disturbance and the cumulative impact of this project, as well as other reasonably foreseeable projects, on the introduction of invasive and exotic species need to be thoroughly discussed and mitigated in the SDEIS.	VEG05
12975	[The SDEIS] combined the percentage loss of rare or endangered plant species so that the overall impact appeared to be more reasonable (1% decline in statewide populations) when the statewide decline for the populations of some species was much greater, and potentially critical...The concern must be discussed at the species level since the impact is at the species level.	VEG01

12185	. Can we trust PolyMet. But it was not PolyMet we need to trust. It is Glencore Xstrata. Glencore Xstrata is the primary owner of PolyMet and as the research firm, Stifel Nicolaus states, Glencore Xstrata will buy the rest of PolyMet when all the permits are in place. So who is Glencore Xstrata and can they be trusted. Glencore Xstrata is a Swiss-based firm known for its ruthlessness. This is the fourth largest mining company in the world. It controls 50 percent of the world's copper through its ownership of 100 mines around the world and its commodities trading operations. Glencore Xstrata's CEO is Ivan Glasenberg, who prides himself on extracting maximum profits from its overseas holdings. Under his leadership, Glencore Xstrata has run a long list of labor and environmental abuses, including 58 mining fatalities between 2008 and 2010, over twice the number reported by any other mining company over that period. Just in 2012, the environmental and labor record includes dumping raw acid into waterways in the Congo; Failure to provide a vapor barrier to prevent acid mist from descending on 3,000 people in Zambia; Utilizing child labor as young as 10 years old at mines in the Congo; and causing environmental damage at the McArthur River Mine in Australia.	PER02

14416	Twenty years of profit versus 500 years of pollution and the loss of something that can never be replaced is foodhardy and misguided.	SO01
<b>Sender Name (Submission ID)</b> Ruth Mason (58018)		
19878	The quality and short term gain of jobs does not balance the long term destruction of water, land, habitat and quality of life.	SO01
<b>Sender Name (Submission ID)</b> Ryan Birkenholz (6131)		
1092	The extensive regulations and controls they must go through provide a reasonable assurance that environmental impacts will be kept to a minimum.	PD28
<b>Sender Name (Submission ID)</b> Ryan Christopher Alger (43456)		
15706	One of the most nocitable side affects of the drilling is the excessive noise pollution. Particularly in the winter when sound travels much further. One of the issues with the current NorthMet SDEIS that i've recognized is the inaccuracy of the projected levels of noise pollution and the GIS models used to estimate them. ... The amount of noise generated and how it affects wildlife should also be looked at closer.	N04
15709	The SDEIS does not adequately project the possible damage and risk of a spill, leak, or overflow from containment ponds. The mine must be designed to withstand at least a 1,000 year rain event without risking pollution. The DEIS does not adequately factor in the long term affects of climate change.	NEPA15
<b>Sender Name (Submission ID)</b> Ryan Gaffke (6139)		
1045	believe they will build and operate a mine that complies with all regulations and protects the environment.	PER34
1046	demonstrates that PolyMet can develop this resource in a sustainable manner and there are logical, engineered solutions proposed for potential impacts.	PD28
1047	PolyMet will....generate significant economic activity, expanding and diversifying our mining economy. PolyMet will contribute to the local and state economy at a time when we really need the jobs and economic benefit. PolyMet can...create hundreds of jobs....PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system.	SO10
<b>Sender Name (Submission ID)</b> Ryan Heule (3273)		
198	Does the financial assurance take into account inflation in the event this mine operates beyond its 20 year life?	FIN08
199	After this project does go end of life who will be responsible to post shutdown monitoring of the tailings basin and pit water in the event Northmet is no longer around?	PD24
<b>Sender Name (Submission ID)</b> Ryan L. Burke (43968)		
14934	The people of Minnesota need sustainable investments that will bring us ahead, and not destroy our water systems and the Northern economy. These companies do not have the state's best interest, nor do they plan on making long-term investments in our people.	SO01

14935	I am writing you today to ask that this proposal be rejected on the grounds that it puts all Minnesotans at risk.	PD01
<b>Sender Name (Submission ID)</b> Ryan Mc Bride (32225)		
12025	I do not believe that the possible contamination of Lake Superior, and hence the entire Great Lakes waterway, and the Boundry Waters Canoe Area Wilderness is worth the minerals gained via mining in these areas.	SO01
<b>Sender Name (Submission ID)</b> S. Alexandra Leary (52194)		
12916	The map the Polymet mine people have offered in their paperwork doesn't encompass the entirety of the 100 Mile Swamp as is indicated on government maps.	WR080, WR175
12917	I believe [the use of inaccurate maps] is an intentional misrepresentation by Polymet of the SCALE and NATURE of the 100 Mile Swamp which encompasses wetlands and ephemeral wetlands.	WET19
12918	Once pollutants like sulphuric acid begin to slowly seep into the 100 Mile Swamp, the ecological security of the nearby Great Lakes is no longer.	WR080, WR081, WR111, WR167, WR175
12919	The nature of the Great Lakes fishery will change for aeons and the use of the Great Lakes as a source of fresh, potable water will be compromised for two countries if the impossible nature of the reality of a 500-year remediation plan is ignored.	AQ05, WR042
12920	Chemical contamination lagoons in such an ecologically sensitive area w/such a high water table would be subject to extreme of temperatures from the freezing and thawing and I cannot imagine these lagoons would hold up over a 500-year remediation period.	WR127
12922	There is no reality in this EIS to the suggestion this company is intent on allocating financial resources for the expected 500-year remediation period, never mind if they've made any effort to scale up their remediation efforts if there is any leakage over time that begins to infiltrate the Boundary Waters Canoe Area Wilderness.	FIN01
12923	If the hydrology studies show that Polymet is unwilling to TRULY PROTECT the Rainy Lake watershed and the Great Lakes by drilling test wells for polution tracking and is otherwise unprepared to handle subterranean pollution, then the permitting process should be reconsidered.	PER06
12925	This site must be handled by attaching a PERMANENT LEGAL STRICTURE as to its continuing remediation that must be the responsibility of the Polymet company and any subsequent transfer of Polymet to another corporate entity.	FIN01
16226	This mapping discrepancy should have been one of the first things on which the Minnesota Department of Natural Resources demanded clarification from the Polymet organization in the early years of development of the EIS. To add to this issue of what surface waters are contested as being potentially subject to pollution, the hydrology of the area is not well understood other than in the vaguest practicable terms.	PD38
16227	There is also no sign Polymet intends to add hydrology protections to its management of the site by drilling test wells to test for seepage at set distances from the site.	PD04
16228	I believe we must conduct baseline hydrology mapping of the 100 Mile Swamp, the Dunka River and other flowage in the Rainy Lake watershed so we have a clear understanding of subterranean water flow and just how quickly we are risking pollution seeping into the Great Lakes.	WR080, WR081, WR175

13454	Why would we want to take a chance on this process when we are in a water-rich area and the report itself says that remediation will be needed or could be needed for 500 years.	PD03, WR195
13455	Add to that that copper-nickel mining has never been done anywhere without significant environmental damage. Let me say that again. Copper-nickel mining has never been done anywhere without significant environmental damage.	PD26
13508	Now, that new thing is reverse osmosis. Before we take one step to do this, I ask that it be proven that this process will work on the scale that will be needed.	PD03
13509	Are the jobs that will be created livable-wage jobs, and how long will they really last?	SO02
<b>Sender Name (Submission ID)</b> Sally Rauschenfels (44096)		
15148	despite my desire for well-paying jobs here, I am smarter than to be seduced into the clutches of this slick Polymet project public relations campaign and resulting incomplete SDEIS for the greedy gain of a few dozen unsustainable jobs. ... The fact that our Minnesota DNR is even considering putting at risk our 10% of the world's fresh water for short-term economic gain is sad and shameful.	SO01
15149	The SDEIS provides no detailed definition of what financial assurance funds will be placed in trust to ensure that water flowing from the waste piles and tailings ponds will be treated and maintained for the required hundreds of years, and that contamination episodes can be cleaned up in the highly predictable event that the company goes out of business soon after closure.	FIN01, FIN08
15150	The hydrologic model for the water moving through the mining and processing site dramatically underestimates the volume of water passing through, and the rate it moves across and under the waste containment sites. Thus, this crucial predictive tool greatly understates the risk of significant acid rock drainage impacts to surrounding wetlands, groundwater, the Partridge and St. Louis Rivers, and ultimately Lake Superior.	WR003, WR189
15151	This revised version of the project has not been improved enough to assure that the mine's waste and the laws and variables of nature can now be managed so as to avoid major pollution for the indefinite future, beyond a time when our present regulatory systems may even be functioning.	PD01
15153	Unlike ferrous mining, Polymet's open pit sulfide mine operation has significantly greater potential to pose human health risks through contamination of drinking water and fish, seriously degrade the St. Louis River, destroy wild rice and irreplaceable wetland habitat, and harm the lake that holds the world's fresh water.	HU03, WET24
<b>Sender Name (Submission ID)</b> Sam DiVita (44760)		
7238	I disagree with how the current (Supplemental) Draft EIS disregards the concerns of the Fond du Lac and Grand Portage Tribal Governments, the 1854 Treaty Authority, and the Great Lakes Indian Fish and Wildlife Commission.	CR01
7242	I also believe the some of the maps in the draft are incorrect. Specifically, the map of the One Hundred Mile Swamp...therefore the environmental impact statement is inadequate until the maps are corrected to show the real details of the area.	PD38
7244	I do believe that runoff from the project will enter the BWCAW and impact our waterways and wilderness areas in Minnesota.	WR111

14919	I would like to request that action be taken against the PolyMet plan, in the form of postponement until a better plan can be developed that captures and controls runoff pollution from the mine. I would also like the plan to address the care of workers, as PolyMet’s financial backers have a history of human rights violations.	PD23, PD32
17269	I am deeply concerned that PolyMet, a company that has never before operated a mine, will not be able to follow through on their claims to not pollute, and that it will be my generation that has to pay the price – in superfund taxes, and by losing priceless wilderness.	FIN01, FIN10
17270	I know that jobs have to be created, but I would prefer to see efforts channeled towards lasting jobs, not positions that will be cut as soon as the mine is either shut down or done providing copper. This copper, incidentally, will be sold to China instead of used in the United States, which I also object to.	SO02
17271	PolyMet’s Supplemental Draft Environmental Impact Statement talks about using ‘reverse osmosis’ on the water to keep pollutants from leaching into the aquifer and the Lake Superior Basin, but the science isn’t sound. Even if reverse osmosis did work, 99% of what the mine is going to produce will be waste products. Is that 1% of copper-nickel needed so badly that we can afford to overlook the potential damage that could be done to more than 8,260 acres of St. Louis River watershed? Open-pit mining like this has been done in more arid climates, and pollutants have still found their way into water. That threat will only be more potent in our water-rich environment.	WR111, WR143
17273	I would like to request that action be taken against the PolyMet plan, in the form of postponement until a better plan can be developed that captures and controls runoff pollution from the mine. I would also like the plan to address the care of workers, as PolyMet’s financial backers have a history of human rights violations.	HU04, PD32
<b>Sender Name (Submission ID)</b> Samantha Henderson (54339)		
17574	I think that we all use products everyday that we wouldn't have if these metals weren't made available.	NEPA05
17575	I think that the project proposer is going to be responsible and minimize the effects of water pollution and air pollution. For example, PolyMet has come up with air filters that can help filter during rock crushing and processing. They are also going to use energy efficient equipment and processes.	AIR14
17576	To minimize water pollution they propose to have liner systems to prevent chemical from seeping into the ground. They will have groundwater containment systems to help control the wastewater.	WR190
17577	PolyMet will use old mining sites to plant new vegetation on. They will keep the invasive species under control in these areas. They will also put back some nutrients in the soil that are needed for the land to have growth again.	PD28
17578	Polymet will have to remove some wetlands, but they will be replacing them elsewhere. They will try to work around them the best that they can.	WET25
<b>Sender Name (Submission ID)</b> Samantha Henningson (47706)		
8090	The landscape and waters of Minnesota are forever, and I do not believe for one minute that PolyMet will pay to remedy problems that this is created...	FIN01
11154	I understand there are jobs at stake, and that the minerals being mined are in demand. But these are short term considerations.	SO01

967	the land exchange negates the original purpose of the U.S. Forest Service to protect these lands, forests and waters at its headwaters.	LAN02
969	the SDEIS needs to be redone to transparently analyze all the short-term, long-term and cumulative negative impacts from an open-pit sulfide mine in a water rich environment.	SO04
970	This SDEIS does not include an analysis of the risks to mine employees and surrounding communities from exposure to air pollution possibly containing asbestos-like fibers ... [or] the long-term health risks of people exposed to water polluted with heavy metals and sulfates from ongoing and long-term water seepage into groundwater, and the Partridge and Embarrass rivers. The SDEIS must be redone to include a rigorous health risk assessment.	AIR03, HU01, HU04
974	The SDEIS economic analysis stands on an old vision of inflating the benefits of extractive mining without revealing the costs of significant current and long-term negative environmental impacts.	SO04
975	the economic analysis misrepresents the tax benefit by not subtracting tax breaks given to the industry, and by not adding the costs to the local, county, and state for public services following this project's development.	SO04
976	The economic analysis under represents comparisons to tourism and other sectors that support tourism. It does not consider potential long-term loss of tourism due to impacted natural aesthetics along with polluted air, water and mercury in fish.	SO02
977	This SDEIS economic analysis should be rejected because of its emphasis solely on the benefits of mining while leaving out the costs.	SO04
978	By allowing this SDEIS to avoid transparency and by lacking balanced analysis, the three governmental agencies are effectively letting go of protecting our public lands and waters.	NEPA15
980	The ideal way to apply this rule [MN Rule 6132.3200] is to not permit seepage of polluted water and the site must be cleaned up during operations, so most of the cost of cleanup is applied as an expense against yearly profits.	PER04
982	[This] is a setup for the future citizens of Minnesota to pay to test and maintain water treatment at the mine and processing site for the next 200-500 years. ... Even if the company were to pay these costs up front, it is not realistic to expect investments to be risk-free for centuries, or to expect a state agency to be able to protect financial assurance from future legislation redirecting these funds elsewhere.	FIN01, FIN08, FIN10
986	The realistic scenario is if the mine is left with a need for active maintenance after closure... eventually citizens will have to pay the cost for cleanup and consequences of the health hazards from heavy metals and sulfate water pollution into ground water and into the watershed	FIN10
988	This proposed sulfide mine should not go forward because it would create ongoing heavy metal and sulfate pollution in surface water, ground water and into the St. Louis River Watershed, which provides drinking water to communities and flows into Lake Superior.	WR041, WR042, WR195
990	This pollution contributes to mercury buildup in fish, and could make this natural resource unsafe for consumption in most of the St. Louis River Watershed.	AQ05, AQ11
991	Fishing is very important to Native people and Minnesota's tourist industry. Warnings about more mercury in local fish negatively affect tourism.	SO02
993	this pollution affects production of wild rice, which is just one of many hunting and gathering rights protected by treaty for the Native American community.	CR01, WR156

994	The SDEIS must be redone to show the full impact on ground water, and the Partridge and Embarrass rivers.	WR044, WR045, WR058, WR173
999	It is unclear whether there are full emergency plans to respond to a long-term power outage or other unexpected failures such as: water treatment plant equipment failure, failure of lining material as it ages, and accidental releases of hazardous wastes. The SDEIS needs to add emergency contingency plans for equipment and other failures along with revealing the estimated volume and level of contamination released from uncontained discharge of polluted water.	PD22, WR127, WR130
1000	The public near the proposed mine needs to be informed with clear explanation and pictures of consequences to their health and environment from polluted air and water from sulfide mining, so they are fully aware of what they are inviting into their community.	SO04
1002	The land exchange is a net loss of wetlands for the St. Louis River Watershed.	WET15
1012	Proposed wetland mitigation will take place outside of the watershed, meaning the type and function of the wetlands will not help water quantity and quality within this watershed ... [and] the function of the 900+ acres of wetlands on the proposed mining site will be lost forever.	WET03
1015	The water table will be drawn down for an unknown distance around the mine, which could encompass an additional 7,000 acres. The SDEIS needs to be redone to include analysis of these 7,000 acres of indirect effects on the aquifer and surface hydrology.	WET10, WR119
1016	In the SDEIS, it is unclear if the lands to be exchanged are free of encumbrances. If the lands already have split interests of minerals, aggregate or timber reserves this could lead to a setup for another land exchange. The SDEIS needs to clarify the title of each of the lands to be exchanged.	LAN04
1017	The SDEIS needs to clarify the title of each of the lands to be exchanged. In the SDEIS, it is unclear if the land exchange is legal.	LAN04
1021	My concern is this proposed land exchange seems to negate the spirit of the law ... [and instead] makes this land unavailable to the public due to it being turned into a permanent industrial waste site ... The SDEIS needs to be redone to reveal all the legal questions and negative consequences from this exchange.	LAN02
1022	the water aquifer will be drained down and ground water will be exposed to pollution from untreated toxic mine seepage	WR086
1023	local citizens could develop cancer or other health problems	HU05
1024	public wetlands will be turned into an industrial waste site effectively creating a net loss of wetlands in the watershed	WET24
1027	mercury in fish will rise leading to less tourism and a loss of tourism related jobs	SO02
1029	wild rice production will be negatively affected, Native American treaty rights will be affected	CR01, WR156
1030	Minnesota taxpayers will be left to pay for 200-500 years of water treatment once PolyMet or the financial organization holding financial assurance goes bankrupt	FIN10
2011	mining has a long history of boom and bust of the local economy, which will likely impact PolyMet's employees and the community before it closes.	SO02

2012	It came to my attention that the major financial backer to PolyMet is a large international corporation, which has a poor record for worker rights, indigenous rights, and environmental pollution.	PD23
15560	..it is unclear if the land exchange is legal. The proposed mining site is land acquired under Weeks Law...does this mean that this land acquired for forest usage and water flow specifically located near the headwaters of Embarrass and the Partridge Rivers which are tributaries to the St. Louis River and flow into Lake Superior, cannot be exchanged due to their...status under the Weeks Law?...The SDEIS needs to be redone to reveal all the legal questions and negative consequences from this exchange.	LAN02
<b>Sender Name (Submission ID)</b> Sandy Stoffel (15427)		
8935	For those that argue that it will be bring jobs to the arrowhead region need to learn their facts. Over 60% of the employees will be brought in from out of the region. ... Polymet has already grossly decreased how many "proposed" jobs there would be.	SO06
12836	The matter isn't "if" the water will be polluted, but "when" it will be polluted. With moose deriving not just water but also food from the waterways around the NorthMet project, moose will be negatively affected by this mine.	WI01
12837	Tourists bring \$1.6 billion in revenue per year in the arrowhead region. They travel from around the world to fish and camp in the pristine waters of the Boundary Waters Canoe Area Wilderness. What's going to happen to that revenue when the fish are killed off and the waterways are too toxic to swim or even camp nearby?	SO02
13818	I believe that Polymet needs to prove they can build a mine that will protect the environment and our waters 100%, this needs to be proven in another state.	PER35
13819	Over 60% of the employees will be brought in from out of the region. Not to mention the fact that Polymet has already grossly decreased how many "proposed" jobs there would be.	SO06
13820	Let Polymet prove, in another state, that they can make a mine 100% environmentally safe.	PER35
14878	To date, there hasn't been one sulfide mine or open-pit mine that hasn't polluted the waterways. ...while all projects reviewed stated that it wouldn't pollute, over 76% of the time it did. Along with that, 89% of these mines polluted when it was stated that it was "completely safe".	WR023
14879	when these mines contaminate, it is up to the taxpayers to fend for the tens-of-millions-of-dollars bill because some of the mining companies filed for bankruptcy.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Santiago and Laurie Sovell-Fernandez (43323)		
11837	I question the accuracy of the modeling used to predict the impact of the project on both ground and surface water quality and quantity due to data limitations. More data is needed to make an accurate assessment of potential impacts in these areas.	WR025, WR071, WR072
15749	I strongly question the conclusion of the SDEIS on potential sulfate and mercury pollution impacts to water resources within and near the project area. Interactions among these water quality constituents are complex and many questions remain about the necessary rules and enforcement required to adequately ensure protection and nondegradation.	PER06

16749	The SDEIS does not refer to use or literature discussion of any methods for forecasting big slides in other open mine pits this discussion or technology. The SDEIS provides inadequate reference to / analysis of extreme precipitation events in the immediate region of the NorthMet mine and processing site. NorthMet contingency plans are dependent on function of mine site infrastructure, which will likely be dysfunctional in the event of a catastrophic wall failure.	WR077, WR130, WR132, WR180
16788	The waters listed in Table 4.2.2-2 Impaired Waters within the Embarrass River and Partridge River Watersheds are listed as impaired for mercury and awaiting a TMDL (TMDL Target Date 2015). They are not included under the Statewide Mercury TMDL. For waters that are impaired but do not yet have a completed TMDL, the MPCA cannot allow any new or expanded discharge that may cause or contribute to the impairment. . . .At a minimum, this issue and concern should be addressed in a revised SDEIS. All relevant information should be provided and alternatives considered.	ALT13
16790	There is a statement in the SDEIS that the water quality model “performs probabilistic simulations, taking into account the uncertainty around many of the model input assumptions”. Please revise the SDEIS to address the following questions and concerns:Which model inputs included uncertainty? Which model inputs did not? Was uncertainty included in the other water modeling – groundwater and surface water?Was uncertainty addressed in a sufficient manner? For example, did the modeling inputs include the possibility of significantly increased rainfall for long periods of time (years or decades)?	WR189
<b>Sender Name (Submission ID)</b> Sara Harrison (39737)		
7067	I would like to know exactly how you plan to hold PolyMet accountable financially for a 500 year window of time, for any adverse environmental impacts from sulfide ore mining in the proposed area. There is no record of any company staying intact for that kind of time horizon. What evidence do you have that they have the commitment or the financial reserves to back-up their promises for this extended period of time?	FIN01
7069	what level of pollution are you going to deem 'acceptable,' in terms of runoff into adjacent rivers and lakes? What impact will that run-off have on fish, birds, wild rice, and wildlife in the region?	PER18
7079	How large of an area will the mining impact?	PD30
7083	What protections will be put in place to ensure that heavy metal contamination does not occur in the watershed surrounding the mining site?	WR130
7084	What level of ongoing monitoring will the DNR and EPA have? What regulatory teeth will you have to hold PolyMet accountable?	PER06
7093	the national and state trends have been to 'relax' environmental regulations, in favor of promoting a business- friendly environment. So, tell me, who will make sure we do not end-up with a 500 year window of unregulated pollution from this proposed mine? I would like to know who will sign their name to that pledge and back it up with the best environmental monitoring available now and in the future.	PER06
13021	I would like to know exactly how you plan to hold PolyMet accountable financially for a 500 year window of time, for any adverse environmental impacts from sulfide ore mining in the proposed area. There is no record of any company staying intact for that kind of time horizon. What evidence do you have that they have the commitment or the financial reserves to back-up their promises for this extended period of time?	FIN01
13027	As well, what level of pollution are you going to deem 'acceptable,' in terms of runoff into adjacent rivers and lakes? What impact will that run-off have on fish, birds, wild rice, and wildlife in the region?	WR110

15545	[Mining in this area] would (if allowed) destroy the vital and vibrant tourism economy in northern Minnesota.	SO02
15546	It would jeopardize the Boundary Waters Canoe Area Wilderness -- not only environmentally, but it would impact every activity tourists partake in; from sightseeing and wildlife viewing to hunting, trapping and fishing.	WILD02
15548	Part of the plan is to "monitor and treat polluted water for 500 years" ? This is simply not feasible. A project that openly plans to pollute fresh water for that long should never be allowed. ... This proposed project would affect all of the Lake Superior Basin, sulfuric acid in the lake will not stay in one place as you certainly know.	WR037, WR128
17055	Part of the plan is to "monitor and treat polluted water for 500 years" ?.... A project that openly plans to pollute fresh water for that long should never be allowed.... reject the exchange of Superior National Forest land that would allow the project to move forward, and deny the Section 404 permit.	COE03
<b>Sender Name (Submission ID)</b> Sarah Oppelt (36615)		
3810	The mine will provide relatively few jobs for a relatively short amount of time with very likely significant environmental impacts.	SO01
3812	If the mine is approved, please do ensure that there are significant financial assurances in the permitting process. It is important to me as a Minnesotan that there is enough money to deal with contamination problems when they do arise to minimize the impacts on our precious waterways and land.	FIN05, FIN08

<b>Sender Name (Submission ID)</b> Sarah Schaefer (54560)		
18965	Polymet’s proposal will leave cleanup for 500 years at its lowest proposed timeframe. This is likely a bill that will be paid by Minnesotan tax-payers. Despite claims that this project will create jobs and revenue, only 100 jobs in 20 years of its existence will be for in-state workers and only approximately 1% of revenue will stay in-state.	SO01
<b>Sender Name (Submission ID)</b> Sarah Sigford (54648)		
17988	Polymet has acknowledged 500 plus years of pollution control is not uncommon, but we don’t see a plan or money for dealing with that scale of problems.	FIN05
17990	Our tax dollars are already going to clean up for the watersheds of many of these rivers that will be polluted. How can we justify continuing to degrade them? This project will be the first of its kind if it passes in MN. We need to set precedent that MN cares more for our water and wilderness. Exchanging precious wetlands, wildlife corridors, and moose habitat is not worth the 20 years of potential jobs.	WR107, WR108
17992	We have no guarantee that Polymet will abide by regulations set forth and we have no guarantee that other agencies and government will properly enforce these regulations. We’ve seen no evidence that reserve osmosis will provide to work with added pollution and chemicals that would be present in mine waste.	PD01, PD03
<b>Sender Name (Submission ID)</b> sarah stonich (45929)		
10359	There's .5 ounce of copper in your cell phone - if every time we bought a cell phone we included 5 pennies for the manufacturer in our payment - that would cover it. A computer, perhaps 30 pennies .... So, how about we eliminate the penny as currency and collect the pre 1983 all-copper pennies for manufacturers needing copper? Too simple? Not really.	ALT09, ALT16
<b>Sender Name (Submission ID)</b> sbarkema (7201)		
546	The people behind this6 push have only one thing on their mind. \$\$\$\$\$\$ They will do anything and promise anything to get this started. The damage it WILL cause and the pollution it will create now and for hundreds of years are what we and our next generations will have to live with long after the \$\$\$\$ has disappeared.	SO01
548	The HUGE potential for additional damage and problems that can happen once this project gets the go ahead is in no way feasible for the few temporary jobs they SAY will be made.	SO01

<b>Sender Name (Submission ID)</b> Sean Piette (39592)		
13531	Sulfide mining is a very dangerous mining and Minnesota does not care for mining. There is, never has been, and probably never will be a clean, environmentally damage free mining.	SO01
<b>Sender Name (Submission ID)</b> Sen. John Marty (42961)		
3843	[T]he modeling in the draft arbitrarily stops at 200 and 500 years, despite the fact that those models show that the water will still require treatment at that point. The models in the SDEIS need to be amended to project out to the point in time where the water meets Minnesota's water quality standards, even if that is many hundreds of years further into the future. The difference between 200 years and 2000 years might seem to be an insignificant point to a business that may not be around in 50 years, but to the state, which would otherwise be forced to pick up the costs of virtually perpetual water treatment, it is an important distinction.	WR035, WR036
3844	The SDEIS needs to factor in failures in water treatment systems. Breakdowns in pumps, power failures and other unforeseen problems are not hypothetical. Over a period of hundreds of years, these failures will be a reality. Pumps and other treatment infrastructure, even ones designed to last for thirty or more years, will break down and wear out repeatedly, and there is a need for backup systems to deal with these contingencies as they periodically occur.	WR129, WR131
3845	The financial assurance details cannot be worked out in closed-door meetings at some later date. The SDEIS is not adequate until it includes the details about how much money will be required to pay for cleanup and in what form it would be held. The public has a right to know and review what is all included in that number to ensure that it is sufficient, bankruptcy-proof, and will be available long after those who have profited from the project are gone.	FIN01, FIN05, FIN08
<b>Sender Name (Submission ID)</b> Sen. Bev Scalze (9578)		
215	We should wait for technology to be developed to offer the possibility of mining them without the accompanying destruction that future generations will pay for.	PD32
1129	I am in favor of an additional user fee for the BWCA that would be shared with the residents of the area to compensate for their not getting the 300 some jobs that come with the destruction of the area.	SO06
<b>Sender Name (Submission ID)</b> Senator Al Franken (47597)		
3595	The NorthMet copper-nickel mining project offers the opportunity for a new type of mining that will also have a significant economic impact on the region and help to diversify the local economy.	SO10

12088 I also believe from an economic standpoint, that expediting the current processes so Polymet could begin construction immediately would bring a desperately needed, immediate economic boost to the Iron Range, not to mention the added benefit of more public lands, through the land exchange.

SO10

**Sender Name (Submission ID)**    Shannon Martin (18277)

13989 I think 500 years of water pumping and treatment is not a good trade-off for 20 years of jobs. I think one of our top priorities in the state should be the state protecting our natural resources in the long run.

SO01

**Sender Name (Submission ID)**    shari smith (48065)

17350 I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations.

NEPA16

**Sender Name (Submission ID)**    Sharlyn Dahl (57502)

19566 I... have total confidence that Polymet has done everything possible to make their operation safe for our environment now and for my grandchildren. I can not believe that with all the time and studies that have been made and proven, that there should be any question of this. Polymet will be an extremely great benefit to our area, and to the state as well.

SO10

19568 With all of the time and money that has been and is being spent on environmental issues, I have full confidence that all it will be an environmentally acceptable mining operation. The permitting process takes a ridiculously long time.

PER20, PER34

**Sender Name (Submission ID)**    Sharon Angell Magliulo (21228)

896 • Inadequate cumulative impacts and effects. "Past, present, and reasonably future actions" are not included. Public needs to be informed that this is the beginning of a sulfide-mining district in the lake country of the Arrowhead. The NorthMet Mine and other proposed sulfide mining projects would be in the Duluth Complex, not on the IronRange; this is not being addressed.(...) • The impacts from the tremendous amount of coal-fired electricity used to operate a sulfide-mining district (or one sulfide mine on top of taconite mining releases) are not adequately addressed.

AIR02, CU01, CU04, PD39

899 • The hydrology is flawed. Poor comparison to the Canisteo Pit. Not the same geological formation; not the same depth; inadequate test borings.(...) • The SDEIS is flawed in its determination of faults and fractures.(...) • This type of mining has never been done successfully in this type of water environment.

WR012, WR023

902 • National Forest Land must not be exchanged. The Weeks Act protects the land. Also, the exchange does not adequately compensate the American Public for loss of this land. The exchange will have a significant effect on wildlife habit and corridors, loss of wetlands and wetland functions (inadequately addressed), as well as overall ecological quality.

LAN02

<b>Sender Name (Submission ID) Sharon Lane-Getaz (42904)</b>		
7727	Northern Minnesota is the site of 3 major watersheds. We and many states downstream from us need fresh, clean water.	WR111
7746	Per Renee Richardson of the Brainerd Dispatch (January 30th, 2014) , “once mining operations are done, mechanical water treatment at the site is proposed for 200 years at the mine site and 500 years at the plant site. The state reported it’s unknown how long water treatment would be required other than to say long term.”	WR035
7757	Northern Minnesota should not extend mining rights to an outside corporation that cannot realistically provide stewardship for our water nor our environment.	SO02
7759	Kathryn Hoffman, staff attorney with the Minnesota Center for Environmental Advocacy, said “the process to treat the water is complex, requiring multiple systems to work successfully and a mine in Michigan using a state-of-the-art reverse osmosis plant to do just that has already had more than 40 permit violations for not meeting water quality standards.”	WR128, WR143
7764	While jobs are important, we may be talking about as few as local 90 jobs in the balance compared to 500 years of ongoing water treatment... “PolyMet project is expected to create 360 jobs...after experts in the mining field are imported the site will create about 90 local hires.”	SO01
<b>Sender Name (Submission ID) Sharon Legg (43727)</b>		
12667	how will a mining company be able to control the sulfides reacting to air and water as they are exposed, as they are uncovered in the pits. I realize that the waste will be encapsulated in the waste piles, but what happens before the waste is transferred to that site? Obviously, exposing acres and acres of rock which contain these sulfides, will impact air and water quality. There will be dust and there will be seepage...not all of the water can possibly be captured and the air will travel with dust in it.	AQ04, WR025, WR134, WR151

18107	We need to [sustain and protect]...not damage the environment ... in any way that our generation and future generations will no longer have this original setting to savor and enjoy. The Northern Forest ecosystem would be forever changed. How can you replace this natural beauty?	LU04
18112	The pollutants deposited in the water from sulfide mining would devastate everything...Polluted water would be felt far beyond NE Minnesota as the rivers and streams enter Lake Superior and the Mississippi to the South, Pacific Ocean to the West, Hudson Bay to the North, and St.Lawrence Seaway to the East...How can you prevent polluted waters from leaving the mining area?	WR107, WR108, WR111, WR130
18114	Human Health...was not adequately addressed in the EIS. Contaminating metals, such as mercury, manganese, lead, nickel, aluminum, and arsenic are all injurious not only to humans, but to all fish and wildlife. ... the population of Northeast Minnesota... were warned not to eat more than one meal of fish a week because of the high amounts of mercury found in the fish. It would be frightening to learn what effects the other metals would have on the brain, lungs, and other body systems.	MERC03
18115	Wild Rice...would be affected by the polluted waters. ... Why should [Native Americans] now have to worry about waters that grow the wild rice are so polluted to prevent them from growing their economical crop so that large companies and corporations can have more money in their pockets?	CR01
18117	Ely, Minnesota is known as a tourist area which benefits greatly from the tourists who come not only from the U.S. but all over the world. Why? Because of its natural beauty, the peace and tranquility of camping on its beckoning lakes, fishing its refreshing waters, paddling its rivers, lakes and streams, and breathing its cool, pine scented air. ...There is no ...reason why these quiet, relaxing ways of life should be replaced ... with noise and unwanted diversities.	SO02
18120	It is stated that there would be reclamation of affected areas in mining localities. Once affected, it can never be reclaimed. How can PolyMet ever make such a statement?	VEG05
18123	the subject of mishaps or accidents has not been mentioned. Everyone knows such things happen, but no mention of how the costs would be covered is included in this SDEIS	FIN05
<b>Sender Name (Submission ID)</b> Shirley Zumberge (58084)		
19846	At this time I see no guarantee of safety to our water, air or wildlife.	GEN03
<b>Sender Name (Submission ID)</b> Sierra Club (3922)		
9676	The companies that own the mines will reap the profits and then leave, forcing the citizens of Minnesota to deal with the damage to the health of humans as well as wildlife. There is no guarantee that any company will be around long enough to sufficiently correct all of the damage done, no matter what these companies promise in the beginning.	FIN01
9842	The waste-water from sulfide mining damages the ecosystem around the mine, as well as everything downstream from the runoff. Studies show there is not a possibility long term pollution, but a certainty.	WR023, WR115
9844	However, there is a guarantee that damage will be done to the natural environment, especially the irreplaceable Boundary Waters Canoe Area Wilderness	WILD02
9845	Destroying the beauty and health of the state of Minnesota is not worth creating a few hundred temporary jobs.	SO01

<b>Sender Name (Submission ID)</b> Sierra Club (3922)		
12412	hazards of sulfide mining demand that any permit granted for mining in Minnesota be conditioned on a posted bond sufficient to cover the costs of mitigating any and all of those hazards.	FIN05, FIN08
12415	The state must first be assured by all competent authorities that this project will not damage Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations.	WET24, WI01
12420	The state must recognize that the mining of precious metals beneath our surface may first require the development of new mining technologies. In this regard, would-be miners should be encouraged to contribute funding for research by the University of Minnesota and work with the University to develop those safe mining practices.	PD32
<b>Sender Name (Submission ID)</b> Sierra Club Northstar Chapter (42950)		
5655	The proposed NorthMet mining project poses numerous unconscionable risks to the State of Minnesota, its citizens and future generations, and the surrounding environment and watersheds. This project will not keep Minnesota's invaluable water resources safe and clean. Hardrock mining is the top toxic producing industry in the country. There has never been a sulfide mine that has not polluted its surrounding environment. Now PolyMet wants to bring this dangerous type of mine to Minnesota. Sulfide mining has never before been permitted in the state of Minnesota and after review of the SDEIS it must be concluded that this risky project cannot be conducted in a safe and trustworthy manner.	PD26
5657	The SDEIS is severely inadequate and is missing many important details. The SDEIS shows that the proposed mining project will pose numerous unsafe and unacceptable environmental risks. The SDEIS does not establish proper safeguards to deal with problems as they arise. Without suitable safeguards the SDEIS cannot be considered complete. . . PolyMet has not provided adequate financial assurance to guarantee that the site will be adequately cleaned up and all traces of pollution dealt with.	FIN05
5660	A flawed computer water model blatantly under-predicts the true amount of pollution that will result from proposed mining activities. This flawed modeling data must be redone. The water model shows long term treatment of waste water will be required for hundreds of years after closure of the mine site. PolyMet stopped its modeling after 500 years. What happens after 500 years have gone by? Who will take responsibility to constantly monitor, treat, and prevent any contaminated water from escaping into the environment 200 years from now, or 500 years from now? Who will bear this financial burden? Expensive treatment and cleanup of PolyMet's mine site for the next 200 to 500 years and likely even longer, is completely unacceptable and violates Minnesota law requiring closed mines be "maintenance free".	PER04, WR037, WR189
5662	The loss and degradation of vast amounts of high quality wetland areas is unacceptable. PolyMet plans to dig up and obliterate almost 1,000 acres of high value wetlands that provide critical habitat to numerous sensitive species, including moose. But it doesn't stop there; over 6,000 additional acres of wetlands would potentially be destroyed or impaired due to mining activities. Many wildlife species are declining in Northern Minnesota and impacts from proposed mining activities will further degrade their habitats.	WET24
5664	If the Land Exchange is approved by the USFS, it would facilitate the destruction of over 1000 acres of high quality wetlands and thousands of acres of the Superior National Forest by a Canadian multinational mining company for a copper-nickel sulfide strip mine. This would be the largest permitted destruction of wetlands since the Saint Paul District of the Corps began permitting wetland fill. PolyMet's NorthMet strip mine is sited on the headwaters of Lake Superior and the Great Lakes themselves. In recognition of the significance of the affected wetlands and watershed, the EPA has said "this project may result in substantial and unacceptable impacts to aquatic resources of national importance (ARNI)".	WET14, WET19, WET23

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
5666	The Sierra Club opposes the proposed PolyMet Land Exchange. The sole purpose is to remove long standing environmental protections, on Superior National Forest public lands, against destroying the surface, and more specifically against strip mining. The land exchange would pave the way for PolyMet to strip mine national forestlands protected by the Weeks Act of 1911 and open a sulfide mining district across Minnesota's Arrowhead Region.	LAN02
5668	Adverse effects on endangered and threatened species, and other wildlife, are inadequately addressed in the scoping documents for the PolyMet Land Exchange including lynx, wolf and moose analyses. Thousands of acres of habitat and important wildlife corridors would be severely and negatively impacted, without meaningful mitigation. This includes northern goshawk territory, numerous migratory birds, Bald and Golden Eagles.	WI01, WI02, WI03
5670	The wetlands impacts in the Land Exchange proposal are even more underestimated because credit is given for the buffer lands that are assumed to be left intact "for the foreseeable future" this is an unfounded assumption. USFS guidelines call for "no net loss" of wetlands (MN also has a No-Net-Loss policy on wetlands) and have not addressed the fact that the current USFS lands and wetlands will be destroyed, most likely the buffer lands wetlands will be as well. A land exchange doesn't create wetlands, it is a loss and the USFS must acknowledge that. The land exchange would actually facilitate and allow the destruction of wetlands (again, the single largest loss of wetlands in MN ACOE history).	WET14, WET23
5672	[T]he loss of the USFS wetlands and forests would be a loss to the public and would be contrary to the Weeks Act and would be against the public interest. For the Forest Service to simply exchange these national forest lands whenever there is a "conflict" between the Forest Service's management and the private mineral estate, would violate the very intent and purpose of acquiring these lands under the Weeks Act.	LAN02
5674	The Forest Service Must Withdraw the Land Exchange Proposed Action Because There Is No Conflict That Needs To Be Resolved. The SDEIS states that the purpose of the Land Exchange is to "consolidate the surface and mineral ownership of the lands involved at the Mine Site" (SDEIS at 1-11)...At the outset, it is important to dispense of the notion that there is some "fundamental conflict" that must be resolved. No such conflict exists. If "the mineral rights that were reserved do not include the right to surface mine as proposed by PolyMet," then there is no conflict with not allowing that kind of mining to occur. PolyMet is not entitled to engage in activities that its predecessors-in-interest failed to reserve at the time the United States acquired the surface.	LAN04
5677	The Sierra Club does not believe that the lands set forth to be exchanged are a fair trade or of equal value for the USFS lands...The EIS should provide a detailed analysis of how the proposed tracts of land were assessed for value, including value to the public for recreation purposes, water, species and scenic resources, value for cultural and historical purposes and future value in terms of biodiversity, lessening of fragmentation and climate change. The true economic value of the surface estate to PolyMet, including gaining the ability to destroy the surface by strip mining, should be included in the valuation.	LAN03
5678	According to the NOI in the Federal Register: "Many of these federal lands are adjacent to lands extensively impacted by past and ongoing mining activities." These are almost the same circumstances as the current PolyMet NorthMet split-estate situation that is the stated purpose of this land exchange. Will the Hay Lake acreage (and all of the non-federal lands) have Weeks Act protections against destroying the surface? Shouldn't that information be included in the SDEIS?	LAN02
5680	Most of PolyMet's proposed exchange lands are in mineral exploration areas. The Mineral section from the Feasibility Analysis was done by PolyMet's own geologist Richard Patelke and is speculative and conflicted by the relationship of the preparer with PolyMet. Yet the USFS is relying upon the documents as fact based instead of merely PolyMet based assumptions. Will the newly exchanged lands have equal protections on the surface as the USFS Weeks Act of 1911 lands do now?	LAN02
5682	Deforestation on the now intact USFS lands will occur in the foreseeable future if the exchange is approved. The exchange, and thus the mine, will likely result in increased invasive plant species across the Superior National Forest.	VEG05

5684	Why has the public had limited access to the USFS NorthMet lands? Please explain the complete history of the Dunka Road. The public has been denied access for many years. The USFS should explain and document by what authority or agreement, etc that the public's use has been restricted on the USFS lands.	LU01
5686	The value of the metals should be part of the valuation, or more accurately, the value of the Access to the metals. The mineral estate is encumbered by the Weeks Act provisions against strip mining, and the value of the mineral estate is less because of the mining restrictions contained in the deeds. It is a GIFT to PolyMet & RGGS (mineral estate holder) if they get virtually unfettered access and the right to strip-mine the minerals merely for the value of the surface lands (through an exchange of equal surface rights). The difference between being able to destroy the surface or not, underground versus strip mining, determines whether the mine is profitable or not (ostensibly worth hundreds of millions of dollars). A private party would most likely not enter into such an arrangement, they would no doubt negotiate many millions of dollars above and beyond the lands offered for exchange. The PolyMet land exchange appears to be a bad deal for the USFS and the American people.	LAN02
5688	Further, the proposal does not meet these four Forest Service Strategic Plan Goals:1) provide and sustain benefits to the American people (desired outcome is forests with sufficient longterm multiple socioeconomic benefits to meet the needs of society);2) conserve open space;3) sustain and enhance outdoor recreation opportunities; and4) maintain basic management capabilities of the Forest Service by reducing landlines and mineral conflicts.	LAN04
5692	Land Exchange violates the Weeks Act of March 1, 1911 and Federal Land Policy and Management Act of 1976; and the Federal Land Exchange Facilitation Act of 1988. According to the scoping documents: "This exchange is proposed under the authorities of the Weeks Act of March 1, 1911 as amended; the Federal Land Policy and Management Act of October 21, 1976; and the Federal Land Exchange Facilitation Act of 1988." The USFS public lands were acquired under the authority of the Weeks Act of 1911 and designated for watershed protection and to secure the maintenance of a perpetual growth of forest. The land was to be held as national forest lands- forever. Please explain how the Proposed NorthMet Mining Project and connected Land Exchange, is in compliance with these laws?	LAN02
5696	The USFS has the ability and the requirement to protect the surface of the USFS lands that PolyMet wishes to destroy by strip mining, it is in the public's long term best interest that they protect the surface. The PolyMet plan calls for perpetual treatment and persistent and long lasting pollution and degradation at the proposed mine site that could be avoided if the USFS kept title to the lands and continued to administer them as Weeks Act lands.	LAN02, LAN04
5698	Underground mining is an option with substantial environmental benefits, but was quickly eliminated on economic grounds – even though it would better protect the surface of the Federal lands.	ALT01
5700	It is the obligation of the USFS to protect the land, air, water, animal and other natural resources of the public lands being proposed for exchange, set to be destroyed and degraded if the land exchange is approved. No acceptable mitigation has been offered for those losses. Again, will the Weeks Act protections be part of the non-federal lands that the Forest Service would get in the exchange? That must be addressed in the environmental review of the project.	LAN02
5701	If Lake County has approved or entered into an agreement or contract with PolyMet for the sale of lands to PolyMet in furtherance and assistance of PolyMet's NorthMet project through the environmental review process, it is prohibited from doing so by state and federal law restricting government action or approval prior to completion of the environmental review process...If Lake County has indeed entered into an agreement with PolyMet, it is a violation of MN Rules part 4410.3100,...The acts of Lake County are prejudicial to the final approval of the NorthMet project. The USFS must address whether the Lake County Lands are part of an illegal action and if so,remove them from consideration in PolyMet's proposed land exchange.	LAN09

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
5704	The Sierra Club concludes that the USFS must find that the proposed land exchange would not result in an overall benefit to the public and is not in the public interest. The land exchange would pave the way for PolyMet to strip mine lands protected by the Weeks Act of 1911 and open a sulfide mining district across the Superior National Forest and beyond. The land exchange, if approved, would have very negative environmental impacts on the forests, wetlands and wildlife of Minnesota's boreal region.	LAN01, LAN02
5706	The SDEIS provides minuscule discussion on the costs and benefits of the no action alternative relative to the preferred alternative and there are few comparisons of the no action alternative to other alternatives.	ALT14
5709	While the SDEIS "identifies" several alternatives, it does not discuss them and is therefore in violation of Federal and Minnesota law. The whole point of this requirement is to discuss different alternatives, and the SDEIS discusses only one; the preferred alternative. Simply listing a one sentence description of an alternative measure to be used, is not discussing the feasibility of that measure. PolyMet is obligated to study, develop and describe all reasonable alternatives and alternatives eliminated from detailed consideration do not count in the range of alternatives.	ALT06, ALT21
5713	Under NEPA, an EIS must "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources." 42 U.S.C. §4332(2) (E); 40 C.F.R. §1508.9(b). Without including other alternatives to the proposed project, there is no discussion of alternative mitigation measures that could be employed. There is no discussion of alternative reclamation plans, waste rock containment, or water treatment strategies.	ALT06, ALT21
5719	The SDEIS fails to adequately assess reasonable alternatives such as underground mining. The SDEIS is also inadequate because it does not address reasonable alternatives that are likely to have far less environmental impacts than the proposed open pit mine alternative. These include the underground mine alternative, the west pit backfill alternative, and the reduced production alternative. These alternatives will result in significant environmental benefits over the proposed action.	ALT01, ALT06
5721	Eliminating an alternative simply because a permittee indicates that it would not go ahead with the project if the alternative was required would allow permittees to avoid increased costs for environmental protection at their own discretion. This would essentially nullify the Minnesota Environmental Rights Act. An underground mine option would result in far less negative environmental effects including a much shorter water treatment period. In addition, an underground mine would have a significant economic benefit.	ALT01
5726	The SDEIS fails to include many relevant projects in its cumulative effects analysis, including current and anticipated mineral exploration in the Superior National Forest, other sulfide mines that are in the process of completing their environmental review and permitting requirements, potential land exchanges, and Superior National Forest vegetation management projects... Notably missing projects include; Twin Metals, Federal Hardrock Mineral Prospecting Permits #2, and Teck Cominco. These three mining projects must be included in the cumulative effects analysis.	CU02, CU08, CU09
5729	Various land exchanges that are being considered must also be disclosed in the SDEIS and how they may impact the potential environmental impacts related to the PolyMet project. This includes the proposed School Trust Lands – Boundary Waters land exchange.	CU08
5732	The SDEIS fails to disclose that there are plans to operate the plant site for other reasonably foreseeable mining projects in the area... Any potential for reasonably foreseeable projects, that will utilize the plant site, must be included in the cumulative impacts discussion.	CU02, CU04
5792	The potential use of the site for underground mining needs to be evaluated. It must be considered that it is reasonably foreseeable that underground mining operations will occur in the future at the NorthMet mine site; this needs to be included in the cumulative effects analysis.	ALT01, CU04

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
5793	The discussion of cumulative impacts on wildlife is severely lacking. There must be a proper analysis of this project and other projects effects on moose, lynx, aquatic species, and other sensitive species within the area and downstream watersheds. Destruction of vegetation and wetland areas, noise, blowing sulfate containing dust, and releases of pollutants into water resources are just some of the cumulative effects that will impact wildlife. Also missing is any references to cumulative impacts to wildlife from ongoing and future climate change conditions.	WI01, WI04, WI05, WI08
5794	The SDEIS fails to adequately assess the environmental impacts caused by increased sulfates, mercury, and other pollutants as a result of this project and other past, present, and future mining projects.	MERC10
5796	The SDEIS needs to sufficiently analyze all potential cumulative impacts to surface and subsurface waters, including downstream areas and watersheds such as the St. Louis River and its estuary, and Lake Superior. Additionally, effects to wild rice waters need to be included.	WR024, WR157
5797	Cumulative effects considered for wetlands need to include the St. Louis River watershed along with the Partridge and Embarrass River watersheds. Project activities will increase the already present existence of pollutants that are degrading water quality standards within the St. Louis River watershed....The SDEIS' review of cumulative impacts to wetlands is insufficient, geographically limited, and drastically under estimates total effects to area wetlands.	WET18
5806	The SDEIS does not specify when or where water alone will be used to suppress dust from roads and other surfaces, and where suppression enhancers will be added to water to improve its suppression abilities. Without a significant environmental or safety reason, water alone should not be used to suppress dust, rather magnesium chloride or another suppression enhancer should be used in conjunction.	AIR07
5808	The SDEIS states that there will be two ambient air quality monitors installed to minimize fugitive dust effects (5-402). But does not specify what they will monitor for. Two monitors are not sufficient, there should be more. Their placement will determine their effectiveness. More information needs to be disclosed regarding the specifics of these air quality monitors.	AIR13
5811	Filling the waste pits with waste rock and then flooding them with water to "minimize" the amount of waste rock exposed to the atmosphere is supposed to be the strategy for preventing oxidation of the sulfide minerals. This plan is insufficient. Metals are still going to leach into the pit water and could escape into the surrounding environment....If a pit floods, disaster unfolds. If a sudden storm occurs there may not be time to adequately dewater the pit to prevent flooding, spills and leakage.	PD15
5812	The SDEIS should include an analysis of the total amount of mercury in the mining process, including bulk tailings, hydrometallurgical tailings, and autoclave scrubber waste, and where PolyMet plans to dispose of this waste. Further, to ensure that mercury capture systems are functioning properly, a regulated monitoring plan should be required to provide reliable data on mercury emissions.	MERC17, MERC20
5813	The SDEIS should include noise contour maps, especially important near recreational areas such as the Boundary Waters Canoe Area Wilderness (BWCAW) so that the public can be fully aware of the noise that they will encounter when visiting state and federal recreational lands. These maps should include not only noise from all mining operations but also noise from transportation activities to the site.	N02
5815	Further, it is incomplete to merely consider noise in terms of decibels, rather noise impacts should also be analyzed in terms of noise tonality, low frequency noise, fluctuating noise, and impulsive noise.	N06
5817	The SDEIS' reclamation plan calls for abandoning pipelines where they lay. This could be a problem if these abandoned pipelines result in water flowing in places where it should not be flowing. All pipelines that are to be abandoned should be fully evaluated to ensure that they are not leaking any contaminants and that their location is not causing water to flow between two different water resources, where without the pipeline there would be no connection.	PD35

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
5819	Regarding waste, the reclamation plan does not expressly state the applicable federal and state laws, regulations, and rules governing testing, handling, storage, and disposal of hazardous, toxic, nuclear waste. These laws, regulations, and rules need to be included in the EIS to assure compliance. The reclamation plan should include a tracking system and a documented certification program so that it can be guaranteed that hazardous materials are properly disposed of.	PD35
5821	The SDEIS does not explain how the reclamation plan will work to prevent erosion from occurring. There needs to be discussion in the EIS and a clear plan for reducing erosion that could lead to negative impacts on water resources.	PD09, PD35
5824	The reclamation plan does not provide enough detail on the desired water balance between the East and West Pits. What conditions would prevent this water balance from being achieved? How long will it take to achieve this balance? What will need to be done to achieve this balance? The reclamation plan needs to provide a more thorough analysis regarding a timeline for water balance between the two pits.	PD35
5825	There is concern that the reclamation plan does not adequately consider how the pits will affect wildlife in the area. How will bird and wildlife species be protected from falling into the pits and the channel that connects them? The reclamation plan needs to assure that wildlife species are protected from these areas and the contaminated waters contained therein.	WI04
5827	The reclamation plan needs to commit to removing all the waste rock and all the contaminated materials underneath the temporary stockpiles after their use is complete.	PD35
5829	In addition, the reclamation plan needs to clearly articulate goals and plans for re-vegetation of the site and procedures and timelines for decommissioning roads. Plans for storage and redistribution of topsoil need to be included. Plans for stopping the spread of weeds and invasive species must be addressed.	VEG05
5830	PolyMet needs to establish a better plan for replacing wetlands on-site. Merely working to purchase or protect wetlands at different locations, away from the mine site, is not sufficient. A commitment needs to be made to re-establish wetlands on-site, the SDEIS should include specific goals including size and volume for re-established wetlands. If it is not possible to re-establish wetlands on-site, this reality needs to be included in the EIS. If PolyMet makes the commitment to reestablish wetlands on-site and these wetlands, after 5-10 years are not functioning, what will be done to remedy the situation?	WET03
5832	The reclamation plan does not contain enough specifics regarding monitoring. Very explicit goals need to be identified and reached before monitoring at the site can be reduced or the bond is released. Monitoring schemes must include timeframes and clearly identify what responses will be for failure to meet these timeframes and goals. The reclamation plan should be reviewed and updated every few years so the public and regulatory agencies are kept up-to-date on the progress of reclamation.	PD24
5833	The SDEIS fails to take a hard look at the impact of vehicle/lynx collisions. It ignores the seriousness with which the designation of threatened species must be taken when reaching the conclusion that vehicle/lynx collisions will not have significant consequences.	WI01, WI03
5835	Lynx are known to travel long distances in search of prey, especially when their preferred prey is at a low ebb (p 5-364; Thumbs 1271). Lynx must try to reach all parts of their critical habitat to forage. The SDEIS ignores these facts, which it describes well, when concluding that the transportation corridor is not a hazard for lynx and that there is a low likelihood of collision between lynx and vehicles.	WI01, WI02, WI03
5836	The assumption that vehicle collisions would be low because lynx will avoid the area due to mine activity is absurd. This project will result in significant negative impacts to the lynx.	WI01, WI03

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
5837	The SDEIS mischaracterizes their own data and in so doing understates the impact on lynx habitat resulting from mining activities at the mine site...Stating the results this way gives the impression that the additional fragmented and reduced acreage of lynx habitat is small and inconsequential. However, this is the wrong impression. The reality is that the proposed action of this one strip mine would increase the percent of fragmented and unsuitable lynx habitat in LAU 12 by 50%.	WI02
5838	The SDEIS is inadequate and incomplete because it does not analyze the impacts of noise, vibration, and air blast on animals, notably the Canada Lynx, a threatened species. And it uses an inappropriate baseline when reporting impact on animals.	WI01, WI05
5839	The SDEIS cumulative analysis of noise, vibration, and air blast is inadequate because it fails to report effect contours from other nearby mining sites on wildlife travel corridors and access routes and, therefore, it fails to take a hard look at cumulative environmental effects of noise, vibration, and air blast on wildlife.	WI03, WI05, WI08
5840	The SDEIS analysis of the effects of noise, vibration, and air blast is deficient also in the near total absence of discussion of all of these factors on animals, in particular the Canada Lynx, a threatened species; or the wolf or moose.	WI01, WI05
5842	We have shown that noise, vibration, and air blast contours encompass five wildlife corridors and their access routes due to proposed mining activities at the mine site. A reasonable cumulative analysis would impose similar effects contours emanating from existing nearby operations such as Northshore mine, Mesabi nugget, etc. These contours would no doubt overlap those shown for the proposed NorthMet action. Concentrations of effects on geographic features such as wildlife corridors and access routes should be highlighted. The SDEIS should show what portion of the effects is due to the proposed and modeled mine site over and above the combined effects due to other sources on wildlife travel corridors and access routes.	N03
5844	The SDEIS is deficient because it does not analyze separately the effects on the Canada lynx population that inhabits portions of the critical habitat area south of the mine site, the plant site, and more generally, the area south of the Mesabi Range.	WI01, WI02
5845	The SDEIS is replete with statements to the effect that the proposed NorthMet action will have no effect on the lynx population as if the population lynx north and south of the Range possess identical risk levels.	WI01
5846	The SDEIS utterly fails to understand the effect of placing a miles long permanent barrier to travel to and from south east of corridor 17. It continually refers to this barrier in legal terms, "direct loss and fragmentation", without detailing how the loss in language impacts the lynx. It seems ludicrous to assume that the experience of the population that resides south of the Mesabi Range, including, of course, the population that lies south of the mine and plant sites, is no more at risk than lynx populations residing north of the Mesabi Range. Lynx to the south of the Mesabi Range are, without even considering the environmental effects of the proposed NorthMet action, already at greater risk than the population north of the range.	WI01, WI02, WI03
5847	Both land exchange proposals are invalid because the "mine site only" land exchange proposal was erroneously rejected and dropped from further consideration. The "mine site only" land exchange proposal includes the smallest land area of all the considered proposals other than the "no action" proposal and would meet some of the inadequacies of the preferred and alternate land exchange proposals. It preserves a much larger amount of high quality critical habitat than either the preferred land exchange proposal or the alternate smaller one.	ALT14, ALT23

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
5848	The agencies rejected the “mine site only” proposal erroneously in spite of their own data [i.e cumulative Class I and Class II incremental effects], an indefensible decision that invalidates both the preferred land exchange proposal and the alternate proposal. The “mine site only” proposal must be rehabilitated as a viable land exchange option. Note: When rehabilitating the mine site only proposal, none of the Superior National Forest land that is situated to the south of Dunka Road should be included. A perusal of the Figures representing the proposed uses of the mine site reveal that nomining use at all is proposed for any of the Superior National Forest land that lies south of the Dunka Road. There is no valid reason to include in the proposals land that is not needed for the proposed NorthMet action.	ALT23
5849	Both the preferred and the alternate smaller land exchange proposals are invalid as additional land area beyond the requirements of the mine site is not required; and none of the proposed exchange parcels satisfy the most immediate, specific environmental requirement required by the Canada Lynx, a federally listed species. ...The agencies have failed in their obligation to take seriously the duty to protect wildlife such as the federally threatened lynx and the State listed wolf which should not be deprived of what remains of the large block of needed high quality critical habitat when it is not required for mining. These proposals include large amounts of land not required for mining which should be maintained in tact in deference to wildlife such as the federally threatened lynx and the State listed wolf. ...None of them [proposed land exchange units] are geographically located in the access path physically proximate to what is the only wildlife corridor not threatened with direct loss or fragmentation of habitat inside the corridor (p. 6-56; Thumbs: 1677); moreover, none of them are so situated with regard to any wildlife corridor...The SDEIS fails to recognize that all of the proposed replacement exchange parcels fail to compensate for this critical environmental fact: All of the land included in the preferred and the alternate B proposals permanently eliminate and/or fragment large areas of existing high quality roadless habitat all of which must be preserved intact in order to assure unimpeded access to corridor 17. Both the larger preferred proposal and the alternate B proposal fail to do this and are, therefore, invalid.	NEPA04
5850	Contemplation of additional mining activity beyond the proposed NorthMet action is a connected action and would invalidate the SDEIS if not fully disclosed. PolyMet rejected the underground option in the absence of adequate analysis...PolyMet’s rejection of the idea of backfilling the west pit is presumptive evidence that further mining activities on Superior National Forest lands included in both land exchange proposals are, ipso facto, reasonably foreseeable actions. If so, then this constitutes a connected action which must be fully disclosed and analyzed in a detailed mining plan estimate before it can be rejected. Failure to fully disclose a connected action would invalidate the SDEIS.	NEPA14
6388	Both the preferred and the alternate smaller land exchange proposals are invalid as additional land area beyond the requirements of the mine site is not required to fulfill the purpose of the proposed NorthMet action...In fact, perusing the Figures representing the proposed uses of the mine site no use at all is proposed for any of the land inside the mine site that lies south of the Dunka Road. There is no valid reason to include in the proposals land that is not needed for the proposed NorthMet action. Wildlife will be seriously affected by the permanently reduced acreage of the mine site, the permanent barrier that would be erected there, and the permanent Category 1 rock pile...mining. Both land exchange proposals include large amounts of land not required for mining. This land should be maintained, intact, in deference to wildlife such as the federally threatened lynx and the State listed wolf.	NEPA04
6389	Wildlife will be seriously affected by the permanently reduced acreage of the mine site, the permanent barrier that would be erected there, and the permanent Category 1 rock pile. The agencies have failed in their duty to take seriously the duty to protect wildlife such as the federally threatened lynx and the State listed wolf which should not be deprived of what remains of the large block of needed high quality critical habitat when it is not required for mining.	WI01, WI02
7198	None of the proposed exchange parcels satisfy the most immediate and essential environmental requirement of the Canada Lynx, a federally listed species and are, therefore, invalid...The SDEIS fails to recognize that all of the proposed replacement exchange parcels fail to compensate for this critical environmental fact: All of the land included in the preferred and the alternate B proposals permanently eliminate existing high quality roadless habitat all of which must be preserved intact in order to assure access to corridor 17.	WI01, WI02, WI03, WI10

