3058	Regardless of how this issue is described or strategically worded in the document, it is our understanding that the project will require long term/perpetual monitoring, maintenance, and treatment. We would argue that a timeframe of potentially hundreds of years should be considered perpetual rather than long term. This will not constitute a site that is maintenance free at closure.	PER04
3111	Under the proposed project, it appears that long term (perhaps perpetual) water treatment, site maintenance, and monitoring will be needed after closure to protect the environment and meet water quality standards. We don't believe that this meets the goal of a maintenance free closure, which is required under MN Rule 6132.3200...Regardless of how this issue is described or strategically worded in the document, it is our understanding that the project will require long term/perpetual monitoring, maintenance, and treatment. We would argue that a timeframe of potentially hundreds of years should be considered perpetual rather than long term. This will not constitute a site that is maintenance free at closure.	COOP01, PER04
3113	Effectiveness of the proposed water treatment and seep collection methods are vital to the project meeting water quality standards. Analysis and design detail are lacking in the SDEIS as a whole. More detail is needed on water treatment and seep collection, including long-term operation and maintenance, since they are essential components of the project meeting environmental standards.	COOP01, PD35, WR019, WR128, WR143, WR144, WR148
3114	The seep collection system is modeled to have a capture efficiency of 90%. Description is needed on how this efficiency rate was determined. We question if such a high capture rate can be achieved, and it would be helpful to include examples and citations of other projects operating seep collections at that efficiency rate. Further, if such capture rates are not achieved, impacts to water quality and quantity should be described in the SDEIS.	COOP01, WR018, WR020
3115	Concern also exists over the methods used to estimate Partridge River baseflow (Section 5.2.2.2.2). XP-SWMM model estimates of Partridge River baseflow presented in the SDEIS have been found to be three times lower than observed values. The XP-SWMM projections, which are based on data from 17 miles away collected from 1978 to 1987, do not align with the rating curve from recent Minnesota Department of Natural Resources (MDNR) winter monitoring data, or the results of the Great Lakes Indian Fish and Wildlife (GLIFWC) projections taken from two years of recent data from the Dunka Road gage in the XP-SWMM model.	COOP01, WR003, WR175
3116	Additional analyses should be performed and included in the SDEIS that investigate how the XP-SWMM model predictions may change with using the new baseflow measurements for the Partridge River to calibrate the model, and how that may affect the MODFLOW and GoldSIM model predictions.	COOP01, WR003, WR091, WR165
3118	It is our understanding that MODFLOW modeling does not account for any water to move east from the tailings basin. The head differential between the tailings basin and surrounding elevation may push water through the east side of the basin, potentially forming a lake. Significant uncertainties exist with groundwater flows and related contaminated water transport.	COOP01, WR093
3119	We disagree with the conclusion in the SDEIS that the PolyMet project will not have any impacts on surface or ground water hydrology in the Partridge and Embarrass Rivers (Section 5.2.2, page 5-8). Augmenting stream flow to tributaries with treated and Colby Lake water will impact surface water hydrology.	COOP01, WR107, WR183
3121	We believe that the interaction of the project's impacts with natural variability in precipitation would be more adverse than reported in the SDEIS. This is because effects of climatic variability are additive to the project-related change, which would be especially true for drier periods.	COOP01, WR077, WR180
3123	It is also noted in section 5.2.3 (Wetlands) that indirect effects on wetlands are expected due to groundwater drawdown. Groundwater drawdown will impact groundwater hydrology and it's connectivity to the surficial aquifer, which will likely impact surface water hydrology.	COOP01, WET15, WR053, WR086, WR166

<b>Sender Name (Submission ID)</b>	1854 Treaty Authority (42968)	
3124	Currently, the wild rice water quality standard is not being met in portions of the Embarrass and Partridge river systems. The SDEIS states that the wild rice sulfate standard would be met for the Embarrass River, assuming the containment and seepage collection system would capture seepage presently going to the Embarrass tributaries. However, the Partridge River will exceed the standard during low-flow conditions. We question how this will be handled in permitting.	COOP01, PER10, WR152, WR154
3125	According to SDEIS, PolyMet is seeking seasonal application [April 1 through August 31] of the standard during non-mechanical water treatment after closure. If seep collection and water treatment do not work as planned (substantial assumptions without a lot of detail), the seasonal discharge may become a larger issue. The SDEIS states that this is beyond the scope of the document, but we believe that it is relevant to the project meeting water quality standards and is an issue to be addressed.	COOP01, WR153
3126	We do not believe the proposed project will result in a decrease in mercury loading to the Embarrass and Partridge River aquatic systems (Section 5.2.2.3.4). For the Embarrass River, we do not believe that: 1) the tailings basin will function as a mercury sink; and 2) mercury methylation would decrease due to projected reductions in sulfate contributions. Regarding flows of the Partridge River, Embarrass River, or their tributaries, we disagree that the project would not significantly impact flow and water level fluctuations, thus leading to increased mercury methylation and bioaccumulation, which taken together may be sufficient to impact habitat leading to alterations of species composition, food web structure, and ultimately mercury bioaccumulation.	COOP01, MERC06, MERC20, MERC23
3128	Potential mercury contributions from peat stored at the Overburden Laydown and Storage Area have also not been addressed.	COOP01, MERC20
3134	Mercury-related concerns are present for created wetlands at the East Pit and mercury concentrations in water discharged from the West Pit.	COOP01, MERC09
3135	Air-related mercury emissions do not account for sources from energy generation or vehicle use at the site.	AIR02, COOP01
3136	For the Lake Superior watershed, any additional mercury releases to the environment are exacerbating already existing impairments including fish advisories set for recreational fishing. Increased fish mercury levels will also have direct impacts on both the cultural and recreational resources of the region.	AQ11, COOP01, MERC02
3137	Indirect impacts to wetlands from mine pit dewatering (866.9 acres with high likelihood of wetland hydrology effects (Zone 1)) may be underestimated as a result of using the analog method described in the SDEIS (Section 5.2.3.2.2). We do not feel the proposed analog method of assessing potential indirect impacts from mine site pit dewatering is adequate, and as such should not be the sole means of indirect impact assessment for the SDEIS.	COOP01, WET08
3138	We do not feel the impact zones and distances are well described, and do not agree with the automatic exclusion of ombrotrophic wetlands from potential drawdown effects. ...GLIFWC conducted an independent assessment using the same methods as the Co-lead Agencies, along with additional analog data from other mining-impacted sites. The assessment found an estimated total of 5719.75 acres of wetlands would be potentially susceptible to severe indirect impacts from mine pit drawdown (Zone 1).	COOP01, WET10
3140	We also disagree the Partridge River would act as a "natural barrier" to the cone of depression, which suggests that the riparian zone of the Partridge River will not be affected by groundwater drawdown (page 5-243). The upper Partridge River is located in Zone 2; GLIFWC's independent analysis estimated drawdowns of 3 to 5 feet under the river, which would severely reduce baseflow in the channel, indirectly impact riparian wetlands downstream, and affect other surface water features. GLIFWC's analysis should be considered in the SDEIS for estimating potential indirect effects on wetlands from mine pit dewatering. This would also have implications for the cumulative effects analysis presented in Chapter 6 (Section 6.2.3.4.4).	COOP01, WET10, WET18

<b>Sender Name (Submission ID)</b>	1854 Treaty Authority (42968)	
3141	Much of the proposed mitigation (Aitkin and Hinckley sites) for directly impacted wetlands is outside of the watershed and 1854 Ceded Territory. This is a permanent loss to these areas and should be discussed in the document. Mitigation options within the watershed and 1854 Ceded Territory should be re-visited.	COOP01, WET03
3143	Upfront mitigation for wetlands susceptible to severe indirect impacts is currently not proposed, and we believe that the USACE should require up front mitigation for all severely impacted wetlands. We also contend that additional up front mitigation should be considered for wetlands that are classified in the moderate to severe category, with robust monitoring being required for wetlands in the moderate category.	COOP01, WET01, WET02
3144	Section 5.2.9.2.2 (Wildlife) does not contain information on game species such as moose, deer, grouse, waterfowl, furbearers, etc. These species are important to the Bands for the exercise of treaty rights, and further analysis is needed.	COOP01, CR01, WI09
3145	This section also contains language about "1854 Treaty Authority-regulated species". We suggest removing or altering this language. The Fond du Lac Band also exercises treaty rights in the 1854 Ceded Territory, and has their own regulations. Further, the 1854 Treaty Authority maintains seasons and limits on some species, but these are not the only species of importance.	COOP01, EDIT01
3146	The project would result in one more piece of the 1854 Ceded Territory permanently altered and impacted. When taken in combination of all the mining operations across the Iron Range and other general development, the Ceded Territory and related exercise of treaty rights have been significantly impacted.	COOP01, CR01
3147	The SDEIS states on page 4-340 that subsistence activity (including hunting, fishing, and plant gathering) accounted for approximately one meal per week among the survey respondents... Our interpretation and analysis of the results would likely show an increased consumption rate from what is reported in the SDEIS.	COOP01, SO09
3148	The SDEIS also states that harvest for all species (including big game and trapping) have generally declined since 1994. We believe that this statement is inaccurate and also seems to minimize the importance of the exercise of treaty rights.	COOP01, SO04
3149	In addition, this section focuses only on harvest activities regulated and reported by the 1854 Treaty Authority, and does not include the exercise of treaty rights by the Fond du Lac Band.	COOP01, CR01
3150	The SDEIS essentially contains no analysis on moose. This issue has been raised by the cooperating agencies a number of times throughout the EIS development process. Given this listing [on August 19, 2013], and the cultural importance to the Bands, the SDEIS should analyze project impacts to moose and also consider it from a cumulative impacts perspective.	COOP01, WI01
3151	Stating the economic benefits of the project, while not stating economic costs to resources and related uses, does not allow for a fair comparison or overall view of the project. Environmental economic tools do exist to value resources and the services they provide, and perhaps some would be applicable and beneficial for the SDEIS.	COOP01, SO04
3152	The document states that there will be a net increase of up to 579.6 acres for the Superior National Forest. Any gains or losses in federal ownership will not be known until the values of all the proposed lands in the exchange have been determined. The proposed exchange loses one large tract of public land for several smaller tracts. The project also results in permanent impacts and changes to the resources regardless of ownership. These issues should be clearly identified in the SDEIS.	COOP01, LAN03
3153	The SDEIS also puts too much emphasis on the current lack of access to the Forest Service lands (Section 3 .1.2.1, page 5-579). This is seemingly done to minimize the impact of losing it.	COOP01, NEPA12

<b>Sender Name (Submission ID)</b>	1854 Treaty Authority (42968)	
3154	Access to the specific public waters and wild rice associated with the land exchange (Pike River, Hay Lake, Little Rice Lake) is currently available. Adjacent land ownership is not a direct impact to this access because wild rice is in public waters that are currently accessible. The SDEIS does not paint an accurate picture to say that the land exchange will result in additional wild rice beds, that there is currently no opportunity to harvest wild rice directly on the federal lands, or that the public would have better opportunities for wild rice harvesting (Section 5.3.4.2.1, page 5-609).	COOP01, VEG04, VEG08, WR155
3155	page 5-591 states that the proposed land exchange would result in a net increase of wild rice beds to the federal estate. Wild rice in these locations are found in public waters (and would not be on federal lands or under federal ownership/management) and are currently accessible through an access on the Pike River. Some resource protection advantages may exist to gaining adjacent federal ownership as it relates to land management.	COOP01, VEG08, WR155
3157	We do not agree that the project and proposed land exchange would increase habitat availability because even the with land exchange, the overall result of the project is permanent impacts, loss, and changes to the resources of n011heastern Minnesota and the 1854 Ceded Territory (Section 5.3.5, page 625).	COOP01, WI02, WI03
3158	Regarding habitat availability and impacts from the proposed land exchange, there is no mention of effects on game species such as moose, deer, grouse, waterfowl, furbearers and others in Section 5.3.5.2.5 nor in Section 6.2.3.6 from the cumulative effects analysis.	COOP01, WI10
3160	We would suggest that the proposed School Trust Lands Exchange also be a consideration. The project would entail exchange, purchase, or some combination of both for the Forest Service to acquire the school trust lands within the Boundary Waters Canoe Area Wilderness.	COOP01, CU08
3161	We believe that limiting the cumulative effects analysis area (CEAA) for water resources (Section 6.2.3.3), wetlands (Section 6.2.3.4) and aquatic species (Sections 6.2.3.7) to the Partridge and Embarrass River watersheds is too small. These CEAA's should be expanded to include the St. Louis River watershed. Impacts associated with United Taconite's proposal for 1,200 acres of wetland destruction to build a new tailings basin within the St. Louis River watershed should be considered. The PolyMet project would add to the load of pollutants in the St. Louis River and would reduce tributary flows to the river. Impacts that may occur due to the project could be underestimated (due to modeling concerns), and would not stop before reaching the St. Louis River. Further, any added impact from the project to the St. Louis River watershed would in turn impact Lake Superior. We believe that this should be the appropriate scale to analyze cumulative effects for these resources.	COOP01, CU01, WR024
3162	We disagree with the conclusion that no cumulative effects to groundwater resources are expected (Section 6.2.3.3, page 6-16)...Cumulative effects at these locations should be assessed with the proposed project along with potential groundwater pollution from the Peter Mitchell Pit, Laskin Energy, Arcelor-Mittal, United Taconite, and US Steel Minntac.	COOP01, WR024
3163	A future action that should be considered in the cumulative effects analysis is any potential future backfill of Virginia Formation waste rock forin-pit disposal at the Cliffs Peter Mitchell Pit. Potential dewatering-related interaction effects between the proposed PolyMet Project and the Peter Mitchell Pit should also be evaluated for cumulative effects.	COOP01, WR024
3164	In Section 6.2.3.4.4 (Future Wetlands and Water Resources) wetlands that would be indirectly impacted from the PolyMet project (and other projects) should be considered for inclusion in the number of wetland acres lost.	COOP01, WET18
3165	In Section 6.2.3.10.4 (page 6-95), it should be clarified that the project would result in permanent impacts, changes, and loss within the 1854 Ceded Territory... No matter how the proposed project is viewed, it would result in a permanent loss or change to treaty guaranteed resources and the exercise of treaty rights...Further consultation required by federal agencies is needed to better understand effects to cultural resources, and to properly plan for avoidance or mitigation.	COOP01, CR01

3166	it is anticipated that Minnesota Biological Survey sites of High Biodiversity Significance would be decreased by 6056.4 acres on Superior National Forest lands.	COOP01, VEG02
3167	The SDEIS states that financial assurance requirements for the project are not included in the document, but will instead be determined during the permitting phase. We are concerned about this approach given the potential for long-term/perpetual treatment, maintenance, and monitoring that may be needed from the proposed project.	COOP01, FIN12, WR037
3168	The SDEIS states that contingency mitigation will not be included initially in the financial assurance package. Financial assurance must be monitored and updated as the project proceeds to properly cover site cleanup and closure.	COOP01, FIN11
<b>Sender Name (Submission ID)</b> 4095481751@vzwpix.com (4305)		
1800	America and the world will need these metals soon.	NEPA05
<b>Sender Name (Submission ID)</b> a s dorman (49088)		
16967	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17
16969	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189, WR202
<b>Sender Name (Submission ID)</b> Aaron Brasket (16895)		
14451	This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin.	WR035, WR111
14457	If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness.	CU04
<b>Sender Name (Submission ID)</b> Aaron Camacho (28831)		
13876	Being that I live just off the Mississippi River and down stream from this potential mine is disturbing knowledge. Any water affected by this mine will eventually make its way down stream to this area where I live.	WR111
13877	I am a concerned citizen of Wisconsin and Native American who feels this continual TAKING from the land for financial gain, will be our undoing.	SO02
<b>Sender Name (Submission ID)</b> Aaron L. Wittnebel (47268)		
9260	Instability of the industry; if the business collapses or goes bankrupt, won't it be the taxpayers left covering the costs of cleanup, unemployment, and reemployment?	FIN01

9264 No health impact study has been conducted, and this industry has a propensity to be very dangerous to not just the health of employees, but to the general public in the surrounding area. If people become ill...the state as a whole will be left to care for those that become ill. HU01

9267 The proximity of the mining operations are very close to pristine and natural lands, that our state pride's itself on. They are natural wonders that draw people to come to Minnesota for our great tourism industry. What will happen to our state's branding, once mining is expanded and we destroy these attractions? LU06

**Sender Name (Submission ID)**    Aaron Poznanovic (54686)

17857 the proposed sulfide mine has grave forecasts...The largest wetland loss ever proposed by Minnesota by directly destroying 913 acres anddegrading 7351 acres through water and air deposition pollution, mine dewatering, and wetland water diversion. WET23

17858 the proposed sulfide mine has grave forecasts...Permanently degrading the pristine "1 00 Mile Swamp" and Partridge River Headwaters by altering the basic geochemistry of the system- ultimately increasing toxic heavy metal pollutants such as methyl mercury and reducing biological diversity. WR111, WR115

17860 the proposed sulfide mine has grave forecasts...Eliminating or degrading prime moose habitat. This is particularly concerning seeing that our state moose population has plummeted over the last decade. WI02

17861 The proposal will not meet the new sulfide standards specified by the Minnesota Pollution Control Agency (MPCA). PER10

17862 The proposal has no alternative that could reduce water pollution and wetland destruction. ALT06, ALT13

17863 [The Project poses] Unacceptable impacts on water resources and wetlands of both national and international importance. WET19

17864 As a resident of Grand Marais, MN, this proposal will directly impact my health and well-being as well as the ecological health of one of the most pristine environments in the country. HU01

**Sender Name (Submission ID)**    Aaron Vail (3039)

614 [The NorthMet Project is]... creating hundreds of jobs in a downtrodden and economically suffocated area of our great state... SO10

**Sender Name (Submission ID)**    Abbi Evans (54337)

17564 The water could be contaminated with sulphate, metals, and mercury. It can affect the following around it: bodies of water, wetlands, vegetation, wildlife, and many other environmental features. WR107, WR108

17565 It will be moving the earth, and will have visual obstructions, noise, and dust. N01

17566 If there are buildings on the land would either result in closure and/or demolition. This would result in people losing their jobs/businesses. SO02

17568 There can be some positive effects though too.1. To make everything run smoothly they will need to hire people, so then there will be jobs forpeople.2. The new resources: iron, copper and nickel.3. It will boost the economy. SO10

17569 Wildlife can be harmed, that includes animals on the threatened andendangered species list. WI01

<b>Sender Name (Submission ID)</b> Abby Huset (54340)		
17444	Some cultural resources could be affected during construction and operations. The things that this could affect are, the sugarbush, a piece of sacred land of the Mesa be Widjiu, part of beaver bay, and a couple other things.	CR05
17445	I think that Minnesota can benefit from this mining process because of all the jobs it will provide and all of the money that it will bring in. Some advantages to this [PolyMet mine] process are ...1. make a lot of new jobs2. once we get the minerals then we can make more electronics and stuff we use in our everyday life3. it will make a lot of money4. they will grow the vegetation backSome disadvantages of this process are ...1. cut down forest area2. it may pollute the water3. it might affect some different cultural resources	SO10
17580	I do agree with the Land Exchange offers because if they don ' t do it here where will they do it. They have to do it somewhere why not here where we know how to make it safer and not pollute as much.	LAN11
17581	All these products (copper, nickel, platinum) are used in our everyday lives. A way this could affect us is if you don't mine we might start running low in those few minerals and they won't be able to make all of those things that we use everyday such as: electronics, batteries watch bands etc.	NEPA05
17582	Another thing is that even though they are going to cut down all this forest and vegetation, as soon as they are done mining they have to try and put it back so it is almost like what it was before.	VEG05
17583	A reason why a lot of people say that it would be a bad idea to mine is because they think it is going to pollute the surface water. What they might not know is that you guys do so much to make sure that it doesn't not, and if it does some how then you guys have an emergency backup to either stop it or make sure the pollution isn' t more than just a little.	WR190
<b>Sender Name (Submission ID)</b> Abdullah Ali (54169)		
16376	I don't like the idea of drilling to happen. Because after the mine is over the environment will be affected for a long time.	WR195
16377	These so much copper you can drill from other locations.	ALT09, ALT16
16379	It can also effect the animals who live near the area.	WI13
<b>Sender Name (Submission ID)</b> aboges1@gmail.com (44547)		
11767	Acres upon acres of our land and gallons upon gallons of our water all over this country are polluted ...the Boundary Waters Area WILL have negative effects on our environment, and it is not worth it for a little extra money and a handful of jobs.	SO01
<b>Sender Name (Submission ID)</b> Aby Wolf (38776)		
4874	Waste rock would leak and seep into the ground regardless of their "99% clean" promises, and it seems very shortsighted to believe that covering huge piles of waste rock with bio-tarp sounds to me like a very dangerous "sweep it under the rug" approach to clean-up.	PD03
4875	Contingency plans for accidents and mishaps are not adequately addressed in the SDEIS, nor is it clear who would be financially accountable for clean up years after PolyMet's business in the region ends.	FIN01, FIN05
4876	The land exchange proposed by PolyMet is not a fair deal-- Superior National Forest needs to keep that valuable land protected for generations to come.	LAN01

16787	The economic boost to miners and small towns in northern Minnesota would be short-lived, unlike the inevitable pollution and contamination to the water and land of Hoyt Lakes and surrounding watershed.	SO01
<b>Sender Name (Submission ID)</b>	Adam (42981)	
8779	How does the land exchange assist the environmental sustainability of the mine?	LAN01
15186	Glencore Xstrata has a terrible reputation globally for avoiding taxes by producing “shell” corporations which they contact for purchase of materials....Why does the SDEIS not include reference to Glencore Xstrata? Why does the SDEIS not include Glencore Xstrata as a strategic partner?	FIN02
15187	As of Thursday, February 27, 2014, the [Minnesota Pollution Control Agency] has decided they will delay the release of their findings [from a 3-year study to determine if the established sulfate standard of 10 ppm should be adjusted]. The MN DNR also decided the same day that they would not review legal request to extend the SDEIS public comments period beyond March 13, 2014. What are the implications for adjusting the sulfate concentration standards on the decision to permit the copper-nickel mine? Why was the SDEIS public comment period not extended to allow incorporation of theMCPA findings?	NEPA07, WR152
15188	The mine site sites uphill and to the south of One Hundred Mile Swamp, which drains to Langley Creek, into the Dunka River, and ultimately to the BWCAW. There is a statement in Section 4.3.3 of the SDEIS that “no delineated boundary exists for the One Hundred Mile Swamp.” However, the US Government National Atlas shows that the One Hundred Mile Swamp drains by Langley Creek. At some point, all water is groundwater. What are the implications for stating that One Hundred Mile Swamp has “no delineatedboundary”? Will the next draft EIS include federal assessments?	WET19, WR024, WR080, WR081, WR111, WR175
15189	Minnesota DNR hydrologists Mike Liljegren correctly informs citizens that “the base flow is really the catalyst for everything.” It is the assumption of base flow that underlies the hundreds of complex computer models determining the estimates of, for example, 500 years required water treatment and 90% groundwater containment...The tribal community has contested in courts since 2008 that the PolyMet base water estimate is at least five times below the actual base flow. What are the implications for utilizing potentially flawed base water flow estimates established 10 years ago?	WR003
15190	What are the preparations for ensuring water models comply with the projections for increased precipitation in the area? What precautions are in the place in the event of a large precipitation event?	WR189
15191	Polymet asserts that contaminated seepage is no more than a “garden hose.”Without the MPCA sulfate standards decision, how can we know that this will not surpass acceptable levels?	WR163, WR164
15192	If the water is going to be contaminated enough that it needs treatment, and the basins are unlined, where is the information about how the ground will filter and clean this water before it enters surface water downstream?	WR070
15193	how much money PolyMet will have to set aside to reclaim the mine, treat polluted runoff and fix any major problems that develop even long after themine shuts down.	FIN05
15194	As far as I understand, the project is still in the public comment period. Why has the DNR “already started the process of getting ready for the permit applications”?	PER38

<b>Sender Name (Submission ID)</b> Adam (42981)		
15195	a few dozen people could make millions of dollars (Glencore shareholders). A few hundred people could make thousands of dollars (~360 jobs). The rest of us (Minnesotans; water-drinkers; children; humans) would have to deal with sulfuric acid contamination in the most freshwater rich environment in the whole world.	WR115
<b>Sender Name (Submission ID)</b> Adam Benson (39720)		
6951	I sincerely hope that your agency thinks long and hard about the tradeoff between 20 years of mining jobs versus up to 500 years of needed pollution control. Not to mention it now appears only half the jobs will go to locals and this project could get canceled as soon as copper prices fall below the needed threshold to make it economic.	SO01
6958	Polymet has a “plan” but no proof they can do this without polluting the regions’ watersheds. I see they claim they will treat the tailings to take out the sulfuric acid content and use reverse osmosis water treatment. Yet it’s clear this has never been proven on an industrial scale. This is especially concerning when one considers the fact that this is a low grade deposit that will produce 99% waste rock.	PD03, WR128, WR143
6987	It appears there is no proposed trial run on a smaller scale for Polymet to prove this can work in a variety of conditions .... In the next 200 to 500 years we can be assured of some extreme weather including periods of flooding. How will their reverse osmosis treatment handle this?	PD03
6991	Are any alternate plans being considered that would utilize an underground mine where the tailings are kept well below the water tables?	ALT06
6997	It is my understanding that determining the financial assurance needed is not part of this initial EIS and comment period. ... Polymet says the ongoing treatment could cost \$3.5 to \$6 million per year and last 500 years. Using the midpoint of these estimates produces a liability of over \$2 billion not even accounting for inflation....there is no way your organization can claim to know what the assurance should be.	FIN05
7003	Since it’s clear this project will result in decades of pollution risk versus a 20 year limited benefit I propose not doing it at all.	SO01
<b>Sender Name (Submission ID)</b> Adam Ferris (7180)		
533	allowing this mine to proceed will only benefit all parties involved.	SO10
<b>Sender Name (Submission ID)</b> Adam Flett (19928)		
13947	I understand the DNR has conflicting motives, both set to make a profit and protect the environment, though I think the presumption that the PolyMet project, or any sulfide mining project can be done without public health issues is a dangerous one, and one that surely has a greater cost than what will come out in profits and tax revenue for the State of Minnesota.	HU03
<b>Sender Name (Submission ID)</b> Adam Sippola (57350)		
18370	The potential for acid mined drainage alone is reason enough to say no to this proposal. If not, we risk long-term pollution of the surrounding wetlands, lakes and rivers, including the St. Louis River that flows into Lake Superior.	WR107, WR108, WR111
18372	water cleanup following the mine's closure is estimated to last up to or beyond 500 years. It is hard to imagine PolyMet still existing by then, paying for continued cleanup of the water that will be polluted and poisoned if this mining project is approved. No. Instead, that responsibility will fall to the citizens.	FIN01, FIN10

18375	20 years of jobs, only 25 percent of which are estimated by PolyMet to be local jobs, cannot justify centuries of cleanup and billions of dollars in cleanup costs.	SO01
18376	As it is, Minnesota law calls for mines to be maintenance free after closure. And this proposed mine site is located in the Superior National Forest, where open pit mines aren't allowed anyway. We cannot begin making these kinds of exceptions for corporations at the expense of our natural environment and at the expense of pure, fresh water for generations to come. We must employ a longer view.	PER04
18377	The destruction of more than a thousand acres of wetlands at the PolyMet mine site would be the single largest loss of wetlands ever permitted in Minnesota.	WET23
18381	it is our responsibility as human beings to begin a trend away from catering to corporations and toward catering to our environment, including the wildlife, plants, land, water and human beings that are a part of it.	GEN03
<b>Sender Name (Submission ID)</b> Adam Swansom (7721)		
908	We loan PolyMet our land for 20 years, less than one generation's time, and they will leave it polluted for 500 years?	PD01
909	Experts who have studied other mining projects across the country said even those that start with financial safeguards can end up costing taxpayers millions of dollars. In Montana, they underestimated the volume of water needing treatment after a gold mine had closed, and state taxpayers had to create a \$34 million trust fund to pay for it. Northern Minnesota cannot afford a miscalculation of that magnitude.	FIN01, FIN05, FIN10
910	acid mine drainage kills fish, wildlife and plants, leaving contaminated waterways devoid of most living creatures. Mining by-products such as arsenic, manganese and thallium, have been shown to increase the risk of cancer and other illnesses in humans.	HU03, WR113
<b>Sender Name (Submission ID)</b> Adam Theis (45635)		
12844	Reject the Polymet mine. These mines that are only miles away, are in complete opposition to the ideals that make the BWCA what it is. These mines threaten the purity and integrity of the BWCA [ and incompatible with wilderness special area]	WILD02
12845	Unacceptable environmental risk. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin.	WR111
<b>Sender Name (Submission ID)</b> adam wright (38312)		
13670	After reviewing the SDEIS and hearing experts on the topic, it is very clear that this company will be responsible not just in the present, but in the future. There is a way to mine these materials safely and Polymet has show that they can do it.	PD28
<b>Sender Name (Submission ID)</b> Addie Welch (57181)		
18661	Combined with other factors environmentally, economically, and socially, Polymet Mining is a dangerous idea that should not be executed in Minnesota.	SO02

10680	I have concerns about your track record in maintaining ecological standards	PD23
10682	I appreciate your commitment to a five hundred year clean up plan, yet I have no assurance your company will even be around for that long	FIN01
10686	I get that there could potentially be some reforestation attempts assuming you hold yourselves to your proposed plan. What do you plan to do about the displacement of native species?	VEG05
10690	I believe it is the DNR's obligation to prevent companies such as this from destroying our nations largest investment.	PER35
<b>Sender Name (Submission ID)</b> Aitkin County, MN (21209)		
16718	There are no actions eligible for crediting identified. If the landowners are claiming partial drainage or farmed wetlands, they must provide the actual Farm Security Agency documents, plus a summation of the information, showing that they meet cropping history. The summary must include field-by-field information. There are conflicting statements in Section 15.2.3 and Attachment C. Section 15.2.3 states that the fields have been used for more row crops than Attachment C claims. Fields are referred to occasionally in the report, but no field map was provided. In addition, sod does not qualify under cropping history. This property is continually referred to as a sod farm or sod fields. Page 30 of the report states that the conversion to a sod farm was in 1998. At that point, most of the dikes from the former rice paddies were pushed into the ditch area. A copy of the Corps permit that details what work was allowed for their impacts to the ditches might provide additional information.	COE08
16721	There are a number of major issues regarding the drainage. Section 15.2.3 states that the fields have subsurface tile drainage. There is no map or drawing provided showing the tile layout. In addition, subsurface tile is not mentioned in Attachment C. In January, 2006, a Conditional Use Permit (CUP) was applied for to conduct peat mining on 40 acres of this property. At that time, the CUP applicant/representative stated that there were no tile lines in either site proposed for peat mining. The areas requested for peat mining were on the east and west sides of County Road 1. Also, because they have been significantly damaged, those areas should not be included in restoration unless the peat is returned to the site. The drainage on this site is listed as ditches spaced 700 feet apart. Figure 9 shows the ditches to be intermittent at best, and generally 1-2 feet deep. The potential restoration proposed at Zim has scope and effect calculations, but there are none for the Aitkin site. For example, at Zim, there is a 2.5 foot deep ditch that has a scope and effect of 60 feet and a 3' deep ditch that has a 65' scope and effect. The ditches at the Aitkin site are 700 feet apart and are shallower than the Zim site. How is this site drained? The scope and effect of a 2-foot deep ditch is not 350 feet. We understand that different soil types affect drainage, however, never to that extent. The applicant must provide adequatedocumentation of drainage. If there are tile lines that are being used, they must be shown to be working effectively. A detailed ditch and tile map and scope and effect calculations must be provided.	COE08

<b>Sender Name (Submission ID)</b>	Aitkin County, MN (21209)	
16722	There is no wetland delineation for this project. A pre-restoration delineation is required. A copy of the delineation shall be provided to the Aitkin County TEP/LGU for approval. It will be ground-truthed in the spring. There was evidently water table information collected on June 5-6, 2007 (page 26). This is one snapshot in time; two days worth of information does not adequately represent a 933-acre site and may not reflect long-term conditions of the site. Also, on page 26, the report states "The water table appears to be near the surface throughout much of the general area, as indicated by the large wetland complexes underlain by muck and peat soils." This paragraph begins with a reference to the wetland restoration site being composed entirely of hydric soils. The information is very conflicting. The timing of the monitoring is not addressing the potential for having wetland hydrology near the surface during the wettest time of the year. We need copies of the monitoring that was done. Mapping conventions can be used to provide wetland delineation information. If the report is claiming that the hydrology is wetland, then, again, we need the cropping history to allow for any crediting under WCA. Also, the 1' contour should be provided in better detail than is shown on Figure 9. There are additional questions on the hydrologic monitoring. How were the monitoring wells installed? Are they meeting Corps standards? How were the wells distributed throughout the site? If a wetland delineation is not provided to the TEP/LGU for approval, the applicant must perform hydrologic monitoring for a minimum of 2 years before any potential crediting is discussed and before any alteration of the site is done.	COE10
16723	An unrealistic and unsustainable number of wetland types are proposed on one 933-acre site. There are ten types, plus upland buffer. These do not represent the original vegetation and it is unlikely that this number of wetland types is found on any other large wetland site in Aitkin County. Regardless of what is being impacted, the wetland types for this potential restoration must be altered to reflect neighboring reference wetlands and the number of wetland types proposed drastically reduced. What is the source for the seeding recommendations? What local reference wetlands were used for these seeding plans? Seeding recommendations prescribed by the Board of Water and Soil Resources (BWSR) should be used. Seed mix #2 should be used on the berm. The monitoring period of 5 years for the tree plantings is not adequate. The performance standards may be unrealistic. Only allowing 5% non-native invasive vegetation seems low. Is it realistic, or should it be somewhat higher (10%)?	COE08
16724	The plans to breach the diversion channel dike must get approval from the ditch authority. The information we have indicates that the diversion channel dike is specifically engineered to direct flow into the channel and not into the surrounding lands. The applicants are proposing a major change to how the City of Aitkin has benefitted from the diversion channel. Eventually a land alteration permit and probably Conditional Use Permit will be required in order to construct the berm around the homesteaded property and to complete all other earth moving activities. Are there any archeological concerns in the project area? There is no information discussing this issue. Is this project specific or banking? 300 acres are left over. The applicants must be made aware that they are restoring more than they can use and that it can't be used for impacts on other projects or phases.	COE08

17832	I would like to see a very strict oversight on the water issues and assurances that there will be adequate funds to clean up the mess that is going to accompany any mining project.	FIN01
17833	My other issue is I think surface property owners should be notified when their property is put on the auction block for mining companies to bid on. Why should I have to hear about this from a neighbor who reads the auction sheets hidden in the journals of the DNR website? Mining companies seem to have all the power, and surface property owners, none.	LAN06
<b>Sender Name (Submission ID)</b> Al Rudeck (18079)		
3193	[The SDEIS]'s sophisticated modeling and engineered solutions proposed by the agencies and the company, in my professional judgment, will be enable PolyMet to perform at or beyond the stringent state and federal requirements to protect water quality on all fronts. In fact, the overall project will reduce background concentrations in sulfates and not increase them, as well as reducing mercury, and not increase them.	PD28
3194	[Mining jobs] provide basic living essentials for hundreds of families and I look forward to the prospect of job creation the PolyMet Project brings...	SO10
3195	They [jobs] provide basic living essentials for hundreds of families and I look forward to the prospect of job creation the PolyMet Project brings, and moreover, the high-quality metals to be produced representing important new and domestic sources of essential clean copper-nickel and other precious metals that fuel modern life, including wind turbines, hybrid vehicles and other modern necessities.	SO10
<b>Sender Name (Submission ID)</b> Alaina Kelley (58116)		
19929	I request that the SDEIS be rejected because it lacks accurate estimates of the economic costs of the proposed NorthMet sulfide mine. I see three potentially expensive side effects of the proposed NorthMet sulfide mine: 1. Active treatment of polluted water and other annual maintenance of the mine site and waste site for at least 500 years. 2. Known pollution resulting from untreated water that will be costly to Minnesota to clean up, or costly to leave polluted (loss of natural capital and health costs). 3. Expected pollution from the accidents that are most likely to occur in and around sulfide mines. SDEIS does not give a comprehensive estimate of how much these three side effects of the proposed NorthMet sulfide mine would cost. As a Minnesota taxpayer, I want to know if the potential benefits of the proposed NorthMet sulfide mine outweigh the potential costs.	FIN10

17038	the broader impact on tribal resources...point to profound repercussions on the future ability of the [Bands] to use, enjoy, and thrive within the boundaries of the...Ceded Territory.	CR01
<b>Sender Name (Submission ID)</b> Alex Christensen (41568)		
6364	The proposed project poses significant, unpredictable, and functionally indefinite environmental health risks to both the humans and other biota of the area.	HU03, WI04
6367	I understand that proponents of the mine routinely cite the influx of jobs and taxable income that would boost the area's economy. I think that is a naive assessment of what this mine would accomplish over time. For starters, the mine, if all goes exactly to plan, will not be around forever. What happens when it must close? Additionally, I have not heard a satisfactory explanation of how polluted water, earth, and air might be treated in a fiscally responsible and ethical [manner].	FIN10
<b>Sender Name (Submission ID)</b> Alex Comb (6445)		
1077	From what I have gathered the proposal is offering what may become 20 years of employment and profit from this mining venture while it is suggested monitoring of the mining may be necessary for up to 500 years. This alone does not suggest a favorable balance.	SO01
1078	Should sulfur pollution occur it could greatly impact this economy as well as possibly impacting the forest products economy of the area.	SO02
1142	I think it would be great to see the LTV site back in operation and a boon to the economy that the construction and operation of the proposed NorthMet mining operation would bring.	SO10
1143	I fail to see how during the mining process these aquifers are protected from contamination of the sulfides exposed in the mining process. The rock is obviously exposed to the air, which makes it reactive and the addition of water when it rains makes it seem likely to lead to contamination of the aquifer.	WR001, WR090
1144	The proposal of returning the waste rock, which is still reactive, to the pit also seems poorly determined. This would seem to be putting highly acidic water into the unlined pit, allowing for an even greater chance of contaminating the water table.	WR001
1145	The plan seems to rely also on using reverse osmosis to treat the effluent. There is a good track record with some of these treatments, though mechanical difficulties can obviously lead to over-flows that would need to be addressed.	PD03, PD22, WR143
1146	What is most troubling is that there is an implied admittance that sulfides are a long-term contaminate. I see nowhere it is suggested that the wastes are ever to be rendered neutralized.	PD05, WR060
1147	It is very difficult indeed, to look down the road 200 to 500 years. .... To think that this mine could be effectively monitored for that time period seems ludicrous at best. And what would the land use in this area be within that time period?	PD05
1148	And what would the land use in this area be within that time period? I don't think we can effectively imagine that, though given what looks like long-term global warming and obvious population growth it would seem this land would be valuable for human development.	LU02
<b>Sender Name (Submission ID)</b> Alex Heegaard-LeGros (47036)

14630	PolyMet project is a great asset to our community. Their safe technologies and their (inaudible) processes, they will be providing (inaudible) services, as well as, even more importantly, jobs for our state.	SO10
14632	We need these resources, and the more we can get responsible operators, the better off we can be.	NEPA05
<b>Sender Name (Submission ID)</b> Alicia Newell (40703)		
14191	I understand that this is a tough issue but we are at a major crossroads. We have to make a major shift and stop this path of destruction.	PER35
<b>Sender Name (Submission ID)</b> Alison Aune (44879)		
17382	[The project] would destroy 1,450 acres of designated critical habitat for the Canada Lynx, habitat essential to the conservation of a threatened species. We must not allow the fragmentation and loss of habitat for moose, Canadian Lynx, and other wildlife.	WI02
17384	Wild rice is sacred to the Ojibwe people, and is a symbol of our state.	CR01
17385	Wild rice beds downstream of PolyMet would become polluted with toxic sulfates. Millions of gallons of untreated polluted water will escape every year, and the mine plan predicts an increased chance that water exceeding the sulfate standard will be released at times, years after closure.	WR149, WR156, WR162
17387	How can we risk the need for extensive water treatment of our waterways for hundreds of years? Who would pay for the cleanup? Taxpayers would have to pay for this and I do not support the huge cleanup bills when sulfide mining companies have declared bankruptcy or walked away from closed.	FIN01
17390	Exposure to air and water pollutants like mercury, asbestos-like fibers, and arsenic would have a significant impact on local communities. I have listened to the physicians who have spoken out against this mine to the very real health dangers it poses.	HU03
17391	PolyMet would be a huge consumer of electricity, using some of the dirtiest coal power plants in Minnesota. PolyMet would emit 707,342 metric tons of carbon dioxide into the atmosphere every year.	AIR02
<b>Sender Name (Submission ID)</b> Allan Blais (54161)		
16054	Who will pay for the hundred year cleanup after this company is long gone?	FIN01
<b>Sender Name (Submission ID)</b> Allan Frink (18303)		
4159	[PolyMet] wanted to put the rock in there and cover it with water, so it doesn't have oxygen, but there is oxygen in the water. The water fluctuates through the ground, depending on how the aquifer moves. Stuff is going to go into the aquifer. They're not even looking at that. They're saying the water can't do that. If water can flow one direction, it can flow the other way.	WR010, WR029
4160	I haven't seen anybody talking about how they are going to have the mercury that is in that rock and all of the other stuff, because there is all of the hard metals in it, too. That's why there is gold and the platinum, because there is lots of them. The problem is because it is low volume. But when you start crushing it all up, to powder like for makeup, which is what they crush that at, that's what they did for the taconite, too, all of that stuff is released.	MERC20

<b>Sender Name (Submission ID)</b>	Alliance for the Great Lakes (22327)	
3376	The negative impacts the project will have on individual downstream lakes and tributaries to the St. Louis River and Lake Superior and the potential to impact the St. Louis remedial action plan support the need to expand the CEAA for water resources.	WR111
3382	The SDEIS does not include adequate consideration of how climate change may affect the cumulative impacts of the NorthMet project on water resources consistent with Council on Environmental Quality (CEQ) draft guidelines. ... The CEQ guidance clearly states that an environmental impact statement should consider climate change in a variety of contexts, not just in terms of greenhouse gas emissions.	WR180
3389	Section 6.2.3.8.10 describes the project’s cumulative impacts on climate change, but only in relation to greenhouse gas emissions. A more in depth discussion of these “predicted increases” [(SDEIS at 5-221)] to temperature and precipitation and how they may impact the NorthMet project would help the co-lead agencies and the affected community better understand the project’s long-term implications and would better conform to the CEQ draft guidelines.	AIR01
3391	The SDEIS should consider additional alternatives for the category one waste rock pile and the emergency overflow channel to reduce harmful runoff and dust emissions.	ALT11
3402	we are concerned with the proposed decision to leave the category one pile uncovered for 13 years, as currently proposed. ... [the project planners] should consider an alternative that would cover the category one pile on an ongoing basis, or build multiple category one piles that can be covered incrementally over the first 13 years. Such an alternative is also consistent with Minnesota Rules, part 6132.2400	ALT13
3410	We are concerned by the lack of detail describing how the agencies determined that discharges from the emergency overflow channel are “not expected.” When one considers that some level of postclosure water quality monitoring and treatment will be required at the plant site for approximately 500 years and the extent of harmful substances in the tailings basin, the environmental review should provide a more detailed analysis to ensure that harmful overflows from the tailings basin will not occur. The lack of discussion about climate change impacts on water resources... raises further concerns about how this determination was made.	WR057, WR070, WR128, WR180
3419	Article 6 of the Great Lakes Water Quality Agreement of 2012 contains a notification provision ... [and] specifically lists “mining and mining related activities” as an example of activities that could have a significant cumulative impact. Providing such notification will ensure that the government of Canada, as well as representatives from Federal Governments, State and Provincial Governments, Tribal Governments, First Nations, Métis, Municipal Governments, watershed management agencies, emergency response authorities, and other local public agencies all receive proper notification of this proposal. We further recommend that ample time for responsive comment be provided following such notification.	HU03
3542	In light of these well documented and accepted impacts [including decreased water flows in tributary streams and wetlands, mercury increases in the Embarrass River and downstream lakes, and increased sulfate levels in the Partridge River], it seems inconsistent to categorically classify the impacts to the St. Louis River and Lake Superior as “only minor” without conducting a proper cumulative impacts analysis.	WR024, WR042, WR081, WR111, WR159
3558	Mud Lake Creek has a current mercury concentration of 3.5 ng/L. The redirection of more runoff to Mud Lake Creek would increase mercury loadings to this water body, which is part of the Embarrass River watershed.	MERC23
3562	the Tailings Basin containment system would collect seepage from the Tailings Basin, which has a current estimated mercury concentration of 1.1 ng/L. The project would be designed to route the seepage to the WWTP, which would be constructed at the mine site. The discharge from the WWTP is expected to be 1.3 ng/L (consistent with the Great Lakes Initiative Standard). The result is a net increase of 0.2 ng/L of mercury as a result of the wastewater treatment.	MERC20

SO10
<b>Sender Name (Submission ID)</b> Allison Herreid (42986)		
8816	The SDEIS acknowledges the destruction of habitat of some of Minnesota's threatened and endangered species, but does not propose a viable solution. In addition to this, resources for such animals, including moose - which though not endangered are in rapid decline in our state, may alter in quality (such as water) that may also affect the health of the animals.	WI01, WI02
15177	The process of restoring "certain disturbed lands" to "potentially create new habitat" will take decades. What about now? We will allow the current habitats to be destroyed, along with crucial resources, leaving these already endangered animals with less...The impact to the habitats and resources of our endangered and threatened species should be more carefully analyzed in order to determine the effects on currently declining populations.	WI01, WI02
15178	Another very important issue that needs more attention is that of water quality and the effect of sulfate on quality and nutrient cycling for wild rice. With the increase of sulfate, nitrogen becomes less available to plants and animals. This means that with the increasing sulfate levels, it will be harder for wild rice to grow due to the lack of nitrogen.	VEG04, WR156, WR157
15179	[sulfate and sulfuric acid] will damage water quality no matter how much gets in, and because most of our water sources are connected, it will be hard to keep these elements from spreading from wetlands, to rivers, and to lakes.	WR111
15180	it is important to add a study of the health impact of this mine.	HU01
15181	Another major flaw I see with this SDEIS is that it doesn't account for uncertainties or accidents. What happens if the wastewater leaks from its container? What if something breaks, allowing for waters to be polluted? How can this science behind this project be so accurate if it has not been performed? It is important that we know exactly what could go wrong and what the mine plans to do when something does go wrong.	MERC20
15182	We will only get 20 years out of this mine, and hundreds will be spent cleaning up after it, which will have substantial costs. It is unreasonable to think that this company will be around to ensure the clean-up is paid for. This will be left for future generations to deal with.	FIN01

<b>Sender Name (Submission ID)</b>	Amber Garlan (3002)	
12334	PolyMet's own study says that the wter from the mine side would need at least 500 years to treatment. 500 years of cleaning up toxic, hazardous waste is not in the public interest.	PD01
14649	The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated.	WR010, WR070, WR108, WR128
14654	PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean[;]... does not put safeguards in place for when things go wrong[;]... does not leave the site clean and maintenance free[; and]... does not protect Minnesota taxpayers	WR037, WR130
14657	the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions.	WR049, WR189
14658	There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis.	PD22
14659	The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment?	WR129, WR144
14660	The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates.	PD22
14663	The plan for at least 500 years of active water treatment violates Minnesota Rules (6132.3200) that call for the mine to be left maintenance free at closure... A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years.	PER04, WR037, WR131
14670	The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability.	FIN01, FIN05
15632	Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854. Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard... Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test	WR162, WR163
15633	PolyMet claims they will meet this [sulfate] standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5.2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby.	WR070

<b>Sender Name (Submission ID)</b> Amber Garlan (3002)		
15634	The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142).	WR156
15635	The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction.	WR137, WR153
15636	the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters.	WR154
17010	500 years of cleaning up toxic, hazardous waste is not in the public interest.	SO01
<b>Sender Name (Submission ID)</b> Amber Waller (54357)		
18205	I think that PolyMet Mining has a very good plan in place. ... I feel PolyMet will take the proper precautions and will deal with any spills or leaks. They have assurance that all water will be treated and plant life restored. They also will keep track of affects to cultural resources. So, I must say that I agree with their plan to build the mine.	PD28
18206	It's a good idea to have insurance if the mine suddenly closes.	FIN01, FIN08
18207	The mine will definitely provide more jobs. It will also boost our economy.	SO10
18208	If the water isn't treated properly, it could cause a lot of contamination problems. Mercury contamination would not be good.	WR128
18209	mining noise could seriously affect the First Peoples hunting. If contaminants leaked, it could kill a lot of gathering plants.	CU11

PD24
<b>Sender Name (Submission ID)</b> Amy Farland (39906)		
6919	The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site..." Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure.	WR035, WR038
6925	Minnesota Rules 6132.3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule.	PER04
<b>Sender Name (Submission ID)</b> Amy Freeman (43088)		
10059	The idea that the site would reach a self-sustaining stable condition by around year 40 doesn't pass the sniff test. They are writing this as if somehow the WWTF that they present as being necessary to prevent long-term discharge of contaminants from the west pit could sustain itself a few decades out. How could this be possible?	PD03
14993	The real issue in terms of long term environmental detriment is this (from page 988 of the SDEIS):...When the West Pit water level rises above the top of bedrock, there would be a release of pit lake water into the West Pit Surficial Flowpath. The affected groundwater in this flowpath would migrate slowly towards the Partridge River.	WR130

14994	the document says that the WWTP (wastewater treatment plant at the plant) and WWTF (water water treatment facility at the mine site) will remain active for long-term needs, but it is very vaguely stated. The reality is that there would be water that is significantly affected by sulfides and metal leachates associated with the exposed rock in the pit and the waste rock in the "stockpile" for a very long time.	WR035, WR037, WR173
14995	It is also hard to envision that the hydarluc barrier could really be that effective as is illustrated. Lots of things happen in soils---animal burrowing, roots that would make it very hard to maintain an impermeable hydraulic barrier.	PD07, PD15, WR019
14996	The WWTF would remain operational until water quality monitoring results demonstrate that a non-mechanical system could produce an effluent water quality, which is shown by pilot-testing and modeling, to achieve future water quality criteria at evaluation locations without the need for mechanical treatment. ...I read this to mean that Polymet really doesn't know how they can come up with a water treatment strategy that is sustainable for the long term.	WR035, WR137
14997	Who then is operating the WWTF on the long-term? The models themselves are based on the notion that high chemical loading will continue for at least 200 years.	WR035
<b>Sender Name (Submission ID)</b> Amy Gardner (44524)		
10668	Trading two decades of benefits for polluting this water rich environment with potential contaminants like arsenic, sulfate, manganese and heavy metals for at least 500 years just doesn't make sense.	SO02
10669	I ask that a better job be done in studying the impact of mercury contamination of fish and the impact of untreated pit releases to surface groundwater on wild rice before the EIS is finalized.	MERC02, WR156
10670	The SDEIS does not address who will perform the indefinite monitoring of the on-site constructed wetlands.	WET22
10672	The SDEIS must reveal wastewater volumes, pollutant levels and it must explore options if something goes wrong(fails) during long term water treatment	WR130, WR181, WR182
10674	I feel that the SDEIS is flawed because the models for the amount of pollutants to be released are based on data from other sites and not on the current water data from the project site or it's surrounding area	WR023, WR071
10675	The company did not study the type of rock or the structure beneath the wetlands.	WR120
<b>Sender Name (Submission ID)</b> Amy Goetzman (44457)		
10963	In order to let an outside corporation access one resource, copper, for 20 years, the DNR appears ready to throw away a much more important resource, water, for a much longer period of time. How is it possible that we are even talking about poisoning our water for 500 years, in two of the state's most environmentally sensitive and important areas?	WR115
10964	Why are they [polymet] being allowed to come in and destroy our natural areas, contaminate our water supply, and ultimately leave the taxpayers with a mess that will never truly be cleaned up?	FIN10
10966	PolyMet has indicated that many of the jobs will go to outsiders. Even the local jobs that are generated are temp jobs.	SO06
10967	It is the DNR's job to protect Minnesota's resources, not give them away to outside interests.	PER35

<b>Sender Name (Submission ID)</b> Andrew Comfort (43342)		
11651	The December 2013 Polymet SDEIS is inadequate because it does not include analysis of uranium in the waste rock, tailings etc. The Eagle Mine in Michigan had trouble with uranium contamination of drinking water. So it is reasonably foreseeable that the Polymet mine could as well. Rock with up to 7 ppm of U was one potential cause of the uranium problems at Eagle Mine.	HAZ03
11829	Rephrase the financial assurance section in the SDEIS so that there is clearly no cessation of financial assurance under any circumstance. Further, state that Polymet and its parent, assigns, successors etc...remain responsible for the financial assurance for all time. Otherwise there is a risk that a legal maneuver could be taken to force the cessation of financial assurance – which would then place the burden onto Minnesota taxpayers instead.	FIN01
12168	Interpretation: the SDEIS is inadequate because it too narrowly interprets “cumulative effects” and “reasonably foreseeable,” thus inappropriately categorizing numerous proposed mines as “speculative.” Both CEQ and Minnesota Rules suggest a broader interpretation.	CU02
12169	in the revised SDEIS one scenario of the cumulative effects analysis should include all proposed mining operations from Polymet to Spruce Road and a further scenario should include the assumption of mining operations along the entire basal contact zone from Polymet to Tuscarora Lake	CU02
12170	the revised SDEIS will provide the opportunity to take a broad view of mining on the Duluth Complex, now, before it commences, based on full information available today of what the area will look like in 150 years or 500 years if/when Polymet to Spruce Road or Polymet to Tuscarora Lake is fully mined and closed, with water treatment either ongoing or prematurely ceased	CU13
12171	the SDEIS...excludes Teck American, Twin Metals and others from the cumulative effects analysis by labeling them as “Speculative Actions.”	CU02
12173	The discussion throughout this comment demonstrates that the SDEIS is inadequate because the future actions of Teck American, Twin Metals and others have been wrongly excluded from the cumulative effects analysis.	CU02

12178	Teck American, Twin Metals and other mining along the basal contact zone of the Duluth Complex (Figures 4 and 8) to the north and northeast of the Polymet site should be included in the cumulative effects analysis per Minnesota Rules because: 1) future development is indicated by historic and forecasted trends 2) these projects can reasonably be expected to affect the same environmental resources, and 3) there is a reasonable basis of expectation that these projects will occur	CU02
12180	it is reasonably foreseeable that any mining company will, over time, mine the entire ore body within its lease area. This suggests that Polymet will mine its deposit right up to the border with Teck American (Figure 10) and the several mines and the continuous ore body linking them from Polymet to Spruce Road will all eventually be one continuous mega-mine.	CU02, CU04
12270	The Bedrock Geology Map by Jirsa of MNGS is a summation of geologic understanding of the Duluth Complex. A note on this map says it “compiles the efforts of many geologists working over a period of nearly 100 years.” It is not currently mentioned in the SDEIS, but should be.	WR012
12276	the historic and forecasted trends discussed above demonstrate that Polymet, Teck American, Twin Metals and others in the area should be included in the cumulative effects analysis per guidance by CEQ and Minnesota Rules, for water from all is funneled to the Basswood River in the BWCAW/Quetico (Figure 5).	CU02
12300	Revise the SDEIS to include study of the cumulative impacts of Polymet and Northshore/Mitchell on the BWCAW/Quetico	CU01, CU02
12304	Revise the SDEIS to include study of the cumulative impacts of Polymet and Teck American on the BWCAW/Quetico and to study the nature of the faults and/or bedrock valleys connecting the two pits.	CU01, CU02
12313	Several dams could be built along the length of this south arm in order to submerge these cliff walls and use a “subaqueous containment” strategy to keep air away from the sulfide-bearing cliff walls. These dams would be at least 800 feet tall and would need to last in perpetuity, but would also need to be repaired and perhaps replaced every 200-500 years. The financial assurance could be used to pay for this repair and replacement of dams as needed.	FIN11
12315	the SDEIS wrongly concludes that Polymet will always drain only southward. But like the site of Northshore/Mitchell which once naturally drained southward, the act of mining changes the land and changes the flow of water and moves the Laurentian Divide. Polymet post-closure will impact the BWCAW/Quetico and the SDEIS needs to be revised with further study to reflect this.	WR024, WR071, WR081, WR111
14742	Polymet is currently south of the Laurentian Divide, but post-closure Polymet will be a part of the BWCAW watershed. The broader interpretation of “cumulative effects” will allow a revised SDEIS to more accurately present how mining operations will change the geography and shift the Laurentian Divide southward.	CU01
14747	pollution will occur with respect to any sulfide ore in Minnesota, even with the advent of new technologies. But the risk is particularly high in the water rich environment of the area from Polymet to Spruce Road and beyond as this is the location of the famously densely packed and interconnected waterways of the BWCAW/Quetico. The granite and other bedrock in this area has no propensity to offset acidity introduced by sulfide-ore mining through any accidents or pre-mature cessation of waste water treatment	WR111, WR195
14748	The Minnesota Minerals Coordinating Committee (MMCC) ...sponsored a March 2013 brochure titled “Explore Minnesota: Copper, Nickel, PGEs.” Three projects (Polymet, Teck American and Twin Metals) are listed in a section called “Active Cu-Ni-PGE Projects.” This categorization suggests that all three deserve to be in the SDEIS cumulative effects analysis.	CU02

14750	As currently devised, the SDEIS is “putting on blinders” and pretending that all of the other mining on the Duluth Complex is not in the works. As the discussion above on historic and forecasted trends shows, the gears of international finance and industry and various marketing forces within Minnesota are at work actively promoting the mining of the whole Duluth Complex, strongly suggesting that this mining will occur.	CU04
14751	we should be judging Polymet in the context of the mining of the whole Duluth Complex – considering both the environmental protections and financial assurance required for that far larger total endeavor, and the environmental and economic devastation that could ensue if such protections or assurance fails. The SDEIS should be revised to reflect how Polymet contributes to the cumulative effects of this mining of the Duluth Complex all the way up as far as Tuscarora Lake. And if we together decide this mining is a bad idea, we can put a permanent moratorium on it before any damage is done.	FIN08
15723	This issue should be studied and if necessary discussed in a revised SDEIS regarding how to protect ground water and what needs to be done for proper disposal of any uranium collected.	WR145
<b>Sender Name (Submission ID)</b> Andrew Gibbons (42923)		
17477	BOTH STATE AND FEDERAL POLICY SUPPORT THE DEVELOPMENT OF MINING PROJECTS SUCH AS THE NORTHMET PROJECT IN THE SUPERIOR NATIONAL FOREST. ...When the U.S. Congress created the Boundary Waters Canoe Area Wilderness ("BWCAW") and adjacent Mining Protection Areas in 1978, it defined the areas in the SNF in which mining is prohibited, as well as the areas in which mining is allowed....Congress and the State went a step further than simply establishing that mining is allowed in certain areas within the SNF but outside the BWCAW.	PER39
17478	In 1979, Minnesota completed a Regional Copper-Nickel Study ending Minnesota’s three-year moratorium on copper-nickel mining. The study concluded that hardrock mining can be conducted in an environmentally sound manner and recommended that state agencies coordinate on mining regulatoryactivities to facilitate copper-nickel mineral development....THE NORTHMET PROJECT PROPOSAL ADEQUATELY EVALUATES ENVIRONMENTAL CONSIDERATIONS.	PER34
17479	The USACE, USFS and other federal and state agencies that will issue permits for the NorthMet Project will be able to draw upon this substantialinvestment by the State of Minnesota in preparing for copper-nickel mining in northeastern Minnesota to facilitate mining development within the framework of robust state and federal environmental regulations applicable to projects in the state.	PER34
17480	See 1 Minn. Env'tl. Quality Bd., The Minnesota Regional Copper-Nickel Study 1976-1979, at I (1979); E.K. Lehmann and Associates Inc., Minn. Dep’t of Natural Res., Minn. Pollution Control Agency & Project Environment Fund, The Report on the Mining Simulation Project (1990); Div. of Minerals, Minn. Dep’t of Natural Res., Report to the State Executive Council, at 31 (1991). Since the 1970s, the MDNR and Minnesota Pollution Control Agency (“MPCA”) have conducted water, rock characterization, and reclamation studies identifyingpotential environmental impacts, including the impact of sulfide-bearing mine wastes and available mitigation techniques. See, e.g., Kim A. Lapakko and David A. Antonson, Duluth Complex Rock Dissolution and Mitigation Techniques: A Summary of 35 Years of DNR Research (2012). MDNR andMPCA have also established sophisticated, well-funded programs for regulating mining and protecting the environment in Minnesota. See Minn. R. Chs. 6115 (DNR-public water resources); 6132 (DNRnonferrous mining); 7007-7019, 7021, 7023 (MPCA – air pollution control); and 7050-7060 (MPCA-waterpollutioncontrol)(2013). Twin Metals Minnesota submits the above-referenced materialsdeveloped by the state for inclusion in the administrative record in support of the SDEIS and the findings and conclusions therein.	REF01

17481	The NorthMet Project will utilize brownfield sites for the location of the processing facility and tailings basin, and in doing so will address existing environmental concerns at those sites...the former LTVSMC processing plant will be refurbished, and portions of the former LTVSMC tailings basin will be used as the tailings basin for the NorthMet Project.... This reliance on brownfield redevelopment reflects sound public policy that is encouraged by both federal and state law.	PD28
17482	The adaptive management principles incorporated into the NorthMet Project design and the SDEIS will enable both PolyMet and the Agencies to adapt long-term management of the project sites to evolving environmental and development considerations. The SDEIS's incorporation of adaptive management techniques into its analysis is consistent with the requirements of both NEPA and MEPA.	PER34
17483	NEPA and MEPA require that issues surrounding long-term reclamation of the Project sites must be addressed with sufficient specificity for the Agencies to evaluate the potential environmental concerns. The SDEIS accomplished this by presenting in an overarching analysis – subject to the imposition of additional specific requirements in the permitting phase and in ongoing monitoring and evaluation once operations commence – the long-term reclamation plans for the NorthMet Project. While development of detailed plans early in the process can be beneficial, the FEIS does not need to address such issues with the level of specificity necessary for permitting, final planning, and ongoing operational management.	NEPA16
17484	There will be multiple opportunities for the pertinent state and federal agencies to address long-term reclamation and financial assurance with specificity and on an ongoing basis during the permitting and operations phases of the NorthMet Project when the details necessary to address those issues will be available. The permitting processes for the MDNR Permit to Mine and other approvals required for the NorthMet Project are subject to the scrutiny and expertise of the permitting agencies, are open to robust public participation, and will incorporate the findings of the FEIS.	FIN17
17485	Minnesota law requires the submission of a “contingency reclamation plan” with the application for the Permit to Mine and annually thereafter. Minn. R. 6132.1300, subp. 4 (2013). The contingency plan must include the methods, sequence, and schedule of planned reclamation activities, including specifically closure and post-closure maintenance. Id. Estimates of the costs that would need to be incurred to implement the contingency reclamation plan if operations were to cease in the upcoming year also must be provided. Id. These estimates form the basis for the financial assurance requirements, which are similarly reviewed on an annual basis for the life of the Permit to Mine and revised as necessary.	FIN05, FIN08, FIN14
17486	At this time, it is important to evaluate these considerations and reach conclusions at a conceptual level sufficient to fulfill the purposes of NEPA and MEPA, but not in the detail that may be necessary to satisfy the requirements for permit issuance or subsequent monitoring of permit compliance during operations. The pertinent issues are adequately addressed in the SDEIS, thereby allowing the FEIS to be issued, and any necessary additional details can be developed during the permitting process or at appropriate future stages of project evaluation.	NEPA16
17487	reclamation needs, and the associated financial assurance required to cover those closure needs, will necessarily change over the course of the operation of any mining project. Accordingly, the requirements of the MDNR Permit to Mine and other applicable permits establish a process for adaptation of closure and postclosure activities and other reclamation requirements over time as needs or facts change. ... It is not feasible to address such operational issues in substantial detail at this point in the process, and the Agencies' approach in analyzing reclamation and financial assurance in the SDEIS complies with the requirements of NEPA and MEPA.	FIN17
17488	The criteria for the release of PolyMet's obligations with respect to long-term water treatment of the NorthMet Project need not be identified in the FEIS in order for the Agencies to meet their duties under NEPA and MEPA to consider the long-term implications of, and mitigation available for, the project. Rather, the details of the long-term reclamation plan, and specifically the monitoring and treatment requirements for the NorthMet Project with respect to water quality, can appropriately be addressed at the permitting stage without compromising the adequacy of the FEIS.	NEPA16, WR190

10746	the rich run the country's economy into the ground. Then, bit by bit - they take advantage of our desperation by convincing the masses to help them to not only dismantle the labor force protections, but also the necessary environmental safeguards. Indeed, they portray these safeguards as responsible for the stagnant economy. Twenty or so extra jobs now are not worth 500 years of pollution. And, as West Virginia also illustrates - bankruptcy by the offending company is the usual "out" for them.	SO01
<b>Sender Name (Submission ID)</b> Anita Suzanne Tillemans (42951)		
12362	Greater than 90% of this water would be captured and treated using reverse osmosis, a process that poses risks as outlined in 2006 by the World Health Organization's report in Geneva, Nutrients in Drinking Water, Chapter 12.	WR143
12367	Has the SDEIS calculated the very real danger of RO processed waters on plant and animal organisms as well as the disposal of these concentratedtoxins?	VEG06, WR143, WR145
12370	Estimates of contamination in the SDEIS are based on models that do not take into account inevitable accidents and failures.	WR202
12374	the SDEIS has no bedrock groundwater samples available from theplant site and the tailings basin, and no testing was done in the Biwabik Iron Formation for these sites. For what reason?	WR008, WR071
12398	The report assumes that most all water in these wetlands is recharged by rainfall and that the underlying bedrock is of low conductivity. I could not find substantial proof of this in the report. There are no long term records and field reports of rainfall over many seasons and years. Even so, the assumption seems to be made that there are no fractures, no artesian aquifers ofsignificance in the area	WR010, WR053
12405	No substantive studies have been done to determine the recharge and discharge areas for all aquifers along the Laurentian Uplands, including the Embarrass and Partridge River watershed aquifers...How much of the pollution will discharge into unexpected waterways from contamination in the recharge areas? ...reports need to be produced on these flowages,There are few wells on site and very little detail concerning underground water flowage at the sites proposed for Polymet's operations.	WR007, WR008, WR071, WR091, WR135
12408	Do we know what vital waters are supplied by particular aquifers in the Laurentian Divide at the proposed sites?	WR071, WR120, WR135
12410	With inevitable variables over hundreds of years, and without additional, extensive, field work and research concerning these aquifers, what reliable calculations can be made to predict drawdowns, potential depressurization of artesian and upwelling of brackish waters among other possible dangers?	WR189
12416	What will the accumulation of polluted water from the mine over decades, hundreds of years do to the St Louis River estuary? The St Louis River is already an AOC.	WR107, WR109, WR111
12423	What of algae bloom, reduction of oxygen and creation of a dead zone at the mouth of the St Louis River and Lake Superior?	WR111
12428	Concerned members of the Ojibwa Nation have indicated that groundwater seepage is greatly underestimated...Without studies of rainwater, and seepage over many seasons and years, how can the SDEIS predict outcomes confidently?	WR060, WR070, WR071
12434	How many more trains will be traveling through and over the wilderness of Superior National Forest and the Arrowhead? How many more trucks? How many earth movers, ATVs, OTVs, roads, how much dust, cumulative noise pollution from 24/7 mining operations (explosions, drilling, digging, crushing, processing, hauling metal)?	N03, N07

12436	The scope of the SDEIS does not address the actual extent of operations related to this project and effects that will most definitely exceed the actual boundaries of the two sites and the transportation corridor.	PD30
12437	The SDEIS considers addressing pipeline failures and spills speculative and beyond the scope of the study. What then is a study based on assumptions and predictions hundreds of years into the future?	WR129, WR131
14760	The proposed copper mine in Babbitt should be a concern to all of us since it will threaten water resources in an extremely important hydrological area of the North American continent and at the source of the largest fresh water body in the world, our Great Lakes.	WR111
14761	Copper mining leaks sulfuric acid into waters above and below ground and is one of the worst polluting mining processes in the world historically. Metal mining requires prodigious amounts of water, and copper mining has historically degraded those resources.	WR001, WR023
14762	demineralized water[generated by reverse osmosis] has proved dangerous in many ways. It will aggressively attack contacted materials by dissolving metals and some organic substances in pipes, storage tanks, hose lines and fittings. Because of this, it poses an increased risk of filtering toxic metals into the groundwater, wetlands and streams at the source and particularly downstream.	WR131, WR143
14763	Without the protective or antitoxic protection of calcium and magnesium additional, increased risk of cardiovascular disease occurs in humans from drinking water treated by RO, and reserve minerals in the body are often depleted.	HU03
14764	the hazards of controlling contamination would continue into perpetuity. Discharges of mining wastewater would continue as long as it rains, with water seeping into pits and ponds and leaching of toxic mining byproducts into groundwater. Potential failure of tailings dams, concentrate spill into streams and wetlands are historically valid concerns and need to be addressed since these will add to the pollution.	WR115
14765	Clean up of polluted river beds and aquifers would not be possible. The damage done, no financial assurance would replace the irreplaceable. In addition, the cost of perpetual treatment of waters that would continue to spill and leach toxins into the environment forever...would outweigh the profit of a relatively few, finite years.	FIN10
14766	Wild rice beds can be found all along the St Louis watershed, rice beds the Ojibwa depend upon in this highly connected and diverse aquatic habitat.	VEG04, WR156
14767	Laws that were made to protect the environment within the ceded territory have eroded away...once the land exchange is made, ... much of the treaty obligations under the ceded territory and wildlife and wilderness protections will no longer have any teeth.	LAN05
14768	polluted water will affect not only flora and fauna that depend on these wetlands, it will, eventually, affect Lake Superior and the Great Lakes.	WET24
14769	The distributions and flowages along nonconforming wavy bedrock formations in the area should be prominent factors in the decision-making process and at the forefront of the SDEIS. The Laurentian Divide runs through the middle of the tailings pond at 1700-1800 feet and very little is documented to date about the complex underground flows from this area. In fact, there is more study necessary before we understand specific recharge and discharge areas in this divergent geological and hydrological area of the Mesabi.	WR008
14770	Once copper mining is begun, contamination of groundwater cannot be prevented in the Laurentian Divide. Water will be contaminated as aquifers are traversed, through cracks, joints, fractures, and bore holes in bedrock aquifers and in direct contact with waste rock as it is mined. It can also flow along bedrock under glacial drift to locations unknown from the site ofcontamination, seeping into and out of these mining pits and tailings bins without being captured.	WR010, WR195

<b>Sender Name (Submission ID)</b>	Anita Suzanne Tillemans (42951)	
14771	Once the mine is closed, seepage and discharge from mining pits of waste rock, slurry and tailings basins will continue into perpetuity. No reliable, extensive studies have truly been done, nor can they be, to determine how much water will actually seep into and from the mining pits and tailing basins at these sites over hundreds of years.	WR023, WR070, WR130
14772	water will be drawn continuously from surficial and possibly bedrock aquifers, as well as St Louis watershed streams and Lake Colby in order to mine copper for 20 years. ...what guarantees can there be that groundwater will not be mined as well, as levels of ponds, pits, and rivers are managed to maintain certain levels? It is impossible to predict the effect that global warming will have on water reserves, nor is it possible to predict weather from year to year.	WR086, WR180, WR181, WR182
14773	Wetlands destroyed will not be replaced in kind...Included in the areaof concern will be 100-Mile Swamp. ...These wetlands are open and continuous, one feeding into another along the entire watershed of the St Louis River.	WET04, WET19
14774	Once granted permits to mine, Polymet will, of course, set a precedent...Would NFS have granted these drilling permits if it had not considered allowing copper mining so close to theBoundary Waters Canoe Area Wilderness? Once noise, air, water pollution have been granted at these levels, even higher levels will then be more acceptable. It is easy to see then how lovers of wilderness, the BWCAW the Quetico ... might be threatened by a copper mine inBabbitt.	WILD02
14775	Could it be that we do not know enough about the aquifers that underlie the Laurentian Divide? Minnesota is a land of more than 10,000 lakes, a land of waters, water that has no boundaries essentially. When one area is polluted, the effects are felt like a ripple.	WR071, WR111
14776	Where little allowance has been made for fractured and folded metamorphic rock in the area, fault lines, and percolation from confined aquifers that are also in the area, it would seem that the report is flawed. This error could cause other faults in predicting leaching, groundwater effects, toxin releases and solute levels in wetlands, lakes and streams.	WR012
14777	Copper mining will pollute ...our fresh water, in an area of complex aquifers that depend heavily upon each, interconnected in ways that we have yet to understand. Without consideration for loss of wilderness, which would be great enough, pollution and drawdown of our water table on the scale that Polymet could bring would be disastrous for a much wider area than this report has addressed.	WR001, WR023, WR115
14778	What financial assurances would restore these priceless reserves of water?	FIN08
14779	Consequences will go beyond the limits of liability for Polymet, and their operations will endanger lands and waters that neither Polymet nor the National Forest Service owns...Although "direct" impacts are considered to be within the boundaries of mining operations, permanent, irreconcilable impacts will have no boundaries. Pollution will reach underground into the water table, above ground into our air, and down stream most certainly into our oceans through vital freshwater resources.	FIN11
14780	SDEIS promises that safeguards and standards will be established in the permitting process, but these are not given in this report and cannot be assessed for the public view.	PER35
14781	Is it correct that less than .004 of the mined material will be copper at the cost of so much pollution? A trade like this does not seem to be in our best interest.	SO01
14782	If concentrate spilled into a stream, it would settle forming sediment, highly toxic unless dredged which would have disastrous effects. This sediment would persist for decades and eventually end up in Lake Superior. Wetlands are susceptible to spills releasing slurry, return water, diesel fuel, solutes, leaching into water tables.	WET24