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
7202	Both land exchange proposals are invalid because the agencies misuse, wrongly interpret, and fail to follow the land exchange guidelines and, as a result, ignore imperative environmental concerns (as regards the impact of the proposed land exchange on the Canada Lynx, a federally threatened species, and the Grey Wolf, an RFSS listed species.)...The SDEIS lists four administrative guidelines when considering the purposes of National Forest System land exchanges... We disagree with the Forest Service claims regarding guidelines (a) and (c). ...We disagree that the affected Superior National Forest land is “chiefly valuable for non-Forest System purposes”. To suggest that protecting essential lynx habitat by insuring access to important wildlife corridors is not a major valuable purpose of the National Forest System, as citing this guideline [guideline a] does, is absurd and represents an abandonment of lawful duty...The attempt to characterize the whole of the land exchange proposals as “isolated and intermingled with private land” in order to justify the sacrifice of thousands of acres of high quality habitat as a remedy for administrative problems with a small detached parcel is to not only a mischaracterization of the matter but also a misuse of guideline (c) in an arbitrary, misleading, and egregious manner. Since there would be no impediment to fulfillment of the proposed NorthMet action by deleting it from consideration, the detached parcel cannot rightly be used to qualify the existing land exchange proposals under guideline (c).	WI01, WI02, WI03
7219	The SDEIS goes on to site three priorities that also serve as guides in the selection of replacement exchange parcels: “Standards and Guidelines to achieve this Desired Condition provide that land acquisitions would generally be guided by the following criteria (G-LA-2, Forest Plan” (pages 51-52) and then ignores them, especially Priority 1: “Priority 1 (a, b, and c are not listed in order of importance) ...The agencies cannot “cherry pick” guidelines to satisfy administrative actions when to do so is in conflict with other imperative obligations. The agencies must pay attention to the priorities, especially Priority 1. They cannot arbitrarily ignore some guidelines and ignore others at will, in this case, abandoning their responsibility to protect the Canada lynx and shepherd its recovery in order to meet administrative goals of lesser importance. Failing to recognize the obvious demand of Priority 1 represents an abandonment of the obligatory function of preserving needed habitat as specified in this guideline... The privately owned proposed exchange parcels are, thus, perforce disqualified due to incorrect application and misuse of land exchange guidelines (a) and (c) while ignoring Priority 1. Therefore, both land exchange proposals are invalid.	WI01, WI02
7611	The SDEIS is inadequate because the agencies failed to construct a land exchange proposal that integrates existing Superior National Forest land with adjacent areas to preserve and expand federal protections to lynx, wolf, and umbrella species’ access to the southwest, south, and eastern access paths to corridor 17...With the likely direct loss of land inside corridor 18 due to expansion of the Northshore mine, corridor 17 takes on even greater importance. The proposed land exchange proposals would not remedy this situation and would remove federal responsibility to protect the lynx and nurture its recovery.	WI01, WI03
7788	A newly developed exchange proposal containing a portion of the area west of the national forest boundary is the only way to consolidate land needed for environmental protection of the lynx and the wolf; and, at the same time, extend perpetual, specific, and necessary federal protection of the Canada lynx managed under the USFS lynx management plan insuring access in perpetuity southwest of corridor 17; as well as state protection of the wolf, a State listed species.	WI01, WI03, WI10
7991	As noted above, the larger parcel proposal fails to preserve a sufficient un-fragmented, straight line access path eastward to and from corridor 17. In like manner, the smaller parcel proposal fails to preserve an eastward path to and from corridor 17 (Fig. 3.3-2; p 3-167; Thumbs 328). The new land exchange proposal should be constructed in such a manner as to preserve from fragmentation additional needed habitat in this eastern access path to corridor 17 by including portions of T16N R13W Sec 33, 34, 35; and T59W R 13 W Sec 2, 3, 4, portions of which are owned by the federal government and already included within the national forest boundaries. Likewise, the new landexchange proposal should include the land lying east of the east pit that is not required to achieve the purposes of the proposed NorthMet action.	WI03

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8002	[S]electing the smaller mine site proposal as the preferred land exchange option is not a complete solution because this option falls short of the opportunity which the agencies have to definitively extend federal forest boundaries sufficiently westward to establish clearly the breadth of the southwest access path to and from corridor 17. In addition, it does not describe an easterly approach to corridor 17 that provides an adequate straight line assess path to corridor 17.	WI03
8004	The failure of the agencies to prepare a land exchange proposal that fulfills the National Forest Service obligation to protect a federally threatened species and state listed species by preserving needed high quality habitat surrounding the mine site, and even to increase the protected critical habitat by bringing all of the eastern, southern, and southwestern access paths under permanent federal and state protection--when the opportunity lay open before their eyes--is a glaring error that confirms the inadequacy of the SDEIS land exchange proposals.	WI01, WI02
8012	The cumulative analysis of the effects of the proposed NorthMet action on wildlife (Canada lynx, grey wolf, moose, bear) is invalid because of a failure to develop an adequate data base on the wildlife travel corridors and access paths thereto, conclusory statements, language which obscures the nature of the impacts, and a virtual absence of a contextual analysis of the cumulative effects of the proposed NorthMet action required by law.	WI01, WI03
8019	The available data are inadequate to clearly indicate where and in what degree or manner the existing and additional effects are or would be situated with respect to the corridors and access paths. Keeping in mind the level of detail found elsewhere in the document, for example in the characterization of the land exchange parcels and the mine site, there is no excuse for this.	WI03
8022	extensive on-the-ground assessments should have been undertaken to further describe the corridors and the access paths to and from them. A rationale should have been devised to reduce the level of judgment involved in setting the boundaries of corridors and access paths and determining which criteria listed above were met and to what degree. Modeling of existing effects and likely future effects with accompanying graphic representations would have provided additional clarity to the matter. It is simply astounding that none of this was done.	WI03
8025	The result of the poor quality of data is that most characterizations of the corridors and access paths are conclusory accompanied by little or no detailed data. We are simply left to accept, or not, the statements of the agencies.	WI03
8053	In light of the effects described above, and in spite of the inadequacy of the data base, one would still expect that the SDEIS would attempt to quantify or at least discuss the cumulative effects of the NorthMet action on corridor 17. Instead, the agencies, after cataloging current and likely effects on the basis of poor quality information simply let stand the unanalyzed statements which, as noted, include incorrect information, inadequate descriptions, and fail to include pertinent information and critical analysis regarding the permanent barrier and the other impacts described.	WI03
8054	Even more glaring, however, is the near complete lack of analysis of the cumulative impact of the proposed NorthMet action on wildlife, especially the Canada lynx, a federally threatened species, in the context of the total loss of five wildlife corridors and the fact that all of the remaining corridors are or will likely be eliminated, reduced in area, or restricted by mining activities or other encroachments.	WI01, WI03
8110	a critically important fact regarding corridor 17, unbelievably, goes unremarked in the cumulative analysis section of the SDEIS, to wit: Of the remaining wildlife corridors, corridor 17 is the only wildlife corridor which is not--is not--- threatened with direct loss or fragmentation of habitat inside the corridor, thus making it of signal importance in any cumulative analysis of the environmental effects.	WI03
8113	The agency must take a "hard look" at what the cumulative total loss of 5 out of 18 corridors and current of future increases in restrictions of use of all of the remaining 13 corridors means for wildlife protection and habitat preservation. The analysis must be thorough and based on the best available science.	WI03

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8147	The SDEIS then should determine the travel capacity of the remaining impaired 13 corridors, analyze whether they are enough to sustain the Canada Lynx population with special reference to the population residing south of the Mesabi Range, what type of physical pressure does this place on the Lynx survival (how much farther will the lynx have to travel, what are the increased dietary demands due to this additional exertion), which roadless blocks are cut-off from by loss or restriction of the corridors, and were these corridors also popular denning or breeding sites.	WI01, WI02, WI03
8150	There is no reasoned assessment or scientific reports to support that loss of 5 corridors, coupled with restrictions on the remaining ones, is not a significant cumulative impact, rendering the SDEIS inadequate. (Sierra 2910 pp. 29-30; revised by jlh to be consistent with the SDEIS.) No analysis of the cumulative impacts on corridors and access paths that meets the requirements of law appears in the SDEIS.	WI03
8155	The SDEIS is inadequate in that it fails to analyze a full range of possible mitigation measures that would reduce impacts to the Canada Lynx, the Grey Wolf, and other large mammals.	WI01
8168	The agencies must remedy the minimal and pro-forma proposed mitigation actions at closure in the SDEIS and consider other mitigations which flow from taking a hard look at lynx populations survival needs, travel habits, and access to important wildlife corridors.	WI01, WI03
8171	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: 1. The planned location of the permanent Category 1 rock pile extends about a mile to the west of the permanently reduced habitat area, the barrier that consists primarily of the fenced pits. It also presents a formidable steep sided massif adding a further impediment to access of wildlife corridor 17. The pile also removes high quality critical habitat north of the permanent fenced pits barrier which seriously impedes access to corridor 17 to and from the east. An important mitigation would therefore result if the Category 1 rock pile were to be backfilled into the west pit. The agencies rejected this recommendation for several reasons with which the Tribal Agency disagreed, as do we in the same terms as the Tribal Agency.	WI01, WI02, WI03
8178	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: The potential for collisions could be reduced by construction of several wildlife travel tunnels under the transportation corridor at points where lynx habitat meets the vehicle corridor. The Transportation and Utility Corridor crosses three streams (p. 4-10; Thumbs 345) which crossings may provide appropriate locations for wildlife tunnels. The culverts containing these streams under the Corridor could be widened to serve as wildlife underpasses. These tunnels could be constructed at the same time as the culverts under the railroad are modified to capture spilled ore from rail transport. The modifications should be completed prior to the onset of actual mining activity.	WI01, WI02, WI03, WI10
8180	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: A portion of the plant site apparently intrudes into wildlife corridor 16 due to prior mining activity, although the exact parameters of the ingress are nowhere detailed in the SDEIS. The area in and around the corridor is said to be of diminished habitat quality due also to prior mining activity, a statement which also lacks detailed description. A plan for improving this degraded area including the corridor itself should be compiled and reclamation should begin at the same time as mining readiness activities commence, that is, about 18 months prior to the onset of active mining activities per se, continued throughout the twenty year life of the mine, and amplified at closing.	WI02, WI03
8183	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: Comprehensive action aimed at reducing noise and vibration emanating from the plant site must be proposed including, but not limited to, the installation of sound insulating materials inside structures and placing vibration absorbing materials under machinery much like that used in the construction of light rail in metropolitan areas.	N04
8189	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: A comprehensive blasting protocol must be compiled with the aim of reducing maximally the effects of noise, vibration, and air blast from this source.	N04

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8194	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: A comprehensive action aimed at reducing noise emanating from the pits, both water treatment facilities, the train loading and dumping stations, and the transportation corridor could include tall sound fences like those found in urban areas along heavily traveled highways. Positioning sound barriers along the transportation corridor, for example, would have the additional effect of directing traveling animals to the passages under the transportation corridor, thus reducing even further the possibility of lynx or wolf/vehicle collisions. The fences should not be constructed, of course, until the passages under the transportation corridor are completed.	N04
8196	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: A more expansive reclamation plan should be developed in order to hasten the day when the fragmented area begins again to resemble the high quality habitat that will be lost by the proposed NorthMet action.	WI02
8200	[The agencies] must consider at least the following and/or other possible actions to mitigate the effects of mining activity on the Canada lynx: Re-vegetation of fragmented areas appears to rely primarily on planting mixtures of native grasses and forbs to stabilize soil. This is inadequate for reestablishing either Snow Shoe hare or lynx habitat; or for that matter, adequate cover for the grey wolf. Plantations of patches of coniferous trees must be interspersed across the area. These tree plantations must be caged in order to prevent destruction by ungulates. An adequate remediation/reclamation plan would be based on the idea of re-establishing satisfactory habitat at the earliest time.	VEG05, WI02
8212	The Moose is a state listed species of special concern. It thus, merits special attention in the SDEIS. But there is almost no mention of the Moose or the impact on Moose habitat of the proposed NorthMet action. This glaring omission makes the SDEIS inadequate...In the hands of PolyMet which has no obligatory responsibility for listed species there will be no Moosemanagement plan and this large area of high quality habitat will be lost forever. It is therefore imperative to maintain federal ownership of the maximum possible acres out of 6,495 acres currently under consideration.	WI01, WI02
8213	If a land exchange is conducted, Alternate B, of those being considered, would eliminate less total acreage, and be of more value to the Moose than the larger preferred plan. However, a rehabilitated "mine site only plan" would be yet better for the Moose because it would eliminate even less of the total acreage (2,719 acres) than proposed by either the preferred or Alternate B plans.	ALT23, WI02
8217	The SDEIS is inadequate because wind rose determinations and subsequent air emissions data, based upon measurements from Hibbing, are not an accurate representation of winds at the mine and plant sites... Mine and Plant Site measurements should have been made, but they were not. In Section 4.2.7.1 (p. 4-427, ff; Thumbs 582, ff.) the Hibbing wind rose model is proposed as comparable to that of the project site. Wind rose models for Virginia or Ely would be more useful than the Hibbing model, which uses annualized data, whereas Virginia's and Ely's are on a monthly basis. Monthly measurements would more accurately reflect the winds from the southwest which are common in these locations from June through September; southwest winds are not common in Hibbing. Ely or Virginia, MN wind rose data are more descriptive representations of winds likely to blow air pollutants into the BWCA and Voyageurs National Park during the months of highest visitor use.	AIR09
8229	In section 5.2.7.1.3 (p. 402, Thumbs 737) the Mine Site and the Plant Site are listed as sources of air pollutant emissions. The rail line that connects these two sites is not included in the air pollutant emissions totals in Table 5.2.7-4 Total Projected Controlled Emissions (tpy). There is no way to know whether adding in rail operations emissions (or what these would amount to) would significantly increase pollutant emissions totals...Air pollutant emissions need to be monitored from all areas of mining operations including mine site, plant site and the rail corridor connecting the two.	AIR13

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8230	It is further noted on p. 402 that there will be two ambient air quality monitors which “are proposed to minimize fugitive dust effects at the mine.” Firstly, monitors themselves can’t minimize dust. Secondly, no mention is made as to exactly where these monitors would be placed or what specific air pollutants they would measure...Placement and number of air monitors is critical. Limiting them to two in number is not sufficient. If the monitors are to providevaluable information to the public, the MPCA and the mine operator (for the purpose of informing their fugitive dust control efforts), those details should be known to PolyMet and disclosed in the SDEIS.	AIR13
8233	The SDEIS is inadequate because it fails to adequately analyze cumulative effect of SO2 and NOx emissions on NAAQS limits under specified likely levels of compliance to MPCA orders. And it fails to provide a more comprehensive analysis of the modeling results and identify significant contributions of the proposed project NorthMet project to any exceedences...the cumulative effect of SO2 and NOx emissions will exceed NAAQS limits. Since there are no guarantees that currently operating taconite facilities will promptly comply with MPCA orders to reduce SO2 and NO2 emissions, the SDEIS should have calculated cumulative results under various scenarios from full compliance to the most likely level of compliance. Additionally, the emissions from the proposed NorthMet project could be contributing significantly to other exceedences of these 1-hour standards. The SDEIS should provide a more comprehensive analysis of the modeling results and identify significant contributions of the proposed project to any exceedences.	AIR09
8237	The SDEIS is inadequate because it does not adequately analyze or describe the implications of the fact that the proposed NorthMet action will compound an already excessive inhalation pollution risk hazard to the region where the mine would be located and create further health hazards...The NorthMet mine will clearly compound an already excessive pollution risk hazard to the region surrounding the mine site create further health hazards. There needs to be a complete health hazard assessment before the process can proceed.	HU01
8245	The SDEIS is deficient because it does not analyze or discuss the effects of employing different levels of pollution control including Best Available Control Technology (BACT) on amphibole fibers, nor the implications of the existing cumulative exceedences, nor the likely lowering of the PM2.5 NAAQS during the 20 year lifetime of the mine...The MCEA recommends that the proposed PolyMet mining operation implement the Best Available Control Technology (BACT). According to this same table (5.2.7-12), PolyMet does not implement the BACT. The SDEIS has no discussion of possible mitigation practices.	AIR07
8249	Examining Table 5.2.7-12 further, it is clear that there is very little room for error in the total 24-hour PM2.5 modeled. The total for mine site and plant site is 34 µg/m against 35ug/cubic m allowed by the NAAQS and MAAQS. These smaller PM2.5 particles are much more dangerous in that they can be inhaled and lodge directly in the lungs according to the Public Health Dept. Additionally, it is likely that the PM2.5 NAAQS will be lowered during the 20 year lifetime of the mine and thus the SDEIS should also disclose how close the area would be to the PM2.5 NAAQS based on the expected level of emissions in addition to the already noted maximum. Given the danger of the amount and type of particulate matter emitted from mining operations, the already high levels of particulates emissions, and the elsewhere noted inadequacies of the wind data require a reanalysis of these crucial health data.	AIR09
8250	The SDEIS is inadequate because of an astounding failure to quantify many aspects of the problem; many sources of greenhouse gases are not included in the calculations; and many statements are conclusory...Voluntary mitigation measures to reduce GHG emission to which PolyMet has committed are described, but they are not quantified (p. 5-433; Thumbs 1341).To see how these measures could reduce GHG emissions by more than 100,000 tpy requires further information such as quantifying other fugitive and mobile sources added to the larger 196,342 figure which don’t count towards PSD. The calculations resulting in this reduction need to be clear and they are not.	AIR01
8252	The mine would occupy and destroy 1000 acres of peatland...“This [amountof peatland destruction] would increase Minnesota’s total annual emissions of CO2 by 2% above 2005 levels.” The SDEIS indicates that long term mitigation measures will offset any CO2 losses from the destruction of wetlands, but immediate effects are not calculated, and the statement is conclusory.	WET13

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8254	There is no plan to capture and sequester the CO <sub>2</sub> or methane that will be released the proposed NorthMet action is initiated. Methane, a gas with 20 times the heat trapping potential of CO <sub>2</sub> , which will be released along with CO <sub>2</sub> as the peat lands are destroyed by mining, is not discussed in the SDEIS. The presumption is that the use of wetland “banking” or constructing new wetlands where none now exist is intended to compensate for the destruction of wetlands that the NorthMet action will destroy. The SDEIS must show evidence that banked wetlands can sequester equivalent quantities of CO <sub>2</sub> and methane.	WET05, WET13
8255	The proposed NorthMet action would seriously undermine extraordinary efforts to retain Minnesota’s peatlands untouched as a primary role in reducing Minnesota’s efforts to reduce its carbon footprint and limit the release of methane. There are assumptions about CO <sub>2</sub> reduction measures by PolyMet which are not substantiated by numerical analysis leading to many conclusory statements.	WET13
8258	The SDEIS fails to analyze whether legal standards regarding mercury will be met. PolyMet has not taken the NEPA mandated “hard look” at problems with mercury. Neither the impacts of mercury deposition in wetlands nor the addition of mercury to groundwater flow through wetlands is assessed in the SDEIS. A proper evaluation of mercury, using the best available science, must be done, and must include the St Louis, Embarrass, and Partridge rivers and the surrounding wetlands. The SDEIS uses a flawed water model that severely underestimates the flow of groundwater. This model cannot be relied on to accurately account for increases of mercury in wetlands.	MERC04, MERC09
8259	The SDEIS only discusses inputs of mercury to the Partridge, St. Louis, and Embarrass Rivers as those discharged from the Waste Water Treatment Plant and Waste Water Treatment Facility. The estimate of increased or decreased loading to the rivers leaves out mercury from air deposition, from leaching to groundwater, and from the transfer of Colby Lake water. When looking at these sources the conclusion that there will be decreased mercury loading is inaccurate. Further, it is not permissible to rely on tradeoffs by increasing mercury into one water body only to hope that there will be decreases in mercury at another water body.	MERC18
8261	The SDEIS must assess the total additional load of mercury to wetlands from all sources (air deposition, groundwater transport, and spillage) and the impact it will have both on the violations of the water quality standards and the mercury level in downstream fish. The SDEIS does not include details on current mercury levels in water in the wetlands that would be impacted, particularly at the mine site. Many wetlands are likely already above the mercury water quality standard, as are the Partridge and Embarrass Rivers and many of their tributaries.	MERC01, MERC09
8262	This project could result in irreversible impacts on Aquatic Resources of National Importance (ARNI). The area contains many bogs, peatlands, the One Hundred Mile Swamp, the St. Louis River which feeds into the Lake Superior Watershed and Great Lakes Basin, and wetlands within the Partridge River watershed which also feeds the Lake Superior Watershed and Great Lakes Basin. The 404 permit application and the SDEIS do not adequately assure that these important water resources can be protected.	PER35
8265	404 permit applicants must have sufficient documentation in order to determine that their project will not violate water quality standards and that discharges will not result in adverse impacts. PolyMet has failed to adequately provide this information. The SDEIS and supporting documents show that discharges will violate effluent standards and applicable water quality standards. The permit application must be denied.	COE03
8270	The SDEIS fails to adequately analyze the current levels of mercury in surrounding water resources, nor the impacts of project caused mercury deposition into these water resources.	MERC16
8276	However, what is missing [from the 404 permit application] and what should, logically, be a part of the overall purpose and need description, is the extent to which this mining operation would serve to offset United States imports of the metals proposed for extraction. It seems misleading to list percentages of United States imports and then report expected extraction quantities at a rate of tons per year. Doing so infers that the proposed mining project has the ability to significantly offset imports, but does not provide the appropriate comparative data.	NEPA02

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8279	PolyMet states there is sufficient income to cover extraction and reclamation costs (p. 15). However, in the discussion of extraction costs, there is no mention regarding whether there is sufficient income to cover wetland mitigation construction, monitoring, repair and maintenance costs. Costs are typically, and sometimes radically, underestimated... PolyMet is proposing experimental wetland mitigation, which may or may not succeed, the cost of which does not seem to have been accounted for in the calculation of development and operating costs.	FIN04, PD25
8283	Wetlands outside of the project area will be monitored for indirect impacts. However, the 404 permit application has very little regarding what would happen if there were significant indirect impacts to wetlands... The SDEIS needs to provide a mitigation plan for indirect impacts on wetlands.	COE02
8284	The SDEIS states that it will capture 100% of surface water run-off. It appears as if the SDEIS is overly optimistic regarding the capabilities of an untried containment system, and it is far more likely that the system will leak at some point in the future. There must be an effective contingency plan and financial penalties in place which will appropriately compensate the taxpayers of Minnesota if the containment system leaks and causes harm and if installation of such a system significantly impacts streams flows and wetland hydrology.	FIN05, FIN10
8285	While wetland boundaries have been delineated in the project area, wetland boundaries on lands proposed for exchange are approximate and not all wetlands were delineated. Unless wetlands on private lands are delineated and there is an extensive, comparable study of wetland functions and values as has occurred within the project area, it should not be assumed that there has been an appropriate examination of wetland functions and values and whether there will be equal exchange.	WET17
8287	The proposed land exchange will exchange high quality wetlands currently on public lands with wetlands that are of lower quality. .. There will be a projected net loss of 6,025.8 acres of wetlands that were on the MBS high biodiversity significance and a net increase of 767, 9 acres that are of moderate biodiversity significance. Exchanging lands containing wetlands will lower quality in terms of functions, values and biological diversity is not in the public interest nor is it an equal exchange.	WET14
8288	[T]he wetland functions and values of these wetlands cannot be appropriately replaced. Wetland mitigation site construction is experimental with respect to construction of open bogs or coniferous bogs. There is not a contingency plan if mitigation fails. There is also not a contingency plan if there are indirect wetland impacts that cannot be restored.	WET01, WET04, WET05
8289	It is troubling to see the great potential for indirect wetland impacts and yet there is no contingency plan in place to deal with such impacts beyond assurances that the appropriate state and federal agencies will resolve such issues should they arise. Currently, the only contingency available to agencies is to require financial assurance, which should be structured in a way that keeps PolyMet's parent company and its shareholders on the hook and meeting their financial obligations.	FIN01, FIN02, FIN11, WET01
8291	The water quality modeling that is used in the SDEIS to support the prediction of meeting water quality standards cannot reliably forecast those values. The model:- has too many deterministic data values trying to represent a complex environment,- does not have enough data available to fully calibrate it,- does not capture the full dynamic of precipitation and drought,- has little or no validation.As such, it is insufficient as a tool to predict the water quality that will result from the project plan.	WR189
8327	More data is needed to better calibrate the modeling for the project and to validate that it is able simulate the movement of contaminants at the plant and mine site. The model can provide good information about how different processes are linked together, but also, some scenarios should be developed based on heavy rainfall and drought events, which, due to our changing climate, will likely become more frequent	WR072, WR077, WR180, WR189

8330	The SDEIS water quality modeling for the mine site is based on modeled values of base flow that do not match real world values. The Partridge river base flows are predicted to be way too low when compared to actual measured values... The implication is that the model thinks very little water moves through the groundwater system.	WR003
8332	The SDEIS sorption values are arbitrary and do not represent the complex soil environment of the mine site or plant site.	WR058
8344	The SDEIS uses simplistic proportioning of annual rainfall into monthly portions...this treatment of precipitation does not include variability during the year like a dry summer and a wet fall. One can have dry years and wet years, but no variability within them. Nor does it handle extreme events at all.	WR057, WR077, WR176
8348	How is overall water quality determined? The only standards that the model is addressing are concentration values. However, the EIS is supposed to address environmental impact, not just ability to meet concentration values. Would anyone allow PolyMet to pump water from Colby Lake to add to the flow of the Partridge River just to meet water quality standards? Those metals and sulfates are going somewhere, even if the concentration is lower due to dilution. The total mass of contaminants in the stream may be much higher. What happens to that load when the water evaporates in back waters, marshes and ephemeral flooded ponds? Does the mass of additional sulfate and other metals (mercury, for instance) build up in Colby Lake (Partridge River) or Sabine or Wynne Lakes (Embarrass River)? Does the mass of sulfate lead to an increase in the methyl mercury concentrations in those lakes? Does the high volume carry those pollutants down to Lake Superior and the St. Louis River delta?	MERC08, WR197
8352	The design criterion for large floods in the SDEIS is too low. The SDEIS design for storm precipitation is 4.1 inches for the 25-year, 24-hour event and 5.2 inches for the 100- year, 24-hour event. Although there are some contingency plans to handle events larger than planned, those plans will fail if the basic design is inadequate.	PD22
8355	The SDEIS has several statements about pump capacity that can be expanded or overflow capacity that can be improved, if needed. Of course, the problem is that there are some kinds of failures that could have very large impacts. If the tailings basin fails, it will be too late to consider improvements to the way it handles floodwaters.	PD11
8357	The SDEIS grossly underestimates the impacts of climate change. There is no mention of an increase in extreme weather, both rainfall and droughts...But there is still no capability in the model for extreme rainfall events that are predicted to increase with climate change. Nor is there any real consideration of extended droughts. As a result, the model cannot tell us what their impacts will be.	WR180, WR189
8359	The water quality model has no validation in the real world...As the SDEIS stands, most of the available data was used in calibrating the model and thus is not usable to validate it.	WR106
8360	The SDEIS has not sufficiently considered the impact of chloride compounds in the ore and rock that will be mined. The Category 1 waste rock pile could leach chloride depending on precisely where in the Partridge River Intrusion mining is done.	WR025
8361	The SDEIS claims that briny groundwater will be substantially below the level of the pit even at its deepest extent. However, there is no discussion of chlorine compounds in the mined rock itself. Severson and Hauck reported the presence of liquid drops with very high chlorine concentrations on many of the drill cores from the Partridge River Intrusion...Obviously, the processing of the ore is expected to consume large quantities of hydro-chloric acid so the plant will have to deal with chloride. However, it is not clear how well contained the chloride from waste rock piles might be, and it should be addressed.	WR025

8371	The SDEIS provides no estimate(s) of how long post-closure treatments will be required. Failure to provide these estimates deprives the public of the opportunity to assess the potential effects of the project, including the indirect effects, "... which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." [40 C.F.R. § 1508.8.] In addition, failure to provide estimates of the times needed for post-closure treatments deprives the public of the opportunity to evaluate the financial risks associated with the NorthMet project.	WR036
8380	The lead agencies assume that the mining company will exist for centuries after closure. This is not a realistic assumption. Mining companies historically are temporary entities that disband soon after a mine project comes to an end. The most reasonable scenario for long term closure is that a state or federal agency will be responsible for monitoring, maintenance, and cleanup activities because a mining company cannot be held accountable if it no longer exists.	FIN01
8389	Waste treatment in the NorthMet Project will be perpetual, as "perpetual" is defined in standard dictionaries to include, "lasting for an indefinitely long time."...The SDEIS states, "Financial assurance could be required indefinitely and could include self-sustaining instruments as discussed in the following sections." (3.2.2.4.1). This statement is in error because Minnesota rules do not allow for a non-ferrous mining operation that will require indefinite post-closure maintenance. The rules require closure and that it be maintenance free.	PD02
8390	Post-Closure costs approaching or exceeding 500 years must be calculated as, "in perpetuity."	FIN01, FIN05
8394	The wisest decision for Minnesota lawmakers would be to stop this mining project from moving forward due to the fact that it will require long-term water treatment. PolyMet cannot set a timeline for when water treatment will be completed. With absolutely no guarantees, the risk of costly cleanup for generations to come is too great. If PolyMet cannot design a project that adequately reclaims the mining area and treats the water within a reasonable amount of time, they should not be allowed to move forward.	PD03, WR036, WR195
8399	A detailed analysis of financial assurances must be present in the EIS, including financial calculations based on worst-case-scenarios of water quality predictions... information regarding the interests and return on investment rates, and the operating costs should have been included in the EIS.	FIN05, FIN08, FIN13
8401	Even with the best possible financial assurance measures in place, the PolyMet project still poses a significant long term risk to water, including Lake Superior and the St Louis River watershed, results in significant loss of wetlands and wildlife habitat, and still leaves significant undetermined financial risk to taxpayers.	FIN10, FIN11
8405	The specific nature of the PolyMet proposal makes developing effective financial assurance particularly difficult. No one has been able to ascertain with any reasonable certainty how long the PolyMet mine site will require ongoing treatment. The models used in creating the SDEIS document stopped at 200 years for the mine site and 500 years for the tailings basin. However, the SDEIS does not conclude that even these extreme timeframes actually represent an end date for ongoing treatment. Into perpetuity is a long time.	FIN01, FIN05
8411	[T]he SDEIS does not address positive economic possibilities outside of increased mining, such as recreation.	SO04
8414	Because the PolyMet SDEIS fails to otherwise include the cumulative impacts of additional copper-nickel mining projects, such as Twin Metals which is now in the pre-feasibility stage or Teck America which has done a bulk sampling, and fails to acknowledge the intention that the permitting of PolyMet will open the door for the creation of a sulfide mine district within the Duluth Complex --then the SDEIS also fails to acknowledge the over-all destruction of high quality forests, wetlands, and waters in areas of the Arrowhead that are not part of the Iron Range, have never been previously mined, and have been a source of economic support for tourism, recreation, and lake property. By exaggerating the benefits of large scale mining and ignoring the negative impacts of a sulfide mine district, this PolyMet SDEIS is incomplete and erroneous.	CU02, CU04, CU17

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8418	In addition, the SDEIS ignores the current and expanding impacts to the St. Louis River watershed as a result of occurring and expanding taconite mining. Nowhere, in any environmental review or granting of permits, is any mention made of the cumulative impacts to the St. Louis River watershed, nor in the impact this has upon the regional economy.	CU11
8422	The SDEIS lacks analysis of societal costs related to the high rates of asthma, autism, heart disease, dementia, and cancer likely related to mining pollution	HU01
8428	The SDEIS fails to address the disparity of income within the mining area economy.	SO04
8430	[The SDEIS] fails to address the large disparity in mining jobs that favor men over women and how this contributes to over-all economic and societal balance.	SO04
8437	The SDEIS fails to analyze the benefits to Canada in comparison to the state of Minnesota. The highest salary benefits will be exported to other countries such as Canada (PolyMet) or Switzerland (Glencore). Chemicals needed for PolyMet's processing plant will be imported from Canada. Major equipment and sources of energy will be imported. Final processing will be done elsewhere.	SO04
8478	The SDEIS presents a one-sided report on the economic benefits of PolyMet to northeast Minnesota. It ignores the extent or quality of jobs that would be lost due to mining impacts. It assumes that the PolyMet proposal is designed entirely to benefit the residents of northeast Minnesota, ignoring the fact that our resources will be extracted and exported, our land denuded and polluted, and potential clean-up costs deferred to future generations, all for the benefit of multinational corporations.	SO04
8481	Just as the ground water and environmental impacts of PolyMet's proposed project lack proper modeling, the economic benefit analysis is equally lacking in rigorous and objective peer review.	SO04
8482	The SDEIS does not adequately analyze the economic benefits of a no-action alternative on the mining proposal.	SO04
8488	The SDEIS presents a one-sided view of the economic benefits of mining activity and totally disregards negative impacts. When water treatment is projected to be needed for 200-500 years or longer, then the long-term economic analysis of this proposed project is inadequate and flawed.	SO01
8497	The SDEIS has not sufficiently analyzed the potential this project has to adversely affect human health. There is great risk to the health of the citizens of Minnesota from long term pollution caused by this project.	HU01
8500	The SDEIS does not address the human risks of exposure via air, water, soil, skin contact, and food and water consumption.	HU01
8502	The SDEIS does not address the increased risks to human health from emissions of highly toxic chemicals and metals.	HU01
8515	There are no data in the SDEIS to show how the proposed sulfide mine operation will prevent leaching into the environment and intake into the body of heavy metals. To what extent will this project add heavy metals and fine particle air pollution to our environment and what will the cumulative effect be to our health? How will the toxicity of pollutants affect vulnerable citizens such as the unborn, children, elderly, those with chronic disease and immunosuppressed individuals?	HU01
8518	Pollution from this mine will be a part of our environment for the next 200 to 500+ years, there must be an analysis of how this will affect human health for us and our future generations. It is the cumulative effects of air pollutants and toxic chemicals in soil, food, and water that result in human diseases. The magnitude of this project will contribute to this burden and the effects to human health must be considered.	HU01

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8521	The PolyMet SDEIS assessment of the risk to human health from exposure to mineral fibers is inadequate and incorrect.	HU01
8522	The risk is high. There are elevated levels of lung cancers, including mesotheliomas all across the Mesabi Iron range. Minnesota Department of Health studies and University of Minnesota studies have found mesotheliomas are 200% higher than expected. For workers on the Iron Range, the risk of incurring mesothelioma rose about 3% per year worked. Lung cancers are above expected by 20%. Thus, the risk of disease is not insubstantial.	HU05
8523	The SDEIS claims only "asbestos" fibers are hazardous, but two lines of evidence make this claim suspect...[A] non-asbestiform amphibole mineral found near to the PolyMet proposed mine has been shown to be just as carcinogenic as commercial amphibole asbestos.	HU05
8524	[T]he SDEIS cannot rely on the fact that the amphibole fibers will mostly be cleavage fragments to conclude that the risk is minimal. They cannot rely on the fibers having an aspect ratio less than 20:1 to claim they are not hazardous.	HU01
8530	There are amphibole minerals in the ore that PolyMet will be mining. Even though it is likely that the presence of asbestos is low, fibers generated by the mining and crushing of the rock are hazardous and should be contained.	HU05
8534	The SDEIS needs to seriously consider the impact of the fibers that the PolyMet project will create and disseminate. At a minimum, roads and tailings should be treated with a dust suppressant. Monitoring should be established in other communities than Hoyt Lakes. Finally, the dust should be handled and treated as hazardous.	AIR03
8539	The potential release of asbestos-like fibers from PolyMet has not been adequately analyzed, even though the SDEIS states that "potential public health risks of uncertain magnitude" could be expected.	HU01
8542	To comply with the wild rice sulfate standard, the PolyMet project relies on engineering controls that capture and treat mine related effluent. These controls must function perfectly for hundreds of years. It is unrealistic to assume that any treatment facility can be properly maintained or managed for 200 to 500 years. It is also unrealistic to assume that seepage from mine pits, waste rock piles, and tailings can be controlled through any type of water management system.	WR128
8544	All of the PolyMet predictions regarding discharge fail to consider the effects of fractures on discharge to groundwater and surface water.	WR011, WR012
8546	Existing groundwater contamination from the previous mining activities is still an issue near the LTV tailings basin and mine pits. The lead agencies need to demonstrate that this legacy pollution can be cleaned up and controlled before permitting new polluting operations on top of existing ones.	HAZ05
8550	The proposed project would severely disrupt surface and groundwater hydrology in the wetlands surrounding the proposed mine features. The SDEIS must take this into account by including a complete set of available data. The methodology in the SDEIS relies on impacts observed at other sites. With current types of access to information, this is totally unacceptable.	WR058, WR064, WR105, WR112, WR119, WR120, WR183
8552	Wetlands in the 100 mile swamp are ecologically significant, provide important habitat for a large variety of animals and have been found to be aquatic resources of national importance. Loss of these functions, particularly forested wetlands, are irreplaceable.	WET19
8553	Thousands of acres of high quality wetlands would be filled and indirectly impacted by hydrologic changes. In addition to the approximately 1000 acres of direct fill this analysis indicates approximately 5700 acres of wetlands would be severely impacted. Mitigation for indirect impacts is not included in the SDEIS. To permit a new project of this type at the cost of such a significant loss of wetlands is reason enough for a No Action Alternative.	WET01

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
8554	The word “moose” does not appear at all in the SDEIS cumulative effects analysis. As of August 19, 2013, moose are now proposed to be listed as a MNDR species of concern. It is premature to move this SDEIS forward without addressing impacts to this iconic species.	WI01
8558	It is likely that wind-blown dust particles containing sulfate compounds that are emitted from mining activities could contaminate wetlands, lakes, and streams near the project site and could cause harm to the Species of Special Concern that have been found in this area and to the animals that depend on these plants for food.	WI01, WI04
8560	The cumulative effect of 24 hour/day, seven days/week of heavy industrial and blasting noise on sensitive wildlife has not been addressed.	WI05
8561	MN Rule 6132.3200 does not allow perpetual treatment: “To receive a permit to mine, the permittee must be able to close the mine in such a way that it is stable, free of hazards, minimizes hydrologic impact and release of substances, and is maintenance free.” The PolyMet SDEIS states that “longterm” (>500 years at the Plant Site and >200 years at the Mine Site) treatment of wastewater is needed which means the site will not be maintenance free at closure.	PD02
8564	The regulatory agencies cannot assume that a proposed project of this size and scope will not result in changes to the average stream of flow of the Partridge and Embarrass Rivers.	WR183, WR186
11088	The NorthMet SDEIS in many particulars deviates from the statutory charge of protecting the environment. Some of these deviations are express and others merely implied by the failure to consider, or to take a “hard look” at uncertain or unsubstantiated conclusions...Many of the inadequacies of the SDEIS, outlined herein in detail (concerning alternatives, cumulative effects, impact on wildlife, financial assurances, acid mine drainage, etc.) indicate that the Agencies are balancing risks to the environment vs. economic factors.	CU14
11095	Wetland function analysis is inaccurate. It is likely, in the foreseeable future, that the additional 3,810 acres of buffer forests and wetlands would be adversely and significantly altered by mining or use of the surface to support mining, etc. If PolyMet does not plan to destroy the surface, then a protective covenant (such as the Weeks Act now provides) can be put on the buffer lands.... Will the additional 3,810 acres of buffer Lands be losing their Weeks Act protections against strip mining? If in the foreseeable future the 3,810 acres won't be used for mining, why wouldn't the protective covenants from the Weeks Act deed restrictions continue on the lands?	LAN02, LAN06
11416	Clearly the project does not meet the stated purpose and need of the project. The mineral estate and the potential for mining, as well as the split-estate of the properties in the exchange are inadequately addressed in the proposal.	LAN04
11421	The land exchange appears to be a scheme to remove Weeks Act protections on USFS lands against strip mining. Over half the mineral estate in the Superior National Forest is severed, is the USFS going to land exchange all of the lands that have "conflicts" between the mineral and surface estates?	LAN02, LAN04
11438	The Mineral Estate is not being adequately addressed. The USFS federal lands, and the mineral estate of the non-federal lands, appear to be severed. The severed minerals estate on the nonfederal lands devalues them. The Federal lands have valuable controlling covenants that protect the surface estate. In addition, the USFS makes no mention of placing Weeks Act protections upon the non-federal lands PolyMet wants to exchange. The true economic value of the surface estate to PolyMet, including gaining the ability to destroy the surface by strip mining, should be included in the valuation.	LAN02, LAN04

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
11627	Potential loss of the additional 3,810 acres of buffer Lands (over and above the mine site) and wetlands needs to be analyzed. It is likely that the buffer Lands will be mined or destroyed by mining, or by the use of the surface for stockpiles, etc., in the foreseeable future. The additional federal buffer lands in the proposed exchange most likely will be used to facilitate and expedite future mining. This needs to be addressed in the EIS...Why is the USFS facilitating future mining projects? The mining and/ or destruction of the surface of the additional 3,810 acres must be addressed in the environmental review process. Has PolyMet optioned the minerals from RGGS on the lands?	LAN04, LAN06
11638	One of the major flaws with the SDEIS is it fails to disclose the history of copper mineral and hard rock mining projects and the environmental disasters that have taken place at other mine sites. This omission violates NEPA's disclosure requirements. There needs to be an analysis and comparison of similar mining projects that have occurred throughout the country and the effects and consequences of the environmental impacts that accompanied them.	PD26
11639	The SDEIS lists several projects as "speculative" and thus excluded them from the cumulative effects analysis. Many of these projects are quite far along and it is important to consider future projects as well as past and present projects. These projects should be included in the cumulative effects discussion.	CU02
11641	In addition to omitted mining projects, there are many vegetation management projects conducted by the Forest Service that should be included in the cumulative effects analysis. Some of these include: the Kabetogama Project, the Mixed Use Motorized Use Project, the Pearl Project, the Glacier Project, the Skibo Project, the Tracks Project, the Birch Project, the Echo Trail Project, the Travel Management Plan of 2009, the Pelican Project, the Tracks Project, the Virginia Project, and the Big Grass Project. Simply listing "forestry practices" as part of the analysis is not sufficient.	CU09
11648	Mining activities from the NorthMet site and operations originating at other mine sites may contaminate lakes, streams, and wetlands around the project area and downstream. Pollutants that get into moving waters such as rivers, streams, and groundwater will have far-reaching effects on wildlife....The SDEIS goes on to conclude that the project is unlikely to cause a cumulative impact to surrounding wildlife species and aquatic ecosystems. This conclusion cannot be made because it is not based on an appropriate, relevant, orlegally adequate analysis.	WI04, WI08
11650	Ore-dust contains many contaminants and these contaminants will accumulate in the environment over the lifespan of mining operations. The rail transfer hopper and the rail car loading conveyer and platform should be enclosedto minimize the amount of dust that will escape. Additionally the rail cars should not be open-top.	PD36
11680	Rail cars will be used to transport ore, side-dump cars are supposed to minimize spillage, but spillage will still occur. It seems certain that these areas will have ore residuals and that completely cleaning up all surrounding sediments will be nearly impossible. How will these areas be contained?What will happen when stormwater comes into contact with these areas? What will prevent stormwater from coming into contact with dangerous ore residuals and carrying them into the surrounding environment?	PD36
11687	The Category 1 stockpile water containment system should have a permeability of 1x10-6 cm/sec or less for the cutoff walls for the Category 1 waste rock and the tailings cutoff wall. For the Category 2/3 and 4 Stockpiles and Ore Surge Pile Liners, all liners made of natural materials should have a permeability of 1x10-6 cm/sec or lower.	PD15
11688	No site stormwater or any other runoff from any ponds should be draining into the Partridge River, any of its tributaries, Trimble Creek, Colby Lake, or any other streams, rivers, or lakes. The potential for disastrous effects is far too great. All runoff and stormwater must be contained and kept from polluting the surrounding environment.	PD04

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
11937	The precise swath of land that is included in the south and southwest access paths is uncertain because the agencies have failed to identify the specific parcels of land they refer to.	WI03
11939	The new land exchange proposal described here is similar to the “mine site only” proposal which was erroneously rejected for consideration by the agencies (See Item 6). The “mine site only” option would resolve some of the problems discussed in this section. However, a new land exchange proposal can be designed to provide better defined eastern, southern, and southwest access paths to corridor 17, preserve the maximum possible needed high quality habitat, add to significant area to the federal lands, and limit the size of the exchange to the minimum size required to fulfill the purpose of the proposed NorthMet action.	ALT23
11942	The agencies routinely use the conditional form of speech in their descriptions of environmental effects. Intentional or not, the language style often obscures more than enlightens.	NEPA07
11965	The proposed project will result in hundreds of acres of peat bogs being destroyed, which means that hundreds of acres of Hg (mercury) sequestering surface will be permanently lost to the Lake Superior watershed. The proposal to replace lost wetlands with artificially constructed wetlands in Aitkin and Pine counties having disproportionately less peat bog surface and are located in different watersheds, which will result in significant mercury impacts to the Lake Superior watershed.	WET03, WET05
11978	Mitigation sites will be just one year into construction, and because there is some experimental methodology being proposed, there is no assurance there will be type for type replacement and no assurance there will be adequate replacement of wetland functions and values. Frankly, the functions and values of the wetlands at the mine site cannot be replaced through wetland mitigation as the wetlands that would be impacted by this project rated by the Minnesota Biological Survey as having high biodiversity significance. Such wetlands have had little or no human disturbance...There are no wetland mitigation sites that have successfully restored or created an open bog or coniferous bog, and therefore, there is no template to determine success.	COE05
11979	The flotation tailings basin (FTB) containment system will decrease the amount of stream flow to 4 tributaries around the tailings basin. Such flows are proposed to be augmented by waste water treatment plant (WWTP) effluent and, secondarily, by taking water from Colby Lake. If, as a result of construction of the FTB containment system, there will be a lack of water to tributaries, it seems there would also be a lack of water flowing to adjacent wetlands. Although some wetlands will be monitored for hydrological and vegetation changes, it seems as if the extent of monitoring is not sufficient to ensure there are no secondary wetland impacts.	WET12
11982	The SDEIS and 404 permit application states that wetland boundaries were mapped in the field after an extensive off site review. The SDEIS states that the working group approved wetland delineation on March 30, 2011. There were updates between April 2011 and fall 2012. Wetland boundaries were again refined in 2013. Boundaries were refined, but no apparent description of what was refined or how boundaries were altered. If boundaries were approved on March 30, 2011, what was the basis for refinement? Furthermore, with all the refinements, can it really be known that wetland boundaries are accurate? Are there more wetlands present than mapped?	COE05
11994	Are leaching rates, hydrologic conductivity, ground water flows, dispersion, sorption rates, and other properties tied to precipitation inputs in the model? From the reference material provided, it does not appear that they are. Does that model run know that there was a sixmonth drought? Many or all of these parameters change with changing hydrological conditions (dry or saturated soil, hydrologic pressure). As it is currently deployed, the model simulates these changes in a random way. That is entirely appropriate when evaluating independent uncertainties, but it will not work when many of the parameters are correlated.	WR077, WR189

<b>Sender Name (Submission ID)</b>	Sierra Club Northstar Chapter (42950)	
11995	The highest concentrations of contaminants may occur during or just following extreme droughts. Because the model does not address drought (other than low annual precipitation portioned through the year) in any significant way it would miss these potentially harmful events. It does not adjust leaching rates to drought or wet-dry cycles. Thus, it will inevitably underestimate the actual leaching that is occurring.	WR077
11997	An assessment of risk where there is a high likelihood of damage being caused by extreme events is not a candidate for probabilistic modeling. The modeling can help figure out how processes are linked, but determining uncertainties on the tails of the distributions is very difficult. It would be useful to see a scenario analysis of drought and flood. That would provide a better idea of the risk involved with those events.	WR077, WR189
12009	PolyMet has not demonstrated that it is capable of paying for collection and treatment of water for hundreds of years. PolyMet has described its water treatment technology with specificity, and can even tell you the cost to treat each thousand gallons of water. PolyMet has designed and has precise schematics for all barriers and collection systems. The drawings are all available in the public documents. They are not in the SDEIS, but we do have great detail about PolyMet's mine plan. The DNR has significant detail about things like the longevity of liner systems on the site. On the other hand, they claim they do not have sufficient information for financial assurance at this point and that the plan is not final and could change. But that is true of all analysis in the SDEIS, and is not a reason not to make those calculations based on the mine plan we have today.	PD25, PD29
12010	PolyMet has projections on financial assurance. They are printed in the SDEIS. The DNR has accepted these numbers, and yet there is no documentation to prove that these numbers are reasonable or based on acceptable assumptions. The state of Minnesota should not be relying on estimates from parties with a vested interest in the outcome.	FIN05
12014	Taxpayers around the country have been left responsible for the financial costs of cleanup when mining companies declare bankruptcy at the end of their mining operation. There is nothing currently in Minnesota law that requires parent companies or majority shareholders to be parties on a permit to mine, issued by the state, which could help to address this problem.	FIN01, FIN10
12019	More recently (2008), higher amphibole fiber levels occurred in the air of Babbitt when the wind was blowing from the south – the direction of the Peter Mitchell Pit. The SDEIS does not consider sources other than the plant as source of fibers, but the mine could easily be cumulative with the Peter Mitchell Pit in producing fiber concentrations in nearby communities.	AIR03
12026	Hydrological and water quality cumulative effects must incorporate the entire St. Louis River watershed. Existing mining discharges have resulted in elevated concentrations of pollutants that persist far downstream in the St. Louis River.	AQ26
12027	We agree that groundwater pollutant travel times have been underestimated and the SDEIS projections are inadequate. Cumulative impacts to groundwater and surface water quality and quantity must be included in the SDEIS.	WR024, WR042, WR064, WR167
12028	We agree that benefits of a No Action Alternative must include improvement in water quality due to the Cliffs Consent Decree.	ALT14
12029	We disagree with agency conclusions that projected mining will have no impact on water quality, based upon not exceeding applicable water quality standards. This is a false conclusion--no existing mine operation in northeast Minnesota is consistently meeting water standards. Mining by its very nature impacts the quality and quantity of water. The claim that proposed copper-nickel sulfide mining will not impact water quality can only be based upon false modeling and/or assumptions.	PD26
12030	We agree with the Tribes that it is impossible to properly mitigate for losses to the landscape and ecosystem based upon the scope of the mining operations, the intensity of industrial operations, and the geological chemistry that results from blasting, crushing, grinding, and processing sulfide ores.	PD01

19863	Even if you can "mitigate" risk, the current natural state is too valuable, and our water is at risk without a mine.	PD01
<b>Sender Name (Submission ID)</b> solfrid ladstein (17725)		
14622	The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS.	HU04
14624	A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process.	HU07
14625	the DNR should: ... Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length	HU04

14063	Since [mining] can be done soundly and produce local jobs and revitalize a struggling economy in northern Minnesota, I do not know of any reason why our state would not want to mine these metals...As someone who's job is connected to the mining industry, mining plays a key role in keeping me, as well as hundreds of other Minnesotans, employed.	SO10
<b>Sender Name (Submission ID)</b>	Staci L Drouillard (54854)	
19071	My concerns about PolyMet and any new mining in Minnesota stem from our proven and documented history with mining; not as a sustainable long term economic source, but as a destructive boom and bust industry that takes much more than it gives to surrounding communities.	SO01
19072	Treatment of contaminated water will be required for more than 500 years. The modeling done by PolyMet stopped at year 200 (at the mine site) and year 500 (at the plant site) because that was the point at which it became clear that water quality would not get worse. However, the modeled water quality at 500 years does not come close to meeting water quality standards. In fact, PolyMet's data indicates that for some pollutants, treatment will be needed for millennia. Copper, lead, and sulfate are all pollutants that will impact the St. Louis River for centuries if treatment ends prematurely.	WR035
19073	The SDEIS predicts that the project will not add to sulfate levels ... or other pollution. But this statement is dependent on the predicted rate at which pollutants will flow to the rivers through groundwater, and these predictions are almost certainly wrong. Modeling of groundwater movement at the mine site is based on estimates of flow of the Partridge River that do not come close to reflecting actual conditions...The result is that the predictions may significantly underestimate the amount of sulfates and other pollutants that will enter the Partridge River.	WR086, WR091
19075	The tailings basin estimate is based on unrealistically optimistic estimates of the effectiveness of the water collection system (and on the assumption that it will operate indefinitely). The result is that the predictions underestimate the amount of sulfates and other pollutants that will enter the Embarrass River and its tributaries	WR018
19078	The St. Louis River downstream from the PolyMet site is already heavily impacted by sulfate. Wild rice production is a fraction of what it once was on the river ...We cannot allow the MPCA and other State agencies allow mining companies to set the sulfate standards. Keep the independently researched and already proven 10 ppl sulfate standard in place for wild rice waters.	VEG04, WR159, WR160
19091	PolyMet's humidity cell testing indicates that mercury will leach from waste rock at more than four times the water quality standard. But PolyMet proposes not to conduct an analysis of the amount of mercury that will enter either the Partridge or the Embarrass River from leakage from waste rock, disturbed peat, mine pits, or tailings. This analysis was done for 28 other constituents, many of which have nowhere near the potential for impacts that mercury does.	MERC16, MERC20, WR034
19093	The SDEIS assesses the impacts of mercury deposition on area lakes, but ignores the streams and rivers. The conclusion that the annual mercury load to the Partridge River will decrease by 1.2 grams and the annual load to the Embarrass River will increase by 0.6 grams does not include deposition from air emissions. That deposition will be significantly greater than the decrease in load predicted in the SDEIS.	MERC23
19096	the SDEIS does not take into account any new power sources that will be required to run large, new mining operations and the effect that these additional power plants will have on mercury pollution in Lake Superior as a direct result of coal-fired power plants around the Lake basin and to our West.	AIR02, MERC10

<b>Sender Name (Submission ID)</b> Staci L Drouillard (54854)		
19099	The existence of toxic fibers in the rock at the Mine Site has not been studied; whether such fibers will be dug up and released to the air is unknown. However, the Northshore Mine is very close by, and it is known to release fine mineral fibers. Minnesota taconite miners in general have a high rate of mesothelioma, a disease that is caused only by breathing fibers.	AIR03
19102	The North Met Mine would completely destroy at least 1,741 acres of high quality ecosystems, which provide habitat for many wildlife species, including Canada lynx, wolves, and moose. Many more acres are likely to be degraded in the area surrounding the mine. Losses will include 1, 7 41 acres of Minnesota Biological Survey sites of High Biodiversity Significance; 698 acres of Jack pine/black spruce forest, which are considered imperiled/vulnerable in Minnesota; and portions of one of only twelve known populations of floating marsh marigold in the state. All of these resources are currently located within the Superior National Forest, and are public resources	WILD02
19132	PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. The majority of the mitigation for the 912 acres of high quality wetlands that would be destroyed outright would occur outside of the St. Louis River basin, so the benefits of wetlands to the river system would be lost. Thousands of additional acres will likely be lost or degraded due to groundwater drawdown, reduced river flow, and the impacts of water and air pollution; no mitigation has been proposed for these losses.	WET01, WET03, WET23
19148	Mines and other development in the Mesabi Iron Range currently create a significant barrier to wildlife migration. Studies have found only 13 to 18 narrow corridors that allow wildlife to move from north to south of the Range. Planned projects and expansions within the taconite industry will severely limit or destroy many of these corridors in the next few years. The NorthMet Mine would further degrade what is already a marginal, but important corridor,	WI03
19150	PolyMet would be responsible for 0.44% of all of Minnesota's greenhouse gas emissions... Minnesota is already highly unlikely to meet its greenhouse gas reduction goals for 2015 and 2025, and this increase would be a significant set-back.	AIR01
19152	PolyMet would ...employ approximately 0.012% of Minnesota's workers...This clearly imbalanced ratio between pollution and jobs benefit seems like a bad deal for Minnesota.	SO01
19157	The Mine Site is on National Forest Land. Rather than requiring PolyMet to comply with Forest Service requirements (which would mean that the mine had to be underground rather than open-pit), the Forest Service is accepting an exchange for a number of smaller parcels scattered throughout the Forest. These other lands do not appear ... to contain the same quality of ecosystem integrity and wildlife habitat as the Mine Site does. The overall effect will be a loss of forest and biodiversity.	LAN02, LAN03
19165	PolyMet does not accurately or completely address the issue of Financial Assurance in the SDEIS or in the business model. They do not provide any substantive details as to how the long term treatment of polluted water will be paid for. Margaret Watkins, a PhD Water Quality Specialist from Grand Portage...calculated that the cost for treating polluted water for more than 500 years could be as much ...One hundred billion dollars!	FIN01, FIN05
<b>Sender Name (Submission ID)</b> Staci Revers (15763)		
828	PolyMet did some revisionist geography to imply that acid drainage from waste rock piles can't flow to the BWCA because the site is on the south side of the Laurentian Divide. In fact, the mine is uphill from a wetland that exists as a divot in the divide and drains down both sides ... The One Hundred Mile Swamp (it's actually a little over 10 miles long). ... I would like PolyMet to do more testing on the flow through the swamp to ensure BWCA is safe.	WET19, WR080

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Stephen J Jay (23471)	
3371	Another section of chapter 4, acknowledges that rock liners may fail to contain contaminated drainage and liners may degrade with contaminated seepage expected to exceed standards for aluminum, antimony, arsenic, fluoride, iron, manganese, sulfate, dioxin, and perhaps beryllium and thallium	WR127
3372	Aluminum may exceed water quality standards for 500 years. Concentration of such toxics in fish that can be eaten by humans presents major implications for human health	AQ05, WR035
3375	The leakage of sulfates with their known role in facilitating mercury methylation, a toxic form of mercury that may cause brain and kidney damage and bio- behavioral disorders in humans, is of concern, as is the long- term implications of sulfate pollution that is detrimental to sustaining growth of wild rice so important to Minnesota Tribal communities?	MERC08
3377	Given the projected pollution with these human toxins and given the myriad uncertainties with long- term management of environmental pollution over hundreds-thousands of years, why is the SDEIS largely silent on human disease implications of sulfide mining?	HU01
3378	Sulfide mines are among the worst polluting mines in the world. (Dartmouth, 2010, 2012; A Mining Truth, 2012; Qu 2012) ... There is no information in this SDEIS that acknowledges this fact and outlines specifically how the proposed project will be unique in preventing what history tells us occurs at every SM site and will occur at the PolyMet sites.	PD01
3383	MN has existing polluted mining sites with Acid Mine Drainage: one off Spruce Road near our residence has been draining acid material into the local environment and watersheds for the past 36 years; another at Dunka LTV mine has been leaching heavy metals into Birch Lake for years. (Sulfide Mining 2014; Sulfide Mining, Spruce Road, 2014). The SDEIS does not address why, with modern technology and knowledge, these sites continue to put AMD into the Minnesota environment.	PD26, WR023
3385	History of sulfide mines is rich with details of major problems that occur during mining operations. Drawing on such history to develop detailed evidence- based contingency planning, would greatly strengthen the SDEIS.	PD22
3386	There is little information provided on contingency planning. For example, the reasonably foreseeable problems that may arise in this project adversely impact waste water treatment and tailings management are not reviewed.	PD22
3387	Historical data can be incorporated in computer models to provide objective estimates of costs associated with such failures and precautions necessary to decrease the rates of mishaps.	FIN05
3388	Sulfide mining presents serious threats to water quality and the health of those persons who drink it. Yet the SDEIS contains flawed methodology and inaccuracies in estimates of water flow through the site. Since the quantity and rate of pollutants entering water sheds and nearby rivers are dependent on accurate estimates of water flow, it is critical that the methodology is accurate. (U.S. EPA, 1994; EPA Letter, 2013)	WR003, WR052, WR086, WR091, WR105
3390	b.Table 4.2.2-2 (Impaired Waters within the Embarrass and Partridge River Watersheds) (p. 4-29) shows data for mercury in fish tissue “found to be above the state’s human health chronic standard.” This Table and other sections in the DEIS fail to present data regarding the “real world” exposure of environments and humans to pollutants—exposure occurs to multiple toxic chemicals not one pollutant at a time. It is the cumulative additive effects of all toxins in the water, air and soil that predict ecosystem degradation and increased risk of human disease. I could not find reference to models that quantified cumulative effects of metals and other toxic chemicals	HU03, MERC03, WR024, WR042, WR071

3394	Synergism among pollutants adds significantly to the increased risk of environmental degradation and human disease, such as lung cancer. (Cancer Research UK, 2013; Frost, 2011) Many persons (men and women) who will be exposed to mining toxic pollutants in the PolyMet proposed project will be smokers. 18.8% of persons in Minnesota smoke (771,300), including 9.5% of pregnant women. Smokers have a 15 times greater risk of lung cancer than non-smokers. But, exposure of smokers to toxic pollutants from sulfide mining (AMD and air pollution) increases lung cancer risk in smokers. Models used to estimate these exposures and risks should be included in this SDEIS	HU05
3396	toxic pollutants may interact synergistically and have a multiplicative rather than an additive effect on risk. No data are presented regarding this well-known “multiplier” or “amplifier” effect when toxic chemicals coexist in leachates and water and air: arsenic, asbestos and radon, among others. (Hubaux 2012) The result of such exposures may not simply be the sum of risks of each toxic pollutant.	HU01
3398	Pollution will include a myriad of toxins, including sulfuric acid, sulfates, and numerous heavy metals. Millions of gallons of polluted seepage from tailings basin and seepage from the mine site will enter groundwater without being treated.	WR021, WR070, WR108
3399	The PolyMet modeling estimates lack foundation in science and common sense and suffer from false assumptions; as such they seriously detract from the credibility of the project proposal. A realistic and coherent review of remediation options is critical but lacking in this SDEIS. (Johnson, 2005)	WR025, WR130, WR189
3400	It is simply unimaginable that PolyMet can manage 526 acres of land covered by 167 million tons of waste rock with plastic sheeting to prevent contaminated seepage, all the while fixing leaks, contending with forest fires, potential catastrophic weather events; etc	PD22
3401	.A Financial Assurance plan is not provided. Such information is one of the main pillars of an EIS proposal, yet it is not currently required by lead agencies until after the EIS is approved. Thus, there is no public comment period available for input into one of the most critical aspects of the PolyMet proposal	FIN13
3403	There are well considered reasons for requiring public comment for the EIS. Why are these reasons not also valid for the ‘permit to mine’ process?	PER01
3404	Lead agencies need to restore the public comment period before proceeding further with the review process.	NEPA07
3405	. PolyMet’s estimate of closure costs of \$200 million and annual maintenance costs of \$6 million are far lower than estimates of the Grand Portage Band of Ojibway that concluded the set aside for financial assurance at the outset should be approximately \$90.5 billion. Such glaring discrepancies must be reconciled and public comment would help inform the issues	FIN05, FIN13
3407	None [Cost Benefit Analysis] is provided despite the critical importance of answers to cost-benefit questions before decisions are made regarding the fate of the SDEIS. Similarly, there are no related analyses such as cost-effectiveness; cost-utility; economic impact analysis or analysis of social return on investment. Such analyses are mandatory for most all major business enterprises or government projects. Their absence here is troubling	SO04
3408	The model used to calculate alleged benefits is seriously flawed and fails to include numerous factors including but not limited to: i.What fraction of wages paid to mine employees will stay in MN?ii.What will be the impacts on jobs of decrease in the price of copper and other metals? iii.What will be the cost of depressed real estate values, lost recreational activities, social disruptions, and unending clean-up of roads, environment, water, and air? iv.When jobs are lost, what will be the cost to MN for unemployment benefits, healthcare, increased crime rates, government infrastructure, and social service costs resulting from mining? (p. 4-325-4-326) v.What will be the economic costs of degradation of the environment short-term; moderate-term and long-term (in perpetuity)? vi.What will be the cost of displacement of other economic activity?vii.What will be the impacts on tribal rights to hunt, fish and gather (1854 Treaty)?	SO04