14783	Reduction in wetlands due to degradation of habitat and wetlands ability to support fish and invertebrates would result in an incalculable loss of wildlife population abundance.	AQ24
14784	It is "reasonably foreseeable" that weather will change and is unpredictable, even in the short term. No scenario that forecasts over hundreds of years can be taken seriously. ...the water and environment will be permanently changed and that no mitigation will return our waters and wilderness to pre-mining condition.	GEN03
14785	Mining operations will cease along with the jobs and profit, long before the degradation has run full circle. What will Minnesota and the world have in return for a few years of jobs and cash if we fail to act as responsible stewards? There are no financial assurances that would cover the cost of such a tragedy.	SO01
14786	We need to take into account the over-reaching consequences of this project in an irreplaceable and unique, geological and biological ecosystem that is Northern Minnesota, the source of three of the greatest river systems in the North America	PER12
14787	What will be the consequences of the land exchange, once Polymet owns the surface and mineral rights to the land on which their operations occur? What powers will the NFS, BLM, DNR and other parties have and exercise to control and monitor damage to our environment then?	LAN04
14788	Downstream from the proposed Northmet project, where all mining water, sediment and dissolved particulates from this plant will eventually go, Jay Cook State park is home to 181 species of nesting and feeding fowl. There are bear, deer, wolves, coyote among 46 animal species in the park. Sax-Zim Bog in the St Louis River estuary is world famous wintering grounds for great gray, boreal, hawk owls and other boreal forest birds. Over 60,000 raptors migrate over Hawks Ridge National Preserve in the St Louis River estuary each year...The Laurentian Divide is home to 155 nesting birds and 40 wildlife species.	WI01, WI02
14789	In Embarrass, just north of the LTV site, there are birding and nature trails, river canoeing and fishing opportunities. At Babbitt, lies beautiful Birch Lake south of the BWCAW, both part of the Rainy River Watershed, so close that mining cannot help but affect the whole area.	LU06
14790	The Superior National Forest Scenic Byway tour begins in Two Harbors and goes through Silver Bay to Aurora through Hoyt Lakes over 145 miles of untouched wilderness with relatively few roads. There are wolves here and Canadian Lynx, only a few of the animals that are attracted to this area. Wolves are of concern in particular, since the DNR has still yet to make a count of the existing wolf populations after two hunting seasons. How do we know the threat to this vital apex predator without a study to determine its numbers?	WI01
14791	Polymet's trains will traverse open wetland networks linked to Dunka River, North River, Ridgepole Creek, Seven Beaver Lake, Swamp Lake, Big Lake, and Yelp Creek, among a few.	WR151
14792	There are 318 species of birds, 200 regular in the Superior National Forest of which 36 are uncommon, 30 rare and 61 very rare, among these the Pie billed Grebe and the Red breasted Merganser. With 155 nesting species, the SNF has the greatest number of breeding birds in any national forest. The BWCAW is of incalculable value biologically, ecologically	WI01
14793	The BWCAW is ...a popular wilderness area with over 200,000 visitors annually, with 1500 miles of canoe routes and 2200 campsites. Do we truly believe that copper mining so close to the entry points of this wilderness will not have significant consequences on these resources and the essence of this kind of experience?	WILD02
14794	This SDEIS, as stated, appears to be based upon "variability and uncertainty around many ... model input assumptions"- in other words, a best case scenario that, in spite of this, predicts 500 plus years of mitigation and pollution from 20 years of mining in the Arrowhead...Once the water is polluted and the ecosystem destroyed, one that took millennia to develop, we will be left with a toxic environment that will be changed forever	PER12

<b>Sender Name (Submission ID)</b> Ann Burns (15663)		
783	the region's future will rely more and more upon sustainable resource management and an emphasis on the natural world that attracts tourism and retirement dollars to the area.	SO02
785	I am concerned about the long-term environmental impacts of the planned Polymet sulfide mine, and feel that the current plan does not do enough to protect our waters.	WR035
791	It is highly unlikely that PolyMet, as a business, will be here [in 500+ years] to keep paying for and executing on any water treatment requirements. Rather, taxpayers will pick up the tab. This plan does not do enough to ensure that the necessary financial resources, to treat waste water and remove sulphur contaminants, will be secured and reliably sufficient.	FIN01, FIN10
796	Further, the current plan is already insufficient in its planned water treatment scope. At the mine site itself, each year more than 5 million gallons of untreated contaminated water will seep into our ground water. At the tailing basin, more than 11 million gallons of untreated contaminated water will seep into our ground water each year.	PD03
802	The plan for waste water treatment [for over 500 years] is not based upon best practices; it is based upon hope and pretense, and should not be permitted.	PER04, WR037
<b>Sender Name (Submission ID)</b> Ann Campbell (715)		
443	I understand [the NorthMet Project] will create jobs but at what cost. 500 years of clean up?? For 20 years of employment.	SO01, WR115
<b>Sender Name (Submission ID)</b> Ann Dow (26131)		
15198	Exchanging land or allowing sulfide mining on Superior National Forest will be at the expense of too many of the other "multiple uses" the forest was established to provide.	LAN01
<b>Sender Name (Submission ID)</b> Ann Galbraith Miller (41085)		
13946	While jobs are certainly important, they are not a scientific argument based on the draft EIS. Those jobs will benefit a few, while the after effects of open-pit sulfide mining will potentially impair thousands of acres of watershed and the Lake Superior basin for HUNDREDS OF YEARS.	WR195
<b>Sender Name (Submission ID)</b> Ann Meany (43351)		
15575	This is a toxic operation. There is no way that copper sulfide mining can be compared to taconite iron ore mining. To allow something as toxic as sulfide mining anywhere in Minnesota, let alone right next to the Boundary Waters Canoe Area is insane.	PD27
<b>Sender Name (Submission ID)</b> Ann Possis (10115)		
337	We must be able to come up with livable-wage jobs without trashing our natural environment. Twenty years of jobs, many of which would be filled with people brought in from outside our area, are not worth hundreds of years of pollution of an irreplaceable part of the world.	SO01
339	The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children.	AQ05, WR115, WR156, WR158

17787	Let us not be short-sighted and hasty in making decisions without all the [data]....	NEPA09
17788	I have lived here my entire life and want to continue living a healthy life. I feel this dream is being compromised by not thoroughly researching and believing in the past lessons from Reserve Mining in the 70s.	HU03
<b>Sender Name (Submission ID)</b> anne morrison (42907)		
8719	I am deeply concerned about the possible impact on the BWCA [Boundary Waters Canoe Area] posed by acid mine drainage from PolyMet's NorthMet project.	WR024, WR081
8720	PolyMet's web site claims that water that will be discharged from its project site would never enter the Boundary Water Canoe Area Wilderness lakes or streams.	WR024, WR081, WR111, WR175
8726	In reality, however, hydraulic conductivity testing is needed to determine the actual effect of [NorthMet] acid mine drainage into the waterways on the edge of the Boundary Waters.	WR071, WR081
8729	The proposed PolyMet mine site borders and is uphill from One Hundred Mile Swamp, which drains (in part to Langley Creek, which is a tributary to Rainy Lake in the BWCA watershed.	WR024, WR071, WR080, WR081, WR111, WR175
8731	Without hydraulic conductivty testing and measurements, PolyMet has no way to show that water entering One Hundred Mile Swamp will not then flow into Rainy Lake in the BWCA watershed.	WR024, WR071, WR080, WR081, WR111, WR175
8738	It is also a concern that the authors of the SDEIS have used incorrect maps which contradict the US National Atlas watershed map, with the goal of suggesting that mine waste water will not seep into the BWCA watershed.	WR024, WR071, WR081, WR111
8739	Significantly, the SDEIS claims that there is no delineated boundary for One Hundred Mile Swamp—while in reality, the boundaries of One Hundred Mile Swamp have been delineated, and are accessible at <a href="http://www.nationalatlas.gov/streamer">www.nationalatlas.gov/streamer</a> .	WR080, WR175
8741	...the SDEIS maps then omit the section of One Hundred Mile Swamp that drains into the BWCA watershed: whereas the National Atlas shows a 10-mile-long wetland that drains to both the St. Louis River and BWCA watersheds, the most recent SDEIS maps depict the One Hundred Mile Swamp as only six miles long, and as existing only on the St. Louis River side of the divide.	WR080, WR175

<b>Sender Name (Submission ID)</b> anne morrison (42907)		
8743	PolyMet's re-drawn and inaccurate maps would mislead a reader to believe that its proposed project [NorthMet] would have no impact on the Boundary Waters.	WR024, WR071, WR080, WR081, WR111
8749	Finally, there has been no baseline water testing in the Dunka River, Langley Creek, or anywhere else in the Rainy Lake watershed.	WR071, WR081, WR085
8751	Without...[baseline water] testing in the Rainy Lake watershed, there is no way to gauge the possible harm to the BWCA [Boundary Waters Canoe Area] and Quetico from PolyMet mine drainage.	WR024, WR081, WR085
8753	PolyMet must be required to correct its SDEIS to include accurate watershed mapping, with hydraulic conductivity testing in One Hundred Mile Swamp, with water quality testing for the BWCA watershed, and with a data-based statement of the impact of the proposed mine on BWCA water quality.	WR080, WR081
8757	I urge you to view the SDEIS critically, and to require PolyMet to provide correct and appropriate data so that the impacts of its proposed project can be accurately assessed.	WR072
<b>Sender Name (Submission ID)</b> Anne Stewart Uehling (54775)		
19463	Polymet does not have a plan for converting to a passive system at the plant site. Thus the need for high maintenance water quality equipment extends possibly into centuries.	GEN03
19465	Polymet (and the DNR) needs to explain how the existing conditions including plant and animal life [in reclamation wetlands] would be replicated in full.	WET04
19467	Models used for comparison of water flow, pollution, etc., are often models too dissimilar to be correct. ... Furthermore, the difference in bedrock type and structure fails to account for fracture and fissure patterns. According to the MN Geological Survey, there are faults under the mine site.	WR012
19469	A truly thorough study of economic impact needs to be made. Polymet claims over 360 jobs for the time of operation, Both the Forest Service and the recreation industry each provide that many jobs. The mine will cause the decline of property values and taxes, affect recreation... Mining will cause the exiting of the 55% of township residential property owners who are seasonal and thus cause a serious decline in tax income for townships. State agencies receive income from permitting and leasing, but local governments do not.	SO05
19471	The impact of one more source of contamination (no matter how small) on the St. Louis River watershed needs to be given careful consideration. The current iron mines are adding levels of contamination, often with waivers from the MPCA, and air borne pollutants arrive from elsewhere.	CU05
19472	Of particular concern is mercury, particularly methylmercury which has become a health hazard in the St. Louis River/Lake Superior estuary.	MERC03
19474	Many of the indefinites need to be filled in. Specifics for water flow calculations, reclamation plans for closure, long term water monitoring plans and financial assurance are either in documents available but not included in the SDEIS or left for future negotiations during the permitting process.	PD01
19475	mercury above 1 0 mg/L are harmful to wild rice, a plant harvested by Native American Tribes, particularly the Fond du Lac Band of Ojibwe whose reservation is on the lower reaches of the St. Louis River.	SO09

14194	mining would...pose human health risks through contamination of drinking water and fish, seriously degrade the St. Louis River, destroy wild rice and irreplaceable wetland habitat, and harm Lake Superior that holds 10 percent of the world's fresh water.	GEN03
14195	[the mine would] provide a significant risk in the watersheds receiving the drainage from Polymet's waste rock and tailings complexes, given that two million tons of sulfur would be brought to the surface during mining, result in unacceptable and long-term water quality impacts, which exceed water quality standards	WR115
14196	All of this for a foreign corporation whose stated goal is to provide the first eight years of copper produced to China, without any plan to meet domestic needs in our country.	FIN04
<b>Sender Name (Submission ID)</b> Armando Santos (54203)		
17259	[mining is] going to destroy the beauty of the land	LU04
<b>Sender Name (Submission ID)</b> Arno A Kahn (54801)		
18151	My concerns center on the documented concentration of sulfur in the holding ponds which is a result of the mining process, as reviewed in the EIS. The likely leaching of this highly toxic sulfur into the surrounding lakes and streams would severely damage the ecology of our area. Elevated sulfur levels would decimate fish populations and reduce or eliminate other aquatic species. These waterways would change from the clear pristine watershed we all know and value.	AQ12
18152	The company has argued that all of this highly toxic water borne sulfur can be contained. Similar mines in other parts of the world and not situated in a massive fresh water basin have been unsuccessful in this regard.	WR023
18153	The EIS states a need to monitor and repair the holding ponds for at least 500 years! Clearly, no current corporation will likely be around 500 years from now Even the posting of bonds or setting up trust accounts would be unlikely to stop the dispersing of this very toxic pollutant [sulfur].	FIN01, FIN08
18154	I see little reason to think that mining precious metals in a pristine watershed that connects to our Great Lakes is a necessity. The short term financial gains and some employment aren't remotely sufficient to risk the inevitable pollution of our watershed. Once introduced into the watershed these pollutants will rapidly disperse, and we have no foreseeable technology to remove sulfur from billions of cubic feet of water.	NEPA02
<b>Sender Name (Submission ID)</b> Art Dale (42522)		
2437	With the experts, I perceive both a flaw in the model used and the lack of basic inputs into that model.	CR01, WR071, WR149, WR156, WR189
6750	The plan that projects no pollution seeping from the permanent mine site waste rock pile into the 100 mile swamp and that pups on the edge of the two mile wide tailings pile will capture 99.37 percent of seepage are based on substantiated assumptions. It is virtually certain that the amount of discharge into surrounding wetlands projected by PolyMet's plan is flawed and that the discharge will not meet water quality standards.	WET24, WR037, WR115
<b>Sender Name (Submission ID)</b> Art Lind (18131)		
3453	You [anti-mining people] keep talking about 200 to 500 years of water treatment. It doesn't say that. It doesn't say the treatment will be 500 years. It says, "Treatment will be determined using measured results," which is the way the law is designed to responsibly handle it. The 200- to 500-year timeframes used in the SDEIS model represents the durations that models were run, not to predict how long treatment would be needed.	WR190

505	Throwing away the natural beauty, a large source of income and state pride, in favor of the temporary income from mining is foolish and shortsighted.	SO01
<b>Sender Name (Submission ID)</b> audrey jiricko (44117)		
8061	From an economic standpoint, any short term gain for Polymet and addition of some jobs in the immediate future will be negated by longterm negative environmental and economic impact when the environment including something as precious as water quality is damaged.	SO01
8065	Heavy metals and toxic chemicals... will certainly impact the reproductive health of women living in the area as well as the development of embryos/fetuses... A lack of information regarding the specific pollutants may lead to catastrophic outcomes for individual women in the area.	HU03
8094	Overall, the project appears to focus on short term gain while ignoring significant negative long term impacts.	SO01
14902	More time is needed to investigate fully the potential outcomes for Minnesotans and the citizens throughout the world who travel to visit your beautiful state.	NEPA07
14903	What is the chance that decades from the mining of the desired material, the company will still be around to take responsibility and continue to try to clean up the surrounding area? History tells us not a chance.	FIN01
<b>Sender Name (Submission ID)</b> audrey kramer (40083)		
6988	The company chosen to head this overwhelming project is not trustworthy. Tell them to look elsewhere for their mining projects.	PD23
<b>Sender Name (Submission ID)</b> Audrey/Dennis M (39318)		
8048	PolyMet is a company with no mining experience and no substantial financial backing. The financial assurances for hundreds of years are not addressed in the SDEIS. This must be corrected.	FIN01
8051	The computer model shows that the water seepage will pollute for at least 500 years and must be treated for the entire time. This is totally unrealistic to expect this to happen. PolyMet is asking to be allowed to run a 500 years experiment that has never been tried before.	PD29
8097	In addition the computer model is known to have been run with incorrect water flow information. The water flow was greatly underestimated requiring the analysis to be completely redone	WR003
<b>Sender Name (Submission ID)</b> Audubon Minnesota (42897)		
4112	The entire Superior National Forest has been identified as an IBA...PolyMet proposes to exchange 6,650 acres of the Superior National Forest for private lands elsewhere in the region. Their mine would then be placed on the former public lands, destroying over 6000 acres of habitats of high biological diversity. Waste rock, tailings and open pit walls would pose a risk to the adjoining wetlands and waters for centuries, due to toxic metal leaching and acid drainage.	VEG02, WI02
4113	The St. Louis River, the major drainage from the proposed mine and processing site, borders large stretches of [the Sax-Zim Bog] IBA. Mercury, lead, arsenic, copper, nickel and other toxic metals that escape from the mining site and any water collection and treatment process will affect aquatic life and accumulate in birds and people who eat the fish or wild rice found in the river. This risk of toxic aquatic pollution will last for centuries.	WR111, WR115

<b>Sender Name (Submission ID)</b>	Audubon Minnesota (42897)	
4132	The SDEIS modeled the “proposed action” with 200 years of active water treatment at the Mine Site and 500 years at the Plant Site. The SDEIS in numerous locations indicates uncertainty about the actual duration of needed active water treatment, but acknowledges it is expected to be “long-term.” Tables and information in the SDEIS Water Modeling Data Package shows high sulfate levels, several times water quality standards in the collected seepage water at year 200 – indicating the need for treatment beyond this timeframe. Arsenic, lead, manganese, nickel, copper, and other toxic metals show similar exceedences, centuries after closure at the Plant Site. Many important facts such as these were not included in the actual SDEIS, obscuring important information needed by the public and agency decision-makers evaluating this proposal.	WR035, WR036
4133	The SDEIS acknowledges that some polluted water will not be captured for treatment – even under the best scenarios forecast in the SDEIS. Untreated seepage to the groundwater and surface water are noted in numerous instances in the SDEIS at the Mine Site, at the Category 1 waste rock dump, and at the Tailings Basin. The pit walls are another source of toxic leakage, particularly after the pits fill with groundwater following closure. These acknowledged sources of toxic runoff total tens of millions of gallons annually...The SDEIS provides no information about what pollutants and at what concentrations will be in the waters that will be captured and sent for treatment from the Plant and Mine sites.	WR002, WR035, WR070
4134	The SDEIS provides little information about the actual design, function and performance of the proposed “reverse osmosis” water treatment system, upon which so much depends to keep water discharges within standards.	WR143
4135	The SDEIS does not provide information on the constituents and concentrations of pollutants in the reject concentrate that contains the pollutants separated in the water treatment system.	WR147
4136	The SDEIS provides no information about the expected parameters of the water discharged from the water treatment systems to area waters.	WR147
4137	With centuries of toxic seepage generation from the mine site and waste piles, it is a near certainty that spills, leaks and discharges in excess of water quality standards will occur, creating a lasting risk to Minnesota’s waters. PolyMet’s proposed action asks Minnesotans to commit future generations to a significant, persistent pollution risk. The SDEIS obscures, rather than illuminates this risk, with important analysis not discussed in the SDEIS itself. Many important questions are left unanalyzed (e.g. how long will it take for tailings and waste piles and the pit itself to stop leaking waters contaminated beyond water quality standards?) or obscured in background reference documents.	WR086, WR195, WR202
4138	PolyMet’s proposed mine anticipates creating centuries of water pollution and neglects to examine alternatives such as lined waste piles and underground mining (discussed later) which could reduce the risk of water pollution in excess of standards...The proposed action provides a near certainty that toxic water pollution will pose a perpetual risk to the St. Louis River watershed and downstream Lake Superior: it must be rejected in favor of the “no-action” alternative.	ALT01, ALT07, ALT13
4140	The mine plan proposes unacceptably large direct (912 acres) and indirect impacts (up to 7350 additional acres) on wetlands, primarily in and near the mine site. PolyMet proposes to mitigate only directly impacted wetlands, while merely monitoring the actual indirect impacts to nearby additional wetlands totaling more than ten square miles. They plan to leave actual details of any mitigation for indirect impacts to later permitting. This information must be included in the environmental review documents available for public review, because the impacts are extensive and significant, and the destroyed and damaged wetlands include rare and fragile types that are difficult, if not impossible to replace (e.g. globally rare tamarack bogs and swamps.)	WET01, WET02, WET05
4141	The SDEIS proposes that more than two-thirds of the mitigation for the 912.5 acres of direct wetland impacts take place outside the affected watershed. This indicates the inability of this company to find mitigation sites within the watershed. With up to 7350 acres of indirectly-impacted wetlands necessitating mitigation in the future, leaving the details and locations of thousands of acres of future mitigation for permitting is likely to lead to massive amounts of out-of-watershed mitigation, which is unacceptable. The SDEIS is incomplete without details of wetland mitigation for the range of indirect impacts estimated in the document.	WET01, WET03

<b>Sender Name (Submission ID)</b>	Audubon Minnesota (42897)	
4143	The SDEIS uses calculations of groundwater flow that have been shown to be grossly understated. Tribal hydrologists have been trying to bring this information to the attention of the cooperating agencies from within the process (SDEIS Section 8, MDO #7) while recent releases of internal documents, during the public review period, indicate agreement by DNR technical experts on this point. (Star Tribune, January 24, 2014.) The corrected information is vital to a fair review of the possible impacts of this project, as PolyMet’s premise that pollution can be contained is built on the idea that nearly all contaminated waters can be collected and treated to water quality standards for centuries. The SDEIS must be rejected as insufficient because it does not contain proper groundwater flow calculations, and any resulting necessary changes to water collection and treatment systems.	WR003, WR017, WR049, WR128
4144	The SDEIS uses extremely optimistic assumptions about the ability of the tailings basin seepage collection system to intercept and divert for treatment contaminated surface and groundwater. The document postulates the capture and treatment of more than 99% of seepage during operations, and in excess of 98% during closure...a period of centuries. (SDEIS 5-159/160) This defies rational thought and actual experience. These optimistic assumptions allow the entire document to portray minimal impacts to downstream waters, wildlife and ecosystems from toxic water pollution. This unrealistic assumption fatally flaws the critical analysis of downstream impacts, necessitating the rejection of the SDEIS.	WR018, WR020
4145	The SDEIS avoids analysis of possible failure scenarios for tailings dams and waste rock stockpiles that will become permanent landscape features. Instead the SDEIS postulates that perpetual regulation applying “design and safety requirements” and “adaptive management” to waste piles totaling hundreds of millions of tons of rock, negate that need for foresight. (SDEIS Section 5-546) This is an entirely inappropriate expectation of perpetual regulation, and transfer of the costs of remedial response to future generations that will see no benefits, only costs, from this project. The avoidance of this analysis in the SDEIS renders it incomplete and inadequate.	GT15
4147	The SDEIS avoids discussion of the detailed performance of the proposed active water treatment systems. The lack of information about design and expected performance, operational effectiveness, and contingency plans for water treatment when the plants are down for maintenance, repairs or replacement is critical. The premise of this document is that “pollution of waters and ecosystems will not happen because we will intercept and treat to water quality standards more than 98% of contaminated runoff.” The SDEIS lacks detailed information to support this critical assertion. Furthermore, without detailed information on water treatment, it is impossible to estimate long-term funds needed for the operation of these facilities for centuries into the future. The SDEIS cannot be considered adequate nor complete without all of this vital information.	WR017, WR018, WR070, WR128, WR143, WR144
4150	The SDEIS does not examine a number of alternatives which would potentially reduce environmental impacts...The 526 acre permanent, category 1 waste rock pile should be lined to reduce the seepage, and the potential for toxic runoff.	ALT07, ALT13
4151	The SDEIS does not examine a number of alternatives which would potentially reduce environmental impacts...The tailings basin should be lined to provide more certainty that the seepage to surface and groundwater is minimized. The projection in the SDEIS of collection of in excess of 98% of leakage without a liner would be somewhat more credible if a liner were in place.	ALT10, ALT13
4153	The SDEIS does not examine a number of alternatives which would potentially reduce environmental impacts...Underground mining should be examined as an alternative to reduce the impacts to wetlands, and associated habitats and species that depend upon those habitats, and as a means to internalize the costs of mining (transferring impacts from public natural resources, to company balance sheets.) The rejection of a full analysis of this feasible alternative is based solely on a constrained economic analysis (did not consider mining the full ore body, used point-in-time commodity values and mining costs, etc.) by PolyMet consultants which appears designed to “prove” this alternative is economically unfeasible. We agree with the Tribal position regarding the inadequacy of the cooperating agency review, and premature elimination of this alternative in SDEIS Section 8, MDO #5.	ALT01, ALT13

4155	The SDEIS is lacking in planning for reasonable contingencies and foreseeable problems which the project might face both during operations and after closure...[including] Extreme rainfall events, such as have been experienced in the region recently, which go beyond the traditional 100 year and 500 year calculations. Impacts to the water collection and treatment systems of such events should be considered and described. What effect will such extreme events have on the concentrated pollution contained in the water treatment pond, or on the reject concentrate from the reverse osmosis system? What are the plans to prevent toxic pollution from escaping into surrounding waters?...Breakdown and failure of any of the critical components of the water collection and treatment system...Contingency plans if the water collection system does not collect upwards of 98% of seepage from the tailings basin...[and] Plans for remediation of portions of the Category 1 waste rock pile if they do produce acid drainage due to inaccurate characterization of the rock, or natural variability of sulfate in the waste.	PD22
4156	The SDEIS does not adequately describe the content and fate of the “reject concentrate” from the reverse osmosis system upon which the claim is based that no water quality standards will be violated for centuries into the future. This reject concentrate will presumably contain a high concentration of toxic metals and sulfates – and be of a large volume. The SDEIS is incomplete and insufficient without this information.	WR143
4157	The SDEIS (Section 5-202) asserts that contact with Duluth Complex rock actually decreased mercury concentrations in rainfall, due to adsorption, going on to state that, “For these reasons, mercury released from waste rock and ore at the Mine Site is not expected to be a constituent of concern in groundwater seepage. The primary NorthMet Project Proposed Action-related source of mercury to the Partridge River would be the WWTF discharge.” ...We believe that this understates the risk of mercury release, and because the mercury is adsorbed and not absorbed, several important issues come into play: [1] adsorption sites fill and, once filled, mercury will flow through the system unimpeded, and [2] adsorption sites are unstable – situations such as changes in pH could cause a significant ‘dump’ of mercury from the adsorption sites, causing significant down-gradient pollution. This needs to be further considered; the SDEIS is incomplete without this analysis.	MERC20
4162	The St. Louis River, the major drainage from the proposed mine and processing site empties into [the Saint Louis River Estuary] IBA...Mercury, lead, arsenic, copper, nickel and other toxic metals that escape from the mining and processing sites and any water collection and treatment processes will affect aquatic life and accumulate in birds and people who eat the fish or wild rice found in the river. Sediments of the estuary could remain permanently polluted, with centuries of toxic pollution expected from the mining site.	WR111, WR115
4188	The SDEIS in several places states that, “mercury loadings are predicted to increase slightly in the Embarrass River (3 percent) as a result of the NorthMet Project Proposed Action, but would be offset by a larger decrease (5 percent) in the Partridge River, resulting in a net decrease in overall mercury loadings (0.6 grams per year) to the St. Louis River as a result of the NorthMet Project Proposed Action.” Assuming this is “net effect” assertion is true, the Clean Water Act does not allow “trades” wherein one water body has increased mercury that is proposed to be offset somewhere else. Increased mercury cannot be allowed in the Embarrass River. The proposed action must be adjusted to propose a manner to eliminate the increase in mercury loading to the Embarrass River.	WET18
4190	Wildlife Exposure and Sensitivity to Mercury: The SDEIS quotes portions of a document (Judd 2013) that discusses lesser levels of sensitivity to mercury in Bald Eagles and river otters, while neglecting to examine more thoroughly area wildlife species which are sensitive to mercury: the Common Loon and mink. (SDEIS Section 5-368)...It is misleading to discuss in depth the lesser sensitivity of some species to mercury toxicity, while neglecting a more thorough consideration of such toxicity to species such as Common Loon and mink. The SDEIS is incomplete without further consideration of the impacts of mercury on sensitive species.	WI01, WI04

4192	The proposed mine will destroy 1718 acres of “Sites of High Biodiversity Significance” according to the Minnesota County Biological Survey. It is expected to destroy populations of nine plant species of state-listed Endangered, Threatened or Special Concern (ETSC) and “indirectly” affect two addition ETSC species. Seven hundred acres of “imperiled-vulnerable” or “vulnerable” native plant communities are included in this total, with the 495 acres of black spruce-Jack pine woodlands slated for destruction representing 20% of this community within the Laurentian Uplands subsection. (SDEIS 5-341)	VEG01, VEG02
4193	This is an unacceptably large impact [of 1718 acres of Sites of High Biodiversity Significance, nine state-listed ETSC, indirectly two ETSC, etc.] that could be avoided, were PolyMet to consider underground mining as an alternative.	ALT01, ALT13, VEG01, VEG02
4194	PolyMet’s proposed mine will destroy more than two square miles of designated critical habitat for the federally-listed Canada Lynx. It is stated that this habitat is unlikely to be restored to suitable habitat conditions for a period of over twenty years after mine closure. (SDEIS 5-364,365.)	WI01, WI02
4195	The SDEIS is incomplete because it fails to seriously consider underground mining which would avoid most of these impacts to this federally-listed species [(i.e., the Canada Lynx)].	ALT01, ALT13, WI01
4197	Moose are in trouble in Minnesota, with populations statewide and regionally on a steep downward trajectory. Moose are a state species of Special Concern. The mine proposes destruction of 2775 acres of key Moose habitat types.	WI01, WI02
4622	The SDEIS is incomplete because it insufficiently considers (hardly mentions) impacts to this important species [Moose], and does not consider alternatives to reduce the loss of Moose habitat, such as underground mining.	ALT01, ALT13, WI02
4623	"Financial assurance information to safeguard future taxpayers from financial liability is lacking in detail and provides no basis for the few figures cited in the SDEIS. PolyMet provides a few numbers in the SDEIS, asserting, for example, that long-term financial needs to run post-closure monitoring and water treatment systems centuries into the future might require \$3.5-6 million annually (SDEIS 3-138). The details of how these numbers were calculated, however, are missing from the document! The fact that the estimate is provided, indicates that the assumptions and calculations exist – they are not provided for public review, however. Small changes in assumptions about discount rates, inflation and rate of return on invested surety assets could make a difference of one or more orders of magnitude over the timeframe that PolyMet’s site is likely to need monitoring and care. It is not acceptable to maintain that this information is not required now, and will be provided only during permitting. This is a grievous omission given the hard-to-believe reliance on active water treatment for centuries to maintain water discharges within water quality standards. This omission alone is grounds for declaring this SDEIS incomplete and insufficient, and was cited as one of the reasons the EPA ranked the previous Draft Environmental Impact Statement “Environmentally Unsatisfactory-Inadequate.”"	FIN05, FIN08, FIN10, FIN13
4624	The SDEIS also does not describe how mitigation of thousands of acres of indirect wetland impacts would be financed. Costs of mitigation on this scale will require millions of dollars. The SDEIS has not proposed any mitigation for these impacts, nor financial assurance for wetland mitigation should it be required in the future. The lack of this information is a serious inadequacy of the SDEIS, and raises the concern that the state will fail to achieve its stated wetland conservation goal of “no net loss.”	FIN11, WET01
4625	The United States Army Corps of Engineers (Corps) should reject the Section 404 wetlands permit for the following reasons...PolyMet proposes unacceptably large direct (912 acres) and indirect impacts (up to 7350 additional acres) on wetlands, primarily in and near the mine site. They propose to mitigate only directly impacted wetlands, with two-thirds of the proposed mitigation to take place out of the affected watershed.	COE01, COE02, WET01, WET03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Audubon Minnesota (42897)	
4626	The United States Army Corps of Engineers (Corps) should reject the Section 404 wetlands permit for the following reasons...PolyMet proposes only to monitor the actual indirect impacts to nearby additional wetlands totaling more than ten square miles; leaving actual details of any mitigation for indirect impacts to later permitting or future regulatory actions. The SDEIS and application for a 404 permit is incomplete without information on how such large indirect impacts to wetlands at the headwaters of the St. Louis River system would be mitigated.	COE02, WET01
4627	The United States Army Corps of Engineers (Corps) should reject the Section 404 wetlands permit for the following reasons...The wetlands that would be destroyed by direct dredging or filling and those that would be damaged by indirect impacts are especially high quality systems. "Approximately 92 percent of the wetlands in the Mine Site are of high overall wetland quality..." (SDEIS 4-157) The DNR and USFS conducted ecological evaluations of the area in the 1990s: both concluded that a large portion of the Mine Site, called the "100 mile swamp" was of high quality because of such features as watershed integrity, the size of its wetlands, the presence of riverine ecosystems, and the large amount of interior forest present.	WET19
4628	The United States Army Corps of Engineers (Corps) should reject the Section 404 wetlands permit for the following reasons...The SDEIS acknowledges that, "The majority of wetlands that would be affected by the NorthMet Project Proposed Action would be 'difficult to replace' (coniferous bog, open bog, coniferous swamp, and hardwood swamp)" (SDEIS 5-313)....	COE03, WET05
4629	The United States Army Corps of Engineers (Corps) should reject the Section 404 wetlands permit for the following reasons...The SDEIS fails to seriously examine underground mining as an alternative to reduce the impacts to wetlands, and associated habitats and species that depend upon those habitats. It acknowledges that an underground mine would "reduce effects on wetlands, vegetation and wildlife habitat... (and would) reduce the scale and duration of potential water quality effects." (SDEIS 3-150) Despite this, the rejection of a full analysis of this feasible alternative is based solely on a constrained economic analysis (did not consider mining the full ore body, used point-in-time commodity values and mining costs, etc.) by PolyMet consultants which appears designed to "prove" this alternative is economically unfeasible. We agree with the Tribal position regarding the inadequacy of the cooperating agency review, and premature elimination of this alternative in SDEIS Section 8, MDO #5.	ALT01, ALT13
4630	The United States Forest Service (USFS) should reject the proposed land exchange as "not in the public interest" for the following reasons...The proposed land exchange circumvents a long-standing prohibition on surface mining in the area. "This project would involve open pit development of privately held reserved and outstanding mineral rights where the Forest Service manages surface resources. Most of the lands involved in the Project were acquired by the United States under the authority of the Weeks Act which restricts the Forest Service from allowing large surface mining as proposed by PolyMet." (Superior National Forest website) The lands proposed for exchange would not carry this protection, resulting in a loss of protection for USFS lands, and is therefore not in the public interest.	LAN01, LAN02
4631	The United States Forest Service (USFS) should reject the proposed land exchange as "not in the public interest" for the following reasons...The lands proposed for exchange, with one exception, do not come with mineral rights. Without the transfer of both surface and subsurface rights, nothing will prevent a continuing "shuffling" of public ownership via land exchange as severed mineral rights are developed. This is unacceptable and not in the public interest.	LAN04
4632	The United States Forest Service (USFS) should reject the proposed land exchange as "not in the public interest" for the following reasons...The lands proposed for exchange include more than two square miles of critical habitat for Canada Lynx, a federally-threatened species. The result of this exchange will be the destruction of this habitat, in exchange for existing habitats in the region: a net decrease in habitat for the Lynx and many associated species. This is not in the public interest.	WI01, WI02
4633	The United States Forest Service (USFS) should reject the proposed land exchange as "not in the public interest" for the following reasons...The land exchange would result in a net loss of 2775 acres of moose habitat, a species that is in sharp decline in the region. The SDEIS avoids analysis of the impacts to this important species (state listed as of Special Concern). This is not in the public interest.	WI01, WI02

4634	The United States Forest Service (USFS) should reject the proposed land exchange as “not in the public interest” for the following reasons...PolyMet Mining Corporation refuses to consider a feasible alternative to their proposed mine plan, which would negate the need for this land exchange, leave most of the surface estate intact and available for habitat for wildlife, and maintain most of the hydrological functions of the wetlands and river systems: underground mining. The SDEIS rejects this technically-feasible mining system on the basis of an unsupported “economic analysis” which presents conclusions, without assumptions and methodologies. This renders the SDEIS incomplete and insufficient, and negates the justification for the USFS to consider a land exchange.	ALT01, ALT02, ALT06, ALT13
<b>Sender Name (Submission ID)</b> August W Haugan (57230)		
17176	I am concerned that leaching from the sulfides in the pit, waste rock, and tailings from the proposed PolyMet copper-nickel mine cannot be effectively contained after the mine is decommissioned.	WR129
17177	Furthermore, if permits are approved this could set a precedent for possible approvals of the Twin Metals projects and the leaching from those projects, could be disastrous for the BWCA watershed.	WR198
<b>Sender Name (Submission ID)</b> Avery Jorgenson (54343)		
17453	Polymet Mining seems to have a very set plan in place. I think that this plan is a good well thought plan because they are doing the best they can to not change to much of the surroundings. Personally I think the copper-sulfate mining will benefit MN. I think that it will benefit us by helping create a better environment and also finding better ways to get the resources we need.	PD28
17456	I agree with the land exchange. I agree because I think that Polymet is trying their best to make it fair but still get the resources they need to continue with this project. The Net will gain or increase most of the needed land and material from this land exchange.	LAN11
17457	This process will also affect the cultural resources greatly. Ways being, fish, plants, and animal species being affect either positive or negative. This project will also affect the people that are living in this area.	CR01, CR05
<b>Sender Name (Submission ID)</b> B Erickson (38678)		
11897	That beautiful region of our state generates 1.6 billion in tourism. Let's protect and preserve a national treasure... Let's not gouge away our future recreational areas.	SO02
<b>Sender Name (Submission ID)</b> B Graves (43114)		
10177	Although Minnesota requires mining companies to provide financial assurances to fund cleanup if the company goes bankrupt or is otherwise unable to perform the work itself, it is very difficult to predict the extent of the pollution and resultant cleanup costs. Also, assets of bankrupt mining companies are often awarded to other creditors.	FIN01
10205	Minnesota law requires PolyMet to put up “financial assurance,” a damage deposit that is supposed to cover the costs of cleaning up the site and treating pollution. However, in the PolyMet mine plan, there are no details of the amount and type of damage deposit adequate to cover the cost of treating polluted water for hundreds of years.	FIN05, FIN08

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	B Graves (43114)	
17798	One peer-reviewed study found that, while all projects that were reviewed predicted they would not pollute, at least 76 percent of the time they still did. The same study found that 89 percent of mines that have polluted said they would not. It is this history that is one of the biggest reasons for worry about proposals to bring the mining to Minnesota. The industry says they won't pollute our prized waters, but they've said that before, and they've been wrong more often than not.	PD26
17805	The Minnesota legislature needs to first pass a bill similar to Wisconsin's "Prove It First" law that, before opening a mine, a company must be able to point to a similar mine to what it is proposing that a) has operated for 10 years without polluting and b) has been closed for 10 years without polluting.	PER25
17814	Wild rice is a significant resource for Minnesota tribes. Even low levels of sulfates are proven to kill wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard. There are wild rice beds downstream of PolyMet. PolyMet must show it would not increase sulfate concentrations in these areas. However, it fails to do so. The mine plan inaccurately describes wild rice waters, understating the area that supports stands of wild rice.	VEG04, WR156, WR157
17816	The mine plan claims to reduce sulfates, but that assumes that expensive water treatment will continue for hundreds of years. Millions of gallons of untreated polluted water will escape every year, and the mine plan predicts an increased chance that water exceeding the sulfate standard will be released at times, years after closure.	WR107, WR128, WR156
17817	It's not just wild rice that suffers from too much sulfate. The toxic reaction that occurs in the much around the plant's roots can adversely affect all types of aquatic flora.	AQ13
17818	Moose have declined dramatically over the last decade. Minnesota suspended the moose hunting season and added moose to its "Special Concern" list in 2013. That listing should trigger analysis of Polymet's impact on moose habitat, but that analysis is lacking. Thousands of acres of moose habitat would be destroyed at the PolyMet mine site, and moose have been observed there. Protecting moose is a particular concern for tribal members, and there is no analysis of the cumulative impact on moose from the PolyMet project and other habitat disruptions.	WI01, WI02
17821	The Canada Lynx is listed as a threatened species under the federal Endangered Species Act. There are only 200 lynx in Minnesota. Lynx have been tracked on land adjacent to the PolyMet mine site, and lynx sign have been found on the site as well. PolyMet would destroy 1,450 acres of designated critical habitat for the Canada Lynx, habitat essential to the conservation of a threatened species. Fragmentation and loss of habitat puts the survival of the Canada Lynx in jeopardy.	WI01, WI02
17823	An important wildlife travel corridor near the PolyMet proposal risks being lost due to mining activity, and increased truck traffic may kill lynx along the road linking the mine and plant sites. Despite this, the PolyMet mine plan fails to analyze the cumulative impact on lynx from the proposal and other nearby projects.	WI01, WI03
17826	) PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. PolyMet would dig up nearly 1,000 acres of high value peat bogs, part of the 100 Mile Swamp, a critical habitat for many plants and animals. This wetland is designated an Area of High Biodiversity Significance by the Minnesota Biological Survey. In addition, over 6,000 acres of wetlands could be damaged or destroyed by PolyMet changing the water flow. When you dig a deep hole in the ground, it fills with water. That water would come from surrounding wetlands, and could dry out and destroy them. PolyMet is required to replace lost wetlands, but they understate the area of wetlands they would affect, they fail to replace the unique habitat offered by peat bogs, and they propose replacements that are far from the mine site.	WET05, WET19, WET23
17838	PolyMet's electricity supplier, Minnesota Power, got 85% of their power from coal in 2013.	AIR02

17845	Asbestos-like fibers are in the rocks at PolyMet. The nearby Northshore Mine was required to stop dumping their tailings in Lake Superior in the 1970's due to similar fibers. Studies show miners who worked in the Northshore and LTV mines have higher levels of mesothelioma. Extremely small fibers from asbestos-like minerals are being studied by the University of Minnesota to see if they caused some of the higher levels of mesothelioma. PolyMet would produce mineral dust smaller than what is regulated and has been studied. It is not known if these fibers would cause harm to workers or nearby residents since they haven't been studied adequately. PolyMet admits that "the potential exists for the release of amphibole mineral fibers from the proposed operations, which could pose a potential public health risk of uncertain magnitude."	AIR04
17846	The PolyMet water computer model assumes that there is little groundwater moving through the site. The result is that the model shows water moving very slowly, and pollutants sticking to soil instead of moving with the water. DNR hydrology data show that the PolyMet water model significantly understates the amount of water flowing in the nearby Partridge River. If this information is wrong, predictions about water pollution are in question. If the model is incorrect, and there is more water flowing through the site than it assumes, the polluted water from pits and waste rock will move more easily through the soil, and reach lakes and rivers more quickly. The water could also carry more pollutants than the PolyMet model predicts.	WR047, WR062, WR091, WR165, WR171
17850	PolyMet is proposing something Minnesota has never allowed before. The company's own computer models show that hundreds of years after the mine closes, water seeping into groundwater and flowing into streams and rivers at the site will be polluted with heavy metals and sulfates. Unless all of this water is captured and treated, the mine will pollute surrounding waters.	WR115
17852	Minnesota law requires that a closed mine site be "maintenance free," but PolyMet's mine plan calls for hundreds of years of monitoring and expensive water treatment. Worse, these models don't even show that the pollution stops after 500 years. They just stopped modeling at 500 years. In other words, the pollution could go on for even longer.	PER04
17856	Minnesota has never permitted a mine that would require hundreds of years of expensive water treatment. This public comment period is the best chance for the public to weigh in on whether the financial assurance required of PolyMet would be adequate, but there is only a brief mention of it in the mine plan.	FIN13
17859	There are several alternatives that should be considered and evaluated in the PolyMet mine that are simply discarded. These include whether the PolyMet proposal could operate as an underground mine instead of an open pit, and whether all of the waste rock created by PolyMet should be backfilled into the mine pits after closure.	ALT01, ALT03, ALT06
17869	Recognize Glencore as a responsible party for permitting.	PER02

6333	Any and all profit from the mine [should go] into a trust fund to pay for any damages and clean up that is caused by the mine. Once the water and any other environmental damage(s) is fixed, then PolyMet can have what's left in the trust.	FIN01, FIN08
<b>Sender Name (Submission ID)</b>	B. J. Alexis (35452)	
13826	West Virginia, North Carolina, how many others have been damaged for years to come due to some form of mining or chemicals for mining. That should provide more than enough evidence to prevent any mining on or near the Great Lakes.	WR023
<b>Sender Name (Submission ID)</b>	Backcountry Hunters & Anglers (50932)	
7856	We respectfully request (for the reasons detailed in the report below: "Hunters & Anglers Question Northern Minnesota Sulfide Mining Proposals") that you reject the PolyMet Mining NorthMet SDEIS and deny permits (i.e., a permit to mine and a Section 404 wetlands permit) that would allow PolyMet's open-pit sulfide mine to irrevocably degrade Minnesota's waterways and watersheds for centuries, if not indefinitely.	PER35
7862	The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated.	WR070
7863	The plan for at least 500 years of active water treatment violates Minnesota Rules (6132.3200) that call for the mine to be left maintenance free at closure. Over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material.	PER04
7864	A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from overtopping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years.	PD04, PD11, PD35
7866	And the proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance and a "damage deposit" the company provides are not outlined in the revised mine plan.	FIN01, FIN08, FIN10
7867	The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability.	FIN01, FIN05, FIN10
7868	PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps will last for at least 500 years and pollution seeping from mine pits into the watershed "would continue in perpetuity."	WR035
7869	This short-sighted sulfide mining proposal amounts to gambling with the future of our Great Outdoors, and Minnesota's nearly 2 million hunters and anglers—and the bait shops, sporting goods stores, resorts, fishing guides, outfitters, gas stations and hotels that depend on their business—won't stand for it.	SO04
7873	The Minnesota chapter of Backcountry Hunters & Anglers (BHA) is concerned about proposed sulfide mining operations in northern Minnesota. The two foreign-owned sulfide mining operations include PolyMet's NorthMet Project mine near Hoyt Lakes and the Duluth Metals mine adjacent to the Boundary Waters Canoe Area Wilderness (BWCAW).	WI13

7879	Much of the debate surrounding sulfide mining revolves around whether companies have adequate bankruptcy-proof financial assurances in place to cover cleanup costs when (not if) acid-mine drainage (AMD) occurs.	FIN01
7880	Copper-mining operations, sometimes called “hard-rock mining” or “sulfide mining,” have left toxic scars across the country, with acids and sulfides leaching into streams, contaminating rivers and lakes, killing fish, and leaving dead zones. And PolyMet says acid-mine drainage (AMD) will be occurring at its proposed Hoyt Lakes mine “for up to 2,000 years.” Less than 1% of the ore would be produced as copper, etc., with waste rock comprising the remaining 99%.	PD01, WR023
7884	Mining of these ores is economically marginal, which is why they haven’t been mined previously. Such mining is highly energy intensive, making the industry susceptible to market fluctuations and vulnerable to bankruptcy.	PD25
7888	Former state Rep. Frank Moe is a guide and outfitter on the North Shore. Moe says when his old friends in the State Legislature consider whether to grant a permit to PolyMet to operate a hardrock sulfide mine, they should consider the other jobs at stake. Not just a couple hundred mining jobs, but jobs like his: there are 30,000 people working in the Northwoods recreation economy. Moe asks the legislators and commissioners whether tourists will still come north if the rivers and lakes are polluted.	SO02
7893	[Former state Rep. Frank Moe] wants PolyMet to make upfront financial assurances that will pay for any and all cleanup costs. He doesn’t want taxpayers stuck with the bill, but Polymet says the upfront assurance is a deal-breaker	FIN01
7898	PolyMet says new technology will virtually eliminate the threat of acid-mine drainage. If that’s the case, why won’t they provide up-front financial guarantees? Why is this a deal-breaker if there’s no concern about creating a toxic waste site? Answer: They must not believe their own rhetoric.	FIN01, PD25, PD32
7900	The very lifeblood of northern Minnesota’s economy is its healthy watersheds and waterways, but PolyMet’s proposed mine waste will be leaching sulfuric acid into those same northern Minnesota waterways “for up to 2,000 years.” Is 20 years of a couple hundred sulfide mining jobs worth 2,000 years of poisoned waterways and watersheds that will cost the rest of us millions, and possibly billions, to clean up?	SO01
7901	It’s no surprise that some of the early warnings have been sounded by resort owners, outfitters and township boards, who rightfully worry that the encroachment of a major mining district into the heart of the Superior National Forest near the Boundary Waters Canoe Area Wilderness (BWCAW) could fundamentally alter the tourism industry. The Stony River Township Board of Supervisors in Lake County passed a resolution rejecting sulfide mining. The township is located in the cross hairs of intense sulfide mining interest at the edge of the BWCAW.	SO02
7903	Minnesotans are beginning to realize that the economic revival touted by mining boosters is nothing short of wishful thinking. Mining has historically always been a boom and bust industry, and in the last 20 years sixteen hard rock mines declared bankruptcy. This devastates local economies dependent on the mining industry and forces taxpayers to cover the enormous cost of cleanup and restoration.	SO02
7904	And the jobs that mining companies offer will not bring prosperity. If mining companies’ promises were true, northern Minnesota would be the wealthiest part of the country after some 130 years of iron ore mining in the region.	SO02
7908	Fishing and hunting annually contribute more than \$190 billion to our nation’s economy, without turning waterways and watersheds into lifeless Superfund sites. Businesses that provide services and products to sportsmen—everything from guide and outfitter services to sporting goods stores, motels, grocery stores and gas stations—are the lifeblood of many rural communities.	SO02

<b>Sender Name (Submission ID)</b> Backcountry Hunters & Anglers (50932)		
7925	The headwaters of two internationally important water resources, Lake Superior and the Boundary Waters Canoe Area, are found here, along with over 10,000 lakes and countless streams, rivers, and wetlands. In terms of acid-mine drainage (AMD) risk, you could easily argue this is one of the worst places on the planet for a sulfide mine.	WR001, WR111
7928	No sulfide mining should be permitted in Minnesota without genuine escape-proof assurances that the mine operators will be held fully accountable for any and all environmental harm they cause. Mining companies have compiled a long record of promising safe practices, breaking those promises, and then shifting the costs of dealing with the damage onto taxpayers.	FIN01
7929	As Bob Tammen, a BHA volunteer (and former miner) from Soudan, said: “The risks to taxpayers cannot be overstated. There’s no profit in operating clean-up at closed mines. Makes a lot more sense for parent companies to strip the subsidiary of assets and then file for bankruptcy, letting the rest of us pick up the bill.”	FIN01, FIN10
7933	we urge you to help ensure that no sulfide mining is permitted in Minnesota without genuine, escape-proof assurances that the mine operators will be held fully responsible for any and all environmental harm they cause.	FIN01
16452	In northern Minnesota, the underlying geologic complex consists of low-grade, highly disseminated metals which are very costly to extract, and over 99% of the mined material would be “waste.” ... Mining less than 1% sulfide ores requires blasting, crushing and grinding of rock, leaving behind tons of waste rock and tailings that will leach acid-mine drainage (AMD) and toxic heavy metals into the watershed.	WR070
16456	“Mining without harm” and “environmentally safe mining” may sound great, but there is zero evidence to back up the claim that sulfide mining can be done without causing devastating watershed pollution.	PD03, WR023, WR195
16464	“In Minnesota, the fishing industry alone supports 50,000 jobs and recreational fishing brings in \$3 billion a year,” adds Minnesota BHA vice-chair Erik Jensen, “which would be in jeopardy when acid-mine drainage (AMD) leaches into creeks, streams, rivers and watersheds, eventually ending up in Lake Superior. In the 1990s, acid drainage from the Formosa Mine polluted streams in Oregon and reduced the fish population by 90 percent.”	LU06, SO02
<b>Sender Name (Submission ID)</b> Bailey Rehnberg (39376)		
6347	Drainage and toxic run-off into the St. Louis River and ultimately Lake Superior is both a hazard to local inhabitants and a dangerous long-term decision. Water has become one of the most precious resources in the world and we must recognize both its crucial importance and its finite nature.	WR111
6348	After 20 years of mining, the taxpaying citizens of Minnesota deserve a detailed financial plan for how Poly Met will ensure 500+ years of water treatment. The fact that these assurances have not made it into the SDEIS scares me as a Minnesota resident and tells me that this company is not looking out for our best interest.	FIN13
6349	this mine would set a horrific precedent for both the health of Minnesota's wildlife and wilderness areas across the country. Please do not allow Minnesota to be part of this short-term economic project that will create pollution for hundreds of years to areas of beautiful and precious wilderness.	WI04
<b>Sender Name (Submission ID)</b> Banny Lesar (42547)		
15615	I think that the SDEIS properly addresses all concerns & shows that the extraction of the minerals by Polymet can be & will be done in an environmentally sensitive manner & the permitting process needs to proceed so that they can start production.	PER34

6810 It is essential to maintain a clean environment in the headwaters feeding into the Partridge and Embarrass Rivers and to Lake Superior. The main assessment tools used to predict contaminant loads are computer models and spread sheets to calculate water flows into, through, and out of the mining and processing sites. It is on the basis of this model that claims of sulfate levels and mercury, are calculated. The model also predicts that water treatment is likely to be required for 200 years for the mining site and 500 years for the processing site. Are these predictions realistic? WR035, WR070, WR189

6811 This rock generates acid run off and releases noxious heavy elements. Containment systems can be maintained and replaced with good planning and adequate funding, but liners under mountains of rock cannot. WR127

<b>Sender Name (Submission ID)</b> Barbara Jones (42541)		
13488	One basic property a model should have is to predict current observed conditions from current measured input parameters...Experts in this are have made the following assessments:From the USEPA to MNDNR, USFS, USACE on Apr 5th 2013 referring to "Goldsim" modelling"A software quality assurance/quality control was not performed. Relying on professional judgment may not always be accurate, and/or others may have different professional opinions. Therefore, the results may not be scientifically defensible.The section of the Quality Assurance Plan pertaining to data quality objectives does not discuss numerical accuracy levels nor did it discuss their underlying rationale. Without this information, the adequacy of the data is indeterminable.	WR189
15594	I have not yet found information to give me confidence that the models can be trusted. Even worse I have found experts in the field who have severe reservations about the predictions. If the models are untrustworthy stop the project. If they are just poorly presented, do a better job. If the system is too complex for the experts to agree on how to proceed we should wait to do more research until we have a better understanding to make an informed choice.	WR189
15595	An item I expected but did not find in the DEIS is detail of contingency plans in case of natural or man-made disasters. What happens if a local wild fire destroys power lines and the site is evacuated for a week or more? Water treatment facilities are vulnerable to these events. There will also be man-made problems from accidents, operator errors, and poor design.	FIN05, NEPA08
15596	During the long period after mining stops, the DEIS estimates that ongoing expenses of \$3-6 million dollars per year are needed to treat water flowing from waste rock and maintain covers and dams. The climate, technical, social, political conditions even 50 years in the future are impossible to predict.	FIN05
<b>Sender Name (Submission ID)</b> Barbara Peterson (7153)		
492	The number of jobs PolyMet would create would be a huge benefit to the Iron Range and increase the tax base which in turn benefits our local economy. Including families, schools,and merchants.	SO02

<b>Sender Name (Submission ID)</b> Barbara Wirth (16942)		
2080	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189, WR202
2081	•The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
2082	•The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	PD07, PD29
2083	•The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.	WR010, WR012
2084	•The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17, WR067, WR126
2085	Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.	NEPA09, WR195
<b>Sender Name (Submission ID)</b> Barry Babcock (39440)		
7783	The historical evidence of contamination from sulfide mining is too risky to place our waters in jeopardy. The MN DNR should be more protective of our clean water assets than catering to the wishes of industry.	WR023
7791	According to "Earth Works" a 2008 study shows that the American taxpayer is stuck with a 70 billion dollar cleanup cost for sulfide mine AMD in our waters. We would be foolish to risk our waters to a 20 or 30 year mining project.	FIN10
<b>Sender Name (Submission ID)</b> Barry Bissonett (43007)		
11664	The PolyMet Environmental Impact Study is hypothetical. Even proven first methods can result in environmental disaster given the event of natural earth movement, equipment failure, or human error.	GT14

6727	The proposed plant site occupies a natural water source. There has been no study regarding the source of the water at the present site and whether or not the area is prone to subterranean water migration by way of natural permeability or existing fractures. Any spill at the site could use such existing routes to dangerously taint the local fresh water system (page ES-5 and 4-43 through 4-44). Why has such a study not been conducted?The SDEIS states (ES-36 paragraph 2) that there is an expected case that stormwater runoff will include lead beyond acceptable levels. It also states (ES-36 paragraph 5) that the NorthMet project would increase the amount of mercury in the Embarrass River. These toxins pose serious risks to plant, animal, and human life in the immediate vicinity and also downstream. The SDEIS admits that the project will pollute the Embarrass River and other streams but pays scant attention to the fact that these streams flow toward and into the St. Louis River, which is, itself, the largest tributary of Lake Superior. Why is there no detailed analysis of possible pollution of the St. Louis River?	WR010, WR024, WR071, WR081, WR099, WR125
8584	Sulfide-bearing rock exposed to air and water yields sulfuric acid, which results in forms of pollution that will last at least 500 years... copper-nickel mining companies have a terrible history of leaving environmental damage in their wake--but it is least dangerous in arid settings. Why would we allow this kind of mining in our region, one of the world's premiere sources for fresh water?	WR001, WR023
8587	The proposed plant site occupies a natural water source. There has been no study regarding the source of the water at the present site and whether or not the area is prone to subterranean water migration by way of natural permeability or existing fractures. 14914	I feel strongly that sulfide mining should not be allowed in NE Minnesota until it has been thoroughly explored.	PD32
<b>Sender Name (Submission ID)</b> Becky Erickson and Dan Sullivan (40122)		
6687	the SDEIS indicates few cumulative effects, there are many unknowns and a significant number of assumptions contained in that report. We know for certain that other similar mines have had measureable adverse environmental impacts.	CU14
15298	We also know that mining companies have poor track records for safety and environmental concerns. Given the fragility of the environment in the vicinity and the potential for long term adverse impacts, I would encourage the DNR to decline this permit.	PER35
<b>Sender Name (Submission ID)</b> Becky Hall (41645)		
2146	Having participated in the public comment events, reading the SDEIS, visiting with PolyMet officials at their site as well as reviewing information provided by the three governmental co-lead agencies (MNDNR, USACE and USFS), I am very confident that each entity has done thorough and extensive work to address the environmental concerns of this project and it should be permitted to move forward with its construction and production of the mining facility at the former LTV site in Aurora, MN.	PER34
2147	The argument that it will take 200-500 year to treat the water from the site is factually incorrect. What the model does show is that PolyMet can comply with Minnesota's laws, some of the strictest in the nation, regarding environmental protection of its lands and water.	PER34, WR036
2148	I also learned, after visiting PolyMet, that even at the site, should any water inadvertently escape the "lined" tailings basins, its acidic level (after being treated at the site) is well below the agencies requirement as well, about the same acidity as milk for that matter.	WR147
2149	Additionally, PolyMet has already committed somewhere between \$100 – 200 million for water treatment, clean-up and mitigation once the plant is closed. Along with already investing millions of dollars in the permitting process over the last decade, PolyMet is also committed to investing millions more in leaving its home, once the mining is complete, in the best condition as it received it.	FIN16
2150	I support this project wholeheartedly rather than remaining dependent on these [precious metal] resources coming from other countries with less environmental regulation and more harm to their environments.	NEPA05
2151	this project has a huge economic impact on our region creating hundreds of great paying jobs for families – 360 full-time jobs, 600 more related jobs, 2 million construction hours, and increased tax revenue that benefits our communities and education system.	SO10

19769	Page ES-38- If the mine is permitted, who will do the monitoring of the wetlands to see if they being affected? These are high quality wetlands as noted on pages 5-224. No determination has been made for replacement but there is a potential for a very high number of acres of high quality wetlands to be affected indirectly as well as directly with as many as 6,498-7,250 acres to be affected. Much of this affect will be from the mine's drawdown of groundwater for processing of ore plus seepage from the tailings basin. Paragraph 2. Page ES- 38- Wow, loss of a huge number of acres of High Biodiversity native wetlands plant communities! Reclamation after mining will not restore the loss of this type of native plant community that has been undisturbed for many years. None of the properties being proposed for exchange will have such Biodiversity in such high number of acres? Is this an acceptable loss? Paragraph 4.	WET01, WET02, WET14
19770	Watershed Restoration- Page 3-71 In the 5th paragraph, who will do the evaluation for conversion to wetlands? McFarland Lake Tract (Tract 5)- I do not know what G-LA-51 is and it does not appear in the Abbreviations section. The only thing that Tract 5 offers is proximity to McFarland Lake. It has no wetlands to assist with replacement of wetlands. Page 4-46- Paragraph 2- The different types of wetlands were not well defined. What are ombrotrophic wetlands? It would have been better to put something in the Glossary or give a much clearer explanation than that provided. Effects are difficult to determine when you cannot understand the terminology.	WET16, WET21
19771	4.2.3 Wetlands Page 4-136- Please see comments in this document for Page 4-447. What is shrub-carr? Will these wetlands be replaced with similar high-biodiversity wetlands? Too bad to lose these good wetlands that are excellent filters of water. 4.2.3.1.1 Wetlands Delineation and Classification- Page 4-139- What is the Eggers and Reed classification System? Who did the classification? Were there other systems that could have been used? Figure 4.2.3-2- Why was only one wetland surveyed south of the Transportation and Utility Corridor?	WET04, WET07
19772	Wetland Delineation and Classification- Page 4-441- In the final paragraph on this page, wetlands are evaluated by function but do not seem to be evaluated by quality which means that a poor wetlands that shares the same function as a high quality wetland could be exchanged without regard for the quality of the wetland. This makes it possible to substitute any wetlands for another by looking only at the functional qualities. Hydrology, Wetland Vegetation, and Community Types- Page 4-447 Paragraph One- The wetlands proposed for exchange are usual types of wetlands found on the Iron Range and are not equivalent in diversity to the wetlands that would be lost on the Mine Site for the North Met project.	WET14, WET17
19773	Table 4.3.3-4- Lists the wetlands by type for the lands proposed for exchange. I have prepared a comparison table with Types of Wetland being lost compared to those in the exchange. ... The tracts for exchange are much different and not equivalent wetlands. Tract 5 has no wetlands at all. Wetlands Functional Assessment- Page 4-448 Once again the only criteria used for wetland evaluation seems to be that of function. Most of the wetlands for exchange did not have the best Amphibian habitat. Also similarly found on Page 5-298. "Wetland hydrology is a complex mix of precipitation, surface runoff, and, in some cases, groundwater. Despite the use of augmentation to mitigate effects, the response of complex natural systems to human disturbance could only be estimated. Therefore, monitoring of wetlands hydrology and vegetation communities would be the most appropriate way to document the extent and magnitude of wetland responses to the NorthMet Project Proposed Action." Lots of decisions are left to "during the permitting phase". This phase of decision making that does not involve public comment nor will we hear the results that are decided during permitting.	WET14
19774	4.2.2.3.1 Groundwater Resources Geology and Hydrology- Page 4-95- In paragraph 3 the "wetlands between the Tailings Basin and the Embarrass River are assumed to represent surficial expressions of the water table (Barr 2009b) and reflect, at least in part, the increase in groundwater and surface water flow from LTVSMC tailings seepage." It is assumed that these wetland/bogs will be studied to see what solutes from the tailings basin are presently present for a baseline of discharge from the tailings basin. WWTF discharges with sulfate concentration of less than 10 mg/L would be discharged into an existing wetland that flows toward Dunka Road and eventually into the Partridge River. Would this discharge continued over the long term, have a negative effect on the wetland and eventually the Partridge River?	WR079, WR143

19775	4.3.2.2.7- Tract 5- McFarland Lake Lands There are no wetlands on this tract of land so it cannot be used for wetland credits. At present around 90% of Cook County is under Governmental ownership (State and Federal) which makes for a very small tax base in the County. PILT (Payment in Lieu of Taxes) payments to local governments have been sharply reduced by the Federal Government which has reduced the tax income for Cook County from PI LT. In addition, the County has strenuously resisted land exchanges in the past with the rationale that lands taken out of private hands reduces the tax base. I think this is not the best option for a land exchange given the situation in Cook County. 4.3.3.2.1 Non-Federal Lands- Page 4-440 In paragraph two, there are three criteria set forth for land exchanges related to wetlands. Since Tract 5 at McFarland Lake has no wetlands, it does not meet the criteria as set forth. General Comment: On the pages covering land exchange information for the five Tracts and the Mine Site, information was hard to follow because information was not well separated.	LAN03, LAN06
19776	Page ES-40- Like all mining, this will be a boom and bust proposition which was not fully alluded to in this analysis. There will be the large number of jobs in the beginning and then when the plant and mine are operational, the number will decline to just a few jobs leaving many of the workers unemployed. This has been the pattern for all mining conducted on the "Iron Range". After the boom, the people that choose to remain in the area are then under or unemployed and are then a drag on the economy of the state of Minnesota. Many have also experienced health issues related to exposure to the dust and debris from mining (mesothelioma) for example. This is also a cultural and socioeconomic fact that was not discussed in this SDEIS.	SO04
19777	4.2.10.1.5 Public Service and Facilities Water and Sewer- Page 4-336 Many of the wastewater systems are aging in the area and many of the septic systems are failing which the three counties in the study area are attempting to deal with. Given the bedrock conditions septic systems are expensive to put in and repair. Additional people living in the area will create strain on these systems. 4.2.10.1.4 Housing- Page 4-332 With an influx of mining personnel, there will be an increase in the price of housing and this will present a hardship for many of the low-wage workers that work in tourism or for the government or education. It will retard the development of the area's tourism and influx of retirees who would provide a more long term stable base for the community. 4.2.10.1.3 Public Finance Page 4-332- "The mining and processing of base and precious metals in the state are not currently subject to production tax." Could not believe this when I read it! The taconite industry must be trying to figure out ways to get into the precious metal mining business since they have to pay production taxes. I saw indication among the other taxes listed that there might also be exemption from sales taxes. They are paying taxes on precious little. No wonder it is called precious metal mining. Also please refer to notes on Page ES-40 in this document.	SO04
19778	1.3.1 Applicant's Purpose and Need Statement Page 1-11-It is admirable that PolyMet finds its mission to be the creation of jobs in northern Minnesota so that it can export our minerals to "developing countries like India, China and Brazil". I realize that PolyMet is an international rather than an American company so that maybe their focus is on the world rather than use of these minerals here domestically, however they are a resource that currently belongs, at this point, to the American people through the United States Forest Service. I am not sure that they should be exported to other countries, especially places like China that have not always had a good relationship with the United States. We also need these types of minerals to develop our green industries. Why the preferential treatment for developing nations? How much of a partner is China in PolyMet? How much of the ores have been pre-promised to these developing nations?	SO06
19779	Pages 4-325-4-326- "Mining employment has declined consistently in all three study area counties, from more than 12,000 in 1980 to approximately 3,000 in 2009 in St. Louis County. Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted. Since mining employment can vary greatly from one year to the next, the decline observed from 1980 and 2009 does not represent a steady reduction in mining-related employment." Mining is not going to provide a stable base of jobs for this area. During later years of mining operation, the numbers of persons employed usually drops to very low levels compared to that at the beginning of mining. It is disingenuous of PolyMet to indicate that one of its prime interests is relieving unemployment in the area.	SO01

19780	Page 1-11&1-12 D-MN-2 "Ensure that exploring, developing, and producing mineral resources are conducted in an environmentally sound manner so that they may contribute to economic growth and national defense." At present this Land Exchange and the mining would not meet these qualifications. It would appear that at least temporarily jobs would be created but mining is a boom and bust proposition so the economic conditions might be met only for 20 years at most. Sending minerals to China would not be a way to contribute to the national defense because we could not know if they are going to be used for peaceful purposes or to develop missiles or the computers that control them. Paragraph 1.	LAN04
19781	3.2.2.4 Financial Assurance-Page 3-136 This is the most troubling portion of this SDEIS. There is much riding on these financial assurances for the State of Minnesota and its taxpayers as well as our environment. In many places, mining companies have not acted responsibly with the recent examples in just the last several weeks of the pollution of rivers in West Virginia and a 32 million dollar fine against a mining company conglomerate from the EPA for over 6,000 violations of its permits. In the end PolyMet's first priority is to successfully mine and make money for its shareholders. It has spent a lot of time and money in advertising at the High School tournaments and in newspapers to appear to be a concerned and progressive company. The company and this SDEIS accents that this mine will be bringing jobs to a depressed portion of our state. However, this has to be balanced against other factors. Mining is a boom and bust industry. At first there are a lot of jobs but after a few years, the number of jobs declines radically and then there are many fewer positions. After the ore is gone, there is no more work and at some point northern Minnesota will be mined out and left with whatever the mining companies have left in their wake for good or bad both in human and environmental terms. If the water is polluted, it will not be possible for anyone to live or use the land or water. Also of concern is the fact this this mine produces highly reactive waste rock that can easily pollute not only the two rivers dose to it but also the St. Louis River watershed and in the end Lake Superior which is a much vaster resource than one copper mine. Since this will not be like iron mining and the wastes are predicted to remain for hundreds of years, there is a lot riding on approval of this mine and its financial assurances. I know of no investment that has stood the test of 200-500 years. I would like to have such instruments at my disposal for my own use. One can only hope that whomever approves the financial assurance documents, is extremely careful and conservative in making their estimates of how much money will be needed to assure treatment of wastes for up to 500 years. Paragraph 2- Since there are no federal financial assurances to be incorporated into this Permit to Mine, does this mean that this site would not be eligible for Federal Super Fund Cleanup Funds?	FIN01, FIN05, FIN08, FIN10, FIN15
19782	Page ES-11-It appears that the final land reclamation, closure and post-closure maintenance would include water treatment that is not yet proven effective which might mean that higher levels of water treatment might be needed over a very long period of time. Who will be providing the maintenance and monitoring activities over the 200 to 500 year horizon? It is not anticipated that PolyMet will exist for that length of time as mining companies seem to come and go relatively quickly. Does this mean that the State of Minnesota and its tax payers will be on the hook for a long time to come? Also determining costs for the Financial Assurances to the State will be extremely difficult since the costs for cleanup are going to be difficulty to determine. It would appear to need to be a very substantial sum of money. Given that the amount needed for financial assurance and closure should be very high, is it even cost effective to mine this deposit since the company's objective is to make money for its shareholders?	FIN01, FIN05, FIN10, FIN11
19783	Page 3-138 & 3-139- Are these Financial Assurance Instruments subject to failure and if so who Will be responsible for the financial costs of cleanup and monitoring? Does this mean a good chance that the State and its taxpayers are going to be responsible for this? 3.2.2.4.2 Financial Assurance Instruments Page 3-138 "failure or limitations on the ability of third parties to pay reclamation costs." Who are these third parties?	FIN01, FIN10