3409	The SDEIS provides little specific evidence or detail on Polymet Corporation, its history, organization, stability, partners and finances.	PD23
3411	A detailed plan of how Polymet expects to manage this site for 500 years would be interesting to read but of no relevance to reality for creation of such a plan is impossible	SO04
3412	The quantity and quality of analyses of the potential adverse health impacts of long-term pollution on the health of Minnesota citizens is wholly inadequate in this SDEIS	HU01
3413	b.Human Risks: This SDEIS fails to adequately address the human risks of exposure via air, water, soil, skin contact, and food consumption, to increased emissions of highly toxic chemicals and metals including: iron, copper, arsenic, mercury, lead, cadmium, chromium, cobalt, zinc, manganese, aluminum, thallium, asbestos like fibers, radon, fine particulate matter; silica, sulfate, diesel exhaust, among others, which acting singly or in combination with synergistic effects have been shown to cause disease, death and impaired quality of life in humans. (Goyer, 2004; Nriagu, 1988; U.S. NIOSH, 2014)	HU01
3414	There are no data presented to indicate how the PolyMet proposed sulfide mine operation will prevent leaching into the environment and intake into the body of heavy metals which are among the key promoters of oxidative stress in humans that promote metal-induced and metal enhanced formation of free radicals in the body with resulting toxicity and carcinogenicity. (Jomova 2011; Franco 2009)	HU01
3415	What are the projected impacts of 200 to 500 years of such pollution for human health of Minnesotans? The SDEIS is silent on these matters.	HU01
3416	Fine particle air pollution increases morbidity and mortality and reduction of such pollution improves life expectancy. For every 10 microg/cubic meter decrease of exposure to fine particulate matter the estimated impact on life expectancy is an increase of 0.61 years. (Pope, 2009)	AIR11
3417	It is the cumulative effects of air pollutants and toxic chemicals in water, soil, and food, predict the likelihood of human disease. I found no estimates of such cumulative effects in the SDEIS.	HU01
3420	Chemicals in AMD [acid mine drainage] and other toxic pollutants are powerful “oxidant stressors” that are well known to cause DNA damage in the body. These chemicals cause cancers, including lung cancer; neurodegenerative and autoimmune disorders; heart and blood vessel diseases; diabetes mellitus; Alzheimer’s disease and Parkinson’s disease. (Jomova 2011; Franco, 2009)	HU05
3421	The heavy metals arsenic, nickel-chromium and other toxicants such as fine particles, silica, and diesel exhaust among others cause lung and other cancers in workers and the general population. (De Matteis, 2012; Hubaux, 2012; Cancer Research, 2013 ; Martinez, 2011 ) to what extent will the PolyMet mining add to this chemical burden and risks to health	HU05
3423	Reproductive pathology: is caused by metals and toxic chemicals commonly found in sulfide mining operations. Such chemicals cause damage or death to human embryos and fetuses, neurological damage in the fetal and neonate brain; recently researchers at Harvard have discovered the association of air pollution with Autism Spectrum Disorder (ASD) in a major study (>320 cases and >22,000 control subjects) of the perinatal exposure to metals lead, manganese, mercury, and diesel exhaust and other pollutants. (Roberts, 2013) I found no mention in the SDEIS of potential risks to pregnant women regarding reproductive pathology.	HU01
3424	Please extend the comment period to 180 days.	NEPA07

3467	NorthMet Project Effects on Biological Resources. p. ES37. 912.5 acres of wetlands would be directly affected by mining operations. It is not clear how the impacts of operations will be monitored and impacts remediated or mitigated. Also, re the footprint of 912.5 how was this calculated? Did it include “wetland” and “buffer zones” integral to the health of the wetland? Was a standard definition of “wetland” used? If so please reference this.	WET02, WET04, WET07
3468	p.ES40-41. It is stated “.it would contribute criteria air pollutants during construction, mining and processing activities, though they would be less than applicable Prevention of Significant Deterioration emissions thresholds.” This statement is confusing without clarifications and definitions of terms. It is not clear how it was determined that “these pollutants were all found to be below state and federal risk guidelines.” Was a dynamic model used that included variables that affect air pollutants over time? To what extent will the project add to the cumulative burden of air pollutants over the duration of the project? To assess compliance with NEPA such cumulative effects must be estimated. ( p.ES 41)	AIR09
3471	Presence of Wild Rice within the NorthMet Project Area. p.4-32. There is no mention of the quality of wild rice for human consumption and projected changes in incorporation of mine related chemicals in the wild rice plants over time. Will viability of the plants be impaired? Will the wild rice be safe for human consumption? What is the evidence?	WR157
3472	[Section] 4.2.2.1.4 Mercury. p. 4-37. Mercury is only one of many metals that will be leached into the water through acid mine drainage. What are the concentrations of other chemicals? What are the projections for change in them over 20 yrs? 200 years?	WR038, WR107, WR108
3474	Upper Partridge River Water Quality: p. 4-73. The statement: “Most of these water quality data represent grab samples and the frequency of sampling does not allow a detailed assessment of water quality trends, seasonal effects, or relationship to flow. Nevertheless, collectively, the data can be used to generally characterize water quality in the watershed and draw some comparisons....” These two sentences make no sense; the conclusion in sentence 2 is not supported by conclusions in the first sentence..	WR071
3475	Air Quality 4.2.7: 4-252: The PM 2.5 Standard Primary is 12 micrograms/cubic meter not 15 as indicated in this Table (see <a href="http://www.epa.gov/air/criteria.html">http://www.epa.gov/air/criteria.html</a> )	AIR12
3476	6.0; 6-1: Cumulative Effects: The SDEIS fails to abide by the intent of NEPA and MEPA, in part, because the analyses fail to consider the cumulative effects of incremental environmental impacts that in turn have detrimental effects on human health. (U.S. EPA. HIP)	HU03
3477	On page 6-3 top table is listed: “mercury deposition and bioaccumulation in fish.” What are PolyMet’s projections for bioaccumulation of mercury and other highly toxic metals and other pollutants in human beings?	HU01
3478	Since such exposures are cumulative over the life of the subject exposed, seemingly inconsequential concentrations of pollutants must be quantified. The toxicants bio- accumulate and cause human disease and death.	CU14
<b>Sender Name (Submission ID)</b>	Stephen P Jorgenson (54344)	
17462	Six endangered or threatened species will be affected by the mining operations. Some species, such as the Canada lynx, will be directly affected by noise and possible habitat destruction. Others will be indirectly affected. Eleven plant species will be affected by the mining operations. If these species aren't protected then they will possibly go extinct.	VEG01, WI01, WI02, WI05
17463	Mercury could also be found in small amounts in the tailings pit. If this were to contaminate the water, then there would be a significant loss of plant and wildlife. Copper, cobalt, and nickel could also be released, all of which could affect the water-based organisms, if they were allowed to enter the water.	WR108

<b>Sender Name (Submission ID)</b> Stephen P Jorgenson (54344)		
17465	A great number of cultural resources will be affected. Although the Sugarbush camp area will not be affected, other nearby resources will be. Parts of the Laurentian Divide will suffer damage. The Divide has been sacred to the Ojibwe people for centuries. The Erie Mining Company Concentrator Building will be affected due its proposed refurbishment and use. The mining will also happen on land that was ceded to the United States by the Bands under the 1854 treaty. This reserved the right for people to hunt, fish, and gather on these lands. With mining operations affecting wildlife, the damage is unknown.	CR01, CR05
17598	The economy of Minnesota, I think, will benefit from the surge of job opportunities and the addition of a new mining branch. The disadvantages, however, seem to outweigh the advantages.	SO01
17599	During mining sulfur dioxide and other gases will be released. The gases will be released throughout the entire processing of the material. Dust will reduce visibility, taking away natural beauty from the surrounding area.	AIR08
<b>Sender Name (Submission ID)</b> Stephen P. Safranski (43108)		
11448	Even with its current scarcity and concern over the environment, the prospect of a project that would impair our clean water resources for 200 to 500 years is significant.	WR115
11451	the potential costs of this project are incalculable.	FIN05, FIN10
<b>Sender Name (Submission ID)</b> Stephen Rossiter (44170)		
8127	The public (i.e. the financial assurance program) should receive much more money up front.	FIN05
8131	Is [Long-term maintenance of the Category 1 Stockpile, including repairing erosion and removal of vegetation] included in the planning of the financial assurance package and how many years is “long-term”?	FIN05
8133	Both Native Americans and low income people rely on a clean natural world for food and water. It would be unjust to force them to accept the risks [of pollution] while others receive the financial benefits.	SO02
8145	Most economic benefits would go abroad while Minnesotans get a few low paying jobs over a few years but the permanent potential for pollution.	SO01
8158	due to carcinogenic nickel dust and other toxic metals that would be present at the sites, I ask that the Minnesota Department of Health do a Health Risk Assessment for the safety of mine workers.	HU04
8160	The SDEIS contains inadequate quantification of unintentional seepage from the mine site that could make its way beyond the mine perimeter thru the groundwater... Minnesota is a very water rich area and attempting a project that requires containing and managing all that water to prevent unacceptable pollution seems foolhardy.	WR089
8161	estimates of the rate of groundwater flow used in the SDEIS seem to be inaccurate and underestimated.	WR052, WR071, WR091
8167	A recent map of fault lines in the project area suggests there may be more routes for groundwater to move thru than acknowledged in the SDEIS... The SDEIS says on page 4-47 that at the mine site “the hydraulic connection between surficial aquifer and underlying bedrock underlying is weak.” But that assertion is not quantified in a meaningful way. Does “weak” mean effectively zero, or, overtime, will the polluted seepage add up to a significant level?	WR010, WR011, WR012, WR014, WR087, WR090, WR168, WR169, WR179

8169	Were the locations used in the water quality models the same locations that will be considered legal compliance points by the EPA (dilute locations downstream or at the property boundary)?	PD03
8177	the SDEIS claims that Hoyt Lakes treats [for] manganese before distribution to residents. But even if the city can remove the manganese during treatment, who will pay for that treatment? And what about the water quality for nearby residents who operate independent residential wells...?	SO07, WR041, WR128, WR142
8186	the section 404 permit [should] be rejected... Only 27 [acres] of mitigation is currently planned while ~8000 [acres] will be directly or indirectly impacted. Furthermore... current mitigation/restoration/reconstruction abilities are wholly inadequate to functionally replace [peat] wetlands... the plan calls for mitigation to be based on future evaluations [but there are no records of such evaluations]	COE01, COE02
8192	[The mine site would destroy lynx dens and disrupt] 2 of the 13 remaining habitat corridors that allow Lynx to move through the landscape and maintain a more genetically diverse (healthy and thus resilient) population.	WI01, WI02, WI03
8204	parts of the project are designed for 1 in 100 or 1 in 25 year precipitation events, yet these sites will be hazardous for at least 200-500 years! ... No plans or provision for mitigating an unexpected/accidental release are in the SDEIS... For each part of the project, the EIS should include how that part is designed to cope with extremely heavy rains, what chemicals would be released in the case of an overflow, and alternatives that would protect against heavier rains.	PD22
8206	Will [the reject concentrate evaporation pond] be adequately lined? How is this pond protected against extreme rain events? I did not see a discussion of this important pond within the SDEIS.	PD03, PD22
8208	A cumulative effects analysis for mercury in the St. Louis River is not in the SDEIS but it should be. Mercury releases (especially if less than 99.37% of tailings seepage is captured) could affect the fish that would be consumed by the Fond du Lac tribe and the St. Louis estuary ecosystem.	HU03
8211	The assumption that 99.37% of seepage (all but 21 of 3,380 gallons) from the tailings pile will be captured is highly suspect. [There is no evidence to support this claim]... The EIS should include an analysis of the consequences if the percent captured is lower than 99.37%, perhaps 50% or 80%	WR018
8215	Besides the no action alternative, the SDEIS does not compare any alternatives... Other action alternatives that should be analyzed are: more intensive/durable linings underneath and covers over the waste pile and tailings, starting reverse osmosis treatment in year 1, and layouts that minimize acreage of wetland loss.	ALT06, ALT07
8218	It is my opinion that if the science behind something is good, it can be made plain to the general public. In contrast, the science in this entire SDEIS has been anything but clear and simple. For nearly every important point in the SDEIS, the only reference cited is from PolyMet/Barr Engineering. It appears that the lead agencies have accepted PolyMet's assumptions at face value, rather than using their own analyses and judgment.	NEPA15
<b>Sender Name (Submission ID)</b> Stephen Snyder (46084)		
10767	The SDEIS does not adequately address a scenario wherein the party that proposes a major mining project has never before operated a mine. PolyMet is a company that has never generated any revenue or income let alone operated any mine. It is just a front organization for the foreign money that is behind this project. ...The assurances made by a front organization should be given no weight. ... The environmental review should demand commitments from officers of the actual companies that will be operating this controversial mine.	PER02

<b>Sender Name (Submission ID)</b> Stephen Snyder (46084)		
10769	The SDEIS does not adequately address the impact on the nearby Boundary Waters Canoe Area Wilderness if the ground waters in part will leach in that direction. ...Since the route of the ground water flowage is only approximated from the surface flows, the SDEIS fails to adequately address other potential consequences. The wilderness character of the BWCAW is a fundamental asset to Minnesota and any potential impact on its watershed must be thoroughly addressed.	WR080, WR111
10773	The SDEIS does not adequately address the material risks that are presented by the proposed mining of base minerals from sulfide-bearing ores in the wet environment of northeastern Minnesota. Models based on copper-nickel mining in dry environments have no application here. This issue is particularly important because the SDEIS is based on inaccurate projections of surface water flow. Exposure to water is the number one risk here, yet the SDEIS itself in its current form only addresses this issue within its margins of error. There also has been no attempt to study the actual ground water flows below the proposed tailings pond.	WR003, WR025, WR026, WR052, WR060, WR071, WR081, WR086, WR091
10778	The long-term maintenance required during and almost forever after for this proposed mine presents an impossible modeling challenge ... The agencies may be able to model the next 50 or maybe even 100 years with some confidence, but it is ludicrous to think that anyone could prepare an adequate model to predict how the massive byproducts of this proposed mining project will be maintained for the next 500 years. ...how can we evaluate the future environmental degradation that will result from this project if it is approved?	PD29
<b>Sender Name (Submission ID)</b> Stephen Talty (17507)		
1975	the water supplies that trickle down toward the Great Lakes where our water source comes from that is of concern. To risk contamination of water supplies that will affect so many people in so many ways-from abundance of wildlife to fishing to drinking water is irresponsible.	LU06
2101	As you are fully aware of the hazards associated with this type of mining-hundreds of years of pollution and destroying of ecosystems and water supplies, please know that we hope this project will not move forward.	WR195
<b>Sender Name (Submission ID)</b> Steve Adams (41841)		
2047	a project that will contribute toxic metals and sulfate pollution to the St. Louis River watershed -- for 500 years!	WR115
2048	The threat that this project poses to the environment, wild rice, and non-mining-related uses of the land should be enough to nip it in the bud.	LU06
2049	The mining industry's record of evading its fiscal and environmental responsibilities is shameful.	FIN01
<b>Sender Name (Submission ID)</b> Steve Braker (15747)		
11989	...fails to guarantee water quality	WR111
11998	...fails to provide safeguards for things going wrong...fails to provide examples of working sulfide mind operations which hae not caused pollution	PD22
12000	...fails to provide enough local jobs to even consider an economic effect	SO06

<b>Sender Name (Submission ID)</b> Steve Clemens (7020)		
444	I am strongly opposed to the proposed Poly-Met mine because of the severe threats to clean drinking water as well as potential pollution to our rivers and Lake Superior.	WR042
449	Short-term (20 years) profits and jobs are a poor risk in face of potential (and probable) long-term environmental damage.	SO01
<b>Sender Name (Submission ID)</b> Steve De Bock (18201)		
13434	It's going to be great for jobs our economy in Minnesota, Northeastern Minnesota, Minnesota in general, and the whole nation, quite frankly... I urge everybody to get behind this and finally let this thing go through	SO10
<b>Sender Name (Submission ID)</b> Steve Debock (18359)		
14652	We embrace this project because of the hundreds and hundreds of new jobs that PolyMet will create either through direct employee instruction or new jobs with their vendors like us.	SO10
<b>Sender Name (Submission ID)</b> Steve El (19992)		
1625	[The SDEIS] claims that since the whole population [of Canada Lynx] in the mine area (perhaps 200 or fewer animals) wouldn't be lost but rather just a few, there is no problem. However, decades of conservation work around the world indisputably show that loss of habitat causes species to go extinct.	WI01, WI02
1626	The SDEIS is explicit (Chap 5-122) about pollution of the Partridge River continuing to be problem "in perpetuity." That is, forever. How can we possibly believe that Polymet will be able to take responsibility for treatment of this pollution in that timescale?	WR035, WR037
14843	I would also add that the area in question is home to an already at-risk population of moose. Moose, of course, depend on wetlands, some 8,000 acres of which will be destroyed. Promises of restoration, even should they be reliably fulfilled, will not come nearly in time to mitigate the destructive effects on the moose population.	WI01, WI02
<b>Sender Name (Submission ID)</b> Steve Gildersleeve (6060)		
1004	Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining.	WET24
1005	The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat -- much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals."	WI01, WI02
1008	According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different? The SDEIS supplies no answers.	PD01
1009	Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest.	LAN01, LAN02

<b>Sender Name (Submission ID)</b> Steve Kinney (54803)		
18157	The exhaustive SDEIS deals with potential challenges intelligently and thoroughly... We have trusted our state and federal scientists, permitting experts and enforcement officials to do their work honorable and completely. I believe they have done the right thing by the people of Minnesota in the past, are doing so now, and will continue to keep our environment clean in the future as science evolves and protective laws and regulations advance.	NEPA16
18158	PolyMet would bring to the Iron Range... hundreds of jobs, millions of dollars in taxes -- including much-needed educational funds -- investment in spin-off industries.	SO10
18159	I have faith that permits to protect our land, water and air will be firmly and fairly enforced... I applaud the work state and federal agencies have already done in closely examining PolyMet's NorthMet project. I trust them to do the right thing and let PolyMet uncover valuable minerals while preserving a beautiful environment that attracted us to a place we now call home.	NEPA16
<b>Sender Name (Submission ID)</b> Steve Koschak (57335)		
18462	not all of the polluted water will be captured for treatment. This is what PolyMet calls minimizing the water pollution in their marketing rhetoric. How is the SDEIS going to address using an antiquated tailings basin which is a leaker? Ten percent of the volume of water that there will be, the waste will not be going into any type of discharge pond. It will not be reclaimed. It will be let go out into the environment. ... Why does the SDEIS not provide a solution to this situation?	WR018, WR070, WR090, WR108
18467	there is no plan for events or failures of PolyMet's water treatment system. It provides no details for what happens in the event of catastrophic accidents or failure for the system to operate for 500 years, during which polluted water is discharged. Daily operations are planned to treat some 6.2 million gallons of water daily. What is going to happen with broken pipes or tailings basin and human errors? ... This mining plant is designed for a 100-year storm, and given the climate change, this design is lacking at best. Scientific studies suggested this facility should be designed for a 500-year storm	PD22
18468	The SDEIS provides no assurance or details on the impact of water quality, on wildlife or on human health if the treatment system fails or there is a breakdown, which is inevitable.	PD22
18469	I have another concern about the water quality analysis and how the samples and the studies were done. One of the water quality testings that they did was done in a dry season. There was very low water flow and they based their figures on low water flow, one of the lowest in decades, and this is what they based their study on. So, we'll have outflow from the water flow and waste not being adequately adjusted to reflect normal water conditions.	WR003
18471	there is a lack of information regarding mercury contamination of fish and ultimately methylmercury in humans. There is an area of homes near to six operating taconite mines and there's already an alarming concentration of mercury and other pollutants.	MERC02, MERC03
18473	There is a lack of alternatives to the probable permanent destruction of some 8,263 (phonetic) acres of land, with some 918 acres being very high-quality irreplaceable wetlands in the St. Louis River watershed. There is no plan to compensate for thousands of acres of wetlands that would be indirectly harmed.	WET01, WET20

18475 The trade that is to take place with the Land Exchange will be a violation of the Weeks Act (phonetic). The Weeks Act (phonetic) was established to prevent open pit mining on federal land, and this land being the Superior National Forest. This trade and this exchange is going to be setting a precedent to other mining industries across the country, not only in the northern part of Minnesota, but anywhere in the United States where you have a federal park or a federal forest, anywhere where the federal jurisdiction is involved with the land, and all of a sudden the industry comes in and decides they want to start an open pit mine. The land owners and the general public is in jeopardy.    LAN02

18476 the UMD Business and Economics Report (phonetic), which this DEIS was based upon, is flawed because it does not address any associated costs of non-ferrous mining, it is only addressing the benefits. Would you ever build a home without making a list of benefits and the costs, both monetarily and otherwise to you? To come up with a mine plan that weighs heavily on economic gains and determines job gross output, but without weighing other job losses and other economic losses in the area, such as tourism, which is dependent on clean water, clean air and a national forested landscape, and is incompatible with mining? This replacement of economic activity, such as tribal life, fish and hunt, under the 1854 Treaty is flawed at best.    SO04

18477 This model does not take into account the loss of environmental lands, the loss of wetlands, wildlife, wildlife habitats, loss of infrastructure due to mining, and the costs of up and down economic industry related to the inflow and outflow of mining employees. What will be done to offset the loss of real estate value for land owners due to the possible sulfide mine? Present day values have already plummeted to the exploratory sites.    SO04

18479 What are the costs of the federal land? 600 acres of federal lands are going to be gated and then fenced off. What are the costs to the local communities and costs of unemployment benefits and increased claims and other social problems? What is impact of the loss of jobs when the copper prices fall?    SO04

18480 Other studies in the SDEIS, in Section 52-82, they mention nothing about people that live on Birch Lake, recreation on Birch Lake, how a business profits on Birch Lake, all they have in reference to anything on Birch Lake are two campgrounds which are federally owned...There are three resorts, two boat house operations and one canoe operator, and hundreds of private lake homes that are going to be subjected to not only the sound, but the impact of the sound of the air blasts of the sulfide mine.    SO04

18482 Our business caters to 1500 plus resort guests per season and these guests travel down beautiful Birch Lake seeking fish, wildlife, peace and serenity. Where we are now going to be impacted by the sound of blasting. The blasting sound will travel that far and the air blast contours and the air blast effects will be affecting the visitors to the area.    N05

<b>Sender Name (Submission ID)</b> Steven George (37819)		
11190	When the Polymet plan was first proposed, the “Scoping Report” said that the EIS had to evaluate “if all tailings will need to be managed in a completely lined basin.” The SDEIS must be redone to analyze the alternative of a completely lined tailings basin. The lined tailings basin alternative should avoid wetlands and streams.	ALT07
11192	The Polymet SDEIS claims that the tailings piles won't cause pollution (page 5-159). Polymet says the project will increase seepage at the LTV tailings dump from 2,202 to 3,380 gallons per minute. The SDEIS claims that with the use of pumps, all except 21 gallons per minute will be contained, which would be a 99.37% collection rate... this collection rate would be unprecedented. The SDEIS doesn't name a single unlined tailings pile that meets these almost perfect results with the use of pumps. The SDEIS must be redone to analyze water quality outcomes if the tailings pile collection rate is not what Polymet claims.	PD08, WR018, WR020, WR090
11198	in Figure 4.1.9 [of the Draft EIS], ...there are at least three streams that ran under the LTV tailings site. One of those streams runs right under Cells 1E and 2E, where they plan to dump the Polymet tailings, and then into Spring Mine Creek. Water is likely to drain through filled over streams as these are the historic drainage routes. Spring mine Creek is already impaired for aquatic life as a result of past mining and has excessive levels of sulfate, aluminum and mercury. (SDEIS, p. 4-122, 4-238). The SDEIS assumes all tailings wastewater will seep to the north side where the pumps will be. The SDEIS must specifically analyze impacts on water quality of seepage that would escape following historic stream drainage beneath the tailings basin.	WR056, WR081, WR104
11202	SDEIS doesn't have a single word addressing the possibility that fractures beneath the tailings site would transport pollutants...Existing tailings seepage already exceeds groundwater standards and on the LTV site, adjacent to the tailings, the SDEIS has documented that Area of Concern #8 has a plume of pollution propagating through fractures. (SDEIS, p. 4-12). The SDEIS must anticipate that tailings contaminants will propagate through fractures and clearly disclose the impacts this leaching through fractures will have on surface and groundwater quality.	WR010, WR012, WR061
11206	Do we really expect Polymet to still exist and be paying for the cleanup and monitoring of the wastes in 500 years, or even 100 years for that matter? Who will this burden fall on?	FIN01
11207	Polymet's plan is completely inadequate in assuring protection of the environment and proper treatment and cleanup. ... I am asking the agencies involved to reject the SDEIS as inadequate and deny Polymet a state permit to mine.	PER35
<b>Sender Name (Submission ID)</b> Steven Graupman (21784)		
8951	I am very concerned with protecting our clean water, but I believe Polymet's plans to mine sulfide ore in northeastern Minnesota as described in the Supplemental Draft Environmental Impact Statement will. I believe that the SDEIS is sufficient and SHOULD be approved, because it details how new mining and processing techniques will be more than sufficient.	WR190
8952	PolyMet would provide many needed jobs and would finally end an economic depression for that area.	SO10
8953	Birds that depend on fish and other aquatic organisms for food might be affected, but their numbers will rebound after mine reclamation.	WI01

251	Is any job considered in that calculation, or does it have to be full-time (40+ hours weekly) permanent employment?	SO06
252	How does the DNR calculate the proposed economic impact of the jobs based on the limited information and description provided by PolyMet.	SO04
255	I am concerned by the lack of details regarding the economic impact analysis.	SO04
256	The claims regarding the number of jobs to be provided by the project are vague and lack any effort at substantiation.	SO04
257	The study needs to be extended to include number, type, duration, and pay ranges for those jobs, as well as an analysis of the economic impact to the area surrounding the proposed sites.	SO04
<b>Sender Name (Submission ID)</b> Steven Jorgens (4220)		
10209	I have a very large interest in seeing mining and jobs to return to that area.	SO10
10210	Polymet partnering with GE to have a reverse osmosis system is also very impressive.	WR190
<b>Sender Name (Submission ID)</b> Steven Kraemer (2971)		
12326	I have read that acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Why won't it do the same in the Arrowhead Region of Minnesota?	PD26, WR023
12328	Why incur major risks and costs from sulfide mining which ultimately might far outweigh the short-term job creation benefits of the mine?	SO02
13458	I have read that acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Why won't it do the same in the Arrowhead Region of Minnesota?	WR023
13459	But, why incur major risks and costs from sulfide mining which ultimately might far outweigh the short-term job creation benefits of the mine?	SO01
<b>Sender Name (Submission ID)</b> Steven L Losh (46879)		
8597	The SDEIS shows that Polymet has done a thorough job of addressing these concerns. They have characterized in detail both geology and waters (both surface waters and groundwater) throughout the affected area:	WR190
8600	Although there can always be more information gathered and added to the models (e.g., bedrock permeability, which is likely very low, beneath the tailings basin), I am satisfied that the proposed action will remedy environmental impacts to an acceptable level.	PD28
8602	A double liner at the hydrometallurgical plant site will protect groundwater and surface waters from leakage from that source.	PD28
8604	During mining, Polymet will capture runoff from critical areas such as the waste piles and tailings basin, and route that water through state-of-the-art treatment facilities. Much of the water will be recycled on site, but the water that is discharged will for the most part be of better quality in terms of substances of concern (such as mercury and sulfate, as well as acidity) than the natural waters at the site.	PD28

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Steven L Losh (46879)		
8605	The proposed strategy for capturing groundwater that would otherwise exit from the tailings area – a cutoff wall to bedrock augmented with ditch and collection wells – appears adequate for ensuring water quality. The results of groundwater flow modeling show that, for reasonable conditions, discharge of waters of elevated concentration of various evaluated substances will be minimal to negligible.	PD28
8606	In the case of aluminum (one of the two substances potentially released at excess concentrations), the source of the excess substance is an already-existing reservoir that will be used in reclamation; in the case of lead (the other substance at potentially excess concentrations), the infrequent exceedances will be due to variations in water hardness rather than to actual elevated discharge of lead. Overall, as long as the proposed actions in the SDEIS are followed and monitored, water quality should not be adversely impacted.	PD28
8608	From the SDEIS, it appears that adequate steps will be taken to ensure water quality well into the future. Monitoring wells will be placed outside the perimeter of the tailings basin to further safeguard water quality, and can guide further remediation should it be necessary during and after mining.	PD28
8609	After mining is finished, Polymet’s reclamation plan appears adequate – among other things, the company will backfill pits with otherwise reactive waste rock to submerge it in water, which will isolate it from oxygen and prevent breakdown of sulfide minerals, cap the tailings area with bentonite to minimize oxidation and leaching of tailings, and continue to be responsible for meeting applicable water quality regulations for any water that does flow off site.	PD28
8610	The report is thoroughly researched and vetted by State and Federal regulatory agencies, which appear confident that the Northmet mine will meet if not surpass water quality regulations, and that environmental impacts of all the other aspects of the mining operations will be adequately remedied by Polymet’s proposed actions.	PD28
8611	While the mine and related operations will clearly affect the local environment, this impact will be dealt with in a responsible, sustainable way that can serve as an example to the mining industry worldwide.	PD28
10429	Polymet and the DNR... conducted long-term tests on the oxidation behavior of ore and waste rock containing various amounts and types of sulfide minerals, specifically to evaluate the potential for generation of acid mine drainage and release of heavy metals during oxidation at the surface. Based on these tests, they designed a strategy for storage of various kinds of sulfide-bearing rock that, in conjunction with runoff and groundwater collection and treatment, can be expected to adequately forestall acid mine runoff and leaching of heavy metals into groundwater or surface waters. This is a key concern regarding environmental impact of the proposed action, and Polymet is using a responsible, science-based approach in addressing it.	PD28, WR190
<b>Sender Name (Submission ID)</b> Steven M Kramer (54894)

580 Polymet comes to us possessing the technology to conduct non-ferrous mining at Northmet as well as the technology to protect the environment during the mining process. Reverse osmosis will treat the waste water to remove sulfides that meet the strict wild rice standard and not cause damage to water runoff at the mine site or in rivers and lakes, all within the standards set by the EPA. All of these technologies have been tested and are effective. Polymet possesses all these technologies and is committed to put them to use in a way that they can mine in a cost-efficient manner and protect northern Minnesota's environment at the same time. PD28

581 Polymet has demonstrated they have the technology to mine Northmet in full compliance with guidelines as established by the Environmental Protection Agency, and will provide funding to continue these environmental processes long after mine closure. They have committed to leave the Northmet site cleaner than it is now and in full compliance with EPA standards for as long as it takes. PD28

**Sender Name (Submission ID)**    Stewart Crosby (11339)

274 To sum up my concerns, I am not confident that the proposed water treatments will work over the timeframe needed to protect existing surface and subsurface water. WR035, WR129

1628 I am opposed to any copper-nickel mining as proposed because I do not believe adequate protection of the surrounding landscape can be guaranteed and I do not believe Minnesotans should have to take such a risk for the benefit of a small number of corporations. SO02

**Sender Name (Submission ID)**    Stewart Mills (18112)

13476 We have tremendous opportunities to grow jobs, to grow prosperity, and grow our economy not only in this area but all across Northern Minnesota, because we have a very interconnected economy. ..project is so well thought out and is so well engineered, and the oversight is so extraordinary, there is absolutely no reason why we cannot have both economic prosperity and clean water so we can hunt and fish and not only enjoy the economy but also enjoy ecology SO10

**Sender Name (Submission ID)**    Stu Astleford (18283)

13994 I believe that the water quality degradation is permanent to the environment and it is not worth polluting a pristine environment that future generations can enjoy for years to come. WR195

13995 ...it is just too risky to put a mine so close to the Boundary Waters, where it will do permanent damage, in my opinion, for generations to come. WILD02

**Sender Name (Submission ID)**    Stu Farnsworth (50049)

13010 The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. FIN10

**Sender Name (Submission ID)**    Stuart Blee (38496)

13576 Polymet has met the State and Federal requirements regarding what they will do to safeguard the water and air. PER34

<b>Sender Name (Submission ID)</b> Stuart Chastain (47659)		
7744	I believe that the proposed NorthMet copper/nickel mine is important both for its economic benefit to Minnesota and for its strategic/geopolitical value to the United States.	SO10
7770	Polymet's proposal to ensure there is no long-term seepage of sludge into aquifers is not adequately redundant. The redundancy of the actual sludge barrier is more important than any long-term financial arrangements to cover environmental damage.	WR019, WR130, WR132
<b>Sender Name (Submission ID)</b> Sue Bowman (18108)		
3355	We know how to mine in Northeastern Minnesota. And we do under the strictest standards. If we don't utilize this great resource of mining copper and nickel in Minnesota, these minerals will continue to be mined in places around the world that have little or no environmental regulations whatsoever causing massive pollution to the earth.	SO10
13473	PolyMet will bring some 360 direct jobs and hundreds more spinoff jobs to the area of the state that needs them.	SO10
<b>Sender Name (Submission ID)</b> Sue Carver (15750)		
13154	the polymet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and water quality for hundreds of years, if not forever.	WR115
13155	Recent news that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
13159	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
13160	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows Poly Met to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR022
13161	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.	WR010, WR012, WR061, WR069, WR168
13162	The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles.	GT07, GT15
13164	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17
13165	The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down.	WR180

<b>Sender Name (Submission ID)</b> Sue Carver (15750)		
13166	The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.	WET12
13168	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.	WR023, WR060, WR181, WR182, WR195
13169	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN13
13170	The Poly Met SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189
13894	I just don't see how it can possibly benefit us. The ore is going to be taken out and given to China. The companies that -- are owned by foreign nationals, who will benefit from the money earned.	SO06
13895	And a few Minnesotans in the northern part of the state will have jobs, but the jobs will be short-term.	SO02
13896	I just can't see any benefit for us, except the long-term pollution that is going to happen that we are going to have to clean up and use our tax dollars for. And the loss of the pristine environment that is up there in the northeast section of our state	SO01

<b>Sender Name (Submission ID)</b>	Susan Nordin (18365)	
5446	[The requested supplemental Health Impacts Assessment should include:] Health risk assessment for on-site workers at both the PolyMet mine and plant, reflecting both cancer and non-cancer risks.	HU04
5447	[The requested supplemental Health Impacts Assessment should include:] Assessment of cumulative mercury risks, including hazard levels in bodies of water that are already impaired for mercury in fish and risks posed by mercury concentration downstream in the St. Louis River.	MERC03, MERC10
5448	[The requested supplemental Health Impacts Assessment should include:] Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis and an appropriate “lifetime” exposure.	HU05
5449	[The requested supplemental Health Impacts Assessment should include:] Assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice.	HU01
5514	We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Risk Assessment be prepared under the guidance of the Minnesota Department of Health.	HU01
5851	The PolyMet SDEIS fails to analyze health risks to workers who would work on -site at the PolyMet mine or plant...	HU04
13054	There are significant concerns relating to human health that need to be thoroughly examined before such a project is allowed to proceed. These have to do with toxic pollutants related to sulfide mining, which are known to affect human health such as methyl- mercury, lead, arsenic, manganese, air pollution and asbestos.	AIR10
13063	We ...expressed concern about the lack of information relating to human health impacts within the PolyMet proposed project's SDEIS... Specific information about toxic pollutants such as mercury, asbestos and air pollution are not fully and clearly disclosed within the SDEIS... The data relating to the amount of mercury and methyl-mercury appears incomplete.	HU01
13073	...the proposed Poly Met copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water... [The SDEIS] fails to adequately assess important risks to human health from pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the SDEIS is particularly troubling.	HU03
13079	The information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of mercury and other air pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	AIR05, WR017, WR018
13083	The PolyMet SDEIS ...provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and the carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water.	HU01
13087	The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice, or game species where pollutants may bioaccumulate.	HU01
13092	The SDEIS should include a Health Impacts Assessment... including: a description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges based on reliable toxicity and epidemiology data.	HU01

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Susan Nordin (18365)		
13093	The SDEIS should include a Health Impacts Assessment...including: an assessment of health risks resulting from fossil fuel combustion, including impacts of burning coal to meet mine energy demands.	HU01
13097	The SDEIS should include a Health Impacts Assessment...including: an assessment of potential health impacts on residential wells from tailings seepage and cumulative health risks from contaminants to other drinking water sources.	HU01
13100	The SDEIS should include a Health Impacts Assessment... including: health risk assessment for on-site workers at the Poly Met mine and plant, reflecting both cancer and non-cancer risks.	HU04
13104	The SDEIS should include a Health Impacts Assessment... including: assessment of cumulative mercury risks, including hazard levels in bodies of water that are already impaired for mercury in fish and risks posed by mercury concentration downstream in the St. Louis River.	HU01, MERC03, MERC10
13106	The SDEIS should include a Health Impacts Assessment... including: assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis and an appropriate "lifetime" exposure.	HU01
17514	Without...a health risk assessment, communities affected by the PolyMet proposed project are denied the opportunity to make a fully informed decision about this project. We believe the lack of such a health assessment renders the current SDEIS incomplete and insufficient.	HU01
17515	We respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks in the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Risk Assessment be prepared under the guidance of the Minnesota Department of Health.	HU01
17516	Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as infants, children and adults is a significant public health concern in Minnesota... We are aware that many of the bodies of water downstreams of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue.	MERC03
17517	Other mine facilities that release mercury and/or sulfates increase the cumulative risk of methylmercury bioaccumulation. The lower reaches of the St. Louis River, including the St. Louis River estuary, are known to contain particularly high levels of mercury.	MERC10
17518	The PolyMet SDEIS fails to analyze health risks to workers who would work on-site...and fails to assess impacts of tailings groundwater seepage on nearby residential populations.	WR041
17519	we...request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate air pollution emission and deposition, water pollution seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project.	AIR02, MERC08, WR033, WR060
17520	We further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the Minnesota Health Department.	HU01
17521	The SDEIS should include a Health Impacts Assessment... including: ...assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice.	HU01

9750	It seems likely that contamination will occur and that cleanup, if even possible, will take a very long time. That is not what I consider a stance for an agency that is supposed to protect our natural resources, especially water.	WR070, WR195
11465	The pursuit of money seems to drive many decisions, but it cannot be our number one consideration, if we want to continue living on this planet.	SO01
18591	I worry about wetland destruction, contamination of the water entering the watersheds to Lake Superior	WR111, WR112
18595	Harm to the ecology of the Superior National Forest is a violation of Indian treaty rights.	SO02
<b>Sender Name (Submission ID)</b> Susan Schneck (54134)		
16028	There are other ways to grow our economy safely with respect to the environment.	SO02
<b>Sender Name (Submission ID)</b> Susan Schurke (18080)		
3196	I'm very concerned about the financial assurance in the SDEIS. Who can ever figure out what the cost of the cleanup will be for 500 years. Who can ever figure out what the cost of the cleanup will be for 500 years. Who will pay this? Who -- what is the amount they could possibly -- that can be put forward to replace something that can never be replaced; our clean water that we desperately need?	FIN01, FIN05
3197	The proposed sulfide mine and tailings dump would pollute streams, wetlands and drinking waters for hundreds if not thousands of years.	WR115
3198	I request that common-sense alternatives like putting liners under the permanent waste-rock pile and the tailings piles be analyzed before the EIS can be finalized.	ALT10
3199	The vast majority of wetlands mitigation is outside the Lake Superior Basin and there is no plan to replace most of the indirectly-affected wetlands.	WET01, WET03
3200	I am concerned that cumulative impacts of the PolyMet Project, and other existing and expanding mines, would impair wild rice, fish and aquatic ecosystems and violate the treaty rights of Indian tribes to hunt, fish and gather in the Superior National Forest lands ceded to the United States.	CU11
3201	I'm concerned that PolyMet's water and air pollution from mine pit, waste rock and tailing piles, and PolyMet's excavation and changing hydrology and wetlands would increase mercury loading to wetlands and streams and increase mercury bioaccumulation in fish putting human health at risk.	MERC02
3202	I'm concerned that PolyMet's discharge would increase carcinogenic arsenic in Hoyt Lake's drinking water and release arsenic, lead and manganese, chemicals that impair brain function, into the ground water.	HU05
3203	I am concerned that PolyMet's water pollution from the permanent mine site waste-rock pile would need treatment for at least 200 years and pollution from the tailings piles would require treatment for at least 500 years.	WR035

13313	I believe that issues that haven't been analyzed at all in the SDEIS, like impacts on workers' health, be studied before the EIS is finalized.	HU04
<b>Sender Name (Submission ID)</b> Susan Solterman Audette (43313)		
15754	Northern Minnesota needs economic development that does not risk polluting surrounding surface waters with a mix of acid and heavy meta	SO01
15755	PolyMet, as proposed in the Supplemental Draft Environmental Impact Statement, creates a new ongoing water pollution source in the headwaters of the St. Louis River, the largest American tributary to Lake Superior, which contains 10 percent of the world's fresh water. PolyMet's own data show it is expected to generate water pollution for more than 500 years.	PD03
15756	Treating the polluted water requires a complex and untested mechanical system of pumps, pipelines, and filters, which would need to operate indefinitely. The plan does not consider the possibility of mechanical or human failure. PolyMet has no contingency plan for predictable mechanical problems such as pipeline failures, extreme weather or human error. These considerations remain unaddressed in the SDEIS and should not, ultimately, be overlooked by our State's designated environmental managers and stewards.	GT10
<b>Sender Name (Submission ID)</b> Susan Soule (38413)		
13644	The idea that we would risk centuries of pollution and the staggering costs of cleanup (provided that is truly possible) to one of our most basic and essential resources for a few hundred jobs lasting two or three decades is beyond belief.	SO01
13645	WATER is a precious resource. Besides being the foundation for much of Minnesota's recreational industry, it is essential to the life of our entire ecosystem from the lowliest life forms to human beings.	WR111, WR195
13646	The idea that we would allow Polymet and its affiliates to do this, with their horrendous track record, is equally terrible.	FIN01
<b>Sender Name (Submission ID)</b> Susan Stanich (11627)		
2311	We will be left with thousands of acres of ruined land and water, ruined for 500 years into the future. Glencore/PolyMet says it will put into place its "reverse osmosis" plant in 40 years, to clean things up. Even if such a thing would work, and the SDEIS doesn't appear it would, the company's history indicates that its more likely to drop out of the picture before then, leaving us with ugliness, illness, poisonous sludge and no money or ability to deal with it.	SO02, WR037, WR128, WR143, WR144

15907	...I feel the offshore companies should not be allow to mine on US soil. They too easily escape the responsibility for proper clean up after the [environmental damage] has occurred.	FIN04
15908	Please show me a study which displays the demand for copper and the need to destroy our ecology for this myopic enterprise.	NEPA03
15909	Jobs? the few actual jobs for the locals is far outweighed by the damage to the ecology for what 20 jobs?	SO01
<b>Sender Name (Submission ID) T. Chandler (44182)</b>		
12727	Many costs associated with this project have not been addressed: costs of health effects due to increased pollution in water and air, depressed real estate values (which has already occurred in the area), costs of future perpetual cleanup which will be born by taxpayers (this site will end up as a Superfund site costing billions of dollars), costs of lost influx of revenue (new residents/tax base, tourists), costs of road and other public infrastructure maintenance, costs of abandoned buildings/homes when the mining company stops operations, and all other costs that will be born by taxpayers. These and all other external costs must be calculated and defined in the SDEIS.	SO01
12729	This mine will result in hundreds of acres of permanent habitat destruction. Important natural resources, from clean ground water to animals such as moose and lynx, will be permanently affected or destroyed.	WI01, WI02, WR111, WR112
15367	No company or government action has ever prevented water contamination from sulfide mines from occurring. No company has ever been able to completely clean up the contamination once it occurs nor is it possible for any company to continue with cleanup for the hundreds of years remediation would take.	PD26, WR023
15368	The SDEIS does not address how [water] contamination will be prevented, nor does it adequately address how clean up of the certain contamination will be handled. The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged.	PD03
15369	The SDEIS does not adequately address the prevention of air contamination from dust, particulates, emissions from machinery, and emissions from power generating plants.	AIR11
15370	The SDEIS does not address how on-site or off-site spills or leaks of fluids, ore and waste materials and other accidents will be handled to prevent contamination.	HAZ01
15373	It is clear that sensitive receptors, including wildlife, residents, and tourists will be affected by the blasting and will permanently avoid the area, not just avoid the area "at times."	N05
15374	The SDEIS fails to provide details of how the monitoring and maintenance of pollution prevention measures would be handled for the hundreds of years needed to Minnesota Rules 6132.3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment.	FIN11
15376	The stockpile covers and liners are not adequate to prevent migration of contaminants to air, surface water, and groundwater. The SDEIS fails to address how the pollution prevention measures would be maintained over the hundreds of years necessary to prevent contamination.	WR127, WR138
15379	Mining companies are notorious for abandoning projects once the ore is extracted, leaving cleanup to the taxpayers. ... If this mining operation is allowed, it will end up as a Superfund site that will take decades just to reach the remediation stage and will cost the taxpayers of this country billions of dollars.	FIN10

<b>Sender Name (Submission ID)</b> Tanya Beyer (17137)		
3459	Last night my friend and I went to the hearing in Duluth, a first of three around Minnesota, about the proposal to let a big mining conglomerate, Polymet, leak sulfuric acid and a mess of other toxic overflow into the Lake Superior watershed in order to get at the copper, nickel, platinum and other mineral wealth that underlies this area our hearts draw sustenance from.	WR111
3460	I say mines because Polymet's proposed mine located near the Embarrass and Partridge Rivers, which would wash the pollution into the St. Louis River and thence Lake Superior, is not the only proposed sulfide mine. Twin Metals is a joint venture between a Canadian and a Chilean company that wants to dig another mine barely three miles from the Boundary Waters Canoe Area near Ely, Minnesota.	CU02
3461	No company, whatever formal arrangements it puts on record, will retain squadrons of river guardians or pit watch personnel past its own dissolution, or past all caring once the blue coldwater lakes of legend or the fishing streams are discolored or pretty well devoid of healthy aquatic life.	FIN01
3462	Arguments made by citizens in favor of mining are that we need the copper that the region has, that no other mining region of the world has the robust environmental oversight found among Minnesota agencies and that we have to at least let Polymet give it a first try, ostensibly to see how well they do protecting the rest of our resources. Unfortunately, and most persuasively, there is the loudly proclaimed and very real need for paying jobs in northern Minnesota. The first point is moot; copper mines crowd the southern two thirds of Arizona, and are also found in New Mexico, Utah, Montana and Michigan. As for oversight, in any area of the world, whatever underlies a mine pit is more or less permeable by water, and no matter what is practiced in the westerly copper mining districts, a place like Minnesota, girded underneath by sands and the soft stuff making up peat bogs, and abundantly snowed-on many winters, creating vast movements of water, is hugely vulnerable to the transfer and pooling up of chemical toxins.	PER35
3463	Meantime, during and after the inevitable bust cycle that follows in the northland, as inhabitants in their degrees of hunger and desperation forage fish, hunt and forage from the land, what if the few fish left are full of mercury, another pollutant released by sulfide mining--or arsenic, or both?	AQ05
3470	And what about carbon emissions from the heavy equipment and land disturbances normal to mining? One source, an Anishinaabe native people's on line tract titled Protect Our Manoomin (wild rice,) says sulfide mining will have an annual carbon footprint of 767,648 metric tons annually. Credit for the facts and figures is given to sources including WaterLegacy, Friends of the BWCA, and Lake Superior Mining News.	AIR01
12992	This whole region is underlain by percolating water which will begin to run with soluble metals including mercury, getting into lakes, marshes and rivers, harming wildlife scarce already including the threatened lynx and our declining moose populations.	GEN03
12995	The Polymet scheme is a rich corporate affair that in no way benefits anyone except those who measure well-being in dollars. A hoax is being perpetrated on the job-poor promising them work at the expense of everything else in the region.	SO02
16242	The questions are when, how soon and how much effluent will make its way where-all and how far.	WR064, WR070, WR111, WR177
16249	our kind of people just doesn't agree to leave things well enough alone where financial wealth is at stake. The ones who can will amplify their rationale for going and getting, and they persuade enough of the others that life will be better for them too as a result. This is how one more big patch of Earth full of places with virgin thickets and swamps, rivers and lakes that still keep their historic complement of fishes and frogs, birds and wild fur bearers risks becoming another piece of everywhere else, with tired water and particulate-blown air.	SO01

19172	The Boundary Waters and the surrounding National Park/Forests are more than important tourist attractions and recreation areas—they are historically and culturally integral to Minnesota’s identity. Our solution to low employment can’t infringe on future generations’ environmental health.	SO02
<b>Sender Name (Submission ID)</b> Tara Widner (54915)		
19316	Manoomin is a sacred plant to the Ojibwe. The Ojibwe were compelled by a prophesy prior to colonization to migrate from the east coast of North America to the Great Lakes region to live where the 'food grows on the water' and that food was manoomin. Manoomin is the first food to be eaten by Ojibwe babies and lastly served at funeral ceremonies. The manoomin harvest continues to be central to Ojibwe families for its nutrition, economical and spiritual value. Any proposed mine that puts manoomin in jeopardy should not be allowed to go forward.	CR01
19317	The Partridge and Embarrass Rivers are wild rice waters that will be affected by sulfide runoff from the proposed PolyMet mine. All mines in sulfide bearing rock in a non-desert environment have resulted in pollution. Minnesota's unique topography with water tables so near the surface, it facilitates surface and ground water interaction and more potential for pollution.	VEG04, WR156
19318	There are no plans for lining the tailings piles. When it rains or snow melts the tailings piles will leach pollutants into the water. There are no plans in place for floods or other emergencies such as the flooding in Northeastern Minnesota in 2012.	WR127, WR130, WR180
19319	Water is sacred. We cannot allow for water to intentionally be polluted and then treated by a method that has not been proven effective at the volumes PolyMet is proposing.	WR195
19320	By PolyMet's own admission, the water will require 500 years of perpetual treatment- completely unrealistic. All of this for the possibility of a few hundred jobs for a couple decades. It is irresponsible to even consider the Polymet offer. There is no amount of financial stability that can guarantee that kind of financial or moral obligation.	SO01
19321	The land is sacred to the Ojibwe. The mine site and the area around the mine is known to the Ojibwe as Mesabe Widjiu, the Laurentian Divide. The mine will pass through the Thunderbird Trail preventing access for ceremony and gathering of medicine.	CR01, CR05
19322	The Ojibwe continue to hold usufructuary Treaty rights in the area where the mine is being proposed. To allow pollution and the ecological devastation will prevent the Ojibwe from exercising their usufructuary rights. You can't harvest manoomin, hunt, trap or gather on land that has been poisoned.	CR01
19323	there is no statement on the potential public health impact to the general public. This area is known for exceptionally high rates of mesothelioma. It has been noted in studies that there are 'asbestos like fibers' in the rock of the eastern Iron Range. There are no assessments of the chemicals including arsenic that will be released into the city of Hoyt Lake's water supply, Colby Lake. There are no assessments on the health impacts of the increase in energy usage that will be required. There are no public health assessments of any kind.	HU01
19324	The part of Minnesota that is being offered up as an ecological sacrifice is sacred to the Ojibwe and a treasure to all Minnesotans.	GEN01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4781	Although the SDEIS describes plans for reclamation at the site post-closure, imperiled, vulnerable and other native plant communities of high biodiversity significance are very difficult to restore, and thus it is highly unlikely that the impacts could be reversed via reclamation. A wealth of research and experience supports the assertion that many of the most imperiled and “vulnerable” native plant communities are very difficult to restore. For example, communities such as peatlands take a long time to establish, and would not be compatible with some of the stated goals for reclamation in the SDEIS including “rapidly establishing a self-sustaining plant community ...and minimizing the need for maintenance.”	VEG02, VEG03, VEG05
4782	Indirect effects on adjacent wetlands from dewatering are also significant. The SDEIS anticipates impacts to adjacent areas and potential indirect impacts on wetlands and water tables from groundwater table drawdown up to 3,200 ft. from the mine pit (SDEIS Section 5.2.2.3.2). These impacts have the potential to negatively impact adjacent high quality and vulnerable wetland types as well as wetland functions. This issue is further discussed in our comments on wetlands and mitigation herein. We also note that the question of the extent and severity of impacts to adjacent wetlands is included in the SDEIS 8.3 and Appendix C.	WET10
4783	Several rare and high quality communities that will be eliminated by the Mine Site are ranked as having high vulnerability to climate change, meaning that they will be under even greater pressure throughout their range. These include acid peatlands and forested peatlands. Additional communities ranked as vulnerable to climate change that will be negatively impacted by the project include wet forest systems, riparian areas, and headwater stream systems...Several of the rare and high quality communities that will be eliminated by the NorthMet mine site were ranked as “high vulnerability” to climate change. These include acid peatlands, forested peatlands, and wet forest types.	VEG02, VEG03
4784	Stream and river systems are also identified as potentially some of the most vulnerable systems to climate change in the upper Midwest and Great Lakes due to the combination of increased storm runoff, more frequent drought/reduced baseflows, land cover change, nutrient loading, altered thermal regimes, and invasive species. Based on the IBI assessment of the Partridge and Embarrass Rivers, several headwater streams have been classified as cold water or cool water. Both of these thermal regime types are also considered highly vulnerable in northeast Minnesota under anticipated climate change due to the sensitivity of many cold water species to increases in water temperature.	WR180
4785	All aspects of environmental review, permitting and mitigation for the NorthMet Project and the Land Exchange should consider the high biodiversity value, landscape context and irreplaceability of habitat that will be lost or impacted.	PD01
4786	The SDEIS proposed action includes the exchange of a single 6,650.2-acre parcel of federal land for multiple tracts within the proclamation boundary of the SNF. A priority habitat for the Conservancy is the 6,344 acre, Sand Lake-Seven Beavers preserve, located within the Sand Lake-Seven Beavers landscape, which harbors one of the state's largest areas of lowland conifers...The proposed mine and plant site occur within this significant landscape.	LU01
4787	Both the federal and exchange lands occur within the SMF ecoregion...The USFS goals for the Superior National Forest include restoring long-lived conifer species and maintaining and increasing older forest growth stages. These goals are based on the recommended desired outcomes, goals and strategies developed in the MFRC’s 2003 Northeast Landscape Plan; a plan developed by approximately 60 people representing agencies, conservation non-profits, industry, and private landowners. The Conservancy shares these goals.	VEG03
4788	In addition, to determine that an exchange well serves the public interest, the authorized officer must specifically find that the resource values served by the non-Federal lands to be acquired equal or exceed the resource values served by the Federal lands to be conveyed...However, overall neither the proposed land exchange, nor Alternative B represents equal ecological or resource values. Again, to determine that an exchange well serves the public interest, the authorized officer must specifically find that the resource values served by the non-Federal lands to be acquired equal or exceed the resource values served by the Federal lands to be conveyed. The proposed exchange appears to fail this test.	LAN01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4789	In addition, it is important to note that the federal lands were acquired under the Weeks Act of 1911 (36 Stat. 961, as amended 16 U.S.C. §§ 515, 521) which permitted the federal government to purchase private land in order to protect the headwaters of rivers and watersheds in the eastern United States. As noted above, the mine site is located within the Sand Lake-Seven Beavers landscape, which encompasses the headwaters of the St. Louis River. Conversion of the federal lands to mining is therefore contrary to the original intent of the federal enabling legislation to protect ecologically significant headwaters.	LAN02
4790	Given the fact that the proposed land exchange will result in a significant net loss of biodiversity habitat, the U.S. Forest Service (“USFS”) should find that the Land Exchange, as it is currently proposed, is not in the public interest as required by 36 C.F.R. § 254.3(b).	LAN01
4791	To avoid a significant net loss of biodiversity habitat, the Land Exchange should expand the portfolio of non-federal tracts to be acquired to include lands with at least a MBS rank of moderate within the St. Louis River Watershed. Focus should be on lands that mimic the habitat lost in the exchange, including not only wetlands, but a wide variety of lowland plant communities, forested bogs and swamp.	VEG02
4792	The final EIS should ensure that the lands with the highest MBS rankings remain part of the Land Exchange. These include Tract 2 (Lake County north and Lake County south), and Tract 3 (Wolf Lands 1-4).	VEG02
4793	The final EIS should eliminate Alternative B, the more limited Land Exchange, since it has no ecological benefit.	ALT23
4794	We note that Shrub swamps represent 12% of the impacted wetland acres and are recognized as distinct wetland types and offer some important functions for wildlife and water quality. However, it should be recognized that shrub swamps often represent a degraded successional form of more herbaceous wetlands such as marsh and fen caused by artificial drainage or fire suppression. As such they may not always be appropriate targets for mitigation or restoration. The Conservancy thus recommends careful evaluation of the setting and prior history of all shrub wetlands in the impacted areas, and where appropriate using the original historic wetland type as the target for compensatory replacement.	WET05
4795	Additionally, the Cooperating Agencies (SDEIS 8.3, MDO 8) provide an alternative analytical method for estimating these indirect impacts from groundwater drawdown and determine that as many as 5,720 acres would be vulnerable to “severe” impacts. These differences are indicative of large uncertainties in the effects of hydrologic alteration that should be reconciled in the EIS and an appropriate single estimate or range provided. We support the Cooperating Agencies’ method as technically valid, and no less reasonable than the two approaches documented in the SDEIS... If the uncertainty persists, the SDEIS must consider the worst case analysis, and if another basis is used for decision purposes, must justify the basis on which a lesser impact is predicted....The final EIS should resolve the uncertainties in the analysis of indirect impacts of hydrologic alteration and provide a supported single estimate or range of acres and wetland types affected. If the uncertainties cannot be resolved, worst case analysis must be included and addressed.	WET10
4796	For this reason the Conservancy strongly supports an up-front commitment to avoidance and minimization of impacts and compensation for lost wetland functions -- at a minimum for wetlands identified as highly likely or moderately likely to experience groundwater drawdown and fragmentation impacts. Such commitment should include identification of viable mitigation options and sites, and applicable compensation ratios in advance of project permitting, along with performance expectations such as timing and triggers for implementing mitigation...The Record of Decision and permit conditions should include advance commitment to mitigation for all indirect impacts, including identification of mitigation sites and compensation ratios.	COE02

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4797	The SDEIS should demonstrate how the project will address the full mitigation hierarchy required under state and federal rules... The 2008 Federal Mitigation Rule reaffirmed an appropriate “mitigation hierarchy” ... The mitigation hierarchy insists that a project applicant must first consider designs, locations and approaches that avoid impacts, then develop plans to minimize those impacts that are unavoidable, and compensate for lost wetland functions and values. The Rule also asserts that compensatory mitigation must be sited with respect to the context and needs of the watersheds in which they occur. Minnesota’s Wetland Conservation Act similarly sets out a required “sequencing” plan that shows the applicant has avoided, minimized, replaced or otherwise compensated for lost wetland functions according to the hierarchy...Insufficient efforts have been made to avoid and minimize impacts through alternative project designs such as underground mining which was taken out of consideration largely for economic justifications. We recommend that the EIS include a thorough sequencing plan that demonstrates adherence to the mitigation hierarchy required by state and federal law and evaluates meaningful alternatives for avoiding and minimizing wetland impacts...The final EIS should include a sequencing plan that demonstrates adherence to the mitigation hierarchy of avoid, minimize and mitigate impacts to wetlands as required by state and federal law.	WET03, WET20
4798	Higher compensation ratios and financial assurance are warranted because of the scale, type and setting of impacted wetlands and the difficulty restoring their functions and values...Moreover, because of the uncertainty in the range of wetlands to be affected by indirect impacts, as discussed above, it is even more important that a higher ratio of mitigation be used, so that the uncertainty does not undermine the assurance of appropriate mitigation overall... It is important to recognize that mitigation is not likely to restore all lost functions and that restoring wetland functions of any kind will take considerable time. Thus it is important that these shortcomings are compensated through higher than normal mitigation ratios. However, it is also important that success criteria for this kind of wetland mitigation goes beyond conventional compliance success, to include functional success, to determine if ecological functions of the system have been restored, and landscape success, to determine how restoration has contributed to ecological integrity of region or watershed...A compensation ratio of 2:1 or higher (and no less than 2:1) should be used for unavoidable impacts to bog, coniferous swamp, hardwood swamp and other wetlands of the lowland conifer ecosystem.	WET04, WET05
4799	The 2008 Mitigation Rule and St. Paul District policy also allows for the agency to require financial assurance mechanisms to ensure that compensatory mitigation is successfully implemented and permit conditions are satisfied in the event of unforeseen circumstances. Under the Rule, the USACE District Engineer can determine that financial assurance is not necessary if alternate mechanisms are in place to ensure confidence in mitigation outcomes. Minnesota state rules (Minn. R. 8420.0552) also require financial assurance for mitigation... the Conservancy believes that financial assurance should be set forth in the final EIS as required under state and federal law. Such financial assurance should be separate from that required for mine reclamation and long term maintenance and should be required until mitigation success criteria are demonstrated to have been fully achieved, not just until construction is completed...Financial assurance, separate from that required for mine reclamation, should be required to ensure the success of mitigation, to cover the costs of monitoring and adaptive management and to ensure against indirect impacts to wetlands.	FIN05, FIN11
4800	Careful monitoring design is needed to validate indirect wetland impacts and evaluate progress of mitigation toward satisfaction of success criteria... However, we believe more detail is needed in the EIS on the monitoring, adaptive management and decision framework that will be used to determine if and to what extent and severity indirect impacts are occurring, the trigger points that would require mitigation to be implemented, and the compensation ratios that would be required...The final EIS should fully address monitoring design, adaptive management, and the decision framework for identifying indirect impacts and associated mitigation.	WET02
4801	A robust monitoring design should require monitoring in all potential impact categories, not just in Highly and Moderately impacted zones.	WET02
4802	Additionally, biological monitoring, including annual vegetation surveys, should be done in conjunction with hydrologic monitoring locations, and hydrologic monitoring should utilize continuous recorders at all sampling sites, with all data collected made available to the Co-Lead Agencies and to the public.	WET22