19784	1.4.5 Financial Assurance Pages 3-136, 3-137, 3-138 Page 1-17- This is covered most extensively in Chapters 2.6 & 3.2.2.4 and the following portions of the SED IS. Comments on financial Assurance will be made that this point in the comments rather than during comments for Chapter 3. "Minnesota Rules, part 6132.1200, require that before a Permit to Mine can be issued, financial Assurance instruments covering the estimated cost of reclamation, should the mine be required to close for any reason at any time, must be submitted and approved by the MDNR." A paragraph later the following is stated: "The level of engineering design and planning required to calculate detailed financial assurance amounts is typically made available during the permitting process and was not available at the time that this SDEIS was prepared." These two statements appear to be somewhat at odds. Is the financial assurance information done before the permit can be applied for or does it have to be done before the permit can be issued? Who reviews the financial assurance information for adequacy? Since we are talking very long time spans of 200-500 years for remediation of waste water from this mining and ore processing and since the likelihood that PolyMet will not exist in those time frames a lot seems to be at stake for the taxpayers of Minnesota and our future generations. Are a few jobs now worth huge expenses for cleanup, since PolyMet is not likely to exist for long into the future and the financial instruments may also not hold their value over that long a time frame. This may mean the citizens of the state will be on the hook for cleanup and follow through. This is not like the mining that has been permitted in the past since there is much more significant environmental damage that is likely to occur. What happens if PolyMet (not an American Company) declares bankruptcy? Although financial instruments listed for use are supposed to be not dischargeable by bankruptcy, you cannot get blood out of a turnip so to speak and the mining companies have proven adept at shirking their financial responsibilities in the past by using bankruptcy. On page 3-138 the following is stated: "failure or limitations on the ability of third parties to pay reclamation costs" Who are the third Parties? In the SED IS a point is made that there are no Federal assurances needed for this mine. Does this mean that it would not be eligible for Super Funds for cleanup?	FIN01, FIN04, FIN05, FIN08, FIN10, FIN14, FIN15
19785	3.2.2.1.10 Reclamation and Long-term Closure Management- Page 3-59 What is mechanical vs. non-mechanical water treatment? Has non-mechanical water treatment been developed at this point? No explanation is offered. What agency did the modeling for the water treatment discussed in this section? No mention is made of what the conditions would be for the release of PolyMet from water treatment. Since time frames discussed for water treatment are 200-500 years is it reasonable to expect that PolyMet will still be around or even financially able to provide for this water treatment? Isn't it reasonable to assume that someone like the State on Minnesota will have to be committing resources to this? No plant will last the 200-500 year length of time water treatment many be needed. In paragraph four, who is responsible for the monitoring of the water from treatment? Also in that same paragraph, what happens with water treatment? One would have to assume that the Plant described will not function for the 200-500 years described as the period estimated for treatment of the water. What happens when the plant fails? Who rebuilds it? It is unimaginable that PolyMet will exist for that time period. There seem to be no plans in the SDEIS for replacement of water treatment facilities and one has to hope that the financial assurances cover the costs for new water treatment facilities.	FIN01, FIN10
19786	Page ES-17- What monitoring is done for the water that accumulates in the pits? Is it acidic and hazardous to wildlife? Page ES-24- Since the water in the pit lake will need treatment, who will be providing the treatment and who will oversee that equipment stays functioning after the mine is closed? What happens if the treatment equipment needs replacement or if non-mechanical treatment does not become an option? No equipment will function for the 200-500 year time horizons given as the length of time treatment will be needed. If the pit water is not treated properly does this pit lake become a hazard to wildlife that may land on or use the lake for nesting? Figure 3.2-29 Will water in tailings basin be toxic to any water birds or wildlife that might get into it? Hydrometallurgical Residue Facility Reclamation- Page 3-130 Is any ponded water safe for wildlife such as waterfowl?	WI04
19787	Page 4-122- Embarrass River Water Quality-Spring Mine Creek is not visualized on any maps in this section of the SDEIS. Paragraph 2-"Spring Mine Creek was listed by the MPCA as impaired for invertebrates and fish while the Embarrass River Watershed from the headwaters to Embarrass Lake was listed as impaired for fish." Are we to expect that the pollution that has resulted in these impaired waters will increase with the use of the tailings basin for the NorthMet mine?	WR060

<b>Sender Name (Submission ID)</b>	Becky Milanese (54766)	
19788	Page 4-133 Lower Embarrass River-It appears from the third paragraph that the conclusion of this SDEIS is that the fish are all ready so contaminated that it will be all right to mine because the mercury in the fish is at mercury concentrations that are too high to remediate. Studies are suggested but have not been done. Why? Because it is a lost cause? The reference to these waters in the center of the paragraph is not clear as to which waters are being referred to. How were the conclusions regarding the mercury concentration in seepage determined? Is this water going to be treated so that mercury levels are lowered? Is the idea that there is already mercury in the fish so the company should not have to worry about possibly adding any mercury? As written, this is difficult to understand.	AQ11
19789	Page 4-29 Table 4.2.2-2- Footnote to this Table indicates that Colby Lake is on the final 2012 TMDL List. With the possibility of mining wastes being added to Colby Lake and White Water Reservoir, will more mercury treatments need to be added for drinking water or fish. I know that the SDEIS indicates that mercury will not be added but is there going to be monitoring to assure that this does not occur?	MERC22
19790	3.2.2.2.4 Use During Operations- Page 3-83 It is anticipated that there will be quite a bit of dust generated over the years of operation of the Mine and the transportation of the ore in open railroad cars. What happens to the water and vegetation in the area of drift from the railroad line? Will this be monitored and if this is a problem would some other type of railcar be used? What remediation is planned for this drift and the environmental damage?	AIR04
19791	4.2.4.2.2 Invasive Non-native Plants- Page 4-174- It is noted in this section that non-native plants and seed mixtures exist and have been used in the past as cover for mining pits and reclamation sites. It is hoped that during reclamation, an effort will be made to use mixes of seed that do not have non-native seed that will continue the former patterns of reclamation. 4.2.4.2.3 Threatened and Endangered Plant Species Page 4-176- What happens to the two state endangered, two state threatened and seven state species of special concern that have been identified on the Mine Site? 4.2.4.2.1 Cover Types- Page 4-183- Regional Foresters Sensitive Species-The Biological Evaluation is referred to in the first paragraph of this section however it is not available and it is not known what is in it which which does not aid in evaluation of the SDEIS.	VEG01, VEG05
19792	Page 4-173-Minnesota Biological Survey- Paragraph One- "The entire 3014.5-acre Mine Site has been characterized by the MBS as various Sites of High Biodiversity Significance due to the presence of the One Hundred Mile Swamp site, which covers 15 percent of the Mine Site, and the Upper Partridge River site, which is 85 percent of the Mine Site (MDNR 2008a)." In Paragraph 2 it is further specified 1/Two native plant communities, black spruce-jack pine woodlands (Fdn32c; 34 percent of Mine Site) and rich black spruce swamp {FPn62a; 7 percent of Mine Site), have been characterized by the MBS as "imperiled/vulnerable" and "vulnerable" respectively MDNR 2008b)." This means that the mine site covers wetlands of which 41% are of high ecological value. This is a pretty large loss. See also Paragraph Two on Page 4-174 under National Hierarchical Framework of Ecological Units.	VEG02
19793	Page ES-41- In Paragraph 6 the following is noted" Air emissions can travel many miles before they are no longer detectable." Does this mean that persons in the surrounding areas are going to be under the threat of particles that can cause respiratory diseases such as mesothelioma? Page ES-41- In this section the point is made that the air pollution is below state and federal risk guidelines. Unhappily, iron mining has created an epidemic of persons with mesothelioma in the area that is currently being studied by the University of Minnesota. I have seen no indications in this document of what will be done to prevent similar respiratory difficulties for the miners doing this new type of mining and the public from drift of particulates. Paragraph 1.	AIR03

<b>Sender Name (Submission ID)</b>	Becky Milanese (54766)	
19794	4.2.2.1.3 Wild Rice Page 4-33- Presence of Wild Rice within the North Met Project Area- The "MPCA has reached a draft staff recommendation regarding waters used for the production of wild rice." The waters From the draft statement are listed but not the conclusions from the recommendations. Page 4-93 & 4-94- Paragraph 2- "Concentrations of sulfate are of special concern because the MPCA staff has recommended that this entire reach of the river from the outlet of Colby Lake to its confluence with the St. louis River is a water used for the production of wild rice (MPCA 2012b). Based on the 2008-2009 data, sulfate concentration in the Lower Partridge River averages about 162 mg/l. For the North Met Project Proposed Action, sulfate concentrations in receiving water has been identified as an issue for consideration in the EIS." This paragraph speaks for itself.	WR158, WR162
19795	4.2.14.2.5 Geotechnical Summary- Page 4-376 In concert with the comments above the following is noted in this section. "The existing northern dam in Cell 2E has been identified as a potential area of weakness as it is underlain a layer fibrous peat up to approximately 10ft. thick that extends north beyond the toe of the dam into a nearby wetland and due to the presence of some contractive fine tailings and slimes."	GT01
19796	Page 4-43-Geology of the Mine Site- "underlying the Virginia Formation is the Biwabik Iron Formation, which is the source of taconite iron ore and is an important water source for residential and community wells in the region. The mine pits would retain about a 130-ft separation between the final pit and the Biwabik Formation based on current drilling and interpolation of geology between drill holes." How will the drillers and blasters know how much separation is being kept between the two formations. Since the Biwabik Formation is quite permeable, with groundwater and precipitation, what are the chances of leakage into the Formation from the mining pit with its reactive wastes resulting in contamination of the ground waters?	WR007
19797	*Page ES-47- It is understood that two of the Co-lead Agencies have no requirement to have a preferred alternative. Without a preferred alternative, it makes it difficult for the public to understand where these agencies (with their expertise) stand in relationship to this SEDEIS and since they should be representing public interests, it would be valuable the public to know if they do have a preferred alternative or what their concerns might be. Paragraph 3.	ALT20
19799	3.2.2.1.7- Waste Rock categorization and Management- Page 3-46 In the first paragraph the "East Central Pit would be flooded ( using groundwater, in-pit runoff," etc. Where will this groundwater be obtained and what will the effects be on the aquifer that it Is taken from? Will this do damage to the remaining wetlands or to the flows of the Embarrass and Partridge Rivers? 3.2.2.1.8 Engineered Water Controls- Page 3-46 What and where is this non-contact stormwater coming from? More importantly, where is it being direct to? This is also a question that is not answered on Page 3-64 in the Section on East Pit and Central Pit. Water Management- Page 3-72 Paragraph One- Why is effluent from the WWTF now sent to the combined East Central and West Central pit when formerly it was sent to an off-site landfill? Also in paragraph one is The following: "The objective of treating the West Pit water would be to manage water quality within the pit prior to groundwater outflow from the pit lake via the surficial aquifer" Why is this water that needs treatment being allowed to get into the surficial aquifer?	PD03, PD04, PD35
19800	1.4.2.1 Overview Page 1-13- "By rule, the MDNR is the designated RGU for the NorthMet Project." This has never made any sense that the MDNR should have the final decision over property that is currently owned and managed by the United State Forest Service for the benefit of ali the citizens of the United States of America. I do not understand how a local branch of government can tell the Federal government what will happen on property that it has no interest in or jurisdiction over. Makes no sense what so ever despite what the MEQB (another local unit of government) says. Shouldn't the USFS be the determining agency since the land exchange has not occurred? Paragraph 3. Reclamation Planning- Page 3-63 What agency receives the annual Contingency Reclamation Plan specified in Minnesota Rules?	PER45

19801	Table 3.2-12- How toxic are the material stored in the Reagent Building? What plans are there for cleanup of spills? (Think West Virginia storage tank leakage and water contamination). 3.2.2.3.6 Hydrometallurgical Process- Page 3-112 & 3-113 Table 3.2-13- How toxic are these materials? I see they need secondary containment. Is there a team trained to deal with spills or leakage? We have to hope that we do not have a situation like the contamination in West Virginia with tank leakage into surrounding rivers.	HAZ01
19802	4.2.14.2.1 Location and Description Overview- Page 4-368 Failure of the tailings basin with a height of 200 feet would release a lot of tailings. Since the new tailings are at the top, they would be sure to inundate the surrounding area. 4.2.14.2.2 Development of the Existing LTVSMC Tailings Basin Page 4-371 What is a long ton? What is a short ton? The Tailings Basin seems unsound in areas. Page 4-372- 11In 1995 and 1996, approximately 1,500 cubic yards of spoil material dredged from Taconite Harbor in Lake Superior was placed in the south-eastern portion of CellIE." I think this Is the material that entered Taconite Harbor when the Tailings Basin at Lax Lake collapsed sending tailings over a large distance eventually entering Lake Superior at Taconite Harbor. As can be seen, Tailings Basins can collapse.	PD10, PD11
19803	4.2.1.4.2 Legacy Contamination- Page 4-10 & 4-11 "Additionally the LTVSMC Tailings Basin seeps are being managed under the Cliffs Erie Consent Order using short-term measures until long-term mitigation measures are determined." What happens to the AOCs when PolyMet takes over? These seeps were not mentioned in the information on the tailings basin in Chapter 3. When are long-term mitigation measures determined? Page 4-17-Is Cliffs Erie continuing to "land farm" petroleum-contaminated soils at this time? This also was not mentioned about the tailings basin in Chapter 3. What is likely to happen when the mining wastes are added on top ofthese "land-farmed" materials. Is this something that PolyMet will continue?	HAZ05
19804	3.2.2.4.1 Cost Coverage and Estimation- Page 3-137 Off-site disposal of pore water from Hydrometallurgical Residue Facility- Who does this disposal and where is it disposed of? How is the water transported? 3.2.2.3.7 Hydrometallurgical Residue Management- Page 3-115 How stable is the existing LTVSMC Emergency basin that will be used for these wastes? 3.2.2.3.2 Existing Facilities- Page 3-87 The tailings basin is of an old design. I assume it is similar to the tailings basin at Lax Lake that failed sending tailings downhill for many miles. This area still looks like a moonscape and efforts to reclaim the area have been pretty unsuccessful. Plants do not grow well. Same concerns for the Tailings Management on page 3-102. What plans are in place should this basin fail? Same comments and concerns for Tailings Basin page 3-116 & 3-117. See also comments later in this document for page 4-126.	PD10, PD11, PD18

19805	Product and Product Tank Disposal-Page 3-128 Who is responsible for the monitoring the tanks for leakage or maintenance? The reagent suppliers or PolyMet? Tailings Basin Reclamation- Pages 3-128 & 3-129 Last paragraph page 3-129, what is periodic inspection? As I have reviewed the rest of the SED IS, it is apparent that the Executive Summary does not highlight many of the problems and important facts that are presented in the rest of the document. It appears to be an overly optimistic and very simplified view of the document and many of the problematic areas are not addressed in the Executive Summary at all. Page ES-10- The tailings basin from the former mining is proposed for use. Has this tailings' basin been studied to determine if it is stable enough to receive more tailings? We have had tailings basins collapse (the basin at Lax Lake) which resulted in massive restoration needs and environmental degradation. Both the Embarrass and Partridge Rivers and their watersheds are close to the tailings basin as noted from later in this SDEIS. Page ES-23- When waste rock is in the Category 2/3 and 4 stockpiles, how is reactivity of the rock controlled since it is exposed to air and water? Paragraph 2. What are stockpile liners made from and are they degraded by the sulfuric acidic runoff from the waste rock? Paragraph 3 In the Executive Summary there are no Figures that show location of the Category 4 stockpile and its proximity to water control system. They appear later in the document but no references are given so it is difficult to understand what is being described. Page ES-23- During operations, the top of the tailings basin is open which allow reactivity of wastes with air and water. Sides of tailings basin is addressed. Again see comments on page ES-10. Paragraph 3 in this document. Page ES-23- In this paragraph it sounds as if the waste rock will be placed immediately into the East Pit however, later in the SDEIS it indicates that waste rock will be stored in piles outside of the pit. Monitoring, Adaptive Management, and Mitigation Pages ES 24-25- How will a flotation tailing basin pond bottom cover system be installed during reclamation? This sounds like it is below water in the tailings basin but how will that prevent oxygen getting to the tailings if it is in the bottom?	PD07, PD10, PD15
19806	Figure 10- Poor labeling of structures on the map make it difficult to evaluate the proposal where this figure is referenced. Missing are the Embarrass River and Colby Lake. Although these structures are identified in later figures, it is difficult to search through the whole SEDEIS to find Figures that show what is being referenced in the proposal at this point. Page ES-40- It is interesting to note that the figure for wages and rents that is estimated for the economy (\$231 million) is not a whole lot below the figure of \$332 million that is estimated for the value of the extracted minerals. Apparently this is enough of a profit for Poly Met to feel that is willing to take on the mining of these minerals. There is nothing to indicate where these figures were obtained and whether the cost of closing the mine and ongoing remediation of the wastes was factored into these figures. Paragraph 5.	PD38, SO04
19807	Category 1 Stockpile Water Containment System and Cover- Pages 3-46 & 3-47 In the last few years, there have been 100 year rain events with rainfalls of over 1" per hour lasting a number of hours. Will this system and its pumping capabilities be capable of handling an event of this magnitude? What if the power fails to the pumping or water treatment facilities? Category 2/3 and 4 Stockpiles and Ore Surge Pile Liners-Page 3-51 It is noted that Category 2/3 and 4 piles are treated exactly the same as one another. Why is this when Category 4 wastes are going to be so much more reactive and produce so much more sulfuric acid? Has this 80-mil LLDPE geomembrane been tested against sulfuric acid? What is the overliner drainage layer composed of? Has it been tested against sulfuric acid runoff? Wastewater Treatment Facility- Page 3-52 Does this Central Pumping Station have power backup in case of power failure from the grid? What happens when the power goes down? What agency does the water quality monitoring and oversees the wastewater treatment?	PD15, PD16
19808	3.1.1.5-Plant Site Layout Overview-Page 3-3 and 3-4 No figures are given that show the location of all the structures at the plant site until later in the chapter. This makes it difficult to visualize both the mine and plant sites and the relationship of structures and make pertinent comments. No mention is made as to whether the tailings basin has been studied for stability. A number of years ago the tailings basin at Lax Lake collapsed spilling tailings across many miles and eventually spilling across Highway 61 and into Lake Superior. Environmentally that area has had very poor recovery. Since this tailings basin is older than the one at the former Lax Lake, structural stability might prove of the essence since these wastes are considerably more toxic than taconite tailings.	PD07, PD11

<b>Sender Name (Submission ID)</b>	Becky Milanese (54766)	
19809	3.2.2.1.9 Water Management- Page 3-52 &3-53 "Sludge waste would be disposed of off-site in a solid waste landfill until the Hydrometallurgical Plant became operational." Where is this landfill? Is it properly devised to handle such sludge until it is returned to the Hydrometallurgical Plant for processing. Shouldn't this be considered a hazardous waste and is there such a landfill in the area? Reference is made to the Hydrometallurgical Plant in Section 3.2.2.3, however in reviewing that section no mention is made of when that plant might be constructed. This means that sludge could be hauled for an uncertain length of time and no indication is given of when the sludge would be returned to the plant for processing. Again the tailings basin is discussed but actual location has yet to be shown.	PD17, PD19
19810	West Pit- Page 3-65 "Reject concentrate from the WWTF RO would be evaporated and the residual solids disposed of off-site." Is this the same off-site facility referenced in section 3.2.2.1.9? This is not the section referred to previously, but is it the same facility? See comments for page 3-53 this document. Category 1 Stockpile- Pages 3-65 & 3-66 Is the process for covering stockpile 1 a new process or is it a proven technique? Who will do maintenance for removal of brush and trees and for how long will that be needed? 200-500 years? In paragraph two, once again there is talk of converting the RO reject concentrate to residual solids, which would be disposed of at appropriate off-site facilities. Again, are is this the same Facility referred to in Section 3.2.2.1.9? Post Closure Activities-Page 3-79 Paragraph one- Who will do the repair and maintenance of the Cover system for Stockpile 1? What are the non-mechanical water treatment systems? Have they been developed to deal with such large amounts of wastes?	PD03, PD06, PD16
19811	3.2.2.2.3 New Construction and Pre-production Development- Page 3-83 In construction of the new water pipeline of 7.5 miles in length, is special piping being used that can withstand the sulfuric water being carried in the line?	PD36
19812	5.2.2 Water Resources- Page 5-5 Summary: "While reusing the existing LTVSMC Tailings Basin offers environmental benefits (e.g., reducing wetlands effects, addressing legacy water quality issues), it does create some challenges because the existing LTVSMC Tailings Basin is not lined and currently releases seepage with elevated concentrations of sulfate, TDS, and hardness, among other constituents. Many of the engineering controls proposed by PolyMet at the Plant Site are related to managing seepage from both the existing LTVSMC tailings and the additional NorthMet tailings. The North Met Project Proposed Action would have the potential to affect groundwater and surface water hydrology and quality in both the Partridge River and Embarrass River watersheds. These two rivers are both tributaries to the St. Louis River and within the Lake Superior Basin." These statements from the SDEIS appear to present a somewhat different picture than the information presented in the rest of the SDEIS. There are many other comments that could be made at this point but much of them would repeat those provided previously in this document. It is distressing to see how many features would not have their effectiveness known until the actual construction of the features such as tailings basin bottom cover and the possibility of damages to these liners. Non-mechanical water treatment is another such item where the final ability for this process to is not known. Much seems to be left to chance and we will figure it out as we go along kind of planning. This would appear to be an invitation for disaster.	WR127, WR137
19813	3.2.2.3.11 Water Management- Page 3-123 What about heavy rain events falling into the Tailings Basin? We have had some 1-2" per hour rain events in the last several years. How will this be handled?	WR057, WR077, WR176
19814	4.2.2.1.2 Water Resource Use Classifications Page 4-23 Groundwater- Mining does not appear in the list of 6 priority allocation of waters determined by the commissioner and would appear to be a low priority for allocation of water. It is not explained who the commissioner is or what organization the commissioner is with. Page 4-24 Surface Water- I would be worried if I lived in the City of Hoyt Lakes because of possible impairment of my drinking water. With so much water taken from Colby Lakes and with discharges into the streams feeding Colby Lake and the White Water Reservoir drinking water could be placed at high risk.	WR043, WR200

<b>Sender Name (Submission ID)</b>	Becky Milanese (54766)	
19815	4.2.2.2.1 Groundwater Resources Page 4-45- Paragraph 1-Presence or lack of presence of fractures in the bedrock seems to be just speculation at this time. If fractures are found, what will be done? Would there be reassessment of the seepage of contaminated waters into other Formations and aquifers? 4.2.2.2.2 Surface Water Page 4-61- Upper Partridge River Hydrology- "Seeps from the southern portion of the existing LTVSMC Tailings Basin (south side of Cell E) naturally flow to Second Creek, a tributary of the Partridge River in the Lower Partridge Watershed (see Figure 4.2.2-1); however, they are presently being captured and pumped back to the Tailings Basin und the Consent Decree between the MPCA and Cliffs Erie." What happens when PolyMet takes over? Page 4-86-Colby Lake Water Quality- A TMDL study of Colby Lake is needed but has not been done yet. Is it even worth doing the study since the mine wastes and discharges may change or make the mercury levels even higher and even more difficult to remediate? Page 4-90-Lower Partridge River Water Quality- In the 4th Paragraph, seepages from Pit 9 have high sulfate concentrations. What is being done to improve this situation? We hope this is not a sign of what will happen after closure of the North Met mine project. Page 4-90- 5th Paragraph- It is a shame that MPCA will not be evaluating water quality standards until the NPDES/SDS permitting process so those results are not available.	WR087, WR118, WR125
19816	4.2.2.3.1 Groundwater Resources Page 4-95-In Paragraph 5 the heights of the tailings basin cells are given. One cell is currently topped and closed at 200 feet. It is assumed that the other cells might be filled to a similar height during the North Met project. Again, the stability of the tailings basin is questioned for filling to such heights and the possibility of collapse has not been studied in this SDEIS at any point.	GT02, GT15
19817	General Comments: Chapter 5 has a number of issues that made it difficult for a layperson to make comments on information in this Chapter which include but are not limited to: Much of the information in Chapter 5 depends upon the use of models with which a layperson has no familiarity. Therefore the ability to judge whether the models being used for decision making are competent has to fall to the experts and there is no discussion of those models by experts in the SDEIS. Despite the use of many models, a lot of this work appears to be "educated guesswork" that will have to be field monitored and checked for accuracy at the time the mine is operating and that is pretty late to make changes. An example of this is found on page 5-213. "water management can be answered using the current construct of GoldSim (i.e. transport time for constituent load in Category 1 stockpile). Certain assumptions were made that may not be applicable to all potential project feature modifications."	NEPA07, WR189, WR201
19818	Page ES-17- What is the Category 1 Stockpile groundwater containment system listed in the first paragraph? Use of the LTVSMC tailings basin is worrisome. See comments from page ES-10. Who monitors contaminants in water seepage levels from the Tailings Basin? Paragraph 4. North Met Project Effects of Water Resources Page ES-35 and ES-36 Who conducted all the water tests listed in Paragraph 2? Aluminum-None of the structures (Tailings Basin, Embarrass River or Colby Lake) are labeled on maps in this section making it difficult to know where the structures are located. Page ES-36- Although water from Colby Lake will be used and it is higher in Aluminum, it does not mean that all the increases in Aluminum will be from water from Colby Lake and there might be some contribution from the North Met project as well. Pretty broad statement that might not supported when the process water is analyzed and found to have more aluminum than the Colby Lake water. Why is Colby Lake water high in aluminum in the beginning. Is this a legacy from iron mining? Paragraph 1 Seepage from Tailings Basin sounds like a lot of water despite the percentage it is quoted as being. Paragraph 4.	WR017, WR082, WR090

19819	Page ES-39 What if the current drought continues and water levels in the Embarrass and Partridge continue to drop? Where will water for the mine be taken from? Paragraph 1 Page ES-39 Who did the water quality measuring? See also comments from page ES-36 Paragraph 2 in this document. Watershed Restoration- Page 3-71 In the 6th paragraph who will monitor the discharges and the runoff to the Partridge River? Beneficiation Process Water 810 gallons (gpm) is a LOT of water to draw from anywhere. How often will this be needed? No lengths of time for such draws were given. Who does the monitoring and reporting on groundwater and surface water quality? Page 4-111- Baseline Groundwater Quality within the Tailings Basin Pond and at Toe of the Tailings Basin- Paragraph 3- What or who is the NTS? This abbreviation is not listed in the Abbreviations or Glossary. Page 4-122- Paragraph 5- Will the only monitoring of the Embarrass River water quality be at PM-13? Who is responsible for collecting those figures and which agency will review these figures? Page 4-126- Embarrass River Tributary Streams- "The existing LTVSMC Tailings Basin, proposed for reuse by PolyMet, was operated from 1953 until it was shut down in January of 2001. The Tailings Basin is unlined and the perimeter embankments do not have a clay core or cutoff, which allows for both surface seepage through the embankment and groundwater seepage under the embankment." This is troubling. How easy are the proposed modifications to do to the Tailings Basin? From Figure 3.2-28, it appears that the Tailings Basin will only have a rock buttress on the toe of the pile with a cutoff wall with a shallow drainage collection system. What is the cutoff wall composed of and is it impermeable? Page 4-127- "For the parameters monitored, data show compliance with water quality standards except for exceedances of hardness and pH near the toe of the of the embankment; exceedances of aluminum, boron, cobalt, copper and lead at PM-10; and exceedances for mercury at all locations." Are we to expect that these exceedances will increase with the new tailings being added to the Tailings Basin the North Met tailings?	WR056, WR070, WR093, WR139, WR188

9218	Please reject the PolyMet NorthMet SDEIS as inadequate ...Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion.	WR003
9222	Reject..SDEIS...and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on..streams.	WR003, WR004, WR115
9234	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands.....Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.	WR003, WR091, WR165
9236	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world....	WR018
9237	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.	GT01

15290	The proposed surface mining of Poly Met will have many harmful effects on the natural state of the environment and disrupt the enjoyment of the many people that come to visit these sacred natural areas.	LU06
15291	With sulfide mining the waste when exposed to air and water will chemically formulate sulfuric acid. This acid will leech toxic metals from the waste rock into the sweet natural waters of Lake Superiors headwaters.	WR001, WR111
15292	The project would jeopardize the Boundary Water Canoe Area Wilderness, which is a destination for many canoe enthusiasts.	WILD02
<b>Sender Name (Submission ID)</b> Benjamin B. Eide (42450)		
6788	Our lake and waterways are what help make Minnesota a great place to live.Lake Superior is not only a state or national treasure but a ONE OF A KIND treasure that is vital to our state. Please don't risk polluting it for a few jobs and a few dollars.	WR111
<b>Sender Name (Submission ID)</b> Benjamin Cook (51560)		
3615	There is no guarantee that any company will be around long enough to sufficiently correct all of the damage done, no matter what these companies promise in the beginning.	FIN01
3616	The companies that own the mines will reap the profits and then leave, forcing the citizens of Minnesota to deal with the damage to the health of humans as well as wildlife.	WI04
3617	However, there is a guarantee that damage will be done to the natural environment, especially the irreplaceable Boundary Waters Canoe Area Wilderness. Destroying the beauty and health of the state of Minnesota is not worth creating a few hundred temporary jobs.	WILD02
<b>Sender Name (Submission ID)</b> Benjamin H Johnson (43031)		
12505	The water treatment plans contemplated in the draft EIS assume that the region will for centuries be part of an organized, advanced industrial civilization that produces abundant electricity, and educated populace with advanced technical skills, and a legal and institutional framework that will hold Polymet to its commitments or, if necessary, assume them. This is a dangerous gamble, and the proposal should be turned down on that basis, or at least altered to require all mandated remediation to take place within a viable timeframe.	PD01
17118	...the remediation operations proposed by Minnesota PolyMet are virtually guaranteed to fail...because the company's operations create dangerous waste that will have to be actively managed for centuries. This management presumes the existence of a basically uninterrupted supply of electricity to power the reverse-osmosis process of water filtration, the continual existence of a corporate or state bureaucracy to operate the equipment, and a level of political stability and cohesion necessary for these electrical and organizational systems to endure.	PD01
<b>Sender Name (Submission ID)</b> Benjamin Tsai (58160)		
19996	The PolyMet SDEIS is still inadequate....It doesn't analyzethe effect of pollution on workers' health or on nearby drinking water wells. It doesn't explorealternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect thatPoly Met's sulfide mine, combined with other mines, would have on toxic pollution, like mercurycontamination of fish.The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake SuperiorBasin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surfacewater and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, andimpair health of adults and children... pollution from the mine tailings andwaste heaps would last for at least 500 years.	GEN03

13571	The company says it will restore the land for 500 years following the sulfide mining? Really? They won't be around and our future generations will be the ones to suffer.	FIN01
13572	Minnesota should be putting its efforts and funds into alternative forms of energy such as solar and even nuclear. Both would create more skilled jobs that pay higher wages that could employ our graduating college students who are now unable to find jobs. We must stop destroying our land and atmosphere and it is time to take other forms of energy seriously.	SO02
<b>Sender Name (Submission ID)</b> Bert and Cynthia Weberg (57171)		
18692	Have other sulfide mines been near a big body of fresh water? If so, what are/were the results? We would hate to be part of the generation that would allow Lake Superior and other great lakes to be poisoned.	PD26
<b>Sender Name (Submission ID)</b> Bert BG Hyde (42868)		
8896	4.2.1. – pg 4-17 – last Paragraph [SDEIS text] “In May 2009, Cliffs Erie conducted a detailed assessment of both surface and ground water...”I am amazed that the mine is assessing their own potential water pollution/contamination – and found no off site contamination... If this is an example of how the MDNR would be monitoring the sulfide mining I have no faith in that kind of oversight. The only alternative that the MDNR can choose is the “No Action Taken” plan.	WR139
8898	Table 4.2.2.1 – Air Temp and Precipitation: The period of record – Babbitt = 1948 – 1986, Hoyt Lake 1958-1984. This data is 28-30 years old. Climate change data is collected from the early 1980s to the present. Table 4.2.2.1 is obsolete. It is of no factual value. Why was it included? It just adds to the bulk of the document without adding to the decision making process.	WR072, WR077
8899	Impaired waters – there is no mention of any CONSEQUENCES meted out to those who impair the waters. Any financial consequence that any mine pays for violating laws, rules, regs.... Is figured into their cost of doing business (CODB) – no mine executives have ever served jail time for poisoning our drinking water.	FIN14
8900	Table 4.2.2.2. – There is nothing on page 4-29 that indicates any ACTION to be taken by the MDNR to stop Hg or any other pollution from taking place!	MERC15
8909	Table 4.2.6.4. has no information about Hg in fish tissue. The IBI doesn't tell me much, mostly “N/A” 61 and 33 – 61 & 33 scale of 0-100 does not indicate good fish assemblage conditions. Why is this disinformation included in the SDEIS?	AQ04, AQ10
8910	Pg 4-45 1st paragraph – fails to mention that in the area of Harris Lake is one of the old quarry sites probably operated by the Cold Spring Quarry Co. As noted elsewhere blasting can contribute to fracturing ground and bedrock which could lead to ground water being transmitted through bedrock over distances of thousands of feet. Pollutants would also be transmitted into the surface water and water table and watershed. Harris Lake area is in the Kawishiwi River watershed which flows into the Boundary Waters Canoe Area Wilderness.	WR010, WR016, WR061, WR081, WR090
8911	Pg 4-45 and 46, 47 – The content of these pages is so well hidden that I could not understand what the author was trying to communicate.	EDIT01

<b>Sender Name (Submission ID)</b> Bert BG Hyde (42868)		
8917	Table 4.2.2.-5 – Well aquifer tests are so few in number as to be insignificant.	WR071, WR072, WR078
8920	MDNR measured Partridge River during winters 2008, 2010, and 2011. PolyMet used 1985-86-87 to estimate their data. What is the value of using data almost 30 years old especially in light of changing rainfall characteristics due to climate changes? Why would PolyMet use out of date Information?	WR003, WR077
8923	Average monthly outflow from Pit 3 (SD012) was about 0.7 cfs, or 1, 814,400 cubic feet/month or 241,920 gallons/month. What does average winter outflow 40.1 cfs mean? 47,520 cubic feet/month? 6336 gallons/month?	WR201
8929	[Text from SDEIS] "Colby Lake is on the MN 303 (d) TMDL list because of mercury concentrations in fish tissue...A TMDL study of Colby Lake is needed to determine what actions are required to reduce the mercury concentration in fish, but has not yet been performed." - Why has the MDNR not got around to starting to protect the public from this toxic element?	MERC22
8934	“Water quality is affected by local runoff from the former LTVSMC processing plant operations” – Is this an example of how the DNR will protect the environment/water quality after PolyMet has abandoned its mining operations?The poor water quality exhibited by these streams is an indication that the permitting process does not prevent water pollution. It documents how much the water has been polluted. There is no mention of CONSEQUENCES that fall upon the mine. At best they may try to mitigate the pollution – but by the time the pollution has been reported, documented, debated, sued-counter sued ... much of the land/water scape has been damaged-destroyed-poisoned.	WR139
8936	High concentrations of sulfate inhibit or prevent wild rice from thriving in waters that would otherwise support an abundance of wild rice... There were several bodies of water that were examined and found no wild rice but then no water samples were tested for sulfates. Why not? Could too high a concentration of sulfates totally kill off a wild rice bed? Wouldn't PolyMet want to know that?	VEG04, WR156, WR157
8938	Paragraph 3 – Last sentence LTVSMC tailings are still seeping from the abandoned mine. Is this an appropriate example of how well abandoned mines are allowed to continue to pollute ground water and surface water? And how well the DNR can prevent pollution from mines in the first place.	PER06, WR070
8941	Were the results of the tests of the residential wells made available to the residents who drank the water from those wells? Were the results an explanation of the results made to the residents? What is the state of their health relative to their drinking water?	HU13
<b>Sender Name (Submission ID)</b> Bert Hyde (46196)		
8220	Pg.3-136 Section 3.2.2.4 Financial AssuranceParagraph 2 - The wetland mitigation that would be constructed should require financial assurances.	FIN11
8221	Why are the financial assurances not spelled out in the SDEIS? These should stand to answer many of the "what if?" questions raised in these SDEIS reviews. With all the pages of "infrastructure" that PolyMet has generated, it seems suspicious that they did not have the time, resources, or expertise to put together a complete and accurate financial assurance plan.	FIN08
8223	Please have PolyMet submit a true financial assurance detailed statement. Please include financial assurances that include information that extends 500 years into the future. Please include information that would make clear how the state of Minnesota would not be financially liable for environmental clean-up if PolyMet goes bankrupt, dies, disappears, or otherwise "skips town."	FIN01, FIN08, FIN10

19865	the long term effects of keeping the water clean are not being acknowledged.	PD01
<b>Sender Name (Submission ID)</b> Beth Lewis (9291)		
1105	I favor the no action alternative on the USFS Land Exchange proposal because when I looked at the locations and description of the tracts of land which PolyMet proposes to swap for the mining site USFS land, I do not feel they are of equal environmental quality. This seems especially true regarding the location, size and quality of wetlands.	LAN03
1108	I asked for more explanation on wetland mitigation required under the Wetland Section 404 of the Clean Water Act. Again, I was shown a map and the areas which PolyMet are proposing to mitigate to offset the destruction of wetlands at the mining and processing sites. These sites are small and at scattered locations, most outside of the St. Louis River watershed.	COE01
1110	I believe the Tribal Agencies Major Difference of Opinion #8 on the method of assessing indirect impacts from mine dewatering and groundwater drawdown should get further consideration. I agree "that the USACE should require up front mitigation for all severely impacted wetlands, but at a minimum up front mitigation should be required for wetlands occurring in Zone 1" and other recommendations. I also believe this wetland mitigation should be in the St. Louis River watershed.	COE01

<b>Sender Name (Submission ID)</b> Beth Lewis (9291)		
1114	Despite the improvements in the supplemental draft, I think the SDEIS needs better data for analysis and further work. Based on the information I have learned from the SDEIS, I believe the St. Louis River watershed will suffer a loss of critical wetlands and risk further contamination to wild rice areas and water quality for plants, animals and humans. This is not acceptable.	GEN03
10781	I do appreciate the extensive work which the Co-lead and Cooperative agencies staff have done on both initial and supplemental DEIS.	NEPA16
10783	I believe more than 90-day review period is warranted for people with the necessary technical knowledge to thoroughly review this analysis and provide substantive comments.	NEPA07
10787	I view the proposed land swap, not in terms of number of acres or appraised value, but in terms of the USFS mandates on forest management. The environmental risks associated with swapping the land requested by PolyMet seem to out number the environmental benefits for the various other parcels.	LAN01
10789	The Lake Superior watershed is already at risk from mercury and other pollutants. The SDEIS materials impressed me with the scope and duration of this mining and processing operations. Tons and tons of tailings are going to be mined and moved in a sensitive, water-rich environment for 20 years. The new flow data on the Partridge River needs to be factored into the hydrological modeling. Why would we risk even a 10% chance of further polluting this key watershed?	WR003
10790	I am also concerned about the quantity of water used in the mining and processing and the impact to groundwater and aquifer sources. The report predicts no significant changes to groundwater and surface water flow when compared to existing average conditions. Yet, I did not read how mining operations will be adjusted in prolonged periods of drought and low water levels, as we have experienced in northeast MN over the last several years and should expect to experience even more in coming decades.	WR181, WR182, WR188
10792	I am also very concerned about the processing facility on the LTVSMC site and the QEAA on groundwater pollution. I...found credible the projection by investment analyst, Wayne Atwell of Edison Investment Research, that the mining company will want to maximize the use of this processing facility for return on investment and increase daily ore production from 32,000 to 90,000 tons per day...I believe this EIS should include modeling with possible daily increases in production.	PD29
10794	What if something goes wrong? In all of this technical analysis, I didn't see "what if" scenarios of impacts if something goes wrong. There is enough history of nonferrous mining to inform a list of key things that can go wrong, what mitigation would be required and possible environmental impact.	PD22
10795	Financial assurance will be legally required. The key questions are how will it be calculated and how much? Will it be adjusted as scope of project changes or unaccounted environmental impacts occur? How do we put a commodity price on clean water?	FIN05, FIN08

8659	What sort of risks would the pollutants in the atmosphere bring to a fetus in the first trimester, or a newborn?	HU01
9966	PolyMet gave inaccurate information about the amount of waterflow. Therefore it's possible they also gave inaccurate information about air pollution.	WR003
9967	What sort of risks would the pollutants in the atmosphere bring to a fetus in the first trimester, or a newborn?	HU01
10663	it's also true the quality of life while living should be a good one. PolyMet is not going to do much to improve the quality of life. It will just make the environment more polluted. A lot of people here like to fish and hunt, a lot of people like walking their dogs, a lot of people like just hanging out by the lake, and if the mining happens, who's to say any of that would continue?	LU06
11010	What sort of risks would the pollutants in the atmosphere bring to a fetus in the first trimester, or a newborn?	HU01
11011	PolyMet gave inaccurate information about the amount of waterflow. Therefore it's possible they also gave inaccurate information about air pollution.	AIR11
13382	Please also keep in mind there are some people in the world who are predisposed to cancer, and too many carcinogens in the air could aggravate their conditions, causing more illness and death.	HU03
13384	A lot of people here like to fish and hunt, a lot of people like walking their dogs, a lot of people like just hanging out by the lake, and if the mining happens, who's to say any of that would continue?	LU06
13388	Kids should be able to get outside and play. If there's a lot of pollutants in the environment, this kind of ruins that.	LU06
16222	A lot of people here like to fish and hunt, a lot of people like walking their dogs, a lot of people like just hanging out by the lake, and if the mining happens, who's to say any of that would continue?	LU06
<b>Sender Name (Submission ID)</b> Bethany Owen (38907)		
5408	The regional economic benefits of PolyMet being permitted to safely mine this valuable mineral deposit radiate outward far beyond the 75-mile distance between the proposed mine in Minnesota and our facilities in Wisconsin. Our regional economy is highly integrated through suppliers, contractors and qualified workers. Of course, our environment is highly integrated as well - sharing the tremendous fresh water resource that is Lake Superior.	SO10
5409	We believe we can have economic growth and jobs, while also protecting our environment. Damaging practices from the early days of mining are no longer tolerated or allowed...Technology and environmental science have evolved, bringing positive changes to the mining industry just as they have to virtually every other industry in our region.	SO10
<b>Sender Name (Submission ID)</b> Bethel Anderson (42722)		
9906	Please reconsider allowing us more time to comment on this EIS document.	NEPA07
17427	At present, in the St. Louis River, sulfate has been shown to produce methyl mercury, which bio-accumulates in the fish. Adding sulfates to the tributaries which feed into the St. Louis River will occur under the SDEIS, both from mass loading from sulfate and from the seepage waste piles.	WR107, WR108

17428	This project [Polymet] would add particulate and nitrogen oxide load and further degrade air quality.	AIR13
17432	Another heavy metal that needs to be considered in a health risk assessment in Manganese. (...) This problem of manganese in the ground water has not been mitigated, and is an inherited problem for Polymet, as they plan to pile further waste on top of this basin. (...) High levels of manganese in drinking water are harmful to health and have been associated with several neurological problems, both in young children and older people.	HU02
<b>Sender Name (Submission ID)</b> Betsy Blume (44364)		
10374	Noise pollution near wilderness areas like the BWCAW will affect users (like me!) and the economic interests of the community that supports these recreation gems.	N02
10375	It is an experiment that Polymet proposes in dealing with the issues of polluting our watersheds. New technology is not evidence that the projects will not have severe long term damage to our water resources.	WR128
<b>Sender Name (Submission ID)</b> Betsy Bowen (42857)		
8814	The Boundary Waters and Lake Superior are precious in the health and welfare of the land that these waters support, and while I do care about jobs for supporting the local people, nothing I have read and studied about this proposal sounds like the risk is worth it... I urge you to protect the water quality. Over-protect it. Without clean water, we are all lost.	WR081
8814	The Boundary Waters and Lake Superior are precious in the health and welfare of the land that these waters support, and while I do care about jobs for supporting the local people, nothing I have read and studied about this proposal sounds like the risk is worth it... I urge you to protect the water quality. Over-protect it. Without clean water, we are all lost.	SO01, WILD02, WR081, WR195
<b>Sender Name (Submission ID)</b> Betsy LePlatt (23581)		
3514	I am very concerned about trading our long term environmental health for short term and not clearly spelled out financial gain.	SO01
3515	One of the things which concerns me most is permanent water pollution. I do not think it is good enough to base such important decisions on "probabilistic simulations," or computer models, of the effects of Polymet's mining activities on water quality.(...) I read the other day that the flow rates on the Partridge River entered on the SDEIS were wrong.	WR003, WR035, WR189
3519	The long term economic impact of this project is also a big concern of mine. Would the clean up cost the State more than the economic gains of the project?	SO04
<b>Sender Name (Submission ID)</b> Betty Holmen Greene (54730)		
18773	In addition, this is just the first of many proposed projects, and it is important to consider the cumulative effects of many copper-nickel sulfide mines.	CU04
18775	Among the unanswered questions are the health impact both on humans and on wildlife, such as moose and lynx. Clean water is vital for both humans and moose and other wildlife.	WI01

<b>Sender Name (Submission ID)</b> Betty Holmen Greene (54730)		
18777	The impact of wetland destruction needs to be carefully considered. Mitigation of wetlands using lands in other watersheds does not really help, especially for wildlife directly impacted by the lost wetlands.	WI02
18778	The impact of sulfates on wild rice needs careful review and consideration. Wild rice is of vital importance to Minnesota's Native American tribes, and the St. Louis River watershed flows through tribal lands. The U.S. Government and Minnesota do not have the greatest track record of respecting the rights of sovereign tribes. The impact on and needs of the sovereign tribes must be given high consideration.	VEG04, WR156, WR157
18780	Hard-rock mining carries the potential for asbestos-like minerals to be released in water effluent or air emissions. The supplemental EIS does not adequately address this, even though the effect on human health of asbestos-like minerals is an emerging concern in Northeastern Minnesota.	AIR03
18783	Sulfide mining will place a huge burden on taxpayers. It is not possible for PolyMet or any other company to provide enough financial funding up front to handle post-closure treatment, monitoring and maintenance, leaving the burden on taxpayers. In addition, should an incident affecting the water supply happen during the mining process, the likelihood of PolyMet or any other company actually providing the clean-up funds is minimal.	FIN01, FIN10
18785	If we lose our precious water resources, the economy of the whole region will be greatly adversely affected, and Minnesotans are the ones who will have to deal with that, in terms of both our health and our finances.	WR195
18786	The environmental review process has not adequately addressed the cumulative impacts to water, land, or air and the degradation of these vital resources for wildlife or for future generations.	CU11
<b>Sender Name (Submission ID)</b> Betty Preus (46968)		
10853	- Health risks such as exposure to mercury, asbestos and arsenic. Mercury is already a problem with 10% of newborns in the Lake Superior basin. Polymet admits that mineral dust released could harm workers and nearby residents. Doctors have recently requested a study of the potential health impact of this project. Let's study the potential impact and not the problem after it has sickened or killed many people.	HU01
10855	- Hundreds of years of polluted water seeping into our streams. I am not convinced that Polymet would be able to contain all polluted water. It will inevitably seep into our clean waters. Boundary Waters rivers have been named at risk for pollution as a result of this proposal. The Boundary Waters is a most precious resource that we simply must preserve for future generations.	WR111, WR129
10857	- Destruction of 6,000 acres of wetland which are currently habitat for our endangered moose and lynx populations and many other species.	WI02
10858	- Questions about whether Polymet would cover the costs of cleanup and whether they would be paying fair taxes. To me, I don't think it would be possible for them to pay enough for damage and taxes because they would be destroying a treasure that is priceless and irreplaceable.	FIN01
<b>Sender Name (Submission ID)</b> Betty Tisel (38391)		
9609	I am concerned that the SDEIS does not include any analysis of the health effects for on-site workers at the mine...The SDEIS must analyze particles and fibers in crushing plant air, not just air outside the property boundary.	HU04
13653	The only "health-risk assessment" in the SDEIS was done for people who are off-site...Other Minnesota environmental impact statements and documents have looked at cancer risks for workers. Why not PolyMet?	HU04
13654	The PolyMet site is a "lean" deposit of copper and nickel - 99% of what is dug out of the ground will be considered waste. Blasting and grinding the dug-up rock will unleash huge amounts of particles and fibers that workers will breathe.	AIR03

<b>Sender Name (Submission ID)</b> Bev Scalze (47482)		
11194	[SDEIS does not include financial analysis] The SDEIS doesn't account for the replacement capital costs of the mine proposal, eg. water treatment plant, holding pond liners, etc.....The draft SDEIS doesn't include capital costs of the life of the liners of the pits or stockpiles, nor does it include methods to monitor the liners and the replacement of those liners and the surrounding possibly-contaminated soils and aquifers.	FIN05
11247	The aquifers surrounding the proposed sites haven't been monitored for the existing conditions of the waters. The draft SDEIS doesn't include maps and analyses of surrounding streams and rivers as to their existing conditions and a process for monitoring in the future. No accounting for monitoring of conditions in the 200 and 500 year models as included by Polymet. The Polymet document labeled Figure H-16-24.2 shows Mixed Influent Cncentration (ug/L) at year 200 that is six times higher than the present water quality standard.	WR060, WR071, WR078, WR079, WR081, WR173
11249	The SDEIS is silent regarding emergency measures in case of failures in construction and treatment	PD22
17924	The SDEIS doesn't analyze the relationship between Polymet and Glencore Xtrata. If the Glencore firm is a silent partner, or at least a financier, that information should be included in the SDEIS because a partner or assign should be part of the application for the permit. The partner or assign (or any other term) should be noted so that all parties are included in the permit and are responsible for cleanup if Polymet (or NorthMet) goes bankrupt.	PER02
<b>Sender Name (Submission ID)</b> Beverly Blinde (42457)		
6794	The risk to our children, grandchildren, and the environment for many generations to come is too great - and not worth the benefits of a few jobs for a few years.	SO01
<b>Sender Name (Submission ID)</b> Beverly Finke (16154)		
11169	Please continue to stand up for Minnesotans, and the many people from the states and around the world who have enjoyed the Boundary Waters area, and wish to continue to do so; this is an irreplaceable asset that should be kept available in its present condition for generations to come,	WILD02
11172	The proposed mine plan isn't just a minor inconvenience. It strikes me as big business making money on the backs of ordinary citizens who would give up far more than they would benefit from the proposed mine plan.	SO02
<b>Sender Name (Submission ID)</b> Beverly Gillen (40727)		
6667	My family has camped in the Boundary Waters and experienced its beauty and peacefulness. We cannot afford to have this resource polluted by mining companies who lamely promote job growth but are really counting profits.	WILD02
<b>Sender Name (Submission ID)</b> Beverly Hanson (42727)		
14364	The ground water and beauty of a natural area is my major concern. I DO NOT trust the mining companies to do the right thing.	LU04
14365	I am writing to express my concerns about open pit mining for copper/nickel in northern Minnesota.Jobs are important, but at what cost?	SO01
<b>Sender Name (Submission ID)</b> Beverly M Berntson (42738)		
11478	I notice lack of proof that the efforts at mitigation stated in the SDEIS will be effective. The SDEIS was supposed to analyze alternatives to prevent this loss and destruction, but in more than 2,160 pages there are no alternatives to avoid or minimize wetland loss.	WET01, WET04, WET20

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Beverly M Berntson (42738)		
11484	The SDEIS claims that putting a compressed dirt pile in a trench is "better" than using a liner for this huge waste rock pile, however it gives no facts. I ask that further studies be conducted to analyze putting a liner under the 526-acre Category 1 permanent waste rock pile located right next to the 100 mile Swamp. No permit should be granted without a liner.	ALT07
14411	I am writing because I am extremely concerned about the potential effect on wetlands that the PolyMet Sulfide mine (section 404) could have, both in the relatively near and the very far future. While the SDEIS admits that the mine will directly destroy 913 acres of wetlands as well 7,315 acres of wetlands that could be lost due to pollution and changes in water patterns at the mine and tailings site, I notice lack of proof that the efforts at mitigation stated in the SDEIS will be effective.	COE02, WET01
<b>Sender Name (Submission ID)</b> Bianca Geisdorf (18104)		
13470	Jobs are important for the future of the students of Mesabi East and the Iron Range. ...We need these jobs that PolyMet will bring to our towns for strong communities and thriving families; not ones that just get by living in poverty. We truly care about our land, air and water and believe that the SDEIS is sufficient to address this. The co-lead agencies have done the job needed to show that PolyMet will not pollute our land, air and water.	SO10
<b>Sender Name (Submission ID)</b> Bill (6595)		
1087	Let them build the copper mine so we can have jobs in Minnesota.	SO10
3464	Obviously there is a tremendous need for jobs here in our area, not China. We need the metals. We also care if mining is done environmentally responsibly to maintain our clean water and air.	SO10
15915	I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations.	PER34
15917	I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS.	WR190
19926	I look at the opportunity to bring PolyMet to our area and look at the needs, the jobs, the benefits, and (inaudible) and also look at the challenges that face a project like this in water quality, wetlands, wildlife. ..Tourism by itself is not providing sustainability. Obviously there is a tremendous need for jobs here in our area, not China.	SO10
<b>Sender Name (Submission ID)</b> Bill & Nancy Henke (4783)		
1895	Full financial assurance by my definition means that it is provided for by the company inflicting the damage, for the duration, whether this is for decades or for hundreds of years. The monetary amount backing this full financial assurance should take into account not only industry projections of clean up needs but also worst case scenarios including catastrophic accidents and acts of nature that overcome technology. 19515	I have been actively following Polymet’s efforts and after reviewing SDEIS, news articles and opinion pieces I am confident PolyMet’s project will have no discernable impact on the natural environment while at the same time greatly benefitting the economic environment.	SO10
19516	I have personally invested in the project not only because of my confidence in PolyMet but also because I want to see my state benefit from the great jobs, economic synergy and expanded tax base and my country from the increase in the domestic supply of critical metals needed in many vital manufacturing industries.	SO10
<b>Sender Name (Submission ID)</b> Bill Conger (38700)		
11900	Please consider the quality of life, the value of wild and natural places, and the health of our citizens and environment and reject the PolyMet plan. It is difficult to place a dollar amount on the above items.	SO02
<b>Sender Name (Submission ID)</b> Bill Erzar (38801)		
4955	I believe that the PolyMet NorthMet project will provide an improvement in the Socio-Economic well being of the area communities, providing primary jobs and affiliated support industry employment.	SO10
4959	It will also provide the school districts and State with additional Natural Resource tax royalties.	SO10
4960	The much needed metals in this complex of copper, nickel, and metals of the PGM grouping will add to the nation’s available resources for our modern day technology that are widely used, and also diminish the need to rely on foreign operations for these minerals.	SO10
17050	[The NorthMet mine] will bring in good paying mining jobs with benefits that will also necessarily employ people in MSHA and County Mine safety engineering to make sure the miners work environment is safe.	SO10
<b>Sender Name (Submission ID)</b> Bill Fredrickson (43099)		
15880	I have followed this approval process for several years and strongly believe that the PolyMet Mining Company has operated in the best interests of the public and the enviroment. Both in the past and fully intends to meet all expectations in the future of the EPA and the Minnesota Department of Natural Resources.	NEPA16
15881	Minnesota really needs the jobs.	SO10
<b>Sender Name (Submission ID)</b> Bill Holden (58108)		
19970	St. Louis, Lake, and Cook counties have a combined population of approximately 220,000 people. The PolyMet plan estimates about 360 permanent jobs over the twenty year life of the mine. This means that the equivalent of .16% of the 3 county regions will have jobs through the mine.If those 360 jobs each pay \$100,000 per year then they will bring thirty six million dollars a year into the community, for the 20 years of operation.In 1996 David T. Schaller form the Department of Geography at the University of Minnesota did a research study of the economic impact of tourism in the region. He found that the major group of visitors are from Minnesota and visit for the fishing. He estimated the regional monetary impact of tourism at around fifty million dollars a year. Tourism and diversified small businesses will bring in that fifty million dollars a year for the next twenty years and on into our great grand kids’ futures.The issues are simple but deep. Short term extractive wealth and its threats to the established community or long term environmental and economic stability.	SO01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Bill Steele (15967)		
1075	The SDEIS itself gives no indication about how centuries of waste water treatment and remediation of probable failures of tailings containment infrastructure will be financed. Clearly, the state of Minnesota must mandate establishment of a large fund for future environmental maintenance at the NorthMet site.	FIN01, FIN05, FIN08, FIN11
1076	Government regulators have an obligation to secure funding to protect Minnesota taxpayers.	FIN10
1080	The SDEIS says nothing about how Polymet will deal with unexpected problems when they arise. ... How will Polymet manage these emergency situations? ... The SDEIS is totally deficient by not spelling out plans for dealing with such contingencies.	PD22
1084	If ... the mine is approved, it should only be authorized with the establishment of a fund large enough to assure that Minnesota taxpayers will not be burdened with the enormous costs of remediation	FIN10
2015	Large ownership of Polymet by Glencore should itself be a red flag. Glencore and its many subsidiaries are notorious for a wide variety of egregious behavior including tax avoidance, violating UN embargoes of despotic regimes, rampant pollution by its mines, and even major human rights violations	PD23
<b>Sender Name (Submission ID)</b> Bill Thronson (54654)		
17970	I support Poly Met Mining and believe they will build and operate a mine that complies with all state and federal regulations. I have attended several of the public meetings and it's clear to me that PolyMet has been extremely patient and thorough in there due diligence. ... I feel the SDEIS lays the proper groundwork for developing an environmentally and economically sustainable project and I support it.	NEPA16
17971	I believe in the importance of buying locally. This mine will produce some metals not currently mined anywhere in the United States. This gives us a clear opportunity to have a positive impact on the economy, not only locally but nationally as well. In addition to the economic benefits, this will be done in an environmentally safe way and help diversify our economy on the ironrange.	SO10
17972	I am confident that impacts to the air, water or land will be minimal, and the land post-closure will be reclaimed to protect natural resources over the long term in compliance with the law.	FIN16, FIN17
<b>Sender Name (Submission ID)</b> Bill Wallace (9644)		
1360	The company says they have a plan to deal long-term with the water pollution and will be putting away money into a fund to address it. The easy solution is to triple or quadruple the amount of funding that the company "claims" needs to be set aside. It is certainly in the company's best interest to lowball the number needed so let's have them put in a much higher number that would cover all possible worst case scenarios. What we don't want to happen is for us to run out of money 40 years from now and be stuck with a company that may not even exist.	FIN01, FIN05
<b>Sender Name (Submission ID)</b> Billy Southwell (43142)		
14538	the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange.	ALT21

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Billy Southwell (43142)		
14539	The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible."	ALT01
14540	The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock.	ALT03
14541	Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility	ALT01
14542	Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits	ALT01
14543	Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action	ALT01
14544	Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action	ALT03
<b>Sender Name (Submission ID)</b> Bjorn K Monson (43043)		
12912	Sulfuric acid, the result of disruption of the sulfide containing rock and exosing it to water and air(oxygen.) This will poison the watershed. It is unlikely that this can be neutralized or contained in the short term, let alone for half a millennium.	WR001
17305	Although drainage from the PolyMet mine would flow to the St. Louis River, which already has adverse effects from acid drainage, allowing a permit for the PolyMet Mine would set a precedent, and likely accelerate permits for mines closer to the BWCA. Acid drainage from these mines would then drain into the boundary waters with disastrous effects.	PER07
<b>Sender Name (Submission ID)</b> Blake Romenesko (11614)		
2293	I also have huge concern for the wild rice and other aquatic plants that are making a recovery in these waters and elsewhere that this project affects.	WR057, WR077, WR180, WR193
2293	I also have huge concern for the wild rice and other aquatic plants that are making a recovery in these waters and elsewhere that this project affects.	VEG04, WR157
7348	I enjoy kayaking in the lower St. Louis River, and I often seen fisherman in the Spirit Lake area. ... I never would go fishing in that water due to pollution particularly from a century of ferrous mining... if this project follows through I am sure that the lower St. Louis will never be able to sustain healthy fishing and remove recreational activity.	LU06
7348	I enjoy kayaking in the lower St. Louis River, and I often seen fisherman in the Spirit Lake area. ... 10437	I realize that this mine could cause severe environmental damage with little pros to individuals (little jobs created, with the boom hitting only the corporation).	SO01
10440	[mine will provide] little economic impact for the state of Minnesota with a huge environmental impact to our land.	SO01
<b>Sender Name (Submission ID)</b> blayne johnson (57479)		
19517	I would hope people agree that Minnesota's Natural Resources and water quality is more important than pillaging a beautiful natural forest area for a few dollars and a lifetime of potential contamination.	SO01
<b>Sender Name (Submission ID)</b> Bob Amis (15289)		
431	there appear to be a number of deficiencies remaining in the document, including numerous unsupported assumptions and unsubstantiated, overly optimistic projections which, if uncorrected, will not adequately protect the region from an unacceptably high risk of air and water pollution.	AIR11, WR026, WR129
432	The SDEIS estimates ... a collection rate of over 99%. The SDEIS does not support this estimate by naming one tailings pile in Minnesota, or anywhere else, that has experienced such a high collection rate from pumps at the edge of an unlined tailings pile . It is my understanding that comparable real world experience is between 50% and 75% collection rates.The SDEIS does not consider the impact to water quality if the collection rate is lower than this extremely optimistic estimate.	PD08, WR018, WR023
433	I ask you to require the SDEIS to be revised to include real world data on collection rates for tailings piles of this type, and an analysis of water quality outcomes if the tailings pile collection rate is not what PolyMet claims.	PD07, WR018, WR023
434	water will flow along the bedrock, find the fractures, and then flow through those fractures ... much faster than the SDEIS assumes. Furthermore, in addition to the existing fractures, mine site blasting will occur ..., creating more fracturing in the bedrock. The impact of this increased bedrock fracturing is not contemplated in the SDEIS.	WR016, WR168
435	Therefore, I ask you to require the SDEIS to be revised to clearly analyze and explain the impact on surface and ground water if contaminated water from the mine site is transported through fractures in the bedrock.	WR012, WR168
<b>Sender Name (Submission ID)</b> Bob Bartlett (28003)

17467	I strongly object to any possibility that our citizens be left with any financial obligation to cover the cost of keeping our lakes, streams as well as all water safe from pollution. Facing the possibility of spending taxpayer money for 500 plus years of guarding our clean water from pollution of this project is outrageous.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Bob Carlson (18089)		
3217	The areas downstream of the PolyMet Project have such a tiny bit of wild rice that I don't think it's really an issue. There's not a bed of rice down there that's large enough to harvest any rice out of, and -- and another thing to add in that tiny bit of rice down is something that really went haywire with the wild rice, we've got a lot of lakes in this area that historically didn't have rice.	WR161
3218	So it makes me wonder if the DNR and maybe our legislators shouldn't look at raising that 10-part-per-million sulfate level because rice is growing pretty darn good right now where that -- where the levels are higher.	PER10
3219	I guess the last thing I'd like to say is that the band members in the 1854 Treaty area have concerns about wild rice, but I think their concerns are really unfounded due to all these other lakes that have been planted that historically didn't have rice.	WR161
13385	I think that concerns about wild rice with this PolyMet Project are really overblown. I've been picking wild rice since 1963, and I've picked most of St. Louis County and adjoining counties, and downstream of PolyMet, I'm completely unaware of any significant wild rice stands. So even if they did release sulfites that were damaging to wild rice, there isn't any wild rice there to hurt, so I think it's an insignificant thing to think about.	WR161
13389	if wild rice was harmed by some sulfides released from the PolyMet Project, they could quite easily mitigate that by purchasing some ponds and planting wild rice. The United States Forest Service and the State of Minnesota have planted wild rice in the area with very good success.	WR161
13390	I think the wild rice concerns are really insignificant and should not be a factor in this draft EIS.	WR161
13461	They've got Hay Lake listed as a control site, you know, for comparison to the PolyMet Project. I think that's a poor, poor lake for a number of reasons.	WR075
<b>Sender Name (Submission ID)</b> Bob Hale (44617)		
12083	My concern with granting permits to the mining companies pertains to the water quality of the mines after the metals have been exhausted.	WR195
12084	I do not see adequate funds being required to execute a plan B in case all the currently mentioned mitigation fails	FIN05, FIN08
15904	there is a larger than prudent risk of contamination. I don't see specified, who will monitor these so called bedrock walls that would contain pollutants.	PD09, PD35
<b>Sender Name (Submission ID)</b> Bob Ilg (45848)		
13069	Please do not let SDEIS do any mining in the Superior National Forest. Please save our wetlands, bogs, and swamps from being destroyed by pollution due to open-pit mines. We do not want contamination of ground water or our lakes and rivers. Once the water is polluted it will never be the same. Clean water is precious to every form of life.	WR111, WR115

10600	Twenty years of jobs with the result being hundreds of years of polluted water.	SO01
10602	This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin...Any project that harms the water supply should be turned down without question.	WR111, WR115
<b>Sender Name (Submission ID)</b> Bob Shannon (47660)		
7828	I have concern that substantial conflicting short-term political and economic interests within the State of Minnesota and the agencies who are conducting the review of this document may compromise the state's ability to provide a rigorous and impartial review of the SDEIS.	NEPA18
7854	The SDEIS provides inadequate evidence that levels of mercury in waters in the 1854 ceded territories will not lead to elevated levels of mercury in fish thus depriving tribal entities of edible fish resources.	MERC24
7857	The SDEIS provides inadequate evidence that wild rice will not be impacted by increases in sulfate levels in waters in the 1854 ceded territories.	VEG04, WR159
7858	Recent action by EPA with regard to limiting (i.e., rolling back) seasonal variances to sulfate standards...should be directly addressed in an EIS.	WR153
7861	The proposed plan provides no credible assurance that any legal or business entity can be relied upon to maintain [remedial] engineering controls for many centuries after cessation of mining activity at the site.	PD24
7865	It is known that problematic measurements of input parameters [were] used for this SDEIS (e.g., critical measurements of water flow). There is considerable and reasonable doubt that site conditions can be considered as stable, especially over [a] very long period of time.	WR003
7870	Beyond the assurances of interested parties, what assurance is there that input parameters and associated estimates of uncertainty are robust, accurate, and unbiased? Would independent measurements yield equivalent values? Have realistic estimates of worst-case assumptions been evaluated?	WR071, WR072, WR189, WR202
7872	What empirical evidence is available that models used will provide robust and defensible estimates for output parameters (including uncertainty) for predictions made for, say, 1 year, 5 years, or 20 years, let alone 500 years?	WR189
7874	Mercury modeling has been deficient: See concerns listed in Appendix C, Great Lakes Indian Fish and Wildlife Commission (GLIFWC) Mercury Section, comments 1-15.	MERC13
<b>Sender Name (Submission ID)</b> Bob Tammen (18090)		
3220	I think it's time [the mining companies] started cleaning up their mine sites and quit granting variances.	PER06
3221	We're going to be trapped in this boom-and-bust economy until we finally accept that we are a talented people up here and we're going to have to build our economy on the talents of our people instead of on stripping our assets, which are going to be shipped overseas, they aren't going to be building windmills in our backyard.	SO01

<b>Sender Name (Submission ID)</b>	Bob Tammen (18090)	
9273	It has been my experience in the industry that acid draining from a mine is referred to as Acid Mine Drainage. Industry efforts to euphemize the term to Acid Rock Drainage is sadly unprofessional and should be corrected in the glossary and in the SDEIS. 4-165 "The Plant Site is located north of the Laurention Divide... Misprint? The plant is South of the divide. See map. 4-376 Last paragraph. Heal should be heel. 5-5 "located in...Mesabi Iron Range" The mine is located in the Duluth Complex in the Superior National Forest. Once again, the SDEIS deserves an EU-3. 6-9 6.2.2.1.6 Essar...begin operation in 2014. Essar will not begin operation in 2014. Update SDEIS. 6-7 Table 6.2-1 Mesaba Energy Project. The IRRRB has granted Mesaba Energy an option to purchase land near Hibbing for a gas power plant. Update table. 6-1 reasonably foreseeable. The impacts of developing a 10 billion ton ore body as described by geologists in Minnesota should be evaluated as reasonably foreseeable.	EDIT01
9274	ES-10 "uninterrupted operation" There is no history or probability of uninterrupted mining operations in Minnesota. 5-5 "waste rock is predicted to average 0.15 percent sulfide" From the Northern Miner January 14, 2008 authorized reprint. "Waste rock...can have up to 6% sulphur content."	PD30
9283	ES-31 PolyMet. Several documents refer to PolyMet and Poly Met (Two words). There must be a reason for having two different legal entities. The SDEIS should explain the difference and perhaps declare which will get dividends and which will have environmental cleanup liability.	FIN01
9286	ES-40 Federal, state, and local taxes. The SDEIS does not quantify rebates traditionally given to the mining industry. Our history of rebates to the taconite industry should be documented and the probability of rebates to the sulfide mining industry should be acknowledged.	SO04
9287	ES-41 "There is no legal access to the federal lands via land,... The SDEIS should acknowledge that the mining industry has the power to prevent American citizens from accessing Superior National Forest land and should resist efforts to give the industry even more power by facilitating a sulfide mining operation in Minnesota.	PER35
9289	ES-41 Cumulative Effects. Respected geologists have estimated that the Duluth Complex is a 10 billion ton ore body and have predicted with great certainty that it will be developed. Being the State of Minnesota has been able to estimate the cumulative benefits for school trust funds, the State should also be able to give a reasonable estimate of the square miles of pits, waste dumps, and tailings ponds that will be created in our water rich environment by the processing of our sulfide ore.	CU04, PD30
9291	1-11 Purpose and Need. There is little economic evidence for proposing mining for purposes of economic development. If you google "world class ore body" you'll probably get over 2 million hits. There's a lot of information about world class ore bodies. If you search for thriving mining communities in conjunction with those ore bodies, your search will probably be fruitless. Mining no longer creates healthy communities.	NEPA01
9292	Endocrine disruptors should be evaluated by the SDEIS. Several metals are endocrine disruptors and the synergistic and cumulative impacts should be evaluated.	HU01
9298	4-95 Tailings Basin. Discussion of tailings storage should include an evaluation of the 1,000' crack in the Hibtac dike in February of 2012 and possible applicability to understanding of Polymet's proposed tailing storage plan. 5-113 Bedrock Groundwater. SDEIS should disclose that exploratory drillings do not have to be sealed for 10 years and the consequences in ubiquitous briny water formations.	GT05, WR023, WR078
9300	4-371 "higher-sulfur waste rock" Percent sulfur of the Dunka waste rock that was buried in LTVSMC tailings should be disclosed.	PD10

<b>Sender Name (Submission ID)</b>	Bob Tammen (18090)	
9301	5-93 "proximity of wells to mine pits" Discussion of water resources and mining should include the problems the City of Hibbing had with one of its wells and the proximity of that well to Hibtac which was reluctant to accept responsibility for the problem. Discussion might appropriately be moved to socioeconomic. 7-12 Unavoidable Adverse Effects. The mining industry is stripping Minnesota's mineral assets. That unavoidable effect should be quantified by the SDEIS and a reasonable estimate made of the long term financial benefit of leaving the Superior National Forest intact for future generations. 7-10 irreversible loss of ore. The November 2013 Minnesota Mining Tax Guide describes ore as a wasting asset and allows a percentage depletion allowance for the reduction in reserves. The SDEIS should give us an estimation of the value of Polymet's ore asset so that the public could evaluate the benefits of leaving that ore in the ground. 6-14 "a portion of Highway 53...would need to be relocated". The SDEIS should disclose that Minnesota taxpayers will pay to move the highway for Cliffs Natural Resources and that it would be reasonable to expect unanticipated taxpayer costs for Poly Met. 5-503 Operations. IMPLAN discussion does not address the Minnesota policy of rebating taxes to the mining industry. Disclose rebates.	SO04
9302	6-16 cumulative effects on groundwater. NRRI TR 2005/01 states that over 2,000 exploratory holes have been drilled in the Duluth Complex. Geological maps show numerous faults in the vicinity of Polymet's operations. The possibility for cumulative effects in an area with saline groundwater is obvious. 5-155 "oxidation of the pit walls" Reference should be made to the Lone Tree flooded pit in Nevada and the surface concentration of low Ph water.	WR010, WR023
9303	5-532 Lime. The SDEIS should analyze the consequences of increasing the amount of calcium in waters that might be invaded by zebra mussels.	AQ17
9304	5-525 Mishandling...discharge into the environment. Even proper handling of ANFO results in the discharge of ultra-fine particles into the environment. SDEIS should analyze fine particle discharge from blasting.	AIR10
9305	5-506 Public Services and Facilities. New schools are being proposed even if sulfide mining is not permitted.	NEPA15
10601	Wetlands Action Group requests that a cost-benefit analysis be done that recognizes ore removal as asset depletion.	SO04
10604	We also request that the EIS analyzes the synergistic effects of discharging mineral based endocrine disruptors from mining operations into waters that already have other endocrine disruptors	HU02
13438	The [mining] industry regularly requests variances to Minnesota's discharge standards, and the State of Minnesota regularly grants those variances. ... There is a variance request for PolyMet's tailings pond which is leaking approximately 2.9 million gallons a day as we speak. If we have stringent environmental regulations in Minnesota, why are these tailings ponds constantly leaking.	PER06
<b>Sender Name (Submission ID)</b>	Bob Tanner (18377)	
2828	I don't think the EIS treats the economic issues thoroughly.	SO04
2834	Minnesota has a history of being unable to regulate the mining industry.	NEPA15
14706	see that we're getting millions in taxes. But that EIS doesn't disclose that we're giving \$220 million back to the mining companies. Over the last 20 years they clawed back \$220 million of our tax dollars.	SO04
14707	What is it going to cost us to move that highway (Highway 53)? The mining company wants the highway moved. We're going to pay. They have enough political clout to get an agreement that we're going to move that highway.	PD36