<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4803	In addition to shallow monitoring wells or piezometers, deeper wells at the same locations (in combination with shallow wells) would provide better evidence of the impacts of groundwater drawdown.	WET22
4804	Weather stations at one or more sites are needed to help distinguish true drawdown impacts from the effects of weather and climate.	WET22
4805	Multi-parameter biological monitoring is also recommended, not just of plants, which often have considerable resilience and do not show impacts for several years, especially in forested wetlands, but also of invertebrates and other biota sensitive to changes in hydrology. Focus should be on edges of wetlands and other locations that provide early indicators of hydrologic impacts.	WET22
4806	Reporting annual average water levels or other such integrated statistics may be nearly meaningless when used to detect drawdown impacts, and it is important to detail the wetland hydrograph at daily, weekly and monthly intervals, all of which are easily possible with the use of continuous recorders.	WET22
4807	In addition to water levels, annual and growing season hydroperiods and hydropatterns are biologically important for determining wetland function and should be reported in consultation with agency staff.	WET22
4808	The commitment to identify and monitor reference wetlands in the monitoring design is laudable. We recommend that monitoring parameters at reference wetlands be the same as impacted wetlands in terms of frequencies, type and locations. Reference locations should be free of all direct and indirect effects from the NorthMet project or other disturbance, including existing or future mining projects, yet close enough in proximity, setting and type that weather and other regional factors are reasonably similar to that of the impacted wetlands.	WET22
4809	Mitigation should focus on viable options within the St. Louis River basin, including watershed- based approaches, mitigation banks or other opportunities to restore aquatic functions at a scale commensurate with the impacts from the NorthMet project... The Co-Lead Agencies should require that site searches focus on a larger suite of in-watershed mitigation opportunities including ecologically suitable wetland banking, on-site mitigation and in lieu fee program development that addresses restoration of functional loss in the St. Louis watershed... As per the 2008 Mitigation Rule, out-of-basin mitigation should be strongly discouraged given the cumulative un-replaced losses of functions and services that accrue in the impacted watersheds....Mitigation should focus on restoration of functional loss in the St. Louis River Watershed and should include ecologically suitable wetland banking, on-site mitigation and an in lieu fee program development.	WET03
4810	As noted in the SDEIS (SDEIS, 5.2.3.3.2), opportunities exist for restoration of tens of thousands of acres of peatlands affected by ditching within the St. Louis River watershed and northeast Minnesota in general, but a determination by the USACE of the feasibility of this for mitigation is not yet completed. The Conservancy strongly urges the USACE to complete this assessment prior to making a final determination of mitigation requirements for the NorthMet project...The U.S. Army Corps of Engineers ("USACE") should complete its feasibility determination for peatland restoration within the St. Louis River Watershed and incorporate this information into its determination of mitigation requirements for the NorthMet project.	WET01, WET03, WET04
4811	The Conservancy believes a coordinated watershed approach to identifying mitigation needs and options is warranted for the Lake Superior basin in Minnesota and that sufficient information is available to conduct a watershed-wide analysis... Using a watershed approach, mitigation could be implemented as an in-lieu fee program or umbrella bank in accordance with a watershed plan as is currently being discussed in the context of the Northeast Minnesota Mitigation Strategy.	WET03

<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4814	The SDEIS analysis of the potential impacts from contaminated water is predicated on best-case assumptions whereby all equipment functions as designed, no operator error is anticipated, and the potential for failure is insignificant. The SDEIS does not provide adequate analysis of the potential impacts from wastewater releases that could reasonably be expected to occur due to human error, equipment breakdowns, or other system failures associated with wastewater collection, transportation, and treatment...The final EIS should identify for all phases of the project potential risk and release scenarios that could occur during routine operation and probable failure scenarios at the Mine Site, Plant Site, and Transportation Corridor including the tailings basins, stockpiles and breakdown of the reverse osmosis systems. The final EIS should evaluate the effect on downstream resources in terms of failure type, duration, and magnitude as was accomplished in the USEPA’s Bristol Bay assessment.	WR202
4815	The Tailings basin, Waste Rock Stockpiles, and Hydrometallurgical Residue Facility are potentially significant threats to groundwater quality. Therefore, the stability and structural integrity of these storage systems warrant additional consideration when evaluating potential risk scenarios... The Conservancy is concerned that the tailings basin will contribute to water quality impacts by leaking contaminants into the ground waters that may be hydraulically connected to surface water. Given the concerns regarding the structural integrity of these storage systems, the Conservancy believes that the analysis of the stability of the Tailings Basin, waste rock stockpiles, and Hydrometallurgical Residue Facility warrant special consideration when evaluating failure and risk scenarios.	WR066, WR067, WR127, WR128
4816	The nature of the effluent from mining operations, and the harsh weather conditions of northern Minnesota pose unique challenges to the effective operation of the wastewater treatment systems proposed at the Project site. The potential barriers to effective wastewater treatment should be discussed and addressed in the SDEIS... The NorthMet SDEIS does not address potential causes of breakdown or compromise of the reverse osmosis system, or the potential for release in such scenarios, nor does it assure that replacement membranes would be promptly available and easily installed in order to minimize any impacts from what would seem to be routine failures of these systems in other facilities.	WR128, WR143, WR144
4817	Minnesota’s mining reclamation rules state that a “mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources and is maintenance free.” Thus, it is important that long-term maintenance needs of active or “passive” treatment systems be thoroughly understood, documented and incorporated into calculation of financial assurance requirements.	PD02
4818	The Conservancy recommends that any consideration of a passive system (e.g. an artificial wetlands treatment system) include an analysis of performance over the long term and under extreme weather conditions as experienced in the region...If wetlands are to be used as a wastewater treatment method, the final EIS should include an analysis of expected wastewater treatment performance during the winter, the length of time a wetland treatment system can function before reaching capacity and how the effectiveness of the system will be monitored. It should also discuss long term maintenance of the system, such as removal and disposal of accumulated metals in the wetland plants and sediments.	WR122, WR137
4819	Given the inevitability of errors, break downs, accidents, and unexpected events over the long run, some amount of failure should be anticipated and incorporated into the project’s design and management. The focus of design and assessment should be on development of decision frameworks and strategies that ensure it is “safe-fail,” or safe in failure, rather than fail-safe. The approach taken in the SDEIS is simply to assume that everything will work as predicted, failures will not occur and the regulatory process will ensure that environmental risks will be mitigated.	PD22

<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4820	Adaptive management is proposed as a framework for dealing with uncertainty, but the SDEIS does not describe an effective AWMP. The SDEIS does not comprehensively evaluate risk due to the lack of a thorough examination of potential failures and the lack of an effective adaptive management plan... The “wait and see” approach reflected in the SDEIS is not adaptive management, and is an inadequate strategy for addressing uncertainty and change... While the SDEIS does include general information about adaptive management plans, it states the AWMP (and other adaptive plans), are preliminary in nature and will be “adjusted” during the final design and permitting process...The Adaptive Water Management Plan (“AWMP”) should provide a clear framework for understanding how adaptive management will work. An adaptive management framework is required that specifies the management assumptions, the monitoring design, thresholds that will trigger mitigation actions, and the actions that will be taken if those thresholds are met.	PD22
4821	All permits should be conditioned on commitment to mitigating actions identified in the AWMP and other adaptive management plans as documented in the final EIS and Record of Decision.	PER06
4822	Given its importance to the environmental risks of the NorthMet project, opportunity for public comment on the AWMP should be provided prior to issuance of a Permit to Mine.	PER01
4823	The NorthMet Project Action has the potential to significantly alter flows and water levels in nearby streams and wetlands, including headwater streams of the Partridge and Embarrass Rivers that are both tributary to the St. Louis River, a Conservancy freshwater conservation priority.... Because the Conservancy’s SMF and Great Lakes ecoregional plans have identified the St. Louis River headwaters (adjacent to the Partridge and Embarrass River sub-watersheds) as a freshwater priority, we are evaluating the SDEIS with respect to the potential to impact flows in the Partridge and Embarrass Rivers and the St. Louis River.	WR081, WR111, WR114, WR183
4824	The Conservancy supports the use of the IHA criteria for assessing hydrologic alteration. However, we note that 20% alteration can represent a significant departure at extremely low flow or high flow conditions when it is additive to the range of natural variation....More protective flow criteria (< 5% alteration) should be used for flows at the low and high end of the frequency distribution to evaluate the potential for impact to aquatic systems. Mitigating measures should be specified for periods when flow alteration exceeds this criterion.	WR130, WR185
4825	The final EIS should reevaluate assumptions about the basic hydrology of the project site in light of current data, including baseflow estimates in affected streams. Assessment of impacts and conclusions derived from flow and water quality modeling results should be revisited if those assumptions are in error.	WR003, WR052, WR071, WR086, WR091
4826	We are concerned, however, about the operative capacity of the WWTF (particularly post-closure) and if the pits and the RO facility will be able to handle 100- or 500-year precipitation events (such as that which occurred in the St. Louis basin in June 2012) indefinitely following closure of operations. To avoid hydrologic impacts from altered storage and runoff, the wastewater pits and WWTF will have to be able to accommodate the full range of potential runoff events, and control discharges so as to make them seasonally appropriate and comparable to the natural hydrograph...The final EIS should explicitly define and describe “adaptive engineering controls” as well as address the capacity to accommodate the full spectrum of extreme storm events at both the Plant Site and Mine Site, including event frequencies anticipated under future climate change scenarios. The EIS should also describe the capacity of the wastewater treatment plant (“WWTP”) to pattern permitted discharges on the natural flow regime.	WR130, WR148, WR180, WR189
4827	The final EIS should include a sensitivity analysis of flow and water quality impacts to a range of baseflow, climate, and leakage estimates. The results of this analysis should be used to identify mitigating actions that would be implemented to avoid additional impacts.	WR022, WR091, WR180, WR197
4828	The NorthMet SDEIS examines and then dismisses the possibility that NorthMet flow changes have any significant implications for downstream channel stability... However, the final EIS should give greater consideration and analysis of the effect of the project on stream channel stability.	WR003

<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4829	The SDEIS states that flows will return to nearly pre-NorthMet Project Proposed Action conditions during closure. However, the Conservancy suggests that downstream impacts to flows in both rivers may extend beyond the 20-40 year timeframe, based on alterations of surface and groundwater hydrology made at the Plant and Mine sites, in conjunction with mechanical treatment operations and discharges, and existing alterations discussed in the SDEIS. It is unclear how much longer the Northshore Mining dewatering and associated augmentation of the Upper Partridge River will continue. Regardless, additional increases in precipitation, precipitation intensity, and variability are considered extremely likely under most downscaled climate models. NorthMet project impacts may be either additive or compensatory to these effects depending on the time frame. The SDEIS fails to address how climate change may affect its predictions regarding flow levels....Assessment of potential hydrologic impacts of the NorthMet Project for the Partridge and Embarrass Rivers should be evaluated based on up-to-date understanding of current and future climate scenarios.	WR005, WR006, WR077, WR180
4830	Based on the IBI assessment of the Partridge and Embarrass Rivers, several headwater streams have been classified as cold water or cool water. Both of these thermal regime types are also considered highly vulnerable in northeast Minnesota under anticipated climate change...Given the potential for flow augmentation and its impact on erosion and sedimentation, the EIS, Record of Decision and permit conditions should address appropriate monitoring and adaptive management for thermal regimes, downstream sediment and associated habitat impacts.	WR130, WR180
4831	NorthMet Project area waters that have restoration potential for wild rice should be designated as “wild rice waters” and should be required to meet Minnesota’s sulfate standard.	WR154
4832	Minnesota Tribes hold substantial legal and cultural interests in wild rice habitat in the project area that should be recognized and protected... In the context of PolyMet’s proposed project, it is important to note that these legal rights might be affected by pollution and hydrologic modifications associated with development and permitted industrial uses that impact natural resources... Therefore, continued tribal access to sustainable and healthy native wild rice is an important issue for the Conservancy...The “affected area” considered by the SDEIS for wild rice impacts should include the entire St. Louis River watershed.	WR159, WR163
4833	Although there is no comparable research on wild rice, it is clear that a fuller understanding of methylmercury fate and transport is needed, and should be part of the adaptive management plan for NorthMet and other ongoing mining operations and reclamation activities. Given the mounting evidence demonstrating negative impacts to wild rice from relatively low levels of sulfides, the positive correlation between levels of sulfate in water column and sulfides in sediment, combined with the remaining uncertainties about long-term impacts and the relationship between sulfate and methylmercury, the weight of evidence tilts against a weakening of the 10 mg/L sulfate standard.	WR130, WR160
4834	The current 10 mg/L sulfate standard for wild rice waters should remain in effect...The waters affected by the NorthMet Project should not be permitted to seasonally exceed the sulfate standard.	WR153, WR160
4835	The NorthMet project discharges and other activities in the watershed should be monitored and evaluated for flow regime alterations that could potentially impact downstream wild rice waters. Potential corrective actions should be explicitly specified in the water management plan.	WR157
4836	The SDEIS needs further focus on cumulative effects analysis, especially the geography of the affected area, future actions considered and incorporation of climate change... The approach in the NorthMet SDEIS is to use different timeframes and cumulative effects affected areas (“CEAA”) depending on the resource being considered. This inconsistency has the effect in some cases of narrowing the scope of the analysis such that it leads to circular logic that precludes evaluation of the full picture of impacts. Similarly, an overly-narrow definition of reasonably foreseeable future impacts is used in the SDEIS that eliminates consideration of other likely mining actions. Accordingly, our comments below are focused on future actions considered, timeframe and area affected by cumulative impacts.	CU05

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4837	The EIS must therefore provide some analysis of the increased impacts that could be expected from additional mining operations within the area, especially ones that will likely come into operation within the same period. While the current status of the other projects might prevent a detailed analysis, the ability to develop a reasonably thorough understanding and evaluation of cumulative risks of mining in a large watershed sufficient to inform permitting decisions is demonstrated by the recent USEPA assessment in Bristol Bay, Alaska.	CU02, CU03
4838	The Conservancy believes this definition [of speculative] is too narrow, and excludes other nearby copper-nickel, PGM and titanium oxide deposits now in the early stages of development. These excluded projects include potential future actions at the nearby Teck American Mesaba deposit, Encampment Minerals' Serpentine deposit, Cardero Resource Corporation's Longnose deposit and Twin Metals' Maturi and Birch Lake deposits...The cumulative effects assessment should include other nearby non-ferrous mining developments, as well as planned expansions of taconite mining and processing as reasonably foreseeable future actions, as detailed in our comments.	CU02
4839	The Conservancy believes that the full St. Louis River watershed is the appropriate CEAA for impacts to water resources, high biodiversity sites, species, wild rice, wetlands and other critical habitat. The NorthMet project site is part of the Sand Lake-Seven Beavers conservation landscape, also known as the Headwaters Site because of its position at the headwaters of the St. Louis River...The cumulative effects assessment should use the entire St. Louis River watershed as the cumulative effects affected area for impacts to water resources, high biodiversity sites, species, wild rice, and wetlands.	CU01
4840	All NorthMet Project area waters are also designated Outstanding International Resource Waters which prohibits any new or expanded point source discharges of bioaccumulative substances of immediate concern (i.e., mercury) unless a non-degradation demonstration is completed and approved by the MPCA.	MERC01
4841	Yet the SDEIS actually uses a smaller CEAA for wetland loss in the cumulative effects analysis than it does in the assessment of direct impacts to and mitigation for wetland loss from the NorthMet project alone: the CEAA is confined to the Embarrass and Partridge Rivers while the entire St. Louis River watershed is appropriately considered for direct impacts to wetlands and mitigation.	CU01, WET18
4842	As described in our comments on water flows and levels, loss of forested wetland habitat also has effects on the temperature of stream and riparian habitat that can have important implications for sensitive species such as moose. When considered cumulatively with the loss of wetland function in the Partridge and Embarrass watersheds and the effects of climate change, such impacts can have profound impacts on the survival of vulnerable species.	WI01, WI02, WI08
4843	The Conservancy believes that the cumulative effects analysis should focus on the amount of habitat of different types, including lowland conifer wetlands and wild rice, which occur across an ecologically meaningful region such as the St. Louis River watershed or the Sand Lake-Seven Beavers landscape, and determine how all past, present and reasonably foreseeable future projects cumulatively modify habitat availability. Then it should estimate how the remaining habitat conditions compare to the needs for well distributed, viable populations of species that depend on the habitat.	CU17
4844	A similar analysis should be completed for watershed functions, first determining how projects, including NorthMet, have cumulatively modified important hydrologic functions, then comparing the results of the analysis to an assessment of needs.	CU15
4845	The Conservancy believes the proper scale of these analyses, and thus for the CEAA, is the St. Louis River watershed, which encompasses the area where cumulative effects on wetlands, wild rice and water resources are most relevant, contains both the Sand Lake-Seven Beavers and Headwaters Site conservation landscapes and a portion of the Hundred Mile Swamp, as well as the majority of northern Minnesota's industrial mining district. Importantly, the St. Louis River watershed is also the heart of wild rice cultural and subsistence use and the region of highest density of remaining wild rice in the 1854 Ceded Territory (SDEIS, Appendix C).	CU01

<b>Sender Name (Submission ID)</b>	The Nature Conservancy (42982)	
4846	The cumulative effects assessment should include an analysis of how all projects have cumulatively modified habitat availability and compare this with habitat needs of dependent species using a population viability analysis approach.	VEG03, WI02
4847	Overall, however, the SDIES appears to take the perspective that climate change effects are so uncertain or imprecise they cannot be incorporated into the assessment in any meaningful way... The Conservancy believes that climate change effects are occurring now, are relevant over the operational and post-closure timeframe of the NorthMet project and should be incorporated into the cumulative effects assessment...The cumulative effects analysis should incorporate climate change effects on sensitive habitat, species and water resources.	AIR01, CU03
4848	While acknowledging the uncertainty inherent in climate change predictions, the SDEIS fails to demonstrate how that uncertainty will be mitigated or whether freeboard, margins of safety and excess water storage and treatment capacity are adequate over the 20-year period of mine operation, much less the 200 to 500-year post closure period during which treatment may be required...The SDEIS should demonstrate how climate uncertainty will be mitigated in the project design and operations, identifying the specific mitigating measures employed.	WR180
4849	The state and federal government should conduct a “tier 1” regional environmental assessment using a Programmatic Environmental Impact Statement (“PEIS”) or Generic Environmental Impact Statement (“GEIS”) model before significant additional mining development occurs.	CU19
4850	The regional environmental assessment should focus on the St. Louis and Rainy River watersheds and be structured similar to the USEPA’s Bristol Bay, Alaska assessment and include the nine essential elements of that study.	CU01, CU03, CU18
4851	The SDEIS should be supplemented to include at least one alternative from each of the following categories: alternative sites; alternative technologies; modified designs or layouts; modified scale or magnitude; and alternatives incorporating reasonable mitigation measures.	ALT06
4852	MEPA prohibits state action, including issuance of a permit, for activities “significantly affecting the quality of the environment” so long as there is a feasible and prudent alternative. Minn. Stat. § 116D.04 subd. 6 (2013). It specifically mandates that “Economic considerations alone shall not justify such conduct.”...Yet both the underground mine alternative and the west pit backfill were excluded as alternatives for economic considerations... The underground alternative was not fully evaluated because PolyMet refused to pursue it:... Instead, the Co-lead Agencies conducted “a semi-qualitative screening analysis of the alternative.”...NEPA requires that the agency evaluating the proposed action verify the accuracy of information supplied by the applicant...The Co-lead agencies appear to have adopted this conclusion [of PolyMet] of the project proposer without independent verification... The evaluation process for both the underground mine alternative and the west pit backfill alternative results in elimination of those alternatives for economic reasons in violation of Minn. Stat. § 116D.04 (2013)...The underground mine alternative and the west pit backfill alternative should be evaluated with more than a screening level analysis, and the accuracy of information provided by the project proposer should be independently verified.	ALT01, ALT03
4853	The Purpose and Need Statement focuses on private economic objectives... By defining the “purpose and need of the project” narrowly, the SDEIS readily eliminates alternatives as not fulfilling the purpose and need of the project... Even the broader Co-lead Agencies’ Purpose and Need statement at SDEIS Section 1.3.2.1 allows economy to trump environment:.. By framing the Purpose and Need and related analysis in terms of production and markets, and excluding alternatives that might currently be unprofitable in a volatile minerals market, the evaluation is driven by today’s private economic considerations... The Purpose and Need statement and analysis should fully encompass long-term and watershed-wide environmental benefits and costs in addition to private economic considerations.	NEPA01
4854	Minn. R. 4410.2800 (2009) provides, in part, that the final EIS shall be determined adequate if it “addresses the potentially significant issues and alternatives raised in scoping so that all significant issues for which information can be reasonably obtained have been analyzed in conformance with part 4410.2300, items G and H.” Id. The SDEIS fails to include and fully evaluate alternatives.	ALT20

4855	The Purpose of NEPA and MEPA require that Financial Assurance be Considered at the EIS Stage and Not Await the Permit to Mine Decision...63. Thus, for the SDEIS to serve as an adequate disclosure and examination of the proposed alternative, it must provide a thorough documentation of the cost estimates underlying the financial assurance, a high degree of assurance that all contingencies that may occur during the perpetual treatment, replacement, and maintenance are fully covered by the proposed financial assurance, and a mechanism of financial assurance that will remain effective and fully payable in perpetuity...The final EIS should be supplemented to include a detailed description and dollar estimate of costs of each component of reclamation to be secured by financial assurance from PolyMet and an opportunity for public comment should be provided on this essential supplementary analysis.	FIN01, FIN05, FIN13
4856	To Fully Inform Decision-making and Public Comment, Financial Assurance Analysis in the EIS Must Include Failure Analysis and Account For Risks Associated with the Unprecedented Duration of Monitoring and Treatment... The NorthMet SDEIS includes a generic listing of adverse contingencies,...The final EIS should be supplemented to include an assessment of the risk and assign cost factors associated with the failure of proposed abatement and reclamation systems for the NorthMet project, as was done in the USEPA's Bristol Bay assessment.	FIN05, FIN11, FIN12
4857	The EIS should address the financial impact and need for assurance associated with additional risks and costs in light of the unprecedented duration of reclamation, monitoring and treatment. .. All the above factors indicate that even with an assumption that the MNDNR will properly perform its duty to assure adequate financial assurance, any current estimate of restoration and reclamation costs must take into account failure scenarios, technological progress, regulatory changes, and extreme weather events such as floods and tornados. The EIS must include analysis of these risks to ensure that they are adequately borne by PolyMet and any successor operators and not Minnesota residents and taxpayers.	FIN01, FIN05, FIN12, FIN13
4858	The final EIS should be supplemented to address the additional costs associated with the unprecedented duration of reclamation, monitoring and treatment required by the NorthMet project, such as facility obsolescence, and regulatory and technological changes.	FIN05, FIN13
4859	The final EIS should commit to a fully funded financial assurance mechanism, at least 90% of which is composed of a trust fund to be administered by a group of governmental agencies, representing state, federal and/or local government.	FIN08
4860	The final EIS should agree to the release of financial assurance obligations only upon all closure, reclamation and mitigation performance criteria being met.	FIN08
5920	On behalf of the Minnesota/North Dakota/ South Dakota Program of The Nature Conservancy, I request an extension to the public review and comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) for an additional 90 days beyond the current end date of March 13, 2014.	NEPA07
5921	The longer review and comment period is warranted by the length and complexity of this document. The quality of comments that the Conservancy and the public will be able to provide will improve with additional time.	NEPA07
17506	On behalf of the Minnesota/North Dakota/ South Dakota Program of The Nature Conservancy, I request an extension to the public review and comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) for an additional 90 days ...The longer review and comment period is warranted by the length and complexity of this document. 14015	It is the DNR's job to protect Minnesota's environment and take care of our natural resources, and allowing mining that has the potential to pollute for hundreds of years is a direct contradiction of this.	PER04, WR195
14016	I do not understand how anyone, especially a government agency that is supposed to put public interest first, can think that a relatively small increase in jobs and economic output for twenty years outweighs the potential for catastrophe and pollution for hundreds of years.	SO01
14017	Minnesota is known for its clean lakes and rivers, but fresh water is not an infinite resource and we should not be actively working to jeopardize the local watershed and Lake Superior, which is what would happen if the PolyMet mine is approved.	WR195
14018	Even if there is some way that PolyMet could guarantee it can pay for clean-up of a catastrophe, Minnesota has only been a state for a little more than 150 years and it would be crazy to knowingly create a situation that leaves us cleaning up water pollution for twice as long as we have been a state.	FIN01
19836	How can the mining company guarantee that if something does go wrong, they can pay for cleaning water for 200-500 years?	FIN01
<b>Sender Name (Submission ID)</b> Theresa Johansen (10691)		
12195	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189, WR202
12198	Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.	WR195
<b>Sender Name (Submission ID)</b> Theresa Nelson (43232)		
15816	I'm by no means rich, but choose to spend my money here in order to experience the BWCA as it is. BUT not if, I even think for a moment that the water is being contaminated, the animals lives are being compromised or the local economy doesn't value protecting this most incredible resource.	SO02

9487	I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations.	NEPA16
<b>Sender Name (Submission ID)</b> Thomas Gillach (42527)		
2440	People are our most important resource. I repeat, people are are most important resource. They need work to live and they need it now to support their families and to bring this area into the future. Polymet will help do this and the enviornment will remain one of their main concerns.	SO10
3799	[The Co-Leads] have put forth a very comperhensive enviornmental impact study report which addresses the many questions and concerns of the future, a future that no one can correctly predict over the next two hundred or five hundred years.	NEPA16
15536	Laws have been written in the past and nodoubt more will be written in the future regarding water and air protection. We have seen evidence in this area of industries working with these concerns and they have made and are making great strides to assure that these laws are followed. We must trust that they will be followed and if infringed upon, will be corrected under the watchful eye of those intrusted with this responsibility.	PER06, PER34
15538	[PolyMet has] been forthright in addressing the concerns of the environmentalists, have taken on the challenges of water purification, have develop a process of water osmossis which has proven to be very effective in removing sulfides.	WR190
<b>Sender Name (Submission ID)</b> Thomas Howes (11563)		
14340	Water treatment for hundreds of years in exchange for money to the local and state governments plus a few jobs is not a sustainable or intelligent decision. The life of this mine will create some economic activity and in return my home territory is tainted forever to benefit a few wealthy investors.	SO01
14340	Water treatment for hundreds of years in exchange for money to the local and state governments plus a few jobs is not a sustainable or intelligent decision. The life of this mine will create some economic activity and in return my home territory is tainted forever to benefit a few wealthy investors.	SO01
<b>Sender Name (Submission ID)</b> Thomas J Arneson (54638)		
18570	The EIS should include contingency planning based on failuremode and effect analysis or some other failure analysis methodology. This analysis should describe the likelihood and impact of failure at each step of extraction, transport, processing, and ongoing site treatment, giving remediation plans (with costs) for responding to each. The currentversion ofthe EIS, treating contingencies only in the most superficial way, if at all, presents an overly optimistic picture of the effectiveness and the cost of preventing pollution.	PD22
18574	The EIS needs to be revised to include analyses of bow long pollution mitigation will be needed. Failure to provide this information makes it almost impossible to assess the feasibility of providing pollution mitigation as long as it is necessary.	NEPA09
18576	The feasibility of ongoing treatment for hundreds of years is questionable, given societal changes and natural disasters that will no doubt occur over centuries. Lack of effective treatment over centuries will result in pollution. To strengthen credibility that centuries of effective treatment is feasible, the EIS should document examples of similar processes that have worked effectively for centuries.	WR023, WR129

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Thomas J Arneson (54638)		
18578	The EIS does not contain information on how it will be assured that financial resources will be available, provided by Polymet, successor companies, or partner companies, for whatever treatment is necessary to prevent pollution for centuries at the mining site and at the processing site. The EIS should contain this information. If the companies stop doing the necessary treatments for financial or any other reason, treatment processes are likely to be disrupted before state or federal taxpayers assume the costs. During this period of disruption pollution is likely to ensue.	FIN01, FIN10
18579	The EIS states estimated costs for pollution mitigation while the mine is operating, at the time it is closed, and annual costs thereafter. But the assumptions, rationale for the assumptions, and calculations to produce the estimates are not provided. The EIS needs to be revised to show this information.	FIN05
18581	Multiple copper/nickel ore mining projects reasonably close to the PolyMet site are now being pursued, and development of some of these sites is reasonably likely. ... Table 6.2-1 should include additional copper/nickel ore mining operations in exploration or development in the area.	CU02, CU04
18584	The potential problems associated with uranium products being found in the ore material or waste rock are not covered in the EIS. ... If Poly Met or its contractors have done sufficient testing to demonstrate uranium will not be a problem at the proposed Poly Met project site, this information should be detailed in the EIS.	HAZ03
18587	I do not support the proposed land swap because I believe it sets a bad precedent for development of additional copper/nickel mines in the area and because it is not fiscally responsible. ... To allow a swap based on an appraised value ignoring mining plans is giving Poly Met a large financial subsidy. I oppose a subsidy of this kind.	LAN03
<b>Sender Name (Submission ID)</b> Thomas King (39167)		
12277	We know with past experience of the iron mines that there will be accidents and spillage of toxic chemicals. Check out lake Vermillion for evidence. We can't risk this kind of exposure with sulfide mining!!!	WR023
<b>Sender Name (Submission ID)</b> Thomas Koehler (9306)		
96	There is no mention of mitigation of other heavy metals that will be released in the water effluent, in excess of current water quality standards.	WR027, WR128, WR130
97	The parent rock body will be fractured by blasting, and there is no mention of how to prevent ground water from entering these fractures and producing acidic drainage into the aquifer.	WR016
913	Past experience with mining companies has indicated to me that any entity engaged in sulfide mining will escape any responsibility, whether legal or financial, by simply dissolving or filing bankruptcy, as has happened in our past. In the case of a projected 200 year or 500 year liability, I am saying that all entities will escape ANY liability with the simple stroke of a pen. There is no provision whatever to assure and insure that any entity of any kind will actually be forced to exist and remain liable for all costs that will otherwise be externalized as has always happened in the past and to date.	FIN01
914	Why isn't any limestone placed with all sulfur-bearing rock to neutralize subsequent acid formation? Will any limestone be placed in the tailings basin? There is no mention of the location of the Poly-Met hydromet facility, where phase two nickel concentrate will be sent, nor any description of the chemical nature of that treatment and its wastes. Autoclaving of concentrate and oxidation under pressure is mentioned, but no description of the chemical nature of the solutions used. Limestone is apparently added to this spent solution, but what of the consequent sulfates? Pit linings are notoriously short-lived and leaky, as demonstrated by other pit linings.	PD34

<b>Sender Name (Submission ID)</b> Tim Peschman (38454)		
14472	My point is that the mining industry is only recently working to start compliance with their discharges. Heretofore, it has been too easy for them to litigate for delays or claim insolvency to avoid their environmental responsibilities.	PER06
14473	I work with Reverse Osmosis systems all of the time and I can testify that they 1.) Require a significant amount of maintenance, 2.) Have a long track record of plugging from precipitation of inorganics and silicates on the membrane surface, and 3.) Are prone to bacterial fouling, particularly in bacterially active waters, such as will be developed at this site. Without some sort of additives (pH control, sequestrants, cleaning systems, etc.) which could impact the environment (I didn't see any discussion of this within the SEIS), they will fail. Without some form of redundancy, they are not reliable.	PD03
14474	The SEIS indicates that there will be no impact to water flow within the Boundary Waters - that all water flow will be to the St. Louis river watershed and ultimately to Lake Superior. Given the volume of water to be used within this facility and the wastewater discharge points, there will be considerable reversal of flows within the various rivers, changing the hydrology of the area.	WR080, WR081
14475	there is more than ample evidence in our present environment to show that hard sulfide-bearing rock mines can not and do not comply with their environmental responsibilities. These responsibilities are passed on to future tax-paying generations by the Mining Companies, as they undergo bankruptcy or name change to protect or eliminate their liabilities.	SO01
<b>Sender Name (Submission ID)</b> Tim Wallace (51599)		
13191	If this mining proposal is allowed to go forward it will only be the beginning for how do you stop future proposal when this one gets approved. Impacts are cumulative as well as specific for each mine regardless if it is surface or underground.	CU04
13194	I own a nice piece of property on the St. Louis River and I will be directly affected by the discharge of contaminants from the PolyMet Mine for the rest of my life if it is allowed. PolyMet has a short life, the rivers and water are needed forever by all life in and near the river. This project must be measured by the standard of short term vs. long term. The decision will be easy and it will be NO if this metric is used.	LU06, WR115
13913	Impacts are cumulative as well as specific for each mine regardless if it is surface or underground.	CU11
13914	PolyMet has a short life, the rivers and water are needed forever by all life in and near the river. This project must be measured by the standard of short term vs. long term.	SO06, WR195

<b>Sender Name (Submission ID)</b> TOM DIMOND (43109)		
11456	The negative impacts to our State greatly outlast the short term benefits. The SDEIS does not include the full economic picture. Tourism is a major employer in Minnesota. Attracting and retaining businesses in Minnesota is highly dependent on the quality of life and the natural environment. Degradation of the environment and potential financial liabilities from 500 years of cleanup could cause job losses that greatly exceed any temporary gains.	SO01
11623	The Cumulative Effect or Cumulative Impact [to wetlands, wildlife, vegetation, and water resources] has not been adequately considered.	VEG08, WET24
11626	PolyMet proposes swapping privately owned lands in the Superior National Forest for the 6,650 acres of federally protected public land. This proposal is contrary to protection of the wetlands and natural resources within the boundaries designated.	LAN06
11631	Estimates have placed the pollution cleanup monitoring and maintenance costs at \$3.5 million to \$6.5 million annually. Cleanup is projected to take 500 years.	FIN01, FIN05
11636	The State needs detailed and verifiable information to protect the taxpayers and environment because the State is the only party that is likely to be here 500 years from now. A miscalculation by the State could create a taxpayer financial liability that risks the jobs and well being of many Minnesotans.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Tom Drill (6337)		
1179	This area is an economic wasteland without this project. This project will transform the area into a vibrant and sustainable economy with jobs and services for over 100 years, possibly 200 years.	SO10
1277	Polymet has mitigated the problems in the watershed where they operate.	PD28
<b>Sender Name (Submission ID)</b> Tom Ehlinger (21326)		
945	Water - fresh water --(...) once it is contaminated, it will take generations upon generations to gradually clear up	WR115
14038	But the idea of putting our fresh water at risk for hundreds, if not thousands of years, for at most several decades of jobs, is utterly astounding.	SO01
<b>Sender Name (Submission ID)</b> Tom Fiero (38703)		
9971	Polymet's modeling for contamination and mitigation stop at year 200 for the mine site, and year 500 for the plant site--ignoring the fact that contamination will continue after these end dates. Will the state of MN and its taxpayers then assume the burden of continuing the necessary mitigation actions?...Polymet must guarantee adequate permanent funding for pollution mitigation actions....	FIN10
9973	Furthermore, the SDEIS modeling of groundwater movement...uses a Partridge River estimated baseflow of 0.51 cfs, which is not realistic. Actual measurements east of the mine site establish a baseflow that is several times higher. ... SDEIS predictions for the amount of sulfates and other pollutants entering the river are probably low.	WR003, WR091, WR149
11990	Significant quantitative errors in the SDEIS need to be corrected, and the corrected document should then be subjected to further review.	NEPA15

1754	The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes.	LAN02, LAN05
1755	The Land Exchange serves only the private interest of a foreign corporation, not the public interest.	LAN01
1756	The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining.	LAN04
1757	The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species.	VEG01, VEG02, VEG03
1758	The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013. Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project.	WI01, WI02, WI03
1759	The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St. Louis River and tribal resources.	CR01
1760	Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice.	CR01
1761	the PolyMet Land Exchange ...[is] inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value.	LAN03
1762	the PolyMet project [will have]... cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish	MERC02, WR156
1763	the PolyMet project and Land Exchange [is]... inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes.	CR01
1764	The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands.	VEG03
<b>Sender Name (Submission ID)</b> Tom Graham (36537)		
14268	[The proposed mine] is extremely bad for the wildlife and water creatures.	WI01
14269	I don't think [the proposed mine is] in the best interest of the area or for the people living there and then the people using the boundary waters canoe area.	WILD02

9333	The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees.	SO04
9334	PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated [and] 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated	WR070
9335	The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site.	WR044, WR049, WR149, WR172, WR173, WR174
14300	What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear?	FIN05
14301	Not all of the polluted water will be captured for treatment	PD03, WR017, WR018, WR070
14302	Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated.	PD04, WR070, WR117
14303	Annually, 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated.	PD04, WR070
14304	The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water.	WR070
<b>Sender Name (Submission ID)</b> Tom Roth (50003)		
12986	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN10
<b>Sender Name (Submission ID)</b> Tom Rukavina (44812)		
7282	It makes economic and environmental sense to locate this Northmet mine in the Hoyt Lakes/ Babbitt area. The towns that will house the workers are already there and are capable of accomodating the influx of workers needed to build and operate the mine.	SO10
7285	By using all the old course and fine crushers, concentrator, power lines and sub-stations, railroads, haul roads etc, the NorthMet project will save the environment by not having to mine for the metals that built this minesite the first time around.	PD28
7287	The human race and the citizens of the USA need the resources that will be mined at the Northmet site.	NEPA05
7288	In order for the human race to move away from the fosil fuels that cause global warming, we need the copper and nickel and platinum, palladium etc that will be mined at this site.	NEPA05
7292	Modern technology and modern regulations will insure that this mine will be one of the most environmentally sensitive mines in the world.	PER34
7293	We know that here in the USA, you regulators will make sure that we put all the safeguards in place to make this mine the safest in the world.	PER34

<b>Sender Name (Submission ID)</b> Trevor Russell (38788)		
4904	There is just no way to be sure that this company will even exist half a millennium from now - when its pollution will still need treatment. Which means there is just no way this won't become a financial burden to our state and an embarrassment to our people.	FIN01
<b>Sender Name (Submission ID)</b> Trish (49559)		
12901	PolyMet may have some good points, but it will also destroy the wetlands!!	WET24
<b>Sender Name (Submission ID)</b> Tristan McCormick (41253)		
9306	As I'm sure you know... the impact of which is huge but containable, sulfide mining tailings produce highly acidic runoff. The upper Minnesotan hydrological system is so interconnected that this would mean centuries of catastrophic and un-manageable ecological costs in what might be the combined most beautiful, ecologically valuable, and visited lake ecosystem in the Union.	WR001, WR115, WR195
9307	Even if they DID commit the appropriate amount of fund (which is probably, you know, hundreds of billions of dollars since the runoff would need essentially indefinite treatment), there is a nearly flawless record of companies like this almost immediately raiding those funds/hiding behind bankruptcy protection. Then who pays for it?	FIN01, FIN08
9308	The few thousand jobs created over the next decade will be nothing compared to the job and revenue losses in the tourism industry that will almost certainly result as people are less inclined to visit a lake system....	SO01
14216	These companies aren't even American! Which might be the WORST possible reason to reject this mine but the money isn't even staying in the state! It's going to some international mining conglomerate acting through shell corporations!!	FIN04
<b>Sender Name (Submission ID)</b> Trout Unlimited Minnesota (54909)		
18866	While state law and prudence require that closed mines be maintenance free, the mining plan outlined in the SDEIS reveals that the NorthMet sites will require hundreds of years of monitoring and water treatment. Indeed, at the end of the arbitrary 500 year time period beyond which PolyMet chose not to run its model, water seeping from the site still will not meet several water quality standards.	WR037, WR128
18868	Some of these pollutants show declining levels, but the SDEIS fails to examine how far the presumably tapering "tails" extends into the distant future. The model needs to be run further out into the future, especially for persistent pollutants such as mercury and other heavy metals.	WR036
18872	The SDEIS does not adequately examine the cumulative impact of long term loading of Lake Superior and inland waters with numerous heavy metals, especially mercury...Indeed all northeast Minnesota trout waters could be impacted by increased emissions of airborne mercury, both from the NorthMet site and from the coal power plants generating the power needed for the operations. These impacts need further analysis in the SDEIS.	MERC08, MERC10
18877	We are particularly concerned that the collective impact of increased levels of sulfates, mercury and other heavy metals leaching into the St. Louis River and Lake Superior, alteration of hydrology, and increased mercury loading in wetlands and waters within the Lake Superior basin will lead to increased bioaccumulation of mercury in fish, ourselves and our children and grandchildren.	MERC03
18878	We note that the SDEIS assumes a net offset in mercury due to treatment of the water entering the Partridge River. However, this analysis fails to account for the fact that there will be no such treatment in the first 40 years.	WR158

<b>Sender Name (Submission ID)</b>	Trout Unlimited Minnesota (54909)	
18879	The SDEIS also discounts the impacts of sulfates and leached heavy metals based upon the fact that they will be somewhat diluted before entering surface waters. However, because of mercury's long term persistence in the environment, discounting impacts based upon dilution is not justified.	MERC16
18881	the impact of failing to replace most of these [impacted/removed] wetlands within the Lake Superior basin needs greater scrutiny. A clear plan is needed which replaces all the important/unctions of these wetland (both destroyed and impacted wetlands) within the Lake Superior basin.	WET03
18882	To preserve the outstanding quality of Lake Superior and the productivity of its coldwater fisheries the wetland impacts must be mitigated within the basin, not elsewhere.	WET03
18883	While the impact of treated water is discussed at length, the substantial amounts of water which will not be collected, conservatively estimated at 10% of all water, are not included in numerous calculations.	WR018, WR070
18884	The SDEIS's assumptions about the absence of fractures under the pit locations, confused by a permeability analysis which assumes no fractures, further cast doubt upon the estimates of seepage volumes.	WR011
18885	Given the substantial doubts surrounding the groundwater model and unproven assumptions regarding bedrock fractures, the lining of all pits and waste rock piles and construction containment systems should be explored as alternatives.	ALT06, ALT07, ALT13
18886	Engineered redundancies for the protection of water quality are warranted from the outset given the importance of preventing any degradation of Lake Superior and its tributaries. It is not appropriate to delay an examination of these measures until the permitting phase. The purpose of the EIS process is to ensure that all potential impacts and measures to avoid them are thoroughly vetted by the public during the EIS process.	ALT13
18887	The SDEIS needs to carefully explore...lining all pits and stockpile locations, including at the mine site;	ALT07, ALT13
18888	The SDEIS needs to carefully explore...installing a water collection system under each liner	ALT13
18889	The SDEIS needs to carefully explore...constructing or extending water containment and collection systems around the entire perimeter of each pit and stockpile	ALT13
18890	The SDEIS needs to carefully explore...locating additional monitoring wells in close proximity to the edges of the containment systems, rather than only at points of discharge into surface waters.	WR078, WR079
18891	We are concerned with plans to essentially "pirate" the base flow from wetlands and streams for many years...The SDEIS fails to examine the impacts on aquatic life of stealing these base flows and pumping it to the pits.	AQ24
18892	The SDEIS should explore other alternatives for supplying water to the pits for subaqueous disposal. Collected groundwater should instead be treated and released into infiltration areas downslope from the containment areas to mimic natural groundwater flow to the streams.	ALT13
18893	The SDEIS fails to detail the monitoring plans which have a bearing on when or whether seepage of contaminated water is detected and corrective action taken. Likewise, it fails to lay out all possible adaptive water management strategies (i.e., share some of the less optimistic scenarios) and evaluate the relative merits and impacts of each.	WR139
18894	Since the adequacy of financial resources can affect the level of impacts, the SDEIS must provide detailed information of the range of financial assurances likely to be required should this project move forward.	FIN08

18895	We strongly disagree with the agencies' decision not to conduct a full examination of the underground mine alternative, and with the reasoning offered for it. This alternative is a reasonable one and should have been reexamined in greater detail in the SDEIS...[If all] costs of the open pit mining plan are counted, we suspect that the underground mine alternative will be as economically feasible [as the proposed action].	ALT01
18896	We do not see evidence in the SDEIS that monetary values have been assigned to all of the real costs of the proposed mining plan. These include the costs of truly adequate financial assurances necessary to meet all contingencies, including adaptive water management measures.	FIN01
18897	We caution that the agencies' reasoning used for dismissing an alternative because it does not meet a proposer's "need" is rather circular and could be used to exclude all alternatives which reduce profits. At some point every measure needed for resource protection which is not in a proposer's plan does not meet its "need" for a desired level of profit.	NEPA01
18898	Page ES-39 indicates that the mine would reduce water flows in several tributary streams to the Partridge and Embarrass Rivers. It dismisses the possibility of potential impacts from this on the basis that the flows would "remain within the range of annual natural variability." This reflects a poor understanding of riverine systems, which need period high water and "flushing flows" to maintain ecosystem health.	WR185
18899	Proposed practice of blending sulfides (and heavy metals discharges) to levels where acid mine drainage cannot occur is untested and optimistic.	WR147
18900	The proposed land exchange fails achieve the stated need, "To eliminate surface and mineral conflicts within the Superior National Forest by exchanging federal lands for non-federal lands that have equal or greater value." The proposed exchange does not accomplish this. Rather it merely exchanges one present conflict for future conflicts involving newly acquired lands which also have severed mineral rights.	LAN04
18901	The 90 day comment period was too short for our members to adequately review the voluminous, often technically complex, SDEIS documents.	NEPA07

2272	I ask that the land exchange be denied until the SDEIS addresses the alternatives to courses of action in regards to the project, at most levels as the SDEIS does little in the way of addressing different methods or outcome scenarios.	ALT23
2272	I ask that the land exchange be denied until the SDEIS addresses the alternatives to courses of action in regards to the project, at most levels as the SDEIS does little in the way of addressing different methods or outcome scenarios.	ALT23
2406	I would like to request that it [SDEIS] is rejected and reanalyzed.	NEPA15
2409	in the SDEIS -- in the EIS they demonstrate that they will be using the LTV site. (Inaudible) it drains from the bottom into three separate streams. It was designed that way. They are just going to pile a different type of waste on top.	WR018, WR182
2410	I will remind you that this type of mining has never been done safely and we live in a high-water content area	WR023
2411	... PolyMet doesn't acknowledge 500-year floods or 1,000-year floods, 2,000-year floods at the site...The main flaw in the EIS, the acronym that applies here, it is that it doesn't show what happens if the pumps at the edge of that tailing pond fail. It doesn't show the alternative scenarios. It doesn't show that 21 gallons per minute that leaks from the LTV site, that they admit will be leaking 21 gallons per minute, that is --first of all, that's never been demonstrated before. They acknowledge that untreated water will be leaving the waste site.	WR021
7859	The wetlands are literally an irreplaceable asset in the watershed; no wetland, natural or fostered, will contribute to the relevant watersheds as the loss proposed in the Section 404 request	COE01
7859	The wetlands are literally an irreplaceable asset in the watershed; no wetland, natural or fostered, will contribute to the relevant watersheds as the loss proposed in the Section 404 request	COE01
13911	When you take a wetland out from one area, you can't just have another one happen somewhere else. Any technologist can tell you that. Any geographer can tell you that. It might be a similar size of wetland, but the service it provides to your economy isn't the same, if in a specific location, you filter more water than in another location. So, just adding more wetlands somewhere else while destroying the wetlands on the other line won't work.	WET05

5507	The public does not fully understand the underlying science related to the generation of acids due to the proposed mining operations...Clarify the underlying geology and chemistry, esp. why certain metals are apt to bind with sulfides in nature...	WR001
5516	How can the time periods for active vs. passive treatment [of water at the Mine and Plant sites] be better constrained? Articulate results more clearly; provide model results across a range of specific flow and treatment option scenarios. Provide results of sensitivity analyses for hydrologic modeling.	WR036, WR137, WR175
5517	How do you insure that the potential for acidic runoff is mitigated before it leaves the pile area? A potential solution may be use of a fine limestone so that water can interact with this material to neutralize any leachate found. (Reaction kinetics information may be needed to show this will work.)	WR127
5518	How does PolyMet assure that there is not a significant amount of class 2/3, class 4 (dc) and class 4 (VF) materials in the class 1 waste pile? Consider a potential approach as follows: put clay liner down, then layer of fine limestone to react with any potential sulfuric acid that may be generated; calculate based on assumption that a little of the class 2/3, class 4 (DC, VF) is present; clarify how rock type separation is to be controlled.	PD15, PD34
5519	What actions must be taken to control acid generation in the east pit area? Consider a calculated limestone addition. Amount of limestone should be based on mass balance calculations to react with/to total amount of sulfur present. It may be possible to pre-buffer the higher sulfate rock as it is being added to the pit so that potential acid sulfate issues are mitigated before they can cause environmental harm. Consider lining the pit walls in areas of enhanced sulfide materialization prior to filling the pit to minimize water contact with sulfide materials.	WR002, WR027
5520	What special quality control procedures will be used to ensure that "excellent" installation of the [geomembrane] liner is achieved? Provide a quality control plan for effective sealing of liner materials.	PD15
5521	What is the expected lifespan of geomembrane liners? Literature suggests that lifespan is unknown, but will depend on type of membrane, geochemical, and physical environment. Major points of failure are seams. Certainly the lifespan will be finite; will it be shorter than the predicted need for either temporary (class 2/3, 4) or long-term (class 1) sequestration? Provide data addressing the life-span and performance of the liner.	PD15
5522	Is ageing of the slurry wall an issue? What if cracks (etc.) are present or are created in the bedrock by the construction of the slurry wall. What contingency plans are in place for problems or failures associated with the slurry wall?	PD07
5523	At present, the amount of actual ore to be process is ambiguous. Clarify the volume of material that will be removed, processed, and produced as concentrate. Indicate actual amount of rock to be processed in terms of metallic values. Indicate the volume of residue from the hydro-met system that will be generated and the proactive treatment regime that will be employed to minimize future issues with this material category.	PD30
5524	Salt will be a significant byproduct resulting from operations of reverse osmosis units. Define how salts from reverse osmosis unit will be handled/disposed of on a long term basis.	PD03
5526	How will PolyMet ensure that facilities will last as long as treatment is necessary? Indicate the measures that will be taken to maintain/improve conditions as adaptive management proceeds. Some of the countermeasures noted in previous sections could be very helpful in reducing overall long-term treatment requirements.	PD22
5532	How will dust loading be handled at the crushing stages of the ore? Describe plans to characterize, monitor and control dust. Describe the physical, chemical, and mineralogical attributes of the dust, and evaluate potentially harmful health affects (for example, respirable silica, elongate mineral particles, etc.)	AIR10

5538	Project will result in increased loading [of mercury] into Embarrass River and decreased loading into Partridge River (because of water treatment). Results in a net decrease in Hg loading to the St. Louis River. However, given the current TMDL for mercury, is any increase in Hg loading to a permanent water body acceptable, even if the net result of the project is decreased loading downstream? Consider engineering solution.	MERC18, MERC22
5544	The pit lake was cited as needing perpetual treatment due to leaching from pit sidewalls (SO <sub>4</sub> , heavy metals). Consider proactively treating the water filling pit so leaching of sulfate, heavy metals is precluded or minimized. Actions could be taken to lessen leaching from mine walls. The following treatments could be considered: (1) Add class 1 materials into pit to reduce depth of lake, and minimize access to pit walls for reactions, to a depth where reaction to produce acid would likely not take place. (2) Limestone addition is typically used to reduce sulfate levels in pit lakes right now -- calculate amount of limestone necessary to mitigate leaching from pit sidewalls and production of metals/sulfate. This reduces amount of class 1 material in class 1 waste rock pile and will reduce the overall depth of the proposed pit lake. In addition, if all the Class 1 material is backfilled into the West pit then the legacy issues potentially associated with any intermixing of higher sulfur rock that might get into this pile are eliminated.	ALT03, ALT06, ALT13
5545	PolyMet could explore sustainability options involving beneficial use of the synthetic gypsum produced during the hydromet process. Encourage the exploration of market options for this material in the building products (e.g. gypsum board) and agriculture (e.g. soil amendment) sectors.	ALT17
5546	What is the magnitude of pH change as a result of the proposed action in relation to background levels of natural and pit lakes in the region? Illustrate pH values of pit lakes across range in relation to proposed pH of pit lake at PolyMet proposed site. Illustrate predicted pH, alkalinity, and sulfate for the tailings basin and the pit lake. Define pH variance. Consider baseline data with respect to acid mine drainage issues and concerns.	WR001, WR060, WR173
5547	Contingency planning [in cases where treatment plant activities are compromised] is a must and should include responses to failure of passive systems (pits, tailing ponds, slurry wall, etc.) and active systems (WWTF, WWTP)...Evaluate 100 year and 500 year weather events and develop responses that will prevent any water deterioration or other environmental degradation.	PD22
5548	There was no analysis to account for changing climate, and potential effects of both higher peak flows and increased variability...Hydrologic models in the EIS do not account for the possibility of lower base flows in summer (due to less precipitation and higher evapotranspiration caused by increased air temperatures), and potential for increased number of intense rain events. Contingency plans are needed for all such scenarios.	PD22, WR180
5549	There is no analysis to account for changing base flow levels. Indicate results of sensitivity analyses at lower- and higher-base flow values that were utilized in developing the hydrologic models.	WR003, WR091
5550	Wetlands will be lost in a region that currently contains a large proportion of its original wetlands. Selecting potential mitigation wetlands can be challenging in these conditions...Focus mitigation on "restorable" wetlands within the same watershed; or consider the possibility of enhancing existing wetlands of the same type elsewhere in the watershed. NRRI expertise can contribute to the selection of restorable wetlands and enhancement of existing wetlands.	WET03
5551	Ensure that worker health safety measures are clearly discussed in EIS, and that contingency plans for worker/public safety in the event(s) of emergencies are clearly spelled out. Indicate measures by which PolyMet will insure that OSHA/MSHA standards for worker health safety are addressed and met.	HU04

5552	What is the true life cycle cost of this project, from inception through closure? An economic model that includes both inputs and outputs must be a part of the discussion; the IMPLAN model was limited in scope and accounts for the benefits side of the equation but does not consider the total costs of this project relative to the benefits of jobs and taxes. Consider conducting a more thorough economic study that includes the externalities, such as the costs of pollution control and abatement, the loss of ecosystem services from the lost wetland and forest cover should be conducted, and cost of road and other infrastructure use and degradation.	SO04
5553	What quantity of refined metal will be produced within Minnesota and/or domestically? What percentage of the metals is anticipated to be used domestically, and what percentage will be exported? Why is it strategically important for the United States to produce these metals here? Describe the degree to which the United States' dependence on non-ferrous metals is anticipated to be met by the project. Indicate current US strategic metal reliance on foreign sources	SO04
5554	What is the position of PolyMet in following the sustainability directives currently suggested by various mining organizations (for example, 10 Principles of ICMM)? We strongly encourage PolyMet to develop and commit to maintaining a transparent responsible mining policy and discuss how objectives will be achieved to maintain a Social License to Operate throughout all phases of the proposed project.	ALT01
<b>Sender Name (Submission ID)</b> United Transportation Union (54880)		
19569	We believe that northern Minnesota has the opportunity to produce minerals that will remain in demand far into the future in a manner that can set the high standard for environmental preservation worldwide...We look forward to the delivery of essential rail service with new economic development in northern Minnesota.	SO10
<b>Sender Name (Submission ID)</b> USEPA (47834)		
2981	Comment # 1. Spill prevention is an important part of the mitigation for this project. Using new or retrofit side dump rail cars (possibly with hydraulic air-operation conversions) should be considered as part of the mitigation package for the proposed action. Proactive mitigation through the use of updated rail infrastructure would help reduce spillage and subsequent environmental concerns, possibly including the need for additional long-term water treatment.Recommendation: Consider use of new or retrofit side-dump rail cars when producing the spilled ore plan.	COOP01, WR151
2982	Comment # 2. Pages 5-50 forward describe how the company has classified its waste rock and tailings into four categories based on their likelihood to generate acid rock drainage. We understand from discussion with the co-lead agencies that lime will be added to Category I waste rock, which is expected to result in neutral to slightly basic pH.Recommendation: The FEIS should indicate that Category I waste rock leachate is expected to have a neutral to slightly basic pH due to the addition of lime.	COOP01, WR027
2983	Comment # 3. Page 5-157, Section 5.2.2.3.3, 2nd Paragraph: information on the design, operations, and monitoring plans for the hydrometallurgical research facility (HRF) is insufficiently detailed.Recommendation: The FEIS should provide information on the HRF's design and operations in sufficient detail for the reader to understand potential impacts associated with this facility and how those impacts will be avoided or mitigated. This includes explaining that a detailed Residue Management Plan for this facility will be required during permitting.	COOP01, PD17, WR066
2984	Comment # 4. Page 4-336 discusses the possibility of inundating an existing coal ash landfill located within the proposed tailings basin. Based on current knowledge of leachate concentrations found in groundwater at such landfills, inundation may lead to future water quality impacts.Recommendation: The FEIS should discuss how constituents found in the coal ash landfill may impact water quality in the Embarrass River, how this landfill will be protectively managed, and how any impacts will be mitigated.	COOP01, WR028

2985	Comment # 5. CWA requirements for antidegradation ("nondegradation" in Minnesota's terminology) help ensure that a proposed project will not result in a loss of existing uses of surface waters, and preclude reduced water quality unless the State determines it is necessary to accommodate important social and economic development (see 40 CFR 131.12). This review must occur before project activity that may result in a new or increased discharge commences, and should not be deferred until NPDES permitting. EPA understands from discussion with MPCA that much, if not all, of the information needed for an antidegradation review is already contained in the SDEIS. Recommendation: The FEIS should include an evaluation of which of Minnesota's nondegradation rules (7050.0180, 7050.0185, 7052.0300) apply to this project, and explain how the project complies with the applicable nondegradation rules	COOP01, PER09, WR109
2986	Comment # 6. The proposed project provides significant overall environmental improvements over the proposal in the DEIS through installation of seepage containment and other controls at the former LTV tailings basin. However, the SDEIS modeling predicts increases in aluminum (Al) and lead (Pb) in surface waters affected by the proposed project- including exceedances of evaluation criteria for Al and Pb at locations on four tributaries to the Embarrass River (p. 5-7 to 5-8). These predicted increases are based on a number of assumptions, including the contribution from remediation of the former LTV tailings basin. The SDEIS modeling also predicts other increases and exceedances of evaluation criteria based on the "Continuation of Existing Conditions" scenario. EPA understands that monitoring of receiving waters downgradient of the existing tailings basin is being carried out now. This monitoring data will be an important source of information to consider along with modeling results. Recommendation: Available monitoring data should be used to inform NPDES permitting. Monitoring should continue throughout the life of the project to inform permitting, adaptive management, and additional measures to prevent or mitigate impacts to aquatic life as necessary.	AQ12, AQ30, COOP01, WR139
2987	Comment # 7. The SDEIS anticipates that pollutants will be discharged from mine site features, travel via groundwater pathways and reach the Partridge River several years following the start of the mining project. See SDEIS Table 5.2.2-26. However, as EPA has stated previously, the pollutants originating from mine site features may discharge to jurisdictional wetlands and tributaries prior to reaching the Partridge River. CWA Section 301 prohibits any point source discharge of pollutants to waters of the United States, either directly or via directly connected groundwater, unless the discharge complies with a NPDES permit. Waters of the United States include jurisdictional wetlands and tributaries. See 40 CFR 122.2. Recommendation: The FEIS should reflect the fact that a NPDES permit is required before the pollutants from the mine site reach waters of the U.S. (including jurisdictional wetlands and tributaries). Statements in the SDEIS about when discharges will reach waters of the U.S. should be revised, and these changes should be reflected in the FEIS.	COOP01, PER05
2988	Comment # 8. The Tribal Cooperating Agencies Cumulative Effects Analysis (September 2013) included in Appendix C of the SDEIS states: "PSDEIS Table 4.2.2-18 reports Colby Lake as currently having an observed mean for Arsenic of 0.78 to 1.4 ug/L (depending on the data set), whereas Figure 5.2.2-35, the No- Action (continuation of current conditions)" P50 model for Colby Lake Arsenic shows annual maximum values of 0.5 ug/L." In addition, the SDEIS shows Colby Lake's current mean arsenic concentration as 0.78-1.4 ug/L on Table 4.2.2-18, with a range of 0.25-2.3 ug/L, while the modeled p90 maximum value in Figure 5.2.2-35 lists the maximum concentration of arsenic in Colby Lake as 0.70 ug/L. Comparing the modeled mean for arsenic in Colby Lake to existing site-specific data in the SDEIS, the model outputs underestimate arsenic concentrations by up to 100%. Colby Lake is currently modeled as a continuation of the Partridge River because there is insufficient data to model it as a lake, which may be causing this discrepancy. We understand that monitoring is ongoing, which may provide additional information on observed arsenic concentrations. Recommendation: The FEIS should document an analysis that addresses this discrepancy between existing conditions in Colby Lake and modeling results, taking into account all necessary data. The FEIS should include any follow-up actions that will be necessary based on this analysis.	COOP01, WR046
2989	Comment # 9. Modeling using MODFLOW assumes no seepage through the berm on the east side of the tailings basin. The co-lead agencies have agreed to reexamine this assumption. MODFLOW outputs are used as an input to the GoldSim model, so changes to these outputs may require updated GoldSim modeling as well. Recommendation: Recalibrate MODFLOW as necessary to reflect seepage on the east side of the tailings basin, and update GoldSim modeling as necessary. The FEIS should explain how this comment was addressed.	COOP01, WR054, WR102

2990	Comment #10. Modeling of water quality parameters is subject to inherent uncertainties that call for ongoing evaluation. For example, acid rock drainage (ARD) in cold, wet climates raises uncertainty due to climatic factors including distinct freeze-thaw cycles, varying contributions from rain and snow, and a period of significant melting during the spring thaw. Recommendation: The permit to mine should require water quality modeling throughout the life of the mine, assuring that the model uses input from actual monitoring discharge data as it becomes available, so this information can be used to support adaptive management. The model should accommodate specific climatic factors associated with the site.	COOP01, WR130, WR139
2991	Comment #11. MDNR has collected new Partridge River flow data that vary from the base flow calculations used for modeling in the SDEIS. The co-lead agencies have explained that the model accounts for this discrepancy, which is correlated with pit dewatering from the upstream Peter Mitchell Pit, a factor that was not present during the time period used for continuous flow data in the SDEIS (1978-1987), Details are provided in a technical memorandum from the coleadagencies. While the flow data used in the S DEIS was appropriate, low-flow conditions may not represent the most conservative conditions, though they are conservative in that they assume less dilutionof contaminants. However, dilution is the only variable considered. High-flow conditions, while increasing dilution, may mobilize contaminants toa greater extent than expected under low-flow conditions. Recommendation: The FEIS should evaluate how base flow affects variables other than dilution, taking into account high-flow as well as low-flow scenarios.	COOP01, WR091, WR165
2992	Comment # 12. There is insufficient detail to explain why "outlier" data were excluded from consideration in the GoldSim model. Recommendation: The FEIS should provide a specific justification to support excluding any such data from modeling.	COOP01, WR072
2993	Comment # 13. Page 5-61: the SDEIS shows that tailings leachate pH increases after 300 weeks, but does not show how leachate pH was extrapolated to the longer term, such as 50-100 years. We understand this data is already available. Recommendation: The FEIS should show how leachate pH was extrapolated to the longer term, such as 50-100 years, through a graph or chart.	COOP01, WR001
2994	Comment # 14. The SDEIS could be interpreted to imply that the plant site is expected to need water treatment for up to 500 years, and the mine site for up to 200 years. We understand from discussion with the co-lead agencies that this interpretation is incorrect. Recommendation: The FEIS should clearly explain the timeframe during which water treatment is projected, for both the plant and mine sites.	COOP01, WR036
2995	Comment # 15. Page 5-20: the SDEIS states that "mercury was not included in the GoldSim model, as insufficient data and a general lack of definitive understanding of mercury dynamics prevented modeling mercury like the other solutes." It also states that "regardless, the NorthMet Project Proposed Action would still need to demonstrate consistency with the mercury evaluation criteria (see Section 5.2.2.1)." Given the absence of modeling data for mercury, it is unclear how consistency with mercury evaluation criteria will be determined. Recommendation: The FEIS should either provide a supporting rationale that explains why elemental mercury does not warrant modeling, and how consistency with mercury evaluation criteria will be determined; or include modeling and evaluation of elemental mercury. If GoldSim is not suitable to model this pollutant, elemental mercury can be modeled using a different water quality model, such as the Water Quality Analysis Simulation Program (WASP)3, which is commonly used by EPA to model elemental mercury.	COOP01, MERC13
2996	Comment # 16. Page 5-509, Section 5.2.10.2.6, 51h paragraph: The SDEIS states that "increased mercury concentrations, and associated increases in mercury bioaccumulation in fish tissue could therefore constitute an environmental justice impact for Band members and other subsistence consumers of fish;" and that "deposition of mercury from the NorthMet Project Proposed Action would cease at closure, but mercury bioaccumulation in fish tissue and existing fish consumption limits could persist beyond the mine's operational life." Table 5.2.2-51 shows how much elemental mercury is expected to leave the project site under currently-proposed control measures. Further consideration of mercury impacts is needed. Recommendation: The FEIS should refine the quoted statement to more clearly characterize the risks associated with mercury releases. Based on this risk characterization, the FEIS should explain what has been and will be done to avoid, minimize, and mitigate mercury releases from the project.	COOP01, MERC02, MERC24