12853	The shortsighted 20 years of jobs versus 500 years of pollution is not the legacy we should be leaving for our children and the generations to come.	SO01
<b>Sender Name (Submission ID)</b>	Brad Borrman (36887)	
15871	I have seen the damage done by other mining projects and do not want to jeopardize the clean water, fishing, forests, and tourism industry we currently have in place.	GEN03, WR195
<b>Sender Name (Submission ID)</b>	Brad Clifford (19530)	
13450	The PolyMet SDEIS doesn't study impacts that could affect mercury contamination of fish in the St. Louis River Estuary, let alone impacts to habitat and tribal resources in the region.	AQ28
13451	A cumulative effect analysis of mining should be done before the PolyMet SDEIS gets finalized.	CU18
18354	How do we trust this economic opportunity? And how do we assure ourselves that we can see sustainability, we can see an economic balance, sort of the idea of an "economic equilibrium," and Dr. Gram Nash's theory... where values were assigned to each component, the land exchanged, the reclamation, the actual value of the minerals in the ground and the cost to get them up, and the tax revenue that the agencies and state can levy to keep it balanced	FIN16
18357	if the questions aren't answered and mitigation and rationalization and the science isn't proven, that's the problem that we have. Who can say honestly and clearly that this science has been proven? When Mesabi Nugget tried to prove their technology, they did a very, very small equation, and it took several years for that to be proven, before they went forward to the next step. And if we skip any step and try to argue that our concerns are dismissive, then the deliberative democratic process gets thwarted.	NEPA09
18361	And so suddenly somebody's assertion isn't as important as the individual that has more money and can buy it, does it? So, when we look at our mineral rights in our forest, they may not be worth what some people believe them to be worth. And if they are, then show us what the math is. And if they can do that, then people will buy into it. But if they can't, and they can't deliver, then remediation, for example, in the river, if it gets to certain levels -- and how do we determine those levels? At .2 on the map, and down at the rice patties it is like .5, and so when they say there is a problem, they are going to go out and build management systems and waste management expansions. ... And so how much damage can happen to the wild rice and the habitat? ... So, unless we can truly understand what the economies are and what the cost benefit is, and making sure that a tax revenue is there to be able to put and build the trust, as well as the bonding and the sureties that they put their money where their mouth is. If I allow you to make a dollar, and I'm going to charge you 25 cents to assure that we are going to have recovery and reclamation, why would you be upset?	SO02

<b>Sender Name (Submission ID)</b>	Brad Sagen (42928)	
12205	Even if economic viability was an allowed reason for rejection of an alternative, the scant analysis of the costs of underground mining does not meet NEPA requirements of review...A robust analysis of costs of underground mining would have set forth a history of metal prices, determined what price makes underground mining viable, analyzed metal price projections in the past and projected metal prices over the next twenty (20) years, and then determined the economic viability of underground mining.	ALT06
12206	Adaptive management is itself an alternative that must be analyzed in a revision of the SDEIS, and on which the public must have a meaningful opportunity to comment.	ALT18
12351	The Scope of the Cumulative Impacts Analysis is Inadequate Because the SDEIS Arbitrarily Excludes Projects that Are Not in Permitting Stage and Fails to Account for Full Plant Operation...The cumulative impacts analysis should be expanded to include projects such as Twin Metals that are in the pre-feasibility stage, and should include all potential mining projects that may utilize approximately more of the existing NorthMet processing facility capacity.	CU02
12352	the SDEIS omitted mercury from its modeling and transport analysis for water quality impacts. Specifically, the SDEIS states: “Mercury was not included in the GoldSim model, as insufficient data and a general lack of definitive understanding of mercury dynamics prevented modeling mercury like the other solutes.”(SDEIS 5.2.2.3.4) This omission of data is especially troubling because the water bodies impacted by the NorthMet Project do not comply with mercury water quality standards...Mercury must be added to SDEIS modeling and transport analysis for water quality impacts	MERC13, MERC16
12355	The SDEIS map that appears as Figure 4.2.3-1 appears to have been deliberately falsified to reduce the size of the 100 Mile Swamp and avoid the issue of whether groundwater from the mine could drain into the Rainy River Basin as well as the Lake Superior Basin. A comparative government map of the swamp area, available at <a href="http://www.nationalatlas.gov/streamer">www.nationalatlas.gov/streamer</a> , shows the swamp to be considerably larger and to extend further east and also north...The possibility of groundwater drainage to the Rainy River Basin should be acknowledged and procedures established for monitoring that possibility.	WET19, WR080
12356	The DEIS is Inadequate Because it Does Not Include the Required Financial Assurance Information...Some mine owners have defaulted on their environmental liabilities associated with their mines, making the cleanup costs borne mostly by taxpayers...The average cost of addressing a mining site under the Superfund program is approximately \$22 million per site.	FIN01, FIN05
12358	The SDEIS must provide reasonable estimate(s) of how long post-closure treatments will be required so that the public may evaluate assess the potential effects and the financial risks of the project.	FIN05, WR036
12359	Toxic Waste Projections in the SDEIS Demonstrate That Water Quality Standards Will Be Exceeded for an Indefinite Future.	WR035
12360	SDEIS post closure reclamation plans rely heavily on adaptive management ...The SDEIS misuses the concept and guidance regarding adaptive management so that it fails to identify the actual contingency measures being considered for possible use, and the circumstances under which they would most likely be employed. It is impossible to estimate financial assurance requirements under these conditions.	FIN05
12364	A revised SDEIS must be prepared to provide supporting evidence that the land exchange serves the public interest. The revised SDEIS must document how the proposal both meets USFS land exchange objectives and fulfils USFS regulations regarding protection of forest lands. Any claim that the project consolidates mineral and surface rights should be removed.	NEPA04
12366	The Forest Service has the duty to protect the public’s surface lands for forests, water, and multiple uses under NFMA, the Organic Act, and the Property Clause	LAN01

<b>Sender Name (Submission ID)</b>	Brad Sagen (42928)	
12369	Failure to Meet USFS Land Exchange Objectives.....Four of the five tracts ... fail to meet the Forest Service objective of reuniting mineral and surface rights. (SDEIS 3-163). Future mining on these lands cannot be ruled out as possible, and thus the public could be acquiring lands that carry the risk of future land-use conflicts. Tract 1, the Hay Lake parcel, has “moderate” risk for future mineral conflict because of the presence of “potential surficial aggregate resources in the far northeastern corner of the tract” (SDEIS 5-586).	LAN04
12372	The Forest Service has the duty to protect the public’s surface lands for forests, water, and multiple uses under NFMA	PER35
14363	The requirement that agencies consider alternatives is critical to NEPA’s implementation...The SDEIS identifies and considers three alternatives: (1) the “no action” alternative (SDEIS 3.2.3.2); (2) the underground mine alternative (SDEIS 3.2.4.1); and (3) the west pit backfill Alternative (SDEIS 3.2.4.2) None of the alternatives evaluated in the SDEIS directly involved different mining techniques or contemplated a different scale or magnitude of mining.	NEPA01
14366	Each of the rationales advanced by DNR and the Corps are legally deficient reasons to eliminate underground mining or reduced scale as alternatives that the SDEIS should have evaluated. Most importantly, the underground mine alternative would fulfill one of the major purposes of the Project. “To eliminate the conflict between PolyMet’s desire to surface mine and the USFS ownership and management of NFS lands, by exchanging federal lands for non-federal lands that have equal or greater value.” (SDEIS 1.3.2.1) With an underground mine, there would be no need for the proposed land exchange.	ALT01, ALT02, ALT06
14367	A revised SDEIS should be prepared to address the substantial environmental benefits provided by an underground mine alternative, including but not limited to preserving forest lands and other natural resources such as wetlands.	ALT01
14368	MN Admin. Code § 4410.2300(g) (agency may exclude an alternative if “it would likely not have any significant environmental benefit compared to the Project as proposed”)...A project of reduced scale would obviously have immense environmental benefits. Therefore, the agencies should have considered a smaller project alternative and compared the environmental impacts of the proposed project with this reduced scale alternative.	ALT06
14372	SDEIS’ analysis of cumulative impacts must expand beyond “general statements about possible effects and some risk” to provide the required “hard look.”...“A proper consideration of the cumulative impacts of a project requires some quantified or detailed information; general statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided.” Klamath-Siskiyou Wildlands Ctr., 387 F.3d at 993 (citations omitted).	CU14
14379	Information on mercury discharge to rivers, potential water quality standard violations, and the impacts on water quality if water collection and treatment systems end prematurely are all missing from the document. In fact, the SDEIS seems to systematically omit any information that might lead a reader to question whether legal standards will be met. These omissions result in an SDEIS that is fatally flawed.	WR038, WR060, WR125, WR158, WR184
14380	The SDEIS must be rejected until mercury is modeled by GOLDSIM for both the Embarrass and Partridge Rivers, or an alternative evaluation of the potential for increased loading of mercury to the Embarrass and Partridge rivers and related wetlands based upon the best available science is provided.	MERC13
14383	Estimates of increased loading of mercury to the Partridge and Embarrass rivers (and extending to the St. Louis River) must include mercury from air deposition, from leaching to groundwater, and from the transfer of Colby Lake water.	MERC10
14390	The Clean Water Act Section 303(d) and 40CFR122 do not permit the tradeoffs proposed in the SDEIS (5.2.2.3.4) in which one water body (the Embarrass River) that already has increased mercury suffers increases in mercury because of a proposal to offset the increase somewhere else. Increased mercury cannot be allowed (Embarrass River) based on a projected mercury decrease (Partridge River).	PER11

14401	...new or increased mercury discharges to waters that do not meet water quality standards are forbidden, no matter how small. Minn. R. 7052.0300(2)...Project Area lakes (Sabin/Wynne, Embarrass, Esquagama, and Colby) must adhere to Minnesota regulations forbidding increased mercury discharges... to waters that do not meet water quality standards.	PER11
14404	Since most mercury methylation occurs in wetlands, the release of mercury to wetlands may be more problematic than direct releases to rivers or lakes. The concurrent addition of sulfates and the likelihood of water level fluctuations in wetlands contribute to the problem...Project Area wetlands must adhere to Minnesota regulations forbidding increased mercury discharges, no matter how small, to waters that do not meet water quality standards. Minn. R. 7052.0300(2); and maintaining the quality of wetlands...Minn. R. 7050.186(1).	MERC09
14407	Failure to Include a Draft Reclamation Plan ... for the Project is a Fatal Flaw in the SDEIS...The SDEIS analysis should have gone farther and shown how the reclamation activities would actually work to keep water quality standards at predicted levels.	PD22
14409	the Partridge River through the East Pit/Category 2/3 Flowpath is predicted to violate water quality standards at the P90 level for both aluminum and cobalt...Regarding the West pit overflow, the SDEIS should disclose that at the P90 level, groundwater in the West Pit flowpath is predicted to violate the surface water quality standard for cobalt (by a factor of 5) and lead at the point of discharge to the river...Although the predicted average discharge from the WWTF would add significant dilution capacity at that point, it is unclear what the discharge regime will be in order to protect seasonal variation in the river flow.	WR177
14410	The SDEIS should address issues raised by...recent scientific reports showing a higher likelihood of unpredicted contamination in projects that have the potential to create acid rock drainage and that are situated near ground or surface waters.	WR023
14417	Waste treatment in the NorthMet Project will be perpetual, as “perpetual” is defined in standard dictionaries to include, “lasting for an indefinitely long time.”...According to Minnesota Rules, Post-Closure Treatment Cannot Continue Indefinitely...NorthMet cannot be approved until proponents can demonstrate the mining area will be closed according to rule and will be maintenance free.	PER04
14422	NorthMet financial assurance must provide for unforeseen but potentially identifiable uncertainties...[such as] climate change where increased variability in weather has led to ‘500 year’ devastating events such as excess rainfall occurring several times in a single decade. Uncertainties concerning the stability of tailings dam (basin) construction and waste rock liner performance, as well as earthquake potential must be provided for.	FIN05
14432	USFS wetland losses from the [land] exchange would be significant, in quality and function. Two of the non-federal tracts proposed for acquisition are located outside the Lake Superior Watershed. At least three are outside the St. Louis River Watershed. The result would be an actual loss of contributing wetlands to an important watershed. Although proposed candidate lands bring wetland values, they are in different watersheds and are adding currently value. The result is a net loss of wetland function values.	WET14, WET15
14433	“USFS policy (Forest Service Handbook 5409.13 § 33.43c) provides that the following list of three conditions satisfy the requirements of EOs 11990 and 11988: 1. The value of the wetlands or floodplains for properties received and conveyed is equal (balancing test) and the land exchange is in the public interest” (SDEIS I-15). While wetland acreage in the exchange may be equal, the value of the wetlands is not. The public is losing 100 year old peatlands for fragmented wetlands of other types	WET14
14446	“Adaptive Management” is nowhere defined in the SDEIS. The SDEIS identifies situations that may require adaptive responses. It does not typically specify the situation specific circumstances requiring a response and nowhere does it identify the specific response and link it to the conditions requiring the response (as required by USFS regulations and recommended in CEQ guidance)...This misuse of adaptive management must be corrected and its erroneous proposals modified or withdrawn	PD22

14448	The SDEIS should be rewritten to follow the CEQ guidance concerning adaptive management, including the identification of specific mitigation alternatives and the circumstances under which they would be used. Adaptive Management itself constitutes an alternative and should be identified and analyzed as a major alternative in the SDEIS	PD22
<b>Sender Name (Submission ID)</b> bradford c. (43249)		
15798	For a few jobs created during the brief period such mining would be around it will leave in its wake hundreds of years of toxic waste and destruction. We do not consider this a fair trade off - not even close.	SO01
15802	This type of mining has a proven track record of being destructive to the environment and communities - without exception! This fact alone should dictate a flat denial of permitting for such mining in Minnesota. The u.s. e.p.a. has shown this industry to be the largest polluter in our nation. There is no doubt this type of mining if allowed in the area proposed would have devastating negative effects on the wilderness, the local communities, water supplies, wetlands and property values (ours included).	PER35
<b>Sender Name (Submission ID)</b> Brandenburg Gallery (46103)		
10810	The PolyMet Environmental Impact Study is hypothetical. Even proven first methods can result in environmental disaster given the event of natural earth movement, equipment failure, or human error.	GT15
10811	M.I.T. researchers, when asked their opinion on whether or not copper-nickel sulfide mining should be permitted in northeastern Minnesota replied: "In a water table as fragile and valuable as the one in northeastern Minnesota, you just don't do it."	WR195
10813	Should companies be allowed to put at great risk the health and welfare of ecosystems, people, and wildlife? No, because individual citizens are not permitted to. If a terrorist were to come and poison our water supply we would go to war over it.	WI01
10814	Minnesota is defined by its lakes and quality of clean water. The shortage of clean water in the world is becoming increasingly severe and large scale. Unlike other resources, there is no substitute for clean water.	WR195
10816	I am saddened to think that Minnesota even considers permitting copper-nickel sulfide mining. Minnesota ought to first make mandatory the recycling of all metals.	PER35
<b>Sender Name (Submission ID)</b> Brandon (44581)		
11818	The clean up costs will far outweigh the costs of running this mine for only 20 years.	SO01
<b>Sender Name (Submission ID)</b> Brandon Swann (11628)		
3315	The PolyMet SDEIS is still inadequate. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells.	HU04, WR041
3316	The PolyMet SDEIS is still inadequate. It doesn't explore the alternatives that could reduce PolyMet's destruction of wetlands.	ALT13
3317	The PolyMet SDEIS is still inadequate. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish.	MERC02, MERC10

1793	We understand mining may create jobs/revenue for the next 20 years, but the destruction/pollution it will create will last for centuries. We feel protecting the environment far outweighs any benefits PolyMet claims.	SO01
1794	Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure.	PD02, PD03
1796	Minnesota Rules 6132.3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule.	PER04
1809	I ask that you...revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS.	PD03
<b>Sender Name (Submission ID)</b> Brennen Stenke (46226)		
8858	The term "risk" implies uncertainty, but as your Environmental Impact Statement shows, there is no uncertainty that PolyMet will negatively impact our environment. Without doubt, PolyMet will foul our air, dirty our waters, rob habitat from our endangered animals, kill our endangered plants, and alter our landscape and its ecosystems.	VEG01, WI02
8859	Indeed, PolyMet will lose an opportunity to make a profit and some of us will miss out on a short-term economic boon.	SO02
<b>Sender Name (Submission ID)</b> brent chezick (44851)		
8015	I believe the environmental review process has been sound and thorough.	NEPA16
8016	The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations.	PER34
8020	It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time...[The modeling completed in the SDEIS] shows the project will still meet water quality standards even that far out – all the more reason to support it.	WR190
8023	This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country.	PER34
8024	Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations.	SO10
8026	PolyMet will...generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities...This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs.	SO10
8029	Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.	PER34
<b>Sender Name (Submission ID)</b> Brent Notbohm (23922)

<b>Sender Name (Submission ID)</b> Brent Notbohm (23922)		
10293	I beg of you to seriously consider the consequences heavy metal contamination could have on our precious region, and the wildlife and water quality that people travel from around the world to enjoy.	GEN03
15019	As a tax paying citizen of the great state of Minnesota who loves the beauty of the Lake Superior basin and the Boundary Waters Canoe Area Wilderness, I am extremely concerned about this project's potentially hazardous environmental impact on the region where I live.	GEN01
<b>Sender Name (Submission ID)</b> Bret Johnson (40019)		
14893	These risks are not acceptable for the economic benefit in a region that prizes natural beauty and pristine waters.	SO01
<b>Sender Name (Submission ID)</b> Brett R. Ewald (41331)		
9316	PolyMet offers at least 20 years of jobs for between 300-360 personnel. The state will reap the benefits of taxes per pound or ton with additional taxes from purchased goods in the local communities. Their modeling....eludes to 200 years of water treatment costing between 3.6 and 6 million dollars per year. What occurs if treatment is ....200 or 500 years?	SO04
14217	It is great if their modeling is too farsighted and treatment is not needed for that long. What occurs if treatment is needed after the 200 or 500 years? Can we rely on future technologies to better mitigate the untreated water?	FIN01
<b>Sender Name (Submission ID)</b> Brett Reiersen (43)		
420	I think a properly planned and managed project could be positive, but i don't think this project, at this point, is properly planned or managed.	PD01
<b>Sender Name (Submission ID)</b> Bria Schurke (18212)		
13444	I will not accept any pollution in the community that I want to raise my children, if there's risk that my children will be raised on polluted water.	WR195
<b>Sender Name (Submission ID)</b> Brian Anderson (38814)		
5006	I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out.	WR190
5008	We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.	SO10
<b>Sender Name (Submission ID)</b> Brian Berggren (43525)		
8134	The Watershed Restoration goals described on page 3-71 seem overly optimistic. Water events, sediment and toxic waste or process water migration, have a way of defeating barriers and will only minimize watershed contamination.	PD03

17051	With technology in place and federal and state guidelines and enforcement the chance to prove copper mining can be done safe for the environment is here. Reverse osmosis is a reality and if we can do it here it will help protect the rest of the world. The economic impact of this is also beneficial for northern Minnesota lets put people to work	PER34, SO10, WR190
<b>Sender Name (Submission ID)</b> Brian Peterson (44186)		
11876	We should be working to expand the borders or protected areas, strengthen the protections and see to it that we save and preserve what we have not yet ruined. In many parts of the state it is too late or not feasible to take such actions.	WILD02
11877	I am fully confident that when all true costs are considered (loss of habitat, noise pollution, water contamination, clean-up, human health costs, infrastructure demands, etc.) these proposals will be a net loss for MN both in economic terms and human terms.	SO01
11878	I also see almost no circumstance where some of the clean-up and reclamation does not fall on the taxpayers.	FIN10
11879	The jobs this will likely create, long-term, are Superfund jobs, the kind of jobs Minnesotans don't want.	SO01
11880	My suggestion: \$500,000,000 in escrow, with an oversight board using the money to immediately address environmental and human concerns. Polymet can always add money, and keep any interest. If the fund is depleted to \$250,000,000, all mining stops, the money is used to reclaim the land and any leftovers go into the Legacy Fund. When the mine closes and the area is properly cleaned and restored, Polymet gets any remaining balance back.	FIN01, FIN05, FIN08
<b>Sender Name (Submission ID)</b> Brian Slaby (24278)		
10320	Considering that Lake Superior has a water retention time of almost 200 years, even a small risk of pollution should be taken seriously. It could create a problem for our continent's largest freshwater lake that's unsolvable for two centuries.	WR111, WR115
<b>Sender Name (Submission ID)</b> Brian Stompe (20141)		
9351	I understand the need for mining but there are places it should not be done no matter what the short term gain. The water shed that feeds into Boundary Waters is one of those places.	NEPA01
<b>Sender Name (Submission ID)</b> Brian Tighe (43187)		
10356	Allowing the Northmet sulfide mining operation would violate a binding treaty with the Chippewa to protect their hunting and fishing rights in that region, by contaminating their food sources.	PER08
15852	Please protect our most important natural resource: fresh water.	WR111
15853	Surrounding water would be contaminated by the NorthMet Mine, and though it creates a few jobs and a some tax revenue, the bulk of the profits go to foreign countries. The risks for environmental degradation are too high.	SO06
15854	The risk that taxpayers will end up footing the bill for long term clean up is too high.	FIN10
15855	The increased risk of chronic illness is too high.	HU03

<b>Sender Name (Submission ID)</b> Brian Wicklund (7083)		
10603	I am deeply concerned about the potential for PolyMet and other mining corporations to be allowed to mine public land that contains Minnesota's most pristine and fragile water system. It is foolish to allow a type of mining with a 100% failure rate of toxic leakage into ground and surface water to be allowed at the source of three watersheds.	WR115
10607	A decision to allow sulfide mining would also be an economic disaster. Any short term gain of jobs and revenue would be trumped by the estimated 500 years of maintenance of the waste.	SO01
10609	In spite of assurances by PolyMet, what companies can you name that have been continuously viable for 500 years? You can bet our tax paying children will be footing the bill for clean up for generations to come.	FIN01
<b>Sender Name (Submission ID)</b> Brian_Walvatne (37830)		
16338	Water is the essence of life and this mine will increase risk of severe environmental damage that could last for 500 years or more.	WR195
<b>Sender Name (Submission ID)</b> Brianne Plumadore (42730)		
14381	I have no confidence that the Polymet company can keep the surrounding watershed safe from pollution caused by the mine.	WR037
14382	As a person with special appreciation for wildlife and resident of the state of Minnesota, I am urging you to reject Polymet's proposals for sulfide mining in our state.	WI01
<b>Sender Name (Submission ID)</b> Bridget Peterson (43547)		
11090	Water is a finite resource. The Great Lakes holds some 80% of North America's fresh surface water and about 20% of the entire world's... putting resources needed not just by us here but by the entire WORLD in such jeopardy for mere profit is ridiculous.	WR111, WR195
11093	We are already wasting such resources by not engaging in recycling what's already out there as much as available, something which could both reduce pollution...and create the much-needed jobs, probably more and longer lasting employment than the mine will create, at a benefit to our environment rather than more harm.	SO02
11094	It astounds me how willing some are to let an outside corporation come in and muck up our environment so drastically for resources that seem most likely destined to be shipped overseas at a great profit for them, and just a few jobs and decades of likely irreversible pollution to our drinking water and environment for us.	SO01
<b>Sender Name (Submission ID)</b> Britt K Johnson (57263)		
17403	The impact of winter release of sulfates should be further studied. The sulfides will accumulate in the organic sediments and not flush down river during the winter. Then in the spring when the H2O warms up the microbiome will be high on verifying the stored sulfates into sulfite at the same time as the wild rice begins to germinate. John Patter's research has shown that sulfite is toxic to wild rice seedlings at very low concentrations. Thus the predictor would be that the sulfite concentration would be the highest in the spring after continuous winter loading due to water discharging of sulfate from the Polymet site. This would put the wild rice seedlings at even greater risk. The EIS should assess to the fact of what winter water releases from the Polymet site on spring sulfite levels in the seedlings of wild rice beds downstream.	VEG04, WR153, WR157

<b>Sender Name (Submission ID)</b> Britta Dornfeld (45147)		
8383	This sulfide mine has said that it has a plan for dealing with acid mine drainage; however, this plan has never been tested before.	WR001
8391	The jobs that this mine would provide are based off of cycles of boom and bust- while they would provide jobs for a thirty to forty years, areas that benefited from these jobs would be in the same, or worse place than they were before the mine	SO02
8393	In starting this mine, more long-term jobs in tourism and public land management would be harmed, since this area would not doubt be damaged by acid mine drainage.	SO02
15426	Also, since acid mine drainage can last for hundreds of years, it is highly likely that the mitigation of the drainage will fall upon the government- an expensive, long-term task that we, as citizens and tax-payers who would help foot the bill, can ill afford.	FIN01
<b>Sender Name (Submission ID)</b> brittany kron (39112)		
5171	It would be unwise of Minnesota to destroy its streams and lakes, poison its animals, and ultimately lower the living standards of its citizens, because it will more than likely pollute lake superior.	WR111
17679	A short gain of profit is not worth the hundreds of years this project could take to clean up.	SO01
<b>Sender Name (Submission ID)</b> Bromley Griffin (22700)		
3294	Short-term jobs for a few native and non-native Minnesotans is no where near worth the risk of the permanent damage to the resource that almost always follows the flash of profits and then polluted silence following the fading of almost all major mining projects, especially copper mines.	SO01
<b>Sender Name (Submission ID)</b> Brooke Shepherd (11263)		
787	The Polymet mine will also affect our air quality by releasing sulfur dioxide, greenhouse gases and nitrogen oxide into the environment. They estimate that even with this pollution, the air quality will still be up to standards. However, an estimation alone doesn't seem safe enough to go ahead with the project.	AIR11
788	There is also a chance of mercury being released into our air and water. Though it would be a minimal amount, it is still dangerous to be releasing any amount of it into our air or water systems.	MERC22
789	The construction of the mine, the noise from the workers, the clearing of forests and the changes in air and water quality could greatly affect the several different species of animals who call the area home. Two of which are endangered species, the gray wolf and the Canadian lynx. Polymet claims that once they finish with the land, they will attempt to restore it; however, this could take decades to have it return to normal and the animals who lost their forest homes may not come back.	WI01, WI05

10355	The USFS and State are sacrificing a good part of the 100 mile swamp. The USFS in their forest plan consider this an ecologically sensitive area.	WET19
12091	The land exchange should consider lands within a reasonable distance from the mine site. The site in Cook county is beyond a fair distance from the mine site and should be removed from the exchange process.	LAN06
12773	Minnesota law is in conflict with the SDEIS, as in order to advance the SDEIS an arbitrary term of 500 years is used as the last year that monitoring is needed. The State law I am talking about is the law prohibiting issuing a "Permit to Mine" to any mine requiring Perpetual maintenance after closure.	PER04
12774	The Weeks Law of 1911 is designed to protect the headwater watersheds of navigable rivers. Both the Partridge and Embarrass river watersheds fall under protection from this law but I could not find it addressed in any of the chapters I read....In all the tables of contents, I could not find anywhere how an emergency shutdown or closure will take place if or when needed. An emergency Shutdown chapter would let others know what management or mine owners plan to do in an emergency.	NEPA04
12776	This project is for the 300 to 600 jobs that will last for about 20 years or so. The USFS and State are sacrificing portions of the 100 Mile Swamp for this mine. The USFS, in their forest plan, has considered this an ecologically sensitive area.	SO01
<b>Sender Name (Submission ID)</b> Bruce Blackburn (54783)		
19500	There is no clean sulfide mining. The waste water will never be clean. And a coal power plant is the energy source for the proposed mine. ... Deny the permits!	PER35
<b>Sender Name (Submission ID)</b> Bruce E Grewcock (42750)		
14434	As you know, mining in Minnesota is a tremendous economic driver for the state and region. Expanded mining of precious metals would have a significant and sustained effect on the economies of both. The addition of thousands of long-term jobs and expanded commerce would directly impact companies such as Minnesota Power, which serves the mining industry.	SO10
14435	Additionally, the raw materials, including the precious metals available in north eastern Minnesota, are essential to construction, and are a substantial cost for our business and ultimately our clients. Costs are higher when these raw materials must be imported, especially when using foreign sources that are unreliable or have unstable governments. There are also substantial environmental impacts when importing materials from countries that do not value environmental protection.	PD30
14436	PolyMet will provide a domestic supply of critical metals needed in medical applications, electricity, catalytic converters, cell phones, computers and other essential products. It will produce these metals in an environmentally sound manner and generate significant economic activity, expanding and diversifying our mining economy. The metals that PolyMet proposes to mine are essential to green technology such as wind turbines, solar panels, hybrid cars and pollution prevention devices such as catalytic converters.	NEPA05
14437	In short, responsible domestic mining will have a huge impact on the economies of the state of Minnesota, the upper Midwest and the nation, and will provide a reliable economical and environmentally sustainable source of raw materials for the construction industry.	SO10

10264	It would be wonderful if the PolyMet and GlencoreXstrata companies could guarantee that the NorthMet mine would be safe for the environment during its operation and centuries after its closure. However, the risks of sulfide mining are very high and there are no guarantees.	SO02
10270	You may believe that PolyMet would never allow sulfuric acid runoff from their mining/refining operations to destroy surrounding wetlands and that any liability for future cleanup costs would fall to the company and not to the tax payers of Minnesota... but please, also consider the track record of sulfide mining because the stakes are very high for Minnesota and this industry does not deserve your faith.	FIN10
<b>Sender Name (Submission ID)</b> Bruce Johnson (43003)		
11445	The WWTF, (Mine Site Nano-filtration) Fails to Produce Credible Results. Predicted performance of the nanofiltration system is theoretical and lacks bench scale test performance results using predicted chemical concentrations that will be seen during operations.	WR143
11463	Sulfate mass loadings will increase in the tailings basin far beyond the predicted low sulfur content of the tailing itself. This increase will produce a lowering of pH and like acid conditions. Sulfate producing acid conditions is a major cause for leaching of some heavy metals e.g. copper, nickel, cobalt, and zinc	HAZ01, WR001, WR060, WR113, WR150
12902	The long-term pollution of our precious water resources is unacceptable. Clean water is our area's most valuable resource.	WR195
12904	The financial assurances are inadequate. What is said is vague and completely unacceptable.	FIN08
12905	The proposed operation would require massive amounts of carbon-intensive energy. We need to be transitioning to sustainable energy systems.	AIR01
12906	The habitat of already vulnerable species, such as moose and lynx, are threatened by this project.	WI02
12907	Wild rice would be further damaged by the inevitable pollution from this misplaced mine.	VEG04, WR156
15303	the PolyMet NorthMet Supplementary Draft Environmental Impact Statement (SDEIS) fails to adequately address major ions and trace elements. The document ignores aquatic toxicity and possible synergistic impacts from waste rock leachates...As a result, predictions of impacts to surface and ground water are understated. Parameters that are minimized or not analyzed may also impair the ability of installed water quality treatment to meet surface and groundwater standards.	AQ06, WR060, WR064, WR110, WR113, WR130, WR147

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Bruce Johnson (43003)	
15304	PolyMet 2013g, p.29 states the nanofiltration membrane has a high selectivity for multivalent ions over monovalent ions. Thus significant monovalent ions will not be retained by the mine site wastewater treatment facility (WWTF) and will be discharged. ... For PolyMet, these are the monovalent ions elements of chloride (Cl-1), fluoride (F-1), sodium (Na+1) and potassium (K+1). These elements will pass though the filter and be discharged with the filtered water...There is a conflict in statements in the SDEIS. There cannot be a 99+% removal rate while the monovalent ions pass through the filter. This demonstrates that no actual bench scale testing with actual waste and the values are simply computer predictions that have no relation to actual performance of the WWTF.	WR143
15305	The SDEIS fails to perform mass balances. Without mass calculations impacts from the tailing basin cannot be reviewed in any scientifically defensible manner. This is a major omission...there only three major locations where waste chemicals can leave this system 1. In a sludge; 2. In a seepage/leakage; 3. In a wastewater discharge. As a result each chemical must be traced by weight from its input to its final disposition. This allows a mass balance to be developed e.g. the waste input is equal to all the waste outputs.	WR189
15307	Average inputs of 500 tons per year of sulfur will be added from the WWTF to the tailing basin ...The sulfate/sulfur mass in the tailing basin will near double annually for 20 years. This impacts the prediction that sulfur will not be a problem in the tailing. It further ignores the latent impacts of the high sulfate releases after the operation ceases.	WR060, WR189
15308	The antimony mass loading is significant and demonstrates a significant potential for long-term impacts...The following are PolyMet's predicted average inputs: beneficiation = approx.0.05 tons per year, WWTF backwash = approx. 0.05 tons per year. WWTP backwash 0.08 tons per year. Seepage amounts to approx. .08 tons per year. This indicates 0.18 tons of antimony will be added to the basin each year.	WR035, WR038, WR060
15309	Nickel mass loadings to the tailings basin are substantial...SDEIS Ch.1,p.1-5 states that 11.3 million tons of tailing will be produced annually. This is 30,959 tons per day (assuming 365 day operation). Nickel can be roughly estimated from PolyMet 2013j Table 5-17, PolyMet 2013g Table 2-1, Large table 1 as describe the background discussion. Using the 90% confidence number and flow the WWTF input to the tailing basin would be 2,699 lbs./day or 1.3 tons per day. Beneficiation of the ore produces 30,958 tons tailing per day with an average nickel concentration in the tailing of 0.031 . The resultant tailing would contain approximately 959 tons of nickel per day. Thus the total nickel addition to the basin would be roughly 960 tons per day.	WR108
15312	The SDEIS fails to address the impacts of blasting agent residues [including nitrate and un-ionized ammonia] in a scientifically defensible manner...The SDEIS further states they will use 15.3 million pounds of explosive per year blasting every two to three days. This calculates to 144,000 lbs. of blast explosive for a twice a week blast cycle, and 96,154 lbs. of blast explosive on a three times a week blast cycle. Polymet 2013L, 8.4.2, p.88 defines the explosive to be used as a mixture of 30% ANFO and 70% emulsion (Table 8-9). These amounts are not inconsequential.	WR032
15313	The SDEIS conflicts with its references on ANFO usage.SDEIS Chapter 3, Table 3.2-5 states 0.45 tons/lb. per blast will be used for waste rock. SRK 2007b report states the ANFO will contain 67% ammonium nitrate. However it further states that it will use 0.3 lbs. per ton of waste rock, which is in conflict with the SDEIS. This discrepancy results in a 27% higher use of blasting agents. This significantly raises the predictions found in Polymet 2013L, Section 8.4.2, p 88.	GT01
15314	The SDEIS does not adequately analyze the fate of blasting agents remaining after individual blast hole failures.	N05
15315	The SDEIS fails to assess nitrogen impacts from blasting residues in the tailing basin...Nitrate is highly mobile and will move through the tailing basin and enter groundwater and shallow seepages. Nitrate will also enter the waste water treatment systems and complicate the treatment efficiency or be discharged to surface waters or the tailing basin. The SDEIS must fully address these inputs.	WR032, WR147

15316	<p>The SDEIS is in conflict with the scientific article they cite to support their modeling and evaluation. PolyMet 2013L 8.4.2. attempts to design their own model to model ground water leachates that pass through the category 1 containment to the Partridge River. Their model cites Footnote 1 as their justification to model release rates of nitrogen blasting residues. Polymet states their evaluation uses a “standard method” for this type of evaluation from footnote 1. (Polymet 2013L p.88) However the Morin report states: "...standard pre-mining techniques cannot be counted on for accurate predictions of nitrogen species. Instead, case studies become an important source of predictive information..." “ Based on this, it is not possible to provide a generic narrow range of nitrogen leaching for prediction, since values here ranged from 0.2% to 28% (two orders of magnitude). The leached nitrogen is obviously dependent on many site-specific factors (Section 2)”...It is apparent from this that PolyMet’ statement of a “standard model” does not agree with their own cited reference and the PolyMet model lacks scientific credibility.</p> <p>Mine Water Leaching of Nitrogen Species from Explosive residues, Kevin A. Morin and Nora M.Hutt, Minesite Drainage Assessment Group, Surrey, British Columbia.</p>	WR189
15317	<p>PolyMet’s analysis ignores discharges from the stockpiles that drain into the pit that then is pumped to the mine site wastewater treatment system. It also ignores the blasting agents that remain in the ore that will either enter the tailing basin and it seepages or enter the hydromet processing facility (NorthMet Waste Water Treatment Facility Design Plan, Version 2 November 30, 2012 pp. 9,10,11,12). These inputs must be evaluated in the SDEIS</p>	WR031, WR032, WR173
15318	<p>The SDEIS evaluation incorrectly assumes un-impacted ground water can be contaminated to the company’s property boundaries for dilution purposes in direct conflict with MN Rule Chapter 7060. The cutoff wall leakage from the category 1 stockpile is modeled assessing nitrate impacts at PolyMet’s property boundary as the point of compliance (PolyMet 2013L 8.4.2). Although property boundary limits have been used by MPCA previously in contaminated site mitigation. It is inappropriate to use property boundaries to allow a new industry to use ground water for dilution when a contamination source is identified prior to operations.</p>	PER09
15319	<p>The SDEIS evaluation ignores synergistic toxic effects of the hazardous materials citation identified in the SDEIS...ANFO is listed as harmful to aquatic life at low concentrations. The blasting emulsion is also a hazardous material and is listed that it may cause elevated nitrate levels in water and could affect aquatic animals (SDEIS Table 5.2.13-1, p 5-528)...emulsions can contain guar-gum, starch, Al2O3, calcium nitrate, sodium nitrate, and various wax-like hydrocarbons. None of this chemistry including aquatic toxicology are defined or provided in the evaluation by the SDEIS or the reference document Polymet 2013L section 8.4.2. PolyMet lacks an evaluation on the impacts of blasting emulsions.</p>	AQ06
15320	<p>The SDEIS proposal to dispose of category 3 &amp; 4 waste rock underwater in the east pit lacks scientifically defensible evidence that the disposal will reduce metal and other parameters leaching/dissolution will meet surface water and ground water standards including toxicity standards.</p>	WR173
15321	<p>The SDEIS ignores the impacts from non-sulfide metal parameters in proposing underwater disposal. There are a number other regulated chemical parameters that will be released when waste rock is placed underwater. These include ...specific conductance, TDS, hardness, bicarbonates, sulfates, sodium, fluoride, chloride, aluminum, arsenic, mercury, calcium, magnesium, manganese. ...As the pit/s fill, the high concentrations of these parameters will seep or flow out of the pit/s and will impact both the adjacent wetlands and the Partridge River (SDEIS Fig.5.2.2-4). Increased calcium loads will also enhance zebra mussels colonization of the watershed</p>	AQ09, AQ17, WR060
15322	<p>The East pit footwall membrane lacks scientific support.The Virginia formation is known to contain high sulfides (3% to 5%) . In the East pit the north footwall will be in the Virginia Formation. This formation when exposed to weathering will degrade and create addition surface area for leaching. ...The SDEIS proposes coat the footwall with limestone and to cover the sidewall with a synthetic membrane and to prevent leaching (PolyMet 2013l, p 99). No documentation or data is provided whether this is a successful practice at other similar sites.</p>	PD35

15323	The SDES proposal to dump high sulfur waste rock underwater is not supported by existing data.	MERC08
15324	Once waste rock is disposed in the East Pit and the pits discharge water fails to meet standards the ability to correct the problem to meet standards will be unrealistic.	PD04
15325	The SDEIS fails to include bicarbonates as a regulated chemical...The bicarbonate surface water standard for 2b surface waters is 5 meq/l (7050.0220 Subp.5). Bicarbonate is currently one of MPCA's parameters of concern for the LTV tailing basin leachate and under an enforcement consent decree. Standards for these parameters have also been exceeded at Mesabi Nugget, a taconite-to-pig iron processing facility on former LTV property.	HAZ01
15326	The SDEIS fails to analyze beneficiation reagents impacts from disposal within the tailing basin. ...The following chemical compounds will be used in the beneficiation process MIBC and DF250 – 2.75 tons per day (tpd); PAX – 3.20 tpd; MagnaFloX10 – 0.45 tpd, Copper Sulfate – 2.9 tpd; Gangue Depressant – 2.9 tpd. (SDEIS Ch. 3 3.2-12. (SDEIS Ch. 3 Table 3.2-12)...Metal sulfide tailing can be expected to contain the residues from the chemical additives of methyl isobutyl carbinol, MIBC/DF250 and potassium amyl xanthate...The SDEIS fails to address the toxicity of individual flotation chemicals. It fails to discuss the individual degradation products or toxicity associated with chemical mixtures, Toxicology on bench scale beneficiation wet testing has not been reported, thus environmental impacts from these chemicals are not addressed in any scientifically defensible manner.	HAZ04
15327	Insufficient time for review...The SDEIS is approximately 2000 pages, however the document only summarized conclusions based on over 60,000 pages of references. A 90-day review window for this size document is absurd.	NEPA07
<b>Sender Name (Submission ID)</b> Bruce Kuehl (39347)		
6125	I am a long term, out of state frequent visitor to MN for tourism reasons. Should MN allow this mine project I think my friends, family and I will look for a different state/province to visit.	SO02
<b>Sender Name (Submission ID)</b> Bruce Ludewig (43496)		
7899	Regarding the land swap.... It seems that there would be a net loss of forest and wetland as a result of this trade and the subsequent Polymet operations.	VEG03, WET14
7907	the proposed trade the USFS is not getting a good "price" for the lands that would be traded to PolyMet.... The lands proposed to be traded to the USFS have little mineral value, so are effectively worth much less.	LAN03
7915	Is there enough financial assurance to cover rebuilding the containment systems 100 years from now? .... I am not confident that the proper monitoring, maintenance and response to unforeseen issues will occur into the future as assumed in the SDEIS.	FIN01
7919	According to the SDEIS, the water discharged...is expected to contain levels of sulfate that are less than or equal to current levels in the watershed, and less than the current standard for wild rice waters...are we certain that we aren't replacing a natural water flow that would have had lower sulfate levels in the absence of the NorthMet project, and thus increasing the flow of sulfate into the watershed?	WR063
7923	If the model results show at a 90% certainty level that water quality won't be impaired with this project, isn't it reasonable to expect that one out of 10 similar projects might result in unacceptable contamination?	WR192
15701	Is sub-aqueous storage really a safe way to dispose of the category 4 waste rock?	PD15

<b>Sender Name (Submission ID)</b> Bryan Thao Xao Chay (54220)		
17311	Polymet’s plan to mine is also wrong too. They plan to mine in a huge area, but they are telling everybody that they’re only mining in a small area. Which is a lie! How can you trust and allow a company to go through with this plan, when it is so obvious that they are lying!	PD30
<b>Sender Name (Submission ID)</b> Bryan W Cox (9333)		
936	If Polymet has developed a reverse osmosis process that extracts minerals from waste well below the EPA standards as they claim, one would believe their ability to be environmentally viable. Furthermore, waste water can be treated before being reinstated into the surrounding area.	PD03, PD05
937	Recent concern regarding water flow data along the Partridge River have been brought forth. Opponents tout further reason to avoid implementing the mine; however, according to the Duluth News Tribune, a sensor was not placed into the river until mid-2011. I question the true impact of this revelation. First, two years is not a sufficient period of time to conclude consistent water flow data. Second, Northern Minnesota went through one of the worst floods in history in June of 2011, which would obviously elevate data. Finally, data can be skewed by both opponents and proponents alike to meet their own agendas.	WR003
938	Our current laws are sufficient enough to protect these standards.	PER34
<b>Sender Name (Submission ID)</b> Bryan Wood (9521)		
10798	a lot of already mined precious metals end up in the garbage and dumps because our state and nation have inadequate and underperforming recycling programs, which would reduce our need to mine these metals.	NEPA06
10808	[A]s soon as sulfide rocks are exposed to water and air, sulfuric acid is created and toxic metal leaching occurs. The outflow of this sulfuric acid infused water, otherwise known as acid mine drainage, contaminates drinking water aquifers, lakes, and streams, agricultural lands, and prime fish and wildlife habitat. Because acid mine drainage cannot be stopped, once started it must be treated until the acid generating material runs out.	AQ08, WR115, WR141
10812	With the proposed PolyMet and Twin Metals mines, there is the strong likelihood that not one but two watersheds (St. Lawrence Seaway and Hudson Bay) would be impacted.	WR198
10815	Just because you write in an EIS that you can contain the pollution doesn’t mean you actually can. If you have enough good writers and attorneys, anything can be made to sound convincing, but Minnesotans are the ones who are going to pay for this when the pollution happens.	WR017, WR018, WR037
10818	The promise of jobs is obviously a huge selling point for this proposal and a reason many back it. But when you look past PolyMet’s initial allure of 360 permanent jobs and 1,000 construction jobs projected, you see the reality...PolyMet is a Canadian based mining company headquartered in Toronto. While they do have Minnesota offices, neither are owned by a Minnesota company, let alone a US company. How much do you think stakeholders hundreds or thousands of miles away in Canada and Chile are going to care about northern Minnesota’s environment when making decisions?	SO06
10820	PolyMet writes that its company expects only 25% of the workers would be hired locally. 90 workers would be from neighboring communities, almost 200 would come in from elsewhere, and 72 would commute from regional hubs like Duluth.	SO06
10821	How many families in St. Louis, Lake and Cook Counties are reliant upon the hundreds of thousands of tourists and outdoor recreationalists who visit this amazing part of our country to enjoy our beautiful waters and lands? How many of those 216,322 Northeastern Minnesotans have jobs heavily or directly tied to tourism and recreation that will be negatively impacted by a polluted environment? Are we prepared to find them all new jobs?	SO02

<b>Sender Name (Submission ID)</b>	Bryan Wood (9521)	
10826	Mining is an extractive business. Because we live on a finite planet with limited resources that also means that it is temporary. At some point, the resource will be exhausted and at that time so will its ability to produce jobs. By contrast, responsibly managed natural resources that support outdoor recreational opportunities can generate revenue and jobs in perpetuity. If we make decisions based on the health of the water, land and air, we will also be creating the framework for a sustainable economic model that will provide jobs and enjoyment for generations and generations.	SO02
10828	The BWCAW is the most loved and visited wilderness area in the U.S.A. providing a continuous, perennial source of revenue for businesses in Northeastern MN...How many people are going to want to camp on those shores, swim in those lakes, eat the fish and drink the water when it is laced with sulfuric acid?	WILD02
10829	If the mining industry impairs our waterways and natural resources to the point where we lose tourism and ultimately jobs, even if all the losses are made up with mining jobs, we still lose.	SO02
10832	The Environmental Impact Statement on the mine suggests that the water from the mines will need to be treated for 500 years...How many operations do we have that have been going for 500 years, are several hundred years into a cleanup phase and are still doing it as they had originally stated? None. How many companies do we even have in North America that have been around for 500 years? Again, none.	WR037
10834	Even if there is only a 1% chance annually that there could be water contamination from the mines, over a 500 year lifespan of the project that turns into a 50% likelihood that at some point, some time, something will go wrong and contaminated water will make its way into the watershed.	WR107, WR108, WR129
10835	To cover the contamination danger, PolyMet will put money away into a cleanup fund. It might even amount to several hundreds of millions of dollars down the line. But how can anyone possibly know what amount of money will be adequate for a cleanup if some disaster happens in 300-400 years? How could there possibly be enough money for a spill that far down the road?	FIN01, FIN05
10837	How popular will we be with our Great Lakes neighbors if we pollute the Greatest of the Great Lakes after all this work has been done to protect and restore it?	WR111
10839	[The Superior National Forest] brings in millions of dollars of revenue into the tri-county area. Fully 445,000 of its acres are covered with water (190,000 of those acres are within the BWCAW). The BWCAW is home to 1,175 of some of the cleanest lakes in the U.S. What are the odds that not one of those acres of freshwater will be contaminated with these mines?	WR111
10840	This permitting process should not be awarded to these mining operations because they have sunk \$190 million into this process, have the loudest voices, the largest demonstrations, pay for buses to bring people down from the Iron Range and sponsor a softball team in Ely. This permitting process needs to be made based on science.	PER35
10841	[T]he science shows that sulfide mining creates acid drainage, and history shows that wherever there have been copper and nickel mines, there have been environmental problems.	PD26
16174	To get at the deposits, mining is necessary, and unfortunately as soon as sulfide rocks are exposed to water and air, sulfuric acid is created and toxic metal leaching occurs. The outflow of this sulfuric acid infused water, otherwise known as acid mine drainage, contaminates drinking water aquifers, lakes, and streams, agricultural lands, and prime fish and wildlife habitat.	WI02, WI04, WR001
16176	Because acid mine drainage cannot be stopped, once started it must be treated until the acid generating material runs out. As acknowledged in federal governmental mining permits, this can take hundreds or thousands of years.	FIN11

<b>Sender Name (Submission ID)</b> Byron Kuster (16074)		
9830	I believe it has overlooked one important matter, the possibility of a terroristic action directed towards the mercury that is planned to be stored on-site... My concern is that a terrorist, foreign or domestic, could create an improvised explosive devise (IED) and direct it to the Polymet's on-site stockpile of mercury. If accomplished, the explosion could disperse mercury in all directions in a manner that would be extremely difficult to clean up quickly and thoroughly. The un-recovered, toxic mercury could then cause seriously pollution to the watershed and underground aquifers...A plan of prevention needs to be included in the SDEIS...This plan should include an estimate of its cost, its duration, and its likelihood of success.	PD22

18492	If we let Polymet mine the way they want to an even worse problem (sulfuric acid run off) will occur in the water of the Lake Superior watershed and by some knowledgeable estimates could take 500 years to be cleaned up. Do we really want to do this to one of the world's largest and most beautiful lakes?	WR111
18494	In every sulfide mine we know of that is not located in permafrost or desert, acid mine drainage has resulted in polluted water. When mining companies claim that mines have operated without violating water quality standards, it is because some states routinely exempt mines from the standards.	WR023
18497	Polymet must ... answer truthfully and positively as to how the polluted water [will] effectively be treated. Is it even possible to rehabilitate the water and environment from pollutants, what is the guarantee of money for rehabilitation and what is the cost and who will pay when Polymet has left?	FIN01, FIN05
<b>Sender Name (Submission ID)</b> Caree Gordon (37752)		
11145	If PolyMet wants us to believe their mining won't pollute the rivers, lakes and water shelf, then they need to take inspectors to past mining sites they have constructed and actually demonstrate that the waters have not been polluted. I doubt very much if they can demonstrate this, as mining has always resulted in pollution.	WR023
11147	Many well established businesses in Northern MN that depend on clean water for fishing, as well as the survival of our wilderness & wildlife will be in jeopardy if PolyMet's mining initiative is allowed to begin destroying the land in Northern MN to extract minerals.	SO02
11151	... the Superior National Forest borders are in jeopardy of being changed. If a border is changed it is geographically a small change; however, the polluted and/or fresh water that runs underground cannot observe a man-made boundary. If our great lakes, rivers & drinking water are polluted, aware people will stop visiting MN for their summer vacations.	LAN01
11152	In 15-20 years when PolyMet has extracted all the copper and minerals from the Earth, they will pull out and leave a wasteland that will take 100s of yrs to rehab.	PD01
11155	I don't even need to mention the health risks people will face when the water is polluted from the carcinogens that are used in the chemical buffers added to the waste before being dumped into the rivers (that eventually run off & enter Lake Superior (i.e. water shelf).	HU03
<b>Sender Name (Submission ID)</b> Carl and Jean Stueland (47082)		
11236	Mining should be allowed only if the mining companies are held to the current Minnesota environmental laws and standards without giving them variances. Mining isn't a problem as long as the mining companies aren't given variances which weaken the laws and standards already in place.	PER06
<b>Sender Name (Submission ID)</b> Carl Anderson (43112)		
11695	When something goes wrong, they'll pay the environmental fine and we'll be left with the mess and contamination for eons to come.	FIN01
<b>Sender Name (Submission ID)</b> Carl Grandstrand (36613)		
10519	I would take clean water over digging up a whole bunch of rock to gain a few tons of copper nickel ore that they might get, and then leave that area in mess of mining taillings. Don't let them destroy our beautiful state and its water supply.	SO02

<b>Sender Name (Submission ID)</b>	Carl Johnson (16285)	
10502	Mark Dayton and his executive council should be at least as cautious as Wisconsin's counterparts in banning any future sulfide mining in the state until the technology, if and when, proves harmless after ten years of mining and at least ten years following the termination of mining, anywhere else!	PER25, PER35
<b>Sender Name (Submission ID)</b>	Carl Unger (11635)	
8257	The undevelopment of the arrowhead region is what makes MN more pristine than other states. With the northwoods environment being mined for resources...the state of MN should be taking a proactive stance in preventing such erosion of our precious wilderness with the replacement of poisons that will get into the air and water.	WILD02
8257	The undevelopment of the arrowhead region is what makes MN more pristine than other states. With the northwoods environment being mined for resources...the state of MN should be taking a proactive stance in preventing such erosion of our precious wilderness with the replacement of poisons that will get into the air and water.	WILD02
<b>Sender Name (Submission ID)</b>	Carla Arneson (9536)	
953	There is no cumulative impact study of all sulfide mining proposed for our labyrinth of waters, where PolyMet would set the standard.	CU04
954	Now we know that mine-site water modeling was based on incorrect numbers for groundwater flow rates, the same concern that tribal agency scientists have raised for years. And why are we even considering a project that has so little data it cannot factor in water-flow variables from multiple years?	WR003, WR091
3320	Released to the public on December 6, the final version of PolyMet's SDEIS is a fabrication, morphing from ERM's determination of water treatment for "perpetuity" to a watered-down version... By the time the general public saw PolyMet's SDEIS there was no mention of perpetual... And by then the public's right to know had been emasculated even further. "Minimum" had been cut, no longer delineating water treatment of "200 years at the mine site and 500 years at the plant site." Water treatment "for the very long term" became "long term." But one telling word survived, it concerned closure, and "transitioning from mechanical to non- mechanical/passive water treatment if or when proven effective." (SDEIS 3.1.1) IF. If, or when, proven effective! Sophistry.	PD03, PD06
7693	There are inadequate and incomplete cumulative impacts (effects) analysis...The SDEIS does not look at the true cumulative impact of a copper-sulfide range in the middle of an irreplaceable ecosystem, an ecosystem that will be damaged beyond repair, for "perpetuity," by the pollution of such a mining district.	CU11
7695	A study of the human health effects from proposed sulfide mining, vital information for the well-being of our children, is missing from the SDEIS.	HU01
7699	Impacts to wildlife, in particular Minnesota's moose, are inadequately addressed, or in the case of moose, missing.	WI01
7700	The massive amounts of coal-fired electrical power needed by proposed sulfide mining operations, in light of global warming, are missing and must be addressed.	AIR02

<b>Sender Name (Submission ID)</b>	Carla Arneson (9536)	
7703	Superior National Forest Service land, prime wetlands, must not be exchanged. Open pit mining on the proposed land is prohibited. To destroy all surface resources for one subsurface resource is not why the Superior National Forest was created. It was intended to be sustainable for future generations.	LAN02
7704	The NorthMet mine would be in the Superior National Forest, right up against the Laurentian Divide; the mine would be situated on top of bedrock that is riddled with fractures and faults (one runs the length of the mine site and crosses beneath the Divide). Blasting would create more fractures, widen and lengthen the ones that exist...No one knows where the contamination will end up. Some of it could easily transfer to the Kawishiwi Watershed.	WR012, WR016, WR169
7705	PolyMet's SDEIS is flawed in all of those areas. Incorrect water flow modeling and incorrect assessment and modeling of contaminated, uncollected seepage makes this SDEIS unacceptable and it must be rejected.	WR189
7718	The SDEIS is missing health studies necessary to protect our children from the impacts of sulfide mining, and from the impacts of massive amounts of coal-fired electricity used for powering the industry.	HU01
7719	The PolyMet SDEIS does not address loss of habitat and other impacts to Minnesota's moose population by proposed sulfide mining, as well as by taconite mining	WI01, WI02
11931	...Minnesota's Arrowhead is facing perpetual pollution and water treatment from PolyMet's NorthMet Project, if its mine is permitted.	WR035, WR111
11941	There is no acceptable trade-off for perpetual water pollution and increased neurological damage to our children, some of it inheritable for unknown numbers of generations.	HU03
11944	The mine pits will eventually fill with water. The north wall of the East pit is Virginia Formation. It is well documented that this formation contains high sulfates and other heavy metals. This fractured mineralized wall will leach acid and metals. The mine pits will eventually discharge, carrying contaminated pit water to the wetlands and the Partridge River. "The East Pit, West Pit, and Category 1 Stockpile are permanent features that would continue to provide solute-loading [metals and sulfate] for a minimum of 200 years." (SDEIS)	WR029, WR173
13373	The Minnesota Department of Natural Resources is lying to the public. PolyMet's NorthMet Project will require perpetual water treatment for its solution. This project, by law, must not be permitted.	WR195
15076	A study of the cumulative health effects from proposed sulfide mining and from taconite mining industries is missing in the SDEIS.	HU01
15077	The massive amounts of coal-fired electrical power, in light of related documented health issues, are missing and must be addressed.	AIR02
15079	the PolyMet SDEIS is missing ...cumulative impact studies of the Duluth Complex. The Duluth Complex is the area where a comprehensive environmental impact study needs to be done of all foreseeable sulfide mining, a sulfide-mining district...."Past, present, and reasonably foreseeable future actions" must be addressed completely	CU01, CU04
15080	Protect our children from further harm; there is no excuse that our fish are so contaminated with methyl mercury that a pregnant woman cannot eat them. There is no excuse that we have 10% of tested newborns with unsafe levels of mercury, likely resulting in diminished IQ. We must have cumulative impact studies, health studies	HU01
15081	Incorrect water flow modeling and incorrect assessment and modeling of contaminated, uncollected seepage makes this SDEIS unacceptable and it must be rejected.	WR003, WR017, WR018, WR049, WR189

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Carla Arneson (9536)	
15082	perpetual water treatment of our waters... is delusional on an environmental, operational, and economic level. Minnesota Statute states that a mine needs to be “maintenance free” at closure. To permit a project that the Co-lead agencies know cannot meet those criteria before it begins is a flagrant disregard of laws put in place in the public’s best interest. No Action Alternative is the only reasonable (sane) choice.	PER04
15084	Thousands of exploratory boreholes are already punched into the Duluth Complex and acting as conduits to our aquifers. Full-scale mining would send contaminants through the numerous faults and fractures (Copper-Nickel Study) and through the exploratory boreholes (many of which are unsealed or partially sealed).	CU02, CU11, WR010
15086	The LTV Steel Mining Co. plant and tailings basin at Hoyt Lakes has long drained its toxic waste to the St. Louis River watershed, and will continue to do so ... if PolyMet's NorthMet sulfide mine is permitted and reuses the LTV site for its massive toxic sulfide mining waste, with correspondingly massive calcium issues. Any increase in mining-related calcium releases to the system would increase the calcium available to zebra mussels.	AQ17
15089	The PolyMet SDEIS does not address loss of habitat and other impacts to Minnesota’s moose population by proposed sulfide mining	WI01, WI02
15433	"Minimum" had been cut, no longer delineating water treatment of "200 years at the mine site and 500 years at the plant site."Water treatment "for the very long term" became "long term." But one telling word survived, it concerned closure, and "transitioning from mechanical to non-mechanical/passive water treatment if or when proven effective." (SDEIS 3.1.1)	NEPA09
15437	During the April 9, 2013 panel discussion on nonferrous mining at the University of Minnesota-Duluth, MDNR Commissioner Tom Landwehr was asked whether the MDNR could issue a permit if it received a plan that called for long-term treatment. "Landwehr replied that treatment would need to be passive (such as water being filtered through a wetland) or not active at closure." (Cook County News Herald)	PER04
15439	Minnesota Administrative Rules concerning closure and postclosure maintenance (Minnesota Rule 6132.3200) states: "The mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." Perpetual water treatment is not maintenance free.	PER04
17704	If a bonding company does take on the risk of PolyMet or any other sulfide mine, PolyMet's SDEIS indicates there is a high probability that sulfide-mining contamination of surface water, sediments, ground water, and soil cannot be cleaned up in our lake district. Money cannot fix the unfixable - or replace the irreplaceable.	FIN10
17705	Sulfide mining in water-intensive areas has never been done without contaminating surrounding waters. Reverse osmosis is not “new” technology. It had been around for decades. If it could solve water contamination caused by metal mining it would have done so by now. Reverse osmosis cannot even solve water pollution at Minnesota’s taconite mines, which are operating under variances or expired permits.	WR143
17706	In Minnesota, mining permits are often written to deliberately leave out or weaken important contaminant parameters.	PER06
17707	The company neglects to point out that reverse osmosis will only treat part of the contamination from PolyMet’s proposed NorthMet Project, only treating discharge water at the end of the 20-year operation; it will not treat water going to the tailings basin for the proposed 20 years of production. As multiple types of waste chemicals concentrate in the basin (alleged in the proposal as a closed system) the treatment will become less effective, (e.g. 80% of 1000 ppm leaves 200 ppm, 80% of 2,000 ppm leaves 400 ppm). Keep in mind that many of the stream standards are in the parts-per-billion level.	WR143

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Carla Arneson (9536)		
17708	Reverse osmosis for PolyMet is not scientifically defensible. No testing has been done that is relevant to the actual mining and treatment situation for this application. No substantive data indicates that reverse osmosis will work fully to meet water-quality standards. In PolyMet’s case reverse osmosis was tested, but using what? It is unclear just what was run through the reverse osmosis system. Was wastewater used from its mineral extraction bulk sample testing? Compared to what PolyMet proposed to actually run through a full-scale treatment system, the “real” water will be much worse. Pre-filter plugging and reject water will be major issues. PolyMet underestimates the quality and quantity of input water that will need to be treated.	WR143, WR176
17709	All filtration systems (reverse osmosis and nano-filtration) require backwashing (backflushing) the pre-filters and the final filter. Since the pre-filter waste is a concentrate of the input wastewater, it will likely be aquatically toxic. Depending on the quality of the input water, up to 40% of the input water can be this reject back flush. The proposal is to return reject waster to the tailings basin. Sludge may go to a landfill, but is untested and likely to be aquatically toxic. Precipitation (rain, snow) will impact the hydrometallurgical residue facility (solids dump). The solids dump will cause leaching. Since the waste particles will be similar to silt or clay, treatment of the solids to prevent toxic leachate will be difficult if not impossible to treat into perpetuity.	HAZ02
17710	PolyMet takes only a small number of samples in its environmental testing processes, which does not represent what will occur in the real world. The heterogeneous mixture of rocks is not consistent and small samples cannot reflect anywhere near actual field conditions. This can be demonstrated with field data from both the Dunka mine and MinnAmax, which has demonstrated that water quality ia much worse than the small-scale lab testing that has been performed. This difference is caused by the heterogeneity (disseminated) nature of the entire deposit; one spot will have lots of sulfur, another spot will have little sulfur. They have only taken a very limited number of environmental laboratory samples in this heterogeneous deposit. In comparison, to evaluate the economics of the minerals, they report taking thousands of analyses to define the 1% of the minerals that are of economic interest.	PD15
17711	The current PolyMet mine is designed for the 100-year storm (a 1980s statistical description of a 1% chance of a very high precipitation storm); given climate change, this design is insufficient. Scientific studies suggest the facility must be designed to withstand a 500-year storm, because the 1980s’ 500-year storm is no occurring almost as often as the 100-year storm. For PolyMet this is critical; it must be able to manage hugh volumes of wastewater. If the storage and/or treatment system is insufficient, untreated wastewater overflows to the nearest stream partially treated or untreated.	WR180

17373	By removing our minerals you are also causing all these sink holes.	GT09
<b>Sender Name (Submission ID)</b> Carol A. Overland (42955)		
12646	the SDEIS has not adequately addressed the issues raised in the EPA letter date stamped February 18, 2010, particularly in the area of Water Quality..."EPA determined that the project will result in unacceptable and long-term water quality impacts, which include exceeding water quality standards, releasing unmitigated wastewater discharges to water bodies (during operation and in the post-closure period), and increasing mercury loadings into the Lake Superior watershed."	WR111
14955	It is essential that this project provide the financial assurance necessary to address the full spectrum of potential impacts and harms, not just after closing in 20 or more years, but sufficient to provide for remediation and mitigation in the event the company is sold or goes bankrupt – Minnesota and US taxpayers and our environment must not be left holding the bag for environmental damage accompanying mining.	FIN01, FIN11
14956	the “majority of the surface land at the proposed Mine Site is part of a single contiguous area of publicly owned land managed by the USFS.” Because this is public land, the DEIS must address adequate compensation for this land to the USFS to compensate not only for impacts, but also for opportunity benefits and a percentage of the profits.	LAN03
14957	The DEIS does not, and must, adequately address cumulative impacts, yet as noted, “the analysis does not address the cumulative effects of the Proposed Connected Actions.” Cumulative impacts that should be address include both the likely potential for expansion of PolyMet mining1, and that of adding the impacts of PolyMet to the many mining impacts scarring the Range, and of the many projects now proposed and now in permitting and construction.	CU02, CU03

14958	Another type of cumulative impacts that is not adequately addressed is that of impacts to supply the electricity to power the operation. The cumulative impacts section ... assumes the Mesaba Energy Project would be built, as although it was granted a site permit for the western site near Taconite, it was denied a Power Purchase Agreement by the Minnesota Public Utilities Commission...where will electricity come from and what will the impacts be? Coal generation or other generation with environmental impacts? The impacts of transmission lines to bring electricity to the project? The impacts of generation and transmission lines on air quality, haze, forest fragmentation, and other issues are not addressed.	AIR02, CU15, PD39
14959	although PolyMet is one of the largest producers of particulate emissions, it is “not considered to be a concern” under Minnesota’s Regional Haze SIP. However, that does not mean that this cumulative impact of particulate matter should be dismissed. See DEIS 6-83, and also note conclusion that regarding SO2 and NOx “additional mitigation or reductions may be necessary to reach the 2018 goal” and that the 2018 goal would not be met.	AIR08
14960	The alternatives review is inadequate. The alternatives review of the DEIS erroneously presumes that the project is needed, and the PolyMet framing is adopted for the context of alternatives, falsely limiting alternatives under consideration. As noted in “RECYCLING OF NON-FERROUS METALS—AN ALTERNATIVE TO SULFIDE MINING IN MINNESOTA, recycling has potential to meet the need for non-ferrous metals and should be considered. The alternatives listed were nearly entirely “eliminated” resulting in an inadequate alternatives analysis.	ALT09, ALT21
14961	In the section on climate change, the EIS addresses only the direct impacts, and not the indirect impacts, such as coal generation for electricity to power the plant, which should be considered	AIR01
14962	Section 8, regarding Major Differences of Opinion is a crucial part of the DEIS, and the position summaries of the stakeholder Tribal Cooperating Agencies in all 18 categories, and Appendix C, Tribal Position Supporting Information, should be given great weight.	NEPA12

10325	If [Polymet] can not provide PROOF of Zero pollution, both now and future, from their project it must be rejected. The requirement of providing proof and reimbursement of all governmental cost to verify their proof is valid must be 100% their responsibility.	FIN01
<b>Sender Name (Submission ID)</b> Carol Reschke (42931)		
8321	PolyMet’s NorthMet Project is anticipated to be the first of several proposals for sulfide mining of precious metals in northern Minnesota. The SDEIS lists eleven projects they consider “Speculative Actions” in section 6.2.2.1.21 that “have not been mapped or considered in the cumulative analysis”...I suggest that a [Generic Environmental Impact Statement] for sulfide mining on the Iron Range would be an appropriate document for addressing cumulative impacts of multiple mining projects currently being planned.	CU19
8349	My...concern is that numerous position statements and comments submitted by the tribal cooperating agencies have not been adequately addressed in the [NorthMet] SDEIS...the cooperating tribal agencies’ substantive comments and discussion of these MDOs are buried in Appendix C	NEPA12
8375	The 1854 Treaty is federal law. When the land in the NorthMet Project area was ceded to the United States, the Ojibwe chiefs who agreed to the treaty wisely reserved rights to hunt, fish, and gather in the ceded lands. If the MNDNR, USACE, and USFS do not thoroughly address the position statements of the tribal cooperating agencies presented in Appendix C, it seems that these co-lead agencies would be vulnerable to lawsuits aimed at protecting tribal treaty rights reserved in the 1854 Treaty. ... it would not be prudent to allow our state and federal agencies to be vulnerable to such treaty rights litigation.	NEPA12, PER08
8387	I agree with the cooperating tribal agencies that the analysis of cumulative effects should include the entire St. Louis River watershed. Considering the investment of federal funds from the Great Lakes Restoration Initiative (GLRI) in the removal of beneficial use impairments in the St. Louis River AOC, it is prudent to consider the cumulative effects of mining projects in the headwaters on the sensitive areas we are working to restore in the St. Louis River AOC.	CU01
8392	I also agree that if some of the hydrology models (e.g. GoldSim) do not accurately predict existing water quality conditions, then it doesn’t make sense to trust the predictions of those models for evaluating cumulative effects.	WR049
8404	I agree with GLIFWC [Great Lakes Indian Fish & Wildlife Commission] that an ecologically significant amount of spillage from rail cars could occur into streams, wetlands, and their watersheds.	WET11, WR151
8420	The SDEIS does not adequately incorporate the findings of recent research on the influence of sulfates and sulfides on the growth of wild rice. The 1854 Treaty Authority accurately notes that research and evaluation of the sulfate surface water standard are ongoing and that application of the standard may change.	VEG04, WR152
8441	In light..of the MPCA research on the wild rice sulfate standard, the SDEIS discussion and models used in the evaluation of environmental effects and cumulative effects need to address the sediment pore water concentrations of sulfides, concentrations of iron in affected sediments, and relationships to concentrations of sulfates in surface and ground water flowing into the St. Louis River watershed.	VEG04, WR152, WR159
8451	Site-specific [sulfate] standards may be needed for some waters. Considerable data suggest that in some cases the development of a site-specific standard would be protective of wild rice production. This is most likely to occur in waters where the sediment iron is elevated.	VEG04, WR152

946	Glencore Xstrata, the primary owner of PolyMet, which [reportedly] will buy the rest of PolyMet once all the permits are in placefor the copper mine in northern MN. So, who is Glencore Xstrata?Glencore Xstrata is a Swiss-based firm known for its ruthlessness. It is the fourth-largest mining company in the world. It controls 50 percent of the world's copper through its ownership of more than 100 mines around the world, and its commodities trading operations.Glencore Xstrata has run up a long list of labor and environmental abuses, including 58 mining fatalities between 2008 and 2010, over twice the number reported by any other mining company over that period.Just in 2012, their environmental and labor record includes dumping raw acid in waterways in the Congo, failure to provide a vapor barrier to keep an acid mist from descending on 3,000 people in Zambia, utilizing child labor as young as 10 years old in mines in Congo, and causing environmental damage at its McArthur River mine in Australia.	PER02

8770	THIS LETTER ALSO CONSTITUTES A MN GOVERNMENT DATA PRACTICES ACT REQUEST. PLEASE PROVIDE ALL DOCUMENTS, BOTH ELECTRONIC AND PAPER, IN THE POSSESSION OF THE MN DNR RELATING TO THE NEED OF THE NORTHMET MINE. PLEASE ADVISE ME IF THE COST TO REPRODUCE AND PROVIDE THE DOCUMENTS IN ELECTRONIC FORMAT WILL EXCEED \$25.	RFI01
15161	According to the U.S. Geological Survey, the U.S.'s need for copper has decreased. The Copper Development Association states the trend is towards recycling more copper than mining new and, copper scrap commands 90% the price of new. A study conducted by Yale University indicates only 50% of the copper in commerce today is recycled...the need to mine copper, especially in the U.S. is unwarranted	NEPA06
15162	Recycling copper, while still creating waste, will do so with less toxicity and environmental damage than mining. Given the robust recycling economy here in MN... a copper nickel mine is unnecessary.	NEPA06
15163	The alternatives suggested and reviewed during the EIS process indicate recycling of copper was not considered. Copper recycling is a relevant and viable alternative as it "improves environmental and/or socioeconomic benefits."	NEPA06
<b>Sender Name (Submission ID)</b> Catherine Anderson (15249)		
394	I firmly believe that we need to be good stewards of our natural resources, and one of the most precious of these resources is clean water. The stakes are just too high to gamble with our water supply, even if the chances are small of it being contaminated for possibly hundreds of years into the future.	WR129, WR195
1819	I am opposed to this mining proposal, as I believe that environmental consequences outweigh the benefits.	SO01
<b>Sender Name (Submission ID)</b> Catherine Coult (32643)

<b>Sender Name (Submission ID)</b> Center for Biological Diversity (52183)		
6006	The Organizations agree that the wetlands that would be impacted by this project constitute an aquatic resource of national importance. The wetlands constitute part of the One Hundred Mile Swamp, a long-recognized wetland of great value, and headwaters of the St. Louis River, the largest U.S. tributary to Lake Superior. Lake Superior and its watershed have been singled out for protection by the U.S. and Canadian governments.	WET19
6007	The One Hundred Mile Swamp has been recognized by the U.S. Forest Service (USFS) and the Minnesota Department of Natural Resources (DNR) as an important wetland and habitat area. All parties recognize the high quality of the wetlands, and their ranking as an area of high biodiversity. ... In sum, this very large, high-quality wetland area is located in an internationally important watershed that has been subject to an enormous effort toward restoration and protection led by the EPA. For the reasons explained below, destruction of these wetlands would amount to “substantial and unacceptable adverse impacts on aquatic resources of national importance.”	WET19
6008	Many of the deficiencies described in the 2010 EPA letter remain in the amended permit application and the SDEIS. In particular, some of the specific reasons that the EPA gave for the finding that adverse impacts of the project may be substantial and unacceptable have not changed. The application and SDEIS still do not provide a mitigation plan for indirect impacts, do not provide sufficient hydrogeological information about the site on which to base an assessment, do not assess or compensate for the actual wetland functions that will be lost, do not ensure that water quality standards will be met, and propose most of the mitigation outside of the St. Louis River watershed.	COE02

<b>Sender Name (Submission ID)</b>	Center for Biological Diversity (52183)	
6009	In this case, all of the activities and impacts of the proposed mine are dependent on the wetland fill permit, and should be considered as part of the review under the EPA Guidelines. ... If the applicant does not provide sufficient information to support a finding that the discharge will not cause or contribute to violation of water quality standards, ACE must find that “there does not exist sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with [the] Guidelines,” id. § 230.12(a)(3)(iv), and deny the permit.	COE03
6010	Our first concern in regards to wetland water quality is that the release of mercury in leachate from waste rock and peat, in air emissions and fugitive dust, and in the discharge of water drawn from Colby Lake will lead to increased levels of mercury in fish, both in the Partridge and Embarrass Rivers and their tributaries, and in downstream lakes and the St. Louis River.	MERC02, MERC16
6011	Neither the impacts of mercury deposition in wetlands nor the addition of mercury to groundwater flow through wetlands is assessed in the SDEIS. The SDEIS discussion meets neither NEPA requirements nor the requirements of the Section 404 permitting Guidelines in this regard.	PER11
6017	ACE should also consider the impact of fugitive dust and Plant emissions on mercury levels in the wetlands, as the fugitive dust would result from the same activities that require the Section 404 permit and are thus secondary impacts under 40 C.F.R. § 230.11(h). ... Unfortunately, mercury deposition has been quantified and considered for downstream lakes only, and not for wetlands or rivers and streams.... The SDEIS also explicitly ignores mercury in fugitive dust at the mine site. Although this is a relatively small source in regards to total emissions, virtually all of it will be deposited at the mine site, within the Partridge River watershed, and it is thus virtually certain to cause or contribute to water quality standard violations in wetlands and the Partridge River.	WET11
6018	Finally, the mine project includes a plan to discharge Colby Lake water into wetlands and headwaters immediately below the Tailings Basin. As explained in our comments on the SDEIS, Colby Lake water has a high level of mercury. Releasing this water into wetlands along with sulfate and combined with fluctuating water levels will almost certainly result in increased mercury methylation in this wetland system. ACE should consider this scenario both as a secondary effect, and in its public interest review pursuant to 33 CFR § 320.4.	MERC09
6026	in the context of impacts from drawdown, Section 5.2.1.2.2 reveals that within 1,000 feet of the pits, impacts are likely even to peat wetlands. In short, the SDEIS and its reference material do not provide support for the assertion that “significant quantities of groundwater are not expected to discharge to the wetlands.” Mineotrophic wetlands form when the groundwater level approaches the land surface for a significant portion of the year. In essence, water in these systems is groundwater. In the absence of adequate rationale for the assumption that groundwater flowing from the mine features would not enter these wetlands, ACE must assume that contamination would impact all wetlands that are hydrologically connected to groundwater in each flow path.	WET10
6032	Neither the permit application nor the SDEIS delineate or otherwise describe a mixing zone. If a mixing zone is being considered, it needs to be delineated and disclosed, and an assessment must be done to make sure that wildlife and aquatic life uses are protected. See Minn. R. 7050.186(1). A mixing zone based on the property line with no assessment of impacts on wildlife and aquatic life is inappropriate for surface water, especially when it is located on what is currently public land.	WR051, WR063, WR093, WR189
6033	The wetland fill at the Plant Site is also likely to result in water quality standard violations. The fill is required in part to buttress and otherwise alter the Tailings Basin so that it can receive tailings from the NorthMet project. The resulting discharge of pollutants from the tailings to wetlands and headwater streams should thus be considered pursuant to 40 C.F.R. § 230.11(h).	PER15, WET12
6034	The SDEIS assumes that more than 99 percent of the Tailings Basin seepage will be collected by the water collection system. The groundwater that is expected to escape the system is apparently assumed to travel underground, not discharging to any wetlands or streams until several miles downstream. No rationale for this assumption is given in the SDEIS.	WR058, WR166, WR167

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Center for Biological Diversity (52183)	
6035	The SDEIS further assumes that 100 percent of the seepage from the south wall of the tailings basin will be collected, and will not enter Second Creek and its associated wetlands. No details are given regarding the water collection system or the hydrology or surface features of the area. At the very least, the SDEIS needs to provide adequate support for the assumption that seepage will not affect wetland water quality in this area. Finally, the SDEIS does not address the potential for seepage from the east side of the tailings basin and the potential that it will drain to Spring Mine Creek. Although most of the east side consists of higher elevation bedrock, a break in the bedrock provides an opening toward Spring Mine Creek. This entire area appears to consist of wetlands that currently drain toward the Tailings Basin. However, the east side of the tailings basin will gain significant elevation from the NorthMet project, which will result in a reversal of the drainage. Significant seepage is likely, and no collection is planned.	WET12, WR018, WR020, WR054, WR056, WR102, WR117, WR133
6037	this project would release additional sulfate into the St. Louis River system. As the largest U.S. tributary to Lake Superior, this river system is of national and international importance. It is already heavily impacted by sulfates, to the point where historic wild rice stands have disappeared from many areas and fish is unsafe to eat. Most of the sulfate pollution is from mining. Permitting new open pit mines within this watershed will only add to an already intractable problem.	WR158, WR159
6044	In summary, due to deficiencies in the SDEIS, we do not know how much sulfate would be released to the St. Louis River over the coming decades and centuries due to this mine, but we do know that the potential is high. We also do not know the level to which we must reduce sulfate additions to wetland, stream and lake environments to restore the ecosystem and eliminate negative impacts on human and wildlife health and welfare. But we do know that significant reductions are needed, and that the level is likely to be below the level at which PolyMet expects to discharge for hundreds of years. If ACE does not have sufficient information to determine whether this mine would contribute to significant degradation of the waters of the United States due to sulfate discharges, it must deny the permit based on a finding that it has insufficient information on which to make a judgment. 40 C.F.R. § 230.12(a)(3)(iv).	WR149
6045	the [EPA] Guidelines require consideration of impacts on state-listed species and other wildlife that is dependent on aquatic ecosystems when determining whether a permitted discharge would cause or contribute to significant degradation of waters of the United States. 40 C.F.R. § 230.30, .32. In this case, the destruction of an important population of a state-listed endangered plant species and the destruction of habitat for moose, a state-listed species of special concern, compel a finding that the permitted discharge would cause or contribute to significant degradation of waters of the United States, and thus must be denied pursuant to 40 C.F.R. § 230.10©.	PER09
6048	Although the Mine Site appears to provide prime moose habitat, no assessment of the loss of this habitat was included in the SDEIS.	WI02
6065	For many years, the EPA and other parties have suggested that the possibility of an underground mine should be assessed as an alternative to PolyMet's preferred alternative. There appears to be no disagreement that an underground mine would have less adverse impact on the aquatic ecosystem. The Underground Mine and other alternatives, and the lack of sufficient information and assessment, are addressed in our comments on the SDEIS. The Section 404 permit must be denied because "there does not exist sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with [the] Guidelines," 40 C.F.R. § 230.12(a)(3)(iv), regarding the availability of practicable alternatives.	ALT01, ALT06

<b>Sender Name (Submission ID)</b>	Center for Biological Diversity (52183)	
6070	The fact is that PolyMet still has not conducted an assessment of the wetland functions that will be lost, despite many comments in 2010 pointing out this requirement, including those from the EPA. Rather than describing the functions that each wetland provides, the SDEIS simply assigns a rank to each wetland based on its quality. The PolyMet mitigation plan is geared toward replacing lost wetlands with wetlands of a similar quality (i.e., high, medium, or low), without regard for functions. This approach does not comply with the EPA Guidelines. Without an assessment, the ACE cannot determine whether mitigation would “compensate[e] for the aquatic resource functions that will be lost as a result of the permitted activity.” 230.93(a)(1). Unless and until PolyMet provides an assessment of lost wetland functions and a mitigation plan designed to replace those functions, ACE must deny this permit application.	COE05
6074	While the exact extent of indirect wetland loss cannot be predicted, some amount of loss is certain. For instance, minerotrophic wetlands within a certain distance of the mine are certain to be lost to groundwater drawdown. Implementing compensatory mitigation in advance of this impact is thus practicable. To the extent that losses cannot be predicted, the permit needs to be detailed, clear, and unequivocal on the mitigation that will be required once impacts are ascertained. The permit application and SDEIS make vague references to additional mitigation if it is deemed appropriate based on monitoring. This is completely insufficient to ensure that lost wetland functions will be compensated for. Although the permit application provides monitoring locations, it does not say what parameters will be monitored, or what would constitute an impact. For instance, will monitoring be limited to groundwater levels, or will wetland vegetation and water quality also be monitored? Will wetlands be deemed “impacted” only when the groundwater level drops a foot below their lowest (i.e., late summer) levels, or will the hydrological regime throughout the year be considered (and if so, how)? Finally, it provides no plan as to what sort of mitigation will be undertaken when wetlands are found to be impacted.	COE02
6075	The Guidelines require that compensatory mitigation be based on a watershed approach “to the extent appropriate and practicable.” 40 C.F.R. § 230.93(c)(1). In a situation where the watershed is losing between 912 and 7350 acres of wetlands, the watershed approach is not only appropriate, but necessary to compensate for lost functions. . . . The permit application describes a process of looking for large acreages within the St. Louis River watershed that could be used for mitigation sites. It describes nothing, however, in regard to watershed needs or plans, or how the proposed mitigation will compensate for lost watershed functions. PolyMet has apparently rejected several potential mitigation possibilities as too expensive or bothersome. While the Guidelines do emphasize “practicability,” ACE needs to consider that term in light of the extremely large loss that it would be permitting here.	COE01
6077	The reality here is that the proposed loss of wetlands is too large to be compensated for. It represents a loss to the Partridge River watershed and to wildlife that cannot be replaced due to its size. PolyMet is having trouble finding mitigation sites within the St. Louis River watershed because of the sheer size of the proposed loss...they [all state and federal agencies involved] are approving significant losses of wetlands within the system that cannot be replaced. This flies in the face of all of the effort and planning that has gone into the Lakewide Management Plan and the Binational Program to Restore and Protect the Lake Superior Basin. . . . This is particularly disturbing given that the wetlands here are not even private property; they belong to the federal government. While PolyMet has private property interests in the mineral estate, the federal government most certainly has authority to limit the circumstances under which the minerals can be extracted in order to protect valuable public resources. PolyMet has rejected underground mining as an option because it is not currently economically feasible.	COE01
6078	In addition to reviewing the permit application according to the EPA Guidelines, ACE must consider whether granting the permit would be in the public interest, weighing the expected benefits against the detriments. 33 CFR § 320.4(a)(1). Granting this permit would not be in the public interest . . . We particularly want to emphasize the impact of wetland destruction on global climate change. . . . the destruction of this amount of peatlands cannot be considered to be in the public interest.	COE03

6079	The ACE public interest review weighs the financial and other benefits of projects that require wetland destruction against the environmental and other costs. PolyMet sponsored an economic study that was used in the SDEIS that vastly overstates the financial benefits of this project, and these projections cannot be used in a legitimate cost/benefit analysis. Furthermore, the SDEIS assumes that these metals are needed by the world economy, and this assumption cannot be accepted as true without supporting evidence. These issues are addressed in our SDEIS comments; we highlight them here as of particular importance to the public interest review.	SO07
6387	Since the SDEIS assumes that changes in groundwater quality may effect wetland water quality, and since the groundwater will include mercury released from mining features (including fill material) the only possible conclusion is that the fill may cause or contribute to violation of the mercury water quality standard and violate an applicable toxic effluent standard or prohibition.	WR158
6390	Appropriate compensatory mitigation is generally required to minimize potential adverse impacts. See 40 C.F.R. § 230.91(c)(2). The mitigation proposed in this case does not “minimize potential adverse impacts of the discharge on the aquatic ecosystem.” The Section 404 permit must therefore be denied due to the lack of an adequate mitigation plan.	COE02
13043	The Hydrogeological Model Used Faulty Assumptions Regarding Baseflow and Hydraulic Conductivity, Making Predictions Based on the Model Unreliable	WR003, WR052, WR086, WR091, WR105
13077	PolyMet’s approach in modeling groundwater flow was to divide the flow at SW-005 based on the area of the watershed at each modeling point. Clearly this approach does not work for a river that loses flow between upstream and downstream modeling points.	WR086
13086	The SDEIS Does Not Include Sufficient Information About Mine Pit Inflow and Drawdown of the Partridge River	WR086, WR179
13105	the discussion of mine pit inflow does not provide a citation at all, see SDEIS 5-90.	EDIT01
13107	the SDEIS must be substantially supplemented and revised to provide information as to the certainty of predictions regarding mine pit inflow and Partridge River drawdown and the range of various model inputs that was used to obtain them.	WR179
13108	The Water Quality Modeling and Assessment Ignores or Mischaracterizes Many Potential Impacts	WR189
13109	The SDEIS Does Not Assess Water Quality Impacts to the Partridge River Along a Three-Mile Stretch Upstream of Monitoring Point SW-004	WR016
13118	SW-003 represents an unimpacted location and the groundwater evaluation location below it represents a location impacted by the East Pit/Category 2/3 Flowpath.	WR177
13126	The Discussion of Aluminum and Lead Exceedances in the EmbarrassRiver is Misleading and Incomplete	WR082
13127	[The SDEIS] fails to consider and disclose the impacts of aluminum and lead on aquatic organisms as required by NEPA and MEPA.	AQ07
13128	The Aluminum Exceedance Would Violate the Clean Water Act...discharges to surface waters that have the potential to result in water quality standard violations are limited by water quality- based effluent limits. See 40 C.F.R. § 122.44(d).	WR177

13134	The Lead Exceedance Would Violate the Clean Water Act...What the SDEIS does not reveal is that natural runoff has a lead concentration below 0.6 ng/L ninety percent of the time, Water Modeling Data Package Vol. 2, Fig. 6-108, while contaminated groundwater at the first evaluation point that includes discharge Northern Organizations Page 11 of 157 to surface water has a predicted lead concentration of up to 2.5 ug/L id., Fig. 6-69.	WR059
13139	Aluminum and Lead Exceedances are Significant Environmental Impacts and Would Violate the Minnesota Environmental Rights Act...PolyMet would discharge lead at a level that would result in water quality standard exceedances where it mixes with water in the environment.	WR059, WR082, WR177
13182	It is unclear whether the “100% deposition line” refers only to total metal, or if it also includes all areas where a specific metal deposition will be greater than 100%. Also, Northern Organizations Page 17 of 157 absence of this information makes any judgment of the contribution of air deposition to violations of water quality standards impossible, as those standards are all for specific constituents.	WR151
13190	The SDEIS needs to include air emissions and fugitive dust sources in its assessment of impacts to water quality.	AIR07, WR151
13193	Finally, we note that the portion of metal that is from fugitive dust will virtually all be deposited locally. The obvious question is, how much of this metal will end up in the Partridge and Embarrass Rivers?	AIR07, WR151
13206	The Assessment and Discussion of Mercury Loading to the Partridge and Embarrass River Systems is Inadequate in Many Ways....increased mercury discharges to waters that do not meet water quality standards are forbidden, no matter how small. Minn. R. 7052.0300(2)	PER11
13211	The SDEIS Dismisses the Possibility of Mercury Transport to the Partridge River Through Groundwater Without Scientific Support	MERC20
13218	The SDEIS Uses Arbitrary Numbers for Many Mercury Inputs...Although the SDEIS predicts that the amount of escaped seepage will be very small, these predictions are based on flawed analyses regarding hydrology (at the Mine Site) and the effectiveness of the collection system (at the Tailings Basin).	MERC04, MERC11
13223	The Estimated Mercury Concentration in Tailings Basin Seepage is Not Based on All Available Data...The SDEIS does not address mercury in water that escapes the tailings basin collection system.	MERC06
13224	The SDEIS Uses Numbers for the Mass Balance Demonstrations That Appear to Have No Scientific Basis...No explanation is given for the use of 3.5 ng/L for other runoff; again, it would seem more accurate to follow the MPCA method.	MERC04
13225	The SDEIS Must Include an Assessment of Mercury Inputs from Air Emissions to the Partridge and Embarrass Rivers and Their Tributaries	AIR05
13226	The SDEIS Must Address Mercury in Colby Lake Water Used to Augment Flows to Embarrass River Tributaries and Second Creek	MERC11
13228	Sulfate Discharges and Water Level Fluctuations from the Proposed Project Would Contribute to Mercury Levels in Fish	AQ28
13232	The SDEIS Must Address the Potential for Mercury Mobilization From Overburden Materials	MERC20
13353	MEPA similarly requires an EIS to identify mitigation measures that “could reasonably eliminate or minimize any adverse environmental, economic, employment, or sociological effects of the proposed action.” Minn. R. 4410.2300(I).	NEPA09

10456	Mines also leave significant and permanent scars to the landscape and for a relatively small economic benefit to our state we are willing to forever change one of the most naturally magnificent places in the world.	SO01
<b>Sender Name (Submission ID)</b> Chad Sahr (22037)		
3332	We can have both clean water and jobs in northern MN. PolyMet has demonstrated it and will prove it when they get their permits.	PER34
19518	I trust that all of the agencies will ensure that PolyMets mining will be safe for the environment. I also know the huge economic impact that this could provide for the whole state of MN. I also know that all of these metals that they will be mining, will still be mined elsewhere. So why not have it done here..... Where we already have the strictest standards!	SO10
19519	PolyMet has proven that they will meet all of the standards and I hope that the regulators won't let the environmentalists delay this any longer. I feel that the groups that are against this are not pro-environment, they are anti-mining. If these groups were pro-environment then they would want this kind of mining here where we know it will be regulated and watched closely. Not in another country where standards are lower.	PER34
<b>Sender Name (Submission ID)</b> Chad Trebilcock (21879)		
9617	I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations.	NEPA16
9620	It's time to move forward as people want and need jobs in the area.	SO10
<b>Sender Name (Submission ID)</b> Chanda Welch (44726)		
16184	The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. [For example,] The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that...during a typical year of operation the federal government would receive \$17.3 million and the state and local governments would receive \$14.5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4.10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503).	SO05, SO08
16189	Table 5.2.10-3 in the SDEIS... projects state taxes of \$15.6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation... No explanation of the change is provided, and no source provided other than personal communication with PolyMet.	SO05, SO08
16190	[Please] Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies	SO05
16191	[Please] Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates	SO05

7255	How can we be assured that Minnesota taxpayers will not be stuck with an enormous bill for cleanup of the mining sites and ongoing treatment costs? Minnesota Rules, part 6132.1200 is supposed to provide for that, but the rule is only effective if (1) the future financial liability is forecasted realistically and (2) PolyMet is capable of providing financial assurances to the extent required to meet their potential obligations for both mine closure and reclamation and environmental damage. Section 3.2.2.4 Financial Assurances of the SDEIS for the NorthMet Mining Project and Land Exchange is the only place where this issue is addressed. Having reviewed that short section (3 pages), I can say with confidence that no businessman would consider the statements made and assurances suggested to be anywhere near adequate for entering into an agreement with PolyMet...no more definitive estimates of future costs to reclaim the sites and deal with long term monitoring of ground water are available. Further, there is no indication that the possibility of substantial contamination of ground water due to failure of impoundments or other issues has even been considered. Costs to deal with this kind of issue could far exceed the general estimates of closure costs (\$120-\$170 million after 20 years of mining) and post-closure monitoring and maintenance costs (\$3.5-6 million annually) that are referred to in this section. There are also no details to permit the DNR or anyone else to evaluate the reasonableness of the estimates given. Furthermore, it is clear from PolyMet's financial statements, that PolyMet will be incapable of providing the kind of financial assurances the state should require before any mining permits are granted. The Consolidated Financial Statements for PolyMet Mining Corp. for the year ended January 31, 2013 shows Total Shareholders' Equity of \$142.9 million, but if intangible assets are excluded (mostly capitalized costs and environmental obligations), Total Shareholders' Equity falls below zero. So at this stage, PolyMet has no capacity with its own resources to provide reasonable financial assurances, and also would not be able to induce a US based institution with adequate financial resources to provide the required assurances. ...Interestingly, buried in a footnote in the offering document for the recent IPO of Glencore, is a statement that Glencore controls PolyMet. In another place, the document assures prospective investors that Glencore is effectively immune to suit in the US. So there is a deep pocket behind PolyMet, but that deep pocket, is not reachable by Minnesota if Glencore fails to voluntarily step up to pay damages....In the situation at hand, the state of Minnesota has its best opportunity to demand meaningful, enforceable financial assurances regarding future damages right now...to protect all Minnesota taxpayers from winding up with a huge bill down the road to clean up large anticipated or huge unanticipated environmental damage by insisting that those who seek permission to conduct mining operations involving sulfide bearing rock provide adequate financial guarantees that those costs will be paid by them or a third party....These guarantees must be enforceable in the US to be meaningful. This probably means requiring a substantial cash deposit into a Trust Fund before mining begins and adding to that from a tonnage charge during mine operations.	FIN01, FIN04, FIN05, FIN08, FIN10, FIN14
8792	The SDEIS doesn't even consider the potential cost of remediation in the event something goes wrong and toxic mine waste escapes a tailings basin or mine or plant site.	FIN05
8794	Is Polymet required to provide adequate Financial Assurance as required by Minnesota Rules, part 6132.120?	PER03
8797	...annual post closure monitoring and maintenance (\$3.5-6.0million)...is projected in the SDEIS to be required for 200 years for the tailings basin and 500 years for the plant site. Since PolyMet has a vested interest in estimating these numbers on the low side, it is reasonable to use the upper end of the projections, and they may well be too low. These are cost estimates based on cost today. Costs will grow in the future, and the cost of inflation of 3% a year seems realistic.	FIN05, FIN08, FIN11
8801	Mine closure and reclamation costs of \$170 million today will be \$307 million in twenty years (using 3% cost inflation). For a Trust Fund to grow to \$307 million in 20 years, \$170 million would have to be deposited today, assuming an earnings rate of 3% a year, a reasonable assumption.	FIN05, FIN08
8806	...any agreement on Financial Assurance that does not provide, before mining commences, the equivalent of a cash Trust Fund well in excess of \$1 billion is grossly inadequate.	FIN05, FIN08

<b>Sender Name (Submission ID)</b>	Cheryl Dannenbring (7548)	
782	Being aware of these critical roles that wetlands play in the ecology and culture of Northern Minnesota, I am extremely concerned about PolyMet's proposed impact on such lands. By its own admission, PolyMet will destroy 913 acres of wetlands directly and another 7,351 acres will likely be destroyed due to fragmentation, pollution and changes in hydrology.	WET24
784	the Polymet's EIS details no plan to mitigate this huge loss within the Lake Superior Basin. Furthermore, the Army Corp of Engineers has no record of requiring wetland compensation or mitigation after a project is built.	WET03
786	I ask that the EIS be deemed unacceptable and that the DNR does not permit the mine on the basis of its own stated goals for preservation and improvement of wetlands in Minnesota.	NEPA09
3602	This EIS should cover all possible known variants of the mining plan, not just the one proposed at the time being. I am concerned that the mining company could start with a small operation and thus be grandfathered into a larger operation without needing to go through all review processes.	ALT01
8607	no copper-nickel mine has ever operated in the United States (or elsewhere) without leaving behind irreparable environmental damage... I believe it behooves our state representatives to look at what heavy metal mining does to the surrounding land and water before deciding to open our state to a similar fate.	WR023
8778	"There is no mine plan for any material that lies outside of the proposed open pit; as such, mining material located beyond the proposed pit outline would be evaluated as appropriate if proposed in the future." This EIS should cover all possible known variants of the mining plan, not just the one proposed at the time being.	CU02, PD30
9341	Polymet claims that all but 21 gallons of seepage per minute ... will be contained via pumps. That is a 99% collection rate. Nowhere is there an example of this almost perfect result .... Simply saying it will happen does not mean that it will.... PolyMet makes claims that are not backed up with hard evidence or scientific review. Nor do they explain what will happen when PolyMet is no longer there to keep the mechanical form of reclamation going - some 50, 200, or 500 yrs....	WR020, WR037
9342	The Forest Service claimed that the purpose of a land exchange was to unify ownership of federal lands so federal forests would not be on top of mineral leasing. But the proposed land swaps do not fill that purpose. Almost all of the land proposed for the swap have split ownership and severed mineral rights.	LAN04
9426	The mine will open a pit reaching below the presently used aquifer, thereby making a permanent connection between all geologic zones that are mined through. There is no plan to create a permanent barrier from the toxic mining byproduct to the water, either during mining or after by-product disposal.	WR090
10516	The SDEIS needs to be redone to analyze water quality outcomes/risks IF the tailings pile collection rate is not what PolyMet projects.	WR018, WR090
10518	[The SDEIS] also needs to detail Polymet's financial guarantee to back up its claims.	FIN01
10520	the land swap will allow PolyMet to take lands from the Superior National Forest—lands currently available for multiple-faceted public use—wildlife habitat, forestry, and recreation—and turn them into a single use (mining) parcel. It is not the Forest Service's job to make land available for a foreign corporation's economic benefit.	LAN01
10762	The mine will open a pit reaching below the presently used aquifer, thereby making a permanent connection between all geologic zones that are mined through. There is no plan to create a permanent barrier from the toxic mining byproduct to the water, either during mining or after by-product disposal.	WR090

11026	The amount of water that the proposed PolyMet mine would require for operations is of great concern to me... 'make-up water' drawn from Colby Lake would average 275 gallons per minute...After twenty years of use, this would mean removing a significant portion of the lake's total volume. No study was done to measure the effects of this lake drainage.	WR181
11029	I reject the 'we'll deal with that if it arises' solution which seems to be an integral part of this SDEIS. Plans for such eventualities must be in place before the operation is permitted.	PER06
11103	the Whitewater Reservoir could become tainted from the City of Hoyt Lakes' sewage discharge. Any number of unintended consequences could arise from using such large volume of water, and polluting much of it to the point that it cannot be discharged from the plant.	WR111
11105	Furthermore, as with the issue of pollution, the effects will be greatly multiplied with each additional mining operation permitted for the Arrowhead region.	CU11
11905	The mine will open a pit reaching below the presently used aquifer, thereby making a permanent connection between all geologic zones that are mined through. There is no plan to create a permanent barrier from the toxic mining byproduct to the water, either during mining or after by-product disposal.	WR090
12492	This EIS should cover all possible known variants of the mining plan, not just the one proposed at the time being. I am concerned that the mining company could start with a small operation and thus be grandfathered into a larger operation without needing to go through all review processes.	CU02, PD30
16200	Polymet's SDEIS, section 3-40 paragraph 2 states "There is no mine plan for any material that lies outside of the proposed open pit; as such, mining material located beyond the proposed pit outline would be evaluated as appropriate if proposed in the future." As in many sections of the EIS, this vague language opens the door to future environmental assaults without having a plan 'on the books' to deal with those eventualities.	CU02, PD30
16846	ES-24, paragraph 3 states that the Hydrometallurgical Residue Facility will be capped and double-lined for the duration of the estimated 500 years of toxicity. No know man-made structure can retain its original and viable properties for such a length of time, especially concrete or geomembrane, which are known to degrade. Thus any claims which count on this system to contain polluted material must be discounted.	PD17
16847	I am wondering how the MN EPA can approve and permit the Polymet copper-nickel mine...when many MN water ways are already polluted by old iron mining operations. The Clean Water Act clearly states that no new source of pollution can be added to already polluted water. PolyMet's permit must be denied until old pollution problems are dealt with.	COE03
16848	all "estimations" for pollution assumed by the SDEIS must not be accepted. Simply saying Polymet won't produce water pollution does not make it so.	WR025, WR072, WR189
16849	There has been no study that proves or disproves that water pollution will migrate via natural permeability or existing fractures...Until independent studies are conducted (not connected to the agencies authorizing the SDEIS) regarding water seepage (sub-terrain water migration) to give a clean understanding of where pollution may travel, the SDEIS should not be approved.	WR007, WR008
19520	What I would like to see in Polymet's EIS draft, is:1. a clear explanation of how they are going to prevent pollution from leaking out of holding ponds that are designed to leak.2. how they plan to keep the leaking pollution from seeping into surface and groundwater? 3. whether accurate water samples are being taken now to determine the pre-mining sulfate levels in surrounding ground and surface water?	WR044, WR045, WR049, WR057, WR066, WR072, WR088, WR116

19521	What I would like to see in Polymet's EIS draft, is:4. whether Polymet is making financial commitments to be responsible for 'clean up' of pollution that appears 20, 50, and 100 years from now. (as it is known that this type of pollution often takes that 20 years to manifest itself--hence the need for accurate pre-mining samples--and that it can be expected to linger indefinitely.5. whether they will be held responsible for restoring deforested areas with the biodiversity that presently exists, and continue to finance that restoration until the forests regain their former health?	FIN01
19523	What I would like to see in Polymet's EIS draft, is:6. whether the economic impact of the loss of tourism-related jobs, jobs related to our present resources of clean water, forests, and wilderness, have ben figured into the scenario?	SO06
<b>Sender Name (Submission ID)</b> Cheryl Gerth (48563)		
13396	I have several friends who still have a financial stake in Polymet's future, but their small economic loss is nothing compared to the threat to the clean air and water which is Minnesota's best legacy.	SO01

<b>Sender Name (Submission ID)</b>	Chippewa Ottawa Resource Authority (42954)	
3895	CORA understands that, in order to address pollution of the St. Louis River watershed...the proponent, under the NorthMet Project Proposed Action, would need to install and operate wastewater treatment systems for the duration of the modeled pollution simulations (200 years at the mine site, and 500 years at the plant site). We are extremely concerned that the authors of the SDEIS...have accepted this concept as a possible scenario. CORA agrees with the cooperating Native American Tribes that this time frame constitutes perpetual maintenance and should not be acceptable by any jurisdiction.	WR037
3896	We do not believe that proposals to mitigate the wetland loss listed in the SDEIS will be adequate and that alternatives to open pit mining at this site should be considered.	WET01, WET04, WET20
3897	Tribal cooperators...have requested that the SDEIS utilize the USEPA's 2011 NEPA review guidance titled "Applying Cumulative Impact Analysis Tools to Tribes and Tribal Lands" however this document has not been used to assess cumulative effects on tribal resources in the current SDEIS. CORA requests that the lead agencies use the resource-specific GIS-based approach as defined in the 2011 guidance to better account for cumulative impacts to resources of tribal significance.	CR03, CR08
3898	We would point out that the requirements for additional mining or disturbance should be even more stringent because of the history of environmental degradation in this area...We believe that the SDEIS should consider [the] commitments [made by the Commissioner of the MDNR in the Duluth News Tribute] and others that, not only the State of Minnesota but the State of Wisconsin, have made to protect wetlands, restore the St. Louis River AOC and ensure that future generations are not left with another costly cleanup.	PER07
4049	[The Project] will destroy and otherwise compromise over 1,000 acres of wetlands located in the Lake Superior basin and will destroy or permanently alter over 1,700 acres of bird and wildlife habitat classified by the Minnesota Biological Survey as sites of high biodiversity significance and nearly 700 acres of imperiled or vulnerable native plant communities.	VEG02, WET24, WI02
4056	the destruction of most of the wetlands and the requirement for a land exchange with the USFS could be avoided if the proponent had kept the alternative of proposing an underground mine for consideration however this alternative has been eliminated from the SDEIS... the reasoning given by the proponent for eliminating this alternative was economic feasibility [however the authors]... did not give the details on what an adequate return to investors would be...We request that the lead agency require that the underground mining alternative be re-examined and included in this SDEIS.	ALT01, ALT06
4069	we would like to point to an editorial by John Line Stine... and Tom Landwehr... published in the August 11, 2013 edition of the Duluth News Tribune and titled "Commissioners' View: St. Louis River is a Gem Worth Saving". In this editorial the commissioners outline the considerable efforts to restore damage to the St. Louis River system ... including over \$500 million of taxpayers' money that have already been spent on remediation. We believe that the SDEIS should consider these commitments and others that, not only the State of Minnesota but the State of Wisconsin, have made to protect wetlands, restore the St. Louis River AOC and ensure that future generations are not left with another costly cleanup.	WR111
4070	CORA does not believe that lands held in trust by the United States Forest Service (USFS) should be exchanged or sold to corporations for development, especially for open pit mining that will affect the ability of future generations to practice their treaty rights.	CR01

<b>Sender Name (Submission ID)</b>	Chris A Norman (11604)	
14242	you need to let the company show the world they can mine and process these elements safely by letting them try. We need the jobs! The world needs the previous metals.	SO10
<b>Sender Name (Submission ID)</b>	Chris Adams (41554)	
9336	In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out ....	WR190
9337	This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs.	SO04
9338	Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.	PER34
<b>Sender Name (Submission ID)</b>	Chris and Catherine Pranskatis (54688)	
17842	The (SDEIS) repeatedly states that water treatment upon closure of the site will be required for an "undetermined amount of time." In all fairness, the site could require treatment for as little as a year following closure, but it may also require treatment for as many as a thousand years. Nobody really knows, which is extremely unfortunate for those of us that live near the proposed mine. Isn't a mine that requires treatment upon closure a violation of state law anyway?	PER04
17843	This SDEIS relays heavily on computer modeling. As we all know, a reliable computer model depends on good quality historical data, and even then, they fail. Considering that this type of project is new and unique to this ecosystem, we simply do not have reliable historical data.	PD22
17844	We have a saying in the engineering field; "Software eventually works. Hardware eventually fails ." I'm sure the engineers of the Deepwater Horizon were surprised when their drill rig sank in the Gulf of Mexico. What about the recent chemical spill in West Virginia? We're rolling the dice by allowing this project to move forward in one of the most water-rich regions of the United States.	WR070, WR111
<b>Sender Name (Submission ID)</b>	Chris Bangs (36657)	
14388	The costs for these copper mining jobs will come at far too high a price for all of the people of MN. The industry's track record of environmental damage is long and damning. Too many abandoned mines have been left for other state's residents to clean up at obscene cost levels.	SO01
14389	Furthermore, this mine is located much too close to the jewel of northern MN-the BWCA, which is a treasure we cannot risk to lose. On its eastern flank lays Lake Superior, the continent's largest source of clean water-which in time may prove to be far more valuable than all the copper below our state's surface.	WR111

<b>Sender Name (Submission ID)</b>	Chris Fleege (47663)	
7886	I feel this SDEIS lays the proper groundwork for developing an environmentally and economically sustainable project and I wholeheartedly support it.	NEPA16
<b>Sender Name (Submission ID)</b>	Chris Gordon (19962)	
1557	I oppose the development of the NorthMet Mining Project. The potential impact on waters that flow into the Boundary Waters Canoe Area as well as into Lake Superior, one of the largest bodies of fresh water is too large to risk.	WR111
1558	We cannot risk this incredibly valuable fresh water for a mere 360 temporary jobs. The jobs are here until the mining company depletes all the metals and moves on to the next one.	SO01
<b>Sender Name (Submission ID)</b>	Chris Haenisch (58104)	
20016	This proposed project does not sound safe with the 500 year hitch to contain the pollution...I think Polymet will declare bankruptcy and walk away from any responsibility like they have in the past.	FIN01
<b>Sender Name (Submission ID)</b>	Chris Heesch (54186)	
17195	the mining project... can also potentially take away camping and canoeing areas. Being an outdoorsy person I would hate for it to damage or take away any of that because those are things I love to do when it's nice.	LU06
<b>Sender Name (Submission ID)</b>	Chris Heeter (38266)	
11300	We are looking at hundreds of years ... of recovery needed in order to re-gain the water quality that we now have. This is not something we can risk, not a resource that we can replace in any way.	WR195
11301	the lure of jobs is strong, the needs are great. And, the jobs that would be created are not from a long view. Not from a place that is sustainable, even for mining in the long run.	SO02
11302	Help us stand for something that looks beyond a few decades and on into preserving a treasured area of wilderness that may not ever recover from this meddling	WILD02
<b>Sender Name (Submission ID)</b>	Chris Lian (15450)	
663	The fact that waste water will need to be treated indefinitely(forever) to avoid polluting our waters is a very scary proposition.	WR035, WR129

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Chris Lian (15450)		
665	This is a bad deal for minnesota ... Polymet plans on processing the metals in another state costing jobs in minnesota.	SO02
666	This project threatens tourism and property values in the region.	SO02
668	Calcium could leech into [Lake Vermilion] via numerous waterways tied to the mine allowing calcium levels to increase to a level that zebra mussels could possibly thrive.	AQ17
669	All of this water flows into the St. Louis River watershed and into Lake Superior poisoning the water I and tens of thousands of other people drink.	WR042
670	Th risk of an environmental catastrophe vs. the creation of a couple hundred jobs is a risk minnesota can't afford.	SO01
<b>Sender Name (Submission ID)</b> Chris Lish (48504)		
7798	The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. ...	LAN01
7812	The watershed of the proposed mine contains three Important Bird Areas (IBAs) which would be directly impacted by the mining, and the flow of contaminants into the watershed of the St. Louis River. These IBAs are home to more than 250 species of rare and common birds, including Belted Kingfishers, Hooded Mergansers, Common Terns, Common Loons, and many others.	WI01, WI02
7814	Calculate how long treatment is needed. The Minnesota Department of Natural Resources (DNR) needs to evaluate how long active water treatment will be necessary to deal with pollution after this mine is closed. Information in the SDEIS suggests centuries of pollution will occur from this mine.Consider alternatives that could reduce environmental impacts. The SDEIS must evaluate alternatives such as lining the waste rock storage areas and tailings disposal basin to reduce leakage of toxin-laden waters into surface and groundwater.Plan for accidents. PolyMet provides no plan to manage common accidents, spills, leaks, or mechanical failures that may occur. The SDEIS must include contingency planning for intense rainfall events and other factors which may render the water treatment system ineffective.Fix problems in water impact analysis. The proposed mine plan uses inaccurate and incomplete information in the model for water quality impacts, which likely under-represents the extent of water pollution.	ALT13, PD03, PD22
7817	However, the NorthMet mining project SDEIS provides no information about how much water treatment would cost, what will be included in the costs, and how taxpayers will be protected from paying for environmental liabilities, such as the environmental clean-up after the mining company leaves (which, given the mining industry's history, seems inevitable). The public deserves to know the costs and risks up-front.	FIN01, FIN05
<b>Sender Name (Submission ID)</b> Chris McGreevy (46853)		
8617	The main one of course is that there is a connection from the Polymet project to the Boundary Waters Canoe Area Wilderness as Langley Creek flows through the Dunka River to the Kawishiwi and on to Birch Lake.	WR024, WR081, WR111, WR175
8618	Water monitoring and remediation at Langley Creek is not mentioned in the study. The fact that this has been missed, intentionally or unintentionally, call in to question quality of the entire SDEIS.	WR081, WR139
8619	The connection to the BWCAW watershed should also mean increased federal scrutiny of the project.	WR111

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Chris McGreevy (46853)	
8620	The Hundred Mile Swamp which is proposed to be exchanged for is an important wetland supporting wildlife and plant life. The various parcels proposed to be exchanged for the Hundred Mile Swamp are not the same quality of environment or even equivalent wetland. Therefore if the proposed exchange were to go forward, as project runoff flows into the wetland, the result would be an overall degradation of the environment in Minnesota.	WET19
8621	The portion of the SDEIS that considers air quality impacts considers only direct effects of air quality from the mining project from grinding and tailings pile dust. It does not consider the effect of power generation needed to operate the plant in this area and what effect that would have on the Superior National Forest. Certainly the amount of power needed to operate this project for Polymet and for expected use of excess processing capacity by Twin Metals would far exceed anything needed for the current population of the area and would have a negative impact on the Superior National Forest and the health of the population	AIR02
8622	The portion of the study that addresses reclamation states that is “uncertain how long” water treatment would be needed but that modeling shows that at 500 years of treatment, water quality would be within acceptable levels. The section also says that Polymet “would be held accountable”. Later the SDEIS explains, without details, that financial assurance instruments would be created. There are several problems with the lack of specificity in this section.	FIN01, FIN05, FIN06
8623	There are currently no financial institutions capable of guarantees extending to 500 years.	FIN01, FIN08
8624	Polymet could legally declare bankruptcy at any point in time and could no longer be held accountable in any way.	FIN01
8625	Given that the current length of time needed for remediation is unknown, how can any financial assurance be made that could cover any unexpected increase in the amount of time needed for remediation and take into account Polymet’s ability to declare bankruptcy and walk away, leaving the taxpayers of Minnesota to pay for clean up.	FIN01
8626	Unusual Weather Events. The report fails to consider the increasing likelihood of unusual weather events including large volume rainfalls, high winds equivalent to the 1999 blow down, as well as extreme winter temperatures, all of which could cause equipment failures, water runoff surges, and retaining wall failures.	PD22
8627	Comparative Studies. The SDEIS fails to study the project in the context of other sulfide copper/nickel mines and the overall historical environmental impact as well as the general regulatory compliance history of the companies involved, including companies who are Polymet investors. If permits are issued, will we see a constant battle to enforce regulations, will variances be sought?	PER23
8628	The SDEIS is prepared only as it relates to the Polymet project. It is widely understood that the excess processing capacity at the Polymet site is intended to be used in relation to other projects, including the Twin Metals project. The effects of the expected increased processing at the site if Twin Metals is operational should be studied now.	CU02, CU04
16645	The map in the study does not seem to accurately reflect the Hundred Mile Swamp. It does not show the full dimensions of the area and the drainage through Langley Creek...Polymet project to the Boundary Waters Canoe Area Wilderness as Langley Creek flows through the Dunka River to the Kawishiwi and on to Birch Lake.	WET19
<b>Sender Name (Submission ID)</b>	Chris Mortenson (7065)	
467	I am continually dismayed that our intelligent and technologically savvy society still holds to arcane mineral extraction techniques. Why is there no one in this debate saying we need to develop and implement different mining practices instead of making small changes to outdated techniques?	ALT16

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Christina Bellert (47001)		
16468	Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test.	WR149, WR162
16469	The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction.	PD03
<b>Sender Name (Submission ID)</b> Christina Diver (57204)		
17097	I find the SDEIS faulty and inadequate because the proposed plan does NOT protect Minnesota taxpayers.	SO02
<b>Sender Name (Submission ID)</b> Christina Erickson (51605)		
3621	Sulfide mining threatens the areas of Minnesota that I love most; wetlands, rivers, lakes and streams across the Arrowhead Region. Even our fabulous Lake Superior and the Boundary Waters Canoe Area Wilderness.	WET24, WILD02
3622	The industry needed to extract the ore creates garbage, and the jobs it creates aren't sustainable over generations. At that point, we won't have our tourism to turn to either.	SO02
12432	The industry needed to extract the ore creates garbage, and the jobs it creates aren't sustainable over generations. At that point, we won't have our tourism to turn to either.	SO02
13915	Sulfide mining threatens the areas of Minnesota that I love most; wetlands, rivers, lakes and streams across the Arrowhead Region. Even our fabulous Lake Superior and the Boundary Waters Canoe Area Wilderness. Acids and heavy metal contamination pollute waters.	WET24, WILD02
<b>Sender Name (Submission ID)</b> Christina Klein (44142)		
14556	The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data.	WR003, WR071
14557	A DNR Hydrology memo shows that the average flow of the Partridge River is 1.5 CFS, while the GoldSim model uses a 0.5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS.	WR003, WR004
14558	If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment.	WR003, WR091, WR106
14559	the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions.	WR065, WR173, WR177, WR189
14560	Redo the GoldSim water model using assumptions based on adequate and accurate field data... Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013...	WR003, WR165, WR189
14562	Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity	WR003

<b>Sender Name (Submission ID)</b> Chuck Viren (58163)		
19951	No one would be willing to take responsibility for the effects of their actions 500 years in the future. Yet somehow, PolyMet seems willing to take actions that will impact the environment for at least 500 years. Are they willing to guarantee the results at their actions for the next 500 years? Is the state? This project is [ILLEGIBLE] inaccurate, [ILLEGIBLE] beyond belief.	FIN01
<b>Sender Name (Submission ID)</b> Chuck Zeugner (43704)		
11928	There are individuals far more competent than I that have repeatedly addressed the inadequacy of the SDEIS economic impact analysis, the failure to address the consequences of creating a mechanism that will produce a permanent source of pollution in important watersheds, and absence of contingency planning in the event of accidents or unanticipated system failures.	WR130
11932	Further complicating the economic analysis is that the positive economic impact of the mining will be temporary within the region while the costs will be long term. At the same time, the abundance of wealth derived from the copper extraction will be taken away from Minnesota to benefit companies and individuals elsewhere.	SO01
11934	assuming that there will be no accidents, system failures, or unintended consequences should be a fatal flaw in any analysis. Any list of these things would be very long, and the economic consequences would be uncountable.	PD22
11935	A third significant issue is that of financial responsibility. Even the most ardent supporters of the PolyMet project acknowledge that there will be environmental impacts, and the SDEIS purports to describe the remediation efforts that will be made to mitigate the damage from those impacts.	FIN01
15673	Further the SDEIS does not adequately account for opportunity costs for displaced activity, or for the value of intangible, but significant items such as tribal rights to hunt, fish, and gather.	SO04
15674	the Arrowhead Region is an incredible treasure in its own right. While it is easy to focus on the value of the copper below ground, it is even easier to ignore the value of clean air and water. As easy as it is for the people that live in the North Woods to undervalue these resources, it is even easier for outsiders.	WILD02

9499	I believe Polymet has put together a great plan that far surpasses any previous mining plan to protect the environment ever seen in Minnesota in the past!!	NEPA16
9516	Minnesota really needs this mine for the economic benefits it will bring to the people of the Hoyt lakes area and also to the State as a whole. Not only will good paying full time jobs with livable wages be created but also many more jobs that will pop up to support this new (already existing mine)! The economic boost for this part of Minnesota this mine will create has been sorely needed for many years!!!	SO10
<b>Sender Name (Submission ID)</b> Cindy Ilg (46880)		
8320	Please do not let SDEIS do any mining in the Superior National Forest. Please save our wetlands, bogs, and swamps from being destroyed by pollution due to open-pit mines. We do not want contamination of ground water or our lakes and rivers.	LAN01
8323	SDEIS is inadequate and should not be mining in a fragile eco system.	NEPA15
<b>Sender Name (Submission ID)</b> Cindy Oberg-Hauser (41879)		
2127	The long terms dangers of this project far outweigh the short term financial gains. We need to maintain the incredible jewel that is Lake Superior and the Boundary Waters.	SO01
<b>Sender Name (Submission ID)</b> Cindy Strong (28360)		
14733	As a youth I recall my first time seeing the northern lights in the BWCA and discovering what the word awesome actually means. We need these areas and so do our future generations. I ask you to make a decision respectful of what our children deserve from us. Please be a good steward to this beautiful planet.	WILD02
<b>Sender Name (Submission ID)</b> Cindy Swanson (41799)		
6370	Since it is simply a fact that the mining of this ore will result in sulfuric acid draining into the waters of northeastern Minnesota it is impossible for us to believe that most Minnesotans would support this mine for the short term economic benefit of a relative handful. The waters of northeastern Minnesota, in particular, have a special place in our hearts and to willfully permit their degradation is woeful governance and the abandonment of the expressed interests of the vast majority of Minnesotans.	SO01, WR001, WR195
<b>Sender Name (Submission ID)</b> Cindy Thomas (47030)		
10630	I may not know you but I do understand how damaging this mine IS going to be to the ecology in the river and surrounding the river.	WR115

14712 This analysis shows that water is a renewable resource that is considerably more valuable than the copper nickel ore... PolyMet and The Value of Its Sulfide Mining Project PolyMet is a Canadian company traded on the Toronto and New York exchanges, planning on selling our minerals, most likely to China through an exclusive agreement with Glencore AG, located in Baar, Switzerland. As we pondered over the SDEIS we wondered just how did Polymet obtain the mineral rights and what is the economic value to PolyMet? PolyMet's numbers are considered representative and used to estimate the copper /nickel mining value of the Duluth Complex. The following slide is from Polymet's investor presentation: • Production rate - first 5 years 32,000 tons of ore per day 72 million pounds of copper per year 15 million pounds of nickel per year 106,000 oz combined precious metals per year • Low Capital and Operating Costs \$312 million initial capital costs Copper cash cost \$1.05/lb (co-product basis) Based on 2008 DFS Update • Robust Economics After tax IRR: 30.6% Annual EBITDA \$217 million Based on 2008 DFS Update LME Metal Prices - US\$ Average - 3 months to 3.31.2013 2008 DFS Update Copper 3.60 /lb 7.937 /t 2.90/lb Nickel 17.85 /lb 17,306/t 12.20/lb Cobalt 11.92 /lb 26;179 /t 23.50/lb Palladium 740 oz 320/oz Platinum 1,634/oz 1,230/oz Gold 1,630/oz 635/oz PolyMet Investor's Presentation of June 2013 4 provides production and value numbers. It does not provide the mineral rights, financial assurance, nor reclamation costs, but presents low capital and operating costs with annual earnings before interest, taxes, depreciation and amortization (EBITDA) of \$217MM. It also 3 Glencore has invested \$118MM into PolyMet 4 <http://www.polymetmining.com/wp-content/uploads/2013/02/PLM-Investor-Presentation-2013-06.pdf> shows an internal rate of return (IRR) of 30.6% for a very lucrative venture, projecting to deliver in excess of \$4B over the twenty-year life of the project. The Duluth complex in northeast Minnesota has received the most attention and is estimated to contain four billion tons of copper-nickel ores. PolyMet has stated that the Duluth complex is number two in the world for deposits of copper, and it is number three in the world for nickel. However, their presentation also shows the low quality of the ore. Less than 1% of bulk ore produces the copper, nickel, etc. generating over 99% waste in addition to the overburden. This equates to over 31,000 tons of waste every day, presenting a significant threat to the water. It is difficult to reconcile the fact that the first two companies investigating sulfide mining are not US companies, but foreign companies set to mine the ore, take the profits out of the country, and ship the ore to China. Where is the value to Minnesota in that? How can that be worth the small number of jobs that only last a single generation? If sulfide mining is permitted, it should at least be a critical part of a US strategic plan to maintain our leadership position in the world... Estimated Value of the Lake Water in Northeast Minnesota Estimated acres of water for the lakes in Cook, Itasca, Lake, and St. Louis counties is 275,169 acres. Assumptions: Average depth is 20 feet. Price per acre-foot of water is \$1,500. Therefore the value of the water is: (acres) x (depth) x (price) = \$8,255,070,000. With continuous natural replenishment and sustainability, this value can be extended twenty years to match the mining operations, for a value of \$165,101,400,000. Estimated Value of the Duluth Complex for Copper-Nickel PGE Assumption: • Polymet is representative of proposed Duluth Complex mining. • Twenty years of mining. Determine the value per ton of ore from Polymet investor presentation: • 32,000 tons per day times 365 = 11,700,000 tons per year • Annual EBITDA divided by number of tons mined equals value per ton: Polymet projected annual EBITDA = \$2

SO04

14713 PolyMet's sulfide mine will be near both groundwater and surface water resources that present an elevated potential for acid drainage or contaminant leachings. Kuipers and Maest studies show: • 85% of the mines near surface water with elevated potential for acid drainage or contaminant leaching exceeded water quality standards • 93% of the mines near groundwater with elevated potential for acid drainage or contaminant leaching exceeded water quality standards. • Of the sites that did develop add drainage, 89% predicted that they would not.

WR023

14715	The current price of metals to be produced from sulfide mining make this venture profitable. The problem is the history of sulfide mining companies that start with the goal of being environmentally friendly but in the end all sulfide mines in water dominant areas are polluters, leaving the taxpayers the cost and task of cleaning up. The terrible history of sulfide mining continues from one mine to the next and is why the DNR must insist that the financial assurance from PolyMet includes payment for the economic value of the water as a natural resource with inherent value.	FIN01, FIN05, FIN08, FIN10

19418	what is the inherent value of the endangered water (not counting the services and tourism money enabled by the water resource)?	SO01
19419	And, what is the impact on residential and commercial property surface rights [of sulfide mining]?	SO03
19419	And, what is the impact on residential and commercial property surface rights [of sulfide mining]?	SO03
19420	The estimated value of the water in northeastern Minnesota is significantly more than the estimated value of the Duluth Complex copper nickel mining operations.	SO01
19420	The estimated value of the water in northeastern Minnesota is significantly more than the estimated value of the Duluth Complex copper nickel mining operations.	SO01
19421	If it is polluted with mercury, sulfuric acid, heavy metals, etc. as a result of sulfide mining, then the value of this natural resource is zero unless the contaminants are removed. And, of course lake homes and resorts are significantly reduced in value. With a reduction in the value of lake property the tax receipts of these counties will also drop significantly. With polluted water the tourism industry will go away.	WR107, WR108

9960	I have some major concerns regarding the SDEIS and specifically, the water model, which is at the foundation of the entire SDEIS (...) The specific miscalculations are related to the amount of water that flows through the mine site at the headwaters of one of the tributaries of the St. Louis River, the Partridge River. A misjudgment in math could potentially result in catastrophic, irreversible impact on the watershed.	WR003
16311	I demand that the DNR addresses this issue, with the highest expectation that the water model within the SDEIS will contain accurate data prior to any further decisions are made. Because of the fundamental flaw in calculation, the SDEIS is fundamentally inadequate and unacceptable.	WR003
16312	From the beginning, we've been told to "trust the science." Well, until a mining company can prove that sulfide mining can be completed and not harm a watershed, this is the wrong place with too much at risk.	PD01

8324	The proposal includes destroying nearly 1,000 acres of our valuable peat bogs..It is also unclear to me just how these wetlands will actually be replaced. Please address the issues of wetland protection and replacement in the PolyMet plan.	WET17
11200	I understand that the PolyMet water model significantly understates the amount of water flowing in the nearby Partridge River. If this information is wrong, predictions about water pollution are in question. If the model is incorrect, and there is more water flowing through the site than it assumes, the polluted water from pits and waste rock will move more easily through the soil, and reach lakes and rivers more quickly. The water could also carry more pollutants than the PolyMet model predicts.	WR003, WR004, WR091
<b>Sender Name (Submission ID)</b> Colles B. Larkin (45604)		
11222	The sulphuric acid & toxic metals produced by this type of mining are the result of exposure of this rock to air & water. This contamination happens wherever such mining exists and has always - with no exceptions - polluted surrounding waters.	WR001, WR023
11226	This particular site is in a water-rich environment and, as such, facilitates/accelerates the seepage of pollutants (sulfide, heavy metals) due to the open-pit mining process.	PD01
11228	The PolyMet site is within the confines of the Superior National Forest (public land). Federal law prohibits open-pit mining within national forests/parks.	LAN02
11233	Since federal law prohibits mining in national parks, a "land exchange" of some 6000 acres has been proposed as an equal exchange for the land & water that will be polluted by PolyMet's mine. This is not an equal exchange.	LAN02, LAN03
11234	National parks/forests are set aside as recreational areas for humans to enjoy Nature as well as habitat refuges for flora and fauna. The reason for setting aside large tracts of land is to provide an extensive natural habitat; a mine in the middle of such an area cannot be compensated by token land elsewhere.	WILD02
11261	The DNR, as presently set up, has a conflict of interest relating to mining decisions. By federal statute the DNR is mandated both to regulate and promote mining on public lands ~ and, in its promotion capacity, to maximize the royalties collected for any mining on state land. Promotion and regulation are two different jobs; one government agency should not be responsible for both. The EPA should be given the regulatory responsibility ~ for the sake of citizen's health and, of course, the ecological impact.	NEPA18
11266	The DNR would compromise our water resources for copper when, per "the Institute of Scrap Recycling Industries, ... copper scrap now provides half of the annual U.S. demand for that metal and the U.S. provides 23% of the world supply of recovered copper"???	NEPA06
11268	The 500 year certainty of polluted water that will compromise the St. Louis River and others that spill into Lake Superior is, I think, too high a price to pay for the small amount of copper and the huge amount of polluting waste.	SO01
11275	I'd be willing to wager that mothers will not want their family members to canoe on waters contaminated with sulphuric acid, mercury, heavy metals, lead...	LU06
15902	A recent article (January 27, 3014) in the Star Tribune noted, as has the WaterLegacy organization, that 99% of the rock from which the mined metals are extracted would be waste. - Last Monday (March 3, 2014) the Star Tribune ran an article: "Duluth tires new view on tourism" and, next page, "Duluth: Not just a pretty view." This article announces the city's effort to expand tourists' awareness of the city's surrounding attractions. These include... "several places to launch canoes and kayaks ON THE WIDE AND SCENIC ST. LOUIS RIVER."	LU04

17001	The most threatening of these adverse effects is the potential for Acid Mine Drainage, a phenomenon in which sulfide ores become exposed to air and moisture, undergo a chemical reaction forming sulfuric acid, and leach into surface water and the aquifer. This process decreases pH levels, thus destroying many aquatic ecosystems and contaminating drinking water.	PD15
17002	The Draft Environmental Impact Statement (DEIS), a federal document projecting the ecological consequences of business proposals, estimates clean-up costs of over \$44.6 million, to complete clean-up tasks including land reclamation and acid remediation. In addition, construction and operation of the mine could disrupt the natural serenity of the area, which, in turn, would negatively influence ecotourism, a significant contributor to the region's economy.	SO01
<b>Sender Name (Submission ID)</b> Collin S. Mackey (44553)		
11789	I feel that Alternative B does not really accomplish anything, as all it really does is reduce the amount of land being exchanged between the NorthMet Project area and federal lands. It does not put further restrictions on waste and toxin management, so does not reduce any of the affects caused by the mine. I feel that if a different, more effective alternative cannot be made, no action should be taken, in order to protect the plants, wildlife, and local tribes at risk.	ALT23
11793	In the NorthMet Project Proposed Action, they state that 90% of the ground and surface runoff ... will be treated. But that still leaves 10% untreated water .....that can seep into the ground or runoff into the Embarrass River, St. Louis River, and other streams and lakes nearby.. could cause significant water quality degradation throughout the area, possibly disrupting fragile aquatic ecosystems nearby.	AQ05
11796	It also concerns me that 912.5 acres of wetlands will be directly affected and 6,498.1-7,350.7 acres of wetlands will be indirectly affected by this plan. Wetlands are a very important part of the environment that play a vital role in the purification of water.	WET24
11798	Another concern is the 4,016.3 acres of vegetation and wildlife habitat that will be reduced. Eleven special concern plant species will be directly or indirectly affected by this plan, which would only endanger them even further, and could disrupt the balance of the local ecosystem.	VEG01, VEG03, WI02
11799	It could also lead to the decrease of the local Canadian lynx population and other species, such as wolves. These are special status species, and any action that can threaten their habitat and endanger their population should be looked at with some scrutiny.	WI01, WI02
11800	This mine will have adverse effects on the Mesabe Widjiu (Laurentian Divide) and other local sites, and could potentially harm 1854 Treaty resources. This could harm the local Native American population and increase their living costs.	SO02
15293	They also state that a side effect would be an increase of aluminum and lead amounts entering into tributary streams... Aluminum and lead can be very toxic,	HAZ03
<b>Sender Name (Submission ID)</b> Colvin Loken (54127)		
16002	Please consider possible water contamination.	WR111
<b>Sender Name (Submission ID)</b> Community of St Martin (54722)		
18625	We are concerned that there exists no substantial evidence or analysis of how climate change, including severe storms, tornados, and downpours can be modeled and anticipated in order to minimize pollution from the mine entering into our water, land and air.	AIR01

541	It seems to me that all mining projects, whether it be for oil, minerals or whatever, end up with some sort of catastrophic consequence. There is always an unforeseen event used as an excuse when the catastrophe occurs.	PD22
545	The jobs created are not worth the eventual costs. I'm sure that there are plenty of other industries that could be located in this area without the possibility of environmental endangerment.	SO01
<b>Sender Name (Submission ID)</b> Conservation Minnesota (42942)		
12007	Will Minnesota's water stay safe and clean?...the water data used to model the pollution risk from PolyMet is insufficient...a DNR hydrologist pointed out that...the amount of water flowing in the Partridge River was incorrect and needed to be revised ..the DNR should have this data reviewed by an independent hydrologist...run new models, and conduct additional research.	WR052, WR071, WR086, WR091, WR189
12012	Are there safeguards in place for when things go wrong?...[the SDEIS] fails to address contingency plans for likely malfunctions like pipeline breakages or downtime of water treatment facilities requiring extended maintenance or repairs.	WR130
12018	The omission of a comprehensive Health Impact Assessment for this project [is troubling]...medical professionals from Northern Minnesota pointed out that the PolyMet project is expected to increase Minnosotan's exposure to five out of ten chemicals the World Health Organization lists as major concerns for public health. Mercury, arsenic, lead, asbestos and air pollution are all potential byproducts of this form of mining...the Minnesota Department of Health needs to be included as the project is evaluated to ensure that potential threats to public health are addressed.	HU01
12022	Will the company leave the site clean and maintenance-free?...Given the confusion around this issue that has been created by conflicting statements from the mining company, state officials, and the SDEIS reference documents, anything less than a science based estimate of the duration of pollution mitigation that can be shared with the public will be inadequate.	PD01
12031	Will Minnesota's taxpayers be protected? ... Minnesotans are ill equipped to determine the amount of potential risk, because the spectrum of potential costs is so wide...The range in time expected to be needed to achieve maintenance free status is anywhere between ten years...to greater than 500 years...This leaves Minnesota's taxpayers potentially on the hook for anywhere between \$235 million and in excess of \$3 billion.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Cook County Coalition of Lake Associations (38695)		
14661	the hydrological models used to predict hydrological events attendant to both extraction and refining have been found to be inadequate as the geology of the Virginia formation--the source of the metals to be mined--is not fully understood....	WR007, WR026, WR105
14665	the SDEIS does not directly state the source or quantity of water to be diverted for use in the refining process. It does speak to drawdown on both the Embarrass and Partridge rivers but how much and for how long is not stated....	WR182
14666	examples of non-ferrous mining cited in the SDEIS are those of mines located in the dryer, water-poor areas of the U.S. and are therefore of questionable value in assessing how best to protect existing water resources....	PD26
14667	critical computer modeling of runoff from tailings piles into nearby waters has been shown to be inaccurate and underestimated....	WR105
14668	it is unrealistic to expect that water treatment projected to last some 200 to 500 years--durations calculated by PolyMet--can actually be accomplished....	PD03
14669	pit lakes are to be lined with a product guaranteed for only 20 years while the lakes will exist in perpetuity.	PD35

<b>Sender Name (Submission ID)</b> Craig Blacklock (6233)		
1169	Tourism has been, and could sustainably continue to be a stable, long-term employer in northern Minnesota. I'm very concerned we might be sacrificing these sustainable jobs in favor of a short-term boost in employment from mining.	SO02
1170	...mine companies may go out of business far sooner than the need to mitigate mine pollution, sticking tax payers with clean up costs.	FIN01
1171	...the PolyMet proposal is the need to actively manage the waste for hundreds of years.	PD03
1174	Actively treating water through reverse osmosis creates the spectrum of huge amounts of electricity into the foreseeable future. Climate change is an imminent threat to the planet.	AIR01
12497	The idea of allowing mining to go forth in the name of jobs, when it would leave 500 year's worth of polluted water, and threaten the BWCAW is unthinkable to me.	SO01, WR111, WR115, WR195
12499	I also feel the climate change impacts of the total mining cycle need to be considered. How much Co2 would be emitted during the mining and the 500 years of ACTIVE treatment of the polluted water?	AIR01
13822	Today's mining technology does not appear to be able to guarantee protection of the environment any more than that of decades ago.	SO01
13823	Perhaps decades from now, technology will allow them to be safely extracted (they will be worth more then, than now anyway), but if not, they should never be mined.	ALT16
<b>Sender Name (Submission ID)</b> Craig Bowron (43992)		
14931	I believe their are multiple problems--among them tax structure, water quality, lack of a health impact assessment, water quality issues--and so I would ask that you not allow the mine to be built as described in the current plan.	GEN03
14932	When the nickel and copper are gone, they will shift to loss prevention--by either loosely following clean up agreements or by abandoning them altogether, thereby forcing them into the courts (whichever option minimizes the losses would be the preferred option). That's not a judgment statement, that's how capitalism works. Bankruptcy is also a tried-and-true method for minimizing losses.	FIN01
14933	I would ask you to fix the Polymet mine plan by hammering out a detailed plan that provides solid financial assurances to the current owners of the nickel and copper: Minnesotans.	FIN10
<b>Sender Name (Submission ID)</b> Craig Johnson (18071)		
3185	I believe we can set a new standard of mineral extraction that will be used as an example for generations to come. And hopefully without eight and a half years of prior scoping and evaluation.	PD28
3186	It should be understood that determination to not allow a proposed mine also involves risk. We risk allowing someone else of lower standards than ours to gain an advantage in the precious metal market.	NEPA03
<b>Sender Name (Submission ID)</b> Craig Olson (18368)		
14673	This project will produce a lot of jobs. Not only construction jobs...There is 360 full-time mining positions. And there's more than 600 related jobs that will be produced. That will produce good-paying jobs for the families that are very much needed.	SO10

<b>Sender Name (Submission ID)</b> Craig Prudhomme (45438)		
15707	PolyMet is proposing to create a mine that will further destroy wetlands and put at risk watersheds that include Lake Superior.	WET24, WR111, WR112
15708	This mine should not be permitted. The potential costs are too great for the potential short-term gains. And these gains will be short-termed by comparison to the costs.	PER35
15710	We think copper and nickel are valuable resources, but when we look at the one most important resource to life, fresh water, we are only now beginning to realize that it is the number one, most important resource. Clean water is finite.	WR195
<b>Sender Name (Submission ID)</b> Craig R. Miller (3491)		
223	It is very problematic that PolyMet's details about a financial assurance or a "damage deposit" the company provides are not outlined in this revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability	FIN01, FIN05, FIN10
227	not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Also, every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated.	WR070
229	the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions	WR044, WR149, WR172, WR173, WR174, WR189
231	The proposed mine plan does not leave the site clean and maintenance free [...]Who will be paying for all of this after the mine is closed in just 20 years?	FIN01
<b>Sender Name (Submission ID)</b> Craig R. QualeyFisher (17340)		
1972	I implore you to take a stand, against allowing the mining companies, anywhere near, any waterway, tributary, stream connected to or running into a Boundary Water Area Lake Or Waterway.	WR111, WR195
2098	The residue left behind by copper mining seeps into the water, kills plant life, fish and wildlife.	VEG06
<b>Sender Name (Submission ID)</b> Craig Spry (42770)		
6680	Polymet, the Minnesota Department of Natural Resources, the United States Forest Service, the United States Army Corps of Engineers, the Minnesota and Federal Pollution Control Agencies, and many other entities have these engineers, scientists, biologist, professors, specialists, and technicians to research, study, model, engineer, and design this project. In fact, they have done [this] to death, over a decade, to protect the environment and get this right. The information and the contents of the SDEIS prove this.	PER34
6682	This is a project that will once again kick start the East Iron Range and encourage future opportunities for the entire Iron Range and surrounding areas. We are all here on the Iron Range because of mining, period.	SO10

<b>Sender Name (Submission ID)</b> craig zlimen (15451)		
671	While I appreciate the need for livable wage jobs in this generally depressed economic area, it seems the risk of wide-spread, long-term contamination of the area's water-supply far outweighs any potential benefit of a few hundred, relatively short-term jobs.	SO01
672	Currently, tourism is the one of the largest sources of jobs and revenue in and around the Iron Range. Given the tourism industry is driven almost entirely by the area's lakes, streams, and outdoor recreation opportunities, it seems absurd to consider any large-scale plan that would place those invaluable natural resources at risk.	SO02
675	It is not worth risking large-scale harm to the environment and established tourism industry for the prospect a relatively small number of jobs expected to be created by PolyMet.	SO01
1902	I sincerely hope the DNR will advocate for the long-term health of Minnesota's environment, water, and tourism and deny PolyMet's permit to mine in Northeast Minnesota.	PER35
<b>Sender Name (Submission ID)</b> craigaparsons (41998)		
2636	The location of the proposed mine is identified throughout the document as being on the Iron range, implying that it is part of the Biwabik iron formation. However I've read reports that contradict this and place this mine location in the sulfide-bearing rock of the Duluth formation.	PD31
2637	There has not been quantitative accounting of the many environmental effects on the economic outlook. Full and part time jobs have been lumped together in the analysis. Also the economic benefits of mining should be compared to a no-mining scenario.	SO04
2638	It is paramount that the technical plan for mine cleanup and water treatment be beyond reasonable question especially in light of the location of this mine so close to pristine wilderness such as the BWCAW, and Lake Superior. The SDEIS as it exists now does not meet that requirement.	PD01
2639	In the last week, it has been announced that the MPCA will soon release new standards for sulfate release into waters that are capable of growing wild rice... Because these new standards, this proposal should be delayed for further consideration until it has addressed compliance with these new rules.	PER10, WR152
2640	The report indicates unacceptably high levels of sulfide in discharge water for hundreds of years after mining ceases, yet none of the projections actually show safe levels being reached for the hundreds of years over which the models were run. How can a decision to permit be discussed without a timeframe identified where active and costly water treatment such as reverse osmosis are no longer required?	PER04, WR038
2669	Are the assumptions underpinning the studies of potential pollution caused by hydrologic and geologic activity consistent with this misclassification [of the mine being located on the Duluth formation instead of the Biwabik iron formation]?	WR007, WR087
2670	Minnesota law 6132.3200, 6d, states that financial assurance for mine cleanup must be provided by the mine owner. I am only asking that this law be followed, and that full details of the economic aspects of the cleanup need to be addressed now, as part of this SDEIS.	FIN01, FIN13, FIN14
<b>Sender Name (Submission ID)</b> Crystal Waters (11638)		
3324	The PolyMet SDEIS is still inadequate. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells.	HU04, WR041
3325	The PolyMet SDEIS is still inadequate. It doesn't explore the alternatives that could reduce PolyMet's destruction of wetlands.	WET20

6955	We Minnesotans are not used to hard rock mining, and many of us do not appreciate how harmful the sulfuric acid from the tailings will be. We need to recognize the fact that grinding the rock into small particles increases the surface area exposed to water. For example, rock 1 00 meters on a side, when ground to the size of baby powder (1 0 micrometers) will have increased its surface area by a factor of 10 million. We have already seen this in "mine slime," in our taconite mines, but it does not leach acid. Slime from the proposed mine would leach sulfuric acid. The acid will be spread to places where it will do damage by the water that is already flowing through the existing tailings basin.	PD01, WR001

9860	the four legged brothers and sisters don't even use money but like the two-legged they need water to live. there are alternatives to destroying eleven percent of the fresh water of the world....	WI01
<b>Sender Name (Submission ID)</b> Dale Swanson (20020)		
14466	I think that exploration for minerals and mining can be done in a manner that would not be detrimental to our environment. I am an environmentalist, but I also see the need to put people to work.	NEPA05
<b>Sender Name (Submission ID)</b> Dan Allosso (40139)		
15310	given Glencore Xstrata's well-documented irresponsibility as a long-term steward of the environment, I think any claims the corporation makes about its commitment to multi-decade or even centuries-long containment of environmental externalities should be treated as nonsense. To put this in the plainest English possible, Glencore Xstrata intends to treat northern Minnesota as a third-world resource provider and waste sink.	PD01
15311	I live in northern Minnesota, and I have no doubt that given a thorough understanding of the issues, none of my neighbors would willingly trade our environment for a short-term solution to economic problems that could be solved in a variety of ways that wouldn't involve making our home unlivable.	SO01
<b>Sender Name (Submission ID)</b> Dan Anderson (38624)		
14067	We have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough.	NEPA16
14068	In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time.	WR190
14069	The model used to calculate the alleged economic benefits of the mine takes into account the costs to the environment and the displacement of other economic activity. Tribal rights to hunt, fish, and gather under the 1854 Treaty will not be adversely affected; nothing is the same as it was when the treaty was signed.	SO10
14070	PolyMet's planned mine layout minimizes impacts to wetlands, and its reclamation and mitigation plans will replace the wetlands that are lost due to mining. In fact, PolyMet will restore and protect more wetlands than it impacts.	WET25
14071	PolyMet will have dramatic, positive socioeconomic impacts to a region that has been built on mining. This project is located in an area that supports mining and the jobs it will bring.	SO10
14072	The land exchange with the U.S. Forest Service will open up new public recreational opportunities for all Minnesotans.	LU01
<b>Sender Name (Submission ID)</b> Dan Burnett (41570)		
6369	It is simply foolish to ask a company to provide water treatment for the area for a length of time that is over three centuries. If the contaminated water is projected to be undrinkable for longer than white people have been politically organized in a meaningful way then we should not allow the water a chance to be contaminated in the first place. It is irresponsible to expect anyone to be obligated for such a period of time.	WR037