2997	<p>Comment # 17. The SDEIS describes current site conditions, including the acreage, type, and quality of the wetland resources at the tailings basin and mine sites. The SDEIS also describes the proposed direct impacts remaining after measures to avoid or minimize direct impacts. However, the SDEIS does not quantitatively assess indirect impacts or measures to minimize and mitigate these impacts, except with respect to wetland losses due to fragmentation. The SDEIS also omits all indirect impacts from the cumulative impacts analysis for wetlands (Section 6.2.3.4). Recommendation: The FEIS should quantitatively assess all indirect impacts. The FEIS should more clearly describe the proposed mitigation plan, including mitigation for indirect impacts. The monitoring and mitigation plans in the CW A Section 404 permit should clearly explain proposed measures to minimize and mitigate indirect wetland impacts during the project.</p>	COE02, COOP01, WET18
2999	<p>Comment # 18. The SDEIS uses wetland assessment sites as an approach for evaluating impacts. The location of these assessment sites is discussed in the SDEIS, and Figure 4.2.3-2 shows locations of wetland assessment sites as points in a diagram. There are few wetland assessment site locations north and south of the mine site, and those shown on Figure 4.2.3-2 are far from the site boundary. The SDEIS does not sufficiently explain the assessment approach. Recommendation: The FEIS should describe in more detail the wetland assessment protocol and the assessment sites used, including the assessment methods used at those locations, why these locations were chosen, and how will they be used (e.g., for monitoring future wetland conditions).</p>	COOP01, WET21
3000	<p>Comment # 19. Section 5.2.3 states that 26.9 acres will be impacted by fragmentation, and that these losses will be mitigated. The criteria used to determine fragmentation are broadly described in Section 5.2.3.1.2, but lack sufficient detail. Recommendation: The FEIS should describe in more detail the criteria used to determine fragmentation losses.</p>	COOP01, WET08
3001	<p>Comment # 20. Figure 5.2.3-4 highlights wetland acres at the mine site where the proposed mine features would indirectly impact wetlands by fragmentation. Fragmentation is defined in the SDEIS as causing a change in the watershed area by greater than 20%. The SDEIS (Page 5-226) briefly describes how fragmented wetlands were identified, but does not explain the method for determining the 20% threshold. Indirect impacts from fragmentation at the mine site will also include habitat fragmentation, divisions in vegetative communities, and the general loss of functions in wetlands that are divided from adjacent wetlands and made smaller by mine features. Wetland acres that are surrounded on all sides by mine features will be fragmented because their ecological functions will be impaired. Recommendation: The FEIS should explain how the 20% threshold was determined. The FEIS should also recognize that the term "fragmentation" may define indirect impacts other than changes in watershed size. These other factors should be included when estimating fragmentation impacts. Compensatory mitigation should also be proposed for all losses of wetland functions due to wetland fragmentation (in addition to adverse impacts from changes to a wetland's watershed).</p>	COOP01, WET01, WET08
3002	<p>Comment # 21. Section 5.2.3 describes the proposed wetland mitigation plan. EPA previously commented on the proposed mitigation ratios, and supports the mitigation ratios proposed in USACE's May 29, 2013 Draft Memorandum on The Application of the Federal Mitigation Rule and St. Paul District Policy Guidance on Compensatory Mitigation, as described on page 5-316. The SDEIS describes the proposed ratios, but also states, "The determination of final mitigation credits ... would be determined during permitting" (p 5-224). Recommendation: The FEIS should provide a status update on development of final wetland mitigation credits. EP A will work with USACE during CW A Section 404 permitting to determine the final wetland mitigation credits needed, including mitigation for indirect impacts.</p>	COOP01, WET04
3003	<p>Comment # 22. The proposed mitigation plan includes post-mining on-site wetland mitigation. Restoration of wetlands on the site as part of reclamation is positive and important, but EPA and USACE have agreed that mitigation credits are not appropriate given how long it will be before this mitigation is carried out. The S DEIS contains inconsistent statements regarding whether or not on-site mitigation is proposed to generate mitigation credits. Recommendation: The FEIS should be clear that post-mining, on-site mitigation will not be used for mitigation credits. The mitigation plan in the CW A Section 404 permit should exclude mitigation credits for post-mining, on-site wetland mitigation.</p>	COE01, COOP01

3004	Comment# 23. Page 6-36, Table 6.2-8 and Pages 6-40 to 6-42, Table 6.2-11: There appear to be some inconsistencies between Table 6.2-8 and Table 6.2-11 with respect to reported future wetland and water resource numbers, including the bullet summaries for the Partridge River (Page 6-40) and Embarrass River (Page 6-42). For the Partridge River, Table 6.2-11 and bullet summary text note future condition with 3,516 acres of deepwater resources, while Table 6.2-8 indicates 1,922 acres. Recommendation: The FEIS should resolve or explain these inconsistencies.	COOP01, EDIT01
3005	Comment# 24. Page 6-21, Section 6.2.3.3.2: the "Contributing Past, Present, and Reasonably Foreseeable Actions" section, lists twelve foreseeable future actions with potential cumulative effects on surface water hydrology and quality in the Partridge River and Embarrass River watersheds. There is some inconsistency between this list and Table 6.2-1 (Page 6-7). "Cliffs Erie, LLC- Hoyt Lakes Area (former LTVSMC)," and "Cliffs Erie, LLC- Area 5 NW Pit" are not included in the table, at least not by these names. Recommendation: The FEIS should resolve or explain these inconsistencies, and use consistent names for foreseeable future actions to simplify cross-referencing by the reader.	COOP01, EDIT01
3006	Comment # 25. Page 6-26 states: "In summary, the maximum cumulative effects of the NorthMet Project Proposed Action, plus present and reasonably foreseeable future actions on the hydrology of the Partridge River, would be expected to reduce average annual flow in the Lower Partridge River at any time during operations by no more than 8.4 cubic feet per second (cfs) and 2.4 cfs (2 percent) during closure of the NorthMet Project Proposed Action, based on average annual flow of 112 cfs at USGS gauging station 04016000 downstream of Colby Lake." In some cases, this effect is well above the mean recorded flow of the Upper Partridge River during certain times of the year. The SDEIS does not address how flow reductions will affect the Partridge River and its resources. Recommendation: The FEIS should discuss the magnitude and significance of these flow reductions, including additional analysis or information as necessary. Potential impacts caused by these reductions should be discussed in section 6.2.3.3.3.	COOP01, WR024
3008	Comment # 26. Pages 6-22 to 6-25 and 6-27 to 6-28, Section 6.2.3.3.3: This text does not reference sources of hydrological effects data for each action. Recommendation: The FEIS should reference sources of hydrological effects data for each action.	COOP01, EDIT01
3009	Comment# 27. Table 6.2-15 shows the direct effect of other actions in terms of populations of each plant species affected. However, the SDEIS notes that for 4 out of 9 potentially contributing actions, "The NHIS data and MDNR take permit data were reviewed and no vegetation records were available for these actions. As a result, these actions are not considered in the cumulative effects analysis for vegetation." Recommendation: The FEIS should indicate whether the lack of vegetation records indicate no cumulative effects on vegetation, or simply lack of data on the subject.	COOP01, VEG08
3010	Comment # 28. We understand that MDNR will not calculate detailed financial assurance until the Permit to Mine process, although it may have additional information before the FEIS is issued. Recommendation: The FEIS should include additional information on financial assurance as available.	COOP01, FIN01, FIN08
3011	Comment # 29. The SDEIS does not identify the least environmentally damaging practicable alternative (LEDPA). This information will be required for CWA Section 404 permitting under CWA Section 404(b)(1). Recommendation: The FEIS should describe the process that will be used to determine the LEDP A, and should provide LEDP A information to the extent it is available.	COE02, COOP01
3012	Comment # 30. The Noise section and page 5-370 of the SDEIS does not sufficiently describe potential noise impacts from blasting and vibrations on wildlife. A cited Federal Highway Administration technical document in Appendix C of the SDEIS provides information on the sound threshold and frequency range for four biologic classes (mammals, birds, reptiles, and amphibians). Recommendation: The FEIS should contain analyses of noise and vibration impacts to wildlife based on the above biologic classes' sound threshold and frequency range, based on information included and cited in the SDEIS. Any impacts and/or mitigation measures should be noted in the FEIS.4	COOP01, N04

3013	Comment # 31. On pages 1-14 and 1-15, the SDEIS notes that the USFS must determine that "the public interest will be well served" before it can enter into a discretionary, voluntary real estate transfer (36 CFR 254.3(b)). This analysis is included in the SDEIS, but should be made clearer and more focused. Recommendation: The FEIS should clearly and concisely summarize the analysis of the proposed land exchange (Alternative A) and Alternative B under 36 CFR 254.3(b), including a clear explanation of the rationale and criteria for selecting the preferred land exchange alternative, and of how protecting cultural resources is included in the public interest determination.	COOP01, LAN01
3014	Comment# 32. The SDEIS states that modeled groundwater capture system efficiency at the tailings basin is at least 90%. However, it does not explain the basis for this estimate.Recommendation: The FEIS should provide the specific model assumptions that were used to make this determination. Recommendation: The FEIS should indicate that any discharge not captured by the proposed capture systems and entering waters of the U.S. (e.g., jurisdictional wetlands, the Partridge and Embarrass Rivers and their tributaries) is subject to NPDES permitting.	COOP01, PER05, WR017, WR018
3016	Comment # 33. Pages 4-261 through 4-264 refer to cultural resources/Section 106 resources solely as historic properties. Recommendation: The FEIS should make it clear that cultural resources include archaeological resources.	COOP01, EDIT01
3017	Comment # 34. Moose is a culturally-important species that has traditionally been subsistence hunted by the Chippewa Tribe. The SDEIS does not adequately describe how the proposed project will impact moose population and habitat of moose. Based on information in the SDEIS, it appears that there are unconsidered impacts to moose population and habitat, such as the proposed impacts to two local wildlife corridors, moose reliance on wetlands during warmweather, and impacts on foraging. Recommendation: The FEIS should more completely explain how the proposed action will impact moose population and habitat.	COOP01, WI01
3018	Comment# 35. On March 13, 2014, MPCA released preliminary findings on the effects of sulfate on wild rice growth.Recommendation: The FEIS should provide the most current available information on MPCA's findings, and on next steps based on these findings.	COOP01, WR152
3019	Comment # 36. Section 5.2.14 addresses geotechnical issues at the mine. Reasonable stability analyses were conducted for the permanent waste rock pile, but it is unclear if the company has committed to designing this unit so it meets conservative static stability Factors of Safety (FOS) (static FOS of 1.5 and seismic FOS >1). The company has committed to meeting conservative FOS for both the tailings basin and the HRF. Recommendation: The FEIS should clarify the company's commitment with respect to design of the permanent waste rock pile.	COOP01, GT04
3020	Comment # 37. Liquefaction analyses were not conducted for the HRF, based on the assumption that those wastes could compress and that the likelihood of liquefaction is remote. However, liquefaction and liner leakage could occur at the HRF because the HRF is proposed to be located above a hydraulically-active seep, which will place inward hydraulic pressure on the HRF liners. Recommendation: The potential for liquefaction should be analyzed. The FEIS should clearly summarize the results of this analysis, including next steps in response to this analysis.	COOP01, GT11
3021	The alternatives analysis in the application references the 2009 Draft Environmental Impact Statement (DEIS) and 2013 Supplemental Draft Environmental Impact Statement (SDEIS), but does not include the necessary detail to determine that the preferred alternative is the Least Environmentally Damaging Practicable Alternative (LEDPA). Since the DEIS was published in 2009, the project has evolved and many alternative have been eliminated. Chapter 6 in the application describes some of those alternatives as they relate to direct wetland impacts; it is not a comprehensive list of alternatives, and it does not consider indirect impacts to wetlands and streams. EPA recommends that the applicant develop a table describing all alternatives considered during the environmental review process (e.g., mine methods, mine configurations, tailings processing options). The table would assist EPA in determining whether or not the preferred alternative is the LEDPA. The table should also include the reasons each alternative was eliminated, including references, and the potential direct and indirect effects to wetlands and streams.	COE04, COOP01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	USEPA (47834)	
3022	The application does not provide a quantitative assessment of all indirect impacts (except for fragmentation impacts). We recognize that the heterogeneity of the project site and the complexity of the wetlands and hydrology make it difficult to quantify indirect impact, but we recommend that specific impacts to wetlands within the mine site be identified to the extent possible. The application should better estimate the changes in functions and values at wetlands, especially those surrounded by mine features.	COE02, COOP01
3023	Specifically, EPA is concerned that there will be indirect impacts to remaining wetland areas in Wetlands Nos. 33A, 45, 48, 57, 68, 101, 88, 96, and 107. Indirect impacts in these wetland areas will include habitat fragmentation, divisions in vegetative communities, and the general loss of functions in wetlands that are separated from adjacent wetlands and made smaller by mine features. Specific compensatory mitigation should be proposed for all losses of wetland functions (including identification of ratios and site locations).	COE01, COOP01
3024	Large Figure 9 and 10 and Large Table 2 in the application highlight wetland areas at the mine and plant sites where the proposed mine features would indirectly impact wetlands by fragmentation. Compensatory mitigation is proposed for those areas. Page 3 of the Wetland Analysis Workplan (Attachment B) gives a brief description of how fragmented wetlands were identified, but the application should also describe the impact thresholds and how the fragmentation impact criteria were developed.	COE02, COOP01
3025	Page 58 of the application states that the purpose of the indirect impacts analysis is to inform the monitoring plan for indirect wetland impacts. The application should include a description of how the impacts analysis will be used to ensure that indirect impacts are avoided, minimized, and mitigated. Section 11-5 in the application implies that the indirect impact monitoring plan will focus on wetlands that are under threat by multiple indirect impact factors (Table 11-1 ); this is not a valid approach because even wetlands that are under risk of one factor (such as only drawdown or only decreased water quality) would result in a loss of wetland function. We recommend more comprehensive monitoring for indirect impacts at the plant and mine sites.	COE02, COOP01
3026	The application does not describe monitoring for stream impacts surrounding the project areas. We recommend that the U.S. Army Corps of Engineers (Corps) require monitoring for indirect impacts to headwater streams surrounding the site as well as impacts to wetlands.	COE02, COOP01
3027	There is a potential for indirect impacts to wetlands, Spring Mine Creek, and Spring Mine Lake on the east side of the tailings basin, but no monitoring sites are proposed for that area. Wetland and stream monitoring sites should be required for the east side of the tailings basin.	COE02, COOP01
3028	Section 17.1 of the application describes that wetland monitoring wells 1,4a, 6, 10, 12, 15, and 21 are "being removed because they are either within the direct project impacts or areas where no potential indirect impacts are anticipated". Figure 16 shows Wells 4a, 6, 10, 12, and 15 just outside the project boundary and between mine features and Yelps Creek and the Partridge River. These wells are in wetland areas that would likely be impacted by adjacent mine features because of their close proximity to the mine features and wetland areas. For a more comprehensive impacts analysis, we recommend that the applicant continues to monitoring at the existing wells where they are outside the direct mine impact locations. Because there are baseline hydrologic data at these locations, changes in wetland hydrology, if they occur, should be evident.	COE06, COOP01
3029	Some wetland types, such as coniferous and open bogs, are sensitive to subtle changes in hydrology. A 50% change in hydroperiod (the proposed impact criteria) may not be an adequate measure of adverse impacts to the wetland vegetation communities. The applicant should include a more complete description of impact criteria and rationale for the proposed monitoring and reporting schedule.	COE02, COOP01
3030	Section 17.4 of the application states that wetland baseline conditions for wetland vegetation will be established during the first growing season after permit issuance. EPA recommends that the Corps require baseline vegetation monitoring prior to permitted impacts to ensure that a true pre-impact baseline is established.	COE06, COOP01

<b>Sender Name (Submission ID)</b> USEPA (47834)		
3031	The vegetation monitoring is proposed for every 5 years. The basis for the proposed monitoring frequency is not clear from the application. Effectively managing certain threats to the wetlands, such as invasive species or vegetation changes due to drawdown, requires early detection, and monitoring every 5 years might not be sufficient to adequately manage the threat. EPA recommends increasing monitoring for vegetation changes to every 2 years to better be able to identify and manage any adverse impacts to wetlands early.	COE06, COOP01
3032	The adaptive management plan described in Section 17.8 uses a phased approach to assessing indirect impacts and providing compensatory mitigation for adverse impacts to aquatic resources. Phase I is described a broad based monitoring; while Phase II would be a more detailed assessment. In order to determine if the adaptive management plan is sufficient, EPA needs more information on the timing and methodology of Phases I and II of the monitoring plan. EPA is concerned that Phase II monitoring would not be designed unless deemed necessary, and that the threshold for determining a need for Phase II is not described. Clear impact criteria must be established and potential mitigation options must be developed prior to permit issuance. EPA recommends that Phase II be planned prior to permit issuance to ensure that wetland and stream impacts are not missed.	COE02, COOP01
3033	The application lacks a description of cumulative effects to the aquatic resources within the watersheds except as they apply to wildlife corridors (Section 12.1.2.3). Cumulative Wetland Impacts (Section 5.3) is included in the March 1, 2013 Wetland Data Package V.7, but it is not referenced in the application. It is not clear if this analysis includes recently proposed projects, as it seems to be missing projects in the iron range (e.g., MINNTAC and UTAC). The cumulative effect assessment in the application should include the most recent and comprehensive information.	COE07, COOP01
3034	Indirect impacts are not included in the cumulative impacts assessment for wetlands in the Wetlands Data Package V. 7. All adverse impacts to aquatic resources should be considered in this assessment.	COE07, COOP01
3035	The analysis of cumulative effects in the Wetland Data Package V.7 evaluates the percentage loss of all wetland types. Many of the wetlands proposed to be impacted at the Polymet site are high quality bog and forested resources, and indirect impacts of mining often include wetland type changes due to changes in hydrology. The cumulative loss of different wetland types should also be evaluated.	COE07, COOP01
3036	The mitigation ratios proposed in the application conform to the conditions included in the Corps' May 29, 2013 Memorandum: Application of the Federal Mitigation Rule and St. Paul District Policy Guidance on Compensatory Mitigation- Compensation Ratios for Loss of Wetlands/Aquatic Resources. EPA agrees that the mitigation ratios proposed in the Corps' Memorandum were reasonable.	COE12, COOP01
3037	One concern that remains is that no compensatory mitigation plan exists for indirect impacts to wetlands and streams. Table 11-1 of the application indicates that more than 7,300 acres of wetland would be potentially impacted by the proposed project. Because in-watershed mitigation is so difficult to find, mitigation options for indirect impacts must be discussed in the application.	COE02, COOP01
3038	EPA remains concerned that a majority of the compensatory mitigation for impacted wetlands will occur outside the St. Louis River and Lake Superior Watersheds. This constitutes a permanent loss of aquatic resources within these watersheds. EPA understands that it is difficult to find in-watershed wetland mitigation opportunities, but the soon to be implemented Northeast Minnesota Wetland Mitigation Strategy may support the Corps and permit applicants to better implement a watershed approach to mitigation. Once implemented, EPA recommends that the strategy be used to find additional wetland mitigation sites within the St. Louis and Lake Superior Watersheds to compensate for indirect wetland impacts at the Polymet Site.	COE13, COOP01

3483	The Fish and Wildlife Service (FWS) believes the northern long-eared bat ( <i>Myotis septentrionalis</i> ) is not adequately addressed in the SDEIS, as it is only listed as a Regional Forester Sensitive Species. Given the status for state and federal listing, the anticipated start date of the proposed project, and its potential for significant environmental impacts, it would be appropriate to discuss the northern long-eared bat under all “Federally and State-Listed Species and Species of Special Concern” subsections in the SDEIS in much greater detail.	WI01
3485	The Cumulative Impacts section of the document fails to address the overall cumulative impacts associated with the 28 prospecting permits represented in the Bureau of Land Management’s (BLM) September 2012, Record of Decision (ROD) for Federal Hardrock Mineral Prospecting Permits, U.S.Department of Agriculture, Superior National Forest.Potential impacts associated with the 2012 ROD on Mineral Prospecting meet the criteria of “reasonably foreseeable future actions” since the prospecting permits are all located on the Superior National Forest and could contribute direct or indirect impacts in the region.	CU02, CU08
3486	In addition to the 20 projects considered in the Cumulative Effects analysis, some effort should be made to consider the cumulative effects of the 11 speculative projects that are in the early stages of development...The NorthMet mine could be considered a catalyst for other mining operations which could lead to much greater impacts to the regional ecosystem.	CU02
3487	The temporary nature of the projected 500 direct jobs created during construction and additional 631 “operations-phase” jobs may result in a substantial need for temporary lodging that could impact to Voyageurs-area visitors in the form of hotel or motel room shortages.	EDIT01
3488	Finally, the major differences of opinion between the lead agencies and the Bands, the Great Lakes Indian Fish and Wildlife Commission (GLIFWC), and 1854 Treaty Authority regarding the effects of the proposed actions should be resolved before any permits are issued.	EDIT01
3489	Mitigation of a larger number of smaller wetlands in the direct area should not be dismissed solely on whether the company deems it economically feasible to do so, especially if those mitigation options make more sense environmentally. The SDEIS states the majority of wetlands that would be impacted would be “difficult to replace.” Alternatives for avoiding impacts to wetlands that are difficult to replace should be considered.	WET03, WET05, WET20
3491	The GIS buffer zones for determining indirect wetland effects cut off at the border to the existing Northshore Mine, even though the wetlands are continual across that border. Impacts to the entire wetland body should be covered in the Cumulative Impacts section	WET08, WET18
3492	The area of potential effects should be larger than the two watersheds that are directly impacted.	WET18
3493	The cumulative impact analysis for wetlands does not constitute an analysis of impacts. It is strictly comparing wetland acreage between pre-settlement (which is based on imprecise estimates), current, and proposed conditions. We recommend using accurate numbers for wetland acres lost in the area over the past few decades instead of using an unknown “pre-settlement” number as the baseline. In addition, wetland impact is more than just acres lost or gained. There needs to be a true analysis of impacts by wetland type and value, and include indirect effects, as is done in the Wetlands section of the SDEIS.	WET18
3495	This section needs maps to illustrate the location and extent of Minnesota Biological Survey (MBS) Sites of High Biodiversity Significance in order to support the claim that the number of sites within the project area is small, and to show how much of the 100 Mile Swamp and Upper Partridge River Sites will be impacted.	EDIT01
3496	Stating that less than 1 percent of the state’s Sites of High Biodiversity Significance would be affected is misleading because not all of these sites are of the same type.	EDIT01
3497	The Indirect Effects discussion of the NorthMet project only talks about dust. The discussion should include effects from hydrologic changes, habitat fragmentation, microclimate, loss of fungal associates, erosion, and exotic species.	VEG07

3498	The SDEIS acknowledges the disturbance of 1718.6 acres of high diversity significance and 698.2 acres of imperiled-vulnerable or vulnerable native plant communities. Deliberately and knowingly taking/destroying populations of state-listed Endangered, Threatened, or Special Concern plant species should not be an acceptable option. Having PolyMet purchase lands with these populations to give to the State raises a question of conflict of interest since the State is the entity proposing this action.	VEG01, VEG02
3499	There are 12 known populations of state-endangered <i>Caltha natans</i> in Minnesota. One of those populations is in Voyageurs. Destroying one of the 12 known populations will put added pressure on Voyageurs to protect any remaining populations.	VEG01
3500	The SDEIS states that non-native species will be used in the reclamation of the Mine Site and Plant Site...Many of the species listed for reclamation have proven to be problematic invasive species. This is not an acceptable practice. The emphasis on reclamation should be on ecological quality, not on speed of getting plants growing.	VEG05
3501	The cumulative impact area is unclear and seems to alternate between use of the Nashwauk Uplands/Laurentian Uplands and the Mesabi Iron Range.	VEG08
3502	The cumulative impact analysis for vegetation, like the wetlands analysis, is weak since the Geographic Information System (GIS) analysis only looked at changes in habitat type. Cumulative impacts should include changes in acreage of Sites of High Biological Diversity and vulnerable communities, loss of threatened plant species, increase in exotic plants, and other vegetation impacts. Those are the true cumulative impacts to the area.	VEG08
3506	The lead agencies should defer to the judgment of the Bands about potential impacts to traditional cultural properties even if the precise locations and significance are not shared with non-Natives.	CR05, CR06
3508	Historic properties such as the Spring Lake Mine Sugarbush are rare, have cultural and historical significance to the entire region, and have research value for understanding Ojibwe land use in other areas, including Voyageurs. Potential impacts to the Sugarbush, beyond fugitive dust deposition, should also be addressed.	CR05
3509	Trail systems such as the Beaver Bay-Lake Vermilion Trail historically connected communities, including connecting Native people who had off-reservation allotments in Voyageurs. Loss of parts of these trail systems may compromise the ability to understand historic Ojibwe land use in the entire region.	CR01, CR02, CR03, CR05, CR06
3510	We would suggest the lead agencies consider that the geographic feature known as the Misabe Widjiu (Laurentian Divide) could be significant not only to Native Americans but significant to the identity of the Region. Further permanent alteration of the Misabe Widjiu could be considered a loss to all Minnesotans.	CR05
3512	When referring to Canada lynx ( <i>Lynx canadensis</i> ), page 5-365 the SDEIS states that, "Although the NorthMet Project Proposed Action would result in a reduction and fragmentation of lynx habitat at the Mine Site, little to no effect on statewide lynx populations would occur as it is unlikely that an individual lynx or pair of lynx would be affected by the habitat decrease." This is unclear and misleading. Our suggested rewording of this is, "Although the NorthMet Project Proposed Action would result in a reduction and fragmentation of lynx habitat at the Mine Site, little to no effect on statewide lynx populations would occur even if individual lynx are affected by the habitat decrease."	EDIT01
3513	FWS also recommends adding the northern long-eared bat to Table 4.2.5-1 identifying Key Habitat, Cover Types, and Associated Species in the Nashwauk and Laurentian Uplands Subsections at the NorthMet Project Area as well as Section 5.2.5.2.1 Federally Listed Species.	WI01

3517	The Draft BA also acknowledges that the Tower/Soudan Underground Mine State Park is an important hibernacula for the species ( <i>Myotis septentrionalis</i> ) and is located approximately 15 miles northwest of the project area. Given the proximity to known occurrences and available suitable habitat, the species is likely to be present at the Mine Site, Plant Site and Transportation and Utility Corridor. In the second paragraph of Section 5.2.5.2.1, please assure that the northern long-eared bat is included.	WI01, WI11
3518	Potential impacts to the northern long-eared bat as a result of this project should be addressed in this SDEIS. This should include, but not be limited to, direct habitat loss of all forested habitat within the project area, potential for Take of the species if any trees are cleared during the Summer Roost Season of April 1st through September 30th, noise disturbance and the potential for bioaccumulation of methyl-mercury or other contaminants.	WI01, WI02, WI04, WI05
3520	The Northern long-eared bat should also be addressed when looking at proposed non-federal exchange lands and added to Tables 4.3.5-2 and 4.3.5-5 since bats were observed at both Tract 1 and Tract 5, but not identified by species. Clarification is needed for Table 4.3.5-5 since “northern myotis” is identified in the table but not mentioned in the textual description for Tract 2.	WI01
3521	Table 4.3.5-4 identifies eastern pipistrelle as an associated wildlife species, but not the northern long-eared bat. FWS recommend the addition of this species, especially if bats were observed on site but not identified to species.	WI01
3524	With respect to Trust Resources that will continue to have direct access to open water sources at the mine site (mainly migratory birds and northern long-eared bat), the SDEIS should clearly state the anticipated water quality of the West and East-Central Pit Lakes, potential for bioaccumulation of methyl-mercury from aquatic invertebrates and other food chain pathways, and layout proposed measures to minimize or mitigate for any impacts to Trust Resources throughout the life of the mine and into reclamation phase. Of particular importance is the water quality of the wetland that will be established over the backfilled East-Central Pit after year 20, at which point would become an intended attractant to Trust Resources. It is unclear to FWS whether the SDEIS fully accounts for all sources of mercury. Supporting information for assumptions of mercury concentration, leaching and absorption should be provided and all materials associated with the proposed pit ponds should be characterized. Lead agencies should also reevaluate the need for containment and adequate treatment of the Overburden Storage Laydown Area, as this may be another significant source of mercury and other contaminants to the ecosystem.	AQ10, WR058, WR088, WR109, WR167
3525	While the air quality analysis appeared to be thorough, we strongly suggest NPS air quality specialists carefully review and confirm NorthMet’s pollutant source data, modeling methodologies, and modeling results.	AIR08
3623	It is difficult to comment on wetland mitigation because the direct mitigation ratio has not been determined and the indirect mitigation will be determined by USACE and MDNR at the time of permit.	WET01, WET04
3624	In addition, the mitigation sites proposed for this project are currently being developed and have not yet been permitted by the USACE. Suitability of these sites as mitigation for proposed wetland impacts cannot be determined at this time.	WET06

9668	If these metals are not mined in Minnesota, they will continue to be mined in places around the world that have little to no environmental regulations whatsoever, causing massive pollution to the earth...[and] they will be mined in places around the world that offer no safety protections to workers, where children are routinely put in danger by being forced to work in these unsafe conditions, and where workers are exploited by being paid inhumane wages that do not allow them to feed their families,	SO10
9670	Mining these metals in Minnesota is the green option because we have a long history of mining responsibly, and we have the most protective environmental regulations in the world for permitting new mines and the alternative to mining in Minnesota is to mine in places that have none of our safeguards.	NEPA05
9671	Minnesota taxpayers are fully protected by the toughest financial assurance laws in the nation, laws that leave control over this process completely in the hands of the experts at the DNR, and in which the companies are faced with one decision—either accept the conditions of financial assurance or do not accept and receive no permit.	FIN17
9672	The United Steelworkers Local 6115 supports iron ore, copper, nickel and other precious metal mining projects in Northeast Minnesota as long as the rigorous and nation-leading process in our state of permitting new mines is followed, that the Polymet Corporation allows union card check/neutrality at their proposed facility, and our union has faith that the experts and professionals in our state and federal agencies, most of whom are proud members of AFSCME or MAPE, will carry out this process and ultimately determine whether or not projects can meet our tough environmental and financial assurance standards.	NEPA16

12190	There has been tremendous political pressure urging approval of the SDEIS, because the Northmet Project will create "jobs" for the Iron Range. The pressure is so clamorous that leads one to think that the "Range" is solely dependent upon this project for additional jobs. Not so. The Iron Range Resources and Rehabilitation Board (IRRRB) just in the last three years has, according to their report, created 1,894 permanent jobs, supplemented by 2,800 construction jobs, jobs that do not contribute to potential serious environmental hazards.	SO02
12196	Numerous statements in Chapters 5 and 8 of the SDEIS "admit" that waterquality violations will likely occur. These statements are followed with therather "flippant" comment that in the event of such occurrences, measures willbe taken to remediate the violation. There is no description or evaluation of the efficacy of such remedial measures. This is unacceptable.	WR130
13903	But the need for such short-term jobs, or more precisely the asserted economic contributions they propose will be provided, the 20 years, must be considered irrelevant for the purpose of this hearing. That issue is out of bounds. Not germane. Because the fundamental issue here is what is at the proposed mining project can be done safely without harm to the natural environments or to human health.	SO01
13904	And also, even the EIS itself is not conclusive. In chapter 8 it contains a litany of major differences of opinion. If indeed there are doubts or disagreements, unanswered questions, or probability that if one of the criteria of the safeguards cannot be met then the only reasonable, prudent decision for our regulatory agencies is to invoke what I call a precautionary principle.	NEPA12
16750	The pressure is so clamorous that leads one to think that the "Range" is solely dependent upon this project for additional jobs. Not so!	SO06
16751	Numerous statements in Chapters 5 and 8 of the SDEIS "admit" that water quality violations will likely occur. These statements are followed with the rather "flippant" comment that in the event of such occurrences, measures will be taken to remediate the violation. There is no description or evaluation of the efficacy of such remedial measures.	WR130
<b>Sender Name (Submission ID)</b> Verna Alt (18477)		
15640	the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever... This project would violate water quality standards for generations to come.	WR038
15641	In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
15642	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.	HU01, WR041, WR115, WR189
15644	The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.	WET12
15645	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR017

<b>Sender Name (Submission ID)</b> Verna Alt (18477)		
15646	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.	WR012
15647	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189, WR202
<b>Sender Name (Submission ID)</b> Vernon Baker (46988)		
10890	I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations.	NEPA16
10891	It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country.	WR190
10892	Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. ... This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs.	SO10
10893	Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.	PER34
<b>Sender Name (Submission ID)</b> Veronica Erickson (54179)		
16416	I don't think you should mine in the area of the boundary waters. The sulfur in the rock mixed with air creates sulfuric acid. Acid kills most aquatic life. This means no more fishing.	AQ08
16418	Many people go to the boundary waters for peace and quiet, but the drill noise along is hard on the ears.	N02
16419	This area has been protected since 1989, and if you plan to mine for 20 years, it will do damage to our water for much longer than that. The contamination from this mine will threaten all water bodies connected to it. The PH of the water will be 4, 3, 2 even 1. Aquatic life dies below a PH of 4.	WR001, WR113, WR115
<b>Sender Name (Submission ID)</b> Veronica Smith (57344)		
18416	I am a band member. And my concern is, of course, is the waters and the streams and the lakes that come down from where the mines are going to be.	WR111
18417	What I have the most concern about is the wild rice. Our Manoomin -- the creator has given us manoomin.	CR01

13439	Computer models show that the water from the mine and processing plant will be contaminated with toxic metals and sulfate...I am concerned that PolyMet will not be able to capture and treat all of the contaminated water before it reaches the St. Louis River and Lake Superior.	WR017, WR018
13440	How will PolyMet be able to treat the polluted water for 500 years? How will they pay for it?	FIN01
13684	The SDEIS uses a small bit of data from 1984 to address the water flowage and its impact concerning the issue of how much and how fast our groundwater, streams and lakes will be polluted. The report is using data that does not reflect what the conditions actually are at the proposed site.	WR003
13685	This report does not adequately answer the question of how this perpetual need for taking care of the polluted waters is to be paid for, and when questioned, they say those details will be addressed during the permitting process.	FIN01
<b>Sender Name (Submission ID)</b> Vincent Graziano (48718)		
12817	Their own simulations say pollution for 500-years, in other words FOREVER.	WR035
16773	I would like for once the State and DNR actually protect the natural resources that they are supposed to protect and not just hand over our future to corporations and especially foreign corporations.	PD01
<b>Sender Name (Submission ID)</b> Vincent W. King (45163)		
8483	It is simply ludicrous to suggest that any amount of human engineering, or any amount of money, can prevent a disaster from occurring, resulting in the acid mine drainage entering the surface and underground waters in the area.	WR001, WR037, WR128
8487	he short-term economic gains from sulfide mining are far outweighed by the long-term risk.	SO01

19512	This plan is short sighted, and will irrefutably negatively affect the waters that Minnesota is famous for.	WR195
<b>Sender Name (Submission ID)</b> Virginia Rosenbaum (35315)		
13090	Lake Superior is connected to the other 4 Great Lakes; together they hold one-fifth of the world's fresh water supply. It would be CRIMINAL to allow a corporation to risk polluting this vital resource, only for a business to make a short-term profit.	SO01
13245	Millions of people rely on the Great Lakes for their drinking water, and there is also a large (billions of dollars) fishing industry that requires clean water.	SO02
<b>Sender Name (Submission ID)</b> Voyageurs National Park Association (54910)		
18911	The SDEIS identifies the Twin Metals mining project as a speculative action, and as a result, Twin Metals is not considered as a cumulative action in the cumulative effects [section]...Currently available information demonstrates that both government agencies and private organizations are considering the Twin Metals project in their long-range planning. [Therefore,] Twin Metals is a reasonably foreseeable action that must be considered in the cumulative impacts statement.	CU02
18912	if the proposed NorthMet project becomes operational NorthMet could set precedent for future mining operations, like the proposed Twin Metals project.	CU04
18914	Water is especially vulnerable to incremental effects of pollution- in this instance- acid mine drainage. If the proposed NorthMet project comes to fruition, the water modeling, treatment processes, and assurances will set a precedent for future projects	WR198
18916	Given the complexity and length of the SDEIS, 90 days was not a reasonable time period for VNPA or other concerned citizens and stakeholders to comprehensively review and respond to the SDEIS.	NEPA07
18917	The FEIS must distinctly evaluate how long active water treatment will be necessary to deal with pollution after this mine is closed...The lead agencies must re-run the water analysis to provide an accurate estimate.	WR036
18918	The public deserves to have a concrete understanding of how long active treatment will be needed and the risks and potential costs to taxpayers associated with that treatment.	FIN01, FIN10
18919	If it is not possible to design preventative measures [i.e., for water quality] into the mine, then the mine should not be permitted to operate.	PER03
18920	We strongly believe the financial risk to the public involved with permitting a mine that calls for treatment of water in perpetuity in a water-rich environment like northern Minnesota sets an irresponsible stewardship standard.	FIN10
18921	[The SDEIS fails] to provide a means for cleanup in the event of a major leak as well as any details for financial assurance for this cleanup. A lack of financial assurance burdens the taxpayers who would then be liable for cleanup costs. With the centuries of proposed treatment, it burdens unascertainable future generations of taxpayers who view the mine's operational life as a distant history.	FIN01, FIN10

<b>Sender Name (Submission ID)</b>	Voyageurs National Park Association (54910)	
18922	if the permitting agencies do decide to permit long-term water treatment, then at a minimum, the costs and financial assurance vehicles should be identified up front before the FEIS and the permitting process is initiated.	FIN05, FIN08, FIN13
18923	The EIS process is the time the public is supposed to have to review the project as a whole. The omission of how PolyMet intends to financially provide for potential accidents and spills denies the public information of an important element we wish to take into consideration in this action.	NEPA06
18924	The SDEIS describes a mine and a processing facility that will require centuries of water treatment after its 20 year operational life. This in direct violation of this statute which requires that the site be maintenance-free at its closure.	PER04
18925	The NorthMet project will be contributing a new source of air pollution in an already degraded area.	AIR13
18926	The cumulative visibility analysis (Section 6.2.3.8.7) is out of date and should be updated (SDEIS at 6-78 - 6-86). It fails to account for the Federal Implementation Plan issued by the U.S. Environmental Protection Agency in 2013 for emissions from taconite facilities, and does not include available visibility data from 2011 for nearby Class I areas.	AIR08
18927	We request analysis of the cumulative impact on moose from the PolyMet project and other habitat disruptions.	WI01, WI02
18928	The Poly Met mine plan fails to analyze the cumulative impact on the Canada lynx from the proposal and other nearby projects. It also fails to correctly identify the Canada lynx as a species listed of "Special Concern." The FEIS should include ways to mitigate the risk to lynx from road traffic and ways to restore its habitat after construction.	WI01, WI02
18929	Mitigation of a larger number of smaller wetlands in the direct area should not be dismissed solely on whether the company deems it economically feasible to do so if those mitigations make more sense environmentally. The SDEIS states the majority of wetlands that would be impacted would be "difficult to replace." Alternatives for avoiding impacts to wetlands that are difficult to replace should be considered.	WET03, WET05, WET20
18930	The GIS buffer zones for determining indirect wetland effects cuts off at the border to the existing Northshore Mine, even though the wetlands are continuous across that border.	WET19
18931	There should be existing hard numbers on wetland acres lost in the area over the past few decades instead of using an unknown "pre-settlement" number as the baseline	WET18
18932	Wetland impact is more than just acres lost or gained. There needs to be a true analysis of impacts by wetland type and value and include indirect effects, just like in the Wetlands section of the SDEIS.	WET14
18933	[The Vegetation] section needs maps to illustrate the location and extent of Minnesota Biological Survey (MBS) Sites of High Biodiversity Significance in order to support the claim that the numbers of sites within the project area is small, and to show how much of the 100 Mile Swamp and Upper Partridge River Sites will be impacted.	VEG02
18934	Stating that less than 1 percent of the state's Sites of High Biodiversity Significance would be affected is misleading because not all of these sites are of the same type.	VEG02
18935	The Indirect Effects discussion of the NorthMet project only talks about dust. The discussion should include effects from hydrologic changes, habitat fragmentation, microclimate, loss of fungal associates, erosion, and exotic species.	VEG07
18936	Deliberately and knowingly taking/destroying populations of state-listed ETSC plant species should not be an acceptable option.	VEG01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Voyageurs National Park Association (54910)		
18937	Having Poly Met purchase lands with [ETSC] populations to give to the State of Minnesota raises a question of conflict of interest since the State is the entity proposing this action.	NEPA15
18938	Many of the species listed for reclamation have proven to be problematic invasive species. This is not an acceptable practice. The emphasis on reclamation should be on ecological quality, not on speed of getting plants growing.	VEG05
18939	The cumulative impact area [for Vegetation] is unclear and seems to alternate between use of the Nashwauk Uplands/Laurentian Uplands and the Mesabi Iron Range.	VEG08
18940	The lead agencies should defer to the judgment of the Bands about potential impacts to traditional cultural properties even if the precise locations and significance are not shared with non-Natives.	CR05, CR06
18941	Trail systems such as the Beaver Bay-Lake Vermilion Trail historically connected communities, including connecting Native people who had off-reservation allotments in Voyageurs. Loss of parts of these trail systems may compromise the ability to understand historic Ojibwe land use in the entire region.	CR01, CR05
18942	we would suggest the lead agencies consider that the geographic feature known as the Misabe Widjiu (Laurentian Divide) could be significant not only to Native Americans but significant to the identity of the Region.	CR05
18943	The SDEIS does not include details outlining emergency procedures for the facilities. We request that the SDEIS be updated to specifically identify the key risks to the environment due to problems that could occur in the process (e.g. failed pumping stations) and containment systems due to extreme weather events and describe how the situation will be handled.	PD01, PD22
18944	the criteria used to evaluate failures should be reviewed and documented in the final EIS to ensure it reflects a general increase in heavy rainfall events due to climate change.	AIR01
18945	The SDEIS fails to include adequate discussion or analyses of alternatives including mining elements (pumping schemes, liners, covers, mechanical filtering and chemicals) capable of reducing the potential for surface and groundwater contamination and potentially, the need for centuries of water treatment.	ALT13
18946	documentation of "Best Practices" would provide stakeholders and the public with a higher level of confidence that all reasonable design and reclamation alternatives which could mitigate environmental impacts have been rigorously and objectively evaluated.	ALT06, ALT07, ALT13

1585	Water is desperately needed in many areas of the US and the world. Why would you not consider uses of all the resources? Why place water on a lower needs level and merely consider it as a resource for mining ore?	WR115
1588	The financial assurance required from PolyMet must include payment for the economic value of the water should it be damaged.	FIN05
1589	Less than 1% of bulk ore produces the copper, nickel, etc. generating over 99% waste in addition to the overburden. This equates to over 31,000 tons of waste every day, presenting a significant threat to the water.	WR025
1592	How can that be worth the small number of jobs that only last a single generation? If sulfide mining is permitted, it should at least be a critical part of a US strategic plan to maintain our leadership position in the world.	SO02
1601	The estimated value of the water in northeastern Minnesota [\$165,101,400,000] is significantly more than the estimated value of the Duluth Complex copper nickel mining operations [\$74,188,034,188].	SO01
1604	And, of course lake homes and resorts are significantly reduced in value. With a reduction in the value of lake property the tax receipts of these counties will also drop significantly.	SO03
1606	With polluted water the tourism industry will go away.	SO02
2072	Water is worth more than the ore and the SDEIS should address this simple fact first.	NEPA09
2073	If sulfide mining is permitted, it should at least be a critical part of a US strategic plan to maintain our leadership position in the world.	NEPA02
<b>Sender Name (Submission ID)</b>	W. Charles Huskins, M.D. (42980)	
8774	The SDEIS does not fully acknowledge vulnerable human populations affected by the environmental impacts of the project.	HU01
8776	The SDEIS does not adequately address the impact of the project on sulfate and mercury contamination of water resources and accumulation of methylmercury	MERC08
8777	The SDEIS does not adequately address the impact of methylmercury exposure on human health, particularly the health of vulnerable populations.	HU01
15164	...the SDEIS does not acknowledge pregnant women or their unborn infants are a vulnerable population with respect to methylmercury exposure...In addition, because mercury accumulates and persists in the human body, women with childbearing potential, not just pregnant women, should be considered a vulnerable population. This is a major omission because developing fetuses are highly susceptible to neurotoxicity caused by exposure to methylmercury.	HU01
15165	...the SDEIS does not acknowledge that elderly adults are another vulnerable population with respect to methylmercury exposure. The risk associated with this population may be due to reduced metabolism of toxic compounds, neurologic co-morbidities, a higher pre-existing load of mercury in their bodies, or increased consumption of contaminated fish...This is a major omission because of the large proportion of the population that already is classified as elderly and demographic trends that will increase the size of this proportion in the future.	HU01
15166	...because the existing [mercury] contamination [of water resources] is already above acceptable levels, any incremental increase in mercury contamination is important, particularly for vulnerable populations	MERC01

<b>Sender Name (Submission ID)</b>	W. Charles Huskins, M.D. (42980)	
15167	Recent measurements from the Partridge River indicate flow rates are 3-4 times higher than those used in the SDEIS models. In addition, the SDEIS does not account for changes in water flow that may occur as a result of climate change, catastrophic weather events, or other industrial activities that may occur during or after mine operations. For these reasons, the SDEIS estimates of sulfate and mercury contamination of water resources may be significant underestimates.	WR003, WR165, WR180
15168	The SDEIS assessment of the impact of the project on accumulation of methylmercury is based on the water quality model predictions for sulfate and mercury concentrations. This assessment is severely limited by numerous areas of uncertainty...Given the critical risk to human health posed by methylmercury exposure, particularly the risk to vulnerable populations..., the degree of uncertainty that surrounds the assessment of the impact of the project on methylmercury accumulation is unacceptable.	MERC11
15169	Given the duration of water treatment required (decades and perhaps centuries), the analysis of the effectiveness of wastewater and seepage treatment should account for variability, and incapacity, in the effectiveness of the water treatment system.	PD03
15170	The Adaptive Water Management Plan (AWMP) is proposed as a means to address the uncertainties identified above as well as unexpected future developments. However, the process by which the AWMP would be developed and reviewed, the opportunity for public comment, and the implementation, monitoring and revision of the AWMP are not described.	WR130
15171	the SDEIS does not address the impacts of methylmercury exposure on high-risk populations (e.g., children, pregnant women, the elderly), which are likely to differ from the impact on the population as a whole.	HU01
15172	The SDEIS uses the "Hazard Quotient"... to quantify the potential impact of the exposure to methylmercury on human health. The SDEIS states "a Hazard Quotient greater than 1 exceeds the health-based target" (Page 6-63). However, the SDEIS does not provide evidence that the Hazard Quotient is a precise and accurate measure of the effect of exposure to methylmercury on human health. Moreover, it does not state whether a Hazard Quotient threshold of 1 is applicable to all segments of the population, particularly vulnerable populations	HU01
15173	The SDEIS estimates the "maximum incremental cumulative Hazard Quotient from the two projects over existing fish mercury concentrations is 0.08 for recreational anglers, 0.61 for subsistence/tribal anglers, and 0.54 for subsistence fishers. The NorthMet Project Proposed Action contributes approximately 59 to 92 percent of the incremental cumulative Hazard Quotient." (Page 6-63)...a mere two-fold increase in this estimate would indicate that the project will have a substantial effect on the health of humans who are subsistence or tribal anglers.	HU03
15174	Perform and report additional studies of the effects of sulfate and mercury contamination of water resources on the accumulation of methylmercury, with adjustment for other variables (e.g., organic carbon, temperature, micronutrients required by sulfate-reducing bacteria, sulfate loadings, and hydrologic conditions).	MERC08
15175	Provide additional description of wastewater and seepage treatment with estimates of its effectiveness under varying conditions, including the need for mechanical interruptions at the Waste Water Treatment Plant, possible breaches in wastewater or seepage containment, and unusual climate conditions that would reduce capture of wastewater and seepage or markedly increase the demand on the system.	WR143, WR202
15176	Provide evidence that the Hazard Quotient is a precise and accurate assessment of the impact of methylmercury exposure on human health, including vulnerable populations ... If this cannot be done, use other methods for estimating the impact of methylmercury exposure on human health or acknowledge that the risk is unknown.	HU01

4037	The 90-day comment period was insufficient, not only because the SDEIS is long, but because important information was omitted from the SDEIS and even from the reference documents provided on CDs.	NEPA07
4038	WaterLegacy’s submissions reach the conclusion that the SDEIS is inadequate and the project is likely to pose significant adverse impacts to the environment, to human health, to environmental justice and to tribal rights and resources.	CR01
4039	The SDEIS is data poor, and its modeled outcomes are determined by unsubstantiated and unreasonable assumptions, rather than by empirical information and field experience. Basic information required to evaluate PolyMet’s proposed action, such as a water balance and loading of solutes in process water flows, is not presented.	WR059, WR060, WR071, WR072, WR172, WR173, WR177
4040	Closer review reveals that fundamental modeling assumptions, like Partridge River baseflow, are erroneous.	WR003
4041	Cited literature is misrepresented and information selectively presented, suggesting advocacy for the project, rather than an independent assessment of its probable outcomes.	NEPA08
4071	Federal regulations promulgated under the National Environmental Policy Act (NEPA) are not followed in the SDEIS. Information is not the high quality required under NEPA, foreseeable failures are not analyzed, cumulative impacts are arbitrarily limited, and no alternatives are evaluated, although alternatives analysis is the heart of the EIS under applicable law.	NEPA14
4072	The SDEIS is not compliant with the regulations in 40 CFR 1500 – 1508, and is technically inadequate. The proposed action is conceptual and not specific, and is not compared to reasonable alternatives. The descriptions of the affected environment are not representative of the site specific conditions at the mine site or the plant site. The environmental consequences presented in the SDEIS are based on assumptions that are not substantiated or are unjustified. Consequently, the conclusions presented in the SDEIS are not defensible and should not be used as a basis for making decisions affecting the environment.	NEPA09
4295	The analyses presented in the SDEIS are not based on an analytical or scientific review of the proposed action and the reasonable alternatives to the proposed action. Instead, the analyses are based on a conceptual description of the proposed action and an extensive set of assumptions of the environment and the performance of the conceptual design. The SDEIS is technically inadequate as a result of the numerous omissions and flaws in the analyses presented in the SDEIS.	NEPA09
4296	The PolyMet proposed action described in the SDEIS also fails to satisfy Clean Water Act Section 404 requirements. The SDEIS does not demonstrate that the project is the least environmentally damaging practicable alternative or that its impacts on aquatic resources of national importance will be mitigated.	COE04
4297	The proposed land exchange serves a narrow private interest and contradicts both federal policy and federal fiduciary responsibilities to protect tribal resources.	CR01
4298	the PolyMet SDEIS declines to model what are likely to be the most significant adverse impacts of its proposal – indirect destruction of high value wetlands in the Partridge River watershed near the mine site and increases in methylmercury contamination of fish as a result of emissions, discharges and hydrologic changes resulting from the proposed action.	AQ25, WET08

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4299	Even with all of the limiting assumptions and lack of clarity in the SDEIS disclosures, scrutiny reveals that the PolyMet project would result in wetlands destruction dwarfing cumulative past and foreseeable watershed impacts from all other sources.	WET24
4300	The PolyMet project would have the potential for significant adverse impacts to aquatic life, a federally-listed species, and to persons who consume fish and wild rice for subsistence.	HU03
4301	The project is modeled to increase cancer risks above Minnesota's health risk threshold and to exceed Minnesota's health risk limits for pollution in groundwater.	HU05
4302	The SDEIS must be revised to provide a clear water balance showing inputs and outputs from the mine, plant, tailings basin, treatment facility and hydrometallurgical residue facility during operations, closure and long-term treatment and maintenance.	WR181, WR182
4303	The SDEIS must be revised to provide a clear statement of the concentration predicted of solutes for representative years in all mine site and plant site potential sources of contamination in units of measurement comparable to water quality standards.	WR060, WR173
4304	The SDEIS must be revised to provide a clear explanation of the modeled sources of solutes in waste rock piles, tailings, mine pits, equalization basins and the HRF, specifying for each the source and concentration of inputs and the degree to which the modeling has assumed a concentration cap, adsorption of solutes or burial of solutes.	WR060, WR173
4305	The SDEIS must be revised to describe the basis for any such critical assumptions pertaining to the level of solute concentrations, including concentration caps, burial or adsorption assumptions.	WR033, WR058, WR060, WR167, WR173
4306	The SDEIS must be revised to provide a clear statement of the volume and concentration of seepage, leakage, spillage and runoff from any potential source of contamination at the mine site and plant site.	PD04, PD08, WR060, WR173, WR189
4307	The SDEIS must be revised to make explicit any assumptions about the efficacy of liners or caps in containing seepage or process water or limiting percolation of precipitation, including all field experience that supports these assumptions and a comparison between the climate conditions and duration under which these were tested as compared to the proposed action.	WR126
4308	The SDEIS must be revised to substantiate any assumptions about the efficacy of collection systems in containing seepage, specifying the particular field experiences, climates, geological conditions and designs where the efficacy has been demonstrated.	PD04, PD08
4309	The SDEIS must be revised to substantiate any assumptions regarding hydraulic conductivities in surficial and bedrock materials.	WR086, WR087, WR096, WR099
4310	The SDEIS must be revised to identify the capital, replacement cycle, operations, and maintenance costs for all treatment and mitigation measures during operations, reclamation and long-term closure, specifying which measures are definite and which are contingent as part of adaptive management.	FIN05, FIN06
4311	The SDEIS must be revised to provide accurate baseflow modeling for the Partridge River.	WR003
4312	The SDEIS must be revised to model propagation of contaminants through high conductivity surficial materials and secondary porosity features in bedrock.	WR010, WR011, WR012, WR058, WR061, WR071, WR090, WR168

4313	The SDEIS must be revised to model propagation of uncaptured seepage in all directions indicated by reasonable geology, hydrology, history and data.	WR103, WR189
4314	The SDEIS must be revised to use current and substantiated sorption coefficients.	WR058, WR167, WR168
4315	The SDEIS must be revised to model site-specific impacts on wetlands that would result from mine drawdown, calibrating such model using accurate hydrologic data and field experience.	WET08
4316	The SDEIS must be revised to model increased mercury methylation in the project area and downstream in the St. Louis River as a result of hydrologic changes, mercury air emissions, dust deposition, and discharge of mercury and sulfates.	AIR05
4317	The Proposed Action must be substantially changed to preclude use of untreated Colby Lake water for stream augmentation to Unnamed Creek, Mud Lake Creek, Trimble Creek or Second Creek.	WR124
4318	The SDEIS must be revised to explain how stream augmentation will be ensured without relying on untreated Colby Lake water to serve this purpose and must demonstrate that the proposed solution will comply with applicable water quality standards.	WR123, WR124, WR125
4319	The SDEIS must be revised to analyze impacts of mercury air deposition from the PolyMet mine site, including magnitude and speciation. This analysis must consider impacts on all waters, including the Second Creek watershed and waters upstream of identified Embarrass River lakes.	AIR05
4320	The SDEIS must be revised to analyze impacts of mercury air deposition considering species other than fish and potential bioaccumulation in downstream waters.	AIR05
4321	The SDEIS must be revised to provide explicit information as to the mass of mercury in peat, overburden, ore, waste rock, process water, tailings, reject concentrate, filtered sludge, HRF waste and any other potential sources of mercury release from the project.	MERC14, MERC20
4322	The SDEIS must be revised to disclose mercury concentrations in seepage from all potential project sources, including the OSLA, Category 1 waste rock pile, liner leaks, mine pits, tailings piles and the HRF, making explicit any assumptions regarding leaks, infiltration and adsorption.	MERC20
4323	The SDEIS must be revised to provide a scientific basis for its assumptions regarding mercury burial, sequestration or adsorption in the East Pit, West Pit lake, tailings or hydrometallurgical residues.	MERC04, MERC20
4324	The SDEIS must be revised to use a reasonable range of probabilities for mercury burial, sequestration or adsorption in lake sediments, tailings, residues and surficial materials based on uncertainty as to the mechanisms of adsorption and desorption and the range of values observed in tests and field experience.	MERC04, MERC20
4325	The SDEIS must be revised to disclose the influent and effluent assumptions and targets for the WWTF, both prior to and after conversion to reverse osmosis, and for the WWTP, explaining for both facilities the treatment methods proposed to achieve compliance with the Great Lakes mercury standard.	WR147
4326	The SDEIS must be revised to assess the sulfur content of mine site and plant site particulate emissions and the impacts of particulate emissions and ore spillage on mercury methylation in the project area and on sulfate loading to the Partridge River and Embarrass River watersheds.	MERC08, WR151
4327	The SDEIS must be revised to assess the impacts of all mine site sulfate seeps and liner leaks to shallow groundwater on mercury methylation.	MERC20
4328	The SDEIS must be revised to disclose the concentration of sulfates in tailings basin pore water and seepage release beneath the tailings basin.	MERC06, WR060

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4329	The SDEIS must be revised to model reasonably foreseeable improvements of water quality at, near and downstream of the tailings basin for a “no action” baseline considering natural attenuation through precipitation and mitigation likely to be required in compliance with the Cliffs Erie Consent Decree.	MERC04, WR108
4330	The SDEIS must be revised to assess the impacts of tailings basin sulfate releases on mercury methylation as compared to a “no action” baseline.	MERC08
4331	The SDEIS must be revised to model the impacts of sulfate and mercury emissions and release and hydrologic changes at both the mine site and the tailings basin site on mercury methylation.	AIR05
4332	The SDEIS must be revised to evaluate effects on water quality, wildlife, human health, tribal rights and resources and environmental justice resulting from cumulative impacts of the PolyMet proposed action on the St. Louis River and estuary.	HU01
4333	The SDEIS must be revised to determine effects of the PolyMet project on compliance with the downstream Fond du Lac water quality standard for mercury.	PER11
4334	The SDEIS must be revised to provide a health impacts assessment for methylmercury, describing salient health impacts and assessing cumulative health risks of increased mercury on fetuses, infants, children and adults.	HU01
4335	The SDEIS must be revised to assess disparate impacts of methylmercury bioaccumulation on low-income families and tribal members who rely on fish for subsistence.	HU01
4336	The SDEIS must be revised to analyze cumulative impacts of mercury and sulfate releases and methylmercury bioaccumulation on tribal rights and resources and environmental justice.	SO04
4337	The SDEIS must be revised to conclude that the PolyMet proposed action would pose an unacceptable cumulative risk to human health and to environmental justice.	HU01
4338	The SDEIS must be redone to accurately model Partridge River baseflow, using all reasonably available data and the range of minimum flows calculated by tribal and MDNR scientists.	WR003
4339	The SDEIS must be redone to revise modeled predictions of inflows and outflows, water quality and wetlands impacts at the mine site, showing the effects that a change in Partridge River baseflow has had on these modeled outcomes.	WR003, WR052, WR071, WR086, WR091, WR115
4340	The SDEIS must be revised to disclose changes in the volume and chemistry of water inputs to the mine site WWTF, tailings piles and plant site WWTP based on revised predictions of baseflow, identifying any planned changes in treatment facilities.	PD03, WR003, WR147
4341	The SDEIS must be revise[d] to consider the presence of known bedrock fractures transecting mine pits and beneath mine site contamination sources in calculating potential water quality impacts.	WR010, WR012
4342	The SDEIS must be revised to assess the hydrologic significance of bedrock fractures, faults and secondary porosity features at the mine site.	WR007, WR008, WR011, WR012, WR061, WR086, WR087, WR099, WR168, WR169
4343	The SDEIS must be revised to consider blasting and weathering impacts on propagation and access of contaminated groundwater to bedrock fractures.	WR010, WR016

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4344	The SDEIS must be revised to provide more robust assessment of the connection between deep groundwater and surficial waters, including additional deep borehole sampling as well as pump testing.	WR007, WR008, WR010
4345	The SDEIS must be revised to assess surficial materials, such as zones of outwash sand and gravel that may provide high conductivity pathways for contaminants.	WR058, WR092, WR096
4346	The SDEIS must be revised to consider the full range of hydraulic conductivities of surficial materials, not just an average based on excluding the most conductive samples.	WR058, WR092, WR096, WR167
4347	The SDEIS must be revised to analyze propagation of seepage from all mine site contaminant sources through shallow groundwater and bedrock secondary porosity features in multiple directions, including flow north and northeast to Yelp Creek, the Hundred Mile Swamp and the Partridge River.	WR011, WR012, WR061, WR080, WR081, WR086, WR087, WR089, WR099, WR167, WR168, WR169, WR175, WR186
4348	The SDEIS must be redone to analyze the Category 1 waste rock pile as an independent contaminant source, propagating pollutants in various directions through shallow groundwater and bedrock secondary porosity features.	WR010, WR071, WR086, WR088, WR167
4349	The SDEIS must be revised to analyze alternatives to minimize seepage from the Category 1 waste rock pile, including liners and a seepage collection system.	ALT07
4350	The SDEIS must be revised to disclose the volume and concentration of Category 1 waste rock pile seepage at various mine years and stages, stating clearly what volume of seepage reduction and collection has been modeled to make water quality predictions.	PD04, WR189
4351	The SDEIS must be revised to use a reasonable range of input assumptions to model uncaptured seepage from the Category 1 waste rock stockpile. This reasonable range of input values must be based on site-specific hydrogeology, climate, change over time, and field experience.	WR017
4352	The SDEIS must consider a broader range of input assumptions for the efficacy of the geomembrane system over time in preventing introduction of precipitation to the Category 1 waste rock pile.	WR127
4353	The SDEIS must be revised to modify the concentration cap assumption for the Category 1 waste rock pile considering the variability of sulfur concentrations and the potential for pockets of acidity and high metals leachate in this waste rock.	WR127
4354	The SDEIS must be revised to remove the potential use of Category 1 waste rock for construction materials given its potential to generate acids and leach metals.	PD15
4355	The SDEIS must disclose solute concentrations within the mine pits at representative years and identify the nature and extent of reduction in solute concentrations predicted to result from subaqueous disposal, any proposed treatment method and from attenuation.	WR088
4356	The SDEIS must be revised to substantiate claims for the efficacy of subaqueous disposal in preventing acid mine drainage and reducing solute concentrations and to discuss the relationship between cycling of pit water for treatment and maintaining anoxic conditions.	PD03, WR173
4357	The SDEIS must reconcile the apparent contradiction between statements that in-pit disposal in the West Pit Backfill alternative provides no environmental advantage and assertions for the proposed action that subaqueous disposal is highly beneficial.	ALT03, PD29

4358	The SDEIS must be revised to analyze the nearest point of connection to surface water for all discharges to groundwater from any mine site contamination source.	WR120, WR177
4359	The SDEIS must be revised to disclose at P90 probabilities the levels of all regulated parameters at the closest location where they would be discharged to surface water from any mine site contamination source.	WR120, WR177
4360	The SDEIS must be revised to clearly state that the proposed action would have significant adverse effects on the environment, including violation of numeric surface water quality standards as a result of mine site discharge.	WR107
4361	The SDEIS must be revised to include a clear and intelligible water balance for the tailings basin and WWTP.	WR056, WR063, WR182
4362	The SDEIS must be revised to consider the presence of known bedrock fractures beneath the tailings basin.	WR011, WR012, WR061, WR099
4363	The SDEIS must be revised provide a reasonable assessment of tailings seepage through faults, fractures and other secondary porosity features beneath the tailings basin.	WR011, WR012, WR061, WR099
4364	The SDEIS must be revised to use a reasonable range of assumptions based on site-specific conditions and field experience to model containment and release of untreated seepage to surface water and groundwater.	WR067, WR189
4365	The SDEIS must be revised to assess potential seepage toward the east based on changes in the topography and water table height in tailings Cell 1E and Cell 2E.	WR054, WR102
4366	The SDEIS must be revised to provide a reasonable assessment of seepage toward the south and Second Creek based on hydrological testing, LTVSMC experience and increased storage of tailings and process water.	WR056, WR117
4367	The SDEIS must be revised to specify concentrations of constituents in plant process water, tailings basin pore water, untreated seepage and WWTP influent, using numbers that allow easy comparison with applicable surface and groundwater quality standards.	WR060
4368	The SDEIS must be revised to specify concentrations of constituents in mine site process water and to verify the capacity of the WWTF to reduce contaminants to meet “targets.”	WR147
4369	The SDEIS must be revised to disclose its assumptions regarding the capacity of the tailings site to contain water, the water pressure exerted, and what increase in the volume of groundwater is predicted during operations and closure.	PD07, WR056, WR090, WR105
4370	Where field experience has demonstrated the insufficiency of water quality models, the SDEIS must demonstrate that models have been revised to verify their accuracy.	WR003, WR049
4371	The SDEIS must be revised to disclose its assumptions regarding concentration caps, explaining what concentrations of solutes would be predicted absent a cap, and how uniform pH and sulfate would be maintained with varying inputs over thousands of acres.	WR033
4372	The SDEIS must be revised to disclose and substantiate its assumptions regarding burial, sorption or retention in tailings and reduction in chemical reactivity resulting from bentonite placement, including field experience that supports those assumptions.	WR060
4373	The PolyMet revised SDEIS must consider alternative methods of avoiding or mitigating impacts of tailings seepage on water quality, including but not limited to constructing a new and completely lined tailings facility on a properly prepared bedrock surface.	ALT07, ALT10, WR133

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4374	The SDEIS must be revised to provide detailed disclosure of the chemical composition and pH of all individual wastes proposed for disposal in the HRF, including but not limited to hydrometallurgical process wastes and WWTF sludge.	PD18
4375	SDEIS must be revised to analyze the chemical composition of all HRF wastes based on additional leachate testing that reflects the current hydrometallurgical and WWTF sludge formation processes, and must evaluate chemical changes over time.	PD18, WR068
4376	The SDEIS must be revised to provide a current mass balance for mercury, including a current analysis of the mass of mercury that would be deposited in the HRF from all wastes, including but not limited to hydrometallurgical process wastes and WWTF sludge.	MERC17
4377	The SDEIS must be revised to provide a rigorous analysis of whether the HRF wastes or any part of them are hazardous wastes under Minnesota law, requiring issuance of a hazardous waste disposal permit.	HAZ02
4378	The SDEIS must be revised to reject any location for the HRF on top of wetlands, compressed peat, slimes or unconsolidated materials, and to reject any location on top of faults or fractures, unless detailed hydrologic analysis has demonstrated lack of hydraulic conductivity to shallow groundwater.	PD19, WR069
4379	The SDEIS must be revised to conclude that the location for the HRF in the PolyMet proposed action is unacceptable.	PD19
4380	The SDEIS must be revised to model water quality impacts from the HRF based on a reasonable and conservative range of liner leakages under normal conditions.	WR067
4381	The SDEIS must be revised to model water quality impacts from HRF discharge in the reasonably foreseeable event of liner failure or stability failure.	WR067
4382	The SDEIS must be revised to evaluate alternatives to mitigate leakage from the HRF including completely dewatering and solidifying HRF materials.	PD17
4383	The SDEIS must be revised to evaluate the potential that materials deterioration and maintenance lapses over time would increase liner leakage and water quality impacts.	PD03, WR127, WR129
4384	The Section 404 permit for the PolyMet project must be denied because the proposed action has substantial and unacceptable impacts on aquatic resources of national importance (ARNI).	COE09
4385	The Section 404 permit for the PolyMet project must be denied because the proposed action has substantial and unacceptable impacts on wetlands in the Partridge and Embarrass River watersheds, impacting drinking water quality, fisheries and wildlife in the Lake Superior Basin.	COE03
4386	The Section 404 permit for the PolyMet project must be denied because the applicant's mitigation plan fails to compensate for reasonably foreseeable indirect adverse impacts on wetlands.	COE02
4387	The Section 404 permit for the PolyMet project must be denied because the applicant's mitigation plan proposes compensation for direct destruction of wetlands outside the Lake Superior Basin.	COE01
4388	The Section 404 permit for the PolyMet project must be denied because the applicant's mitigation plan fails to minimize and avoid impacts on irreplaceable wetlands in the Lake Superior Basin.	COE01

4389	The Section 404 permit for the PolyMet project must be denied because the SDEIS fails to consider project and mitigation alternatives that would reduce impacts on wetlands and ARNI.	COE04, COE09
4390	The Section 404 permit for the PolyMet project must be denied because it has not been demonstrated that the proposed action is the least environmentally damaging practicable alternative.	COE04
4391	The SDEIS must be revised to employ a valid site-specific model and provide high quality information on the indirect adverse impacts on wetlands from all of the following: a) mine drawdown; b) tailings area hydrological change; c) water quality impacts; d) air deposition of pollutants.	WET10, WR112
4392	The SDEIS must be revised to specifically state the number of wetland acres where indirect wetlands impacts are reasonably foreseeable, providing a scientific basis for its conclusions.	WET07
4393	The United States Forest Service (USFS) should reject the proposed land exchange as inconsistent with federal laws requiring that exchange of public lands be in the public interest and for fair value.	LAN01, LAN03
4394	The USFS should reject the proposed land exchange since it conflicts with federal regulations disapproving exchanges of land with split estates and reserved mineral rights.	LAN04
4395	The USFS should reject the proposed land exchange as inconsistent with the Forest Plan, due to water quality and wetlands impacts, and losses of mature forests and high diversity habitats for rare and endangered species and species of special concern.	LAN04
4396	The USFS should reject the proposed land exchange due to losses of wetlands, headwaters and higher order streams in the Lake Superior Basin and adverse impacts on high priority national and international waters.	WR107, WR108, WR114
4397	The USFS should reject the PolyMet project and proposed land exchange as inconsistent with provisions of the Forest Plan and obligations of the federal government to protect tribal rights to fish, hunt and gather plants.	CR01
4398	The USFS should immediately disclose all appraisal information for the land exchange and allow public review and comment.	LAN03
4399	The SDEIS should be revised to analyze the impacts of loss of wetlands, headwaters and higher order streams in the Lake Superior Basin.	WR071, WR112, WR114
4400	The SDEIS should be revised to analyze cumulative impacts of the land exchange and the PolyMet project on tribal rights to hunt, fish and gather wild rice and other plants in the Ceded Territories, Reservation waters, the St. Louis River, and the Lake Superior Basin.	CR01, CR03
4401	The SDEIS must be revised to assess specific conductivity, including background levels from reference streams, elevations in project waters resulting from existing mining impacts, improvements in water quality predicted from attenuation and enforcement, and impacts from the PolyMet proposed action.	WR064, WR071, WR108
4402	The SDEIS must be revised to assess cumulative impacts of the specific conductivity from the PolyMet project on aquatic life in downstream waters, including the St. Louis River.	AQ14, AQ26
4403	The SDEIS must be revised to evaluate the significance of the potential impacts on aquatic life from increased metal solutes under the proposed action, including solutes not predicted to exceed numeric water quality standards.	AQ06

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4404	The SDEIS must be revised to include results from toxicity testing of leachates from PolyMet project wastes and tailings to evaluate risks to aquatic life from uncaptured seepage.	AQ05, AQ06
4405	The SDEIS must be revised to evaluate impacts on aquatic ecosystems from hydrologic changes resulting from the PolyMet project in the Partridge River watershed, including Yelp, Wetlegs, Wyman, Longnose and Unnamed Creek as well as the Partridge River. This consideration must include revised and accurate baseflow inputs.	AQ24, WR003, WR081
4406	The SDEIS must be revised to evaluate impacts on aquatic ecosystems from the volume as well as chemical composition of WWTF effluent that would be discharged to the Partridge River during closure.	AQ23, WR147
4407	The SDEIS must evaluate the impacts of hydrologic changes to the Partridge River watershed resulting from the PolyMet proposed action [on aquatic life], considering seasonal and climatic variations, not just averages.	AQ24, WR003, WR180
4408	The SDEIS must evaluate an alternative where reverse osmosis is constructed on the PolyMet mine site in year one and augmentation provided to Partridge River watershed streams to mitigate impacts on aquatic ecosystems.	ALT13
4409	As detailed in Section I, the SDEIS must be revised to provide a comprehensive assessment of the risks of methylmercury resulting from the PolyMet project to fetuses, infants, children and adults, including people who rely on fish for subsistence as a result of fish consumption in the Embarrass River and Partridge River watersheds and in the St. Louis River.	HU01
4410	The SDEIS must be revised to assess impacts of air emissions at the PolyMet mine site and plant site for on-site workers both for cancer and non-cancer health risks.	HU04
4411	The SDEIS must be revised to model exposure of PolyMet on-site workers to mineral fibers and estimate the health risk to workers from mineral fibers based on the best protocols and research available, including the U of M 2013 data.	HU04
4412	The SDEIS must be revised to model the volume and concentrations of mineral fibers in air emissions from the PolyMet mine site and plant site and in water discharge to groundwater and surface water to assess health risks to the public.	AIR03, WR025, WR107
4413	The SDEIS must be revised to disclose all parameters of concern, including lead, mercury and methylmercury in all residential wells between the tailings basin and the Embarrass River, sampling multiple times and correlating results with location and depth of wells.	WR041
4414	The SDEIS must be revised to analyze potential impacts [(including health risks)] of tailings basin seepage on residential wells, using reasonable assumptions regarding the volume and concentrations of seepage that would be released untreated from the PolyMet tailings piles.	HU01, WR041
4415	The SDEIS must be revised to evaluate health risks from coal combustion emissions resulting from the PolyMet proposed action.	HU01
4416	The SDEIS must be revised to state that increased discharge of arsenic from the PolyMet project would increase cancer risks beyond Minnesota's cancer risk threshold of 1 in 100,000.	HU05
4417	The SDEIS must be revised to state that increased manganese discharge at the tailings basin would exceed Minnesota's health risk limit of 100 µg/L.	HU01

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4418	The SDEIS must be revised to provide a Health Risk Assessment for air emissions, discharge to surface water and groundwater and, where applicable, bioaccumulation of pollutants that may pose a risk to human health from the PolyMet proposed action. This Health Risk Assessment, prepared in conjunction with the Minnesota Department of Health, must:1. Explain health risks of pollutants in terms intelligible to decision-makers and the public;2. Use reasonable assumptions about emissions, seepage and transport of pollutants;3. Evaluate cancer and non-cancer risks for vulnerable populations, including fetuses, infants, children and the elderly;4. Evaluate cancer and non-cancer risks to populations with highest levels of exposure, including on-site workers, persons with residential drinking wells downstream of the site, and persons who rely on fishing, hunting and gathering for subsistence.5. Evaluate cumulative risks of multiple chemicals and exposure routes.6. Evaluate past, existing and reasonably foreseeable impacts of pollutants in assessing health risks.	HU01
4419	Upon completion of a Health Risk Assessment, the SDEIS must quantify as socioeconomic costs all costs related to health impacts, including medical treatment costs, lost productivity and costs from reduction of neurological and other functions in infants, children and adults.	SO04
4420	The SDEIS must be revised to assess the probabilities and environmental consequences of partial or complete slope failure of waste rock stockpiles.	GT15
4421	The SDEIS must be revised to assess the probabilities and environmental consequences of partial or complete dam or slope failure at the tailings and hydrometallurgical residue storage facilities.	GT15
4422	The SDEIS must be revised to assess the probabilities and environmental consequences of extreme weather and flooding at the mine site and plant site.	PD22
4423	The SDEIS must be revised to assess the probabilities and environmental consequences of pipeline spills and rail accidents along the transportation corridor.	PD36
4424	The SDEIS must be revised to assess the probabilities and environmental consequences of failure of the integrity of liners beneath sumps, basins, ore surge and waste rock piles and the hydrometallurgical residue facility.	PD11, PD17, PD22
4425	The SDEIS must be revised to assess the probabilities and environmental consequences of failure of leachate collection and wastewater treatment systems to perform as planned.	PD11, PD22
4426	The SDEIS must be revised to provide sufficient detail as to the nature and duration of wastewater treatment, leachate containment, liners, caps, maintenance, monitoring, and wetlands compensation to support mitigation and financial assurance requirements.	FIN05, FIN06, FIN11
4427	The SDEIS must be revised to provide a detailed projection of capital costs, operating costs, life cycle replacement, adaptive management and contingency costs for unanticipated events to allow determination of financial assurance requirements.	FIN05
4428	The SDEIS must be revised to evaluate the Underground Mining project alternative based on the full scope of mineral resources at the site and the reasonable costs of both Underground Mining and the proposed action, including long-term mitigation costs.	ALT01
4429	The SDEIS must be revised to evaluate the West Pit Backfill mitigation alternative, explaining any environmental concerns posed by in-pit disposal of waste rock.	ALT03

4430	The SDEIS must be revised to evaluate the Mine Site Reverse Osmosis in Year One alternative, including the following components:1. Require on-site treatment of mine site stormwater and process water with reverse osmosis to meet surface water quality standards and prevent degradation of water quality starting in year one.2. Employ hydrological testing to assess appropriate quantities and locations for water release to support wetlands and headwaters streams in the Partridge River watershed.3. Release water treated by mine site reverse osmosis through pipe and/or spigot systems to mitigate the impacts of hydrological changes and mine dewatering on high value aquaticresources in the Hundred Mile Swamp and Partridge River Headwaters.4. Treat East Pit water with mine site reverse osmosis starting when reclamation begins, to limit acidity and metals seepage from the East Pit to aquatic ecosystems.	ALT13
4431	The SDEIS must be revised to evaluate alternatives for the management of reject concentrate, including but not limited to evaporation or disposing of reject concentrate off site.	ALT09
4432	The SDEIS must be revised to evaluate alternatives for the Category 1 waste rock pile that seal faults and fractures, construct the pile over a compacted subgrade, and place liner and leak detection systems under the waste rock pile.	ALT07
4433	The SDEIS must be revised to evaluate an alternative for the Overburden Storage Laydown Area that seals any faults and fractures, constructs the pile over a compacted subgrade, and places liner and leak detection systems under the OSLA	ALT07
4434	The SDEIS must be revised to evaluate alternatives that place PolyMet tailings in a new tailings facility excavated to bedrock and constructed on a compacted subgrade above liners and a leak detection system.	ALT10
4435	The SDEIS must be revised to evaluate additional alternatives that reduce seepage from tailings, including post-closure dewatering and dry tailings disposal.	ALT10
4436	The SDEIS must be revised to evaluate alternative locations for HRF, excluding sites located above an existing landfill, compressed peat, wetlands, or bedrock faults and fractures.	ALT09
4437	The SDEIS must be revised to evaluate an alternative where HRF wastes are managed and monitored as hazardous wastes, including active dewatering and stabilization at closure.	ALT09
4438	The SDEIS must be revised to evaluate the alternative of disposing of hydrometallurgical wastes and sludge off-site in a facility designed and maintained to manage this material.	ALT09
4439	The SDEIS must be revised to evaluate an alternative using new rail cars with sealed compartments to transport ore and fines.	ALT06
4440	The SDEIS must be revised to state clearly that the cumulative impacts of the PolyMet project and other past, present and future mining projects would have a significant adverse impact on aquatic life.	AQ27
4441	The SDEIS must be revised to state that the cumulative impacts of the PolyMet project and other past, present and future mining projects on wildlife corridors would have a significant adverse impact on the Canada lynx, a federally-listed species.	WI01, WI03
4442	The SDEIS must be revised to include a cumulative analysis of the effects of PolyMet proposed action on wetlands values.	WET18
4443	The SDEIS must be revised to analyze the cumulative effects of the PolyMet proposed action on groundwater in the project area, including impacts of Northshore and Cliffs Erie facilities.	WR024

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4460	The SDEIS states that no air emissions risk assessment was performed for local mercury deposition at the mine site because potential emissions are less than 1.0 pounds per year. (SDEIS, p. 5-431). Although this screening may be appropriate for dispersed smokestack emissions, it is an inappropriate exclusion for mercury contained in mine site particles, most if not all of which should be assumed to deposit locally in the Partridge River watershed.	AIR05
4461	In addition, the PolyMet SDEIS' analysis of plant site mercury emissions is incomplete...The analysis does not consider deposition of mercury from the plant site to the Second Creek watershed, which is immediately adjacent to the plant site and is neither part of the Colby Lake watershed nor the watersheds for Embarrass River lakes.	AIR05, MERC08
4462	In addition, the SDEIS' assumption that there is a simple linear relationship between mercury deposition to a water body and fish tissue methylmercury concentrations (SDEIS, p. 5-21) is too narrow... An increase in sulfate to sulfate-limited methylating environments, along with an increase in mercury deposition could have a synergistic and multiplicative effect on methylmercury concentrations.	MERC02, MERC08
4463	The PolyMet SDEIS fails to provide high-quality information and analysis regarding mercury seepage and indirect discharges to surface waters.	MERC04, MERC20
4464	The PolyMet SDEIS does not provide high-quality information as to potential mercury seepage from mine and tailings sites. The SDEIS contains no information regarding mercury levels in groundwater seepage or surface water from mine or tailings basin sites.	MERC20
4569	The SDEIS does not disclose mercury concentrations or leach test results from overburden or peat. However, technical documents contain the results of leach tests on both.	MERC20
4570	The SDEIS fails to discuss testing updates to determine mercury releases from waste rock.	MERC20
4571	The PolyMet SDEIS needs to reconcile various test results and provide mercury leachate results for all categories of waste rock and a reasonable range of predictions of mercury release through seepage.	MERC04, MERC20
4572	The PolyMet SDEIS states that the tailings basin would receive inputs of mercury from residual concentrations in the tailings and process consumables, with contributions from Colby Lake makeup water and Mine Site process water. (SDEIS, p. 5-205). However, no analysis is provided from which a decision-maker or citizen could determine the mercury mass and concentrations that are deposited to the tailings piles.	MERC04, MERC20
4573	The SDEIS states that process and tailings water samples from a pilot study conducted with NorthMet ore were found to have mercury concentrations of 11.2 and 0.7 ng/L, respectively and that mercury loadings to the Tailings Basin are estimated to be 16.2 pounds per year. (SDEIS, pp. 5-205, 5-206). No reference is cited for this data. The SDEIS also asserts, again without a citation, that "about 95 percent of the mercury originating in the ore is expected to remain within—or be adsorbed to—the tailings and the hydrometallurgical residue, where it would remain isolated from further transport to the environment." (SDEIS, p. 5-431)	MERC04
4574	The PolyMet SDEIS assumes that mercury concentrations in untreated tailings basin seepage will be 1.1 ng/L; runoff will range from 1.1 ng/L if it interacts with tailings, to 3.5 ng/L if it does not interact with tailings; and tailings basin pond water will be 2.0 ng/l. (SDEIS, p. 5-206). However, even the reports prepared on PolyMet's behalf do not support these assumptions.	MERC04
4575	The PolyMet SDEIS contains no explanation of mercury removal technologies that would be provided at the WWTP. By assuming that WWTP influent will not exceed 1.3 ng/L, the PolyMet SDEIS avoids the question of what treatment and at what cost would be needed if the WWTP had to significantly reduce mercury concentrations in order to comply with the Great Lakes standard.	MERC15

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4576	The PolyMet SDEIS provides no information as to the amount of mercury contained in the hydrometallurgical residue and avoids any discussion of its impacts by assuming that leakage from this facility “would be negligible.” (SDEIS, p. 5-157).	MERC12
4577	The PolyMet SDEIS’ assessment of the risks of mercury methylation and bioaccumulation is inadequate.	MERC03
4578	The PolyMet SDEIS does not evaluate the reasonably foreseeable impacts of the Proposed Action on mercury methylation and bioaccumulation.	MERC23
4579	Although it is undisputed that the risk of methylmercury is significant and that the PolyMet project would affect high-risk areas for mercury methylation, the PolyMet SDEIS makes no attempt to analyze the risk of mercury methylation locally and downstream as a result of air emissions, water discharges and hydrological changes at the proposed PolyMet mine and plant site.	AIR06, MERC08
4580	The PolyMet SDEIS does not assess impacts of particulate air emissions and ore spillage on mercury methylation.	AIR05
4581	The PolyMet SDEIS does not discuss the impacts of sulfur from particulate emissions on mercury methylation. Particulate emissions from both the mine site and the plant site are substantial.	AIR10
4582	The PolyMet SDEIS does not disclose the level of sulfur in these various particulates or analyze to what degree and in what areas sulfur in particulate deposition would contribute to mercury methylation in wetlands at and near the project area.	MERC08
4583	The PolyMet SDEIS’ analysis of mine site and tailings site sulfate seepage and mercury methylation is inadequate and inconsistent with applicable law.	MERC20
4584	The PolyMet SDEIS acknowledges that the project will increase the sulfate load in the Partridge River. (SDEIS, p. 5-208). However, the SDEIS provides no analysis of how sulfate discharge at the mine site, along with the air deposition and ore spillage previously described, would predictably increase mercury methylation in sulfate-limited waters.	MERC08
4585	As discussed in Section II of these comments, mine site sulfate discharges are underestimated and seepage will occur in additional directions, potentially impacting more wetlands.	WR070, WR174
4586	PolyMet mine site deposition of sulfur-bearing particles and discharge of sulfates are of particular concern for mercury methylation, since mine site wetlands and waters are likely to be low-sulfate waters where sulfate inputs would increase mercury methylation. (See SDEIS, p. 5-208). WaterLegacy found no sulfate monitoring data for the mine site wetlands within surficial groundwater flow paths.	MERC08
4587	The SDEIS supplies no predictions of sulfate levels in tailings pore water or in seepage to groundwater beneath the tailings pile.	WR060
4588	PolyMet SDEIS assumption of more than 99 percent collection of tailings seepage is unsubstantiated and unreasonable. Analysis of both the volume and concentration of sulfates in uncaptured and undiluted groundwater seepage must be provided in a revised SDEIS.	WR018
4589	The PolyMet SDEIS comparison of Proposed Action water quality impacts at the tailing site to “Existing Conditions” rather than the foreseeable improvements that would result from the No Action alternative is inconsistent with federal regulations and inconsistent with the Consent Decree for the existing Cliff Erie LTVSMC tailings basin.	WR108
4590	Reduction of sulfate discharge from the LTVSMC tailings basin does not depend on approval of the PolyMet project; it is required by law. Effects of tailings basin discharge from the PolyMet Proposed Action must be compared to a “no action” baseline that includes remediation to comply with water quality standards and with the Cliffs Erie Consent Decree.	ALT14

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
4591	The SDEIS acknowledges that hydrologic changes and water level fluctuations increase methylation of mercury: ... Thus, hydrologic changes and water level fluctuations can stimulate mercury methylation and enhance bioaccumulation. (SDEIS, p. 5-210)[.] The PolyMet SDEIS makes no effort to apply this scientific research to describe, let alone quantify, risks from the Proposed Action. This omission must be rectified.	MERC11
4592	The PolyMet SDEIS must be redone to analyze cumulative impacts on mercury bioaccumulation in the St. Louis River and more thoroughly analyze cumulative impacts of mercury on human health and environmental justice.	HU01
4593	The PolyMet SDEIS denies that mercury and sulfate loadings from the Proposed Action have the potential for cumulative effects on water quality in the St. Louis River. (SDEIS, p. 6-18). The PolyMet SDEIS then fails to consider the potential for cumulative effects on water quality in the St. Louis River of mercury methylation near the project area flushed downstream during storm events or bioaccumulating in the food chain.	MERC10
4594	comparison of tailings basin sulfate releases with “continuation of existing conditions,” rather than a reasonable no action baseline, distorts predictions of sulfate loading to the Embarrass River Watershed.	WR083
4595	PolyMet cumulative mercury and methylmercury impacts are likely to have unacceptable environmental, health and environmental justice effects.	MERC24
4777	The SDEIS analysis must recognize the cumulative risks from adding additional incremental mercury and methylmercury to an area where fish tissue mercury already poses significant hazards.	MERC10
4778	The SDEIS must also be revised to provide a more robust and candid health risk assessment for mercury.	HU01
4779	The revised SDEIS should place mercury deposition to Embarrass River lakes in context by disclosing the actual Hazard Quotient in these lakes...What theSDEIS fails to mention is that actual Hazard Quotients for the Embarrass chain of lakes are far above 1...The health risk for subsistence anglers or subsistence tribal members relying on fish from these lakes would be up to 15 times the EPA-assumed safe intake level for a pregnant mother or child underthe age of 15.	HU01
4780	Not only would mercury and methylmercury increases from the PolyMet project impact downstream water bodies already impaired due to excessive mercury in fish tissue, these increases would also affect tribal waters, treaty lands where tribes have the right to hunt, fish and gather for subsistence, Lake Superior’s largest tributary, a critical estuary, and a region where a dismayingly large proportion of infants are born with unsafe mercury levels in their blood. WaterLegacy believes that this PolyMet mine project in this particular location would pose an unacceptable cumulative risk to human health and to environmental justice.	HU01
5012	The PolyMet SDEIS’ analysis of water quality impacts from PolyMet’s proposed open-pit sulfide mine and other mine site features relies on inaccurate modeling, unsubstantiated and unreasonable assumptions, as well as insufficient data. The SDEIS water quality model outcomes seem to be determined by its assumptions, rather than arrived at by an objective and independent analysis. The SDEIS must be redone to address multiple inadequacies, which are likely to understate water quality impacts.	WR060, WR064, WR071, WR115, WR149, WR172, WR175, WR189
5013	The PolyMet SDEIS incorrectly models Partridge River baseflow.	WR003
5014	Both tribal scientists and MDNR scientists concur that it is likely the SDEIS modeling for the mine site uses an inaccurate deterministic baseflow input, and that a more realistic value would be approximately three times the input used in the SDEIS.	WR003
5015	PolyMet SDEIS’ water quality modeling rests on inaccurate and unsubstantiated assumptions regarding fractures, hydraulic conductivities and pollution transport through bedrock faults and surficial materials.	WR011, WR012, WR061, WR071, WR073, WR087, WR099

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5016	The SDEIS modeling of attenuation through soils results in a prediction that copper, nickel and arsenic will take thousands of years to travel from source areas to evaluation locations or the Partridge River. (SDEIS, p. 5-56). This attenuation model does not consider transport through fractures or other high porosity features.	WR012, WR058
5017	The SDEIS must be revised to consider the presence of known bedrock fractures transecting mine site pits and beneath mine site contaminant sources in calculating potential water quality impacts.	WR012
5018	PolyMet SDEIS' assumptions regarding Category 1 waste rock pile seepage, collection and reactivity underestimate water quality impacts.	WR025
5019	the PolyMet SDEIS uses an unsubstantiated deterministic input to model more than a 90 percent collection rate of all seepage from the unlined Category 1 waste rock pile. No field experience supports this presumed collection rate, and PolyMet's own work plan requires engineered systems to be modeled as probabilistic inputs. Finally, SDEIS assumptions regarding the efficacy of seepage reduction from its proposed cover system lack data support and may be overstated.	WR017, WR127
5020	The SDEIS assumption that all Category 1 seepage will migrate to the West Pit is unsupportable.	WR017, WR073, WR088, WR089
5021	Where faults transect the West Pit, the direction of flow for contaminated seepage both during operations and after closure must be analyzed, not assumed.	WR010
5022	Containment efficacy for the mine site collection system is unsubstantiated and modeling of uncaptured seepage is unreasonable.	WR017
5023	The SDEIS provides no data or field experience suggesting that compacted soil or clay could withstand hydraulic forces over time, that gravity flow in the trench would maintain a gradient to resist drainage passing through the compacted soil trench wall or that a slotted drain pipe would remain unclogged. The sole support for the claim that "nearly all" seepage would be collected by the proposed perimeter trench and dirt wall is as follows: The geologic conditions are favorable for a cutoff wall due to the presence of low permeability bedrock. Performance modeling of the containment systems performed by PolyMet and reviewed by the Co-leads provides strong evidence that the capture efficiency would be greater than 90 percent. (SDEIS, p. 3-47)	PD03, WR019
5024	The SDEIS does not disclose the volume or concentration of seepage that would result if the cover was not provided or was ineffective. However, the SDEIS states that water modeling indicates that "for many constituents, this stockpile would be the largest source of constituent load" if seepage were to be captured and routed to the West Pit. The SDEIS further states that the Category 1 cover system "would be the primary engineering control" that limits constituent loading from the stockpile. (SDEIS, p. 5-213). Neither seepage collection assumptions nor postclosure seepage reduction assumptions for the Category 1 waste rock pile are adequately substantiated.	PD16, WR017, WR127
5025	The SDEIS understates the potential of acid generation and solute leachate from the Category 1 waste rock pile and the mine pits.	WR001, WR025
5026	The SDEIS also fails to substantiate the efficacy of subaqueous disposal in preventing acid mine drainage and high levels of solutes in the East Pit and West Pit during reclamation. No field experience at other mines is cited.	WR024
5027	The PolyMet SDEIS' assessment of mine site compliance with water quality standards is misleading. Scrutiny suggests that standards will not be met.	WR107

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5028	As discussed above, the SDEIS minimizes potential discharge from mine site contaminant sources by underestimating Partridge River base flow through the site, by denying the potential for propagation through higher conductivity pathways in surficial materials and bedrock, by excluding flow paths to the north and northeast of the mine site, by imposing concentration caps, and by assuming collection and reduction of seepage based on models unsubstantiated by field experience.	WR005, WR017, WR018, WR033, WR091, WR167
5029	Other sections of WaterLegacy’s comments demonstrate that the SDEIS fails to analyze mercury discharge either from the mine site or plant and that sulfate discharge and its impacts on wild rice are inadequately and improperly assessed. The SDEIS also does not analyze specific conductance, or potential impacts of degradation of water quality on aquatic life	AQ05, AQ14, MERC08, MERC17
5030	Throughout our review of the SDEIS, WaterLegacy has been concerned that the SDEIS reflects advocacy for the project, rather an independent “hard look” at scientific evidence. Some specific instances of misleading edits, phrasing and omissions are highlighted in this section. In addition, despite gaps and assumptions in the SDEIS that serve to minimize potential water quality violations, WaterLegacy believes there is sufficient evidence related to mine site contaminant sources to identify excursions from water quality standards.	WR107
5031	The PolyMet SDEIS’ analysis of whether discharge to shallow groundwater will meet surface water quality requirements is misleading.	WR115, WR195
5032	The SDEIS’ language and analysis undermines the ability of either decision-makers or the public to evaluate whether PolyMet’s discharge of pollutants to shallow groundwater connected to surface water will comply with surface water quality standards. The SDEIS provides an inadequate basis for regulation to protect surface water quality. This deficiency is also reflected in SDEIS analysis of seepage from the tailings basin, where only groundwater standards are applied as evaluation criteria.	WR010, WR112
5033	the SDEIS contains no analysis of where pollutants discharged at either the mine site or the tailings site will first daylight to groundwater.	WR093, WR167
5190	Other decisions as to which data is presented in the SDEIS may also conceal rather than disclose water quality risks. For example, critical information on the amount of groundwater flow from various mine site contaminant sources and the time it would take for pollution migration is only disclosed for the P50 model, not the foreseeable P90 greater risk.	WR060, WR064, WR173
5191	The PolyMet SDEIS does not evaluate water quality at the nearest points where compliance with surface water quality standards would be required.	WR064, WR177
5192	As previously discussed, the PolyMet SDEIS does not evaluate seepage from the Category 1 waste rock pile toward the Hundred Mile Swamp or north or northwest to the Partridge River. Even for the flowpaths from mine site contaminants on the south of the site, “evaluation locations” are not equivalent to CWA compliance points.	WR081, WR167, WR177
5193	Not only does the SDEIS fail to analyze compliance with surface water quality standards where contaminants from mine site first daylight to wetlands. Yet more striking, the SDEIS fails to assess compliance with water quality standards at the “surface water release” points, as defined in the text of Table 5.2.2-8 above, where contaminants first reach the Partridge River.	WR017, WR173, WR176, WR189
5195	Even with the PolyMet SDEIS’ incomplete analysis, modeling shows mine site discharge excursions from water quality standards.	WR107, WR109
5196	As detailed above, the SDEIS model of pollutants from mine site contaminant sources understates the concentrations likely to be found in mine site surficial flowpaths. However, even using only the data that the SDEIS has provided, modeling indicates that mine site discharge would cause or contribute to violations of surface water quality standards. The SDEIS either fails to identify these excursions or attributes them to another source.	WR115, WR172

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
15197	In its primary data table, the SDEIS also fails to provide information about contaminant levels from the West Pit flowpath at the Partridge River location where it is clear that groundwater discharges to surface water.	WR173
15199	The SDEIS seems to misdirect attention away from, rather than candidly disclose, these violations of numeric WQS.	WR109
15200	The PolyMet SDEIS provides unsubstantiated and unreasonable predictions of seepage of untreated contaminants from the tailings piles. This flawed and overly optimistic analysis affects predictions of drinking water contamination, compliance with surface water quality standards, impacts on aquatic life, effects on natural stands of wild rice and increases in downstream mercury methylation due to sulfate loading in the St. Louis River as well as the Partridge River and Embarrass River watersheds.	PD08
15201	In addition, SDEIS disclosure of solute levels and of the assumptions behind its modeling of seepage concentrations is opaque and insufficient. The concentration of solutes in seepage is likely to affect predictions of contaminants in treated effluent as well as in untreated seepage escaping the tailings basin. Even with current modeling, discharge of treated effluent is likely to cause or contribute to excursions from water quality standards for aluminum, lead and selenium.	WR059, WR064, WR147, WR189
15202	NEPA requires that an EIS must use “high quality” information and “accurate scientific analysis.” 40 C.F.R. §1500.1(b). The PolyMet SDEIS water quality predictions from tailings basin seepage do not meet this test. The SDEIS must be rejected as inadequate on this basis alone, and supplemental and transparent modeling on tailings water quality issues must be included in a revised SDEIS, available for public review and comment.	GT11, WR049, WR050
15203	SDEIS tailings seepage collection assumptions are unsubstantiated and unreasonable.	PD08
15204	The SDEIS assumption of nearly perfect seepage collection is the critical foundation upon which all claims that PolyMet might comply with water quality standards downstream of the tailings piles rely. This assumption is unreasonable, unfounded, inconsistent with site conditions and inconsistent with the Modeling Work Plan methodology adopted by PolyMet and the Co-Lead Agencies.	PD08
15205	The PolyMet SDEIS modeling explicitly assumes that its row of pumps will capture 100 percent of the surface seepage and 90 percent of the 209 gpm of groundwater seepage on the north, northwest and west sides of the tailings site. (SDEIS, p. 5-159). By analyzing no other release of untreated seeps from the tailings site, the SDEIS also assumes that no seepage will be released into Second Creek and that no seepage will drain into groundwater beneath the vast, unlined tailings piles through fractures, and that neither historic streams nor changes in topography will carry seepage to the east of the tailings piles as tailings are deposited. Each of these claims is unreasonable and unfounded.	WR012, WR018, WR020, WR054, WR056, WR061, WR099, WR101, WR117, WR118
15206	PolyMet tailings pile seepage collection claims are not supported by field experience.	WR020
15207	Despite formal requests for substantiation, the Lead Agencies have provided no documentation verifying that field experience supports their claim that virtually all seepage can be captured with a pump collection system at an unlined tailing basin.	WR180
15208	Water inflow to the tailings site during PolyMet’s operations will increase groundwater seepage.	WR057
15209	The PolyMet SDEIS provides no water balance information from which to determine the volume of water that would be in the tailings piles during operation and closure. No information is provided from which one might calculate the downward pressure or “head” that would result from the height of the water. Ongoing review of the hydraulic conductivity and storage coefficients of surficial and bedrock materials suggest that PolyMet SDEIS models may be erroneous.	WR057, WR095, WR105

5210	Seepage from PolyMet’s tailings will discharge untreated through fractures, faults and historic streams beneath the tailings.	WR010, WR011, WR012, WR061, WR071, WR090, WR092, WR096, WR099, WR104
5211	The PolyMet SDEIS misrepresents and overlooks available information regarding tailings site geology. The SDEIS states, “Jennings and Reynolds (2005) mapped the surficial deposits around and beneath the Tailings Basin as Rainy Lobe Till, which functions as the surficial aquifer and is generally a boulder-rich till with high clay content” (SDEIS p. 4-95). However, the cited reference reports the surficial Rainy lobe till mapped in the vicinity of the proposed NorthMet project as “clay-poor.” Till matrix textures are reported to range from 48 to 87% sand, 9 to 40% silt and 0 to 13% clay, but “generally much less than 10% clay.” (Jennings and Reynolds, 2005). This is a sandy till, not a till with high clay content.	EDIT01
5212	Although the preliminary SDEIS referred to “fractured bedrock” beneath the tailings site (Preliminary SDEIS, May 2013, p. 5.2.2-58), the SDEIS released to the public in December 2013 does not contain a single reference to fractures that may be present at the tailings site. The map prepared by geologist J.D. Lehr, using Minnesota Geological Survey data and a 2011 statewide compilation of bedrock geology, shows several faults in the bedrock beneath the tailings site and the hydrometallurgical residue facility. <sup>25</sup> The SDEIS should have analyzed these fractures and their hydrologic relationship with surficial materials and shallow groundwater.	WR012, WR071, WR099
5213	the SDEIS does not discuss how the historic branches of the creek connected to Spring Mine Lake may affect groundwater flow beneath the tailings or how the increased height of the water table in PolyMet tailings may affect flow patterns on the east side.	WR102, WR104
5214	the elevation of Spring Mine Lake is 1,676 feet above sea level. Although the current Cell 1E and Cell 2E tailings piles are lower than Spring Mine Lake, the new water table in the PolyMet tailings would be higher than that of Spring Mine Lake, reversing the topography and potentially changing the flow of groundwater in sediments of the historic creek branching beneath the east side of the tailings. The PolyMet SDEIS fails to discuss or assess how increased tailings water table elevation would affect seepage toward the east of the tailings piles.	WR102
5215	Seepage from PolyMet’s tailings will discharge untreated to Second Creek, on the southeast side of the tailings piles.	WR117
5216	Statements in the SDEIS regarding groundwater seepage on the south side of the tailings site appear to be inconsistent. In one section, the SDEIS states, “Groundwater currently seeps from the existing LTVSMC Tailings Basin to the headwaters of Second Creek.” (SDEIS, p. 5-153) In another narrative, the SDEIS claims that there would be no impacts on wetlands resulting from changes in groundwater flow since, “All of the seepage from the south side of the Plant Site is surface water.” (SDEIS, p. 5-297).	EDIT01
5217	SDEIS disclosure of solute concentrations at the tailings site is opaque and unreliable, preventing verification of seepage concentration rates or concentration rates in treated effluent.	WR189
5218	The SDEIS provides very little information as to the concentration of contaminants at the tailings site.	WR030
5219	The SDEIS does not provide information on the volume of inputs and outputs to the tailings pond, tailings piles or WWTP. The SDEIS does not disclose modeled solute concentrations in the tailings pond, tailings pore water, tailings seepage or WWTP influent. The SDEIS does not specify the treatment or pre-treatment that will be used at the WWTP. Overall, even with the help of citizen chemists and engineers, it was not possible to understand, let alone verify, the key SDEIS assumptions regarding contaminant sources at the tailings site.	WR030, WR057, WR060, WR063, WR143, WR147

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5220	The SDEIS states that its predictions included a concentration cap, based on the assumption that tailings would have less than 0.12 percent sulfide and would never produce acid drainage. (SDEIS, p. 5-61, 5-160). Without disclosing predicted inputs to the tailings basin, the SDEIS provides insufficient information to substantiate this assumption. No explanation is provided as to the way in which a constant concentration would be maintained in several square miles of tailings piles receiving mine process water, tailings seepage, and beneficiation slurries at various times.	PD08, WR033
5221	The SDEIS statement that the proposed action “contaminant release parameters are based on a combination of laboratory tests and water quality observations at similar tailings facilities in northern Minnesota,” (SDEIS, p. 5-63) is un reassuring. Minnesota has no other tailings facilities for copper-nickel mines.	WR030
5222	The SDEIS states, “the operating configuration and requirements of the process units within the WWTP or the capacity of the WWTP could be modified to accommodate varying influent streams and discharge requirements.” (SDEIS, pp. ES-24, 5-214). The SDEIS may refer to this as “an adaptive engineering control,” but for either a decision-maker or a member of the public, this conceptual approach is insufficient to demonstrate water quality would be protected.	WR130, WR143
5223	It is likely that PolyMet tailings basin seepage and WWTP effluent would cause or contribute to excursions from water quality standards.	WR064, WR108
5224	As described at length in the preceding sections, modeling assumptions for uncaptured seepage are unreasonable underestimates of volume. Concentrations of solutes in seepage are undisclosed, and may also be unreliable. Even within the limits of this model, tailings seepage in the North flowpath would violate the surface WQS for lead. The incremental increase in North flowpath manganese would also exceed Minnesota’s groundwater health risk limit.	WR010, WR018, WR019, WR059, WR060, WR064, WR071, WR082, WR090, WR099, WR108, WR109
5225	Lead and other contaminants are likely to surface in wetlands “within the surface watersheds immediately downstream of the Tailings Basin, which includes watersheds upstream of modeling locations.” (SDEIS, p. 5-308). But, even without considering the nearest point where lead would daylight to surface water, lead discharge from the North flowpath at Mud Lake Creek (2.5 µg/L) would exceed the applicable 1.3 µg/L chronic standard for lead in 50 mg/L hardness waters. Minn. R. 7050.0110, subp. 4.	WR059, WR064, WR082
5226	In the North flowpath, manganese concentrations at the property boundary are modeled at 759 µg/L in comparison to 522 µg/L under continuation of existing conditions. At the property boundary, where groundwater standards apply, not only is the modeled concentration seven-and-a-half times the manganese health risk limit (HRL), but the 237 µg/L modeled increase in manganese exceeds Minnesota’s 100 µg/L HRL set to protect infants from harm.	HU03, WR064, WR109
5227	The SDEIS suggests that aluminum exceedance is an artifact of the modeling. (SDEIS, p. 5-189). This may or may not be the case. The GoldSim model assumes that effluent from the mine site WWTF will meet the “target” of 125 µg/L. But this assumption may be unrealistic for the WWTF filtration plant. During mining operations, concentrations of aluminum in the west equalization basin for the WWTF would range as high as 530,000 µg/L of aluminum. <sup>32</sup> Without a more transparent disclosure of aluminum inputs to the tailings piles and the WWTP, it is not possible to discount the modeled exceedance from aluminum standards.	WR063, WR064, WR143
5228	Lead levels modeled for the PolyMet proposed action would cause or contribute to excursions from Minnesota’s WQS for lead. Lead concentrations for the proposed action increase in every tributary as compared with continuing existing conditions. Under the proposed action, lead levels at Mud Lake Creek MLC-3 (1.9 µg/L), Trimble Creek TC-1 (3 µg/L) and PM- 19 (2.9 µg/L), and Unnamed Creek PM-11 (3 µg/L) would all exceed the 1.3 µg/L chronic WQS for lead in Lake Superior Basin waters with hardness of 50 mg/L.	WR082

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5229	The PolyMet SDEIS provides unsubstantiated and unreasonable predictions of seepage of untreated contaminants from the tailings piles. This flawed and overly optimistic analysis affects predictions of drinking water contamination, compliance with surface water quality standards, impacts on aquatic life, effects on natural stands of wild rice and increases in downstream mercury methylation due to sulfate loading in the St. Louis River as well as the Partridge River and Embarrass River watersheds. The PolyMet SDEIS must be rejected as inadequate on this basis alone.	PD08, WR019, WR041, WR113, WR115
5230	The concentrations both in untreated seepage and in WWTP effluent depend on the levels of solutes in tailings site process water. In addition to revision of water quality models to include a realistic volume for untreated seepage, the concentration of solutes in tailings seepage, plant site pond and process water, and WWTP influent must be disclosed in a revised SDEIS so that models of water quality downstream of effluent can be verified.	WR060, WR063
5231	The Hydrometallurgical Residue Facility (HRF) will contain some of the most concentrated and toxic wastes produced by the PolyMet project. Yet, the SDEIS fails to disclose the chemical composition of these materials or explain the analysis that was done to determine whether or not they would pose hazards to the environment.	WR068
5232	The PolyMet plan selects an unsuitable location for the HRF, increasing risks of liner failure and instability at this permanent waste storage facility. The SDEIS inappropriately denies the potential for releases as result of liner leakage from the HRF. Planned management of the HRF is insufficient to reduce risks of significant releases.	PD17, PD19
5233	The PolyMet SDEIS provides inadequate information as to the nature and chemical characterization of HRF wastes.	PD18
5234	The SDEIS does not tell decision-makers or the public what concentration of acids, salts and metals is predicted for the hydrometallurgical process wastes and filtered sludge that would be deposited in the HRF. No documents among the SDEIS references model the overall chemistry of the hydrometallurgical residue facility at any relevant time period. Neither the SDEIS nor any document identified to date explains the analysis that was done by any regulatory agency to determine whether the HRF should or should not be characterized as hazardous waste.	PD17, PD18
5235	The SDEIS does not discuss the chemical composition or process by which the WWTF will produce filtered sludge... We've found no analysis of the volume or chemistry of the filtered sludge proposed to be deposited in the HRF. However, levels of sulfates and metals in reject concentrate, even before dewatering to form sludge, indicate that sludge may pose a hazard if released to the environment.	PD18
5236	The PolyMet SDEIS does not include a requirement that the HRF obtain a permit as a hazardous waste facility. Neither does the SDEIS contain any analysis of whether the HRF should be treated as a facility for storing hazardous wastes. This analysis is long overdue.	PD17
5237	The proposed location for the PolyMet hydrometallurgical residue facility is an unsuitable site.	PD19
5238	The PolyMet SDEIS proposes to construct the PolyMet hydrometallurgical residue facility on two shallow marsh wetlands totaling 36.1 acres...Minnesota law precludes establishment or construction of either a hazardous waste facility or an industrial solid waste facility in a "wetland" or in a location "where the topography, geology, hydrology, or soil is unsuitable for the protection of the ground water and the surface water." Minn. R. 7045.0460, subp. 2; Minn. R. 7035.1600. Location of the HRF on top of wetlands is prohibited pursuant to Minnesota rules.	PD19
5239	The PolyMet SDEIS inappropriately fails to consider liner leakage both within an expected leakage range and under conditions of liner integrity failure.	PD22
5240	The SDEIS fails to provide any analysis of the impacts of liner leakage on modeled water quality.	PD03

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5241	As a result of the liner stress posed by the proposed location of the HRF on top of shallow marshland, peat, slimes and other unconsolidated materials, failure of liner integrity is more likely. In addition, both the HRF process and the chemical trains for filtered sludge involved limestone or lime, creating high concentrations of calcium. The presence of these ions will increase the likelihood of failure of the second liner, the geosynthetic clay liner.	PD17
5242	Management of the hydrometallurgical residue facility is insufficient to reduce the risk of liner loss of integrity or impoundment failure.	PD17
5243	Minnesota rules ensure that a facility issued a hazardous waste permit or a state disposal system permit will be properly inspected and maintained and that long-term closure will reduce the risks that caustic or toxic wastes will be released. There is no such assurance for the HRF...The SDEIS does not propose any schedule for monitoring liquids removed from the leak detection system, or for inspections to ensure that the pumping system is not clogged due to solids accumulation.	PD17
5244	Although the SDEIS claims, “mitigation measures would be undertaken if there was any indication of potential solute releases to groundwater or surface water” from the HRF (SDEIS, pp. 5-89, 5-157), the nature of these measures is not specified. Short of excavating the hydrometallurgical residue facility, there is no mitigation that would restore the patency of a liner that has lost its integrity.	PD17
5245	The PolyMet SDEIS uses an unverified analog for indirect impacts on wetlands and unsubstantiated assumptions about impacts of mine drawdown, fragmentation, and pollution to understate the reasonably foreseeable indirect effects of the PolyMet open-pit mine, mine wastes, processing and tailings facilities. Despite these understatements, the PolyMet proposed action would have substantial and unacceptable impacts on aquatic resources of national importance.	WET08, WET19
5246	the PolyMet SDEIS plan for wetlands mitigation is inadequate. The SDEIS proposes wetlands mitigation for only 27 of up to 7,351 acres of wetlands that would be indirectly impacted by the proposed action. Even where mitigation is proposed, more than two-thirds of the compensatory acres and credits are outside the Lake Superior Basin. From a functional perspective, wetlands at the proposed PolyMet mine site are irreplaceable.	WET01, WET03, WET04
5247	Finally, no alternatives are analyzed in the PolyMet SDEIS, although both the underground mine project alternative and several mitigation alternatives discussed in Section XI of these comments would have the potential to reduce impacts on project area wetlands, including aquatic resources of national importance.	WET20
5248	The PolyMet SDEIS must be revised to model indirect wetlands impacts. The Clean Water Act Section 404 wetlands dredge and fill permit must be denied due to substantial and unacceptable impacts on wetlands, an inadequate mitigation plan and the failure to demonstrate that the proposed action is the least environmentally damaging practicable alternative.	WET08
5249	Construction of open pits, stockpiles and haul roads at the mine site could fragment wetlands. Groundwater drawdown from mine dewatering, groundwater mounding/drawdown from tailings basin seepage containment, and changes in stream flow could create hydrological effects converting one wetland type to another or converting a wetland to an upland. Changes in wetland water quality could impact the functions and values of remaining wetlands. (SDEIS, p. 225). As a result of all of these factors, in addition to direct destruction of wetlands, the PolyMet proposed action could indirectly affect up to 7,351 acres of wetlands at the mine site and tailings basin site (SDEIS, p. 5-224, 5-309), resulting in a total potential impact on 8,264 acres of wetlands.	WET24
5250	All wetlands in the Partridge River watershed impacted by the PolyMet project should be considered ARNI. Minnesota Biological Survey mapping shows that the Hundred Mile Swamp, Upper Partridge River and Partridge River Peatlands sites are all areas of high biological diversity.	WET19

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5251	In addition to the aquatic resources in the Partridge River Watershed, it is likely that there are wetlands near the tailings basin that should be considered aquatic resources of national importance.	WET19
5252	The PolyMet proposed action would have substantial and unacceptable adverse impacts on ARNI, which are poorly estimated and understated in the SDEIS.	WET19
5253	Direct wetlands destruction alone resulting from the PolyMet proposed action would constitute substantial adverse impacts on aquatic resources of national importance in the Partridge River watershed. Even before indirect wetlands effects are considered, net destruction of wetlands in the Partridge River watershed from the PolyMet project would result in net loss of 666 acres. According to the PolyMet SDEIS, this direct wetlands destruction from the proposed action would be 26 percent of the total historical and predicted loss of wetlands in the Partridge River watershed from all other sources. <sup>40</sup> This is a substantial and unacceptable loss of ARNI from a single project.	WET19
5254	The PolyMet SDEIS' analysis of reasonably foreseeable adverse indirect impacts on wetlands is inadequate and understates indirect impacts.	WET24
5255	The discussion of indirect wetlands impacts in the PolyMet SDEIS is inadequate and potentially misleading. The comparability of the Canisteo pit to the PolyMet mine pits for purposes of the "analog" estimates is unverified. Even applying the Canisteo pit proxy, the SDEIS' use of data seems selected to understate impacts.	WET08
5256	When incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, NEPA requires that the information be secured and included in an EIS. 40 §C.F.R. 22(a). In addition, under 40 C.F.R. §1500.1(b), an EIS must use "high quality" information and "accurate scientific analysis." The PolyMet SDEIS' analysis of indirect wetlands effects doesn't meet these tests.	WET01
5257	The SDEIS' heavy reliance on the Canisteo pit proxy to predict indirect wetland impacts also fails the accurate analysis test 40 C.F.R. §1500.1(b).	WET08
5258	The record is insufficient to verify the reliability of the Canisteo pit "analog" to estimate mine drawdown at the PolyMet mine site. Although the SDEIS claims that that the "geologic and hydrogeologic settings of the Mine Site are relatively similar to the Canisteo and Minntac sites." (SDEIS, p. 5-92), data does not support this conclusion. The PolyMet East pit would be 630 feet deep and the West Pit would be 696 feet deep, (SDEIS, p. ES-17), while the Canisteo pit averages 100 feet deep. <sup>41</sup> The PolyMet mine is underlain by Duluth Complex and Virginia Formation, while the Canisteo pit has thicker glacial till and is underlain by Biwabik Formation rock. (SDEIS, p. 5-92). Absent rigorous site-specific characterization of geology and hydrogeology at the mine site – which might obviate the need for an analog at all – there is no verification that mine drawdown at the Canisteo pit would be comparable to the PolyMet site.	WET08
5259	Apart from the inappropriate use of a Canisteo pit "analog" to estimate mine drawdown impacts, the SDEIS' assumptions underestimate reasonably foreseeable indirect impacts on wetlands. The SDEIS assumes that ombrotrophic coniferous bogs and open bogs would not be impacted by mine drawdown because their hydrology is supported by precipitation. (SDEIS, p. 5-243). But, "no data or research was used from actual wetlands responding to groundwater drawdown" was used in the SDEIS for conclusions regarding wetlands sensitivities.	WET10
5260	The SDEIS also apparently assumes that if changes in the average annual flow of the Partridge River would not diverge from naturally occurring variation, one could conclude that there were no potential indirect wetland effects for wetlands abutting the Partridge River. (SDEIS, p. 5-273). Finally, with respect to wetlands effects, the SDEIS concludes that the Partridge River "is likely to act as a natural barrier to the expansion of the cone of depression" for mine site drawdown. (SDEIS, p. 5-243). The PolyMet provided no testing data or research to support any of these assumptions.	WET08, WET10

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5261	The PolyMet SDEIS does not consider the levels of sulfates or metals in “dust” deposited or the effects these specific chemicals might have on wetlands. The SDEIS assumes that there would be no effects on wetlands unless dust levels were sufficient to interfere with photosynthesis, and set the threshold for this effect at doubling the existing levels of background deposition.	WET11
5262	Perhaps the clearest example of the SDEIS’ inadequacy in characterizing reasonably foreseeable wetlands impacts is on the mine site itself. On the mine site alone, 540 acres of wetlands would remain vulnerable to impairment and destruction after 758 acres of mine site wetlands are destroyed as a result of constructing mine pits, waste rock piles and other mine features. (SDEIS, p. 5-224). It is likely that all of these wetlands would be adversely affected by fragmentation, hydrologic changes, water pollution, air deposition or a combination of the above.	WET07
5263	The PolyMet proposed action would have substantial and unacceptable adverse impacts on ARNI as a result of fragmentation, mine drawdown, hydrologic changes, water and air pollution.	WET19
5264	The SDEIS also fails to identify the total acres of wetlands in the Partridge River and Embarrass River watersheds where adverse impacts are “reasonably foreseeable,” whether as a result of fragmentation, mine drawdown, hydrologic changes, seepages, leaks, spills or deposition of contaminants. The SDEIS is inadequate without this assessment and must be revised to clearly state and justify on a sound scientific basis the reasonably foreseeable direct and indirect effects on wetlands from the PolyMet proposed action. <sup>47</sup> Until that time, no mitigation plan can be evaluated and no Section 404 permit issued.	WET07
5265	WaterLegacy believes that the PolyMet project would have substantial and unacceptable adverse impacts on wetlands and ARNI, in particular. The PolyMet project’s potential direct and indirect impact to 8,264 acres of wetlands would dwarf both the historic wetlands destruction and the projected cumulative wetlands destruction from all other sources in the Partridge River watershed (2,557 acres) and the Embarrass River watershed (402 acres). (SDEIS, Table 6.2-9, p. 6-38; Table 6.2-12, p. 6-41).	WET19
5266	The PolyMet plan for wetlands mitigation is plainly inadequate.A. The PolyMet plan fails to compensate for indirect adverse impacts on wetlands.	WET01
5267	The PolyMet SDEIS contains no discussion of where or how additional compensatory mitigation would be provided for indirect wetlands impacts.	WET01
5268	The vague and indefinite possibility of subsequent compensation for adverse impacts on wetlands resulting from fragmentation, mine drawdown, hydrologic changes, water pollution and air deposition in the PolyMet SDEIS fails to adequately protect ARNI and other wetlands resources under the Clean Water Act.	WET19
5269	The PolyMet plan fails to provide mitigation for direct adverse impacts on wetlands within the Lake Superior Basin.	WET04
5270	PolyMet’s mitigation plan for direct destruction of wetlands, as reflected in the SDEIS, proposes 101.8 acres of on-site future restoration, plus 530.9 acres of restoration or preservation at the Zim wetlands bank in the St. Louis River/Great Lakes Basin. The balance of mitigation project acreage —68 percent of the total – are proposed are in Aitkin and Hinckley, both geographically and ecologically remote from the project impacts. (SDEIS, Table 5.2.3-18, p. 5-327). When wetlands restoration credits are evaluated, even a higher percentage – 72 percent of the total – are located outside the 8-digit HUC watershed where the PolyMet proposed action would destroy wetlands in the Partridge and Embarrass River watersheds. (Id.) The SDEIS plan for wetlands compensation is inadequate, even for direct wetlands impacts.	WET01, WET03
5271	The PolyMet wetlands compensation plan does not provide ecologically equivalent wetlands functionality within the Lake Superior Basin.	WET03
5272	The PolyMet proposed action is not the least environmentally damaging practicable alternative as required under the Clean Water Act Section 404.	ALT20

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5273	a Section 404 dredge and fill permit may not be issued under the Clean Water Act unless it is the least environmentally damaging practicable alternative to a dredge and fill project that would impact wetlands and headwaters streams. The PolyMet proposed action does not meet this test.	ALT20
5274	Project and mitigation alternatives described in Section XI of these comments would reduce the direct or indirect impacts to wetlands and ARNI. An underground mining alternative would greatly minimize wetlands destruction. The West Pit Backfill alternative would allow for wetlands restoration, and placement of permanent sources of contaminants above liners would reduce seepage impacts on adjacent wetlands. Construction of Mine Site Reverse Osmosis in Year One would allow mitigation of both pollution and drawdown impacts to Partridge River watershed high-value wetlands and ARNI.	ALT01, ALT03, ALT06, ALT13
5275	The SDEIS proposes a land exchange as a necessary precondition for PolyMet’s open-pit mine project. Although this project meets PolyMet’s interest in an open-pit mine and may reduce “conflict” between the U.S. Forest Service and the company, the proposed land exchange is unlikely to meet the financial requirements of the Federal Land Planning and Management Act, is not in the public interest, conflicts with the Forest Plan, and would adversely impact environmental and tribal resources.	LAN02
5276	The PolyMet SDEIS fails to disclose appraisal information to confirm that the exchange would not give a favorable deal for PolyMet - at taxpayers’ expense - and fails to evaluate impacts on aquatic resources of national importance within the Lake Superior Basin.	LAN03
5277	The PolyMet SDEIS does not demonstrate that the land exchange would comply with law written to protect the public from unfair trades.	LAN03
5278	The SDEIS provides no information demonstrating that either the proposed or the alternative land exchange would comply with Federal Land Planning and Management Act (FLPMA) requirements.	LAN02
5279	Despite requests by WaterLegacy both in the scoping process and pursuant to the FOIA, the Forest Service has declined to provide appraisal information to allow members of the public to verify that the PolyMet exchange would be equitable. Particularly in light of the Forest Service’s definition of its interest solely in terms of furthering minerals production, disclosure of appraisals for early and public scrutiny is necessary to ascertain whether the proposed exchange is an unequal trade, benefitting PolyMet at the expense of citizens and taxpayers.	LAN03
5281	The purpose and need for the land exchange asserted in the SDEIS serves a single private interest, not the public interest.	NEPA04
5282	The purpose and need for the PolyMet land exchange stated in the PolyMet SDEIS reflects a singular interest of the PolyMet corporation in open-pit mining in a certain location, not the broad range of uses and values that would serve the public interest.	NEPA04
5283	The exchange of federal lands for private lands with split ownership and severed mineral rights would be contrary to federal regulations and the public interest.	LAN04
5284	The proposed land exchange would be inconsistent with provisions of the Superior National Forest Plan that protect ecological values and would diminish the environmental value of the federal estate.	LAN04
5285	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Management activities do not reduce existing quality of surface or groundwater or impair designated uses of surface and ground water.” (Forest Plan D-WS-4, p. 2-10)	WR107

5286	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Water in lakes, streams, and wetlands meets or exceeds State water qualityrequirements.” (Forest Plan, D-WS-5 p. 2-10)	WR107
5287	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Improve and protect watershed conditions to provide the water quality, water quantity, and soil productivity necessary to support ecological functions and intended beneficial water uses.” (Forest Plan, O-WS-1, p. 2-12)	WR107
5288	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Wetland impacts will be avoided whenever possible. Where impacts are unavoidable, minimize and compensate for loss when undertaking projects.” (Forest Plan, G-WS-13, p. 2-15)	WET16
5289	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Wetlands will be managed to prevent the reduction of their water quality, fish and wildlife habitat, and aesthetic values. Management actions will not reduce water quality within a wetland, or upstream or downstream of a wetland, unless restoration of natural conditions is the primary goal of the activity.” (Forest Plan, G-WS-15, p. 2-15)	WET16
5290	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Increase acres of old-growth lowland black spruce and tamarack forest communities.” (Forest Plan, O-VG-16, p. 2-24)	VEG03
5291	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“[M]aintain the characteristics of mature or older native upland forest vegetationcommunities and promote the maintenance or development of interior forest habitat conditions.” (Forest Plan, O-VG-17, p. 2-24)	VEG03
5292	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Contribute to the conservation and recovery of federally-listed, proposed, or candidate threatened and endangered species and the habitats upon which these species depend.” (Forest Plan, D-WL-3(c), p. 2-27)“Maintain, protect, or improve habitat for all threatened and endangered species by emphasizing and working toward the goals and objectives of federal recovery plans and management direction in the Forest Plan. (Forest Plan, O-WL-4, p. 2-29)	WI12
5293	The PolyMet SDEIS does not discuss various Forest Plan provisions that pose conflicts with the PolyMet proposed action. The land exchange and the PolyMet open-pit mine would be inconsistent with these provisions protecting water, wetlands, wildlife and forest resources:“Avoid or minimize negative impacts to known occurrences of sensitive species. (Forest Plan, G-WL-11, p. 2-31)	WI12
5294	Although other aspects of the land exchange are analyzed in some detail, the PolyMet SDEIS provides little discussion of the effects of the proposed land exchange on wetlands and headwater streams within the Lake Superior Basin that serve critical functions for nationally and internationally important waters. SDEIS land exchange sections don’t explain that losses of firstorder headwaters streams, second-order streams and wetlands can have significant impacts on downstream water quality, wildlife, and fisheries.	AQ29, WET14, WET19