<b>Sender Name (Submission ID)</b> Dan Carn (18110)		
13474	We have a great opportunity here. This is a world-class resource. And I think this is a stepping-off point that has an awful lot of merit...This is already an industrial site. We already have a huge facility there. We're using the existing tailings basin. And we have the railroad infrastructure in there. The only thing we're doing is moving the pit area	SO10
<b>Sender Name (Submission ID)</b> Dan Cooke (6426)		
1071	I do not believe the few jobs that this will bring to the state is worth the potential of long standing environmental impact.	SO01
<b>Sender Name (Submission ID)</b> DAN DEMARINO (21971)		
3303	The seemingly never ending long term assurances voiced by those opposing the mine may be able to be resolved by the requirement to have long term bond assurance.	FIN08
3304	The hard points are that families will be able to survive with a great quality of life if they are allowed to have an income. The mine will provide that. The community will be able to grow economically.	SO10
<b>Sender Name (Submission ID)</b> Dan Dimick (57969)		
19876	The economic gains are outweighed by long term environmental risks.	SO01
<b>Sender Name (Submission ID)</b> Dan G. Eischens (7524)		
780	I think that the environment would be better off after the sulfides are no longer exposed to the effects of climate after the reclamation work is done.	PD05
781	This is just the type of mining project this state needs to boost the economy and school aids it delivers, along with jobs and a supply source of much needed copper.	SO10
<b>Sender Name (Submission ID)</b> Dan Harp (42532)		
2443	What better place to do this project? Everything we do has an impact, and we should make our impact as small as possible. Being this is already an industrial site, this is about as good as it gets. There's already a huge facility and a tailings basin that can be re-used.	SO10
2444	We need these metals and PolyMet can mine them, while having a plan in place to reduce the probability of risk. If you want to eliminate all risk, you can't do anything and will have nothing.	PD28
15576	If we don't develop an industry with a world-class resource here, we can expect to be extorted by a place that can provide the metals we need – and that would be a huge cost.	NEPA05
15579	about the long-term costs of monitoring... they'll have to keep monitoring, but that's not very expensive. Costs will be minimal.	FIN17
15580	My opinion is that when the mined rock is first exposed, there will be a lot of [water] treatment needed. And that may be the case for 15 to 20 years. But after that, the likelihood of any deterioration of rock will drop off exponentially. After a time, I have to believe it will be simply standard levels of constituents in the water – as if the mine had never happened. Sure, they'll have to keep monitoring, but that's not very expensive. Costs will be minimal.	WR190

427	20 years of destruction for a few labor jobs and exporting our “precious metals” with a 500 hundred year price tag just doesn’t make sense. The time is not right... we should save it for the future generations when it means more than just a few jobs.	SO01
11758	THE TIME IS JUST NOT RIGHT AND THERE IS NO PROVEN SYSTEM AT THIS TIME TO MINE COPPER NICKEL WITHOUT POLLUTION! ... We have one of the worlds largest supply of fresh water. Any degree of pollution is incomprehensible for a few jobs.	SO02, WR115, WR128
<b>Sender Name (Submission ID)</b> Dan Humay (18062)		
3169	I think my initial concerns were triggered by reading that copper mining has never been conducted anywhere in the world without producing grave pollution of water resources in the mining area.	WR023
3170	I'm especially concerned about the contamination of mercury from the mining operation. Northeast Minnesota already has a serious problem with mercury. And the Minnesota Pollution Control Agency has listed a number of water, rivers, lakes, and streams in this area as impaired with methalized mercury found in fish tissue. So there are some warnings about eating levels of fish beyond a certain point.	MERC02
3171	Any increase in the level of mercury in the water table, whether it be in a stream, river, lake or aquifer is not acceptable. And I don't see where they can give any assurance that this will be done.	MERC01
3173	To date I think they've tested 1,465 children and they found their bodies are contaminated with mercury poisoning. And yet we're going to allow a mining company to create a situation that will only exacerbate this. I think that's unconscionable. For 360 jobs for 20 years that's an embarrassment that we will perpetuate a widespread health problem to that end.	SO01
3432	Right now, today, as we sit here, in this watershed, the Minnesota Pollution Control Agency has classified dozens of strange rivers and lakes as impaired. What would make them impaired? Levels of mercury above what are considered to be safe. Methylyzed mercury appearing in fish tissue.	MERC01
3437	Sixteen million gallons of water this year, the next year, the next year, the next year, the next year. How much mercury is that? The EIS really falls short in dealing with mercury, and I think behooves you to hold them accountable. ... We cannot put at risk children who are innocent residents the way we are now. 1,675 kids have been tested positive [for elevated levels of mercury] so far, and I think that's unconscionable --in the name of jobs or minerals or anything else.	MERC03
<b>Sender Name (Submission ID)</b> Dan Iler (17693)		
1984	With a projected mine life of twenty years and a projected water clean up of the mine site for a minimum of 200 years and 500 years at the plant site the risk to reward is skewed to the way too risky side!	SO01, WR037, WR195
1985	It is impossible to account for all the variables [such as] floods, cracks in bedrock allowing seepage to ground water, plants and roots tearing into a possible synthetic cover over the tailings pile ... inevitable mechanical breakdowns, leaks or breaks in piping used to move waste water, human error, or.....?	FIN05
1986	it is unrealistic to think there is a magic formula to get a monetary number for 200 - 500 years of water clean up and reclamation. ... there is not a company out there that has a track record of being in business for 500 years. It seems inevitable that eventually Minnesotans will be on the hook to cover the cost of clean up.	FIN01, FIN05, FIN10

<b>Sender Name (Submission ID)</b> Dan La Vigne (18244)		
13630	Even current tailing ponds leak, for example, the one at Minntac. It has been out of compliance for years. How is PolyMet going to do better?	PD07
13632	Putting money aside in a fund is not feasible, especially for 200 to 500 years. Who can predict the cost? Besides, human nature being what it is, the probability of that fund remaining untouched is next to nil. I can easily imagine it being raided to reduce taxes or for something else.	FIN01, FIN05, FIN08
<b>Sender Name (Submission ID)</b> Dan Nelson (38401)		
9619	20 years of mining is not enough to pay for hundreds of years of pollution risk and monitoring when the company could easily renege on its pledges by selling it's assets or opting for bankruptcy in the case of a disaster.	FIN01, FIN11
13765	Water Pollution - there are no sulfide mining operations that have not had problems and I do not believe PolyMet has shown that they will prevent any major pollution problems. The tailings and mine waste are reactive for too long a time period to take this lightly.	WR001, WR023, WR035
13766	Precedence setting - there will be other permit requests and if this first permit is put through without it being bullet proof then other companies will use that as the benchmark. So even if Polymet, by some stroke of luck, does everything right and does not have an issue, other companies may have issues that they can't handle. So Polymet, as the first one down the pipe, needs to be conservative in their projections and promises and liberal in funding for all the risks now and for hundreds of years.	PER07
13767	Job Outlook - Any pollution problems from this project will negatively impact the tourism industry jobs for far more than the 20 years of mining jobs.	SO02
13768	Thank you for your time and consideration and the very professionally run public meetings on this topic.	NEPA17
<b>Sender Name (Submission ID)</b> Dan Parsow (57507)		
19503	I feel strongly that they have put together an excellent team of professionals and that this project will meet and exceed all environmental standards. In addition this project will bring much needed jobs and tax revenue to the area.	SO10
<b>Sender Name (Submission ID)</b> Dan Petrella (40134)		
15302	Water in Northeastern Minnesota doesn't soak into soil because the soil is primarily rock. Water simply runs through the rocks and directly into the rivers. We found good solutions regarding the mining of taconite and I'm sure we can find a good ecological solution to copper-nickel mining if we deal with the honest facts. I urge we find other ways then is currently proposed to dispose of the water tailings from the copper-nickel mining.	ALT13
<b>Sender Name (Submission ID)</b> Dan Steinhacker (52226)		
12957	the history of copper sulfide mining repeatedly shows a short window of increased employment and a certain future management of contaminates that remain long after the economic benefits and Polymet have gone.	SO01
12958	The lackluster initial proposal by Polymet is indication that any mining in Minnesota will be business as usual and business as usual with copper sulfide mining has a short window of benefit, generations worth of contamination and local communities and states left to deal with the mess.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Dan Sullivan (11327)

<b>Sender Name (Submission ID)</b> Dan Sullivan (11327)		
803	The Polymet proposal does not sufficiently address the amount of money that should be set aside for environmental degradation. The mining industry has a long history of declaring bankruptcy and leaving taxpayers with the bill.	FIN01, FIN05, FIN10
805	The risks of this project are so much higher than the reward and I am opposed to it.	SO01
<b>Sender Name (Submission ID)</b> Dan Turpening (58161)		
19918	I am very much opposed to the Polymet mine. The environmental risks are too great in my opinion.	GT01
<b>Sender Name (Submission ID)</b> Dan Waters (18123)		
13504	All these things point to the fact that Ely and the entire East Range needs mining. This is what the range was built on. This is what will sustain Ely and the rest of the range is mining. We can have both. We can have mining. We can have clean water. We can have tourism. There's no reason not to have any of those.	SO10
<b>Sender Name (Submission ID)</b> Dana Harth (50549)		
11007	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards.	WR023, WR060, WR181, WR182, WR195
13294	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.	WR023, WR060, WR181, WR182, WR195
13920	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards.	WR023, WR060, WR181, WR182, WR195
<b>Sender Name (Submission ID)</b> Dana L Jackson (54916)		
19325	The prospect of allowing potential long term damage to lake Superior and St. Louis River waters which flow into the lake --just for a short twenty years of copper and nickel extraction-is extremely serious. We cannot get this wrong.	WR111
19326	The water quality model in the SDEIS predicts that the Northmet Project water quality effects would not exceed the evaluation criteria at the P90 level except for aluminum and lead. These projections do not seem to take extreme weather events over a long period of time into consideration.	WR057, WR176, WR180
19327	My main concern with the SDEIS is the inadequate plan for dealing with financial assurances that will only be covered in the negotiations referred to as the Permit to Mine, which will be handled by the Minnesota DNR. The SDEIS does not provide enough information on financial assurances to confirm that amounts, timing, and safety are going to be met, over the long haul. A very thorough initial discussion is needed in the SDEIS.	FIN05, FIN13
19328	Also, the DNR Division of Lands & Minerals is the only authority for protecting Minnesota taxpayers and Minnesota natural resources from the consequences of inadequate financial assurances. DNR by virtue of its mission charge is a conflicted agency. The State of MN directs the DNR to "develop" these mineral resources in addition to the charge that the development meets environmentally acceptable outcomes. We have considerable history in MN that DNR has not always enforced regulations it is charged to enforce.	FIN10

<b>Sender Name (Submission ID)</b> Dana L Jackson (54916)		
19329	No number of calculations could result in an adequate financial assurance for 500 years. Allowing a project design in the SDEIS that accepts 200-500 years of post operation treatment is not acceptable. However, that post operation monitoring should be paid for by Polymet for as long as is needed.	FIN01, FIN05, FIN11
19330	North Met should be required to complete the reclamation, and remainder treatment phase of the mine in no more than 10-15 years after mining is done. The SDEIS should require such project design and build financial assurances on that basis. Allowing up to a decade a for post mining obligations are reasonable.	FIN05
<b>Sender Name (Submission ID)</b> Dana Lansky (43508)		
8078	unless the PolyMet NorthMet SDEIS bases all of its conclusions about the next five hundred years on the assumption that our climate situation is likely to be significantly changed for the worse, it is not taking reality into consideration.	AIR01
8081	Even if some governments hold up well under the environmental stresses to come, it seems extremely unlikely that all governments and systems that exist today will still exist five hundred years from now or even one hundred years from now.	SO02
8085	if humans don't survive the coming changes (and aren't around to continue water treatment schemes), that doesn't mean that no animals will. Shouldn't we be doing what we can to give as many life forms as possible a fighting chance for survival?	WI06, WR128
16100	please make sure the PolyMet NorthMet SDEIS explicitly states the assumptions about Minnesota's climate, economy, society, water security, food security, and political system for the next five hundred years; upon which its conclusions depend. And please require that every one of those assumptions is backed up with strong evidence that those assumptions can be dependably relied upon for the next five hundred years.	PD29
16101	Any sulfide mining proposal that doesn't address and plan for the reality that our climate situation will deteriorate is not addressing everything it should.	PD22
16102	Considering that some governments may collapse and climate-harming shipping and air travel could get banned, any scenario that involves the ongoing need for any materials and technologies whatsoever that are not easily and completely obtainable locally should be dismissed without any further consideration.	PD22
16103	Do PolyMet's water treatment plans require continuing access for hundreds of years to materials that are not easily obtainable locally? Will it be possible for Minnesotans to assemble such water treatment mechanisms themselves even if they no longer have access to sophisticated technology? Will local communities have access to everything they need to clean up all water pollution that occurs if mistakes are made or disasters happen?	WR035, WR128
16106	It is well known that clean water will become increasingly scarce. And no amount of money could possibly make up for anything that could decrease the likelihood that surviving Minnesotans have access to sufficient healthy water to drink and healthy food to eat.	SO01
16107	it is unreasonable for Minnesota Department of Natural Resources officials to accept mining proposals that could further undermine the human rights of Minnesotans based on such hopes alone.	PER35
16108	Please make sure the PolyMet NorthMet SDEIS provides comprehensive plans for the full range of possible disaster and failure scenarios that could take place over the next five hundred years, and explains how all of those possible scenarios could be addressed with local materials, by local people experiencing environmentally stressful circumstances, without the aid of a monetary system, and without the aid of sophisticated technology.	PD22

10577	The scale of the proposal is so overwhelming and the technology so unproven that it appears that a failure is all too possible - and at what cost?	PD32
14169	We know that water is so mobile that any failure will lead to immediate leakage. Minnesota is known for its 10,000 lakes. We cannot accept the potential of seriously polluting pristine areas.	WR070, WR126
14170	How can you assure that precious Minnesota water and land resources will be preserved and protected?	GEN01
<b>Sender Name (Submission ID)</b> Daniel J. Peters (38636)		
11870	the risks to MN water quality, at a time when potable water is becoming more scarce and valuable, is too great.	WR111
11873	I do not trust PolyMet or its parent corporation, and suspect they will simply declare bankruptcy and walk away with their profits, leaving the taxpayers of the state to foot the bill for potentially centuries of water pollution mitigation.	FIN01
11874	All that risk for 5 years of jobs for a few hundred people?	SO01
<b>Sender Name (Submission ID)</b> Daniel Merfeld (57367)		
19605	This project will not only provide MUCH NEEDED jobs both now and in the future, but will also create many off-shoot jobs in the process.	SO10
19606	When it comes to the impact on the environment, all I ask is that the state of MN keep a close eye on how the plant is being run, as you do with all the current mines in the state. Continue to monitor what the mines put back into the environment and regulate it as you have been.	PER35
19607	Between mining and logging, these two jobs are the life-blood of Northern MN. We need these jobs or else our communities will quickly die out. Even Ely is not able to survive on tourism alone in our current economy. WE NEED MINING IN MN.	SO10
<b>Sender Name (Submission ID)</b> Daniel Mettner (47063)		
16276	the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR115
16277	In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
16280	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.	MERC02, WR041, WR115, WR189
16281	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003

<b>Sender Name (Submission ID)</b> Daniel Mettner (47063)		
16283	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR017
16289	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures.	WR012
16291	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17, WR067
16292	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won’t allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards... This project would violate water quality standards for generations to come.	WR189, WR202

7804	The SDEIS assessment of Tailings Basin mercury contamination conditions is fraught with systematic data integrity problems that include mathematical errors in key formulas, improper selection of data sets, and suspected sample collection errors...These flaws have resulted in SDEIS drafters reaching the erroneous conclusion that Tailings Basin mercury seepage will meet Great Lakes Initiative standards of 1.3 ng/L.	MERC04
7810	As detailed in the attached comments, the present plan for the NorthMet Tailings Basin is to reuse LTV's 60 year old unlined tailings basin that contains decades of heavy mercury loadings.	MERC20
15103	The errors and omissions in the Tailings Basin dataset have permeated the SDEIS and its supporting reports, resulting in incorrect fundamental conclusions as to current and future mercury discharges at the Tailings Basin and Waste Water Treatment Plant. In particular, the Tailings Basin and Waste Water Treatment Plant as proposed are likely to significantly increase total mercury, and especially methylmercury, loading in the Embarrass River watershed.	MERC04, MERC23
15104	In view of the data integrity issues and improper mercury discharge conclusions, the NorthMet SDEIS should review previously discarded Tailings Basin alternatives.	ALT21
15108	Of particular note are errors in the calculation for average water quality at the Tailings Basin...the preparers of the SDEIS failed to appreciate that some of their data was in the units "ng/L", and some of it was in the units "ug/L"... This failure resulted in large errors in a key SDEIS summary of mercury contamination, which incorrectly states that the majority of water seepage sites were below the Great Lakes initiative mercury level, when in fact most of these sites were actually above the Great Lakes Initiative level.	MERC04
15109	improper subsets of data: ...the SDEIS repeatedly considered only data that would show favorable mercury levels, while ignoring data to the contrary.	MERC04
15111	The Tailings Basin has four active NPDES monitoring locations that are positioned to intercept Tailings Basin seepage. ...Inexplicably, the SDEIS relies almost exclusively only on data from one of these discharge locations – the one that appears to show seepage below 1.3 ng/L. All three of the other discharge locations, including one that is better positioned relative to the likely flow of NorthMet discharges, were essentially ignored. The result is an improperly skewed assessment that mercury levels will be lower than 1.3 ng/L. Correction of this error shows mercury discharges above 1.3 ng/L.	MERC04
15112	a comprehensive review of mercury seepage data collected over time at the Tailings Basin also shows that Tailings Basin seepage will exceed Great Lakes Initiative mercury levels of 1.3 ng/L. Despite the availability of this information, it is essentially ignored in the SDEIS.	MERC04
15113	The SDEIS also relies upon a faulty mercury sequestration test that predicts remarkably low mercury levels in Tailings Basin seepage, while ignoring a superior test that does not predict significant sequestration. Specifically, the SDEIS gives great weight to a very flawed 8 hour experiment with NorthMet tailings in a flask, while never even mentioning in the SDEIS a much more comprehensive test prepared for the NorthMet site that showed mercury levels are likely to be significantly above Great Lakes Initiative standards.	MERC04
15115	The SDEIS includes an "Assessment of Existing Pond Water and Groundwater Quality at the Tailings Basin" that shows mercury seepage at nearly six times the Great Lakes standard for mercury discharges. This result is inexplicably not discussed further in the SDEIS.	MERC06, MERC20
15116	Mercury assessment errors lead to faulty WWTP design and pilot testing, as well as a defective containment system, both of which will likely lead to significant methylmercury discharges into the Embarrass River watershed	MERC04, MERC15

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Daniel Pauly (42966)	
15117	A combination of errors and faulty analysis cause the SDEIS to erroneously conclude that Tailings Basin mercury discharges will be below 1.3 ng/L... [This leads] to notable flaws: 1) failure to design and test a Waste Water Treatment Plant (WWTP) that will adequately determine viability of mercury removal; and 2) design of a discharge capture system that incorporates a wetland that will receive the majority of the mercury and sulfate from the Tailings Basin, and which will meaningful increase mercury contamination in the Embarrass River watershed.	MERC04, MERC15, MERC23
15118	The WWTP will use reverse osmosis to remove contamination from Tailings Basin seepage. The SDEIS discusses a pilot test for the WWTP that was conducted in 2012. Unfortunately, the WWTP pilot test never evaluated mercury removal using reverse osmosis...The report states that maybe as little as 20 percent, or maybe as much as 99 percent, of mercury might be removed...Even then, according to the SDEIS documents, removal of methylmercury does not appear possible using the planned WWTP design.	MERC15
15119	the NorthMet site has an inadequate mercury assessment that lead to an improperly designed pilot test, which results in tremendous uncertainty about whether PolyMet will be able to adequately remove mercury from Tailings Basin seepage and WWTP inflows.	MERC15
15120	The SDEIS seeks to address these concerns with a proposed “adaptive engineering” approach for the WWTP design and operation. An “adaptive engineering” approach is inconsistent with best practices in the literature for removal of contaminants using reverse osmosis, because each location and system has unique problems and challenges...By approaching critical issues and long term challenges with an adaptive engineering approach, the NorthMet project risks decades of uncertainty, contaminant release violations, and unforeseen costs	PD03
15121	the currently proposed NorthMet Tailings Basin has been modified since the DEIS to create a containment system outside of the Tailings Basin. The containment system will include an up to 160 acre wetland that will be receiving the mercury and sulfate laden waters from the combined LTV/NorthMet tailings... The NorthMet project’s own model data shows in great detail that most mercury and sulfate will be delivered directly to this wetland, and not to the containment system drains. Contemporary research...shows that this wetland, with its mixture of mercury, sulfate, and organic matter, is a prime environment for methylation of mercury.	MERC09
15122	recent research by government investigators in Minnesota in the last few years has shown shockingly high levels of methylmercury in wetlands, including methylmercury spikes at the toe of taconite tailing basins. The SDEIS never asks what will happen to that methylmercury. It is likely that some of it is going to be carried to the WWTP, but as the WWTP pilot test itself reports, there is no plan for removing it...Current research shows it will be absorbed by everything from mosquitos to earthworms, and will then travel up the food chain throughout the Embarrass River watershed.	MERC02, MERC09, MERC15
15123	Tailing Basin Alternatives were Prematurely and Improperly Eliminated...the present plan for the NorthMet Tailings Basin is to reuse LTV’s 60 year old unlined tailings basin that contains decades of heavy mercury loadings. The existing LTV tailings basin has been drying out since 2001, and seepage volumes have declined. As noted in the SDEIS with reference to the No Action Alternative, the LTV tailings basin should continue to dry out in coming years, with a concurrent drop in contaminated discharges.	ALT10
15124	...two alternatives, at a minimum, should have been considered more thoroughly to see if they could have avoided the problems of perching a new unlined basin on top of an old unlined basin: either (a) putting a liner between the basins; or (b) locating the new basin somewhere other than on top of an old unlined basin. Both of these alternatives offer significant improvements in regards to preventing release of mercury from the existing LTV tailings basin, avoid the interaction of seepage water between two different types of tailings, and allow for what will likely be a significantly less complex and less expensive waste water treatment facility...I believe these alternatives were prematurely dismissed because DEIS and SDEIS preparers overlooked the fact that that mercury contamination would be an issue	ALT10

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Darlene Eckert (42930)	
9822	The proposal is to cover [the Category 1 Stockpile] with grasses for vegetation... the grass will require continual maintenance into perpetuity...it will be difficult to maintain grass on that slope as it is designed to drain water. With only 18" of soil to grow grass, the grass will be continually dry during the growing season and will need fertilization and water to maintain the grass. It will require periodic mowing or burning to maintain the cover. It will really look like a weed patch with erosion 10 stories high. Visually unappealing.	VEG05
9823	The Category 1 stockpile, as I recall will be 280 feet tall and over a mile long. It will be covered with a 40 mil cover, and 18 inches of soil. This will be about the height of a 28 story building. In this relatively flat area, it will be visible for quite a distance. It will be the size of a Butte and appear like a Mayan temple with the stepped sides...Not a pretty sight.	LU04
9825	The new butte will block the wind in addition to acting as a visual barrier. I'm uncertain of the effects of reduced wind on the climate but expect that it will create a microclimate downwind of the category 1 stockpile...This will further impact the wetlands in that area, warming the water and changing the vegetation types.	VEG07
9826	The purpose of the synthetic cover [on the Category 1 stockpile] is to reduce infiltration of rainwater thus reducing leaching of undesirable mineral into groundwater or runoff... As time goes on the permeability of the cover will increase allowing more leaching to occur and contamination to seep into ground and surface waters. By the time this occurs, NorthMet will be long gone so it will be up to the State to manage...This does not meet the legal requirements of no maintenance for closed facilities.	PER04, WR127
9829	Longterm category 1 pile options:...NorthMet should backfill this material back in the mine pit...When they have completed excavation of the first mining pit, they can transport the category 1 material back to the pit in the empty trucks as they return to the pit. Some of the category 1 pile can remain and be used for closure of the ponds.	ALT03, ALT06
9831	Longterm category 1 pile options: ...Perhaps the stockpile could be constructed in a more natural way to simulate a mountain for a future ski area. Another option would be to use the top for wind towers, although I find this visually poor it may be beneficial to surrounding communities or Allele.	ALT06
9833	The DEIS underestimated the cumulative impacts to native habitats in this region. The entire iron range, a band of land from Grand Rapids to nearly the Boundry Waters, has suffered near total destruction of the native habitat. The destruction of habitat is not from one action but a continuing series of actions including mining, urbanization and settlement among others.	CU17
9837	The property transfer portion of this proposal is truly absurd from the public point of view...In the NFS accounting system, as long as it has the same percentage of land under its jurisdiction, the trade is good. However, ... these wetlands created soon after the last ice age cannot be compared to several chunks of property in different watersheds. There is no comparison between the natural wetlands in biodiversity and productive habitat no matter how thorough the restoration is.	LAN03
9838	The iron range development has formed an almost complete barrier to wildlife movement along its length. The DEIS has identified corridors used for wild life movement, several of which are in the vicinity of either the plant site or mine pit. Through the NorthMet proposal, the corridors will be further narrowed and reduced or lengthened.	WI03
14465	The transfer of the property should not be approved as the proposed transfer properties are a great distance from the mine location proposal, ecologically of less value and fragmented compared to the proposed mine site. Mitigation rules specify that replacement land be in the same watershed.	LAN03, LAN06

18019	Demanding full financial assurance in the form of a full bond against potential cleanup costs should be a minimum requirement before proceeding with any new, high-risk mining; however, even that would still not safeguard our waters from contamination.	FIN08
<b>Sender Name (Submission ID)</b> Dave Cicmil (6190)		
1054	With the time, research, and money that has been invested towards this project and Polymet's commitment to the environment, providing well-paying jobs and tax revenue, while providing the metals so badly needed to improve our quality of life.	SO10
<b>Sender Name (Submission ID)</b> Dave Clapper (17001)		
1640	When an opportunity like PolyMet comes around to mine the world's largest cooper reserves, we owe it to the region to create hundreds if not thousands, of jobs ... Our economy could use a boost in that region	SO10
2086	I for one believe that PolyMet Mining would operate the mine responsibly and protect the long-term environmental concerns.	PD28
<b>Sender Name (Submission ID)</b> Dave Crawford (38374)		
11210	The PolyMet SDEIS fails to acknowledge the Tribal Cooperating Agencies' position that there will be a need for containment or treatment of contamination from mine waste, mine pit, and tailings pile in perpetuity. Require the SDEIS to be redone to include this testimony and an objectively substantiated response from PolyMet.	WR035
11213	The PolyMet SDEIS does not adequately substantiate PolyMet's claim that 99.37 percent of the seepage from the tailings pile will be captured and that no contaminants will seep from the mine waste rock pile. Require the SDEIS to be redone to provide verifiable substantiation of claims of protection of surface waters from contamination.	WR018, WR020, WR021, WR070
11214	Damage to wetlands surrounding the project site and direct destruction of 913 acres of wetlands by the project are inadequately mitigated. The majority of mitigation for direct destruction will take place outside the Lake Superior Basin and therefore does not mitigate the impact of the project on the Lake Superior Basin. There is no plan to replace most of the indirectly damaged wetlands which will likely be compromised in the area surrounding the project. Deny the Section 404 wetlands destruction permit and require a reassessment in the SDEIS of likely impacts to surrounding wetlands outside the project footprint.	COE01, COE02
11216	The PolyMet SDEIS does not adequately assess the potential impacts of contaminant seepage through existing bedrock fractures and through additional fractures which may result from routine blasting operations at the mine pit. Require the SDEIS be redone to accurately address these impacts.	WR012, WR016
11217	The PolyMet Land Exchange would result in net losses of thousands of acres of high biodiversity plant communities, floodplains, and mature forest. Deny the land exchange in both of its two proposed alternatives.	VEG02, VEG03
11219	The PolyMet SDEIS lacks a health risk assessment which sufficiently addresses likely impacts to PolyMet workers' health and the effects of airborne and seepage contaminants on drinking water wells, surface waters and their human-consumable resources of fish and wild rice, and on aquatic and terrestrial wildlife throughout the watershed, including threatened and special concern species. Require a health risk assessment.	HU04, VEG04, VEG06, WI04

<b>Sender Name (Submission ID)</b> Dave Crawford (38374)		
11221	The PolyMet SDEIS fails to explore alternatives such as comparing an underground mining alternative with the proposed open pit mine; placing waste rock back into the pit; placing liners under the waste rock pile and tailings piles; or implementing engineering solutions to reduce water drainage away from Partridge River Watershed wetlands and streams. Require a new SDEIS which documents these alternatives and compares them with the current proposal.	ALT06, ALT07
11223	Deny PolyMet a mining permit until all of these inadequacies are corrected with well-substantiated data and with guaranteed measures to negate adverse impacts for the entire expected duration of the problem.* This is of particular importance because the precedent which is set in allowing a hard rock mining permit in sulfide-bearing rock will set the bar for any subsequent applications for similar mining.	PER35
11229	Mining companies are temporary entities, but the PolyMet proposal creates a permanent problem. Regulatory oversight is not sufficient unless it guarantees that the party initiating a proposal will take, and be held to, all of the responsibilities for all costs and damages, present and future, which may arise as a result of implementing the proposal. If the initiating party can't make this guarantee, the proposal should be denied.	PER03
<b>Sender Name (Submission ID)</b> Dave Ethier (43337)		
11237	The PolyMet NorthMet SDEIS contains inadequate analysis of risks to the citizens and taxpayers of Minnesota and the impact this project will have on water quality.	HU01
11238	There has not been enough research and analysis to identify the impact of a 100 or 500 year flood on containment systems and the site in general.	PD22
15588	Conduct a impact assessment for potential historic flooding for the PolyMet project, and include the results of the assessment in the EIS.	NEPA05
<b>Sender Name (Submission ID)</b> Dave Gaddie (6605)		
1090	...move forward with jobs and materials that will help drive the economic environment for all of us who operate a business in NE Minnesota.	SO10
1198	I would like you to approve the permits necessary for PolyMet to proceed to construction. This project has been thoroughly vetted as it should be, but it should not be held to higher standards than any other mining project currently operating in NE Minnesota.	PER34

<b>Sender Name (Submission ID)</b>	Dave Redelman (43605)	
15678	My primary concerns involve addressing long term water quality issues. Sulfide mining has a generally poor record leaving long term water pollution after closing the mines. I am sure the proposals for these polluting mines also looked good on paper but still resulted in long term pollution problems.	WR023
15679	What is typical of [the permitting] process as the SDEIS is for the first sulfide mine in Minnesota? Also, forgive me but it seems absurd that more detailed engineering and analysis of risks would only be completed during permitting. Again, the engineering design and the risk analysis are both crucial in the EIS. Any decision to proceed forward to the permitting process is dependent on this risk analysis.	PER03
15680	Spatial variability and spatial statistics of sulfides and other possible pollutants within the rock in the pit area not adequately addressed.	PD15
15681	Given the spatial variability of sulfides in the pit rock, is it even possible to separate the rock into categories for permanent storage? I do not see the spatial statistics on the variability of sulfides in the pit rock in the SDEIS.	PD15
15682	Waste Rock Categorization Properties Table 3.2-8 lists the percentages of Total Waste Rock Mass listed for each category. Where are the statistics that describe the variability and accuracy of these estimates?...How does the sulfide in the pit rock vary spatial based on your current drill samples?... How can you be confident that the waste rock can even be separated into the categories throughout the mining process without these spatial statistics?...How will you assure that rock from the different waste rock categories will be kept separate?	PD15
15683	I do not see where any specific astronomical or ecological light pollution issues are addressed as described in the thematic response: "This topic is discussed in Sections 5.2.11 and 5.3.11 of the SDEIS."	PD01
15684	the cumulative effects from increased development and population need to be addressed. The State needs to develop best practices to address these topics and then include the best practices in development projects. Local zoning ordinances will only begin to adequately address these issues with leadership from the State.	CU15
15685	The night sky is one of the draws to the BWCA. All the proposed mining operations as well as other industrial and residential development near the BWCA would increase light pollution with a negative impact on viewing the night sky.	WILD02
15686	The effects of ecological light pollution are much more difficult to understand and to remedy. According to Bogard and other researchers, there is increasing evidence of negative effects on bats and migrating birds as well as nocturnal vertebrates and invertebrates.	WI01, WI04
15687	There are cumulative, long term effects from ecological and astronomical light pollution from increasing development and population. The DNR needs to develop best practices for both ecological and astronomical light pollution. These best practices need to be part of the PolyMet EIS.	PD01
<b>Sender Name (Submission ID)</b>	Dave Salo (18085)	
3211	Now, in conclusion, we know these metals are not readily available on the surface, but we need to extract them from the ground, and we need to do this to maintain the current manufacturing of these drugs and these products.	NEPA05
<b>Sender Name (Submission ID)</b>	Dave Sandstrom (9560)	
971	Polymet is utilizing environmentally friendly technologies designed to mine resources without abusing the environment - technologies that simply were not previously available.	PD28

<b>Sender Name (Submission ID)</b> Dave Semerad (18158)		
13256	We believe this project will infuse economic vitality into the communities... Not only will meaningful projects be created across a wide spectrum of careers, but confidence and faith in Minnesota industry will be uplifted finding its way into communities, schools, and families. For every \$1 million of investment, 28,500 jobs are projected. We urge that this project proceed without further delay.	SO10
<b>Sender Name (Submission ID)</b> Dave Worshek (42566)		
17065	As a city councilor I feel it will help bring much needed jobs into the range. I feel it will also bring in other business's to our area which could also add jobs. Besides new jobs to our area I believe this will also be a real shot in the arm to our existing businesses. I also hope that this will bring new families to area with young children which will be a boost to our schools.	SO10
17066	I do feel the land exchange with the Forest Service is a positive proposal. The Forest Service is basically trading out of an area that has been right in the middle of taconite mining. They will be receiving land such as the Hay Lake area that has many acres of wetlands, is wooded and has little access. I believe that it is stated that there would be a net gain of approximately 70 acres of wetlands.	LAN11
17067	As far as water resources I do feel that with the restrictions places on Polymet that the water quality in existing stream/drainages would end up cleaner than what is now coming out of the old LTV tailings basins. I believe the main concerns would be sulfate and mercury and with the treatment planned it shows that concentrations would actually lower. The great lakes initiative discharge standard for mercury is 1.3 ng/L which is hard to make without doing anything to our water.	WR190
17068	Under the socioeconomics section it states that there will be no effect under the no action alternative. I do not believe that is correct. I believe that if we do not get some type of new industry up in this area we will lost businesses. Our local small businesses have been barely getting by and if we do not see something positive in the near future there will be some that will have to close their doors.	SO04, SO10
17069	Under wilderness it also states that no action has no effects. I also disagree with this statement because Polymet will bring new families to the area that may be looking for an out experience. This could mean more visitors to the BWCA, and more tourists to our area using our recreations facilities.	LU06
17070	I would rather have the mining happen here under our rules and regulations rather than in some far off area where we do not get any of the benefits but do get some of the adverse effects.	NEPA05
<b>Sender Name (Submission ID)</b> Dave Zins (45274)		
9167	The only way the public could ever utilize the mine site for recreation would be by trespassing. This is the reason I believe the land exchange with the U.S. Forest makes sense. This land exchange would open up lands that have been privately held, for the general public to use and enjoy for generations.	LU01
9169	I believe that the technology exists for this project to move forward now and start a new generation of mining with sustainable jobs for years to come.	SO10

14336 Minnesota’s top natural resource is clean water. With the Boundary Waters lakes and Lake Superior we have a resource that can’t be matched in the country. However, that resource is fragile and the biggest enemy is pollution. There are no examples of open pit copper mining in the world that haven’t caused destruction or displacement of the ground water. In our case, that destruction would also include surface water, our greatest resource. WR023

14337 We know the demand for copper and other metals won’t dry up and the value of the ore will certainly appreciate. It’s also very likely that earth-friendly means of extracting the metals will be developed in the future. What would it hurt to save a known valuable resource until it’s safe to extract it? Imagine the value if Minnesota had saved some of our high-grade iron ore. PD32

14338 We need to be sensible stewards of our resources. We can’t accept short-term gains in exchange for long-term harm to our most valuable asset. SO01

11348	What is the environmental impact of a threefold increase in the volume of ore dug up – at the PolyMet mine and at other mines that would need to be opened to supply their processing facility?	SO04
<b>Sender Name (Submission ID)</b> David Arbeit (42935)		
9846	The right decision hinges on the trade-off between a reasonable expectation of economic benefit over a short twenty-year period in exchange for an unreasonable expectation that mitigation will prevent incalculable and irreversible environmental damages, economic costs and human health issues that will be felt by generations.	SO01
9855	[The SDEIS is inadequate because of] inadequate assessments of long-term risks, a bias towards “best-case” scenarios that convey a false sense of prospects for mitigating risks ... and the absence of compelling evidence that technologies needed for reducing long-term risks to acceptable levels will be capable of achieving that outcome.	HU01
9861	PolyMet has depicted scenarios that might possibly be effective, but sulfide mining has never been undertaken in Minnesota and there is more than ample evidence that sulfide mining elsewhere has caused extensive damage to the environment, economy and public health.	HU03
9863	The benefits promised by the project, principally jobs for residents of northeast Minnesota are important. But are new mining jobs to be added by crippling or destroying a viable recreational industry and the development of businesses and sectors that do not endanger the unique resources in Northeast Minnesota?	LU06
9865	For a fraction of the expenditures that will be needed to attempt to make this project safe, the State should consider investing in infrastructure that supports a high-tech but green economy in the Northeast, such as high-speed broadband, entrepreneurial start-ups, and education and training.	SO02
9870	I urge you to reject the PolyMet NorthMet SDEIS as inadequate and, further, to reject all attempts to open the State to open pit sulfide mining unless and until the capacity to totally eliminate the risks of environmental impacts of such activities have been demonstrated using proven methods and technologies during the full life-cycle of mining, maintenance and mitigation elsewhere.	NEPA15
14498	[The SDEIS is inadequate because of] a complete failure to analyze risks to on-site workers, the absence of a Health Risk Assessment of the effects of toxic pollutants on people and habitat downstream	HU04
14499	[PolyMet's plan for] closure and post-closure maintenance “if or when proven effective” for a period that PolyMet acknowledges “would last for an unknown duration.” This last sentence is telling: what if no effective method exists for putting the genie back into the bottle when a toxic contaminant is leached or released – especially once operations have ended.	PD06
14500	If the SDEIS were an academic exercise, it would probably deserve an A-plus. Yet, the assumptions made and scenarios used to demonstrate a low-risk result defy what we already know – even under “blue sky” conditions, risk cannot be reduced to zero.	PER23
14501	what about the cost of a highly improbable scenario should it occur? Can it really be measured and who, if not the public, will end up paying for it? Must we forget the results of catastrophic failures such as Fukushima, Exxon/Valdez or Deepwater Horizon?	FIN01, FIN05
<b>Sender Name (Submission ID)</b> David B. Edgette (46258)		
8860	Please DO NOT issue a mining permit to PolyMet. The St. Louis River and Lake Superior already have too much pollution flowing into them as a result of past and present industries. Potential additional pollution from PolyMet should not be allowed. In fact, more clean up of all fresh waters should begin ASAP.	CU11

8862	The copper concentration in the ore body that PolyMet plans to mine is of such low concentrate that a large amount of material will need to be removed for a very small return of copper.	PD30
8865	The destruction of forest and pollution produced for 100's of years is not worth 15-25 years of mining jobs.	SO01
8867	Sure it might be profitable for corporations like Minnesota Power to sell more electricity produced from their polluting coal burning power plants. This also would not be good for the environment.	PD39
8870	A land exchange does not replace the location and original forest as was intended when it was set aside for the future. Recreational land is one of Minnesota's largest long term assets.	LU01
8871	Please DO NOT issue a permit to allow PolyMet to profit for a short term by shipping their copper to China, leaving Minnesota with another polluting hole in the ground.	SO01
<b>Sender Name (Submission ID)</b> David Bergerud (42720)		
9896	Water contamination treatment would need to remain in operation for up to 500 years. We need to ask what does this mean? What would happen if treatment were interrupted or stopped? What would happen if the treatment facility infrastructure failed or was damaged?	PD04, WR144, WR202
9897	Five hundred years would make PolyMet the oldest business in America. I find it difficult to believe they would be there for us 500 years from now for a 20 year project today.	FIN01
9898	How much bonding will be required to service such a long term problem? How do you factor inflation for 500 years?	FIN05, FIN08
9899	If water treatment were abandoned, what would be the environmental repercussions? What would be done if this company failed or was sold or cannot uphold its obligations? If the environmental obligations were dumped on the state or federal government, how much money will the taxpayer have to shell out?	FIN01, WR037
9900	If mining is our economic lifeline, why are there so many derelict buildings and homes scattered around the range towns? What will these towns look like after the operation halts? Will we be faced with a surplus of structures, facilities, and homes when the bust occurs 20 years from now?	SO02
9901	How does PolyMet address the economic equation of an enviable end to the operation? Will they pay for unemployment, re-education training or relocation expenses? How do you weigh the trade-off of a 20 year environmentally controversial private venture against the protection of our unique and fragile environment?	FIN01
<b>Sender Name (Submission ID)</b> David Brown (42119)		
2169	Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health.	HU03
2170	The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates -- which increase mercury in the food chain -- will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks.	MERC20

12171	The SDEIS inadequately analyzes human health impacts of PolyMet’s pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution.	HU01
12172	The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health.	HU01
3262	reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health.	HU03
3266	The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS’ claims that mercury and sulfates -- which increase mercury in the food chain -- will be “captured” are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks.	MERC20
3267	The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution.	HU01
3268	The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant.	HU04
3269	Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources.	MERC16
3271	Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health	HU01
3272	Complete the mercury TMDL study of the St. Louis River before finalizing the PolyMet SDEIS or issuing any permits for the PolyMet sulfide mine project.	MERC22
12314	I’m just against the mining just simply because of the 500-year exposure and what it would mean to the wetlands and the water there.	WR195
12316	I think ultimately that’s all going to come to be billed to the taxpayers.	FIN10
12318	I would rather use that money to create other programs for the people that would essentially benefit from this.	SO02
12319	We should use less copper and all sorts of industrial products. And I don’t think the fact that people aren’t yet ready to give up copper is a reason to create more mines for copper.	NEPA06
16620	The SDEIS inadequately analyzes human health impacts of PolyMet’s pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer.	AIR10
16621	The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage.	HU01
16622	The SDEIS inappropriately reduces the 70-year “lifetime” to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary.	HU06

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> David Brown (42119)		
16624	The SDEIS arbitrarily denies effects of water pollution on the St. Louis River.	WR111
16625	The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence.	SO04
16627	Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured.	MERC20
16630	Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution.	AIR05
16632	[Include] Description of the known human health impacts of all pollutants in PolyMet’s air emissions and water discharges in language understandable to the public.	AIR07
16634	[Include] Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis.	HU02
16635	[Include] Assessment of all risks using a 70-year “lifetime” for exposures.	HU06
16637	[Include] Assessment of cumulative risks of multiple chemicals and exposure routes (drinking water, fish, wild rice) on infants, children and the elderly.	HU02
<b>Sender Name (Submission ID)</b> david burrow (47221)		
8848	We fish, swim, canoe, Kayak, sail, bike ride, camp and cross country ski. Clean water is critical to everyone in Northern Minnesota that enjoys these activities.	LU06
9067	This area has a great many lakes and includes two watersheds... These watersheds represent a substantial amount of the fresh water reservoir on the planet... It is for this reason, I believe, that copper mining should not be introduced into Minnesota.	WR111, WR115
9072	Oxidization of sulfide bearing waste rock resulting from extraction and processing will create sulfate. Sulfate contact with surface or groundwater, accidental or otherwise, results in acidification of the water. Lakes and wetlands in NE Minnesota are very sensitive to changes in ph. Small changes effectively "poison" the the water and will kill fish and wildlife.	WI04, WR001
9078	The Northeastern area of Minnesota, currently being considered for the NorthMet project, is a unique land and water resource. So unique that a significant portion of the area has been designated as a National Wilderness Area (BWCAW). As a result, there are limits placed on the area with respect to how it can be used with the intent of preserving it for the long term. Copper/heavy metal mining will put the BWCAWin jeopardy.	WILD02
9085	Studies have shown that there is a great deal of copper in the earth's crust distributed around the planet; enough to last thousands of years at current rates of use. In addition, we continue to increase our recycling rates for essential minerals.	ALT09, ALT16

9089	The SDEIS acknowledges that the environmental impact of untreated waste rock and water as a result of the NorthMet project could be serious and perhaps devastating. As such, multiple treatment and containment techniques detailed in the SDEIS will be employed to manage the threat of environmental damage. However, despite best efforts at protection, every existing copper mine has caused significant environment damage. Worse still is that the possibility for damage exists not just during the mines operation but for many, perhaps hundreds of years into the future.	WR023, WR115, WR195
9177	In an anticipation of the possible future cleanup costs, there are suggestions, not detailed in the SDEIS, of a surety bond or some financial instrument that sets aside monies to pay for ongoing management/treatment of the mine's waste products. Given that few corporations remain in business for hundreds of years, including those involved in mining or backing bonds, how then can Minnesotans be assured that we collectively will not be responsible for future cleanup/ treatment costs associated with copper mining?	FIN01, FIN08
<b>Sender Name (Submission ID)</b> David Carlson (11539)		
2489	The precious resources of water, particularly, along with forest and wildlife, are irreplaceable and are worth far more than any short-term profits to be gained by sulfide mining. The safeguards promised do not and cannot outweigh the severe risks and environmental degradation that would likely ensue from this proposed operation.	SO01
2489	The precious resources of water, particularly, along with forest and wildlife, are irreplaceable and are worth far more than any short-term profits to be gained by sulfide mining. The safeguards promised do not and cannot outweigh the severe risks and environmental degradation that would likely ensue from this proposed operation.	SO01
12840	There are hundreds of reasons to say no to this mine. Reasons for it? Maybe a couple hundred non union jobs for 20 years. The risk to the waterways of this state are just not worth it. The costs the taxpayers will end up picking up to clean up their mess when they leave will be endless.	SO01
<b>Sender Name (Submission ID)</b> David Cartwright (42793)		
6878	I believe it is short sighted with the lure of economic benefit of the expense of long term environmental impact. Most concerned about the impact on water quality.	SO01

17765	It seems to me that the goal should be complete containment of mining waste and associated water and dissolved metals with no long-term waste management costs when the mining is done.	PD09, PD35
17766	The allure of reverse osmosis in water treatment together with an impervious membrane is that it offers at least some technology for a long-term solution to acid mine runoff, even if it is never-ending. It is not satisfactory because environmental threats are only delayed, and who will pay for long-term maintenance is not determined.	FIN01
17767	Minnesota is at a competitive disadvantage because of our wet climate, the problem with water seeping through tailings, and long-term sulfuric acid and dissolved metal mine runoff. What can go wrong with copper mining in moist places is well illustrated by the Berkley pit in Butte, Montana, or the Elizabeth mine in Vermont, both federal Superfund sites.	WR008, WR023, WR107, WR180
17768	PolyMet has clearly spent little effort at finding a better acid mine runoff solution.	ALT13
17769	In the context of centuries, a polymer will not work [for waste rock disposal] because it will break down. The East pit should remain separated by solid Duluth Complex rock. Rather than ending with a revegetated bog, the pit should be designed with a low mound on top to shed water and be revegetated, and not allow percolation down into the pit. Otherwise it will have the same outcome as the Flambeau mine. The objective should be to eliminate water circulation into the pit, within the pit, and out of the pit.	ALT06, ALT13
17770	The level of mercury (and methylmercury) is already so high in Lake Superior that the Minnesota Department of Health has issued advisories about human fish consumption. ... The discussion should be about how to remove dissolved metals in Lake Superior harmful to human health, not about absorbing additional threats. Public policy regarding power plant and other emissions of mercury has significantly reduced the amount of new mercury pollution going into the lake, but it is still increasing (see Minnesota Sea Grant).	PER11
17771	In the SDEIS study area, "background" is already a compromised concept, particularly as regards the effects of sulfur dioxide (SO <sub>2</sub> ), a primary smokestack effluent. After decades, how can it not increase dissolved metals. How can it not effect wild rice in Minnesota?	WR203
17772	If a better copper mine waste disposal solution is not found, the trade-off between copper mining benefits and further damage to the waters of the State is not worth it.	SO01
<b>Sender Name (Submission ID)</b> David K. Nelson (47595)		
7180	[T]his state has a lot to offer everyone...Water recreation for one, camping, fishing, hunting, tour guides, lodges for people to get away from the big city life. No one can predict the out come for the generations to come	LU06
<b>Sender Name (Submission ID)</b> David Kane (18309)		
4166	Sulfide plus oxygen equals sulfuric acid just like one plus one equals two. So we're talking about -- I don't know -- thousands, millions of tons of sulfides baking in the sun, water. Everybody knows how much it rains in Minnesota.	HAZ03
4167	I grew up close to the Embarrass River in Lakeland and chain of lakes, close to Bass Lake, which is a spring-fed lake. I'm curious what kind of study has been done with the underwater type studies of this kind of mining and fracturing of rock formation like this.	WR011
12795	I don't think it's wise to mine toxic material on top of a (inaudible) that straddles the continental divide.	PD08

12797	Polluting your environment for 20 years' worth the jobs and then taking care of that water for 500 years -- a number pulled out arbitrarily -- to me I don't know who is going to be paying for it. I think it's going to be dumped on the taxpayers.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> David Kozlak (14933)		
332	Like the tailings that polluted Lake Superior in the past, I hope that we have learned what is safe and what is not to our waters.	WR023
336	Growing up my father taught me how to respect the land ... I too would like to teach my young son those same lessons in that environment, please do not allow PolyMet to endanger that opportunity	GEN01
338	What can we do when the pollution spreads? ... And who will pay for the damages..to our fisheries, to our woodland animals and hunting, to our wild rice, timber and other current resource based sports, business and industries?	FIN01
340	Will fishing and hunting licences drop? Will permits into the boundary waters drop? Will tourism falter? Or will irreversible damage be done.	LU06
<b>Sender Name (Submission ID)</b> David Kremer (47027)		
10623	As a union member myself, I value good jobs, but not at the expense of this {BWCA}Minnesota/national/international treasure.	SO01
<b>Sender Name (Submission ID)</b> David Krings (7628)		
826	Since the area is already impacted by previous mining activity, this is our chance to recover more metallic ore and to fund a true rehabilitation of the land so our grandchildren will find it in a better condition.	PD28
<b>Sender Name (Submission ID)</b> David L. Ivonon (53223)		
15343	I would love nothing more than to see good paying jobs...However, NOT at this expense	SO02
<b>Sender Name (Submission ID)</b> David Langfeld (43343)		
11654	I believe that the Polymet project be given full approval by the State of Minnesota agencies involved for permitting. I believe enough scrutiny has been applied to the project by all of the agencies involved over the many years that it has been waiting, not to mention the vast amount of money spent by the company to address the environmental concerns of those special interest groups who, I believe, don't have valid argument against the project.	PER34
11655	[the Aurora and Hoyt Lakes communities] have waited far too long for the day that good paying jobs would return to the former LTV site that once sustained a good quality of life... I have observed the closures of schools and businesses, as well as the losses of the various civic organizations that made for an enjoyable upbringing in these communities.	SO10
<b>Sender Name (Submission ID)</b> David Lankinen (39241)		
12577	the few jobs that it would create is not worth the environmental costs that would occur and create scars on the landscape forever.	SO01

8666	Does the tourism industry in the region benefit? Some businesses in the tourism industry are already experiencing a decline in business because of test-drilling sites located nearby...What will happen to the tourism industry once sulfide mining begins production?	SO02
9596	Do the taxpayers of Minnesota benefit? Does the state benefit? PolyMet and other companies seeking to mine in the region are not Minnesota companies, nor are they even U.S. companies!	SO06
9598	Do the locals in the region who are pro-mining really have the chance to benefit as much as they are being promised? PolyMet's operation is estimated to provide a few hundred jobs only, and only for 20-some years. How many locals can realistically expect employment? Do we really want to trade a few hundred temporary jobs for 500 years of cleanup?	SO01
9600	Do the property owners in the region benefit? I'm one of those property owners, and I pay a small fortune each year in property taxes that help support the region. I view my own property, and the region as a whole, as a JEWEL, as a LEGACY to pass on to the generations that follow me. I do not want to see this jewel poisoned by poorly managed sulfide mining!	LU06
13410	The Boundary Waters and other lakes and parks in the region draw thousands of visitors each year from around the country and around the world. Some businesses in the tourism industry are already experiencing a decline in business because of test-drilling sites located nearby, What will happen to the tourism industry once sulfide mining begins production?	SO02
13411	PolyMet's operation is estimated to provide a few hundred jobs only, and only for 20-some years. How many locals can realistically expect employment? Do we really want to trade a few hundred temporary jobs for 500 years of cleanup?	SO01
13412	Do the property owners in the region benefit? I do not want to see this jewel poisoned by poorly managed sulfide mining!	SO01
<b>Sender Name (Submission ID)</b> David Litsenberger (38778)		
4889	As a "threatened" species, it is of concern to the DNR to see that this species [lynx] is successful in reproducing and able to forage for food. However, the proposed Polymet project would add on to the fence-like barrier the Iron Range mines present to lynx and other mammals in this region.	WI01, WI03
4890	In times of food shortages they will migrate as much as 250 miles (Kurta's Mammals of the Great Lakes Region). The mining activities of the Iron Range, a rather vast disturbed area, therefore, acts to restrict the movements of lynx.	WI03
4891	Also, the fact that Polymet has never had a mine and doesn't have the financial resources for assurances in case of (and they will occur) environmental mishaps, well, this project should not be allowed to go forward.	FIN01
16789	Should the Polymet project win approval it is easy to see that more projects of this type will then be approved to where this barrier will extend from Grand Rapids to the Boundary Waters.	CU04
<b>Sender Name (Submission ID)</b> David M Windseth (47697)		
7956	This mine has a strong potential to pollute northern Minnesota waterways, including areas of the Boundary Waters and Lake Superior, and is not worth the risk to the wilds of northern Minnesota, which many people depend on for tourism to make a living.	WILD02
7957	Most of the money used to mine will not remain in MN, and if the tailings dam does leak many times the company will take the money and declare bankruptcy to avoid having to pay for cleanup costs, putting the responsibility unfairly on the citizens of MN.	FIN01

7959	50 years of jobs is not worth the 500+ years of monitoring and risks it puts on one of the cleanest water systems in the world.	SO01
11117	These types of mines have a bad track record in wet environments like Minnesota, and should not be allowed to compromise the state we all live in and enjoy.	PD26
<b>Sender Name (Submission ID)</b> David Maki (39035)		
10182	As an engineer, I am fully aware that there is not a single case study documenting Sulfide mining that did not lead to long lasting watershed pollution involving increased acidity and heavy metal contamination.	WR023
10184	PolyMet is a new company with no mining experience or track record of responsible pollution management.	PD23
10185	However, the track record of PolyMet's parent corporation Glencore is riddled with environmental disasters, labor violations, and human rights abuses around the world.	PD23
10186	I strongly urge you to consider the history of Sulfide mining in general, and Glencore's record of environmental stewardship when considering this issue.	PER02
10187	I have deep reservations concerning the effects Sulfide mining will have on the natural and cultural resources of the Partridge and Embarrass Rivers. Both rivers contain significant wild rice resources. Wild Rice is a traditional cultural property of the Anishanabe people.	CR01, CR05, WR158
10189	Heavy Metal contamination, both real and perceived, will have a negative impact on this traditional resource [wild rice] for the next 200 to 500 years.	VEG04
10191	I strongly urge you to reject PolyMet's shortsighted plan for polluting Minnesota's public waters.	WR195
10193	Short-term profits do not justify centuries of pollution.	SO01
<b>Sender Name (Submission ID)</b> David Mccue (31504)		
14004	My god, this is an area where motor boats are restricted. How is it even possible that a proposal like this even gets drawn up on paper. If industrialists had their way the whole world would be a turned over waste land. Between oil, sulfer, and fracking this country is under attack. Leave the forrests alone !!!!!	WILD02
<b>Sender Name (Submission ID)</b> David Mcmillan (18350)		
14634	I want to say to the lead agencies and the DNR that the roles you have been charged with, you have done a thorough and comprehensive job in looking at this and applying the stringent standards in regard to the state's applicable laws, and that the SDEIS and the EIS is accurate, comprehensive and complete.	NEPA16
<b>Sender Name (Submission ID)</b> David Miller (40832)		
10157	the SDEIS fails to consider a range of common sense risks by making rosy and unsupported projections concerning water capture and treatment, wetland mitigation, air pollution and other side effects of a massive, industrial mining zone in the heart of the Superior National Forest.	AIR11, WR017, WR018, WR128, WR202

<b>Sender Name (Submission ID)</b>	David Miller (40832)	
10158	The NorthMet Project will contribute additional sulfate to the groundwater from tailings basin water that is not captured and treated, water that seeps through fractures in the mine pit walls and stockpile infiltration and run-off.	WR010, WR011, WR070, WR087, WR088, WR107, WR108, WR173
10159	Every year, 11 million gallons of polluted seepage from the tailings basin and 5 million gallons from the mine site will enter groundwater and the environment without being treated.	WR070
10160	All of the PolyMet predictions regarding discharge from the mine pits and waste rock piles...are made without considering the effects of documented fractures at these sites on discharge to groundwater and surface water. Groundwater contamination from the previous mining activities is still an issue near the LTV tailings basin and mine pits.	GT01
10162	PolyMet's favorable water modeling is also based on groundwater base flow data that now appears to have significantly underestimated the likely speed and volume of water flow and resulting sulfate discharge around the mine and processing plant.	WR003
10163	The water infiltration rate is lower than the design targets for engineered controls at landfills, has never been observed in any known wetland system, and accounts for only five percent of precipitation falling at the site.	WR126, WR165
10165	Even the most reasonably foreseeable problems at the site, including pipeline breaks, dam or slope collapse and problems with waste water treatment go unaddressed in the SDEIS.	WR131, WR132
10167	Design for the 100-year storm also fails to account for the current state of our climate and is insufficient.	WR180
10262	PolyMet's discharge would also release arsenic, lead and manganese into the groundwater. These effects must be studied and addressed in the SDEIS.	WR107, WR108
10265	Although PolyMet's testing indicates that its waste rock leaches mercury at more than four times the water quality standard, it proposes not to conduct an analysis of the amount of mercury that will enter the watershed.	MERC16
10272	the sulfate discharges will have adverse effects on wild rice...The proposed engineering controls for the PolyMet mine will not assure wild rice water quality standards are met.	VEG04, WR156
10278	No substantive data indicates that reverse osmosis will work to fully meet water quality standards.	WR143
10282	Even if it were conceivable that PolyMet could monitor and maintain this site to current water quality standards for hundreds of years-which is a simply unbelievable claim- this would not be in compliance with Minnesota law that requires the mine to be left maintenance free at closure.	PER04
10285	To establish this mine would destroy 1,741 acres of high quality ecosystem, including 912 acres of high quality wetlands, with a rich diversity of native plants and provide a wide range of ecosystem services such as reducing the severity of floods, water filtration, carbon sequestration and habitat.	WET24
10287	Yet the proposed exchange of wetland proposed by PolyMet would include sites two-thirds of which are located outside the Lake Superior watershed and would fail to provide in-watershed benefits previously provided by the destroyed wetlands.	WET03, WET15
10290	can pollution be controlled for hundreds of years? The SDEIS weakly attempts to address the mechanical and hydrological aspects of this question, but they are incomplete without addressing how much money will it take to assure Minnesota water quality standards are maintained (without variance) in the face of pollution that is perpetual, without Minnesota taxpayer assistance?	FIN05, WR037, WR128

<b>Sender Name (Submission ID)</b> David Miller (40832)		
10292	The SDEIS makes no effort to consider alternative means to reduce the harm this project would visit upon our Minnesota environment. These could include underground mining, liners under the permanent waste rock pile and the permanent tailings basin, returning waste rock to the west pit to reclaim wetlands and introducing reverse osmosis in year one at the mine site to treat and release water on site and reduce indirect wetlands destruction. Under Minnesota law, economic considerations alone do not justify rejection of alternatives.	ALT01, ALT03, ALT07, ALT10
17358	Engineering controls that are planned for the mine must function perfectly for hundreds of years to meet applicable water standards. The assumed performance of these critical water capture systems in the SDEIS is over 90% effectiveness. This assumption is neither reasonable nor realistic.	PD03
<b>Sender Name (Submission ID)</b> David Miranowski (6253)		
10544	We cherish our beautiful lakes and are all very afraid that if PolyMet fails to be thorough/convincing in their pre-planning efforts, they will be even more reckless in their physical treatment of our land.	LU06
<b>Sender Name (Submission ID)</b> David Moen (36338)		
10009	The study of potential health effects has been inadequate and I am VERY concerned that 10% of infants born in St. Louis County have mercury toxicity today and this project will likely put more citizens at risk.	HU01
10012	The SEDIS study has several deficiencies including inaccurate assumptions about seepage of toxic metals into surface and ground water. Health impacts include complex neurological changes that are irreversible.	WR070
12052	The study of potential health effects has been inadequate and I am VERY concerned that 10% of infants born in St. Louis County have mercury toxicity today and this project will likely put more citizens at risk.	HU01

11251	The enormous amount of effort and study that went into this SDEIS is mind boggling. Spending over 8 years and \$100 million dollars to prove that you can run a mine in a safe manner should be commended by Polymet.	NEPA16
11258	I feel they have taken all necessary steps to comply with the state and federal standards and will continue to do so into the future. I also feel that this project, once operational, will attract more intense scrutiny by State and Federal agencies, environmental watchdog groups, and the local communities, which will further strengthen the environmental stewardship that Polymet has committed to, and continues to show throughout this process.	PER34
11260	I trust that our State and Federal agencies have followed the permitting process to a tee, and that your review and involvement in this process will produce a mining permit that will ensure all aspects of the environment are protected.	PER34
11263	We cannot produce the much wanted green energy without the copper, nickel, and other precious metals in our world. We also cannot import these metals from other parts of the world without knowing that they were produced with more environmental impact to the environment.	NEPA05
<b>Sender Name (Submission ID)</b> David Reisenweber (46436)		
8956	A major omission in the NorthMet SDEIS that particularly concerns me is the affects of weather extremes. A lightning strike or a windstorm could destroy equipment used to move polluted material to the right place at the right time. Is there a backup plan? How will the mountains of sulfide ore be successfully contained when catastrophic precipitation events occur?	PD22
8959	The NorthMet SDEIS lacks plans for accidents and emergencies that will happen, when something goes wrong with ponds, pipes, pumps, filters, etc. needed for water treatment.	PD22
8964	The bedrock of northeastern Minnesota has many cracks and water will probably move differently depending on amounts of precipitation received. Is there flexibility in the SDEIS to find what is moving where? I could not find it.	WR010
8966	Does the state of Minnesota have maps of the complete hydrology of the Duluth Complex where this mining is proposed?	RFI01
<b>Sender Name (Submission ID)</b> David Robert Ott (18249)		
13666	I feel like it hasn't been proven beyond a reasonable doubt that the water quality issues will be adequately addressed. Therefore, I think the risks are too high, and I think it would spoil a great treasure of our state, being the water quality of the whole drainage ultimately going to Lake Superior.	SO01
<b>Sender Name (Submission ID)</b> David Ross (11617)		
3300	It did so because the board understands how the strategic mining industry in Northeastern Minnesota will generate thousands of new jobs for our region. As well, the board appreciates how strategic metals mining will have a positive impact on local tax revenue and education funding.	SO10
3300	It did so because the board understands how the strategic mining industry in Northeastern Minnesota will generate thousands of new jobs for our region. As well, the board appreciates how strategic metals mining will have a positive impact on local tax revenue and education funding.	SO10
3301	The [Duluth Chamber of Commerce] board realizes how mining companies operating in Northeast Minnesota, such as PolyMet, will utilize advanced technology to protect our environment. We understand PolyMet and other companies will be required to meet Minnesota's rigorous environmental standards to ensure that our air and water quality standards are protected.	PER34

3263	The five hundred years of water pollution with heavy metals after the mine is something that neither this corporation nor the state are geared towards dealing with.	WR037
3264	Jobs at this price are not a bargain we need to strike. Not for a measly twenty years of jobs.	SO01
<b>Sender Name (Submission ID)</b> David Tomasoni (18107)		
3353	PolyMet is an open-pit mine, which will provide 500 to a thousand construction jobs, 366 direct jobs and over 700 spin-off jobs. Some people say it is not worth it. Well, tell the people of Aurora and Hoyt Lakes that these jobs aren't worth it and see what kind of reaction you get. Tell the people of the Iron Range that mining jobs aren't necessary and see what kind of answer you get. Try to even imagine living on the Iron Range without mining. The entire area would be a huge ghost town.	SO10
3354	PolyMet is mining. This is not sulfide mining, this is precious metals mining. These will be conflict-free metals. In other words, no ten-year-old kids will be employed at 50 cents per day, no wars will be fought to overthrow regimes. But rather, we will have an environmentally considerate mine in a region where mining has existed and provided for our economy for over 125 years.	NEPA05
<b>Sender Name (Submission ID)</b> David Tomassoni (18167)		
13334	Mining is the Iron Range's economy. PolyMet is mining. 500 to 1,000 construction jobs, 366 direct jobs, over 700 spinoff jobs.	SO10
13336	Our green economy demands copper, nickle, platinum, palladium, gold, and more. There are four tons of copper in a windmill. There is copper and precious metals in solar panels, computers, electric cars, medical devices, catalytic converters, TVs, and, yes, broadband. ... There are 39 different minerals in that cell phone. Every one of them must be mined.	NEPA05
13340	do we want to continue outsourcing jobs, importing pollution, and buying our minerals from countries in a constant state of conflict... or do we want to have great-paying, environmentally friendly jobs on the Iron Range with all the benefits to go along with them to develop a domestic source of precious metals to advance our green economy? The choice is clear, it's PolyMet.	SO10
14656	This is a good document. This is a document that has been scrutinized and gone over and over. Wetlands have been mitigated. There will be no acid drain off that has not already been decided.	WET25
<b>Sender Name (Submission ID)</b> David Welch (18262)		
13715	My substantive comment is a comprehensive analysis of water flow cannot be done. Climate change is progressing so rapidly that it is not possible to predict with accuracy the extent of pollutant migration into the hydrological system. Mitigation must be planned from the basis that passive water treatment is not applicable due to the inability to accurately project rainfall and to accurately project future rainfall and climate change.	WR196
<b>Sender Name (Submission ID)</b> David Williams (39370)		
6275	Copper/heavy metal mining will put the BWCAWin jeopardy. This area has a great many lakes and includes two watersheds, one emptying into the Hudson Bay and the other into the Great Lakes. These watersheds represent a substantial amount of the fresh water reservoir on the planet.	WR024, WR081, WR111
6279	Sulfate contact with surface or groundwater, accidental or otherwise, results in acidification of thewater. Lakes and wetlands in NE Minnesota are very sensitive tochanges in ph. Small changes effectively "poison" the the water and will kill fish and wildlife.	WI04

243	200 or 300 jobs compared to over 245,000 jobs in the tourism industry seems like a very bad trade.	SO01
1350	Details about financial assurance — a “damage deposit” the company provides — are not provided in the revised mine plan. The public does not know how much 500 years of water treatment will cost. According to Grand Portage Water Quality Specialist Margaret Watkins, this number could be in the 100 billion dollar range, a figure she calculated using the mining company's own financial assurance formula. The SDEIS does not address how the company will be held responsible for centuries of costly water treatment — or how the public will be protected from liability.	FIN01, FIN05, FIN10
1352	During operations, over 6.2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down.	PD22
1353	The plan for at least 500 years of active water treatment violates Minnesota Rules (6132.3200) that call for the mine to be left maintenance free at closure.	PD02
1354	526 acres and over 167 million tons of reactive waste rock would be left on the surface. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A plastic sheet placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of deep-rooted woody plants that might perforate the synthetic material.	WR127
1356	A pit “lake” and tailings basin pond would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River and the Embarrass River. I don't believe that PolyMet will see this situation through for 500 years or more.	WR037, WR129
<b>Sender Name (Submission ID)</b> Dawn Hofstrand (14649)		
8875	How will Polymet prevent polluting Minnesota's waters if we experience a massive storm with substantial, torrential rain such as that experienced by Duluth within the last two years? What is the contingency plan to protect our waters?	PD22, WR130, WR202
13781	Before allowing sulfide mining by Polymet in this area, the citizens of Minnesota deserve certain assurances from Polymet regarding the safety of its mining plan. At the very least, these assurances should include contingency plans for protecting Minnesota's waters when the best-case scenarios envisioned by Polymet's plan do not occur.	PD22
13783	2. The Polymet mine plan requires continuous water treatment at various wastewater treatment plants. How will Polymet prevent polluting Minnesota's waters if the wastewater treatment plants breakdown? What is the contingency plan to protect our waters?	PD22
13784	3. The Polymet mine plan envisions the use of massive tailings basins for the waste rock. How will Polymet prevent polluting Minnesota's waters if the tailings basins leak? What is the contingency plan to protect our waters?	PD11
<b>Sender Name (Submission ID)</b> Dawn Trexel (39255)		
12624	Just because there is a company interested in mining our minerals doesn't mean now is the best time to do so... Perhaps in the future we will have more sustainable methods for extracting such minerals.	SO02
<b>Sender Name (Submission ID)</b> Dean & Peggy Erzar (44366)		
10380	The governing bodies did a great job on the SDEIS and should continue making changes and watching out for us as the process goes on.	NEPA16

13023 The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. FIN10

**Sender Name (Submission ID)**    Dean Erickson (18385)

2892 The addition of potential sulfuric acid drainage into the St. Louis River Watershed, which is the largest watershed in the United States, flowing into the largest body of fresh water on earth seems unacceptable. WR111, WR195

2896 I also just want to point out that we base our predictions of water flow on the past. What we're seeing in the future is not the same as what we've seen in the past. We have minimal understanding at the revolution we need of climate change impacts in our watershed. And the flush scenarios are likely inadequate. WR180

2898 the MEPA and the other organizations that are collaborating to do this, ...we expect to spend \$420 million cleaning up our mess in the area of concern. .... it seems contradictory I guess I would say to be spending that much money to be cleaning up something when we're not tending to the 11 headwaters. SO02

2899 we are a ceded territory. And we have a lot of things that we need to take care of on behalf of the original people on this land. CR01

**Sender Name (Submission ID)**    Dean Flugstad (15811)

911 How will retention dams hold back sulfide and toxic metals for hundreds of years. WR132

912 Mining of all kinds has a very poor long term record in environmental integrity. It is get in, extract, get out and let the people pay for the clean up and mourn their lost environs. FIN01

2008 A 2200 page document perhaps was intentionally made so long it could hide all sorts of sins. NEPA07

**Sender Name (Submission ID)**    Deanna Erickson (20103)

1733 The Polymet Draft EIS does not make any mention of the Area of Concern or the Beneficial Use Impairments, nor does it adequately address how these impairments might be mitigated in the event that sulfuric acid enters the water column of the St. Louis River. WR012, WR130

1734 I am not in favor of this proposal and believe that on behalf of the largest US river entering the largest freshwater lake in the world, we are internationally obligated to deny permits for the Polymet operation. PER35

**Sender Name (Submission ID)**    Deanna Greene (42529)

15561 This area was established in part by mining – giving many people in this area jobs. The beauty of the area – land, water, animals, and air – reflects many positives of how, through the mining across the Range, it has stood strong. Mining brings jobs – jobs bring a community security with economic stability. The “earth” WILL survive and, more importantly, people will have the means to earn a living and financially independent. SO10

<b>Sender Name (Submission ID)</b> Deanne Roquet (43827)		
15944	PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions... The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution.	AIR01
15945	The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed.	WET13
16068	The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient.	WR057, WR080, WR176
16069	PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk.	PD22, WR130, WR132, WR180
16070	the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure.	FIN01, FIN05, FIN08
16071	The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period.	FIN13
16073	If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety.	PER07
16075	Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota.	AIR01, VEG03
<b>Sender Name (Submission ID)</b> Deb Brinkman (19960)		
1556	The SDEIS is inadequate; it does not provide any reassurance that this mining will not result in irreparable harm to the watery environment in our Arrowhead. PolyMet's proposed mine threatens our clean water and public health.	HU03, WR115
14220	500 years of pollution is unacceptable.	FIN10
<b>Sender Name (Submission ID)</b> Deb Bryant (45866)		
10258	I am vehemently opposed to the prospect of a copper sulfide mine being developed in Minnesota for many reasons to include the poor track record of the Glencore corporation, the risk to habitat and water quality, and the direct disruption such activity would create next to a wilderness area.	WILD02, WR023
10260	The estimated gain of a limited number of jobs for a mere 20 years is not worth the huge risk of damage done that will last potentially for centuries.	SO01
10261	There is huge weakness in the environmental draft statement pertaining to water quality, and based on the unsuccessful track record of preventing environmental damage as demonstrated through other such mines, there can be no assurance that the proposed mine will be any different.	WR023