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5295	The PolyMet land exchange would impair tribal resources in the Ceded Territories and conflict with tribal land resource management.	CR01
5296	The proposed land exchange would neither protect access to cultural resources nor protect the ecosystems upon which tribal rights to fish, hunt and gather plants depend.	CR01, CR05
5297	The PolyMet SDEIS fails to analyze specific conductivity, a pollutant limited by Minnesota water quality standards, which is known to be a stressor for aquatic life. Even though existing tailings basin seeps have exceeded standards for specific conductivity, the SDEIS neither reports existing conditions nor models impacts of the proposed action on specific conductivity.	AQ14, WR064
5298	The SDEIS recognizes that levels of many pollutants would increase were the proposed action approved, and that the proposed project would have a potential cumulative adverse impact on aquatic life. What is lacking in this analysis is a discussion of the significance of this adverse impact and its relationship to legal standards preventing degradation of water quality.	AQ27
5299	The SDEIS provides no data on specific conductivity in waters near the PolyMet site and no information to help decision-makers evaluate whether the PolyMet surface mine would impair aquatic life at or downstream of the project site as a result of high conductance. However, Barr reports included as references to the SDEIS demonstrate that discharge from the existing LTVSMC tailings basin violates Minnesota's specific conductance standard and that specific conductance is elevated in streams near the project area with aquatic life impairments.	AQ06, AQ14
5300	In order for the SDEIS to evaluate impacts of the PolyMet proposed action on aquatic life, both specific conductance in the affected environment and predicted levels of this pollutant resulting from the proposed action must be analyzed.	AQ14
5301	The SDEIS must assess the significance of water quality degradation from the PolyMet proposed action to aquatic life and test leachates for aquatic toxicity.	AQ06, AQ27
5302	The SDEIS does not reach a conclusion as to the significance of the impacts of these increased pollutants on aquatic life. This evaluation must be addressed in the SDEIS, not passed off for possible consideration in permitting (SDEIS, p. 6-61).	AQ27
5303	The SDEIS' analysis of potential adverse effects to aquatic life from increased metal releases has two important gaps. The SDEIS does not assess the significance of degradation of downstream waters on aquatic life. In addition, the SDEIS does not discuss the potential toxicity of leachates from sulfide mine wastes, tailings and residues...Toxicity testing of mine waste, tailings basin and hydrometallurgical residue facility leachates prior to finalizing the SDEIS would identify risks to aquatic life from inorganic ions as well as from metals solutes.	AQ06, AQ27
5304	The SDEIS provides insufficient analysis and mitigation for hydrologic changes, particularly to the Partridge River watershed.	WR130, WR180
5305	The SDEIS' assessment and mitigation strategy for hydrologic impacts to the Embarrass River watershed may be incomplete or unrealistic. However, even this level of evaluation is lacking for the Partridge River watershed.	WR130
5306	The PolyMet SDEIS provides no assessment of effects of the project on the mine site Unnamed Creek, Wetlegs Creek, Longnose Creek, Wyman Creek or Yelp Creek. For Wetlegs, Wyman and Longnose, the SDEIS states that a lack of hydrologic impact was assumed, rather than analyzed. "No baseline flow data collection or hydrologic modeling was conducted for Wetlegs, Longnose, and Wyman creeks as the NorthMet Project Proposed Action is not expected to affect the hydrology of these streams." (SDEIS, p. 4-79). We were unable to locate any discussion in the SDEIS of hydrological impacts of the PolyMet project on Yelp Creek, immediately to the north of the mine site. We also found no discussion in the SDEIS of how mine drawdown during operations and WWTF discharge after approximately year 40 would affect aquatic functions in the Unnamed Creek on the PolyMet mine site.	WR071, WR081

5307	The PolyMet SDEIS contains an inadequate and incomplete assessment of the potential health impacts of the proposed action.	HU01
5308	In the case of mercury and methylmercury, as described at length in Section I of these comments, data regarding emissions, mercury and sulfate discharge and hydrologic change is missing or inaccurately represented, and the SDEIS fails to evaluate the potential risk of increased methylmercury bioaccumulation in the food chain.	MERC04
5309	the SDEIS completely avoids analysis of certain risks of both air emissions and water discharge, distorts the evaluation of pollutants by using criteria that are not reflective of health risks, considers cumulative impacts of prior industry pollution as “background” and, over all, reflects an insufficient concern and transparency regarding health risks to workers and members of the public.	HU01
5310	The PolyMet SDEIS fails to analyze pertinent health risks posed by air emissions and water discharge from the proposed action.	HU01
5311	The SDEIS does not analyze health risks for on-site workers.	HU04
5312	The PolyMet SDEIS fails to consider any health impacts to workers who actually work on the mine site or plant site. Any references to worker health in the SDEIS only pertain to “offsite workers.” (See SDEIS, pp. 5-421, 5-422, 5-423, 5-425, 5-426). This is an inappropriate omission.	HU04
5313	Primary on-site risk drivers for mine site cancer would be dioxins and dibenzo(a,h)anthracene related to mine vehicle emissions. (SDEIS, p. 5-423). If risks to on-site workers were calculated, it is likely that they would be above Minnesota’s air emissions health threshold.	HU05
5314	At the plant site, again without analyzing mineral fibers, risk drivers for cancer and non-cancer health risks were similar to those at the mine site, excluding indeno(1,2,3-cd)pyrene and adding the additional risk of hydrochloric acid. (SDEIS, Table 5.2.7-21, p. 5-425). Even at the edge of PolyMet’s plant site property boundary, chronic risk from inhalation of pollutants would reach Minnesota’s non-cancer health risk threshold. (SDEIS, pp. 5-425; Table 5.2.7-22, p. 5-426).	HU05
5315	If risks to PolyMet’s on-site plant personnel were calculated, it is likely that they would exceed Minnesota thresholds for both cancer and non-cancer risks. Additional mitigation measures might be required to reduce on-site health risks. For example, the proposal to vent air exhaust from the crushing plant back into the plant (SDEIS, p. 5-442) might be re-considered.	HU05
5316	The PolyMet SDEIS’ discussion of the risks of mineral fibers minimizes their health risks and avoids any analysis of potential morbidity and mortality increases from exposure to fine particulates containing these materials.	HU01
5317	The SDEIS mischaracterizes the University of Minnesota (U of M) taconite worker study, saying the study concluded that “the worker exposure resulting in the increase in mortality is primarily due to commercial asbestos exposure and not the rock being mined (University of Minnesota 2013).” (5-439 to 5-440). Although the U of M study noted that the study could not completely control for the presence of commercial asbestos where data was lacking, the study clearly associate the risk of mesothelioma with exposure to elongate mineral particles (EMP) measured in taconite dust.	HU07
5318	The SDEIS states, “the potential exists for the release of amphibole mineral fibers from the proposed operations, which could pose a potential public health risk of uncertain magnitude.” (SDEIS, p. 5-439). This is insufficient analysis in a situation where a proposed action may pose a significant risk to workers and to public health.	HU01
5319	The PolyMet SDEIS must provide a detailed analysis of mesothelioma risks in consultation with the EPA and U of M researchers. This analysis could begin by estimating exposures to elongate mineral particles for workers at the PolyMet plant and evaluating those exposures in light of the U of M data that correlates EMP exposure with higher rates of mesothelioma. An effort should also be made to model other adverse health effects.	HU01

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5320	In addition to evaluating the mesothelioma risks to workers, the SDEIS should also estimate the volume and concentrations of fibers emitted in fine particulate matter and discharged with seepage to groundwater and surface water.	HU04
5321	However, the SDEIS fails to assess the cumulative health risks from air emissions resulting from coal combustion required to meet PolyMet project energy demands. It is wellknown that coal combustion emissions, including nitrogen oxides, sulfur dioxide, particulate matter, fine particulate matter, mercury and lead significantly impact human health. These impacts may not be experienced at the PolyMet property boundary, but they are project impacts that should be quantified and disclosed in the PolyMet SDEIS.	HU01
5322	The SDEIS' discussion of the impacts of the PolyMet project on arsenic is incomplete and fails to consider the adverse health impacts of this Group A human carcinogen (IRIS 2007).	HU01
5323	To evaluate the risks of the PolyMet proposal, the SDEIS must analyze actual increased risk of cancer as well as compliance with legal requirements.	HU01
5324	Even with all of the limiting assumptions in the SDEIS, PolyMet's modeled increase in arsenic (0.25 µg/L) for Colby Lake drinking water would increase cancer risk by more than Minnesota's 1 in 100,000 health threshold. Minn. R. 4717.7840, subp. 2B.	HU05
5325	The PolyMet SDEIS' inadequately evaluates the human health risks of discharge of pollutants that may affect drinking water.	HU01
5326	The PolyMet SDEIS does not provide either decision-makers or the public with information regarding potential health risks of PolyMet discharge. In fact, its "evaluation criteria" explicitly diverge from the applicable health-based standards.	HU01
5327	The SDEIS' comparison of modeled concentrations from PolyMet's discharge to a "continuation of existing conditions" scenario may also distort analysis of pollutants relevant to human health.	HU01
5328	The PolyMet SDEIS provides no information on environmental impacts if facilities at the mine site and plant site do not perform precisely as desired. When an agency is evaluating reasonably foreseeable significant adverse effects, risks of failure should be included in the analysis.	PD22
5329	The PolyMet SDEIS provides no evaluation of the probability or consequences of failure, accidents, or unanticipated effects of severe weather. Such an assessment must be provided to evaluate reasonably foreseeable significant adverse effects of the PolyMet mine, waste rock storage, tailings storage, and transportation and storage of contaminated process water, concentrates and sludge. The assessment of risks of failure would provide a factual foundation for financial assurance and to evaluate mitigation alternatives, both of which are currently lacking in the PolyMet SDEIS.	PD22, PD25
5330	If failures are not improbable and risks are significant, expanded waste rock piles must be factored into wetlands compensation. Similarly, foreseeable environmental consequences of slope failure of the permanent Category 1 waste rock pile may require reconsideration of the West Pit Backfill alternative to eliminate that impact.	ALT03
5331	Evaluation of the probability and consequences of tailings dam failure may result in assessment of alternatives to the modeled tailings storage design. The SDEIS states that the tailings design "meets the minimum Factor of Safety." (SDEIS, p. 5-566). The SDEIS does not demonstrate or even assert that the tailings storage design is optimized to reduce the risk of catastrophic failure.	PD11
5332	In Northeast Minnesota, the probability of extreme weather events is high – and increasing. The sumps and ponds at the mine site and the tailings and hydrometallurgical residue storage facilities at the plant site are vulnerable to flooding. PolyMet's geotechnical report does not say what level of rainfall was modeled as the "probable maximum precipitation" in evaluating tailings basin slope or dam failure.	GT05

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5333	The SDEIS must evaluate the risks of rail accidents and pipeline breaches in the transportation corridor.	PD36
5334	The SDEIS must evaluate the risks of imperfection in collection and treatment of seepage and wastewater at the mine site and plant site.	PD07, PD15
5335	For permanent waste storage facilities and hundreds of years of wastewater treatment, the risks of failures and poor performance magnify. Such failures could create impacts on water quality, and must be evaluated as reasonably foreseeable adverse effects of the PolyMet proposal.	PD22, WR202
5336	The SDEIS provides little information about financial assurance for the PolyMet project. Although a range of preliminary cost numbers are listed (SDEIS, p. 3-138), the SDEIS neither explains the time horizon upon which appropriate calculation of financial assurance would be based or the nature of equipment and operations that would be included in assessing costs. Financial assurance must be analyzed as part of environmental review, not just in permitting. This analysis would increase the likelihood that controls for adverse environmental impacts would be effective during mine operations and for hundreds of years after closure.	FIN05, FIN13
5337	SDEIS modeling of various contaminant sources over time indicates exceedances extending the entire modeling period – 200 years at the mine site and 500 years at the plant site. (See e.g. Water Modeling Data Package – Mine Site, SDEIS reference PolyMet 2013i, Figure pdf p. 1267). These same modeling assumptions are used to calculate and cap solute levels in earlier years. They must also be used to calculate the need for long-term wastewater treatment.	WR033, WR035
5338	Disclosure of financial assurance cost estimates is needed in the SDEIS both to characterize mitigation and to minimize public economic risk.	FIN05, FIN11
5339	The SDEIS notes that “PolyMet has developed preliminary cost estimate ranges” for hypothetical closure at years 1, 11 and 20 and that cost estimates “would be finalized by the MDNR during the permitting process.” (SDEIS, pp. 3-137, 3-138). Reviewing these SDEIS preliminary costs estimates for closure (SDEIS, p. 3-138), it is not possible to determine on what these estimates are based or to assess whether assurances at this level would be sufficient to protect long-term water quality. If the costs for treatment and mitigation are known, they should be disclosed to decision-makers and members of the public.	FIN05, FIN11
5340	Identifying the level and timing of costs for water treatment could provide specificity on the design for the PolyMet project that is lacking in the SDEIS. In addition, if certain costs are not included in the financial assurance estimate, their absence could indicate lack of a real plan for mitigation. For example, it would be useful to members of the public to know what has been budgeted for indirect wetlands mitigation.	FIN05, FIN11
5341	The SDEIS states, “The level of engineering design and planning required to calculate detailed financial assurance amounts is typically made available during the permitting process” (SDEIS, p. 2-10). If the level of engineering design and planning is, in fact, insufficient to calculate financial assurance, it is also insufficient to make the representations about water quality contained throughout the SDEIS.	FIN05
5342	Although the SDEIS includes an alternative in the size of the proposed land exchange, the SDEIS does not explore or evaluate a single alternative pertaining to the underlying open-pit sulfide mine project or the management or mitigation of potential contamination sources. The PolyMet SDEIS does not demonstrate that the proposed action is the least environmentally damaging practicable alternative. A revised SDEIS is needed to evaluate reasonable alternatives that minimize and mitigate impacts on wetlands and water resources.	ALT06, ALT20, ALT23
5343	An EIS that fails to evaluate reasonable alternatives is inadequate, and a Section 404 permit may not be issued for a proposal that is not the least environmentally damaging practicable alternative.	COE04
5344	The PolyMet SDEIS does not evaluate alternatives and does not propose the least environmentally damaging practical alternative to protect aquatic resources.	ALT20

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5345	The “alternatives” section of the PolyMet SDEIS is inadequate on its face. It constitutes less than 10 pages out of a massive 2,169-page document, most of which are used to assert that alternatives need not be investigated. The SDEIS explores no alternatives other than a “B” choice for the land exchange, which does not affect the underlying mine project, beneficiation or mine waste disposal plan and “would have the same effects” as the NorthMet Project Proposed Action.	ALT23
5346	Several reasonable alternatives have the potential to reduce impacts of the PolyMet Proposed Action on wetlands and water quality. The Underground Mining alternative and West Pit Backfill mitigation alternative were improperly eliminated from consideration. WaterLegacy proposes a Mine Site Year One Reverse Osmosis alternative that would be a less environmentally damaging practicable alternative to the PolyMet proposed action and identifies several mitigation alternatives for management of wastes and contaminant sources that must also be assessed. These alternatives should be evaluated and made available for public comment in a revised SDEIS before a Final EIS is prepared.	ALT20
5347	The PolyMet SDEIS improperly eliminated both the underground mining alternative and the West Pit Backfill alternative based on an unreasonably narrow definition of the objectives of the Proposed Action, a confusion of public and private purposes, and an insufficiently skeptical examination of statements and reports from the project’s main beneficiary.	ALT01, ALT03
5348	underground mining could be technically feasible and less environmentally damaging than the Proposed Action and that the “independent” analysis of its economic feasibility was based on an unreasonably narrow definition of the potential project and unrealistic project costs. This analysis is sufficiently unreliable that it cannot support rejection of the underground mining alternative.	ALT01, ALT06
5349	Neither the Revised Underground Mining Assessment, the Bornhorst Report nor the PolyMet SDEIS make any attempt to compare the economic feasibility of underground mining with projections of profit or loss for open-pit mining based on PolyMet’s actual costs for land exchange, construction, operations, treatment, reclamation, mitigation and financial assurance. There is, thus, no way for decision-makers or the public to determine whether underground mining, in fact, is less economically feasible than PolyMet’s actual open-pit mining proposal.	ALT01
5411	In order to determine if underground mining is the least environmentally damaging practicable alternative, underground and open-pit mining alternatives need to be compared and evaluated in a revised SDEIS -- identifying mineral resources likely to be extracted with each method of mining, projecting reasonable costs including costs for treatment, mitigation and financial assurance, and then comparing environmental and other benefits of both underground and open-pit mining alternatives.	ALT01, ALT06
5412	Elimination of the West Pit Backfill alternative was unreasonable...Elimination of the West Pit Backfill mitigation alternative without evaluation in theSDEIS appears to be based on PolyMet’s private interests and/or future mineral development.	ALT03
5413	Neither federal law nor the PolyMet Scoping Decision support elimination of an alternative from consideration to secure a better rate of return for a project applicant. Minnesota’s Environmental Policy Act prohibits the use of economic considerations to reject a feasible and practical alternative that minimizes or mitigates adverse effects on state natural resources. Minn. Stat. § 116D.04, subd. 6.	ALT21
5414	If the Co-Lead Agencies have, in fact, eliminated the West Pit Backfill from consideration as a mitigation alternative in order to allow future expansion of open-pit and/or underground mining, the underground mining alternative must be evaluated and the SDEIS must also include the potential mining expansion among its cumulative effects.	ALT03, ALT06
5415	If underground mining is not selected, an alternative that implements mine site reverse osmosis in year one may be the least environmentally damaging practicable alternative (LEDPA) to reduce indirect impacts of the proposed action on the Hundred Mile Swamp and Partridge River Headwaters wetlands and other aquatic resources near the PolyMet mine site. This alternative would allow mitigation of indirect impacts of mine dewatering and seepage from mine pits on high value wetlands and ecosystems on and near the mine site.	ALT20

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5416	Mine Site Year One Reverse Osmosis could minimize or mitigate hydrological and water quality impacts on high value mine site wetlands and headwaters. This alternative would:• Require on-site treatment of mine site stormwater and process water with reverse osmosis to meet surface water quality standards and prevent degradation of water quality starting in year one.• Employ hydrological testing to assess appropriate quantities and locations for water release to support wetlands and headwaters streams in the Partridge River watershed.• Release water treated by mine site reverse osmosis through pipe and/or spigot systems to mitigate the impacts of hydrological changes and mine dewatering on high value aquatic resources in the Hundred Mile Swamp and Partridge River Headwaters.• Treat East Pit water with mine site reverse osmosis starting when reclamation begins (at or about year 11) to limit acidity, oxidation and metals leaching from the East Pit and seeping to aquatic ecosystems through surficial and bedrock groundwater.	ALT20
5417	WaterLegacy suggests that the Mine Site Year One Reverse Osmosis alternative is available, technologically feasible and economically feasible. Potential environmental benefits include reduced impairment and destruction of Hundred Mile Swamp and Partridge River Headwaters wetlands and aquatic systems resulting from dewatering, hydrological changes, and seepage of pollutants from the East Pit through surficial and bedrock groundwater.	ALT20
5418	The Mine Site Year One Reverse Osmosis alternative should be explored and evaluated prior to any decision on the Section 404 wetlands permit, in order to meet the requirements of federal law to select the least environmentally damaging practicable alternative and prior to any state decision on the adequacy of the EIS, in order to comply with MEPA’s prohibition on state action that is likely to cause pollution, impairment or destruction of natural resources when there is a feasible and prudent alternative that may prevent or mitigate such adverse impacts.	ALT20
5419	Additional mitigation alternatives should be explored and evaluated to reduce the impacts of mine wastewater, tailings and mine waste rock management, leaks, seeps, discharges and spills. Risks and water quality impairments resulting from discharge of contaminants from mine site wastes, rail corridor spills, tailings seepage and hydrometallurgical residue leaks are described in preceding sections of these comments. The SDEIS must be revised to consider alternatives to mitigate these risks and impairments.	ALT06, ALT13
5420	The PolyMet SDEIS suggests that, starting in year 35, reject concentrate would be evaporated or disposed of off site. (SDEIS Figure 5.2.2-4, p. 5-163). But the SDEIS proposes no alternative management of reject concentrate prior to that time to minimize or mitigate the impacts of rail car spills, liner leakage or flooding at the West Equalization Basin in the event of extreme weather in excess of a 100-year storm.	ALT09
5421	In addition to considering the West Pit Backfill alternative, a revised SDEIS should evaluate the alternative of placing liners and a leachate collection system beneath the mine site Category 1 waste rock pile.	ALT07
5422	There is no information in the SDEIS as to the time that infiltration would reach the Partridge River under a P90 scenario and no analysis of the potential that contaminants would daylight to wetlands between the OSLA and the Partridge River. Although surface water runoff from the OSLA would be pumped and sent either to the tailing basin or the WWTF (SDEIS, pp. 5-101 to 5-102), the SDEIS neither proposes nor evaluates any liner or leachate collection system to reduce infiltration and seepage from the OSLA. (SDEIS, p. 5-97). The SDEIS also provides no assessment of the concentration of mercury in the OSLA surficial aquifer flowpath.	ALT07, ALT13
5423	[T]he PolyMet SDEIS contains no evaluation of any other location for the tailings, or any design that might use liners and seepage collection to minimize tailings basin impacts on water quality. The SDEIS must be revised to provide alternatives to the proposed deposition of tailings in unlined piles in Cells 1E and 2E on top of the existing unlined LTVSMC tailings basin.	ALT10
5424	The SDEIS neither considers alternative locations and management practices for the hydrometallurgical waste and sludge proposed for deposit in the HRF, nor considers the alternative of an off-site location in a facility designed to contain these wastes. Both alternatives should be discussed in a revised SDEIS.	ALT09

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5430	Some of the deficiencies in the PolyMet SDEIS cumulative impacts analysis magnify problems in the underlying analysis of the project's impacts on water quality... one of the consequences of errors and omissions in modeling sulfate and mercury and failing to model methylmercury was that the SDEIS denied that the cumulative effects assessment area (CEAA) for the project extends to the St. Louis River...this error in the scope of analysis must be rectified. Cumulative water quality impacts to the St. Louis River, including but not limited to mercury, methylmercury and sulfates must be analyzed. This deficiency alone is significant enough to require that a revised SDEIS be produced and made available for public comment.	MERC10
5433	Overall, inadequacies in the underlying water quality analysis prevent an accurate cumulative assessment of water quality impacts, including impacts of sulfates on wild rice, of methylmercury contamination of fish and of the PolyMet project on environmental justice and tribal resources.	CU11
5435	WaterLegacy also believes that the scope of projects considered in the SDEIS cumulative impacts analysis is inappropriately narrow. The SDEIS fails to consider impacts from other reasonably foreseeable mine projects. Most important, as reflected in PolyMet's technical reports and commissioned reports for investors, it is reasonably foreseeable that, if permitted, PolyMet's mine and processing facilities would expand. The PolyMet SDEIS must analyze the potential impacts of expanded mining and processing on the PolyMet site, even if only to state that such expansion could not be accommodated without substantial and unacceptable impacts on the environment.	CU02
5437	Apart from the violation of numeric standards, the SDEIS reflects the potential for cumulative impacts on aquatic life, especially in impaired waters. These adverse cumulative effects would result from the degradation of water quality, the presence of ionic stressors, changes in hydrology, and the shift of the hydrologic regime in the Partridge River and Embarrass River from a natural ecosystem to a mechanical system, as a result of the PolyMet project and past, present and future mining activities. These cumulative impacts are summarized in Section VII of these comments.	AQ24, AQ27
5438	Cumulative impacts of the PolyMet and other mining projects on lynx are even more significant. The PolyMet project, along with other past, present and reasonably foreseeable mining activities, would result in an almost complete disruption of historic wildlife movement from the northwestern to the southeastern sections of the Arrowhead region.	WI01, WI03
5439	Even though impacts on wildlife of the PolyMet project, if considered alone, may not reduce lynx population or sustainability, the cumulative impacts of the PolyMet action and other mines and roads across and near the Iron Range would result in a significant adverse effect on population stability and persistence of the lynx. The SDEIS should clearly identify cumulative impacts of the PolyMet project on the Canada lynx as a significant adverse effect on a federally listed species under the ESA.	WI01
5440	The PolyMet SDEIS' analysis of wetlands impacts fails to consider wetland functions. It is purely a numerical calculation based on the assessment that, since the time of settlement, the loss of wetland acreage from every past, present and reasonably foreseeable land use other than the PolyMet project totals 2,557 acres in the Partridge River watershed and 402 acres in the Embarrass River watershed.	WET18
5441	The SDEIS provides no cumulative analysis of impacts on wetlands functions or values...the SDEIS must be revised to include a cumulative analysis of the effects of PolyMet proposed action on wetlands values.	WET18
5473	The SDEIS' assessments of cumulative impacts on mercury, methylmercury, sulfates and other water quality contaminants is inadequate...The PolyMet SDEIS' assessment of mercury and methylmercury impacts is inadequate. The cumulative effects assessment area (CEAA) for mercury and methylmercury must include the St. Louis River. Both project area and cumulative analyses of mercury and methylmercury in the SDEIS must be redone.	MERC10

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5525	Analysis of the cumulative impacts of the PolyMet requires evaluation of all of the past, present and reasonably foreseeable impacts on mercury and mercury methylation in the St. Louis River, including all direct discharges of mercury throughout the watershed, all mining and other industrial projects that contribute sulfates to the watershed, and all ditching activities that affect wetlands in the watershed. A mercury total maximum daily load (TMDL) study is required to determine the factors contributing to these findings of mercury in fish.	MERC10, MERC22
5527	The SDEIS failed to identify potential cumulative effects of the PolyMet project on shallow and bedrock groundwater...failure to identify cumulative effects on groundwater results from unsubstantiated and unreasonable assumptions regarding faults, fractures and other secondary porosity features in mine site and plant site bedrock and regarding the lack of hydrologic connection between shallow and bedrock groundwater. Once these deficits in evaluating project area geology and hydrogeology are rectified, a cumulative assessment must be provided to include past, present and reasonably foreseeable impacts of other mine projects near the project area, particularly Cliffs Erie and Northshore mining activities.	CU02
5528	Cumulative sulfate loading would also affect wild rice waters further downstream in the St. Louis River. A revised SDEIS must consider the cumulative impacts of sulfate loading to the St. Louis River, including impacts to wild rice and mercury methylation along the full length of the River through the estuary.	MERC10
5529	The PolyMet SDEIS provides little analysis of the cumulative impacts of the PolyMet project on environmental justice. This is an important concern for WaterLegacy and members we serve who are low-income persons reliant on fishing, hunting and gathering wild rice for subsistence. A federal executive order and federal policy guidance requires that this deficiency in the SDEIS be remedied	SO04
5530	The SDEIS environmental justice analysis is inadequate. A revised SDEIS must evaluate cumulative harm to low-income, minority and tribal subsistence consumers resulting from reduced productivity of waters for fish and wild rice downstream of the PolyMet project.	SO04
5531	...the SDEIS must evaluate disproportionate multiple and cumulative exposures to chemicals that pose a hazard to human health, such as arsenic and methylmercury, as a result of consuming wild rice and fish.	HU01
5533	The PolyMet SDEIS provides an incomplete analysis of cumulative effects of the project on tribal rights and resources. The SDEIS provides a narrative description of cultural and historic resources and concludes, "The NorthMet Project Proposed Action would result in both direct and indirect effects on historic properties and culturally important resources."	CR03
5534	Going beyond the analysis of historic properties, however, the SDEIS has significant gaps. The SDEIS discusses cumulative effects on usufructuary rights, but focuses that analysis only on the PolyMet project area, (SDEIS, p. 6-90) rather than considering cumulative impacts of mining activities throughout the 1854 Ceded Territories. The SDEIS states that cumulative effects analysis should focus on plant and animal species that are traditionally or culturally important to the Bands (SDEIS, p. 6-95), but does not analyze impacts on wild rice, fish or moose. Without considering any impacts to these key resources, the SDEIS concludes that neither the PolyMet project nor the cumulative impacts of other past, present and potential future project are likely to reduce the "availability of 1854 Treaty resources that are typically part of subsistence activities in the 1854 Ceded Territory." (SDEIS, p. 6-95) This conclusion is unsubstantiated.	CR01, CR03
5535	WaterLegacy believes that the SDEIS must provide a more rigorous analysis of cumulative impacts of the PolyMet project on tribal resources. In addition, any consideration of a land exchange or permits for the PolyMet project as well as any NEPA review of the adequacy of the SDEIS must reflect federal fiduciary obligations to protect these resources. Our members view protection of tribal resources as a concern for all citizens and taxpayers represented by the government of the United States in signing treaties with Indian tribes.	CR01, CR03

5536	Federal responsibilities to protect treaty-covered resources require a comprehensive analysis of cumulative impacts of the PolyMet project and past, present and reasonably foreseeable future activities on fish, wild rice and game, particularly moose. Federal obligations to protect trust resources in the 1854 Ceded Territories, along with the evidence of significant adverse environmental impacts on water quality, wetlands, mercury contamination of fish, aquatic life and human health described in these comments, also supports denial of a Section 404 wetlands permit and land exchange for the PolyMet project.	CR01, CR03
5537	The SDEIS excludes as “speculative” the Cliff Erie UTAC expansion, even though this expansion is already permitted under Section 404 permit 81-172-13, is now undergoing a further permit review process,104 and the highway relocation for its expansion is already underway in the DEIS process. (SDEIS, p. 6-14). The UTAC would impact another 1,300 acres of wetlands. The SDEIS, however, considers the cumulative impacts of a Mesabi Nugget project despite the fact that it is “currently on indefinite hold by the applicant.” (SDEIS, p. 6-11).	CU02
5539	The SDEIS declines to include the Twin Metals copper-nickel mining project in its cumulative impacts analysis, despite the strong likelihood that this project will proceed if it is environmentally permissible. The recently released Twin Metals prefeasibility study locates the tailings storage facility and buffer just west of the Northshore Peter Mitchell Pit, increasing the likelihood that impacts from Twin Metals would cumulatively affect water quality within the Embarrass River watershed.105	CU02
5540	Yet more critical, a revised SDEIS must consider the cumulative impacts of reasonably foreseeable expansions of mining at the PolyMet mine site and processing at the PolyMet plant site. A proponent of mineral development may not choose an arbitrary limit on what is economically recoverable, but must base an EIS on the full range of likely production.	CU04
5542	On page ES--- 42, the claim is made that alternatives were identified and screened in accordance with the requirements of 40 CFR 1505.1(e). This is an erroneous citation. The reference to 40 CFR 1505.1(e) refers to NEPA and agency decisionmaking procedures, not the preparation of an EIS. The correct citation is 40 CFR 1502.14, which states, “Alternatives including the proposed action. This section is the heart of the environmental impact statement. Based in the information and analysis presented in the sections on the Affected Environment (1502.15) and Environmental Consequences (1502.16), it should present the environmental impacts of the proposed action and the alternatives in comparison form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public.”	EDIT01
5543	The result of the screening of alternatives in Sect. 3.2.3 was either to eliminate an alternative or incorporate an alternative into the proposed action. As a result, there is no other alternative to the proposed action other than the alternative of no action. This is specious reasoning that is not responsive to the purpose of an environmental impact statement or the requirements of 40 CFR 1502.2(g). The SDEIS preparers have assumed the responsibility of the decisionmaker for each of the Federal agencies responsible for this SDEIS and have made the decision for the decisionmaker prior to receiving public input. This is a clear violation of NEPA and the requirements of 40 CFR 1502.2(g).	ALT06
5555	40 CFR 1502.7 specifies the page limits for an EIS should be less than 300 pages. 40 CFR 1502.2(a) states “Environmental impact statements should be analytic and not encyclopedic.” 40 CFR 1502.2(c) says that “Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.” The SDEIS is in excess of these page limits, is not concise, and is more encyclopedic than analytic. Redundant information that is often contradictory or irrelevant is included in every section. The history of the SDEIS presented in Sect. 2 is encyclopedic and should be an appendix at best. Sect. 2 does not contribute to the SDEIS or to understanding the information presented in the SDEIS.	NEPA08
5556	The description of the proposed action is conceptual and not quantitative. While the process description in Sect. 3 is largely complete, the fluxes within the process are incomplete or missing. For example, on page 3---163, the makeup water is described as being between 20 – 810 gpm. At the least, this sort of description is confusing and leads to the conclusion the design is incomplete.	PD30

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5557	The Category 1 waste rock pile is proposed to have a cutoff wall and a drainage collection system around the entire perimeter of the pile. The water collected by the system is to be sent to the WWTF. The collection efficiency of the collection system is alleged to be greater than 90% (pg. 3---46). This is simply an assumption not justified or supported by analysis or data. Such a drainage system would require routine maintenance to prevent clogging from fines or mineralization. This is not noted in Sect. 3 and is not considered in Sect. 5.	PD16
5558	[T]he performance period for treatment at the mine site is modeled as 200 years and the performance period for the plant site as 500 years. These periods are again simply assumptions that are not justified. There is no evidence that the engineered systems proposed can reasonably be expected to perform as built for 500 years. There is no discussion or analysis to support the long---term performance of the WWTP. There is no analysis of accidents or failures over these extended performance periods.	PD03
5559	[T]he performance period for treatment at the mine site is modeled as 200 years and the performance period for the plant site as 500 years. These periods are again simply assumptions that are not justified...There is no consideration of alternatives that would not require these extended performance periods. To accept these extended performance periods without the consideration of alternatives is contrary to the requirements of 40 CFR 1500 – 1508 and renders the SDEIS unacceptable.	ALT13, NEPA14, PD03
5560	Fig. 5.2.2---6 does not incorporate the historical creeks that are present beneath the existing tailings pile.	WR081, WR092, WR096, WR104
5561	Fig. 5.2.2---18 presents a GoldSim result that has a maximum concentration of sulfate at 2500 mg/L, which precipitously drops to approximately 250 mg/L by year 35. The SDEIS does not explain the constant sulfate concentrations for 20 years, the order of magnitude reduction in the sulfate concentration over 15 years, or the constant sulfate concentration for the next 165 years.	WR086, WR173
5562	Table 5.2.2---22 lists potential contaminant sources, but either does not consider any releases from the west equalization basins at the WWTF, or allows for arbitrarily low leakage rates. Assuming no releases or minimal releases from the WWTF is an implicit assumption that is not justified.	WR126
5563	On Pg. 5---121 the capture of seepage from the south side of the tailings pile and the flow augmentation of Second Creek is described. For this description to be valid the existing pumping system for capturing seepage to Second Creek would have to be assumed to operate perfectly. The WWTP would have to operate without accidental disruption for hundreds of years, the pumping system would also have to work without failure for hundreds of years, the addition of approximately 100 ft. of saturated tailings to the tailings pile could not significantly increase the leakage from the tailings pile, and the natural drainage of Second Creek which originates under the tailings pile could not discharge beneath or around the collection system. This set of implicit assumptions have not been disclosed or justified in the analysis.	WR117
5564	Table 5.2.2---29 suggests that background groundwater, non---contact stormwater and the Northshore Mine operations contribute to the sulfate loading in the Partridge River at SW---004a. The table also suggests that no PolyMet sources contribute to the sulfate loading except a 4.3% increase resulting from water treated at the WWTF in closure year 200. To reach this conclusion, implicit assumptions that are not conservative must have been built into the GoldSim model. These implicit assumptions need to be identified since they are the likely basis for this improbable set of results.	WR049, WR177, WR189
5565	Fig. 5.2.2-27 is physically unrealistic. For this result to have any basis in reality, a continuous, constant source term would have to be associated with the model. Except for a natural source, such a source term does not exist, and will not exist as a result of this project.	WR033, WR044

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5566	Table 5.2.2-36 is yet another example of the use of implicit assumptions to provide a result which is misleading. The notion that the addition of 100 ft. of saturated tailings to the tailings pile will not affect groundwater seepage is physically unrealistic. The notion of partial containment structures around the tailings pile collecting nearly all of the drainage from the tailings pile that has no liner is also unrealistic. These results are simply misleading.	WR018, WR105
5567	In my opinion the SDEIS has developed insufficient site-specific data to adequately inform an evaluation of the projected or actual impacts of the Northmet Mining Project on mercury methylation in the adjacent watersheds. My opinion to this effect is based on: the lack of data on background methylmercury in the SDEIS (4.1.1); inconsistencies in minimum detection limits for total mercury in data presented in the SDEIS (4.1.2), and; failure to conform to standard approaches with respect the manner with which Hg data is calculated, interpreted and then subsequently presented (4.1.3).	MERC07
5568	The SDEIS fails to make reference to methylmercury (the Hg species of concern) in the Predicted Environmental Consequences Of The Proposed Connected Actions section of the Executive Summary (ES-34-37) and this oversight is carried throughout most of the the document when actual data are being presented and discussed. SDEIS Section 4.2.2.1.4 Mercury (4-37) provides an overview of Hg in the Embarrass and Partridge Rivers, where, in addition to total Mercury, it states that “Methylmercury concentrations in the Partridge River at SW-005 average 0.4 ng/L and in the Embarrass River average 0.5 ng/L at PM-12 and 0.4 ng/L at PM-13 over the same period.” This is the only reference to methylmercury in natural surface waters that I noted, and Table 4.2.2-4 (4- 41) that is referred to in this section does not present MeHg data (only THg).	MERC07
5569	Moreover, the SDEIS does not provide any THg or MeHg for sediments in lakes, rivers and streams, or wetlands, despite the importance of the solid phase in supplying both species to downstream waters either through in situ methylation or solid-liquid phase partitioning.	MERC04, MERC20
5570	Other THg data presented have similar inconsistencies, including: Table 4.2.2-6 (Summary of Existing Groundwater Quality Monitoring Data for the NorthMet Mine Site). Apparent MDL for Hg 0.25 ng/L.	MERC07
5571	Other THg data presented have similar inconsistencies, including: Table 4.2.2-13 (Baseline Water Quality from the South Branch of the Partridge River). Apparent MDL of 500 ng/L where data are being reported from the 1970s – reliable trace mercury data in water were not reported until the mid-1980s so this data has no utility, and the absence of any more recent data is questionable.	MERC07
5572	Other THg data presented have similar inconsistencies, including: Table 4.2.2-14 (Average Existing Water Quality Concentrations in the Partridge River). Apparent THg MDL of 0.0025 ng/L is analytically impossible using current technologies. I suspect that this is an error in reporting and highly problematic given that this is taken from the range of THg concentrations reported, which must also be in error.	MERC07
5573	Other THg data presented have similar inconsistencies, including: Table 4.2.2-15 (Mean Water Quality Data for Longnose Creek, Wetlegs Creek, Wyman Creek, and West Pit Outlet Creek). Apparent THg MDL of 0.25 ng/L.	MERC07
5574	Other THg data presented have similar inconsistencies, including: Table 4.2.2-23 (Existing Pond Water and Groundwater Quality at the Tailings Basin). Apparent THg MDL of 0.25 ng/L. Methylmercury also reported here with apparent MDL of 0.03 ng/L.	MERC07
5575	Other THg data presented have similar inconsistencies, including: Table 4.2.2-24 (Summary of Existing Groundwater Quality Monitoring DataDowngradient from the Existing LTVSMC Tailings Basin). Apparent THg MDL of 0.25 ng/L. Methylmercury also reported here with apparent MDL of 0.05 ng/L.	MERC07
5576	Other THg data presented have similar inconsistencies, including: Table 4.2.2-34 (Summary of Surface Water Quality Monitoring Data for the Tailings Basin Surface Seeps). Apparent THg MDLs range from 0.25 to 2 ng/L depending on sampling location. MeHg reported for one location with all samples detected (lowest is 0.15 ng/L) so no estimate of MDL is possible.	MERC07

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5577	Other THg data presented have similar inconsistencies, including: Table 4.2.2-6 (Summary of Existing Groundwater Quality Monitoring Data for the NorthMet Mine Site). Mercury data is presented under the “Total metals” part of the table as opposed to the “filtered” section. Unfiltered groundwater samples are unrepresentative of the mobile phase and should be discounted.	MERC07
5578	The SDEIS does not use currently accepted methods for interpreting non-detect samples in the background data presented. In all data tables where non-detect samples are reported, the tables are footnoted with the following statement: Where non-detects occur, the mean was calculated using half the detection limit. The contemporary state of the science does not accept this simplistic handling of nondetect samples.	MERC05
5579	All of the concerns expressed associated with this Opinion call into question the assessments of relative impact of the proposed project on mercury presented within the SDEIS. For example, the NorthMet Project Proposed Action is predicted to increase mercury loadings in the Embarrass River, but decrease mercury loadings in the Partridge River. The net effect of these changes would be an overall reduction in mercury loadings to the downstream St. Louis River. (5-8; 5-210). These assertions may be inaccurate and/or incorrect if the background Hg concentration data were re-evaluated in a more technically appropriate manner.	MERC04
5580	The SDEIS oversimplifies or fails to address other factors that affect Hg fate and transport in its assessment of potential impacts of the proposed Project on downstream water quality. For example: “All samples [from monitoring locations at or near the tailings basin] were well below average concentrations in precipitation (approximately 9.8 ng/L).” (SDEIS 5-21) This statement implies that precipitation-derived Hg is a larger and more important source than runoff from tailings, but is misleading since a) the data is from a 2003 source which cannot account for a trend in decreasing Hg in precipitation in Minnesota; b) fails to recognize that precipitation-derived Hg is primarily delivered to the watershed, and is not a significant direct input to surface waters; c) 75-80% of Hg loading to most aquatic ecosystems is from runoff (Harris et al., 2007) with small seepage lakes and the Laurentian Great Lakes being exceptions.	MERC04, MERC20
5581	5.2.2.3.4 Mercury (SDEIS 5-201). “Current scientific understanding of the factors and mechanisms affecting mercury methylation and bioaccumulation is limited.” Based on the burden of evidence in the scientific literature, this is an inaccurate statement. A thorough discussion of the response of fish tissue Hg concentrations to changes in Hg loading is easily found in Munthe et al. (2007), where a multitude of factors, based on a significant body of other literature, are described in governing the response of fish tissue Hg in response to changes in Hg loading.	MERC02
5582	(SDEIS 5-207, 5-208)...clearly identifies increased sulfate loading as implicated in enhancing Hg methylation, yet by its wording, suggests that the scientific literature is conflicted in its findings. Upon close reading of the cited material, it is clear that there is no disagreement in the scientific literature on this issue. Jeremiason et al. (2006) found that increased sulfate loading to a peatland in north-central Minnesota increases mercury methylation and export. The SDEIS fails to go further and state that these authors also found that sulfate concentrations in the peat and waters quickly decreased to below detection level after sulfate addition because of the process of sulfate reduction (and mercury methylation). This is precisely the conclusion of Branfireun and Roulet (2002) (sulfate concentrations decrease as methylmercury concentrations increase), yet the citations are presented as conflicting results in the SDEIS with the inclusion of the word, “However”. The scientific literature, including those cited in the SDEIS, is unequivocal on this issue: increased sulfate loading to freshwater systems increases MeHg production.	MERC08
5583	5.2.2.3.4 Mercury (SDEIS 5-201). “Mercury was not included in the GoldSim model, as insufficient data and a general lack of definitive understanding of mercury dynamics prevented modeling mercury like the other solutes.” This is an inaccurate and misleading statement, and implies that Hg does not conform to basic chemical laws, and is unmodellable given current knowledge. A more accurate statement would be that, “The model that was employed as part of this assessment does not include Hg dynamics. This is a deficiency of the model.”	MERC13

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5584	The SDEIS does not make the connection between the dominant wetland type and landcover class (bog wetland, ombrotrophic or otherwise) in the area of impact around the proposed project and methylmercury production in the landscape. This is a critical oversight because of the potential impacts on hydrology and atmospheric deposition as a result of the proposed project (see 6.5 Opinion 5). The literature, including some of that cited in the SDEIS, draws a clear connection between bog-type peatlands and methylmercury production and export, with some of the most relevant work done in the state of Minnesota.	MERC20, WET13
5585	The SDEIS indicates in numerous locations that, “Most of the wetland vegetation present at the Mine Site (69 percent) is indicative of acid peatland systems (i.e., open and coniferous bogs) that are dependent on precipitation rather than groundwater for hydrologic inputs and reflect a perched water table.” (SDEIS 4-150). The focus on the lack of groundwater inputs to bogs downplays the role that the internal biogeochemistry of bogs has on downstream water quality. Peatlands, in particular bogs, are among the most potent Hg methylating environments in the temperate/boreal landscape. Grigal et al. (2000) highlighted the importance of peatlands in the overall mercury budget in north-central Minnesota.	MERC20, WET09
5586	the SDEIS presents the shallow groundwater hydrogeology, bog hydrology, and the nature of connectivity between these landscape components in a purely conceptual fashion, or with limited data from an unproven analog system. In doing so, hydrological impacts of the proposed development on surrounding wetlands and subsequent changes in methylmercury production and release are not adequately evaluated.	MERC09
5587	The SDEIS is entirely deficient in documenting the effect of depressurization of the underlying aquifer due to open pit dewatering. There is no geophysical data concerning the extent and thickness of the surficial aquifers. There is no modelling presented that simulates the development of the cone of depression associated with pit development over time. The reliance on the analog case to evaluate the potential extent and magnitude of the cone of depression and dewatering impact of surface wetlands and streams is completely unsatisfactory, in my opinion, given the availability of robust hydrogeological models that could reasonably evaluate potential impact scenarios.	WR086, WR087, WR119
5588	[T]he classification of degree of potential wetland impacts due to the proposed project in Table 5.2.3-3 is unsubstantiated, not based on sufficient empirical evidence, not based on the best available science, and may in fact be opposite to the real outcomes. This conclusion undermines the efficacy of the proposed wetland impact monitoring strategy outlined in the SDEIS, which would be “based on those wetlands that would have a high likelihood of indirect effects as a result of groundwater drawdown.” (p. 5-310).	WET10
5589	The potential for the discharges of mercury and sulfur from the tailings stockpiles/ponds are inadequately addressed in the SDEIS, and the potential for both direct and indirect downstream water quality impairments are understated.	MERC01
5590	The SDEIS relies on several insufficiently substantiated assumptions regarding collection of seepage from both the mine site and tailings basin to assert that surficial groundwater won’t be impacted by release of sulfates to methylating environments. In my opinion, the data presented in the SDEIS is insufficient to discount the potential for seepage of sulfates and associated impacts to wetlands in the vicinity of both the project mine site and tailings basin. Such seepage would enhance MeHg production in the project area and could also contribute directly to water quality impairments in sulfate-poor sediments downstream of the project site.	WR017, WR018, WR149
5591	it is my opinion that the potential for cumulative downstream impacts both from mercury and mercury methylation at the project site are understated in the SDEIS. Based on the literature (much of which is from Minnesota) and my experience in other wetland ecosystems, it is my opinion that discharges of sulfate and total mercury and hydrologic changes to peatlands at the project site have the potential to significantly increase methylmercury in downstream wetlands and surface waters...There is also no reason to assume that effects on mercury and methylmercury would be limited to the smaller streams, or the main channels in the Partridge or Embarrass River watersheds. Both direct and indirect water quality impairments would have the potential to affect the St. Louis River.	MERC08, MERC10

5592	Reviewed as a whole, the PolyMet NorthMet Supplementary Draft Environmental Impact Statement (SDEIS) fails to adequately address major ions and trace elements. The document ignores aquatic toxicity and possible synergistic impacts from waste rock leachates. The SDEIS fails to evaluate parameters in a scientifically defensible manner.	WR064, WR071, WR110, WR141, WR177
5593	Mine Site water quality assessment is based on improper assumptions about rock characterization and chemistry. Category 1 waste rock pile will create acidic pore water and leach high volumes of sulfates and toxic metals.1. The SDEIS improperly uses small sample size and averaging to design waste rock humidity cell tests.	PD15, WR025
5594	The SDEIS humidity cell testing lacks the rigor necessary to predict sulfur content of the waste rock stockpiles.	WR034
5595	The SRK RS53/RS42 document describes the humidity cell process, stating 89 samples were used to categorize waste rock, a total of 309 million tons of waste rock (NorthMet Project Waste Characterization Data Package V. 9, March 7, 2013, SDEIS reference PolyMet 2013l, section 4.3). This sample size is scientifically inadequate for characterization of such a massive pile of waste rock.	WR025
5596	Sorting waste rock stockpiles will not be possible to the degree presumed in theSDEIS. The SDEIS proposes to use block modeling to separate heterogeneous waste rock into four classes based on the sulfur concentrations in block modeling (SDEIS, p. 3-44). This modeling cannot be consistently duplicated in the physical action of loading trucks from the windrowed blast rock.	PD15
5597	The SDEIS states its plan to use Category 1 waste rock for construction material (SDEIS, Table 3.2-8). However, this material should be considered reactive waste (SDEIS PolyMet 2013l, p. 2). It has a high potential for leaching beyond surface water standards and should not be used as construction material.	PD15
5598	The use of a block model intended to predict the amount of profitable resource to determine concentrations of other parameters does not accurately predict potentially toxic waste rock leachates. This error will compound the inaccuracies resulting from the averaging of the sulfate mineralogy from the humidity testing.	WR025
5599	The SDEIS fails to adequately evaluate chlorides. Chlorides will be much higher than predicted, impacting wastewater treatment performance and surface and groundwater quality.	WR002, WR025, WR147
5600	The SDEIS incorrectly assumes the occurrence and concentrations of chlorides are few in number and only in fractures containing water.	WR010, WR025
5601	The SDEIS incorrectly assumes chlorides are mostly found in fractures exceeding PolyMet’s mine pit depth.	WR010, WR025
5602	PolyMet assumes but does not substantiate that chlorides are localized to Amax. Such an assumption is not consistent with scientific evidence.	WR087
5603	The SDEIS incorrectly assumes chlorides are found only on the rock surface and in inundated fracture zones.The SDEIS (SDEIS, pp. 5-113, 114) incorrectly assumes that brackish water is contained only in fractured rock, rather than in inclusions within the rock. Because the SDEIS contends both that brackish water is only in fractures and that fractures at the mine site are insignificant; the SDEIS then assumes that the brackish water will not be a continuing source of pollutant. These assumptions are inaccurate.	WR010, WR025, WR078

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
5604	The SDEIS fails to accurately evaluate the impacts of high levels of chlorides on the inundated meromictic east, central, and west pits water at closure (Novotny, 2007). Meromictic impacts from chlorides to ground and potentially surface water and wetlands must be addressed. The SDEIS fails to address impacts of high chloride that is not captured from the seepage and liner leaks; potential impacts on surface water, groundwater and wetlands quality must be addressed. The SDEIS fails to discuss how chlorides may affect reject concentrate and sludge chemistry, potentially impacting waste storage. The SDEIS fails to discuss how any passive treatment systems proposed for closure would control chlorides.	WR002, WR025, WR137, WR147
5605	The discussion in the SDEIS relating to more recent faults and fractures does not take into consideration the significant and relatively recent large-amplitude crustal movements associated with glacial isostatic rebound and their fracture-generating and aperture-expanding potential.	WR012
5606	The SDEIS must recognize the fact that numerous faults and other fractures, including some that have recently formed, are documented at both the Mine Site and the Tailings Basin Site. The SDEIS must adjust the modeling of groundwater and contaminant flow accordingly.	WR012
5607	[A]pplying such low hydraulic conductivity values to the bedrock at the Mine Site as a whole does not accurately reflect field conditions described in other places in the SDEIS as well as in the scientific literature. Considering groundwater flow through fractured bedrock would result in travel times possibly orders of magnitude lower than assumed in the SDEIS. Again, this is major inadequacy of the SDEIS' treatment of hydrogeology.	WR010, WR011, WR012, WR071, WR087, WR090, WR099, WR168, WR169, WR179
5608	the SDEIS analysis of water quality impacts seems to rely heavily upon old references from studies conducted at locations other than NorthMet while at the same time ignoring more recent high-quality geologic studies from the NorthMet project area itself carried out by the Minnesota Geological Survey (Jirsa et al, 2011; Severson and Miller, 1999; Miller and Severson, 2005a; 2005b; 2005c; and 2005d for example) and by PolyMet and its consultants (PolyMet, 2007b and PolyMet, 2013i for example).	WR009, WR023, WR071, WR072
5609	The subject of contaminant transport from the Tailings Basin seems not to take into account surface drainage conditions and the resulting near-surface groundwater flow conditions that existed prior to the construction of the LTVSMC tailings basin.	WR053, WR071, WR081, WR091, WR096, WR104, WR130
5610	The SDEIS also does not acknowledge existing seepage along the east side of the Tailings Basin (Seep 31 shown on Figure 6 in Barr, 2007g) nor discuss how the historic streams flowing from Spring Mine Lake may affect groundwater flow to the east from beneath the Tailings Basin.	WR071, WR081, WR102
5611	The potential for seepage from the Tailings Basin towards the east due to these current and forecast conditions and the potential need for a seepage collection system on the east side of the Tailings Basin seems to have been overlooked in the SDEIS.	WR071, WR081, WR102
5612	The level of detail presented in sections describing the surficial geology of the Tailings Basin area is minimal, not well referenced and is not based on site-specific geologic studies. The following statement made by Barr Engineering sums up their contribution to the understanding of the surficial geology of the Tailings Basin Area in support of the SDEIS. "Site specific geologic studies of the glacial deposits have not been conducted" (Barr 2009f). For this reason, the SDEIS must rely upon the published literature and anecdote to characterize Tailings Basin surficial geology.	WR023, WR058, WR071, WR072, WR096, WR098, WR104, WR105
5613	Many sections of the SDEIS dealing with geology have serious omissions where scientific data should have been provided. The scientific credibility of the SDEIS is further compromised by numerous instances where cited references are misquoted and other areas where important assumptions made about geology and hydrogeology are unsupported.	WR071
9361	The PolyMet SDEIS provides an inadequate and, often, misleading assessment of mercury discharges and emissions, sulfur deposition, and sulfate seepage to shallow groundwater.	MERC08, WR156

9362	The PolyMet SDEIS analyzes neither the impacts of pollutant discharges nor of hydrologic changes on the formation and bioaccumulation of methylmercury.	MERC08
9383	The SDEIS demonstrates that use of Colby Lake water for flow augmentation would violate Minnesota's 1.3 ng/L Great Lakes mercury standard and the Clean Water Act. Five out of five Colby Lake samples exceeded Minnesota's mercury standard, with a range of concentrations from 4.8 ng/L to 6.0 ng/L and a mean of 5.4 ng/L. (SDEIS, Table 4.2.2-4, p. 4-41).	WR184
9391	Although the PolyMet SDEIS refers several times to the 92 percent [mercury] burial assumption (see SDEIS, pp. 5-202, 5-203, 5-204) at no point does the SDEIS cite any literature or data substantiating this assumption.	MERC04
9413	Although the SDEIS suggests that mercury in mine pit lakes generally remains below the 1.3 ng/L standard, average mercury concentrations in 2 of the 16 listed mine pits exceed the standard. (SDEIS, p. 5-202). In addition, mercury concentrations in 5 of the pits ranged above the 1.3 ng/L standard. (Water Modeling Data Package – Mine Site, SDEIS reference PolyMet 2013i, pp. 308-309). Neither the pits nor the data used can be readily identified.	WR201
9431	The NTS 2006 bench study referenced in the PolyMet SDEIS (SDEIS, p. 5-206) does not support claims for 95 percent adsorption of mercury to NorthMet tailings.	MERC04
9448	modeling of methylmercury impacts of the PolyMet project would have been possible using available models and concepts well understood in the scientific literature.	MERC11, MERC13
9902	the SDEIS gives only a cursory and simplistic treatment to the role bedrock fractures play in the transmission of groundwater at the NorthMet Mine Site and at the Tailings Basin... (page 4-45). In many places within the SDEIS important statements made relating to bedrock fracturing are either unreferenced, inaccurately referenced or otherwise unsupported by data tables, figures or maps. Perhaps of greater concern are the numerous instances within the SDEIS where statements made related to the hydrologic significance of bedrock fractures blatantly misrepresent what the cited author(s) stated.	WR126
9903	[Figure 3.2-28] portrays the bedrock that occurs beneath the Tailings Basin as an "assumed no-flow boundary". The implications of this are that groundwater flow through bedrock at the Tailings Basin is so insignificant that it can be conceptually ignored. If this assumption were accepted achieving the collection of 90 percent or more of contaminated groundwater would sound reasonable; however this rather critical hydrogeologic assumption is not supported by either data or cited references within the SDEIS.	PD08, WR010, WR011, WR061
9905	Recent geologic mapping by the Minnesota Geological Survey shows a fault beneath the existing Tailings Basin and proposed Hydrometallurgical Residue Facility ("HRF") (Figure 1 [of Lehr_PolyMetSDEISReview]). Numerous other faults are mapped in close proximity (Jirsa et al, 2005; Jirsa et al, 2011; Jirsa et al, 2012). The hydrologic significance of these faults is unknown at this time because the SDEIS did not address them.	WR012
9910	Numerous recently-developed tools and technologies are commonly used in combination with more traditional mapping methods to successfully evaluate the hydrologic properties of bedrock fractures [including LiDAR topography datasets, traditional drill core logging, borehole geophysical techniques]... Apparently none of these techniques were employed in the SDEIS process to identify fractures or assess groundwater flow through fractured bedrock. This seems like a major omission, resulting in unsupported assumptions and inadequate information regarding groundwater flow at both the Mine Site and Tailings Basin.	WR007, WR008, WR011, WR012, WR014, WR019, WR056, WR061, WR072, WR087, WR097, WR098, WR168, WR169, WR170

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
9911	Neither Farvolden et al (1988), Douglas et al (2000) or Rouleau et al (2003) make statements that support the SDEIS' assertion [on page 4-45] that the degree of faulting and fracturing of rocks is in any way related to the age of the rocks. On the contrary, one pertinent remark made by Farvolden et al (1988) is that "mineral deposits on the Canadian Shield are commonly associated with geologic anomalies, in particular contact zones, faults or fracture zones"...	WR023, WR061, WR071
9913	the SDEIS downplays the hydrologic significance of bedrock fractures and does not seem to include groundwater flow through fractures in its seepage calculations.	WR012
9914	[SDEIS, p. 4-45] there are no Foose and Cooper references listed in the SDEIS from either 1979 or 1980, so it is assumed the references and conclusions in this paragraph are from Foose and Cooper 1978 and 1981 which are cited in the list of references.	EDIT01
9916	these statements [on pg 4-45] made relating to bedrock fractures are not supported by the references cited in the SDEIS. Neither of the two Foose and Cooper papers report that "the most extensive faults are largely filled with gouge." Their only mention of fault gouge in these two papers is that they used its presence to trace fault zones in the field. Neither paper discusses distance groundwater may flow through faults and fractures in the Duluth Complex - in fact neither mention groundwater flow at all.	EDIT01
9917	The sections of the SDEIS describing bedrock fractures rely mostly on references that are quite old while failing to reference vast amounts of more recent geologic data and scientific literature directly relevant to assess hydrologic role of bedrock fractures at NorthMet... The NorthMet deposit mine plan and other critical documents and datasets... have been reviewed by what are essentially external auditors... who prepared the 43-101 Technical Report for the NorthMet project (Desautels and Zurowski, 2012) on PolyMet's behalf. Quality geologic data have been collected over the years from the NorthMet area that could have been used to present a more detailed and realistic understanding of the bedrock fractures known to exist at both the Mine Site and the Tailings Basin than what is presented in the SDEIS.	WR011, WR061
9968	One specific example of the type of data relevant to the nature of bedrock fracturing that have been collected but are not presented in the SDEIS is the RQD table from PolyMet's drilling database (PolyMet, 2007b)...More detail from the RQD table would allow for a greater understanding of the spatial variability of bedrock fractures.	WR014, WR015, WR023, WR071
9970	It would be very instructive [in the SDEIS] to view the spatial relationship between the lowest RQD values [from PolyMet's drilling database (PolyMet, 2007b)] and fault zones and lineament trends mapped using LiDAR data.	WR014, WR015, WR023, WR071
9972	the average RQD values for Duluth Complex rocks (93) are not that greatly different from the Virginia Formation (88) or even the Biwabik Iron Formation (80)... The RQD values of certain rock units within the Duluth Complex – unit 7 for example – have average RQD values less than or equal to the Virginia Formation (87.4 vs. 87.6). These data seem to contradict the numerous claims in the SDEIS that the degree of bedrock fracturing and therefore hydraulic conductivity values for the Duluth Complex rocks are so much lower than the extent of fracturing and resulting bulk hydraulic conductivities in the Virginia and Biwabik Iron Formations.	WR014, WR015, WR023, WR071
9974	"Evidence of several high-angle faults, consisting of brecciated intervals and fault gouge mineralization, was noted in the exploration cores from the NorthMet Project area (PolyMet 2007b)." (SDEIS p. 4-45) The statement above is accurate, but it omits important information about the dimensions of brecciated intervals and the orientation of the faults. This information would have a direct bearing on the potential for bedrock fractures to transmit significant quantities of contaminated groundwater... These specific details [found in PolyMet, 2007b (p. 16)] about the dimension of potentially very porous fault zones at NorthMet should be presented in the SDEIS and their hydrologic significance addressed in groundwater modelling where appropriate.	WR010, WR014, WR015, WR023, WR071