17898	I believe that Polymet Mining will and can do everything in their power to run a good business, provide jobs, act accordingly with the State of MN, DNR and other environmental agencies. They've been in the news and public eye way too long not too!	PER34
<b>Sender Name (Submission ID)</b> Debby and David Ortman (54685)		
17865	We would rather see government efforts put towards recycling and reusing the already valuable minerals we have in circulation than trying to eke out the minute amounts found in the hard rock of Northern Minnesota.	NEPA06
<b>Sender Name (Submission ID)</b> Deborah (42918)		
11385	The SDEIS assumes that all the water that needs to be treated will be collected, contained, and treated, and no contaminated water will escape. Such optimism is naïve and foolhardy—leaks, spills, etc., from containment systems must be anticipated and prepared for with measures that will immediately be triggered to prevent the water from reaching groundwater, wetlands, streams and rivers.	WR130

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Deborah (42918)	
11388	The SDEIS assumes that the bedrock under the mine and plant sites is solid and will not allow seepage and runoff to flow into groundwater and elsewhere. This is a faulty assumption. The bedrock in this vicinity has multiple faults, fractures and fissures, through which water will flow to unknown locations.	WR012
11426	PolyMet also states that its mine will operate for up to 20 years, but it will leave behind millions of gallons of polluted water for hundreds of years. Polymet states that it will be able to capture all of this contaminated water and treat it for as long as is needed, which is likely to be hundreds of years ... If treatment ends before the pollutants are removed, copper, lead, and sulfates will impact the Embarrass, Partridge and St. Louis River watersheds and Lake Superior for centuries.	WR035, WR115
11432	...membrane liners and geosynthetic covers that are intended to prevent precipitation from percolating through the waste rock and tailings into the environment, WILL eventually leak—they have not been shown to last for hundreds of years without cracking or breaking, or being damaged by erosion, growth of roots, shifting or settling of the ground, or other factors that should be expected. This means that contaminated water collected in pits lined with membrane liners WILL eventually leak into the environment...Polymet has not shown that its lining and barrier systems will completely function for the hundreds of years needed.	WR127, WR138
11434	The modeling used to estimate the speed and quantity of groundwater flowing through the site is flawed and leads to a conclusion that underestimates the quantity of pollutants that will reach nearby rivers, as well as the speed with which they will arrive in the rivers. ...The groundwater movement model should be re-done, using much more realistic baseflow averages plus scenarios in which large amounts of precipitation occur in a short period of time.	WR003, WR189
11437	It is simply too risky to move forward with the SDEIS and PolyMet project without clear understanding of the underground faults and fractures that could transmit contaminated water to places unknown....In addition, the effects of repeated blasting on underground rock formations, and these faults and fractures, is unknown—it's certainly possible that they will become larger or more numerous, changing the flowage of contaminated water	WR010, WR016
11442	Retracting contaminated/acidified water—the SDEIS does not explain how damage can be retracted. If leakage occurs, or worse, a spill, how can the acidified water be pulled back? It can't—it proceeds downstream, and down into groundwater,...leaching dangerous heavy metals and mercury into the environment. ... Is there a proven way of restoring the surface and groundwater to its normal Ph? The SDEIS does not adequately address this topic and therefore is inadequate.	WR001, WR130
11459	Contingency plans should be prepared and in place before mining operations start, that address both foreseeable problems and unanticipated events.Foreseeable problems include accidents, unusual storms, and failure of man-made systems. ... I submit that even more extreme weather events than the Duluth flood must be anticipated and adequately planned for. The SDEIS does not include sufficient assurance of contingency plans to protect the environment in the event of both foreseeable and unforeseen catastrophes.	WR057, WR077, WR176, WR180, WR193, WR197
11462	The rock at the PolyMet mine site contains amphibole ("asbestos-like") fibers that have been linked to mesothelioma. Both the effects of airborne particulate on health and the effects of ingesting airborne copper, mercury, etc. on human and animal health should be analyzed before PolyMet's proposal can proceed.	HU05
11470	The current SDEIS does not provide adequate information on....The costs of contingency plans ... for both foreseeable events and for the worst scenarios. These include the costs of monitoring to immediately identify leaks, spills, breaks, etc.....The cost of financial assurance to protect Minnesotans.....The actual costs of monitoring, maintaining, and replacing treatment equipment over many decades or even centuries.....The costs of long-term maintenance and management of wetland mitigation sites in addition to the mine and plant sites. In addition, the costs of retracting damage should be factored in	FIN05, FIN11

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Deborah (42918)	
11491	The SDEIS must include the details of how the contaminated water that seeps or spills will be neutralized before it causes damage to flora and fauna and leaches heavy metals including mercury into the watershed.	WI04, WR130
11499	financial assurance must cover the costs of contingency mitigation measures (MInn. Rule 6132.1200) if engineering controls become unable to ensure compliance with applicable water quality standards. The SDEIS states that contingency mitigation measures would not be initially included in the financial assurance package (5-215). This is foolhardy—failure or inadequacy should be anticipated as reasonably likely, and the costs of repairing or replacing the controls as well as costs of mitigating damage that occurs before completion of the repair or replacement should be built into the financial assurance required.	PER03
11528	Ongoing and recent studies are showing the devastating impact of sulfates on wild rice. ...PolyMet claims that it can meet the current sulfate standards, but its promise does not address the ... [sulfate accumulation from] untreated, contaminated water that will seep or flow from the sites. .... In addition, PolyMet’s assertion that it will meet current sulfate standards assumes that all the engineering controls, including the seepage capture system, the cap and liner system, the discharge controls, as well as the wastewater treatment system will all function perfectly for hundreds of years.	WR070, WR127, WR128, WR156, WR159
11534	The SDEIS ...[does not] consider the potential cumulative environmental impacts of current mining activity as well as new exploration and potential mining and processing throughout the region. Rather, it restricts the cumulative effects assessment area (CEAA) to the Embarrass and Partridge River watersheds, and does not even include the St. Louis River or Lake Superior. The impacts on Northern Minnesota the entire Great Lakes basin should be evaluated.	CU01, CU02
11539	Current mining interests seek variances, and current regulatory agencies often allow them, without public notice or comment. The validity of PolyMet’s assurances and the validity of the SDEIS’s analysis are both undermined if at some date PolyMet or its successor(s) seeks variances and the regulatory agency grants them. ... What assurance do we Minnesotans have that variances or exemptions won’t be granted to PolyMet (or its successor) in the future? The SDEIS doesn’t provide sufficient assurance that monitoring and enforcement of requirements will be strong and vigilant over the hundreds of years needed	PER06
17437	The potential for severe environmental damage from this kind of mining, never done before in Minnesota, is huge. While we all hope sulfide mining can be done in this water-rich environment without damage, experience throughout the world shows otherwise.	WR023
17438	The SDEIS does not adequately address the measures that will be required to be in place in the event of accident or failure of water containment, transport, or treatment systems.	WR130
17439	significant amounts of untreated water—which is contaminated to some degree despite PolyMet’s assertions—will seep into the environment, completely by-passing any preventive efforts. The SDEIS does not adequately recognize this as a concern.	WR107, WR108
17440	Despite PolyMet’s promise to contain all contaminated water, its own mine plan shows that millions of gallons of polluted water will seep off site, untreated, during usual operations. Flooding events and other catastrophes will exacerbate the damage. The SDEIS must address how the millions of gallons of untreated water will be kept from flowing into the Partridge and Embarrass Rivers, to the St. Louis River and ultimately into Lake Superior.	WR070, WR107, WR108, WR111, WR130, WR202
17441	PolyMet has not shown that runoff and/or seepage from the permanent waste rock pile and the tailings piles will be prevented adequately. It doesn’t even propose that liners be installed under all the tailings piles and waste rock. PolyMet proposes to store tailings in the former LTV tailings basin, on top of tailings that are already leaching contaminated water.	WR070, WR127

17443	The process of extracting the copper and other minerals from the rock will require the waste rock to be ground into a fine powder, some of which is likely to escape into the air and become a risk to humans and animals. In addition, additional material is likely to become airborne during transit of the waste rock to storage areas. The particulate itself is likely to be harmful to air-breathing animals, and the contents of the particulate, including copper and mercury, could be harmful as well to human and animal health.	AIR04
17446	The waste rock will leach mercury at more than 4 times the water quality standard (according to PolyMet’s humidity cell testing). ... PolyMet states that “insufficient data” prevents it from modeling the amount of mercury that will enter the rivers. However, the SDEIS itself states that PolyMet will “increase mercury concentrations in the Embarrass River as well as some nearby lakes... the City of Hoyt Lakes’ municipal drinking water is downstream from PolyMet’s waste piles. ... 1 out of 10 infants in Minnesota’s Lake Superior Region already are born with unsafe levels of mercury in their blood. Adding greater mercury concentration to the watershed will increase the danger to humans. PolyMet should not be allowed to proceed	WR158
17448	The SDEIS also is inadequate regarding the financial assurance required to protect the state of Minnesota and its taxpayers. No one should bear the costs of clean-up of any environmental damage other than the companies and people profiting from the mining. Minnesotans should be absolutely guaranteed that, if there is any environmental damage, resources in sufficient amounts have been set aside up front to cover all the costs of remediating the damage, or better yet, retracting it.	FIN01, FIN10
17449	The SDEIS should address the means to "reclaim" the water that's been acidified, the plants and animals killed off, the surface water and groundwater restored to pre-damage levels of water quality. The SDEIS should address these means, and the costs to implement them.	FIN11
17450	Long-term financial assurance must be adequate and safely protected from being diverted to other uses, so that it is available if and when it is needed. ...The need for water treatment will continue...for decades and perhaps centuries.... PolyMet asserts that it “does not need to know” the length of time for which reclamation costs should be estimated, but that PolyMet will provide whatever is needed. ... How can the amount of needed financial assurance be calculated if one critical factor—the length of time for which it is needed—is unknown? How can the state be assured that the financial assurance will cover the costs, if we don’t know how long those costs will last, and therefore can’t know the total costs?	FIN01, FIN05, FIN08
17452	The financial assurance must be enough to protect Minnesota taxpayers, long after the mine ceases operations and, likely, long after PolyMet and its successors are gone. This includes protection from bankruptcy or dissolution—of PolyMet and of any other financial backing of the enterprise-- that would leave Minnesotans liable for any costs. The risks of the entire enterprise should be entirely on the company, its partners and investors.... The SDEIS is inadequate—it does not provide nearly enough information with which to estimate the anticipated reclamation costs, and it doesn’t provide a financial assurance plan that will remain viable for 500 years, or that accounts for unanticipated liabilities, or that anticipates the inability of third parties to pay.	FIN01, FIN02, FIN05, FIN10
17454	The DNR asserts that further information on financial assurance is not required until the Nonferrous Permit to Mine stage of the process, and therefore is not required in the SDEIS. While this position may technically be correct under the current state of Minnesota’s laws and rules governing the process, it does not adequately protect Minnesota’s taxpayers, and therefore is a shirking of the DNR’s duty to carry out its responsibilities. See Minn. Stat. Sec. 116D.04, subd.6.... The DNR and other lead agencies have the opportunity—and the responsibility—to ensure that this critical component of the PolyMet proposal is open for full public disclosure and ability to comment at the SDEIS stage.	FIN13, FIN14
17455	There are ... several concerns related to the economic impact of the PolyMet proposal: oThe boom-and-bust cycle of most mining means any economic improvement will be short-lived.OMost of the profits will go to stockholders and investors located elsewhere. ONon-mining jobs associated with more sustained economic activity (such as recreation and tourism) will likely be lost and not recoverable long after the mine closes.OMany of the jobs will not be long-term, full-time jobs for Minnesotans. OMany of the more highly skilled jobs will go to people who come to the area temporarily and send their incomes back to their permanent residences.	SO02

17458	PolyMet predicts about 360 direct jobs and 330 indirect jobs in the local area during operations. It doesn't specify that each is a full-time permanent job, nor that the jobs would all employ local residents. ...Construction is ...expected to at least "marginally reduce the unemployment rate" in the study area. ... Upon closure of the mining operations, far fewer people would be employed, the remaining jobs being in closure and reclamation activities. P. 5-499. So few jobs., for such a comparatively short period of time, are not worth the risk to the ecosystem of the St. Louis River watershed and Lake Superior.	SO01
17459	While the SDEIS acknowledges that mining activities typically follow a boom-bust cycle, it does not analyze the aftermath of the "bust", including the impact of the loss of jobs on the economy. It states that the boom-and-bust phenomenon was not modeled "because the duration cannot be predicted." p. 5-496. The SDEIS simply says that unemployment will increase, and goes no further....The SDEIS should thoroughly assess its impact, to present a complete picture of PolyMet's environmental impact.	SO02
17460	the SDEIS barely mentions the loss of jobs in non-mining activities. While acknowledging that an indirect effect on tourism and recreation might occur due to noise, dust, water pollution and other disturbance, it does not estimate the loss of recreation and tourism-related jobs in the area or examine the effects of the loss of those jobs. The displacement of other economic activity, including jobs and income related to hunting, fishing, eco-tourism, outdoor recreation, and the destruction of habitat for many species is ignored.The SDEIS is inadequate.	SO02
17461	The land exchange proposed by PolyMet would circumvent federal law by taking 6,700 acres in the Superior National Forest that are now protected from strip mining under the Weeks Act, and exchanging them for private lands acquired by PolyMet. The only reason for the land exchange is to remove it from Superior National Forest and federal protection from mining. I oppose this land exchange—it will take protected land and submit it to devastating strip mining.	LAN02
17464	The SDEIS states that the comments and supporting documentation submitted by the Tribal Cooperating Agencies have not been verified or validated and examination of the points they make is being "deferred." P. 8-20. The reader is simply referred to Appendix C. This approach does not give the public the opportunity to know and comment on the lead agencies' analysis of the Tribal Cooperating Agencies' assertions.	NEPA12

11243	My presence and my vote will always be against destruction of the native forest in any way.	VEG03
11246	Reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health.	HU03
<b>Sender Name (Submission ID)</b> Deborah Huskins (18232)		
13582	PolyMet says that they can capture all of the contaminated water on site and treat it before it's released into the environment. Their own mine plan shows they will have millions of gallons of polluted water that will seep offsite untreated. PolyMet will be collecting some of the water in pits lined with membrane -- membrane liners. These liners will eventually leak. What will happen if we have a flood event like the Duluth flood event?	WR070, WR127
13583	Contingency plans are important. No one has explained how the damage can be retracted once it occurs. If leakage occurs, or worse, a spill, how can the acidified water be pulled back? It can't. It proceeds downstream and down into the groundwater killing plants, fish and all aquatic life it contacts, leaching dangerous heavy metals and mercury into the environment.	PD22
13584	Reclamation costs are used to determine what the financial assurance is that will be required. But how can we give a dollar value to the damage once it's occurred? Financial assurance must be enough to protect Minnesota taxpayers in the future; long after the mining company is gone. Protection from bankruptcy is important, also, because Minnesotans otherwise would be left liable for any costs.	FIN05, FIN10
13585	It [the SDEIS] doesn't provide a financial assurance plan that will remain viable for 500 years and account for all unanticipated liability. How can it? How can a corporate entity be held accountable for these costs over centuries? The answer is get all costs up front. But we really don't know what the costs of the water treatment monitoring maintenance and repair for decades and even centuries are.	FIN01, FIN05
13586	Another reason the SDEIS is inadequate is that the economic analysis is not complete. What jobs really will go to Minnesotans and which ones will go to non-Minnesota, non-U.S. employees? What about the jobs that are displaced or disappear when the mining starts, and what about those jobs that disappear afterwards? A cost-benefit analysis is needed. When the mine closes, there will be costs due to the impact of lost jobs, unemployment and other societal costs. The SDEIS does not take these into account.	SO06
13587	Displacement of other economic activities should be part of the cost-benefit analysis, including activities associated with hunting, fishing, ecotourism and outdoor recreation.	SO02

<b>Sender Name (Submission ID)</b>	Deborah Huskins (18232)	
17960	The SDEIS assumes that all the water that needs to be treated will be collected, contained, and treated, and no contaminated water will escape.(...) The SDEIS does not adequately address the measures that will be required to be in place in the event of accident or failure of water containment, transport, or treatment systems. In addition, significant amounts of untreated water-which~ contaminated to some degree despite PolyMet's assertions-will seep into the environment, completely by-passing any preventive efforts.	WR070, WR129, WR130, WR131
17961	If treatment ends before the pollutants are removed, copper, lead, and sulfates will impact the Embarrass, Partridge and St. Louis River watersheds and Lake Superior for centuries. Despite PolyMet's promise to contain all contaminated water, its own mine plan shows that millions of gallons of polluted water will seep off site, untreated, during usual operations. Flooding events and other catastrophes will exacerbate the damage. The SDEIS must address how the millions of gallons of untreated water will be kept from flowing into the Partridge and Embarrass Rivers, to the St. Louis River and ultimately into Lake Superior.	WR037, WR070, WR202
17962	PolyMet has not shown that runoff and/or seepage from the permanent waste rock pile and the tailings piles will be prevented adequately. (...) Polymet has not shown that its lining and barrier systems will completely function for the hundreds of years needed.	WR127, WR128
17963	The modeling used to estimate the speed and quantity of groundwater flowing through the site is flawed and leads to a conclusion that underestimates the quantity of pollutants that will reach nearby rivers, as well as the speed with which they will arrive in the rivers.	WR009
17964	The SDEIS assumes that the bedrock under the mine and plant sites is solid and will not allow seepage and runoff to flow into groundwater and elsewhere. This is a faulty assumption. The bedrock in this vicinity has multiple faults, fractures and fissures, through which water will flow to unknown locations. (Data sources: several studies by Miller, J.D. Jr. and Severson, M.J., 2005 Bedrock geology of Babbitt quadrangles, Minnesota Geological Survey Miscellaneous Map series M-100-150, and Jirsa, M.A., et al, Bedrock geologic map of Minnesota: Minnesota Geological Survey State Map Series 5-21) .	WR012
17965	Retracting contaminated/acidified water-the SDEIS does not explain how damage can be retracted. If leakage occurs, or worse, a spill, how can the acidified water be pulled back? It can't-it proceeds downstream, and down into groundwater, killing the plants, fish, and all aquatic life it contacts, leaching dangerous heavy metals and mercury into the environment.	PD22
17966	The process of extracting the copper and other minerals from the rock will require the waste rock to be ground into a fine powder, some of which is likely to escape into the air and become a risk to humans and animals.	AIR07
17969	The SDEIS also is inadequate regarding the financial assurance required to protect the state of Minnesota and its taxpayers.(...) The current SDEIS does not provide adequate information on 1) the reasonably anticipated costs of foreseeable problems, 2) the costs of currently unforeseen events, and 3) the duration of remediation efforts. Much more information is needed to determine the amount of financial assurance that the state should require before granting any permissions to mining interests to proceed.	FIN05, FIN06, FIN10
17973	o The boom-and-bust cycle of most mining means any economic improvement will be short-lived.O Most of the profits will go to stockholders and investors located elsewhere.O Non-mining jobs associated with more sustained economic activity (such as recreation and tourism) will likely be lost and not recoverable long after the mine closes.O Many of the jobs will not be long-term, full-time jobs for Minnesotans.O Many of the more highly skilled jobs will go to people who come to the area temporarily and send their incomes back to their permanent residences.	SO02

17975	Ongoing and recent studies are showing the devastating impact of sulfates on wild rice. (...) PolyMet claims that it can meet the current sulfate standards, but its promise does not address the untreated, contaminated water that will seep or flow from the sites. The SDEIS is inadequate because it does not address the sulfate accumulation from untreated contaminated water.	WR070, WR127, WR128, WR150, WR156, WR159
17976	The SDEIS states that the comments and supporting documentation submitted by the Tribal Cooperating Agencies have not been verified or validated and examination of the points they make is being "deferred." P. 8-20. The reader is simply referred to Appendix C. This approach does not give the public the opportunity to know and comment on the lead agencies' analysis of the Tribal Cooperating Agencies' assertions.	CR06
17979	The SDEIS considers only the PolyMet proposal, not the other sulfide mining exploration efforts already underway in Northern Minnesota in anticipation of developing mines. Neither does it consider the potential cumulative environmental impacts of current mining activity as well as new exploration and potential mining and processing throughout the region.	CU02
17980	The SDEIS doesn't provide sufficient assurance that monitoring and enforcement of requirements will be strong and vigilant over the hundreds of years needed, and is inadequate in this respect.	PER06
<b>Sender Name (Submission ID)</b> Deborah J Rasmussen (42740)		
12041	The mine site in question is now part of the Superior National Forest and a land swap is proposed with the Forest Service. What land would be exchanged for the proposed mining site and how would this affect the plants, wildlife, and overall well-being of the Superior National Forest?	VEG01, VEG03, WI01
12042	PolyMet proposes to add processing waste from the new plant to an existing tailings basin that is currently leaking polluted water. How will this leakage be corrected in order to fully protect groundwater and the environment?	PD10, WR105
12044	[Water] treatment would be required at the mine site for a minimum of 200 years and at the plant site for a minimum of 500 years. Five hundred years is far longer than the US has even been a country. What entity can guarantee being around to provide the required water treatment for that length of time? Who will be held responsible – essentially forever -- to guarantee the water treatment required as a result of this mining activity?	PD24
12047	The Partridge and Embarrass Rivers both run in close proximity to the proposed mine site before flowing into the St. Louis River. The St. Louis River then flows into Lake Superior. Lake Superior is the largest source of fresh water in the country... Exactly how will Lake Superior water be protected from potential pollution resulting from this mining activity?	WR111
12048	No sulfide mine has ever operated without polluting its nearby waters. PolyMet says it has technology to prevent this. What is their proof for this claim and what scientific organization that is uninvolved with PolyMet's proposal can substantiate that proof?	PD26, WR023
12049	The EPA says that the hardrock (including sulfide) mining industry is the largest toxic-waste producing industry in the US. How would the DNR justify bringing this source of toxic waste to northern Minnesota?	HAZ03
12050	How will the nearby Boundary Waters wilderness area be protected from the pollution generated by this proposed mine -- including noise pollution.	N02

6812	Data used to generate predictions must be as accurate as possible, otherwise the model has little validity (Garbage In-Garbage Out, or GIGO). As pointed out in the memos submitted by Coleman and others, there is significant lack of agreement between the low baseflow predicted by the surface water model (XPSWMM) and baseflows measured in the field and by continuous stream gauging. A major tenet of modeling is that computer simulations are discredited if phenomena have not been field tested and do not reflect actual conditions.	WR003
13490	Uncertainties related to long time delays and the future...One factor is the intrinsic delays between the period at which human activity actually creates environmental harm and the point at which the damage becomes visible.	FIN05, FIN08, WR044, WR049, WR172, WR173, WR174
15597	After reviewing the information in Chapter 8 and specifically the five letters and memos contained in the hydrology section of Appendix C of the SDEIS, I contend that the modeling assumptions are so questionable that the predictions presented in the SDEIS provide serious challenges to prediction of a critical economic component: future mitigation and remediation costs.	MERC20, WR005, WR035, WR037, WR126, WR189, WR195
15598	there is significant lack of agreement between the low baseflow predicted by the surface water model (XPSWMM) and baseflows measured in the field and by continuous stream gauging. A major tenet of modeling is that computer simulations are discredited if phenomena have not been field tested and do not reflect actual conditions.A.The great discrepancy between the modeled Partridge River baseflow level just east of the mine site. At 0.42 cubic feet per second(cfs) and actual measured baseflow, at 5.0 cfs is too great, even accounting for some assumptions made in the model.B.The same problem occurs in the GoldSim model in predicting water quality at the mine site. Goldsim did a poor job in predicting current ground and surface water quality, in some cases mis-predicting water quality by more than 400%. Since accurate prediction of cunent water quality is an easier task than predicting future water quality, given increased levels of uncertainty of input variables in the future, the Goldsim model is a bad choice for predicting future water quality, which was its purpose in the SDEIS. Poor confidence in data input in the model makes model error too great.	WR003, WR044, WR047, WR086, WR111, WR130
15600	Failure to adequately take into account environmental costs as well as benefits is a serious flaw in the economic analysis in chapter 4.	SO07
15601	There is too much uncertainty in predicting future costs: Minnesota has existed as a state for 156 years, since 1858. The origins of our present federal system date from 1776, a period less than half of the 500-period estimate of maintenance. Predicting both costs and certainties about corporate liability become problematic when such future timeframes are involved.	FIN01, FIN05
15602	It can take long periods of time -sometimes decades - for pollutants to seep into aquifers and contaminate water supplies. Gardner and Stern explain how these future consequences not only temporarily mask the severity of pollution but that remediation measures in the future may come too late to fix the damage that is already in place or require sums that are far greater than was predicted in the original cost estimates.	PD03
15603	The inability of the hydrological models to match present field conditions and the inability to simulate current ground and surface water quality makes model error too great.	WR044, WR049, WR108, WR117, WR172, WR173, WR174
15604	As Chapter 8 and Appendix C of the SDEIS point out, the models used to predict environmental risks are seriously flawed, leading to serious modeling errors that therefore underestimate potential environmental risks and then seriously underestimate future costs for remediation. The most reasonable risk management strategy at this time is to take NO ACTION.	PD03, PD04, WR189

14006	This proposed project has major potential negative impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, and harm to wildlife.	HU03, WET24
14007	Allowing PolyMet to build an open pit sulfide mine, using a Federal land exchange that includes protected Superior National Forest land is not in the public interest.	LAN01
<b>Sender Name (Submission ID)</b> Dennis Dietzel (3099)		
144	there would need to be water remediation for 200 to 500 years[...]The United States as a country is just over 200 years old, and, to my knowledge there are no corporations that have ever existed nearly that long[...] We have no idea how many resources would be required 100's of years from now to handle such a situation.	WR037
<b>Sender Name (Submission ID)</b> Dennis Dunphy (50934)		
13304	How does the DNR plan to forecast the value of a human life lost due to pollution from the mine?	FIN05
13307	How can they predict the success of technology never used in the Boundary Waters area?	PD32
16278	Poly Met has not money to do what they keep promising along with the DNR to do. Poly Met is a Canadian company with not legal or moral ties to Minnesota or the U.S. The only source of money for them is the American citizens	FIN01, FIN02, FIN04
16279	Once that water is polluted it is no good anymore. You wouldn't be able to drink it or swim in it. You wouldn't be able to fish it. So, nobody comes to Minnesota anymore to fish or camp. Because politicians set on their duffs and let it happen. The Chamber of Commerce and their buddies wanted the jobs. I can't see any future or benefit here at a Poly Met Mine.	SO01
16282	How many mines will open up [as a result of this mine being approved]?	CU04
16284	How can Poly Met open a mine when they have not money to do so?	FIN01
16285	Why would we let a Canadian mining company like Poly Met open a mine in Minnesota since they have no ties to the United States?	PD23
16286	Have they looked at the pollution of other mines and told the public the truth about the pollution from these other mines?	PD26
16287	Why has the DNR used numbers given them by Poly Met without doing their own analysis?	PER06
16288	How can they not look at the action needed when pollution takes place which it will? What are the actions that will take place when a river is polluted?	WR195
<b>Sender Name (Submission ID)</b> Dennis Falk (39977)		
6260	As I read the SDEIS and understand state statutes and regulations, this project will not meet the allowable standards for water quality. The mining activity will last perhaps 30 years, but the need to treat water to bring it to an allowable standards will likely last 200-500 years.	WR115

14802	... a ton of typical high tech equipment contains much more gold and other resource material than does several tons of related ores. I contend we need to get at reclamation in a proper manner...I propose that before any mining might be provided for that Reclamation of related resources be done and evidenced near the 100% level.	NEPA06
<b>Sender Name (Submission ID)</b>	Dennis Good (38576)	
9710	Also, any land exchange has to consist of equally valued land. But 5 out of the 6 non-federal tracts involved in the exchange have severed mineral rights. So how does this resolve all these conflicts?	LAN04
14028	the Co-lead Agencies have identified a preferred alternative and it's not the No Action Alternative.	ALT22
14030	...To say that the Underground Mining Alternative is not "economically viable" means either that the Co-lead Agencies have looked at PolyMet's books or that Polymet wrote the position paper. I think that the authors of this "position paper" should share their financial acumen with Brad Moore and other Polymet officers so that they can answer questions posed by the MN Legislature.	ALT01
14031	This section says that financial assurance would consist of "surety bonds, irrevocable letters of credit, cash and cash equivalents, trust funds and insurance policies or a combination thereof"... This is all worthless paper backed up by even more worthless paper with not a tangible asset to be seen. Polymet's stockholders and controlling interests (Glencore, Exstrata) have their exit strategies all worked out.	FIN01, FIN08
19257	Section 1.3, page 142, Purpose and Need. It is amazing how the Co-lead Agencies purpose and need statements dovetail so precisely with Poly Met's. There is no essential difference between them. This section looks and sounds as if it were written by PolyMet's lawyers and consultants. But on page 2112, in response to a comment made by the GLIFWC is this: "The Co-lead Agencies developed this language for insertion in the SDEIS." Well, how cozy is this. And there's nothing in the Co-lead Agencies statements about "public interest", "conservation of natural resources", clean air, clean water, wetlands conservation, fish and wildlife, etc. PolyMet couldn't have done a better job writing this.	NEPA02
19258	Again, keeping in mind Section 1.3, it's obvious the Co-lead Agencies have identified a preferred alternative and it's not the No Action Alternative.	ALT21
19260	First, the Co-lead Agencies prepare Purpose and Need statements that repudiate everything that they allegedly stand for and then they prepare position papers for PolyMet dismissing the Underground Mining Alternative and at the same time pretending that they have not identified a preferred alternative. To say that the Underground Mining Alternative is not "economically viable" means either that the Co-lead Agencies have looked at PolyMet's books or that Polymet wrote the position paper. I think that the authors of this " position paper" should share their financial acumen with Brad Moore and other Polymet officers so that they can answer questions posedby the MN Legislature.	ALT01
19262	All throughout the SDEIS, whenever the Land Exchange Connected Action is discussed, are statements about "quality of titles", "complexity of titles", "risk of conflict", "high risk federal lands", "low risk non-federal lands", "instant conflict", "re-unify the severed mineral estates" and" The USFS needs to resolve this fundamental conflict" etc. etc. What conflicts? What the USFS needs to do is to manage these lands in the public interest.	LAN04
19264	In Section 1.4.3 page 145: "The Forest Supervisor may complete anexchange only after a determination is made that the public interest will be well served". Also, any land exchange has to consist of equally valued land. But 4 out of the 5 non-federal tracts involved in the exchange have severed mineral rights. So how does this resolve all these conflicts? These statements are nothing but lawyerese, seemingly written by and for the benefit of Polymet and their controlling interests (Glencore, Exstrata et al).	LAN03, LAN04

<b>Sender Name (Submission ID)</b>	Dennis Good (38576)	
19267	Section 5.2.3.3.2, Wetland Mitigation, page 1220 says that: "Most of the wetlands that would be affected by the NorthMet Proposed Action would be of pre-European settlement condition and rate at the highest Floristic Quality Assessment levels for these plant communities in Minnesota. MNRAMvegetative diversity/integrity ratings would be "exceptional" for these pre-European settlement condition wetlands". This is the federal land. Elsewhere in this section is a narrative describing the efforts expended by state, county and federal entities to accommodate Polymet' s wishes. So I have a question:If I, a private citizen with little money wanted to develop property containing exceptional pre-European settlement wetlands, would state and federal "Regulatory Agencies" marshal all their resources to study, analyze, negotiate and search all over the state for suitable mitigation sites for me? I think not They even allowed Polymet to veto criteria provide by the State of Minnesota for restoring wetlands on state lands. All you need is enough money to have your wishes granted.	COE01
19271	Speaking about the No Action Alternative, under the No Action Alternative, there will be a 1% decrease in wetlands but the exceptional pre-European settlement wetlands will be preserved. Also there will be a 2% increase in deep water area-213.1 acre increase in management area allocations-228.6 acre increase in acreage in the SNF-229.2 acre increase in public water lakes-11.7 mile increase in shoreline-48.9 acre increase in wild rice beds-227.2 acre increase in GAP land cover types-213.1 acre increase in landscape ecosystems-227.2 acre increase in key habitat types-Wetland resources decrease slightly but again, the exceptional pre-European settlement wetlands will be preserved-No change in special status wildlife species-Increase of surface water featuresSo how is the Land Exchange Proposed Action in the public interest? It's not This is all about private interests and money.	ALT13, ALT14
19275	Section 3.2.2.4 of the SDEIS deals with, however briefly, "Financial Assurance". Considering the 200-500 year timelines of this project (200-500 years being the only way for the models to work), you would have thought that this section would have something more to say. This section seems to have been written by Polymet lawyers and consultants with the attitude that nobody should be concerned. The first thing to keep in mind about the state's financial assurance laws is that they are laws and rules and not enshrined in the Minnesota Constitution and therefore can be amended, altered and/or legislated away at any time and for any reason. This section says that financial assurance would consist of "surety bonds, irrevocable letters of credit, cash and cash equivalents, trust funds and insurance policies or a combination thereof."	FIN01, FIN08, FIN14
19276	There actually is a tangible asset available though: the minerals in the ground. So here's my plan: the state pays someone to do the mining but instead of the minerals winding up in China, the state stockpiles them and sells them as needed to pay the clean-up costs.	ALT13
<b>Sender Name (Submission ID)</b>	Dennis Hansen (57516)	
19504	the extra air emissions from processing can be mitigated with today's technology, it will not cost too much more.	AIR11
19505	Sulfide runoff can be reduced with proper mine contouring, wastewater treatment (even something as simple as limestone treatments).	PD34
19506	the abandoned mine pits can contoured properly and be turned into new lakes, lake homes and property tax revenue.	SO10
19507	These mines are future lakes.	LU07
19508	Even though I am a proponent of mining in northern MN, I do recognize, in the past, mining companies have taken MN's resources, siphoned the profits away from MN, declared bankruptcy and left a mess behind. Today's mining industry should come out with short term and long term plans to alleviate these concerns and gain public support.	FIN01
19509	In short, most everyone agrees that northern MN needs the industry and nobody wants mining to leave our water and habitat degraded, but with today's technology, we can turn the future abandoned mines into lakes and recreational assets.	SO10

10303	The very process proposed to treat the toxic wastes is in question. Doesn't it border on insanity to talk about treating mining wastes for hundreds of years?	PD03
10304	The health effects of this project, unearthing toxins and exposing these to air and water are unknown, and this has not been addressed in the EIS. ...Some of these concerns are mercury, toxic metals, arsenic, and asbestos-like fibers.	HU01
10306	A Health Impact Assessment should be required and it is surprising that this hasn't been done. We should know how many lives will be affected by these environmental toxins, and the sociological and economic costs.	HU01
10307	It is unknown how this project will affect wild rice, hence our water quality and our quality of life in Minnesota, where water is our life.	WR157
10309	How will this development affect the tenuous moose population? Thousands of acres of wetlands and moose habitat will be destroyed, with an impact that reaches beyond this immediate development. Critical Canada lynx habitat will be lost, as well.	WI01, WI02
10312	but this activity would have an impact far beyond the immediate area. One generation of good jobs is not worth twenty generations of pollution and health risks.	SO01
14584	while this development, like any of this scale and investment, would provide good-paying jobs in my part of the state, I see this mine as doing much more harm than good.	SO01
14585	It is not required in this EIS, but considering the scope of this project and the pervasive pollution it will create, the technology and costs of containing and remediation of this pollution for hundreds of years MUST be part of this permitting process.	FIN05
<b>Sender Name (Submission ID)</b> Dennis Kittock (21459)		
1449	[PolyMet] will figure out a way to leave us with a big mess.	FIN01
1450	We are also very concerned about water contamination [from the NorthMet Project].	WR195
<b>Sender Name (Submission ID)</b> DENNIS NELSON (28040)		
10995	The destruction of fish and wildlife habitat from polluted lakes and rivers, contaminated drinking water, huge cleanup costs...and "hundred-year recovery" make ANY (AND ALL) OPEN-PIT SULFIDE MINING JUST TOO 'TOXIC' AND 'HAZARDOUS' FOR THAT REGION.	SO01
16713	Lake Superior--a vast freshwater resource unique among the Great Lakes--and the millions of acres of wildlands, about 1,000 pristine lakes and streams, and around 1,500 miles of canoe routes within the Boundary Waters Canoe Area Wilderness MUST BE PROTECTED FROM THE PROPOSED OPEN-PIT SULFIDE MINE!	WILD02
16716	the federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open-pit sulfide mine is NOT IN THE PUBLIC INTEREST--AND SHOULD NOT BE ALLOWED!	LAN01
16717	I have really serious concerns about this project's potential impacts on that region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife species/populations (like the threatened Lynx and declining Moose populations), and the cumulative impacts from open-pit sulfide mining.	WI01

2382	I want to assure people that there will be downstream victims of the sulfide mine runoff that will occur at PolyMet.	WR111, WR115
2384	the liners are called geo liners because they're merely packed down on dirt of some sort. The reverse osmosis procedure that's being promised won't filter out arsenic, which is... at a neutral level. Filter out another carcinogen, nickel sulfate. And these will get into our drinking water downstream and the downstream consumers of that water will be the victims	WR127, WR143
2385	And when this case comes before (inaudible) I want you to all look at the decisions being made by the court and make sure that they follow the Federal Land Management Policy Act and require all mitigation rather than what is economically beneficial to the mining companies.	LAN02
2386	I want to talk about jobs. This is isn't a job promoter, this is a job killer. First of all, we've been asked and we are currently subsidizing PolyMet to the tune of 12 percent (inaudible)	SO02
8967	Allowing only 90 days for public comment for this project is inadequate to fully vet objections to the project which PolyMet and lead agencies have allegedly spent tens of millions of dollars and more than 9 years.	NEPA07
8977	The lead agencies are being paid to provide an SDEIS that will be permitted. This payment conflicts with their permitting and monitoring responsibilities. For them the permitting of PolyMet is nothing less than employment featherbedding.	NEPA18
8978	[The agencies] have an pecuniary interest in permitting PolyMet including the promotion of future projects that will go through licensing and which they will have to monitor. The agencies are denying cumulative impacts because they want to hide their own misconduct.	NEPA18
8979	Why should we have to tolerate "evaluation criteria" that they created in the first place. Is every watershed available for contamination of "evaluation criteria."	PER06
8983	Future monitoring and the filling in of some very substantial gaps of the SDEIS will be left to these lead agencies that have contracted with PolyMet to act on their behalf. These agencies have already in the DEIS written an EIS that was rejected by the EPA.	GEN03
9009	The MDNR that told us that the DEIS would protect us is going to be the agency that will be paid to monitor compliance.They will present us with test results that are self serving.	PER06
9013	What is the deal with putting the filtrate from the mechanical treatment in "licensed landfills." This simply delays the release of toxins like thousands of tons of arsenic into the environment.	PD04
9016	Reliance on sorption or absorption of arsenic by iron compounds currently is not taking place in the tailings basin or at the mine site. Releases of arsenic and other heavy metals should be expected to lead to death and disability downstream.	WR049, WR050, WR058
9023	Present and past subsidies to PolyMet ... contribute to a violation of the National Land Management Policy Act.	PER26
9027	This SDEIS conspires to violate the Weeks Act, Clean Water Act, Clean Air Act, and a number of other laws.	PER26
9030	The failure to utilize more costly measures to mitigate environmental degradation to attain cost savings on the basis that the project cannot proceed without these cost savings also calls into question the merit of the project under the National Land Management Policy. These include inadequate liners, the failure to utilize the underground mining alternative and a number of other measures including many failed to be disclosed by the SDEIS which violates due process legal notice requirements.	PER26

<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
9032	The SDEIS does not require PolyMet to bolt, wire, and shotcrete the pit walls to inhibit the migration of water and pollutants in and out of the pit as was done by Kennicot at its Flambeau Mine. This would have an additional benefit if done simultaneously with mining of inhibiting the collapse of the pit wall of the type that occurred in Utah at a Kennicot Mine in 2012. It is more essential that it be done by PolyMet because of the weaker wet rock.	PD15
9034	The SDEIS simply shifts, as indicated on 5-211 and 212, toxic materials around or fails to specify actual measures to be taken.	WR128
9041	I was disappointed that there was no uniformed member of the corps of engineers... at the Duluth hearing to answer questions.	NEPA11
9049	The "cutoff wall placed into existing surficial deposits" indicated at 3-117 will be inadequate and the modeling indicating that 90% of runoff water will be collected is irrelevant. In order to collect 90% the wall would need to project below the originally placed as loose tailings fill down to bedrock, all fractures in the bedrock would need to be sealed off hold a great deal of water pressure, have the drain tile at the bottom of the wall which is standard foundation engineering, and the wall would have to be extended to the east side of the tailings basin.	PD07
9053	the iron tailings do not sequester mercury any better than any other soil. Elemental mercury is currently not leaching out of the tailings basin because lower levels have had the mercury scoured out through the introduction of sulfates running through them. Mercury is at higher than normal environmental levels in the surface areas of the tailings basin as a result of the absence of sulfates. Once the sulfates are again introduced at the top this mercury will methylate and flow out at higher levels than normal. Water discharge through the lower levels with sulfates will be redirected through the basin increasing the release of methylated mercury currently unexposed in the basin formation at these lower levels.	MERC06
9055	The " WWTF is now proposed to be upgraded to a RO process during closure to manage sulfate concentrations in the effluent " described at p. ES-24 is inadequate. It is unacceptable that toxins other than sulfates that will not be captured by RO including carcinogens Nickel Sulfate and Arsenic III shall be allowed to flow unimpeded. It is unacceptable that sulfates will be left untreated at any time... The amount of water going into the WWTF will overwhelm any treatment facility that could be built. The amount of water going into the system is dramatically understated.	PD03
9058	"Bentonite would be incorporated into the exposed outer side-slopes of the Tailings Basin as it would be built up to create a barrier that would limit oxidation. This limiting of oxygen transfer would reduce pollutants generated from the Tailings Basin." The pollutants will not be reduced. Their introduction into the environment will merely be delayed. Further more limited limitation of oxygenation is part of the formula for mercury methylation. Eventually exposure and oxygen reaction will occur.	PD08
9065	The Economic Impacts of mining only include allegedly positive impacts and fail to state the negative cumulative economic and social impacts of mining? ES-41 Since the SDEIS puts in issue the economic impact of the PoltMet project it is necessary that the authors specify the basis for and underlying assumptions made in determining the following at ES-40. "Federal, state, and local taxes would total an estimated \$80 million annually. During operations, there would be approximately \$231 million per year in direct value added through wages and rents and \$332 million per year in direct output related to the value of the extracted minerals. As with employment, these direct economic contributions would create indirect and induced contributions, estimated at \$99 million in value added and \$182 million in output."	SO04
9068	is the portion of \$231 attributable to wages based on the unlikely prospect of a union mine?	SO04
9071	It is my recollection that it was reported back in April of 2008 that the PolyMet power rate agreement would cause our power rate to increase by more than 10% or roughly 1-5 billion dollars over the 20 year life of the mine.	PD39
9076	"Post-reclamation activities would include monitoring and maintenance of reclamation and water quality until the various facility features were deemed environmentally acceptable, in a self-sustaining and stable condition." p.3-59 -environmentally acceptable to who?	PD24

<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
9203	"The specific capacity tests conducted in two wells indicated that the upper portion of the Virginia Formation is more permeable than the lower portion (Barr 2007b). This is attributed to the increased amount of fractures and joints in the bedrock closer to the surface. Overall, groundwater flow within the bedrock units is thought to be primarily through fractures and other secondary porosity features because the rocks have low primary hydraulic conductivity. Near the ground surface, groundwater in the bedrock is thought to be hydraulically connected with the overlying surficial aquifers, resulting in similar flow directions (Barr 2007d). "-The rock that we are concerned about running from the fractures forming and radiating out from the Partridge River are not in the Duluth Complex, See figure p.3-35.-The SDEIS is using the Duluth Complex as the basis for non-permeability in the bedrock.	WR087
9206	P.4-45 "One exploration borehole at the Minnamax prospect encountered groundwater at a depth of 1,390 ft in the Duluth Complex that flowed for a period of 6 days, indicating the potential presence of over-pressured groundwater in the bedrock (Barr 1976)."-It won't take very many pressurized flows to drain that Partridge River, divert it's flow, and fill the mine that will need to be pumped. The Minnamax mine was so wet at all times that visitors while hearing the noise of constant pumping had to where hip boots!	WR023, WR087
9208	"Tests using wells that penetrate through the surficial zone, however, found much higher average hydraulic conductivity, with values similar to the Biwabik Formation aquifer (see Table 4.2.2-5)."- The zone where the surficial deposit meets bedrock is a primary zone of water conductivity generally in hydrology.	WR011
9211	"Tests using wells that penetrate through the surficial zone, however, found much higher average hydraulic conductivity, with values similar to the Biwabik Formation aquifer (see Table 4.2.2-5)."-this higher conductivity found conflicts with the general SDEIS claim of lack of conductivity upon which MODFLOW and GoldSimm projections were based.	WR011
9217	"Tests using wells that penetrate through the surficial zone, however, found much higher average hydraulic conductivity, with values similar to the Biwabik Formation aquifer (see Table 4.2.2-5)."-This study also reported that the upper 200 to 300 ft of the Duluth Complex formation appeared to be fractured and jointed more extensively than at greater depths, so that the upper portion of the bedrock should have greater hydraulic conductivity and thus better hydraulic connectivity than deeper bedrock. p.4-46 to 4-47.	WR011, WR012
9220	"Tests using wells that penetrate through the surficial zone, however, found much higher average hydraulic conductivity, with values similar to the Biwabik Formation aquifer (see Table 4.2.2-5)."-Blasting will exacerbate and open fractures	WR016
9221	p.4-53"The metals exceeding groundwater evaluation criteria in the surficial aquifer probably reflect natural conditions because there is no record of any historic activities at the Mine Site that could have contributed these constituents. - how about the effect of the drill exploration?"	WR203
9223	p.4-60"exceedances of arsenic and nickel water quality standards were detected.(in background water sampling)."-this is an indication that drill exploration has an environmental impacts contrary to representations made by one or more co-lead agencies or it should be a warning sign of the high levels of arsenic in the mineral deposit.	WR203
9225	p.4-60"Groundwater Use -There are no existing domestic wells between the Mine Site and the Partridge River. However, there are several MDNR water appropriation permits in effect for mine pit dewatering that affect the Mine Site, including the Northshore Mine permit (Permit 1982-2097). The permit authorizes Northshore Mining Company to withdraw up to 36,000 gpm (80 cubic ft per second [cfs]), of which a maximum of 13,000 gpm (29 cfs) can be discharged to the Partridge River, a maximum of 12,000 gpm (27 cfs) can be discharged to Langley Creek, and a maximum of 11,000 gpm (25 cfs) can be discharged to Unnamed Creek." -Is this permit being transferred? Does it have to go to the tailings basin? Are these permits an indication of what is to be expected in terms of discharges from the PolyMet pit?"	WR051

9226	"The only consistent exceedance of water quality standards was dissolved oxygen near the headwaters of the Partridge River (SW-002,"-this fact will have serious ramifications for the mine plan when this water flows into the pit that the SDEIS plans to flood on the assumption that the flooding will suppress the re-activity through the denial of oxygen of the pit face rock and category 2,3, and 4 waste rock.	WR029
9229	p.4-86"Colby Lake is on the Minnesota 303(d) TMDL List because of mercury concentrations in fish tissue, but is not included in Minnesota's regional mercury TMDL because the mercury concentrations in the fish are considered too high to be returned to Minnesota's mercury water quality standard. p.4-86"-but this water will be used to augment stream flows around the tailings basin and increase mercury levels in the Embarrass River and concentrations of mercury downstream to Lake Superior in violation of the Great Lakes Initiative.	MERC22
9232	p.4-95"soil borings into the surficial till identified the composition as layers of clay and sand, plus cobbles and boulders that prevented recovery of an intact sample (Pint and Dehler 2009). Near the toe of the Tailings Basin, average depth to bedrock is approximately 25 ft, as reported in site boring logs (Bart"-this is the environment in which the co-lead agencies think that a below ground containment wall can capture 90% of tailings basin water-fat chance.	WR018
9249	Constituent readings for the Partridge River, Embarrass River, and especially for the tailings basin down gradient are of limited value outside of the context of contemporaneous rainfall effecting dilution. Readings for surficial Rivers and Lakes-Concentrations at low water levels are the real indicator of the health of a well, river, or reservoir lake when concentrations are highest and plant and aquatic life mortality are greatest and sometimes absolute resulting in dead rivers because once everything is killed there is no life to regenerate.	WR081
9251	The hydrology on pages 4-149 to 4-151 overstate the homogeneity of the mine site surficial aquifer and are irrelevant to what is going to happen when the homogeneous portion removed from the underlying fractured bedrock along the stream bed is removed. These fractures are the vehicle for surface drainage to the larger river fracture when the mine side fractures are breached by the mine excavation the water table will follow these fractures into the mine and because of the lower hydrolic resistance will drain more area more readily including the surficial water on the opposite side of the river. River flow will follow the path of least resistance and associated erosion and be redirected naturally through the pit area.	WR011, WR012, WR061, WR081, WR087, WR090, WR099, WR169, WR179
9253	"although a few individual samples within the Partridge River Watershed exceeded surface water quality evaluation criteria, overall in-stream water quality meets state water quality standards"...-this phenomena also invites manipulation of sampling data. For example, a high baseline could be established for a stream by sampling in low water levels and after impacted by a new project sampling would be conducted at high levels to indicate compliance when results show baseline levels.	WR109
9254	"Upper Partridge River sampling sites were indicative of a warmwater stream populated by typical warmwater species, including gamefish such as northern pike and yellow perch (see Table 4.2.6-4)." -the presence of warmwater species where trout would be expected is an indication of the warming impact that mining has on stream ecosystems and the PolyMet will exacerbate this situation as indicated for Wyman Creek:	AQ15
9256	p.4-255Compare directions and other indications for distances as given elsewhere in the SDEIS. Some distances and directions within the SDEIS appear to be inaccurate.	N01
9257	the SDEIS fails to asses additional break up of large animal migratory ability broken up by mining and mines going from southwest to northeast?	WI03
9258	"Cooperating agencies have not participated in production or endorsement of any components of the EIS or the NorthMet Project."-it doesn't appear that way especially when PolyMet is paying the agencies, has had access to the agencies to lobby the contents of the EIS for 9 years, the public is left with 90 days to respond, the agencies are allowing a EIS that is vague and ambiguous to proceed, and one EIS prepared by the cooperating agencies has already been determined to be rated by the EPA Environmentally Unsatisfactory-Inadequate Information. This SDEIS continues to be a product of the evasiveness of the last DEIS.	NEPA18

9623	p.4-314(public access) &quot;There are access points to the NorthMet Project area, however, via a Forest Service road, the Partridge&quot; -the gating off of the forest service road is a Forest Service NEPA violation.	LU01
9624	p.4-315The study area for socioeconomics extends beyond the area of direct potential project effects to include all of Cook, Lake, and St. Louis counties (see Figure 4.2.10-1). -this is arbitrary because the cultural results of the socioeconomic are not fairly addressed	SO04
9625	p.4-319"represented by the loss of so many iron industry jobs"-This statement is taken out of context and in fact a complete and accurate reading of Powers is that these jobs were consolidated by the industry due to efficiencies. The whole of the report by powers should be up for consideration in order for it to provide a fair context.	SO04
9626	p.4-325-26-factors not included by Powers include tax policy which promotes mining, the MP PolyMet power utility agreement, the IRRRB which administers most of the funds indicated on p.4-332 and funnels public tax money back into mining arbitrarily, increased health care costs mining areas, displacement of agricultural jobs at the expense of mining, etc.-why is no LQ value analyzed for long term job losses in regional agriculture due to pollution from mining and at the expense of mining pollution?	SO04
9627	p4-326 -mining has displaced the potential for additional tourism. It is misleading to say they exist harmoniously	SO02
9628	p.4-340"Grand Portage's subsistence fish consumption averages 144 grams/day, five times higher than the MPCA assumed fish consumption rate of 30 grams/day. Fond du Lac's subsistence fish consumption is on average 60 grams/day, two times higher than the MPCA assumed fish consumption rate (ERM 2012). The effects of mercury bioaccumulation on subsistence activity are discussed in Section 5.2.10.2.6."-mining has a disproportionate impact on the poor and minorities.	SO02
9629	Government ownership of large tracts of land for the benefit of mining contributes to an evasion of property tax payments and contributes to homelessness by restricting access to land for residential building.	SO03
9630	p.4-349...[Scenic Integrity Objective designation for the Mine Site] is an arbitrary characterization of the mine site which has nothing on it	LU05
9631	-Furthermore the existence of an old mine site does not preclude land of park-like character adjacent to it. For example, p.4-359 Lake Vermilion State Park is 16 miles northwest of the NorthMet Project area (see Figure 4.2.12-1), on the eastern shores of Lake Vermilion adjacent to Soudan Underground Mine State Park.	WILD03
9632	p.4-361-reading hazardous waste reference on this page, nickel, arsenic, mercury, et.al. currently locked in the mineral formation meet the definition of hazardous waste.	HAZ02
9633	p.4-371"leaking and failure of LTVSMC discharge pipes."-Are these the pipes exiting at the embarass river that I have pictures of? Are they going to plug these to catch and treat 90% of the run-off the tailings basin. Plugging these will add such hydrostatic pressure to the tailings basin that it will collapse.	GT03
9634	p.4-383"To facilitate the expedited consolidation of the in-place LTVSMC tailings, wick drains would be installed within the Emergency Basin. This would reduce drainage path lengths and increase the drainage ability in the LTVSMC tailings and underlying compressed peat. "-it appears that the tailings basin had these wick drains built into it.	PD07
9635	p.4-384"she4ar strengths will increase if installed wick drains are unsuccessful."-with what consequence?	GT11
9637	p.4-395Tract 1 is an old dump site.	HAZ05

9638	p.5-7" In this SDEIS, non-mechanical treatment systems are not described in detail because the NorthMet Project Proposed Action is based on mechanical treatment only."-Why isn't the mechanical treatment described then?-Why aren't modeling parameters and protocol described?	WR137, WR143
9640	p.5-8", but mass balance modeling and analog data from other natural lakes and mine pit lakes in northeastern Minnesota suggest"-not a relevant premise from which to draw a conclusion indicating the lack of foundational reliability in the modeling.	MERC04
9643	"that the mercury concentration in the West Pit Lake, the source of the only surface water discharge at the Mine Site, would stabilize at approximately 0.9 ng/L. There would also be mercury in the tailings, although about 92 percent of the mercury in the ore is predicted to remain in the ore concentrate and the mercury concentration in seepage from the Tailings Basin is expected to be less than the standard. The WWTF and the WWTP would be designed to meet the 1.3 ng/L mercury standard for its effluent."-you mean the WWTF and WWTP haven't been designed yet?	WR147
9644	"Overall, the NorthMet Project Proposed Action is predicted to increase mercury loadings in the Embarrass River, but decrease mercury loadings in the Partridge River. The net effect of these changes would be an overall reduction in mercury loadings to the downstream St. Louis River. "-you mean mercury would be reduced in the Partridge River merely because it has a mercury and sulfate emitting mine next to it?	MERC18, MERC23
9646	p.5-9What is the AWMP-list of contaminants on p.5-9 incomplete.	WR038
9659	"Natural (unaffected) groundwater concentrations for beryllium, manganese, and thallium (bedrock unit only) at the Mine Site and beryllium and manganese at the Plant Site are greater than secondary drinking water standards and/or the HRL (see Table 5.2.2-2)...-Natural/unaffected at the plant site indicate post mining impacts whereas "bedrock unit only" at the mine site indicates a sample taken somewhere in drilled/disturbed rock. This is an attorney's analysis for purpose of deception and not anyone's reasonable interpretation of natural or unaffected. Neither does the fact that these readings were found at other mine sites on the iron range make them background levels. Just because it is found in isolated disturbed areas doesn't mean that it is a natural origin.-thallium is a serious poison and indications of it should be of serious concern for proceeding with mining its use has been banned by presidential order 11643 in 1972.	WR072, WR090
9660	p.5-11-recent studies on the health effects of arsenic would dictate a stricter than 10 parts per billion standard.	PER29
9661	p.5-13"Hydrologic evaluation criteria include a comparison of proposed hydrologic changes with both existing natural conditions and historic hydrologic alterations from permitted mining practices,"-is this a comparison with this actual sulfide ore body or some arbitrarily picked iron mine.	PD27
9663	there is no MODFLOW recognition of the pipes that are draining the area around the Plant site. Is the water in these pipes considered ground water or surficial water? There is just no recognition or mention of these drainage pipes.	WR056, WR093
9681	p.5-51"chemical reactions, including mineral precipitation and surface adsorption, would limit the concentration of many contaminants in non-acidic waste-rock effluent and thus would reduce the rate at which contaminants were released; and"-precipitation would not "limit the concentration of soluble contaminants like arsenic, nickel compounds, and concurrently methylated mercury, the mercury and arsenic generally bound with the sulfide in the pyrite which allow them to become reactive quicker. Pyrite was observed to be a prominent feature at the Minnamax mine within a few miles of the NorthMet mine site.	WR038
9685	p.5-54"the rate of oxidation and constituent release was estimated from studies of seepage release measured in Dunka Mine rock, which is a nearby source of waste rock with similar chemical composition"-if Dunka Pit mine rock were similar the adjacent rock would be readily accessible and being mined for sulfide ores.	PD27

9690	p.5-55Table 5.2.2-14 is just an attempt to confuse by using some kind of alternative terms for solubility and ground filtration.	WR201
9691	p.5-55 "four solutes are assumed to be attenuated by adsorption in the aquifer: arsenic, antimony, copper, and nickel."-for arsenic this statement fails to differentiate between Arsenic V isotope which is arsenic at a lower PH state and Arsenic III Isotope which is the same arsenic at a more neutral state. This EIS projects inconsistent scenarios in assuming a lower PH but not the type of arsenic which is exhibited at that PH level.-the modeling also fails in that it is unable to explain already existing exceedances previously noted as being observed for arsenic at the mine site.	WR025, WR058
9692	p. 5-57GoldSim as manipulated explains nothing relevant, reliable, or valid.	WR189
9693	"Table 3.2-13Sulfuric Acid 1,500 tons per yearHydrochloric Acid 3,590 tons per yearLiquid Sulfur Dioxide 1,433 tons per year...- regarding tailings geochemistry we need to start with the fact that the SDEIS is telling us that the tailings basin is going to have some potential for acid mine drainage.	WR150
9734	-The range between .12 and .14 percent sulfur according to the EIS indicates that there is some probability that the tailings themselves will produce acid mine drainage. This disregards the effect of the process water which will be added. The SDEIS can hide the treatment process from us but it appears that it is heavily reliant on some sort of ion exchange as there is an indication that large amounts of limestone will be used.	WR027, WR143
9746	The SDEIS starts by disregarding the hydrostatic effects of the headcreated by digging the pit. When the pit is dug, the large amount of water surrounding the pit will want to drain into the pit, even with the soil conditions the SDEIS claims exists above bedrock... The SDEIS tells us that the surficial water flow follows the fractures and that these fractures have associated fractures radiating out from them. This will create drainage into the pit. This drainage into the pit will be more pronounced on the north wall where this water will divert the Partridge River through these fissures and keep the north Virginia formation wall flowing with contaminants that will have to be pumped out to accommodate mining operations.	WR179
9748	-this leach-aid water will be pumped to the WWTF and run through lime to neutralize it but no system exists where the lime will not get coated with the sulfide metals that are precipitated out and fail to continue to neutralize the acidic water it is intended to neutralize. This process will lead to higher than the .06 to .14 percent Sulfur that the SDEIS indicates will be a base level for the tailings and increase the chances that at least at times the tailings basin will become acidified at a level above the .12 level indicated for acidic conditions.	WR001, WR143, WR146
9753	The reverse osmosis, even if the filters stay unplugged and a suitable disposal is found for the filtrate, is not designed or expected to filter out ions that are smaller than water molecules and highly soluble in water. Toxic heavy metals like arsenic, nickel, and methyl mercury will flow unimpeded to Lake Superior and beyond in the solution created.	WR111, WR143
9757	P.5-62The fact that the modeling failed to measure predicted, "concentrations of several solutes, including many metals."doesn't necessarily mean that the non empirical measurements were understated by the model or that there were "additional attenuation effects." It probably is more likely that the data fed into the model was invalid or that it is just a bad model. Why should we give credibility to a modeling that has no proven track record of reliability?	WR049, WR050
9759	p.5-63"NorthMet Project Proposed Action contaminant release parameters are based on a combination of laboratory tests and water quality observations at similar tailings facilities in northern Minnesota."-again, this is not a valid comparison.	WR030

<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
9787	-it seems a fairy tail that it could be conservatively assumed that a wall made of compacted dirt would hold back an average of 25 feet of ground water, that a trench could be dug to be tucked around boulders 25 feet down in the ground, that the ground water would flow uphill as indicated in Figure 3.2-28, or that there is even a remote chance of in any way modeling this result...and they still don't explain the pipes draining away from the tailings basin into the Embarass River or what will be done with those. I know it doesn't take 300 years for water to travel 3.25 miles through a pipe. I would say maybe an hour.	PD04
9789	p.5-77"This P90 threshold generally equates to a reasonable worst-case scenario and has been adopted for other mining NEPA documents where probabilistic modeling was used (e.g., Idaho Cobalt Project [USFS 2009b]). "-use for one solute hardly give the modeling any basis for reliability or validity, this is flimsy.	WR110, WR192
9790	p.5-79"Filtered sludge from the chemical precipitation process would be sent off site for disposal or stored at the Hydrometallurgical Residue Facility. The reject concentrate stream from the WWTP would be transported to the WWTF via rail tank cars where it would be added to the West Equalization Basin." -this procedure simply delays discharge of contaminants to the environment.	PD03
9791	p.3-115"A pond would be maintained within the Hydrometallurgical Residue Facility so that the solids in the slurry would settle out, while the majority of the liquid would be recovered by a pump system and returned to the plant for reuse."-with all the mixed materials going into the Hydrometallurgical Residue Facility how is any of it of good enough quality for reuse. Why are so many materials consumed on p.3-312 if they are capable of being recycled. This is another misleading aspect of this SDEIS.	PD18
9792	p.5-80"The WWTP would be constructed south of the Tailings Basin near the coarse crusher and would include an RO unit designed to achieve less than 9 mg/L sulfate in effluent, as well as all other applicable water quality standards."-the RO needs to be designed before permitting and if what is the sulfate level in the 10%+ that escapes the tailings basin containment. Won't it exceed the 10 parts per million sulfate standard?	WR143
9793	p.5-81What is the West Equalization Basin?	PD04
9794	p.5-82"Once the Hydrometallurgical Residue Facility is reclaimed"-This cannot be reclaimed. It will in theory (if all goes as represented by PolyMet) contain the consumables on Table 3.2-13, treatment sludge from the WWTF, ect. How does PolyMet really expect to be able to determine if this is leaking in a timely manner?	PD20
9795	WWTF will be inadequate to treat pit runoff to be discharged into the Partridge River. It will contain exceedances for mercury, carcinogenic nickel compounds, arsenic, and other toxins.	WR143
9798	"Surface runoff would be routed away from the mine pits using a combination of existing and new ditches (see Figure 5.2.2-15)." -This will cause contaminants to run into the Partridge River as 20 years of contaminant mining dust from blasting will have accumulated and be subject to erosion into these ditches and the river.	WR025, WR151, WR174, WR191
9802	p.5-83"The typical discharge rate from the WWTF is predicted to be 285 gpm."-this amount underestimates the amount of flow as it disregards the unintended redirected flow of the Partridge River through the pits. This redirected flow would be exacerbated if the north pit wall were to collapse during mining. The rock composing the pit walls is wet rock which is more brittle than dry rock(as I explained in my DEIS comments) added to this will be a shearing effect between the Virginia, Duluth, and underlying rock formations.	WR179

<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
9807	p.5-89"distillation crystallization unit to eliminate the liquid reject stream. The moist waste solids from this system would be disposed of off site."-googling distillation crystallization does not identify any existing technology by that name. Again, solids should not be disposed of offsite where PolyMet would escape responsibility for their monitoring and release.-the pilot testing has no more foundation for reliability than the modeling.	PD03
9847	you cannot just "Despite the difference in pit depths," as indicated in the SDEIS. The difference between the height of the water which is at the surface above the PolyMet mine and the bottom of the mine is the "head." The higher the head the more the pressure pushing it down. The depth of the mine relative to the water is everything.	WR119
9848	"The proposed Category 1 Stockpile groundwater containment system, which is tied into bedrock, would minimize effects of pit drawdown on these waterbodies."-the addition of the stockpile material after the construction of the containment system is likely to be like putting a rock on a sponge and the containment system will burst like a water balloon	WR017
9851	p.5-98"1.25 inches of spilled material over a 2,000-m2 area."-the amount and effect of this spillage is underestimated as this is highly reactive rock and inadequate precautions against spillage are indicated.	WR151
9854	p.5-102"The GoldSim modeling assumes, however, that a small volume of leachate would seep through tears/flaws in the geomembrane liner, reaches the groundwater table, and follows what is referred to as the Ore Surge Pile Flow path, ultimately discharging to the Partridge River."-GoldSim modeling is only as good as the data fed into it if it works at all. Goldsim modeling is of questionable reliability as indicated in this SDEIS.	WR126
9856	However, it is agreed that tears will form in the liner and reactive water will run off and not be caught. SDEIS projections have failed to recognize pit water which will lead to more saturated ore in this and stockpile 2/3 which will cause more extensive tearing due to the additional weight and lead to more highly reactive waste water flowing untreated into the Partridge River. The solution to this problem is for PolyMet to use a more durable liner.	PD15
9858	p.21(polyMet 2013gAWMP)"Effluent concentrations used as inputs to the GoldSim water model are based on the PWQTs and the overall Project water management strategy."-PWQT stands for preliminary water quality targets-some of the assessments will be made based on "information from process equipment vendors related to hydraulic and chemical treatment performance." It is unlikely that accurate information will come from a sales pitch by a vendor which is how this SDEIS seems to be weighted.	WR147
9859	It is impossible from the SDEIS to make the modeling predictions given in pages 5-94 to 5-150 plus as the Goldsim results are only based on PolyMet targets which may or may not be achievable. Whether or not these targets are achievable needs to be part of the foundation for this SDEIS. This foundation is failing like that of the DEIS.	WR147, WR189
9862	sorption occurs in very limited conditions and sorption minerals are likely going to have to accommodate overwhelming amounts of arsenic and other metals subject to sorption. I believe the leachates from the above ranged 41 to 4,868 times the ten parts per billion standard. Even a small percentage of leachate escaping the PolyMet site will cause exceedences.	WR107, WR108, WR109
9866	pilot testing referred to fails to identify treatment conditions, assumptions made in the testing, types of arsenic oxidized or not, As V or As III, therefor it lacks notice and fails to provide a basis for comment.	WR143
9868	p.5-157-any leakage in the hydrometallurgical facility would be disastrous and irreparable once the process started. More information is needed on the types of liners proposed.	PD17

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
9869	p.5-158-Again, are the pipes draining from the direction of the tailings basin being considered as ground water or surface water. These pipes would be assumed to drain at a different rate. What is the drainage rate attributable to these buried pipes?	WR093
9871	p.5-159-the ground water containment system that it is claimed will collect 100 percent of ground water needs to be further explained. Under the conditions previously described in this SDEIS that is just not remotely physically possible.	WR017
9872	p.5-160 already oxidized and precipitated nickel and arsenic would erode and flow out with water regardless of PH because of it's ionized solubility.	WR001
9875	p.5-161-humidity cell testing result are not reflective of actual conditions.	WR034
9876	If at closure there is going to be a liner/bentonite layer installed under the pond, the area under the liner will dry out under some conditions unless the pond liner is leaking. Either the pond is saturated or it is leaking oxygenated water. This is a prime condition according to DNR Bavin and Berndt studies for methylization of mercury.	WR057
9878	The thickness and effective hydraulic conductivity of the bentonite layer would be designed to achieve a pond seepage flux of 6.5 in/yr or less. - sounds precarious given different weather conditions and specificity for performance.	WR057
9879	p.5-165-because of the limited conditions in which sorption occurs the slowing of these solutes is exaggerated.-travel times lack foundation, e.g.,free flowing water does not take hundreds of years to flow.	WR058
9880	p.5-178-Colby Lake water is higher in sulfates than existing flows from the existing tributary stream water and will result in damage to downstream wild rice beds.	WR124
9883	p.5-182-seems to be telling us that the WWTP is expected not to work.	WR059
9884	p.5-183-raising the level of arsenic to 10 parts per billion from the tailings basin is unacceptable. This combined with cumulative impacts downstream, existing levels of arsenic in the St. Louis River, and the combined health effects of arsenic with other increases in other solutes is a deadly cocktail for people drinking water out of Lake Superior. Furthermore, the 10 ppb is only a PolyMet target which we cannot expect to be enforced by the agencies under the weight of special interest pressure.	WR042, WR109
9885	p.5-188Table 5.2.2-47 is misleading because it uses sulfate levels based on Barr and not DNR readings for Colby Lake water which were higher and because it includes Spring Mine Creek water	WR149
9886	p.5-201-202-mercury concentrations in reactive waste rock will be much higher. In this rock stratification will occur with sulfide erodedmercury methylizing in solution and stratifying. Results shown in lab testing will not carry over into natural conditions and are not applicable.	MERC01
9887	p.5-202"The West Pit, like seepage/head water lakes (e.g., lakes with no significant inflowing streams),"-not true/disputed. There will be Partridge River high oxygen inflow through rock fractures and sub-surficial erosion.-furthermore, it is not relevant to compare a sulfide ore body to head water lakes or a select number of pit lakes.	WR088, WR179

<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
9889	Not only will mercury not be sequestered in the tailings, mercury that has been sequestered by lack of contact with sulfates will be reactivated with the addition of sulfate laced tailings during the operation of the mine.... PolyMet given its methodology in disregarding the methylation of mercury and overestimation of sorption makes it's fabricated model appear to be unreliable. Given the mines footprint relative to the size of the Partridge River watershed, at best assuming the validity of the PolyMet Modeling, any benefit to filtering the small amount of background existing run-off from the footprint of the mine and surfaces to be treated would be negligible and beyond detection. The fact of the "natural runoff (with a total mercury concentration of 3.6 ng/L)" is so high merely reflects the environmental impact that exploration drilling has had on the site, contradicts PolyMet's sequestration theory	WR158
9890	p.5-208-the effect of DEIS changes including containment systems won't work as previously indicated.-the results of the Bavin and Berndt study is misrepresented. The study actually indicated that higher sulfate levels eventually dilute, travel downstream and methylate mercury.	MERC08
9891	p5-210-because the Embarrass River system is more than double the size of the Partridge River system the 3% increase in the Embarrass and the 5% increase in the Partridge will result in a net increase in mercury.	MERC23
9892	-SDEIS neglects a discussion of the augmentation water from Colby Lake which MPCA testing from 1976-2007 showed mercury of 190 ng/L (p.4-88) while the Embarrass river only has 4 ng/L (p.4-123). All the tailings basin surficial seeps show less than 4 ng/L (p.4-129). This is an increase of more than 45 times the amount of mercury being put into the Embarrass River tributaries.	WR125
9893	This 20 year Colby Lake stream augmentation would seriously contaminate fish in the Embarrass River watershed for a generation in the downstream Embarrass River and increase mercury in the Lake Superior Watershed. PolyMet will be taking current cleaner runoff from the LTV tailings basin and replacing it with much higher mercury contaminated water. Even though this water would also flow in the St. Louis River a net increase will occur because the dillution effect of the alleged cleaner tailings basin water will be removed. This is a clear violation if the Great Lakes Initiative Law.	WR125
9894	Colby Lake water is warmed by the nearby Minnesota Power Laskin plant (p4-85). The warmer water will increase the solubility of the metals in the river system and form an environment that will serve as a catalyst more conducive to oxidizing metals and methylating mercury.	WR043, WR046
10030	p.5-211 to 222-plans for future efforts should not be allowed. these efforts depend on DNR or MPCA enforcement which, based on historical enforcement of environmental protections and laws should be expected not to occur. Furthermore, the agencies paid participation in The EIS process gives them a vested interest in its success, the failure of which they will have an inherent propensity to deny.	PER06
10032	the Aitkin and Hinkley sites will not compensate for wetlands lost in the St. Louis River watershed. Wetlands need to be retained and justly deserve to be retained to provide environmental filtering effect, retention of water for flood control, et.	WET03
10033	the Zim site is already wet and serves the functions of a wetland. Calling the Zim site a wetland or flooding it with more water serves no wetland purposes. I have walked the area composing the Burns sod farm as one of their customers.	WET06
10035	none of the given [wetland mitigation] sites should be qualified as mitigation.	WET06
10036	p.5-225-a key component of the adaptive management plan should be to identify additional compensatory wetlands in advance that would actually serve an additional wetland function within the St. Louis River watershed to compensate for wetlands lost in the St. Louis River watershed.	WET02
10042	p.5-223-243-indirect wetland effects need to be assessed for evaporation resulting from loss of vegetation cover these should include ombrotrophic wetlands.	WET08