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
9975	The hydrologic implications of bedrock containing fault zones with field-documented dimensions on the order of several feet thick that are filled with rubbly rock at the Mine Site should have been specifically addressed in the SDEIS, but this analysis appears to be missing.	WR012
9976	it is virtually certain that the number of fractures documented from drill core greatly underrepresents the actual number of fractures present at the Mine Site. Because the faults mapped at NorthMet are high-angle faults (SDEIS, p. 4-45) and most of the exploratory bedrock drill holes at the NorthMet Mine Site were drilled vertically (PolyMet, 2007b), drill holes would not likely encounter fractures because of their high-angle orientation (Golder Associates, 2010).	WR014, WR015, WR023, WR071
9978	The SDEIS presents a discussion of lineaments lower on page 4-45 that, contrary to current geologic literature, downplays the relationship of lineaments to bedrock fractures and therefore their significance to the hydrogeology of the NorthMet Site. "Numerous lineaments have been mapped over northeastern Minnesota, but these have been associated with glacial deposition and not fracturing in the underlying bedrock (Morey 1981; Heutmaker and Morey 1982)." (SDEIS, p. 4-45) The cited literature refers to glacial "processes," not glacial "deposition" (Morey, 1981; Heutmaker and Morey, 1982). These terms do not have the same meaning.	EDIT01
9986	The argument is then made in this section of the SDEIS [on page 4-45] that since over-pressured groundwater was not encountered at NorthMet, hydrologically interconnected bedrock joints or faults do not exist at NorthMet. This rationale would ignore the simpler and well-known hydrologic situation where hydrologically interconnected bedrock fractures exist under water table conditions (Siegel and Ericson, 1980), not over-pressurized conditions.	WR012
9987	The strategy used in siting drill holes in Duluth Complex deposits would not be focused on defining fracture zones; it would attempt to avoid these areas altogether. This is not to say that mineral exploration drilling cannot provide useful hydrologic or fracture data. However, it is incorrect to conclude that because a certain set of mineral exploration drill holes did not encounter interconnected hydrologic conditions, that interconnected hydrologic conditions do not exist at Minnamax or NorthMet.	WR023, WR071, WR086, WR087
9988	There have been thousands of mineral exploration and scientific bore holes drilled into the basal Duluth Complex and footwall rocks over the past nearly 40 years. These larger datasets would undoubtedly contain information that would add to the understanding of the interconnectedness of fractures or the presence of pressurized ground water. These data are not presented in the SDEIS.	WR014, WR015, WR023, WR071
9991	The quote... [(starting with "One exploration" ending with "world")] from page 4-45 of the SDEIS stating that the upper fractured zone of bedrock has been removed by glacial scouring should be properly referenced or otherwise supported by data to be taken seriously. This statement is not supported by any of the cited references and is contrary to common knowledge that fractured bedrock is present at NorthMet. Drilling logs included in the SDEIS' supplementary materials (PolyMet, 2013i; RS-35, RS-42 and RS-46) show intervals of weathered bedrock at multiple locations thereby reducing the credibility of this statement.	EDIT01, WR012
9992	Mine dewatering will lead to an increase in the amount of oxygen that is available to weather rock in pit high walls. This increased weathering rate may be particularly effective at increasing the aperture of bedrock fractures. Rouleau et al (2003) reported that mine dewatering causes oxidation of newly unsaturated rock (including fracture surfaces) increasing the rate of chemical reactions thereby affecting groundwater.	WR173
9993	The SDEIS incorrectly characterizes the information that is available about bedrock fractures at the NorthMet site and fails to address in any rigorous fashion the potential for long-distance transport of groundwater and contaminants through bedrock fractures.	WR012

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
9999	“Due to the generally low hydraulic conductivity of bedrock, independent calculations indicate that groundwater transport in bedrock is minimal and does not affect solute concentrations at the evaluation locations.” (SDEIS, p. 5-33)The blanket statement about low conductivity bedrock at the Mine Site is not supported... The conclusion that groundwater transport through bedrock has no effect on solute concentrations can only be reached by ignoring groundwater flow through bedrock fractures, a position that is not scientifically defensible. Assumptions made in the SDEIS about hydraulic conductivity of bedrock at the Mine Site should be revised and better related to actual field conditions.	WR010, WR011, WR012, WR014, WR071, WR087, WR090, WR099, WR168, WR169, WR179
10005	“Although the presence of fractures at the Mine Site cannot be completely ruled out, site specific data, such as boring logs, indicate the bedrock appears competent, only rarely encountered deep fractures near the surface, and hydrogeologic investigations have indicated that the bulk hydraulic conductivity of bedrock at the Mine Site is very low.” (SDEIS, p. 5-33)These statements are not true... there is no debate whether fractures exist at the Mine Site; only their detailed hydrologic significance remains unclear. Reports and drilling records presented previously confirm the presence of fractures.	WR014, WR015, WR023, WR071
10103	While the SDEIS fails to acknowledge the fault that exists beneath the Tailings Basin and the proposed HRF, its location is described in PolyMet (2012a), however they suggest there is ambiguity whether this fault exists... The fault beneath the Tailings Basin and HRF is shown on all Minnesota Geological Survey bedrock geology maps covering the Tailings Basin site from 2005 to the present (Jirsa et al, 2005; Jirsa et al, 2011; Jirsa, et al, 2012)... This fault’s location is mapped based on sound geologic inference or it wouldn’t be shown. It can’t be “confirmed” unless careful excavation was carried out along the entire length of the fault.	WR015, WR023, WR069, WR071
10111	The faults shown on Figure 1 [(of Water Legacy, LehrMaps&Figures)] should have been acknowledged early in the environmental review process, and their presence should have triggered additional field studies designed to map the underlying bedrock fracture system and to characterize its hydrologic properties.	WR015, WR023, WR071
10116	due to an admitted complete lack of field data, it is clear that assumptions rather than data have been used to characterize the hydrogeologic properties of the bedrock beneath the Tailings Basin.	WR008
10194	Any conclusion that the rocks at the Tailing Basin site have lower hydraulic conductivity than the Duluth Complex rocks needs documentation to be considered scientifically valid.	WR009
10197	the SDEIS presents conflicting data in Table 5.2.2-7 where hydraulic conductivity values used as MODFLOW inputs for the Giants Range Granite are shown as being several orders of magnitude higher than the rocks of the Duluth Complex, not significantly lower (from Table 5.2.2-7: mean hydraulic conductivities: GRG = 0.026 ft/day vs. DC = 0.00049 ft/day). These blatant contradictions in the reasoning used to portray the hydrogeology of the NorthMet site need to be resolved before the SDEIS can be considered scientifically adequate.	WR087, WR168
10201	[In the SDEIS, p. 5-68-69]... the statement about construction of a slurry wall that is keyed into bedrock is in direct conflict with SDEIS Figure 3.2-28 that shows no keyed relationship between the proposed slurry wall and the bedrock beneath the Tailings Basin site. This is a very important aspect that has direct bearing on the effectiveness of the engineered system designed to capture contaminated groundwater emanating from the Tailings Basin.	WR019
10203	An existing capture and pump back system is apparently in place at ... [the south side of the Tailings Basin in the upper reaches of Second Creek] (SDEIS, p. 5-89). Its ongoing performance should be addressed in this section of the SDEIS as well as how proposed changes to the Tailings Basin hydrology over the 20-year mine life will affect these seeps and the existing seepage collection system.	WR117, WR118

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
10302	of the total amount of nickel that exists in the NorthMet deposit a maximum of only 65 to 75% is expected to be recovered and 25 to 35% will end up in the Tailings Basin bound up in silicate minerals... The same weathering process that liberates calcium to buffer acid will also cause nickel to be released from the lattice of olivine... This situation where large amounts of nickel are weathering from silicate minerals within the Tailings Basin coupled with the likelihood that significant volumes of seepage will escape capture from around the Tailings Basin is likely to lead to excessive levels of nickel migrating off-site. The SDEIS should explicitly analyze the “loss of nickel to silicate” issue, in light of the hydrogeology of the Tailings Basin.	WR025
10322	A few pages above, the term “till” was used as a general term, now in this paragraph [on page 4-46] the term “alluvium” seems to be used as a replacement term for all surficial sediments. On page 4-149 the entire package of surficial sediments is referred to as “soil”. This is more than semantics; it leads to confusion as to exactly which surficial sediments are being referenced: the entire surficial sediment section or only till units or only alluvium units or only the post-glacial soil that exists at the land surface? This usage promotes a simplistic understanding of surficial geology, which in turn is converted into overly simple and inaccurate inputs to predictive models.	EDIT01
10327	“This surficial till is relatively young (~14,000 to 60,000 years old), and has been described at a regional scale as unsorted sandy loam mixture with pebbles, cobbles, and boulders (Jennings and Reynolds 2005).” (SDEIS, p. 4-43) This statement doesn’t accurately describe Mine Site surficial sediments. First, there is more than one till unit at the Mine Site (PolyMet, 2013i; Barr, 2006b). Drilling logs in these reports provide numerous examples where multiple tills were encountered during drilling at the Mine Site. In some instances multiple tills are separated by intervals of outwash sand and gravel - some that are greater than 10 feet thick (RS-11 for example in PolyMet, 2013i). The thickness and extent of these outwash zones in the subsurface should have received more attention in the SDEIS; they represent significant pathways for groundwater flow and contaminant transport.	WR023, WR071, WR086, WR087
10328	The simplistic conceptual model of surficial geology at the Mine Site has resulted in a very simple and likely flawed plan to mitigate water quality problems that may arise from the presence of sulfur and metals in the overburden.	WR189
10335	Any NorthMet geochemical test results from unsaturated overburden presented in support of the overburden management plan in the SDEIS would be very sensitive to the texture of the material chosen for testing and its age and yet neither the SDEIS or PolyMet (2013i) report what types or textures of unsaturated overburden were subjected to geochemical analyses.	GT13
10339	“Unsaturated overburden is the material that has been above the natural water table and exposed to air long enough for chemical reactions to have taken place.” (SDEIS, p. 3-44) This statement is unsupported and misleading... This statement neither takes into account drift prospecting literature which has documented metals in fine fractions of till collected from the vadose zone even when the sulfide minerals themselves have been completely weathered; nor the fluctuation of groundwater levels between the time the oldest overburden sediments were deposited and the present time.	PD31
10396	A figure showing this isopach map [referred to on page 4-45] inserted at this point in the SDEIS would be very helpful in envisioning how the surficial sediment type and thickness varies across the Mine Site. But this map neither appears in the SDEIS or among cited reference documents. The Table of Contents for Golder Associates (2007) lists the isopach map, but the file does not appear in the MDNR DVD set and was not available for review.	EDIT01
10399	A detailed bedrock topography map would also be useful at several places in the SDEIS to illustrate where features such as troughs and bedrock valleys are located on the bedrock surface and to assess pathways that may transmit contaminated groundwater at the interface of the overburden and bedrock.	EDIT01

<b>Sender Name (Submission ID)</b>	Water Legacy (52178)	
10408	Knowing dimensions of sand and gravel outwash layers within the overburden [(SDEIS page 4-46)] and their orientation would help predict where groundwater conduits and seeps will be located within the overburden. It appears that no surficial geologic maps for the project areas were prepared specifically for the environmental review process. This is a serious deficiency in a geologic data set that underpins so much of the predictive modeling that is presented in the SDEIS. The SDEIS, in addition, ignores most of the detail in published surficial geologic maps for the area. With respect to geology, the result is a data-poor environmental review process.	WR023, WR071, WR086, WR087
10419	The spatial distribution of permeable outwash layers and their hydrologic significance must be considered for accurate modeling of groundwater flow, but this has not happened in the SDEIS. PolyMet has carried out extensive geologic field investigations at the NorthMet Mine Site and they do report outwash to be present within the overburden (PolyMet, 2007b; 2013i).	WR023, WR071, WR086, WR087
10506	in Table 4.2.2-5... laboratory-derived hydraulic conductivity values for reported “silty sand” are shown as ranging from 0.00043 ft/day to 0.0081 ft/day. The difference between laboratory-derived hydraulic conductivity values of up to 167 ft/day reported in PolyMet, 2013 or even higher in Stark (1977) should be reconciled with the results from a silty sand presented in Table 4.2.2-5 in the SDEIS.	EDIT01
10510	It is stated elsewhere in the SDEIS, as well as being common knowledge that the elevations of groundwater surfaces in surficial sediments under unconfined conditions usually mimic surface topography... It follows from these statements, in addition to well-understood geological concepts, that 20 percent of the surficial groundwater flow paths from the Mine Site should be to the north and northeast. This seems to have been ignored and should be corrected in the SDEIS groundwater modeling or it should be better explained why near-surface groundwater flow does not follow surface topography at the Mine Site.	WR086, WR089
10512	It should also be explained why Figure 2-3 in Polymet 2012s shows flowpaths from the Mine Site north to 100 Mile Swamp and Yelp Creek. This figure shows travel times of 1-5 years and 5-10 years along these flowpaths, not the travel times of thousands of years stated in the SDEIS (p. 5-33).	WR080, WR089, WR167, WR175
10529	The SDEIS’ claim [on page 4-43] of hydrologic separation from the Biwabik Iron Formation aquifer should be supported by a more robust reference than personal communication from one of PolyMet’s consultants. The SDEIS should include an accurate geologic cross-section based on actual drilling information, showing the locations of faults and fractures, not a schematic or overly generalized cross-section where subsurface conditions can be so easily misrepresented.	EDIT01
10545	The discussion on page 4-43 describing the relationship between rocks of the Duluth Complex and older rock to the north does not fully convey the important relationship between the Duluth Complex rocks and the older rocks to the north. The Duluth Complex in the vicinity of NorthMet intrudes the argillaceous rocks of the Virginia Formation (the “footwall of the deposit”). This is not a trivial point because the Virginia Formation is responsible for supplying the sulfur to the ore deposit and because contact metamorphosed Virginia Formation in the footwall and inclusions represent some of the most reactive waste rock that will be encountered.	WR071
10549	The examples of incorrect usage of geologic terminology in the SDEIS below suggest the sections on geology were not given the level of editorial review appropriate for a scientific publication. “The NorthMet Deposit itself is below the surficial till in the layered mafic intrusive rocks of the Duluth Complex, which are part of the Partridge River intrusion.” (SDEIS, p. 4-43) Actually the Duluth Complex is not part of the Partridge River intrusion. The Partridge River intrusion is part of the Duluth Complex.	EDIT01
10554	[The examples of incorrect usage of geologic terminology in the SDEIS below suggest the sections on geology were not given the level of editorial review appropriate for a scientific publication.] “The oldest of the sedimentary rocks is the Pokegama Quartzite. These sedimentary rocks are underlain by Archean granite of the Giants Ridge batholith.” (SDEIS, p 4-43) The correct terminology is Giants Range batholith, not Giants Ridge batholith. This same incorrect usage is repeated in several additional places on pages 4-94 to 4-95.	EDIT01

<b>Sender Name (Submission ID)</b> Water Legacy (52178)		
10561	The claim that there is little connection between water in the bedrock aquifer, water in the surficial aquifer and surface water is made in several places within the SDEIS. In some places these claims may be supported by data; in other places they are not [see SDEIS, p. 4-47 and p. 4-149].	WR010, WR023, WR053, WR071, WR120, WR166
10589	Without data in the body of the SDEIS to support the claim that a single pump test could lead to such an unequivocal conclusion, the reviewer is forced to search for additional tables, maps or cross-sections that could support the claim that the connection between the surficial aquifer and groundwater is “weak” [(see SDEIS pages 4-149-150)]... The statement that the interaction between surficial deposits and bedrock is “insignificant” is not supported by Siegel and Ericson (1980). Actually they stated the opposite... Other hydrologic studies carried out in the immediate NorthMet area contemporaneously with Siegel and Ericson reached the same conclusion.	WR010, WR023, WR053, WR071, WR120, WR166
10611	It has been suggested that the source of this ammonia in the bedrock aquifer is from unoxidized blasting emulsion used in the Peter Mitchell Mine to the north. The presence of ammonia in deep groundwater from the Mine Site is difficult to explain other than as surface contamination traveling deep into the bedrock groundwater system.	WR013
10613	PolyMet also intends to use peat and unsaturated overburden for construction and reclamation. These materials will be stored in unlined stockpiles (SDEIS, p. 3-44)... It is suggested that, unless specific data demonstrates otherwise, all overburden at NorthMet should be managed as reactive with the potential to leach metals. Stockpiles of overburden and peat should be placed above geomembrane liners with leachate collection systems and neither should be used in construction.	PD15
10622	There seems to be a contradiction in the definition of reactive waste rock contained in the SDEIS and what is defined in some of the supporting technical materials [(SDEIS 5-51)]... It is unclear from reading the SDEIS how this agreed-upon definition changed into the SDEIS threshold of 0.12% sulfur -- allowing Category 1 waste rock to be placed in an unlined stockpile. Even if rock with between 0.05% sulfur and 0.12% sulfur may not generate acid, it will leach metals at levels that would not meet water quality discharge standards (SRK, 2007b).	WR107, WR134
10626	Any reactive rock, as defined in the [2007] SRK report and the MDNR’s acid mine drainage research program, should only be stored above geomembrane liners with leachate collection systems.	PD15
10632	If NorthMet were to operate as proposed, at the end of 20 years of mining there could be 650 to 700 million tons of resources remaining. This number could grow larger if metal prices increase and/or metal recovery technologies improve and/or additional drilling and assaying occurs. This issue has bearing on probably cumulative effects of the project and should be analyzed as part of a revised EIS.	CU04
10635	Most of the following deposits have 43-101-compliant resource estimates prepared and some are in the pre-feasibility stage: Twin Metals Spruce Road, Maturi and Birch Lake deposits, Cardero’s Longnose and Titac deposits, Teck America’s Mesaba deposit and Encampment Minerals’ various deposits (MDNR, 2013). It is well-known that these companies are poised to begin environmental review should the NorthMet Proposed Action receive approvals. The cumulative environmental effects of these projects should be addressed in a revised EIS.	CU02

1055	It is extremely important to let PolyMet prove the can mine safely in this state with the technology we have today. Not only does our state need jobs and revenue, our country needs this!	SO10
<b>Sender Name (Submission ID)</b> Wendy Hansen (44397)		
10595	I don't feel that putting jobs ahead of public safety can be justified.	SO01
10597	Please don't let a company from India put our safe, clean water at risk!	WR115
<b>Sender Name (Submission ID)</b> Wendy Jerome (4190)		
8737	100% of sulfide mines leak toxic carcinogens and sulfuric acid... We can count on the death of aquatic life and the terrestrial life - including human beings- dependent on it, if sulfide mining is allowed in Minnesota.	WI04
9881	Some think that sulfide mining would bring jobs to MN. On the contrary, it would bring a few hundred part time and full time jobs, that would be intermittent, given world ore prices. The mining would last 20 years.	SO02
9882	Minnesota would loose a slowly, but steadily growing recreation economy - and wilderness that is a world treasure for the world.	SO02, WILD02
18843	The lands proposed to be exchanged for the acres that will be destroyed by mining are not the same as the unique target areas, rated of "high biological diversity" by the Minnesota Biological Survey.	LAN03
18844	The PolyMet proposal gambles on the relocation or survival of lynx, moose, and finer interdependent systems of aquatic and land plant and animal forms which are not yet known well enough. Wild life will be lost, and food chains will be destroyed.	AQ01, WI01
18845	Substances that would leak and spread into the Boundary Waters and Lake Superior include known carcinogens, sulfuric acid, lead.	GEN01
18847	Wild rice would be poisoned by sulfates. Effects of these and other mine effluents on the natural ecosystems and on the human body have not been fully studied.	VEG04, WR156, WR157
18849	The cost to Minnesota taxpayers into the future to attempt to clean the polluted water is notaffordable, and it is not certain water, air, or land could be cleaned.	SO01
18850	PolyMet is a gamble for 20 years of 320 irregular jobs that would cost our state a huge taxburden and the permanent loss of an international wilderness treasure.	SO01
19890	100% of mines leak.	PD26
19905	Exchange of mine lands for private lands still robs wild life and future human visitors. They lose ultimately, irretrievably with land exchange.	LU06
19919	I believe permitting sulfide ore mining in MN is a risky undertaking that is nearly certain to destroy a growing recreation economy, water quality, wildlife, plant life and aquatic life and a natural heritage we preserve for the world.	GEN03
<b>Sender Name (Submission ID)</b> Wendy Moylan (40188)		

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Wendy Moylan (40188)		
14109	I am very sympathetic to the need for jobs in northern Minnesota, however I strongly urge to you stand strong in supporting ONLY projects that will move forward the goals to reduce greenhouse gas emissions.	AIR01
<b>Sender Name (Submission ID)</b> Wendy Paulsen (46979)		
10872	1. PolyMet would pose an ongoing pollution threat to the St. Louis River and Lake Superior, long after the mining stops...Unless all of this water can be captured and treated, the mine will pollute groundwater and surrounding streams and rivers...And it is my understanding that fractures in bedrock have not been adequately addressed.	WR012, WR111, WR115, WR129
10873	2. In the PolyMet mine plan fails to discuss financial assurance adequately - there are no details of the amount and type of damage deposit adequate to cover the cost of treating polluted water for hundreds of years.	FIN05, FIN08
10874	3. The tax estimates in the PolyMet mine plan lack detail and are full of discrepancies. From one draft of the mine plan to the next the estimated taxes jumped 500% without explanation. This is important, since the state taxes that would apply to a copper-nickel sulfide mine have never been used before. The copper-nickel mining industry is exempt from several state and local taxes, such as property tax and corporate income tax, and has its own unique tax structure. Therefore, the State of Minnesota should confirm these tax estimates, and not just rely on the company to provide them.	SO04
10875	4. PolyMet has never operated a mine before, and is dependent on their largest investor and “strategic partner” Glencore for much of their revenue. Glencore currently owns 25% of PolyMet, with the option to increase their stake to 33%. Glencore also owns the first five years of minerals produced by PolyMet if it opens... It has a long history of environmental pollution, human rights violations, and anti-labor practices. The SDEIS should be revised to recognize Glencore as the party responsible for permitting.	PER02
10876	5. The PolyMet SDEIS fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling.	HU01
10878	6. Federal and state law require environmental impact statements like the PolyMet mine plan to consider a range of alternatives. That is done to ensure all reasonable options to protect the environment are considered... PolyMet mine plan does not consider any alternative to their proposal other than a slightly different version of a land exchange.	ALT21
16692	The SDEIS has no contingency plans for mechanical break-downs in the complicated filtration system that PolyMet proposes to treat the polluted water, even though that system would have to operate for centuries. PolyMet's water treatment system isn't prepared for the super-storms that are growing more frequent due to climate change.	WR176, WR180
16693	Worse, PolyMet's model doesn't even prove that the pollution stops after 500 years. Instead, the company simply stopped modeling at 500 years. In other words, the pollution could go on for even longer.	WR035
16694	The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of mercury and other air pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	MERC08, MERC20
16695	SDEIS be revised to provide more complete information on mercury and sulfate air pollution emission and deposition, water pollution seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project.	MERC08, MERC20

16696	There are several alternatives that should be considered and evaluated in the PolyMet mine that are simply discarded. These include whether the PolyMet proposal could operate as an underground mine instead of an open pit, and whether all of the waste rock created by PolyMet should be backfilled into the mine pits after closure.	ALT01, ALT03, ALT06
<b>Sender Name (Submission ID)</b> Wendy Robertson (18349)		
2532	I am also concerned and alarmed of the SDEIS plan to mitigate the 930 million (phonetic) acres that wasn't previously mentioned. The wetlands that will be eliminated by PolyMet's infrastructure, mine, waste piles (phonetic), et cetera, it is crucial that we take a look at it.	WET24
2533	The Federal US Army Corp of Engineers' mitigation role requires that (inaudible) before mitigation, which replaces the loss of wetlands, function within the same Hydrological Unit Code, HUC. The word to focus on here is "function."...functions of the wetlands will be lost by having the mitigation outside of our area. Having the compensatory sites in Simm (phonetic), Aitkin and Hinckley will not replace the loss of wetlands' functions to nature and the public.	WET03
2534	I also request that the lead agencies extend the time for public comments by three more months; 108 days. And 2,000 plus pages is a lot to digest and make educated comments	NEPA07
2535	I protest having these three public hearings in January, which is the coldest winter month. The cold and icy weather may impair comments by the elderly, sick and the disabled. You are disenfranchising these groups.	NEPA10
10931	this document fails to place the prospective mine within a larger historical, economic, and environmental perspective	CU02
10937	The primary failing of the SDEIS is that, seen from a broader perspective, it is internally inconsistent, reflecting a larger social schizophrenia wherein we demand both economic growth and a functional environment.	SO01
10940	But to be fair, and to the central point, all these agencies have been given an impossible mandate by wtp, namely to both promote economic growth (p.1-12) and to protect the environment	PER42
10941	the SDEIS attempts to regulate the acceptable impact of a proposed mine, yet it does not limit the number of hardrock mines in the watershed, the region, or the state, hence there is no limit to total impact. ... If wtp [we the people] and our representative agencies were serious about environmental protection, we would, in lieu of outright rejection, cap-and-trade this type of mining: we would put up for auction one and only one (the cap) right-to-mine permit (rtmp) for sulfide mining.	CU18
10945	The SDEIS simply trades one form of impact for another, it does not reduce its quantity, and transforms it to a form that is not as localized and not as immediate.	GEN01
10948	The SDEIS has a glaring omission: enforcement of the conditions of the permit...regulating personnel would [should] have to have an office or trailer on site, and be staffed by a rotating team of specialists, from construction inspectors, hydrologists, air quality specialists, to environmental chemists. They would be intimately familiar with the permit conditions and see that they are being fulfilled.	PER06
10951	Inspectors and enforcement personnel on large project sites can lose control, and as employment and investment accumulate, the the political power of Polymet can overwhelm the regulators, so that the company may do as they please, witness the existing toxic conditions at the plant site--the legacy of the former LTV plant--as cited in the SDEIS.	SO02
10952	The Cumulative Effects portion of the SDEIS not only fails, but fails spectacularly.	CU03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Wendy Robertson (18349)	
10955	The SDEIS should have included a concise summary of how much of the planet’s ecosystem would be destroyed and compromised if this proposal is realized.	NEPA15
10956	The title history of Tract 2 of the land exchange seems odd, even suspicious...Its title was in the public domain (Lake County), passed into the private domain by purchase, and then is to be used in exchange for public lands (p. 4-396). So what was once public becomes public again to offset loss of Federal land to Polymet. The purchase of county land by Lake Forest Enterprise, Inc. should have been detailed and made transparent in the SDEIS. Was this by auction as is usually required?	LAN04
10957	The SDEIS omits a whole class of external costs, namely the social costs associated with the potential industrialization of northeast Minnesota.	SO04
10960	Given the volume of the SDEIS, its most notable success is the effective limit on serious and thoughtful commentary by the abbreviated time allowed for its reading, for subsequent deliberation, and comment writing.	NEPA07
10961	As the three lead agencies “have jointly prepared the SDEIS” (opening sentence of the COVER SHEET), how can it be that these same agencies that will issue the critical Record of Decision?	NEPA08
10962	The several sections of the SDEIS dealing with GHG emissions are confusing and contorted..... First it is noted that the annual GHGe emissions are under the USEPA threshold (Table 5.2.7-7), but we later are told that the threshold is not a limit, but rather would simply require BACT for these emissions (p. 5-429).	AIR01
12234	The SDEIS does not address the cumulative effects of the additional mining companies that are waiting in the wings for future permits.	CU04
12237	The SDEIS has several issues in watershed mitigation that are not addressed.	WR130
12238	I am asking that the agencies involved to extend the comment period for an additional 90 days.	NEPA07
14633	The lands surrounding these wetlands are also indirectly altered and these will not be even considered in the total.	WET01
15183	the SDEIS must also require a financial assurance package, no only for shutdown and cleanup (after the company has extracted and sold their sub-surface mineral property and can leave), but also for construction and operation.	FIN01, FIN08
15184	The SDEIS simply trades one form of impact for another, it does not reduce its quantity, and transforms it to a form that is not as localized and not as immediate. Carbon dioxide is transparent and therefore out of sight.	AIR11
15185	such regulations don’t impose limits at all. Take for instance the infamous sulfate standard; not only does it not cap the amount of sulfate that can be discharged into the environment, it does not even cap its rate of discharge: time units do not appear in the denominator of the standard. It is a concentration limit only; to meet the standard Polymet has merely to add water. Or consider the BACT standard, which may reduce impact from what it may have otherwise have been, but sets no mass or rate limits.	PER06
18745	I was fortunate to be selected as one of the 80 plus speakers to give testimony. Given that many others did not have the opportunity to speak only reflects the insufficient amount of time for public comment at hearings and the refusal to extend the comment period on this SDEIS. I am asking that the agencies involved to extend the comment period for an additional 90 days.	NEPA07

18746	The SDEIS does not address the cumulative effects of the additional mining companies that are waiting in the wings for future permits. They are watching to learn what happens as the Polymet process breaks ground in asking to be permitted. By ignoring this glaring omission, I can only conclude that you are not reading the investment brochures of mining companies that are seeking worldwide investors currently.	CU04
<b>Sender Name (Submission ID)</b> Wendy Saliin (39118)		
5182	Minnesota boasts countless beautiful natural spaces; it is what draws people to Minnesota and what holds them here. Therefore, preservation of clean water and wilderness will provide a more sustainable economic stimulus to state, local, and regional economies than mining.	SO01
5183	A copper scrap metal recycling project would be a sustainable alternative to the boom and bust cycle of mining.	NEPA06
5184	Mercury contamination is already a problem in area lakes, posing a major problem to humans and animals who consume fish from these waters - we already know that this is especially dangerous to pregnant and nursing mothers, infants, and young children. Sulfide mining is known to increase mercury levels in water.	HU03
5187	The WHO lists 10 chemicals of major public health concern. Sulfide mining involves 5 of them: mercury, arsenic, lead, asbestos, and air pollution. All Minnesotans could potentially suffer the ill effects of these chemicals, but this is especially of concern to potential future employees of the mine.	HU03
18251	Natural beauty and a healthy natural environment are not only important to the health and well-being of Minnesotans, they are also a crucial component of state, local and regional economies.	SO04
18258	Minnesota does not deserve to bear the burden of so much risk when likely so little lasting benefit, economic or otherwise, would exist.	SO01
18261	TAXPAYER BURDEN... we are mulling over the possibility of a mining project that we acknowledge will pollute regional waterways for a minimum of 500 years?!	FIN10
<b>Sender Name (Submission ID)</b> Wendy Schlueter (10936)		
633	The City of Babbitt also thanks PolyMet and the State of Minnesota for being open to the advanced technologies and compliances adhered to for fulfilling and challenging employment opportunities the mine will provide.	NEPA16
634	We are also confident that the mining company and its entities will be in compliance in every aspect to promote this very important and necessary economical job source to Minnesota.	SO10
<b>Sender Name (Submission ID)</b> Wes Bailey (43244)		
15803	The short-term gains (the vast majority of which will go to out-of-state shareholders) are absolutely not worth the risk to our state's clean and living waters.	SO01
<b>Sender Name (Submission ID)</b> Western Lands Project (42975)		
7997	The fundamental flaw underlying the proposal and the analysis is the proposition that the conflict between Polymet's mineral rights and the National Forest surface ownership "needs to be resolved." That may be the case from Polymet's point of view, but for the Forest Service and the public on whose behalf it manages the forest, there is no conflict. The land is protected from subsurface exploitation, as it should be.	LAN04, NEPA04

<b>Sender Name (Submission ID)</b> Western Lands Project (42975)		
8755	The proposed land exchange does not serve the public interest as required under both the Federal Land Management & Policy Act (FLPMA) and the Weeks Law. The proposal was brought forward by and in service of private interests, and it the duty of the Forest Service to protect the interests of the public in the lands at issue, acquired under the Weeks Law.	LAN02
15159	We are particularly troubled that the Forest Service would entertain a land exchange that does not consolidate ownership of the public lands, but would result in a split estate on land the Forest Service proposes to acquire-- this is drastically counter to fundamental federal land exchange policy and jeopardizes the public interest. The split estate poses two threats: that mining could occur on some or all of the land and/or future land exchanges could be leveraged by way of threats to conduct mining or exploration that would damage surface lands belonging to the public.	LAN02, LAN04
<b>Sender Name (Submission ID)</b> Weston (45272)		
9159	I am strongly against the mine. It will destroy the environment in northern minnesota	GEN01
<b>Sender Name (Submission ID)</b> Whitney Morgan (57248)		
17376	In the review it is stated that potential exists for the release of amphibole mineral fibers from the proposed operations, which could pose a potential public health risk of uncertain magnitude” this is extremely alarming to me. The fact that, that statement can be made in a project’s Environmental Review should let alone be the deciding factor in not approving sulfide mining in Minnesota.	HU05
17378	I believe the detrimental effects from mercury that would be emitted is not accurately reported. In a letter approved by many Duluth area physicians it is stated that the review doesn’t report the amount of mercury that will discharge into our local watersheds. Due to this lack of information, the review is not complete for mercury pollution is extremely dangerous to our communities health and eco systems.	MERC16
17379	I believe the health effects of sulfide mining is not accurately reported. Many Duluth area physicians have come out to state that the review doesn’t properly deserve all of the health impacts that would come with sulfide Mining. ... sulfide mining would threaten my entire communities health by exposing lead, arsenic, lead, asbestos and mercury pollution into our air and water. These threats need to be included in the projects environmental review, along with the major health impact they will have on my family, friends, and community.	HU03
<b>Sender Name (Submission ID)</b> Whitney Snyder (12288)

9450	If copper mines and their associated industry are developed, as proposed and planned...resulting in unacceptable levels of groundwater and surface water contamination, along with other irreversible and devastating environmental and aesthetic damages.	NEPA09
9452	The 2004 EPA report identified 156 hard rock mining sites nationwide that have the potential to cost between \$7 billion and \$24 billion in total to clean up (at a maximum total cost to EPA of approximately \$15 billion).	FIN08
9454	The results [of the Minnesota Department of Health study] showed the highest levels of babies affected [by toxic levels of mercury] were in Minnesota, at 10 percent, with 3 percent in Wisconsin and none in Michigan.	MERC03
9455	Fetuses, infants and children are most at risk from mercury exposure because even small amounts can harm the developing brain and nervous system.	MERC03
9456	The pristine Arrowhead region and Minnesota have a lot at stake...The BWCA [Boundary Waters Canoe Area] alone is visited by over 250,000 every year.	WILD02
9457	According to the state, tourism translates to about 235,000 Minnesota jobs - 11 percent of the state's total private-sector employment.	SO02
9458	In 2004 an EPA special report on hard rock mining in America was done. The US EPA report states, of the approximately 156 such hard rock mines currently on the Superfund National Priorities List, 40 percent of these will take from 40 years to 'in-perpetuity' to clean up. Effectively meaning they will continue to leak toxic metals and acid mine drainage into the surrounding environment, and watersheds, quite literally for thousands of years. This is not speculation.	PD26
9459	And the tourism sector generated \$732 million in sales taxes alone last year, about 17 percent of the state's total sales tax revenue.	SO02
9460	Our [Minnesota's] reputation for the purity of this most valued resource – our water and woods – it is the prime draw for tourism - and is in grave danger of being irreparably damaged.	SO02
9461	This process of mining brings massive amounts of 'sulfide-bearing rock' to the earth's surface, pulverizes it, and exposes it to substantial amounts of weathering.	AIR11
9462	In addition to major issues arising from dust and air pollution problems, the minerals gradually oxidize to form dilute sulfuric acid and ferric hydroxide, resulting in the mobilization of toxic heavy metals and acid mine drainage to the surrounding environment.	HAZ03, WR151
9464	The 2004 US EPA special report on hard rock metals mining notes that currently, the US Forest Service estimates, that an astounding 10,000 miles of streams and rivers have already been heavily polluted by this mining industry.	WR023
9467	Mercury contamination of our waters is already significant.	GEN01
9468	The Polymet project is only the first of many companies waiting in line to change the very nature of this area as we know it. There are now at least 11 more ready and waiting or in various stages of exploration.	CU04
9469	The cumulative effects [of mining] will bring staggering change to a priceless and mostly still pristine area.	CU11
9470	This land [proposed location of NorthMet] does not belong to the mining companies or elected officials to do as they please.	PER45

<b>Sender Name (Submission ID)</b>	William K. Dustin (41985)	
2585	What other groups or individuals were involved [in preparing SDEIS besides Polymet and Tribes being involved]? How closely did the authors of the document work with PolyMet, and did any personal relationships result there from? Are any of the authors hoping to find employment in the mining industry?	NEPA18
2586	“The NorthMet Project Proposed Action has changed substantially since preparation of the 2009 DEIS.” This remark appears fairly frequently in the SDEIS.....I got the impression reading through the SDEIS that it was written to rule—i.e. a response was conceived that would fit the rule, but there was no evidence of where it has been done in practice. In other words, what is being proposed here is an experiment that could well fail.	NEPA09
2587	...once the negative externalities [of the proposed action] become evident at some point in the future, no one will be held accountable. The present actors will have taken their profit and left the scene and the current regulators will have retired.	FIN01
2588	p. 3-5 “PolyMet would be held accountable to maintenance and monitoring required under permit and would not be released until all conditions have been met.” How will PolyMet be held accountable?	FIN01
2589	p. 3-6 “ The Land Exchange Proposed Action would include up to five tracts of non-federal lands in St. Louis, Lake, and Cook counties that would comprise up to 6,722.5 acres (GLO); .....” This looks like a copout. A lesser acreage should not be accepted.	LAN03
2590	p. 3-7 “Long-term, post-closure monitoring and adaptive management involving mechanical treatment for as long as required until if and when non-mechanical passive treatment is proven at the site, for affected water from the pits, permanent stockpile, Hydrometallurgical Residue Facility, and Tailings Basin.” Who is going to do all of this? If it is the state, are there FTEs in the budget?	FIN01
2591	p. 3-39 How much additional waste will be derived from the ore? This is low grade ore where 99% is waste.	PD15
2592	p 3-41 “It would be necessary to dewater the pits during mining to remove groundwater and precipitation runoff. These waters would be directed to low areas in the pits, collected in sumps, and pumped to the WTF. The mine pit sump areas and pump capacities would be designed to minimize delay to mining operations during the typical spring snowmelt or major precipitation events.” Who is going to design the pumps and where have they been tested?	PD24
2593	p. 3-52 “However, should water monitoring undertaken during or following operations indicate a need to do so, the WWTF could be expanded or treatment capabilities modified to meet water quality standards.” How will this be guaranteed?	PD24, WR130
2594	p. 3-59 “PolyMet would be held accountable to maintenance and monitoring required under permit and would not be released until all conditions have been met.” How will this be enforced? What about bankruptcy?	FIN01
2595	p. 3-64 “The overburden portions of the pit walls would be sloped and graded at no steeper than a height-to-vertical ratio of 2.5:1 ..... There would always be a clear path to the water surface.” Here is an example of writing to rule. It looks like these proposals are being made up as you go along. There is no enforcement mechanism.	PD24
2596	p. 3-91 [Referring to the sentences] “New tailings would be placed ....existing geotechnical conditions at the Tailings Basin and Hydrometallurgical Residue Facility.” This doesn’t make sense. My understanding is the existing tailings basin is already leaking AMD into the environment.	PD10
2597	p. 3-117 and Figure 3.2-28 “Along the eastern side of the Tailing Basin, high bedrock eliminates groundwater seepage. Along the southern side, surface features result in all seepage emerging at a surface seep.” Assumption [that the bedrock eliminates groundwater seepage] is the mother of all screw-up’s.	PD12, PD13, WR105

<b>Sender Name (Submission ID)</b>	William K. Dustin (41985)	
2598	p. 4-139 “Subsequent to publication of the DEIS, baseline wetland types were re-evaluated. Additional field visits were conducted from April to October 2010, in addition to further mapping efforts.” Did this result in a lowering of standards?	WET21
2599	p. 4-149. “The hydrology of the wetlands at the Mine Site has been stable over time.” This stability should be preserved to prevent pollution of the One Hundred Mile Swamp and the headwaters of the Partridge River.	WET19
2600	p. 4-170 “Of the wetlands that are located on the Mine Site, the majority (92 percent) is rated as having a high overall wetland quality and 8 percent are of moderate overall wetland quality.” This is why the wetland mitigation proposal is unsatisfactory. An artificial wetland cannot replicate a natural wetland, particularly wetlands that are the source of a waterway.	WET05
2601	p. 4-173 [Referring to sentences:] “Sites of High Biodiversity Significance contain very good-quality occurrences of the rarest species,.... which is 85 percent of the Mine Site.” This is another reason as to why the land exchange is inadequate.	VEG02
2602	p. 4-247 “The climate for the NorthMet Project area and Minnesota, in general, is defined as continental. The region is subject ....to more frequent Arctic air masses.” How is global warming being factored into the models used to determine long term cleanup and monitoring?	AIR01
2603	p. 4-304 “For most Native American tribes, subsistence is synonymous with culture and identity.” The Native American tribes will need to be included in some way with respect to the proposed permanent fund.	CR01, CR06
2604	p. 4-435 [Referring to sentences:] “Wildlife habitat was rated high ...human disturbances or effects.” “Amphibian habitat was rated high ...to successfully reproduce.” This as another reason not to disturb the wetlands, particularly with respect to amphibians, because this group is experiencing the highest level of species extinction. They seem to be very sensitive to environmental pollution.	AQ19, WET24
2605	p. 4-436 “The federal lands were found to have 1,889.4 acres (29 percent) of floodplain (500-year floodplain) and these floodplains are not FEMA regulatory floodplains.” What will happen if there is a 500 yr. flood? Global warming could make flooding more common.	WET14
2606	p. 4-440 “The value of the wetlands or floodplains for properties received and conveyed is equal (balancing test) and the land exchange is in the public interest.” I doubt that the properties exchanged are equal, but it [is] a privatized interest, not a public interest.	WET14
2607	p. 5-7 “The Co-lead Agencies have selected the 90th percentile probability (P90) as its evaluation threshold in determining whether the model results meet established evaluation criteria...” P90 is an unacceptable level of significance. Most statistical research uses P95 as the level of significance, and in this case, where there is the potential for severe pollution, the level should be P99. In addition, statistical modeling is not the same as demonstrating that this type of mining can be done without significant environmental damage. There is an extreme amount of uncertainty in computer models.	WR110
2608	p.5-69 “The probability functions are based on the variability of measured data, professional judgment, or both.” Whose professional judgment? PolyMet’s?	WR073, WR189
2609	p.5-152 The evaluation criteria are not shown on the graph.	EDIT01
2610	p. 5-223 It is unfortunate that this type of wetland mitigation is allowed because it is not adequate.	WET05
2611	p. 5-226 “Additionally, wetlands in the Northshore Mine and areas directly north of the Northshore Mine have been excluded from the evaluation.” Why?	WET08

<b>Sender Name (Submission ID)</b>	William K. Dustin (41985)	
2612	p. 5-247 “Under this methodology approach, the likelihood of wetland hydrology effects would be as follows:...” This methodology is unclear...	WET08
2613	p. 5-298 “Therefore, monitoring of wetland hydrology and vegetation communities would be the most appropriate way to document the extent and magnitude of wetland responses to the NorthMet Project Proposed Action.” Who is doing the monitoring? Using what criteria?	WET02
2614	p. 5-333 “Should the USACE determine that a greater percentage of the compensation be accomplished within the St. Louis River Watershed/Great Lakes Basin, the applicant may be directed to re-evaluate compensation opportunities within that watershed.” ... Will the public be notified if it does?	COE02
2615	p. 5-448 What is the impact of blasting on bedrock fracturing leading to potential groundwater pollution?	WR016
2616	p. 5-493 “The NorthMet Project Proposed Action would create slightly increased demand for housing and public services in cities and towns near the NorthMet Project area.” There will be excess housing and less demand for public services at mine closure.	SO02
2617	p. 5-496 “Prices based on PolyMet’s 2008 Bankable Feasibility Study (PolyMet 2008). This is the most detailed published information available, and PolyMet is legally bound to these data.” What does legally bound mean here?	SO04
2618	p. 5-513 “After closure, PolyMet would retain ownership of the Mine Site and the federal lands, and public access would likely remain restricted.” What is PolyMet going to do with the site after closure? Is public access restricted because the site is heavily polluted?	PD30
2619	P5-514 “The Plant Site is located at the former LTVSMC processing plant. It is owned by PolyMet, and it is not open to the public. Entry roads are gated and/or guarded. No recreational activity is permitted at this site, nor would it be permitted during construction, operation, and closure of the NorthMet Project Proposed Action.” Who will be permitted to access the site to monitor compliance with all permits?	PD24
2620	p. 5-534 “All hazardous materials would be transported by commercial carriers in accordance with state and federal hazardous material shipping requirements.” How adequate are these [hazardous materials shipping] requirements in light of all the accidents resulting from rail transport of crude oil from North Dakota?	HAZ06
2621	Section 5.3.5 Wildlife don’t care about who owns the land, they only care about habitat, and the land exchange will result in a loss of habitat.	WI02
2622	To not account for these so called speculative actions [described in Section 6.2.2.1.21] in considering the combined effects on the environment in unconscionable. For evidence that these activities are more than speculative refer to the March 1, 2014 edition of the Ely Echo, which, on page 7, has an article with a map entitled “Twin Metals unveils first look at proposed mine operations”.	CU02
2623	p. 7-10 “Irreversible commitments of resources are those .... ore or wetlands that would be permanently converted to rock stockpile.” ... You might add that once started, there is no going back. If PolyMet violates the terms of its permits, they know no one is going to shut them down.	PER06
2624	p. 7-12 Modeling is not the same as a physical demonstration. Reverse osmosis has been mentioned in this document and is supposed to start being used ad year 20. How will this work and where has it been physically demonstrated?	WR143
2625	p. 8.8 “Also, preliminary economic screening by PolyMet determined that sale of metal precipitates produced from an underground mine would not meet the NorthMet Project Proposed Action Purpose and Need,....” Why?	NEPA01
2626	p. 8-10 “If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be taken to reduce those effects.” What [are those] steps?	WR035

18674	Mining with sulfide in northern Minnesota would be a short-sighted action that would deteriorate the health of the ecology and quality of life in the area. Long after the resources are tapped, our children will still be dealing with the toxins left behind.	SO02
<b>Sender Name (Submission ID)</b>	William R Whiteside (18307)	
12226	And I'm very happy to see as we're looking forward the huge amounts of money -- billions of dollars -- that are going to be available to young people not only of the Iron Range, not only of Duluth, Northeastern Minnesota, but all of Minnesota to assure better educational opportunities, more solid infrastructure, better bridges, highways, hospitals. All the things that are necessary to a healthy and a good environment for people to live in.	SO10
<b>Sender Name (Submission ID)</b>	William Robbins (46971)	
10869	Without knowing the design operating pressure [of RO system], a decision maker would not know the following: How much wastewater will have to be stored or treated by secondary methods. The intended size and cost of the RO system, including pre-filtration equipment. The costs of long-term maintenance, monitoring and repair of the RO system. Without adequate maintenance, monitoring and repair, the cleaner water stream will soon cease to meet even the minimum water quality standards. There seems to have been a focus on controlling water effluent from tailings. This is important, to be sure, but the huge amount of water, both meteoric and ground source water from the open pit will likely dominate water flow which needs to be treated, so sizing of the RO system needs to accommodate large, erratic flows from storm runoff.	WR143
10870	All the following generate airborne dust: Removing overburden, mining, transportation, milling to reduce size preparatory to froth flotation, and tailings storage. I found little mention in the Supplemental Draft EIS of sources of dust, design of equipment and engineering processes to minimize dust generation and remediation procedures to contain and dispose of dust.	AIR07
10871	By planning for a 40-year period of mining, rather than a 20-year period, the removal rate of copper/nickel would need to be reduced. I understand that the up-front costs would be recovered more slowly, and this would generate reduced profits. Benefits to the long term economy, the people in the area, and the environment would result, and those uncertainties would decrease, issues associated with the long term needs of maintaining the site after active mining operations cease.	ALT01
<b>Sender Name (Submission ID)</b>	William Rudie (27497)	
10480	I appreciate the desire of those living in this area to have an opportunity for economic advancement if only for a limited time but the cost in permanent damage to this land and these waters is simply too high.	SO02
15271	The short form of the environmental impact statement could easily say "...the unique and delicate environment of Northern Minnesota will be damaged. Mining companies have been unable or unwilling to do what is required to prevent pollution caused by such operations in the past and there is no reason to think that this mine will be any different..."	PER35

<b>Sender Name (Submission ID)</b> William Wilton (57215)		
17151	Research to recycle and reuse what has been already extracted can bring many jobs is just a start.	ALT09, ALT16
<b>Sender Name (Submission ID)</b> William Youman (58168)		
19888	...the mining should NOT go forth and be NOT approved due to wildlife, water quality and health issues for local residents and all of MN and the water resources.	GEN03
<b>Sender Name (Submission ID)</b> william youmans (46190)		
8162	We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling.	HU03
8166	We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health.	HU01
8170	Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	MERC20

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	william youmans (46190)	
8172	The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water.	HU01
8182	The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential.	HU04
8184	The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate.	HU01
8191	For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project.	MERC02
8193	We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the Minnesota Health Department.	HU01
8195	This Health Impact Assessment should include at least the following:1. Description of the known human health impacts of all pollutants in PolyMet’s air emissions and water discharges based on reliable toxicity and epidemiology data.2. Assessment of potential health impacts on residential wells from tailings seepage.3. Health impact assessment for on-site workers at both the PolyMet mine and plant.4. Assessment of cumulative mercury risks, including hazard levels in bodies of water that are already impaired for mercury in fish and risks posed by mercury concentration downstream in the St. Louis River.5. Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis and an appropriate “lifetime” for exposure.6. Assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice.	HU01
8214	Environmental Impact Statements, such as the PolyMet SDEIS, are required by the National Environmental Policy Act to contain analysis of impacts on human health. However, human health is subordinated to environmental impacts, is addressed in a piecemeal fashion, and there is no examination of the social determinants of health in the SDEIS. An HIA would integrate human health into the environmental review for the PolyMet NorthMet proposal, allow consideration of mitigation measures, and involve the community in planning for the project.	HU01
<b>Sender Name (Submission ID)</b>	Wintergreen (10185)	
367	This SDEIS is fundamentally inadequate. We’re told to rely on science to get it right. How can we if the agencies that are doing the science got it wrong? Let’s start over before we risk permanent damage to Minnesota’s lakes and streams and our nation’s most significant watershed.”	NEPA09

**Sender Name (Submission ID)**    Wintergreen (10185)

1436 For 5 years PolyMet and various government agencies have studied the potential impacts that the nation’s most polluting & toxic industry might have on the nation’s most water-rich ecosystems. For 5 years, we’ve been told to trust the science. Don’t worry, they’ve told us, PolyMet's models will get it right. These models will determine whether a mine slated to operate for just 20 years is likely to pollute a headwaters of the Great Lakes watershed – the world’s most significant freshwater resource -- for hundreds of years if not forever. But now we learn that PolyMet's models got it wrong. They based the study on the wrong data. Their key parameter, stream flow volume, was incorrect. It’s simple: to determine how much pollution might travel from the mine site to Lake Superior, you measure the flowage of the headwater stream that connects the two – the Partridge River. But the scientists we are asked to trust did not measure the flowage. They simply guessed using computer models. They guessed wrong. New data shows that at least 3 times as much water flows down the Partridge River than was wrongly assumed in their study.

WR003

And here’s the kicker: For 5 years scientists with native American tribes who know the lay of the land better than any of us warned the agencies that PolyMet’s stream flow data was incorrect. The warnings of the tribal scientists were ignored. Why? Is it because much greater flowage might mean much greater pollution treatment costs than PolyMet is willing to pay? Is it because much great flowage might spread the pollution to a much larger area than PolyMet is willing to clean up? Is it because PolyMet’s proposed treatment plants will have to process larger volumes of water for hundreds of years than any financial assurance package could ever possible pay for? If the agencies that prepared this SDEIS could not get a simple key parameter correct – the amount of water currently flowing from the mine site – how can we possibly trust them to accurately predict the impact of this mine on our watershed hundreds of years from now -- when it will still be releasing toxins into our surface & groundwater.

7542 Please reject the Polymet proposal as it would destroy the natural environment and compromise our waters. WR195

7543 This cost significantly outweighs any short term financial gain that may result from the copper mine business. SO01

**Sender Name (Submission ID)**    Wynter George (54182)

16433 I think building a mine is a bad idea because it will effect our environment. It will destroy our rivers and are boundaries water. WR111, WR115

**Sender Name (Submission ID)**    Xa Peter Vang (54209)

17648 The boundary water has been our largest wilderness since 1978 and it should be kept like that. The boundary waters is the icon behind Minnesota. WILD02

17649 I think we should not turn the boundary waters into a mine. I believe we should protect an environment that holds such beauty and serenity. LU04

17650 Sulfide mining will have a large impact to the environment; sulfide will turn into sulfuric acid and pollute the boundary water. WR001, WR111

17651 Pollution is a big problem all over the world and we all want to stop pollution, so why build something that will create more pollution. GEN01

**Sender Name (Submission ID)**    Yasmina Antcliff (11521)

2473 I am concerned about mercury levels in the water effecting our fish populations. We need more research. The SDEIS must be redone to check levels of mercury before the contaminated water comes in contact with waterways. MERC02

2473	I am concerned about mercury levels in the water effecting our fish populations. We need more research. The SDEIS must be redone to check levels of mercury before the contaminated water comes in contact with waterways.	MERC02
9340	The Environmental Impact Statement doesn't tell us how much mercury pollution will be seeping out of the PolyMet tailings into surficial waters.	MERC20
<b>Sender Name (Submission ID)</b> yvonne eckstein (40197)		
6626	Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit -- that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever	PER35
6627	The opportunity to provide employment from the PolyMet project has strong appeal to some residents in the area--and jobs are a real concern BUT I think the short term benefits of these few jobs are vastly outweighed by the longer term and possibly permanent damage to health and environment of Minnesota residents	SO01
6629	I would ask the SDEIS analyze and study the potential impacts of some alternatives to an open pit design--like underground mining, putting liners under the permanent waste pile and the tailings pile	ALT01, ALT07
6630	PolyMet should be denied a permit to mine until the potential impacts of their proposal receive further study, and questions such as--will mercury loading in wetlands pose a risk to fish, to human and animal health; what are the actual costs of treating the water pollution from the permanent mine site waste rock and how long will PolyMet pay for it.	HU01
6631	The groundwater flow rates in SDEIS are inconsistent with "real world" data. What is PolyMet planning to do if their modeling predictions of no risk of water pollution from seepage both from the waste rock pile and the tailings pile do not hold true?	WR058, WR090, WR130
6632	I believe PolyMet's open pit mine plan is deeply flawed and my concern as an old Minnesota resident is the long term potential harm to the environment.--water and air pollution from the mine site, leaching of heavy metals into wetlands and lake drinking water, loss of public lands in Superior National Forest, destruction of irreplaceable wetlands	PD01
<b>Sender Name (Submission ID)</b> Zabelle Stodola (51512)		
3612	Whatever short-term economic gains might accrue regionally are simply not worth the long-term risks to the environment, to residents' health, and to the local tourist economy.	SO01
3613	The location of PolyMet's proposed NorthMet open pit mine is near important tributaries such as the Embarrass and Partridge Rivers. Therefore, the potential for acid mine drainage polluting the St. Louis River and, crucially, Lake Superior is significant.	WR113
3614	I am also opposed to the land exchange PolyMet has proposed which would zero out critical federal environmental protections such as the Weeks Act. Strip mining is not permitted on Weeks Act land, so special legislation removing environmental regulations would be necessary in order for PolyMet to move forward with the process. Protection provided by the Endangered Species Act and the National Environmental Policy Act would also be removed by the exchange. Shame! Further, if this project goes forward, we could see legislation in the future that would fast track a land exchange largely to benefit multinational mining companies.	LAN02
8763	The location of PolyMet's proposed NorthMet open pit mine is near important tributaries such as the Embarrass and Partridge Rivers... the potential for acid mine drainage polluting the St. Louis River and, crucially, Lake Superior is significant.	WR111

8765	I am also opposed to the land exchange...which would zero out critical federal environmental protections such as the Weeks Act. Strip mining is not permitted on Weeks Act land, so special legislation removing environmental regulations would be necessary in order for PolyMet to move forward with the process.	LAN02
10460	I would like to remind decision makers that in the past, the taconite industry put private economic gain over health and environmental protection and dumped waste into Lake Superior with disastrous consequences. It has taken years to deal with that mess.	PER35, WR023
16981	ven worse, the mine and associated facilities could be expanded later because other deposits exist in the surrounding area. Allowing construction of the NorthMet mine is an open door to further expansion.	CU02, CU04
16982	I understand that the Swiss corporate mining giant, Glencore, financially backs PolyMet and plans to sell the metals globally. This company, which owns approximately 25% of PolyMet, faces accusations of human rights abuses, environmental damage, and labor violations elsewhere.	PD23
<b>Sender Name (Submission ID)</b> Zac Cerwinske (54335)		
17313	I don't want the NorthMet Mining Project approved. I am worried about the environment, especially the loss of almost three fifths of our wetlands on the proposed site. Wetlands can decrease flooding, remove pollutants from water, recharge groundwater, protect shorelines, and provide habitat for wildlife.	WET24
17314	A partially filled or damaged wetland can't fully control floods, or help to improve water quality. A badly degraded wetland can lose its ability to remove excess sediments, metals, pesticides, and other pollutants. Wetlands have the ability to provide environmental benefits, but they are not indestructible. If we want wetlands to continue to perform their ecological functions, then we have to do our part to protect them, and this is why I don't want the NorthMet Mining Project to be approved.	WET24
<b>Sender Name (Submission ID)</b> Zac Kenoyer (54345)		
17677	I think [PolyMet] should find a way to minimize the Cultural resources effect They should change their plan so they do not bother the Ojibwe people. ... [find a way to build the mine without] inconveniencing them during construction and ruining some of their historic land. ... This will affect cultural resources because it will affect three of five historic places during construction, excavation, filling, etc...Also the 1854 treaty specifies that its reserved for fishing, hunting, and gathering on this land that would be affected.	CR01, CR05
17678	I think this mining will benefit Minnesota by creating jobs and getting us needed resources to use or export.	SO10
<b>Sender Name (Submission ID)</b> Zach Insheep (54190)		
17214	In the process of building the mine we would be destroying natural water filters, wetlands, peat.	WET24
17216	Worldwide we only have 0.024% of clean drinking water. We should not take our water for granted even if it is for copper.	SO01
<b>Sender Name (Submission ID)</b> Zach Kunkenborg (54193)		
17220	I mean we have one of the most pure watersheds up there, near the boundary waters and all, so why would you put a sulfuric mine up there and risk tainting the water?	WILD02

17221	Also you get a lot of waste from this mining, think of all the waste this will create.	GEN01
<b>Sender Name (Submission ID)</b> Zachariah Mitteness (37824)		
16336	The polymet mine would jeopardize sacred manoomin (wild rice) which is almost exclusively here in Minnesota, Wisconsin, and parts of Canada.	VEG04
16337	...the polymet mine would have an effect on the serene beauty of the boundary waters.	WILD02
<b>Sender Name (Submission ID)</b> Zachary Behnke (54219)		
16293	PolyMet has many problems with their plan and environment impact statement. One of the major problem with PolyMet, is that they re-drew maps to disguise the fact that the runoff from the mine waste piles will enter the BWCA. Not only do they need to get new, ACCURATE maps from the DNR, but they also need to test how much waste will flow to the BWCA and how long it will take to get there.	WR080
16294	PolyMet has many problems with their plan and environment impact statement. The water will have toxic levels of metal at LEAST for 500 years. That will need constant treatment to make it safe. The MN DNR needs to get a water model that is capable of telling how many years it will take for the waste water metal levels to drop to the safe range.	WR036
16298	The environmental impact statement is a set up deal. It's a way for PolyMet and people to provide jobs for 20 years at max, for at LEAST 500 years of toxic pollution that will destroy not only BWCA, but also destroy any natural parts of Minnesota left. I hope you do not allow these scandals to ruin generations of the great outdoors, and take away from the Minnesota culture.	FIN10
<b>Sender Name (Submission ID)</b> Zachary Blankenheim (40036)		
6644	The moose is a truly iconic symbol of the Northwoods in Minnesota. The population is already in drastic decline with studies just getting underway to search as to the reasons why. Further decline in moose numbers may also impact the wolf population. Without the moose as a food source the wolf population will possibly rely more heavily on the white tail deer. If the numbers of white tail deer decline that will impact hunters and the amount of revenue that the area receives.	WI01
<b>Sender Name (Submission ID)</b> Zachary Johns (38609)		
14064	The Boundary Waters Canoe Area Wilderness, yes, our beloved Boundary Waters, is being threatened by the scourge of Sulfide Mining... many around the United States put our BWCA on the same level as Yellowstone, Yosemite or the Great Smokey Mountains. If we screw this up, it will be a national disaster.	WILD02
<b>Sender Name (Submission ID)</b> ZACHARY LORTON (3225)		
625	When mining in Areas near bodies of water it is inevitable that chemicals will reach and contaminate the water.	WR195
626	When sulfuric acid leaks out from the metal mines it contaminates not only the lakes but also the groundwater.	WR195
627	If the lakes were to be poisoned by chemicals, much like many city lakes, the fish population would surely decrease.	AQ05

<b>Sender Name (Submission ID)</b>	Zachary Nelson (47577)	
7141	At 200 years of clean up...the "jobs" created would be [short] term and would put Ely in the same position as Duluth in the 80s when it was dependent on mining and almost died when the industry fell through.	SO01
<b>Sender Name (Submission ID)</b>	Zack Heuring (47400)	
10263	We cannot afford the hundreds of years of harmful effects for maybe twenty years of jobs. This is a short term fix to a long term problem on The Range and will not serve our state or economy well in the future.	SO01
<b>Sender Name (Submission ID)</b>	Zdenek Mestenhauser (21373)	
979	I attended the public comment event on Jan. 28 in St. Paul. This event was rigged with an intent to skew the outcome. It did not allow equal time for true public comment vs. industry comments. The DNR set the event up to favor industry input by allowing the unions to submit requests to speak, when there was actually no intention to speak and provide public input. (...)The public hearings have to be repeated to allow true public input in order to be valid.	NEPA11
981	Value of clean water is not calculated for the next 500 years.(...) Climate change impact was not considered in the SDEIS. This needs to be analyzed to better understand the long impact such a mining operation would have. Several scenarios need to be considered. Raising sea levels will displace population; raising temperature will make Minnesota a better place to live. More severe and extreme storms will happen in the future. Calculations for 5,000 year storms need to be considered in the study. The water treatment plants have to be able to withstand those.	WR180, WR195
983	It is virtually impossible to design a system that will last 500 years. The plan has to address this topic to a great detail in order for experts and the public to assess if the design of such a facility would be adequate. The cost of such a facility has to be estimated.	SO04
984	PolyMET has to show facts to support this claim. Research shows that there is not a single sulfide mining operation that does not pollute. There is certainly not one operating in such a water rich ecosystem.	PD26
985	The proposed mining will increase the contamination of water with heavy metals including mercury. The SDEIS does not adequately estimate the impact of mercury contamination of fish downstream and including all the great lakes.(...) A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. The SDEIS does not address in sufficient detail the amount of mercury and methylmercury released into the Embarrass River. The plan must address mercury pollution.	MERC02, MERC10, MERC11
987	There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin failure.(...) The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates in the Lake Superior watershed.	PD22
989	It is unfair to Minnesotans that this public comment period is the only chance for us to weigh in on whether the financial assurance is adequate. Given the uncertainty of the amount of anticipated and unanticipated water pollution and the required treatment period, how will Polymet and the DNR protect taxpayers centuries into the future? The financial consequences of this project will outlive everyone, every mining company, and even every governmental institution we know today. The PolyMet SDEIS gives no details of the amount and type of damage deposit adequate to cover the cost of treating water for countless generations into the future.	FIN01, FIN05, FIN10, FIN13

<b>Sender Name (Submission ID)</b>	Zdenek Mestenhauser (21373)	
14128	The USEPA gave the proposed mine its lowest ranking: Environmentally Unsatisfactory and Inadequate. Polymet's SDEIS clearly shows that after 20 years, there will be three enormous pits up to 696 feet deep full of water polluted with sulfuric acid and toxic heavy metals. Treatment at the mine site will be required for a minimum of 200 years and at the plant site for a minimum of 500 years. Mine tailings will be added to an existing tailings basin that is currently leaking polluted water	WR035, WR070, WR115
19899	Based on available information, pollution of clean water is inevitable... Financial assurances are insufficient! The cost of investigating pollution will be up to the public. It is not worth the risk. This technique has never been used successfully. Please do not gamble with our natural resources!	FIN10