10047	p.5-243-Analog mine sites are dissimilar to PolyMet because as previously indicated. The water table at PolyMet maintains a higher elevation and puts the water under more pressure to flow farther. Rather than restrict the area of drainage the Partridge River expands the zone because it is within the zone of bedrock fractures which the surficial water flow follows as indicated elsewhere in this SDEIS. All wetlands to the Northwest, North, and Northeast will run into the PolyMet mine pit. Drawdown will occur following the Partridge River beyond the 10,000 foot boundary until pumping from the pit augments and restores the river flow downstream of the pits.	WET08, WET10
10048	p.5-239-277-disregarded in this analysis are the cumulative effects of evaporation drawdown from defoliated ground, accelerated defoliation from drying, dusting, the toxic effects of toxic dust or watering, increase runoff from dry defoliated ground, and draw down from the mine pit on vegetation.	WET18
10050	evidence of erosion that should be expected to continue from PolyMet seepage. This eroded ground should not be expected to support a containment wall or boulders reinforcing the base of the tailings basin.	GT01, GT03
10052	p.5-291-Indirect wetland impact will occur at the plant site from evaporation caused by the trampling of vegetation.	WET08
10058	p.5-298water losses in the watersheds of the tributary creeks are underestimated because they do not account for water flowing through drainage pipes running from tailings basin drainage area to Embarrass River(draw down and intensification of contaminants). If containment system catches 90% of water there will be a shortage of more than 20%. This 20% augmentation from Colby Lake will lead to heightened levels of mercury in the first 20 years and after 40 years in addition to the more extensive augmentation occurring in years 20-40 as indicated previously in these comments in violation of the Great Lakes Initiative Law.	WR125, WR184
10063	p.5-318-State and Federal governments want mitigation on private lands because they plan to continue the degradation of wetland environments on their own lands in violation of state and federal laws.	NEPA15
10065	it is incorrect to characterize ditched peat lands as adversely effected. These lands could be utilized as productive farmlands. These lands have diminished value because of the pollution of the St. Louis River that has diminished the regional agricultural economy.	WET24
10066	mining should replace lost wetlands destroyed by mining. The intent of the law is not to make agricultural perpetually subservient to mining. Furthermore, replacing wetlands lost to mining does not functionally compare when replacing them with agricultural lands.	WET05
10067	p.5-339-discussion of reclamation is a joke. When have any of the co-lead agencies ever reclaimed a mine in Minnesota.	PD09, PD35
10126	p.5-341-the characterization of the loss of state lands of significant high biodiversity of less than one percent as not being a large percentage decline is a subjective, biased, reckless, and slippery slope characterization of these losses.	VEG02
10148	p.5-343as with all the cover systems in the project root systems from tree growth will eventually penetrate the cover and subject the underlying soils to oxidization reaction. As with any of the stated mitigation measures effects are only delayed.	VEG05
10164	the status of the Floating Marsh Marigold should be upgraded to endangered and this (PolyMet mine site) habitat protected.	VEG01
10166	draw down as indicated earlier in these comments will wipe out this 8% population of [the marsh marigold].	VEG01
10168	it needs to be determined if this is a genetically isolated variety of Marsh Marigold to avoid extinction of the species.	VEG01

10170	the Floating Marsh Marigold is listed as endangered in Wisconsin where there is only one known population.	VEG01
10171	p.5-373-mercury effects on the sensitive wildlife listed will be intensified by the release of the high mercury Colby Lake augmentation water as indicated earlier in these comments.	WI04
10172	The presence of the mine causes the disruption of the migration corridors and ability of a variety of larger species due to the chain of Mesabi Range mining from east to west. Although this has been made a concern of natives in the area little has been done to dispel what they have learned. Moose populations are declining to critical levels. Additional arsenic deposition in the Partridge and Embarrass Rivers will damage the health of aquatic animals, and moose as aquatic grazers as arsenic is known to be absorbed into aquatic plants. Small levels of poisoning have serious effects in an already fragile life of a wild animal.	WI01, WI03, WI04
10180	exceedences of arsenic and mercury have been observed in Colby Lake water and should be expected to increase in frequency in the future and in augmentation. No consumption of any amount of walleyes, as has been the history of Colby Lake, will be recommended for fish in lakes downstream of the tailings basin in the Embarrass watershed. Warmed augmentation water from Colby Lake will kill off colder water fish along with other effects that need to be further researched.	AQ05, AQ11, AQ15
10181	second creek augmentation should also be expected to increase in warming, arsenic and mercury.	AQ05, AQ15
10183	p.5-394-under the no action alternative Colby Lake augmentation would not occur. Benefits of tourism and cleaner environment would accrue.	SO02
10350	the PolyMet project will emit more than 10 tons of HAP in amphibole fibers.	AIR03
10351	no relevant BACT demonstration is attainable.	AIR13
10353	as indicated on page 5-531 there are sources of hydrogen sulfide gas that should be added or considered alone as exceeding the 10 ton HAP or 25 ton HAP cumulative standard. Potassium amyl xanthate will be converted to some extent to hydrogen sulfide gas as indicated with a total potential conversion of 1075 tons per year with the only requirement for conversion being heat and moisture.	AIR10
10376	[F]ugitive lime dust needs to be treated as hazardous waste.	AIR10
10379	[E]ven though it will not directly emit green house gas it will indirectly generate green house gasses and contribute to hazing in the boundary waters through its usage of power generated from Minnesota Power which will exceed 100,000 tons per year. The lack of attainment in the boundary waters should require PolyMet to be treated as if it were in a non-attainment area and a general conformity determination should be required.	AIR02
10383	[T]hese sources [amphibole fobers,hydrogen sulfide gas, fugitive lime dust, greenhouse gasses] and other should qualify PolyMet as a major source emitter. Relevant, reliable, and valid modeling needs to be conducted for these sources.	AIR09
10385	"At the Mine Site, emissions were estimated for material handling sources associated with excavation, portable crushing and screening operations, blast hole drilling, use of unpaved roads, and vehicle exhaust."-it appears that modeling was based on PolyMet fabricated and self-serving data.	AIR10
10387	"Model inputs for these sources were provided by the MPCA"-these should be determined to be not credible."-the MPCA has refused to enforce the CAA and other law against mining and power companies supplying power to mining companies	AIR09

10388	"Per MPCA guidance, the MESOPUFF II algorithm and secondary particulate formation were not used in the PM10 increment consumption evaluation."-this breach of protocol invalidates the modeling.	AIR09
10390	"Since the two receptor grids represent two separate AOCs, the maximum concentrations are not additive"-this is a misapplication of the Clean Air Act.	AIR09
10393	p.5-395 to 417-the modeling described is meaningless without information forming a basis for the inputs and violate due process notice. Are these models based PolyMet target inputs as in the water modeling.-air quality modeling provided herein violates due process and is incomprehensible.	AIR09
10397	It has been proven that air pollutants inhibit the ability of pollinators to find food and pollinate plants ...This will have an impact on the ability of the Floating Marsh Marigold to survive as a species.	VEG07
10402	p.5-557"similar industry standards and other large tailings dams in Minnesota. "-it is improper to use this as a standard for this project as tailings basins in the past have failed by design	GT02
10403	[Tailings basin] design criteria are unconstitutionally vague and based on invalid inputs.	GT13
10405	[I]nputs used for the geotechnical stability of the tailings basin are inadequately explained and based in terms of methodology for selection, reliability or validity of selection.	GT13
10406	[T]he peat soil forming the base for the rock buttress, when subjected to hydraulic erosion from seepage or lack thereof from the containment wall will not support it. The rock buttress is expected to slide through the area of the containment wall.	GT03
10413	p.5-569 The peat earth foundation for this structure is inadequate to allow it to retain its shape and structural integrity. This will result in liner failure.	GT10, GT12
10418	p.5-575"Liquefaction analysis was not applicable and not performed because the material proposed in the constructed dams would be well-compacted and the Hydrometallurgical Residue Facility liner system would limit leakage through the dams."-these assumptions are made in error.	GT11
10420	If Lake County has approved or entered into an agreement or contract with PolyMet for the sale of lands to PolyMet in furtherance and assistance of PolyMet's NorthMet project through the environmental review process, it is prohibited from doing so by state and federal law restricting government action or approval prior to completion of the environmental review process.	LAN09
10421	St. Louis County entered into a Wetland Restoration Agreement with PolyMet dated February 7, 2006 and was subsequently sued in Minnesota District Court. District Court Judge Heather Sweetland ruled in favor of the plaintiffs , Wetlands Action Group, motion for plaintiffs summary judgment granted. Further, the court held that a contract is the same as a permit and proceeded to void the agreement and associated actions, because it was a violation of MN Rules part 4410.3100. See Wetlands Action Group, et al., Plaintiffs vs. St. Louis County, et al., Defendants April 17th, 2007. Lake County's entering into an land sale agreement with PolyMet is a discretionary contract and, thus, a permit under Minnesota rules.	LAN09
10433	The USFS must address whether the Lake County Lands are part of an illegal action and if so, remove them from consideration in PolyMet's proposed land exchange.	LAN09
10434	The zone of impact for PolyMet extends beyond the State of Minnesota to other states and foreign countries. Wisconsin will be impacted through the arsenic and heavy metal poisoning of the drinking water of Superior, WI and other Lake Superior south shore communities that obtain their drinking water from Lake Superior.	CU06

10441	Current water quality monitoring is not only compromised by a conflict of interest, it is inadequate in scope and current arsenic levels seem to be unavailable to the public in the water quality reporting that exists for Superior drinking water.	WR072
10443	The PolyMet Mine and Plant will emit toxic waters that will harm waterfowl. Of particular harm will be the Hydrometallurgical Residue Facility. Contact with hydrometallurgical pond water will likely cause imminent death to unsuspecting waterfowl protected under international treaty (Migratory Bird Treaty Act) for the benefit of Wisconsin citizens.	WI01, WI04
10469	The hazing from power generation to supply PolyMet will have negative effects on other migratory species including the Monarch Butterfly which is also protected under law.	WI01
10473	PolyMet will violate the Clean Water Act which will diminish the quality of other water uses in the State of Wisconsin along with the quality and quantity of resources such as wild rice and fish which will absorb harmful to human health heavy metals like mercury and arsenic.	MERC01, MERC03
10475	Furthermore, the PolyMet land exchange involves the disposition of a national resource objectionable to Wisconsin citizens.	CU06
10486	It is enlightening that the SDEIS allows PolyMet to phrase legal pollution discharge standards and allow them the base modeling on their own targets. Is it just coincidental that the targets coincide with legal requirements? The transparency here of the fraud attempted to be perpetrated by the SDEIS on the public is that the co-lead agency don't intend to require PolyMet to make or keep any promises.	NEPA18
10487	The co-lead agency foresee in have foreseen in advance that they would provide a vague and ambiguous SDEIS to avoid criticism when the pretext of a plan cannot be implemented.	NEPA15
10488	The SDEIS disregards the cumulative impacts of SDEIS and permitting resulting from issuing a permit based on this SDEIS.	CU11
10610	The largest impact is the dilution of standards created in the SDEIS. From here on other permit seekers will have the expectation and will probably be required to be treated the same as PolyMet.	PER35
10644	[The SDEIS] should be expected to violate the Clean Air Act, Clean Water Act, Weeks Act, NEPA, MEPA Federal Land Management Policy Act, and other statutory law. It violates Federal and State of Minnesota Constitution in terms of Equal Protection of the laws, Due Process, and other provisions.	PER26
12262	Allowing only 90 days for public comment for this project is inadequate to fully vet objections to the project which PolyMet and lead agencies have allegedly spent tens of millions of dollars and more than 9 years	NEPA07
12411	Reliance on sorption or absorption of arsenic by iron compounds currently is not taking place in the tailings basin or at the mine site. Releases of arsenic and other heavy metals should be expected to lead to death and disability downstream.	HU03
12422	Present and past subsidies to PolyMet including public historical public ownership to allow PolyMet to avoid paying past property taxes, the Minnesota policy (which exists in no other state)to server mineral interests which devalues land and passes the tax burden of land ownership and cost of government services off on non-mining supported businesses, drilling subsidies paid for by the state of Minnesota, millions of dollars of public money not fully publicly disclosed by the IRRRB granted directly to PolyMet, the failure to adequately and in advance require financial assurance and the pollution subsidy which will destroy other valuable public resources and cause other businesses and the public to subsidize PolyMet with higher health care costs, the diminution or public recreational and tourism opportunities, etc, all contribute to a violation of the National Land Management Policy Act.	FIN08

12429	This SDEIS conspires to violate the Weeks Act, Clean Water Act, Clean Air Act, and a number of other laws.	PER26
12440	It is known given the DNR Bavin and Berndt studies that mercury from mining and power generation upon which mining is dependent contribute elemental mercury to Lake Superior and sulfates that serve to methylate that mercury and make it biologically available to fish in Lake Superior poisoning and weakening those fish.	MERC02
12443	P.3-140 "Economic feasibility - Each alternative was assessed as to whether it could meet economic and financial requirements to construct and operate the proposed project, including whether the cost of implementing the alternative would be economically feasible to meet the Purpose and Need."-This type of catagorical analysis systematically discredits the whole SDEIS process and violates the Federal Land Management Policy Act.	SO04
12450	"Colby Lake, which is used for domestic consumption by the City of Hoyt Lakes, is designated as Classes 1B (treated with simple chlorination for domestic consumption)"-contaminating this lake puts an unfair burden on taxpayer in health care costs for the unwary water consumer of Colby Lake.	SO02
17712	The arsenic standard in particular is unreasonably low as it was the standard adopted from that set by the World Health Organization at a time when detection technology was limited and as a result was set at 10 parts per billion. We should not be threatened by claims that PolyMet will meet government standard that are third world at the outset. The primary obligation of the lead agency is to protect public health and any cutting corners or exception to that rule is a violation of their social contract with individual citizens	WR110
17713	What is the deal with putting the filtrate from the mechanical treatment in "licensed landfills." This simply delays the release of toxins like thousands of tons of arsenic into the environment.	GEN01
17714	The failure to utilize more costly measures to mitigate environmental degradation to attain cost savings on the basis that the project cannot proceed without these cost savings also calls into question the merit of the project under the National Land Management Policy. These include inadequate liners, the failure to utilize the underground mining alternative and a number of other measures including many failed to be disclosed by the SDEIS which violates due process legal notice requirements.	ALT01
17715	The SDEIS does not require PolyMet to bolt, wire, and shotcrete the pit walls to inhibit the migration of water and pollutants in and out of the pit as was done by Kennicot at its Flambeau Mine. This would have an additional benefit if done simultaneously with mining of inhibiting the collapse of the pit wall of the type that occurred in Utah at a Kennicot Mine in 2012. It is more essential that it be done by PolyMet because of the weaker wet rock. ...The collapse of a pit wall would be welcomed by PolyMet as a justification for a mine expansion.... The failure of PolyMet to bolt and shotcrete pit walls does not even follow "usual and customary" mine operating standards in the area.	WR173
17716	In the DEIS the EPA issued a finding of EU-3 (Environmentally Unsatisfactory - Inadequate Information). The SDEIS simply shifts, as indicated on 5-211 and 212, toxic materials around or fails to specify actual measures to be taken. The SDEIS should be viewed in the context of the burden set by the EPA-EU-3 rating.	GEN03
17717	... the tailings basin by design will not sequester toxic materials as represented. The "cutoff wall placed into existing surficial deposits" indicated at 3-117 will be inadequate and the modeling indicating that 90%of runoff water will be collected is irrelevant. In order to collect 90% the wall would need to project below the originally placed as loose taillings fill down to bedrock, all fractures in the bedrock would need to be sealed off hold a great deal of water pressure, have the drain tile at the bottom of the wall which is standard foundation engineering, and the wall would have to be extended to the east side of the tailings basin.	PD07

<b>Sender Name (Submission ID)</b>	Dennis Szymialis (18326)	
17718	...the iron tailings do not sequester mercury any better than any other soil. Elemental mercury is currently not leaching out of the tailings basin because lower levels have had the mercury scoured out through the introduction of sulfates running through them. Mercury is at higher than normal environmental levels in the surface areas of the tailings basin as a result of the absence of sulfates. Once the sulfates are again introduced at the top this mercury will methylate and flow out at higher levels than normal. Water discharge through the lower levels with sulfates will be redirected through the basin increasing the release of methylated mercury currently unexposed in the basin formation at these lower levels. ... The claim made on p. ES-36 that somehow the mere presence of the PolyMet mine is going to reduce mercury in the Partridge river is simply bizarre	MERC06
17719	The " WWTF is now proposed to be upgraded to a RO process during closure to manage sulfate concentrations in the effluent " described at p. ES-24 is inadequate. It is unacceptable that toxins other than sulfates that will not be captured by RO including carcinogens Nickel Sulfate and Arsenic III shall be allowed to flow unimpeded. It is unacceptable that sulfates will be left untreated at any time.	WR143, WR147
17720	The amount of water going into the WWTF will overwhelm any treatment facility that could be built. The amount of water going into the system is dramatically understated.	WR148
17721	The following statement made on page 3-4 of the SDEIS represents the type of misleading information that mining companies provide to deceive the public. "Bentonite would be incorporated into the exposed outer side-slopes of the Tailings Basin as it would be built up to create a barrier that would limit oxidation. This limiting of oxygen transfer would reduce pollutants generated from the Tailings Basin." The pollutants will not be reduced. Their introduction into the environment will merely be delayed.	WR023, WR107
17722	The Economic Impacts of mining only include allegedly positive impacts and fail to state the negative cumulative economic and social impacts of mining? ES-41	SO04
17723	... it is necessary that the authors [of the SDEIS] specify the basis for and underlying assumptions made in determining the following at ES-40. "Federal, state, and local taxes would total an estimated \$80 million annually. During operations, there would be approximately \$231 million per year in direct value added through wages and rents and \$332 million per year in direct output related to the value of the extracted minerals. As with employment, these direct economic contributions would create indirect and induced contributions, estimated at \$99 million in value added and \$182 million in output." -For Example, is the portion of \$231 attributable to wages based on the unlikely prospect of a union mine?	SO04
17724	The WWTF really is a sham which is revealed when one considers process water: "would be collected and treated at the WWTF. Treated water would be pumped to the Tailings Basin at the Plant Site."p.3-53. and tailings basin water will be pumped to the WWTP(at the plant site). This process fails to allow for the discharge of any water to the environment? It makes no sense to refilter the water already filtered.	WR143
17725	"The sludge waste would be disposed of off-site in a solid waste landfill until the Hydrometallurgical Plant became operational (see Section 3.2.2.3). When available, sludge waste would be filtered and moved by truck along the Transportation and Utility Corridor and introduced to the autoclave in the Hydrometallurgical Plant to recover metals or placed directly into the Hydrometallurgical Residue Facility (see Section 3.2.2.3.7)" P. 3-53.-It is planned that the toxins that are captured will be allowed to merely leach out in an uncontrolled environment. These toxins will leach out as a result of incomplete neutralization.	PD18
17726	Toxic to fish-collector-potassium amyl xanthate 3-100, 1,171 tons per year(p.3-102)-dumped with tailings-this should not be allowed	AQ05
17728	Standards delineated as part of Forest Plan in 157-159 are superseded by Weeks Act Legislation and particularly as such mining is fundamentally inconsistent with the Forest and as such the lands exchanged are not protected by the Weeks Act and are not in effect an arms length transaction as proposed.	LAN02

18491	after it does close, or it is closed, who is going to be taking care of the land and the water that will be exposed and potentially polluting? After the closing of the plant, I am concerned about the length of time that the purification is going to be necessary. I have read that it could be up to 500 years, 200 or 500 years (indicating). And who would be responsible for this? Who would actually be accountable or who would actually take care of it? Who is taking care of it	FIN01, FIN08
18493	I am concerned about how long these mines will actually -- this mine that we are coming here tonight for would actually be operating, in the whole scheme of things.	PD30
<b>Sender Name (Submission ID)</b> Diane (3655)		
428	Sulfide mining has never been done without environmental consequences... There are no metals more precious than our water and we owe it to future generations to protect it at all costs.	WR195
429	Many of us up here depend on tourism for our livelihood. People from all over the country come here for the peace and tranquility that are found in it's woods and waters. Are their needs less important than that of large corporations that are only interested in how much money they can make?	SO02
430	Should Native Americans be asked to risk continued wild rice harvests? Wild rice requires clean water to grow, a mining accident could destroy that crop.	VEG04, WR156
11307	The PolyMet mine plan should be altered to include greater protection and replacement of wetlands.	WET24
11308	I would like the DNR to provide in greater detail and with more accuracy the length of time that water polluted by the Poly Met mine will need to be treated	WR036
11310	I would like the DNR to further analyze the effect of Polymet's plan on the Canada Lynx.	WI01
15623	Another way that PolyMet would affect the environment would be using a large amount of electricity, more than likely from dirty coal power plants in Minnesota. In keeping with Minnesota's goal to reduce carbon emissions, the PolyMet mine plan should be required to use clean energy.	ALT13, PD39
15624	The effect on human health from the PolyMet mine should be considered with a health impact assessment that would be included in the PolyMet mine plan. Many hazards could directly affect public health due to exposure to arsenic, mercury, and asbestos-like fibers. Mercury, for example, would be emitted from the plant and increase the amount of mercury in the water, in the fish, and in the diets of Minnesotans relying on fish in their diets.	HU01
15625	Minnesota's state grain, Wild Rice, is put at risk and should be better protected in the PolyMet plan. As an important resource in Minnesota, and particularly for Minnesota's native people, the rice beds downstream of the mine would be affected and water there might not meet the state's wild rice sulfate standard.	VEG04, WR157, WR159, WR162
<b>Sender Name (Submission ID)</b> Diane Anderson (45427)		
11362	I have monitored the public meetings and discussions and I am deeply concerned that the state is more interested in short term job growth over the long-term negative effects from the mine on our water quality	SO01
11366	The proposed mine plan does not keep Minnesota's water safe and clean.	WR115

<b>Sender Name (Submission ID)</b> Diane Mundt (37946)		
13725	If we can make sure our state remains beautiful and healthy people will want to live and work here. That is what will keep us prosperous in the future.	SO02
<b>Sender Name (Submission ID)</b> Diane Peterson (47371)		
12389	Polymet claims that pumps on the edge of the tailings pile will capture 99.37 percent of the polluting seepage. The DNR should require solid evidence that 99.37 percent of Polymet's toxins will be prevented from contaminating our environment. As reported by J. R. Kuipers et al., in Comparison of Predicted and Actual Water Quality at Hardrock Mines (2006), every time sulfide mining has been tried in a water-rich environment, it has resulted in contamination of surface and/or ground water with sulfates and toxic metals.	WR018, WR023
<b>Sender Name (Submission ID)</b> Diane Skoog (54514)		
18744	It is federal land and to me that means that any swap should benefit at a federal level. The way I see it, [the proposed exchange] does not befeir the federal tax payer. It only leaves the federal tax payer on the hook for a new superfund site....	LAN01
<b>Sender Name (Submission ID)</b> Diane Steen-Hinderlie (52209)		
12942	First, regarding water resources, a federal website shows that there will be connections/flow to the Boundary Waters Canoe Area, which will jeopardize this invaluable state and indeed national treasure. There will be mine "acid drainage" that will leave lakes, rivers, and streams without most living creatures.	AQ08, WR011, WR113
12944	Mining pulls water from areas, so a thousand acres of wetlands at the mine site will be lost.	WET24
12946	So, secondly, wildlife is affected. Birds, fish, moose, even lynx, etc., are poisoned. Their habitat is threatened, changed beyond their evolutionary capacity to adapt.	WI01, WI02
12947	Of course there's human life threatened, with increased cancer rates, etc.	HU05
12948	Plus, the end of operations finds a devolving of responsibility from companies to the taxpayers, private to public. This happened right next door in So. Dakota, where a mine went bankrupt and the state had to request Superfund status.	FIN01
16223	No sulfide mine has ever operated without producing polluted drainage. 2/3 of attempted remedies fail.	PD26
<b>Sender Name (Submission ID)</b> Dianne Ensign (16507)		
2031	The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for--information that is necessary to evaluate the environmental effects of this proposal.	FIN01
2032	... sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior.	AQ05
2033	Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02

940	Is a performance bond going to be required of the company? 2. How is it going to be determined that the bond will be sufficient to cover the cost of clean up?3. Can the fund be used to clean up spills or damage as they occur? If so how is the fund going to be refreshed?4. How is the bond going to be protected from government changing its use designation and reassigning the money for other projects in the state? 5. What is to keep the fund in place for 500 years or until the site is deemed safe?6. Who is going to administer the fund and be responsible for its use? 7. Is the bond going to be invested to make interest as it sits in place?8. If a bond is required, how is it going to keep pace with the rising cost of construction costs as the years go on?	FIN01, FIN05, FIN08
941	Who is going to be responsible for monitoring the site? 10. What powers will the monitors have to deal with immediate problems that will arise?11. What is going to happen to the tailings in the pond after they reach saturation of sulfates?12. How is the water seeping through the tailings and into the bedrock cracks and pores going to be monitored?13. As a suggestion, would it be safer for all concerned to build a concrete table on which the tailings could be placed so that the sulfides and sulfates could be better treated and controlled? 14 How are the emissions on the stacks going to be controlled? 15 Who is going to monitor them and be responsible to see that they are being held within the EPA limits?16. If effects are seen in the environment (effects on the water, plant and animal life) around the mine site, who will be responsible for applying corrective action and how will the effects be monitored measuring the water leaving the site and air off the stacks?	PER04
<b>Sender Name (Submission ID)</b> Don & Tess Uzelac (15775)		
833	The state and federal regulators will ensure that PolyMet’s project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations.	PER34
836	I’d also like to address some misinformation ... It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a long time [200-500 years]. It also shows the project will still meet water quality standards even that far out.	WR190
837	This [groundwater flow] model demonstrates that PolyMet’s plans comply with Minnesota’s laws.	WR190
838	We cannot afford to miss this job opportunity.	SO10
839	Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.	NEPA16
<b>Sender Name (Submission ID)</b> Don Arnosti (11523)		
2475	I oppose the proposed land exchange for two reasons:1.If is not necessary for mining access to the ore body. Surface mining is prohibited – but underground mining could be allowed and is much less destructive to natural resources. If it’s not economic now, then the mining can wait until it is.2.No mineral rights come with the land. What will stop this exchange-game happening again?	LAN02, LAN04
<b>Sender Name (Submission ID)</b> Don Brown (43076)		
10022	The SDEIS does not seem to... adequately address issues concerning the health and safety of human resources ... What substances will be released into the air, water or otherwise and what effect will that have on human (and non-human organisms)?	HU01
10023	The DSEIS does not appear to address the effects of releasing heavy metals brands other than mercury into the environment. There appears to be no doubt that certain other heavy-metal released into the environment including but not limited to magnesium.	WR108

1260	The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest.	LAN01
<b>Sender Name (Submission ID)</b> Donna Ceglar (16118)		
9666	This proposed mine is too close to the BWCA, the risks are too high and there are too many unanswered questions.	WILD02
11063	...I understand the importance of supporting mining operations as a source of economic stability. However, I also recognize the much bigger importance of protecting the environment of Northern Minnesota.	SO01
<b>Sender Name (Submission ID)</b> Donna Henry (15992)		
1107	I Ask that you extend the public comment period for the proposed PolyMet Mine. The current 90 day comment period is not enough time. Due to the size, complexity and difficulty in reviewing the SDEIS - 180 days is needed to adequately review the proposal.	NEPA07
1109	The PolyMet project proposes a land exchange of 6,700 acres of federal land within the Superior National Forest. ... According to current federal law, it is illegal to strip mine land acquired under the Weeks Act for watershed protection.	LAN02
1112	The modeling done by PolyMet stopped at year 200 (at the mine site) and year 500 (at the plant site) because that was the point at which it became clear that water quality would not get worse. However, the modeled water quality at 500 years does not come close to meeting water quality standards.	PER04
1113	No back-up plan if Reverse Osmosis doesn't work for water treatment.	WR128
1115	Hardrock mining carries the potential for asbestos-like minerals to be released in water effluent or air emissions. The PolyMet environmental review process does not adequately address their effects on human health as this is already an emerging concern in northern Minnesota.	AIR03
1116	"Mitigation" for the [wetland] direct impacts will occur primarily outside of the St. Louis River/Lake Superior watershed, in an area to the south that is unlikely to support comparable ecosystems and cannot replace the lost functions to the St. Louis River system	WET03
1117	The proposed mine is harmful to wildlife, threatening home ranges of endangered lynx, wolf, as well as moose which are dramatically declining in the state.	WI01
1119	PolyMet mine could spell life or death for critical habitats and the birds that live there ... More than 300 bird species spend at least part of their year in Minnesota and three Important Bird Areas would be especially vulnerable. These include winter habitats for Great Gray Owls and breeding habitat for dozens of neotropical songbird species. At particular risk are water-dependent bird species, including Belted Kingfisher, Common Loon, Goldeneye, Red-breasted Merganser, Hooded Merganser, Common Tern, American Bittern, and Least Bittern.	WI01, WI02
1120	this mining operation would ooze toxic pollution into the region's waterways for as long as 500 years.	WR115
<b>Sender Name (Submission ID)</b> Donna Johnson (37952)		
13722	The value of our clean water far exceeds any mineral value now or in the future. Its not worth the risk.	SO01

1214	Diminished water supplies due to severe drought, rising consumption due to population increases and industrial needs are becoming more common throughout Minnesota.	WR188
1215	With so many areas in Minnesota currently experiencing water shortages it makes no sense to risk contaminating groundwater in the Duluth Complex ... Consider, too, that the proposed NorthMet mining operation would use 6.2 MILLION gallons of water per day.	PER12
1216	Please consider the cumulative impact of even more sulfide mining... other still larger sulfide mines would apply for permits and argue their right to mine citing NorthMet's precedence. ... That would lead to more water contamination and groundwater draw downs and shortages in the future, wouldn't it?	CU04
1217	We must protect and save what water remains and use it for human beings, not for industry.	WR195
1218	If NorthMet were permitted, contaminated surface drainage from NorthMet would run into the Partridge River, then into the St. Louis River and from there into Lake Superior.	WR111
1221	Sulfide mining, even in dry land areas has caused ground and surface water contamination lasting for hundreds of years. The Duluth Complex is a water- rich area, thus it is even more susceptible to water contamination.	WR115
1222	Are the people, much less regulatory agencies, guaranteed that someone will be around to treat the contamination virtually forever? I know of no such assurance or guarantee.	PER06
1223	11 (eleven) million gallons of contaminated seepage from the tailings basin would enter the groundwater each year, and another 5 (five) million gallons from the mine site would seep untreated into the groundwater each year. What of the impact of the millions of gallons of untreated contaminant that would enter the ground water on a yearly basis accumulating throughout the years?	WR107, WR108
1226	Given the large scale of the proposed NorthMet operation and the water-rich environment of the Duluth Complex...massive contamination of groundwater and surface waters could be expected, if the engineering were flawed or, if any unforeseen accident or disaster were to occur.	WR128, WR129
1227	Fractures are found at the NorthMet mine and the plant site which would transport contamination. The mining blasts themselves would break up hundreds of tons of rock every two or three days, adding to the number of fractures through which contaminated water would be able to flow.	WR011, WR012, WR016
1229	Based on the above MERA [116B.01] and these comments, I consider that it is not in the public interest to endanger water vital to present or future generations...I urge the regulatory agencies to reject the NorthMet SDEIS and to refuse any permits submitted by the NorthMet sulfide mining company.	PER35
2026	I urge the regulatory agencies to please reject the NorthMet SDEIS and deny any permits which could harm Minnesota's water quality and supply for many future generations.	PER35
10038	Improve monitoring practices.....to ensure maintaining strict water quality standards. Monitoring wetlands for contamination requires: monitoring stations be located in areas where leaks and run-off might be expected, monitoring stations be located at closer and more frequent intervals, than the SDEIS proposes; monitoring of all stations to be MONTHLY at least, not merely, as the SDEIS says, 'at least annually;' enough, technically-trained regulatory AGENCY staff, not company staff, to do the monitoring job.	PER06

<b>Sender Name (Submission ID)</b> Dorie Reisenweber (16076)		
10049	The state should require of any mining company(ies) a contingency fund available during any of the mine’s various operations. This contingency fund would be in addition to the financial assurances already mandated upon closure, as mentioned in the SDEIS. The contingency fund should be sufficient to pay for all monitoring expenses, for whatever technical training is needed for monitoring staff, for any remediation as agreed upon between the affected residents, mining employees and the regulatory agencies, and for mining-incurred medical expenses of the mining or regulatory agency employees or area residents, as well as for emergency events whether due to natural disaster or mining leaks, mining accidents or any mining situation which poses harm to people and the environment.	FIN05, FIN07, FIN11
10056	Contingency funds to pay for the monitoring staff should be assessed to the mining company(ies) and placed in the state’s coffers before any such mining were permitted. Furthermore, thpse monies should be obligated to cover the entire cost of monitoring and therefore subject to increased funding levels as determined by the monitoring agency(ies).	FIN11
10057	Monitoring and reporting on a) city and residential wells in the Duluth Complex and b) of drainage areas surrouding the mine's entire working and storage areas for contaminants which result from sulfide mining (such as arsenic, asbestos-like fibers, cadmium, lead, magnesium, mercury, and nickel, and to name only a few). These should be required to be monitored and reported on a monthly basis by a sufficient number of properly trained STATE AGENCY staff.	WR039
10061	The health of mine employees, as well as the health of residents within a pre-determined area of the mining facilities should be monitored at least once before mining begins...The cost of any ailments or illnesses attributable to the effects of mining should be borne by the mining company(ies) through a state-held contingency fund	HU04
10673	I write to urge an extension of the public comment period for the NorthMet SDEIS.	NEPA07
10676	[T]he SDEIS took over two years of work by agencies and experts. Lay people need time to analyze such a lengthy document dealing with a project which the SDEIS indicates could require five hundred (500) years water treatment. The project’s many impacts to water, air and life in northeastern Minnesota demand serious, thoughtful and objective analysis by both the public and by government agencies.	NEPA07
14464	The cost of any ailments or illnesses attributable to the effects of mining should be borne by the mining company(ies) through a state-held contingency fund provided for by the mining company(ies) involved.	FIN01
15912	No one wants a project that dumps toxic tailings into our waters. Please reject the NorthMet SDEIS.	WR195
15913	Surely...you would think Minnesota’s environmental laws will protect the water, but no. Permit after permit and variance after variance have been granted to taconite mines which continue to pollute raising sulfide, manganese and mercury levels above the accepted standards. And that is before sulfide mining has been allowed to start up.	PER06
<b>Sender Name (Submission ID)</b> Doris Bandel (41790)		
3276	My family has a cabin in Voyagers National Park. The last 4 generations of our family have joyously spent time at the cabin. I want the next 4 generations to have the same envirmment available to them.	LU06
13972	I am particularly alarmed by the possibility of sulfide mining in Minnesota. Although the PolyMet mine watershed drains into Lake Superior, the Twin Metals Mine would drain into Voyager National Park.	WILD02

<b>Sender Name (Submission ID)</b>	Doris Lawson Gerdes (36778)	
7816	Fragmentation of directly and indirectly affected wetlands was not adequately analyzed. The SDEIS treatment of wetland mitigation and wetland monitoring is also inadequate. It does not specify the type, location, and acreages of replacement wetlands, which should be located within the St.Louis River watershed and provide equivalent wetland values and ecosystem services. To adequately evaluate wetland composition, structure and function, affected wetlands should be classified to MN DNR Native Plant Community (NPC) Classification System type.	WET02, WET03, WET07, WET21
7819	There is no mitigation for the 698.2 acres of imperiled or vulnerable native plant communities destroyed as a result of the proposed project. Replacement acres for these native plant communities should be within the same watershed. Reclamation objectives that simply state “rapidly establish [vegetation]” are not adequate, and do not address the restoration of native plant communities. Furthermore, it is not possible to restore areas to a “natural state” when the area is now underlain with toxic waste rock.	VEG02, VEG05
7825	The SDEIS no action alternative should be selected because the proposed project will require long-term water treatment and monitoring. MN Rule 6132.3200 requires that, to receive a permit to mine, the permittee must be able to close the mine in such a way that it is, among other things, maintenance free. Furthermore, it unrealistic to expect a commitment of centuries of water treatment and monitoring.	PER04
7837	The SDEIS fails to adequately disclose the environmental consequences of the proposed project on biodiversity and ecosystem function. The SDEIS inappropriately analyzes the effects on Minnesota DNR Sites of Biodiversity Significance and fails to analyze the effects of the project on other biodiversity areas within the Laurentian Uplands subsection and the St. Louis River watershed. Fragmentation of biodiversity areas directly or indirectly affected by the proposed project was also not analyzed.	VEG02, WI02
7843	Environmental consequences of the proposed project on many of the biodiversity areas, even those close to the proposed project area were not analyzed (most notably the MN DNR Headwaters Site, the Sand Lake Peatlands Scientific and Natural Area, and the USFS Big Lake candidateResearch Natural Area).	VEG02
7855	The UMD economic impact analysis (EIA) used by the SDEIS to determine the socio- economic consequences of the proposed project misapplies standard EIA methodology, resulting in an economic analysis of the proposed project that is flawed from the outset. A socio- economic analysis that includes an aggregation of economic, environmental and community measures that support a healthy, sustainable economy (such as those described in the Minnesota Genuine Progress Indicator) is needed to adequately analyze the socio-economic costs and benefits of the proposed project. The EIA (and therefore the SDEIS) grossly exaggerates the short-term impacts, provides no comparison to potential employment impacts that might result from investments in other forms of economic development, and fails to compare the modeled short-term impacts in the context of associated long and short-term negative environmental, economic and fiscal costs of the proposed project and other non-ferrous mining proposals in the region.	SO04
8102	The proposed project is located within lands covered by 1854 Treaty with northeastern Minnesota Ojibwe people. The 1854 Treaty requires the federal government to protect tribal rights to hunt, fish and gather wild rice. The SDEIS fails to adequately address the environmental, cultural and economic costs of the proposed project on native peoples based on these treaty rights.	CR01
8123	Information presented on existing fractures, and the potential for increased fracturing that may result from continuous blasting at depth, is incomplete or non-existent. The proximity of the proposed project, especially the north side of the mine site, to the Laurentian Divide and the potential for leakage of polluted groundwater into the Rainy River Headwaters watershed was not addressed in the SDEIS.	WR010, WR012, WR016, WR071, WR085
8129	it is also critical to understanding the effects of the proposed project, for the SDEIS to include groundwater transport analysis on mercury.	MERC11

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Doris Lawson Gerdes (36778)	
8149	The SDEIS fails to adequately analyze the direct and indirect effects of the proposed project on the ability of the Superior National Forest (SNF) to meet federal mandates for the management of National Forest Lands. Therefore, the SNF must conclude that the proposed project does not serve the public interest.	LAN01, WILD01
8163	The SDEIS is flawed in that it fails to adequately address financial assurance requirements. Because of the enormous costs involved and an industry track record where taxpayers are left with the costs of clean up, it is critical that the SDEIS elucidate the terms of financial assurance requirements and provide a vetted estimate of the cost. Financial assurance analysis should be thorough and adjusted for inflation over time. Who will be liable should Polymet become insolvent? How will financial assurances remain viable for 500 or years or more?	FIN01, FIN05, FIN08, FIN10
8176	The SDEIS fails to adequately address the need (and cost to the taxpayers) for specialized disaster-response strategies associated with the failure of containment or treatment facilities due to unforeseen events and “unanticipated liabilities”.	FIN01, FIN10, PD22, PER03
8187	The effects of extreme weather events (fires, floods, drought) occurring with increasing frequency and intensity, should be factored into hydrologic models, pollution predictions, pollution transport models, treatment plans and monitoring.	WR180, WR189
8190	The SDEIS failed to adequately incorporate the effects of climate change in their analyses of the environmental consequences of the proposed project...The SDEIS failed to adequately address the carbon footprint of the proposed project and its’ effects on the states’ carbon budget.	AIR01
8198	The length of time that the public has to review the SDEIS is insufficient. An additional 90 days would allow the public a reasonable comment period.	NEPA07
12665	Forest Stewardship Council standards require the identification of high conservation value forest for the certification of managed forest lands in Minnesota.	VEG03
12669	misapplies standard EIA methodology...Hjerpe, Evan and Spencer Phillips 2013. A Review of “The economic impact of ferrous and non-ferrous mining on the State of Minnesota and the Arrowhead Region.” <a href="http://www.nmworg.org/wp-content/uploads/2013/08/Phillips_Hjerpe_UMD_Review_FINAL_2013_12_30.pdf">http://www.nmworg.org/wp-content/uploads/2013/08/Phillips_Hjerpe_UMD_Review_FINAL_2013_12_30.pdf</a>	REF01
12674	The analysis is also inadequate.... Minnesota Planning – Environmental Quality Board, 2000. Smart Signals: An Assessment of Progress Indicators. <a href="http://www.gda.state.mn.us/pdf/2000/eqb/measure.pdf">http://www.gda.state.mn.us/pdf/2000/eqb/measure.pdf</a>	REF01
12787	The proposed project lies within the proclamation boundaries of the Superior National Forest (SNF). Whereas, the Weeks Act of March 1, 1911 does not allow open-pit mining on National Forest Lands in order to protect the watersheds of navigable streams, it stands to reason that the proposed project should be prohibited within the proclamation boundaries of the SNF.	LAN02
12789	The land exchange does not mitigate the fact that the proposed project still lies within the SNF and does not relieve the Forest Service of their responsibilities for “the protection of the watersheds of navigable streams” mandated by the Weeks Act [PUBLIC-NO. 435.] [H. R. 11798]. These land exchanges render the SNF incapable of meeting not only this mandate but many of the management obligations set forth in the SNF Land and Resource Management Plan (2004).	LAN02
12869	The destruction and degradation of wetlands proposed by the project will present unacceptable risks to water quality and ecosystem services in the headwaters region of the St. Louis River watershed. Therefore, a USACE Section 404 Wetland Destruction Permit should not be issued for the proposed project.	WET24

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Doris Lawson Gerdes (36778)		
14479	In addition to those wetlands directly lost by the proposed project, the SDEIS should mitigate for all wetlands that will be lost or degraded by the indirect effects of groundwater drawdown, dust deposition, ore spillage during transport, stockpile leakage, etc.	WET24
14497	Furthermore, the SDEIS fails to disclose and factor into the analysis the losses associated with the disparities in tax revenue from the erosion of the mining production tax (especially relative to the value of ore) and production tax “rebates” back to the mining industry. Lost revenue could be calculated by updating the production tax, applying a minimum tax on the value of the ore and/or collecting an income tax on corporate profits on par with other countries. The analysis also mixes apples and oranges by aggregating predicted economic benefits from ferrous and non-ferrous mining.	SO05
16524	Direct loss of wetlands at the mine and processing site, degradation and loss wetlands along the waste rock transportation route, and hydrologic and water quality changes downstream from the project area would result in unacceptable losses of the ecosystem services that these wetlands provide, such as water regulation, water purification and nutrient cycling. Therefore, a USACE Section 404 Wetland Destruction Permit should not be issued for the proposed project.	COE03
16526	Wetland mitigation plans and vegetation rehabilitation plans are grossly inadequate.	WET01, WET04
16533	The information presented in the SDEIS is inadequate to address the environmental effects of the proposed project on groundwater. Groundwater mapping is incomplete for this part of the state. The proximity of the proposed project, especially the north side of the mine site, to the Laurentian Divide and the potential for leakage of polluted groundwater into the Rainy River Headwaters watershed was not addressed in the SDEIS.	WR061, WR080, WR087, WR099, WR135, WR168, WR169
<b>Sender Name (Submission ID)</b> Dorothea Diver (11355)		
264	To issue a go-ahead permit to a mining plan that so endangers - for 100s of years - our most precious resource - clean water - is an abdication or your department's mission to protect and do no harm to our environment.	WR115, WR195
1634	... the SDEIS as proposed by the DNR is very inadequate in failing to offer a plan that leaves the site clean and maintenance free.	NEPA09
1635	In addition, the water modeling that involves the ongoing protection of the Partridge and Embarrass Rivers has been recently proven very off - by a factor of four in some cases.	WR003
12712	I would ask that there be more studies and surveys done regarding the impact upon native plant communities identified by the MN Biological Survey by the proposed Polymet mine.	VEG02
12716	Today I want to point out that this mining plan completely disregards Minnesota Rules (6132.3200) that require the mine to be left maintenance free at closure of the plant.	PER04
12718	The SDEIS will require at least 500 years of active water treatment.	PD03
12719	The results of the studies showing the need for unimaginably long monitoring – clearly beyond the reasonable life of Polymet – highlights the unfeasibility of this kind of mining within Minnesota’s clean water standards.	PER35, WR035
12720	I don’t see provisions in the SDEIS for worker safety regarding the inevitable massive airborne contamination and dust emissions during the proposed Polymet mining operation. There is inadequate information concerning the long term effects of these contaminants on workers or the community. I ask that more studies be done in this regard as well as more safety precautions put in place for workers.	AIR09

12754	You cannot simply base the swap on acreage exchange – each wetland is complex in their functions within a specific site and I see no analysis offered which gives us adequate information about any of the specific wetlands sites involved in the ‘swap.’	WET14
12756	Plus, there has been no mapping of the water flowage on the entire mining area – what the contaminated water will actually do underground is at present an unknown.	WR135
12757	You cannot simply base the swap on acreage exchange – each wetland is complex in their functions within a specific site and I see no analysis offered which gives us adequate information about any of the specific wetlands sites involved in the ‘swap.’	WET14
12758	Plus, there has been no mapping of the water flowage on the entire mining area – what the contaminated water will actually do underground is at present an unknown.	WR135
12759	And since this site drains into streams that eventually flow into the St. Louis River – Which has only recently had major detoxification issues – and then to the impt. Body of Lake Superior – we should not move ahead with this project and land swap until more scientific information is available.	NEPA09
14426	The SDEIS is insufficient and should not be approved....The SDEIS must be redone to analyze the alternative of a completely lined tailings basin, which should avoid wetlands or streams.	ALT10
14427	These tailings are toxic as admitted and will be located next to the old LTV dump, which was built to admit leaking. Since there is no liner under the proposed Polymet tailings basin, we know that there will be leakage there as well – into ground water sources and streams.	WR117, WR133
14534	I call this plan economically unsound because Polymet has entirely skirted the issue of how the centuries-long “clean-up” (which they admit to) will be funded. The plan is entirely inadequate on this point and it will surely fall on the taxpayers’ shoulders. This is not in the public interest.	FIN10
14535	The SDEIS wholly omits specific plans for inevitable accidents or catastrophic crises. Other industries dealing with hazardous materials are required to submit such plans. Why not Polymet? Their residues are definitely hazardous – hence the 500 year necessity of monitoring water associated with this mine. It seems to be a completely cavalier attitude of Polymet on behalf of safety of both workers and the environment.	PD22, PD29
19194	It is so important that we get the standards for the projected Polymet undertaking set at levels that will set the bar for many mining projects which will surely follow. I therefore ask that the 18 areas cited as “Major Differences of Opinion” by the tribal co-operating agencies be addressed and corrected in the final EIS.	CR05, CR06
<b>Sender Name (Submission ID)</b> Dorothy Dolezal (50062)		
13017	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won’t end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN10
<b>Sender Name (Submission ID)</b> Dorothy Nordness (40640)		
6274	I have often visited northeast Minnesota for its beauty, its clean waters, and the life-changing experience of canoeing in the Boundary Waters...I am very concerned that this area be protected from any intrusion that could potentially disrupt this pristine area.	WILD02
6278	The long-term implications of PolyMet mining operation's water protection seem impossible to actually fulfill for the duration needed to assure that the water is not polluted with harmful chemicals.	FIN08, WR129, WR195

<b>Sender Name (Submission ID)</b> Doug Buell (23304)		
14894	The fact that PolyMet will reuse an existing plant and brownfield site in an area of the state that has seen continuous mining and processing for over 100 years is a positive in that a minimum of "new lands" will be disturbed.	PD28
14895	This mine and processing operation will provide well paying and full time employment, that is at a premium. I do not believe that "tourism" jobs will be adversely affect. For the most part unaffected jobs are minimum wage and part time. Those are jobs for students and second incomes and are not family supporting.	SO10
<b>Sender Name (Submission ID)</b> Doug Christy (57338)		
18441	we have, you know, the best and the brightest right here in Minnesota on our staff, as far as the DNR, the Forest Service, the Corps of Engineers, the University of Minnesota that have been studying this. And if people don't trust the information we are getting from them, who will they ever trust?	NEPA16
18442	People -- people have to work to live up here and this is one way they can do it. We need the jobs.	SO10
<b>Sender Name (Submission ID)</b> Doug Connell (18370)		
14675	I just want to make a point that the economic impact of this project is not restricted to the Iron Range. It affects all of Minnesota. It affects the region. The jobs that are created directly and indirectly are going to benefit the whole region.	SO10
<b>Sender Name (Submission ID)</b> Doug Halverson (40524)		
14264	I believe Polymet is doing all the right things to make their operation environmentally safe. I am very confident that there will be no pollution of any streams, rivers or lakes including the Boundary Waters.	PD28
14265	Even though some people feel that copper-nickel mining pollutes lakes and streams, I beg to differ as I grew up in Coniston, Ontario which is in the Sudbury Nickel belt. Even with 3 smelters running in the 1960's and 1970's there were no lakes or streams or rivers that were polluted by mining and smelting sulphide ores	WR190
<b>Sender Name (Submission ID)</b> Doug Hildenbrand (19940)		
1517	We are fully in support of proceeding with the project as proposed! Congrats to the agencies who have played a vital role in developing controls and measures that address environmental concerns.	NEPA16
<b>Sender Name (Submission ID)</b> Doug Lande (57346)		
18404	I am requesting that the executives in charge of approving or disapproving the DEIS will take the "no-action alternative," as stated in the executive summary, on Page 43, and that no land exchange of public property be allowed to create a mining operation for private financial gain.	LAN01
18407	the DEIS doesn't take into account uncontrolled Co2 emissions, such as that generated by the electric plant used by the mining operation. I don't think this is accounted for in the edition which says that the Co2 emissions are minor and not a major emission source. So, I would like to see all controlled and uncontrolled Co2 emissions related to the mining operation be listed.	AIR05
18409	I don't believe that the DEIS explains who does the monitoring of potential pollution sites, who pays for the monitoring, and where the public can access in an easy manner the monitoring results.	PD24

18410	I do not believe that, as stated in the DEIS, that reclaimed wetlands should serve for mitigation lands, as they will never again be as productive as they were before they were reclaimed.	COE01
18411	don't believe that the 90th percentile discussion of probable pollution levels related to water is appropriate and I believe the modeling to be flawed as described in the dissenting opinion of the tribes.	WR192, WR193
<b>Sender Name (Submission ID)</b> Douglas DeNio (42794)		
6896	Hard rock mining and surface/ground water contamination are not mutually exclusive. Recent and historical evidence of water contamination associated with hard rock mining in the Rocky Mountain West is prevalent and damaging....	WR023
6901	The take-away from the Summitville mine disaster as relates to the proposed PolyMet Mine are many, but the most prominent are 1)requiring an adequate performance bond and 2) ensuring design parameters meet present day climate conditions. As a registered professional engineer, I would state that the minimum performance bond requirement for the proposed Polymet Mine be in the range of \$500 -\$800 million dollars. Likewise in ever changing climate, all treatment, wastewater collection, storm water collection and containment facilities need to be designed for a 28 inch rainfall event over a 36 hour period to prevent mine contaminants from being discharged to ground or surface waters. ...Meaningful water modeling results require the input of rainfall events of this magnitude to insure prediction accuracy which translate into design parameters for all aspects of the mining facility and processes. Hard performance requirements such as these must be included as part of the Draft EIS for the proposed PloyMet mine....The Draft EIS does not sufficiently identify cumulative effects of future mining operations in conjunction with the PolyMet proposal. ...what happens to the mining permit after the NEPA process plays out and the permit is issued. Will PolyMet transfer the permit to another domestic, Canadian or Chinese firm for considerable remuneration? This possibility requires that the EIS address anychange/transfer maneuver so that all health, life safety and environmental provisions are ironclad and can be enforced wherever the final permit lands.	PER03
6908	Job projections on these types of natural resource extraction projects can be highly variable. I would estimate far less than half of the 350 jobs projected in the EIS will become available to existing Iron Range residents. Based on my observations with the gas extraction industry, top management, professional, mid level management and mining technicians will come from out of country or out of state. A significant amount of trade jobs will also be filled by non-resident employees. ...The draft EIS needs to identify net job creation for Iron Range residents after factoring in job losses from other existing local economies....Certainly the metal commodity has speculative component to it as would any commodity (copper is down in price for the past several months).	SO06
6909	The proposed PolyMet mining project will also jeopardize other sustainable economies that already provide existing jobs such as tourism, recreation, hunting, fishing, canoeing, etc.	LU06
<b>Sender Name (Submission ID)</b> Douglas Gregor (54857)		
19331	The best way to truly secure [financial assurance]... is to create a pool of funds that is: (i) held and "owned" by the State; (ii) is not "owned" in any way by the NorthMet site operators; and (iii) which is irrevocably available and committed to cover reclamation costs. The State also must secure the right to enter upon the production lands and perform any and all required remediationactions. To fully pre-fund such a "trust" fund would be prohibitively expensive for a start-up company such as is envisioned at the NorthMet site. A more realistic approach would be to require some pre-funding of such a "trust" fund, supplemented by more traditional forms of financial assurances for the balance of the initial projected reclamation costs.	FIN01, FIN08

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Douglas Gregor (54857)		
19333	To fully fund the projected reclamation obligations over time, the State might wish to consider a modified form of the Taconite Economic Development Fund program contained in Minnesota Statutes Section 298.227. That program sets aside a portion (31 cents per ton) of the production taxes levied by the State against the producer entity to be available for the partial funding of capitalimprovement projects. In the case of the ...NorthMet project, a similar portion of the production taxes collected by the State from its ore production could be placed each production year into a "Reclamation Fund" ...to ensure that funds would be available for use by the State when and if the producer entitycould not fund needed reclamation costs.	FIN01, FIN08
19334	The critical challenge of the [financial assurance] proposal would be structure the fund in such a way that no portion of those trust funds would ever be subject to the claims of any bankruptcy court or creditors of the producer entity. The fund would always be "as good as gold" and available to ensure that the State would not inherit any reclamation expenses	FIN01, FIN08
19335	there should be a "Citizens Advisory Council" ("CAC") established by special legislation that exists from the day that the initial permits are issued and continues ... until any and all site remediation work is completed ... While the State does have ... the responsibility for enforcing environmental regulations, history suggests that, over the course of time, adequate funding and staffing for such enforcement efforts may diminish, the regulators may become too accommodating and sympathetic to the interests of the producer, and the regulating agencies may be torn between the State's desire to promote economic activity, employment and tax revenues, and its equally significant obligation to protect the State's natural environment.	PER06, PER24
19336	... representatives [of the proposed "Citizens Advisory Council" could be drawn from the ranks of many of the same organizations that have... participated in the environmental review process- such as representatives of the local tourism industry, native American tribes, commercial fishing interests, natural environmental advocacy groups, water quality advocacy groups (from all potentially affected watersheds), and similar groups.	NEPA08
19337	To be and remain effective, the [proposed "Citizens Advisory Council"] CAC would have to have an assured and adequate budget ... [and] would have authority and perhaps even a mandate to employ professional engineers and environmental specialists, accountable only to the CAC, to monitor the site activities. It would be absolutely critical that the CAC have inspecting engineers on site during the construction and installation ... of all of the required environmental regulation facilities and equipment	PD24
<b>Sender Name (Submission ID)</b> Douglas Kuehl (44549)		
11768	There exists at least one assessment that ... needs to be considered before mining should be permitted... whether or not there exists sufficient need for the amount of copper and nickel expected to be mined when considering the current and future developments in replacement products, i.e. will the new technologies that have been developed using carbon nano-fiber for electronics, building materials, etc. rapidly replace the need for even small amounts of new sources of copper and nickel, thus resulting in rapidly making the mining operation unprofitable.	NEPA03
11772	This may be reviewed on the internet in, among other sources, at HYPERLINK "http://www.mining.com"www.mining.com by looking at discussions of the research results of Cambridge University, or simply searching for applications of carbon nanofibers on the internet.	REF01
<b>Sender Name (Submission ID)</b> Douglas P Fulton (54727)		
18716	The environmental review process has been long and very expensive, but the SDEIS demonstrates that PolyMet will help meet our nation's demand for copper, nickel, platinum, palladium, gold and cobalt, put Northeastern Minnesotans back to work and ensure the protection of our precious natural resources.	SO10

<b>Sender Name (Submission ID)</b> Douglas P Fulton (54727)		
18717	As described in chapter 5 of the SDEIS, PolyMet's NorthMet project would generate as many as 500 direct jobs during peak construction and 360 direct jobs during operations. The direct jobs would generate additional indirect and induced employment of 332 during construction-phase and 631 additional operations phase jobs. These jobs, as well as the estimated \$80 million annually in federal, state and local taxes, are very important to the future of the Iron Range and Minnesota.	SO06
<b>Sender Name (Submission ID)</b> Douglas Wood (45685)		
12855	I am opposed to the proposed PolyMet & Twin Metals mine operation in NE Minnesota...Because of the location of the minerals, all within igneous and metamorphic bedrock billions of years old and laced with fractures, the chances of acid contamination are high...A waste water treatment program that will need to be in place and stringently monitored and overseen for a period of at least 500 years... [high potential impact to water due to] location of these and other mining proposals is at the head of two great watersheds - St. Lawrence Seaway (including of course incredibly valuable and highly sensitive Lake Superior and the other Great Lake and Hudson's Bay.	WR001, WR010, WR111, WR198
12856	economic benefits of tourism alone in the area - the Boundary Waters alone is visited by 140,000 visitors a year on multi- day trips - dwarf these potential [socioeconomic] benefits in the short term, but more importantly in the long term.	SO02
<b>Sender Name (Submission ID)</b> Drake Best (54334)		
16892	The disadvantages overpower the advantages. The copper-sulfate mining process could boost Minnesota's economy, but we can find other ways to boost the economy. The effect on the environment is not good. Although PolyMet is planning to minimize or possibly avoid the effects, they can't stop everything that could happen.	SO01
16894	The Ojibwe people would lose part of the sacred Mesabe Widjiu. It is not fair to take away even one inch of their sacred land. Many Indian tribes throughout the country have lost most or all of its land. Taking away even more of their land is unethical.	CR03, CR05
16895	PolyMet should not mine in the region is, the effect it would have on endangered species. One endangered species in particular would be the Canada Lynx. The Canada Lynx are struggling to sustain a population in Minnesota and mining would only exacerbate the situation.	WI01
17402	If the project does take place, 913 acres of wetlands would be permanently lost. I understand that PolyMet plans to recreate some of these wetlands after the mining is done, but they will not be able to replenish the valuable home of organisms and many animals.	WET05
17405	Mining in this region would also harm the St. Louis River. As many people know, the St. Louis River flows into Lake Superior. There is already a lot of pollutants in the lake, and polluting a river that flows into the lake would only make things worse.	WR111
<b>Sender Name (Submission ID)</b> Dressel (54853)		
19061	...sulfate rock oxidizes...to create sulfuric acid...Sulfuric acid in ground water will cause leaching of heavy metals such as mercury from rocks further contaminating the water. These are unavoidable consequences of this type of mining. The proposed mine will require decades or perhaps centuries of wastewater monitoring and treatment...This is an intolerable length of time.	WR115
19063	...climate change has enhanced the likelihood of extreme precipitation events which can quickly overwhelm efforts to contain mine run-off.	WR180
19066	The proposed sulfate remediation process has not been adequately tested under the sensitive conditions prevalent in northern Minnesota...The mineral resources in the State are not going anywhere. The metals can be extracted later, safer, when the technology has been clearly proven.	PD32

19968	Some significant questions are left unanswered, including:How long will the mine need to be maintained? The study mentions 500 or more years. That sounds an awful lot like forever or we don't know to me.How much will maintenance cost? Maintaining a complex and polluted site forever would cost quite a lot, I assume.Who will pay the maintenance cost? I don't believe Polymet will be around forever so I can only assume that means Minnesotans will pay for it. Mining operations are expected to last 20 years, according to the study. After the 20 year boom what support will there ber for communities that will face the mining bust? Who will pay for and provide this support?	FIN01

<b>Sender Name (Submission ID)</b>	Elanne Palcich (42959)	
7515	In addition to underground water flow patterns, due to fractured bedrock, there is also some question about water drainage regarding the 100 Mile Swamp. According to 2011 lidar data, it appears there are actually man-made dikes that decide the water movement between the Rainy and Lake Superior watersheds.... More accurate mapping is needed.	WR071, WR080
15025	The Forest Service omitted an underground mine option as the only legal alternative; because it was omitted, the plan was never analyzed. As a result, the Forest Service has wasted tax payer money and agency time on the preparation of an open pit proposal that cannot meet the obligations belonging to the Forest Service.	ALT01
15026	The rationale for choosing the proposed parcels to be exchanged fails to demonstrate that this would be an equal exchange.	LAN03
15027	The Forest Service fails to adequately analyze the loss of wetlands and Aquatic Resources of National Importance (ARNI). The loss of wetlands in acreage would be significant and the quality of the wetlands irreplaceable.	WET19
15028	The Forest Service fails to adequately analyze the loss of wildlife, bird and migratory bird habitat, and the loss of wildlife corridors. Of great concern is the lack of analysis on impacts to threatened or endangered wildlife species or Regional Forester Sensitive Species (RFSS) of plants.	VEG01, WI01, WI02, WI03
15029	the concept of a land exchange as put forth by the Forest Service presents a precedence that would greatly facilitate the opening of a sulfide mine district in what is now Superior National Forest. The Forest Service is thus removing itself from its over-riding obligation to the citizens of this state and nation, in which land was put aside in order to protect the watershed and preserve the natural quality and character of the land for all generations.	LAN02
15030	The Forest Service also fails to adequately analyze the economic impact of copper-nickel sulfide mining in northeast Minnesota, by neglecting to analyze the costs of degradation to the environment over a time frame of 500 years or more, and by not considering the loss of current and potential jobs that are based on a clean environment.	SO01
15037	the Forest Service has neglected to adequately analyze cumulative impacts to the Forest, including continued mineral exploration, taconite mine expansion, and potential copper-nickel mining proposals from Teck Cominco and Twin Metals. The Forest Service has failed to fulfill its obligations to protect and preserve our public lands according to Federal law, including the National Environmental Policy Act (NEPA). The land exchange violates the Weeks Act of March 1, 1911, the Federal Land Policy and Management Act of 1976, and the Federal Land Exchange Facilitation Act of 1988	NEPA04
15038	Various land exchanges that are being considered must also be disclosed in the SDEIS and how they may impact the potential environmental impacts related to the PolyMet project. This includes the proposed School Trust Lands – Boundary Waters land exchange.	CU08
15040	On Mar 12, 2014 Rep. Richard Nolan [D-MN8] introduced H.R. 4220: To authorize the exchange of certain Federal land and non-Federal land in the State of Minnesota. This land exchange must be included in the PolyMet NorthMet environmental review. ...This land exchange ...must undergo citizen scrutiny.	CU08
15043	cumulative effects that include existing and already permitted taconite expansion must be included in sulfate and mercury impacts...potential PolyMet expansion as outlined in the Edison Report, and additional potential copper-nickel mining, as evidenced by bulk sampling by Teck Cominco and a pre-feasibility study by Twin Metals, must be included in mercury/sulfate impacts	CU02
15044	air-borne mercury impacts must be analyzed	AIR05
15045	existing pollution in the St. Louis River watershed must be incorporated into the data	CU01

<b>Sender Name (Submission ID)</b> Eli Bissonett (45195)		
9001	Please describe a realistic and enduring legal framework for financial assurance that would render damage deposits bankruptcy-proof. What is the agreed definition of "bankruptcy-proof", among Polymet and all involved agencies	FIN03
9003	Please include more qualitative modeling of the effects of the proposed action on mercury in fish, flora, and fauna.	VEG06, WI04
9005	Please conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS	HU01
15515	Please address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink.	MERC20
15522	Please redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity. Please don't let the SDEIS wording underestimate the possible magnitude of ground water base flow unpredictabilities, especially those incurred by seasonal fluctuations of water levels.	WR003, WR065, WR071, WR177
15524	Please provide detailed descriptions or modeling of how PolyMet mining operations could strain existing health and social service infrastructure.	HU01
<b>Sender Name (Submission ID)</b> Eli Riesgraf (54351)		
17629	The disadvantages though are not so obvious, people just think about what we will get from the mine and not what we will create from this. We will create pollution, as in bad air quality. The air we breathe to live, is going to get ruined, even if it's just a little bit, it will get ruined.	SO02
17631	In northern Minnesota [there are] a lot of cultural resources. The company would expand and ruin some of the cultural sites up there. They would ruin the sites with dust, smoke, and other air pollutants.	CR02, CR05
17632	The one good thing this company is doing is the land exchange. I think this is the good thing because they are giving back what they take and use. What I mean by that is that you are using like 6,500 acres for the mining, and in return you guys are buying around 6,500 acres and giving it to the public. Now that is a good way to give land back to the public.	LAN11
18178	I think the people up there agree with me when I say the pollution will affect their breathing. All the dust, smoke, and air chemicals will maybe cause diseases to people breathing the air pollutants. No matter how well you try to hold in the pollutants, some will always escape into the air.	HU03
<b>Sender Name (Submission ID)</b> Elias Anoszko (44798)		
12832	This mine is short sighted and would permanently impair the environmental quality of one of the most biologically rich areas of Minnesota.	VEG02
12833	Sulfide mining has never been shown to not pollute and we can expect to be dealing with the pollution from Polymet long after Polymet has gone bankrupt. Who pays for pollution? we the tax payers of MN will be paying for it, not the mining company.	FIN01
12834	The lakes of the BWCAW already have high levels of mercury pollution, making the fish in some lakes unsafe for human consumption. Polymet must not be allowed to add to the mercury load of these already threatened water bodies.	MERC02, MERC23
12835	Furthermore Polymet there is a good chance that Polymet would leach acid mine drainage into area lakes and streams that have inherently low buffering capacity. This could make much of the affected areas unsuitable for growing wild rice.	VEG04
16436	The mine plan inaccurately describes wild rice waters, understating the area that supports stands of wild rice.	VEG04, WR154

The major investor of this project, Glencoe, a Swiss owned company has a long history of illegal activity. Responsible mining and cleanup is not in their for profit interest.	FIN01
9436	If we could see the future, the choice would be clear. 526 acres of land on the edge of the BWCWA turned upside down, 167 million tons of waste rock covered by black plastic, supposedly enclosed in a waste treatment system, that requires continuous monitoring and maintenance for centuries to contain the toxins, which is realistically impossible. Hundreds of miles of dusty roads traveled by loud and smelly, polluting trucks, noise, light pollution. These mines are nothing like the Taconite mines of the past.	CU11

9443	Please protect our waters, the people that live here and the beauty that makes this one of Minnesota's favorite places to visit.	LU06
11098	There is also a long list of previous mining projects that have failed to meet environmental standards, leaving the area polluted and sticking the local government and its taxpayers to pay for clean up, or more likely, to live with the pollution because clean up is too expensive and often not even possible.	FIN01
11099	It seems obvious that the risks far outweigh the potential benefits of this project. Why would we sacrifice even an acre for the short term impact of a few jobs and a bump in the economy when we know the benefits (if there are any) would be temporary and the negative consequences would certainly be passed onto countless future generations?	SO01
11101	Who will be responsible for the long term management of the water and area polluted by this mine? Of course the company and its investors should be, but we know the company will try to weasel out of any clean up and long term pollution management.	PER02

10231	I am writing to request the immediate termination of PolyMet's project to implement the first open-pit copper-nickel mine in an area comprised of wetlands and water ways that could lead to the possible contamination of the Boundary Waters and Lake Superior.	WET24
10240	...sulfide oxides will release heavy metals in the ground and the water bodies around the mine. Decades after the mine has been closed, those heavy metals will remain in the soil and the water. That will be the same water in which many organisms have found their habitat, the same water used to grow our crops, and the same that will eventually be used for human consumption.	HU03
10248	The birds, fish, mammals, all part of the food chain, will be contaminated [by heavy metals], and contaminate the organisms that prey upon them.	AQ05
10251	Alternatives to open-pit mining do exist, such as hydrometallurgy. A leach liquor solution is used to extract the precious metal. An extractant is then used to extract the metal out of the solution then purified for use. This process will not generate millions of tons of rock waste, cheaper and more environmentally friendly than the traditional mining processes that cause a lot of pollution.	ALT19
10254	... the pollution that will be caused by the mine will take far too much time and resources to clean up. There are benefits to this mining pit, namely the much needed copper. However, the cascade of drastic consequences the pollution will bring, leading up to health issues in human populations. For these reasons, I strongly urge you to put a stop to this project.	HU03
<b>Sender Name (Submission ID)</b> Eliza Schrader (9617)		
15004	the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever... This project would violate water quality standards for generations to come.	WR195
15005	the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
15006	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.	MERC02, WR041, WR115, WR189
15009	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR017, WR018, WR022

15012	The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet’s tailings would be placed on top of huge, leaky and unstable existing tailings piles.	GT07, GT15
15355	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
15356	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures.	WR012
15357	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won’t allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189, WR202
<b>Sender Name (Submission ID)</b> Elizabeth A. Phyle (43954)		
6884	The benefits of job creation and mineral access are simply not outweighed by the heavy [environmental] costs. ...The estimated 500 years of water clean up that will be necessary if this project is approved, far out ways the short term benefit.	SO01
6893	[PolyMet] should not be able to generate these [environmental] externalities in Minnesota and leave with the bulk of the profit.	FIN01
<b>Sender Name (Submission ID)</b> Elizabeth Ann Fryberger (57138)		
16830	Water is vital to life and Minnesota must protect this dwindling vital resource.	WR195
<b>Sender Name (Submission ID)</b> Elizabeth Bartlett (43416)		
15563	The people whose health would be most impacted are the miners and their families, probably for generations to come, the local indigenous population, and first and foremost women and children, including fetal health. Even small doses of mercury, methylmercury, lead, arsenic at critical moments of fetal development will cause irreversible damage to internal organs, spinal development, and brain development.	HU03
15566	Would the owners of Polymet be willing to have the pregnant women among their loved ones be exposed to the toxins that will be released in this mining project? I say, that they themselves must be willing to live here, drink this water, breathe this air. This is a multinational corporation which has no stake in the local population.	HU03

14276	This mine sends us in the wrong direction for caring for our state and it's beautiful lands, which belong to ALL Minnesotans. I hiked in Superior National Forest last year and I don't want it to be the last time.	LU06
<b>Sender Name (Submission ID)</b>	Elizabeth Olson (58032)	
19839	A state that prides itself in its lakes - the PolyMets Toxic Sulfide Mine will DEFINETLY endanger this resource.	GEN01
<b>Sender Name (Submission ID)</b>	Elizabeth Plummer (16222)	
10152	PolyMet should have a plan to reasonably clean up the water before they are allowed to proceed.	WR130, WR143
<b>Sender Name (Submission ID)</b>	Elizabeth Sivertson (42863)	
8873	My overall concern about the SDEIS is that it fails to show to how toxins will be kept out of the water systems leading to Lake Superior. The water "treatment" and collection systems under rock waste piles being managed by pumps at the end of 2 mile long rock piles 25 stories high seem inadequate to keep leaching toxins from entering the water ways. With the many possibilities and probabilities that those systems could fail in their goal to prevent water pollution, I believe that PolyMet's plan is inadequate. Planning to pile sulfide bearing tailings on an old LTV pit storage area (originally meant for iron tailings to drain into streams) is irresponsible.	WR021, WR111
8877	What bothers me is the unfounded claims by PolyMet to be able to collect the rain run off for treatment in a wetland rich area, to somehow "contain" the toxins and then treat them sufficiently with pumps and treatment systems that would need to be in place for as much as 200-500 years.	WR195
9398	Their models and graphs showing that the toxins will increase as these tailings piles age- leaching more toxins by many times as much in about 40 years' time .... and long after companies could be held accountable	FIN01
9406	All of the floods and accidents that could occur, and the fact that the SDEIS is inadequate in addressing such probable accidents or floods... [with no] sufficient safeguards in case of flooding, or accidents or spills addressed in the SDEIS.	PD22
9407	There are fractures in the earth below the PolyMet site, and new fractures would no doubt be created by the several times a week mine blasting.	WR012, WR016
9408	I don't believe PolyMet's plan to build a 5 mile long cement wall to bed rock would be sufficient to "hold" toxins from leaching into water systems. I can't imagine how the geological evidence showing such a water rich landscape could possibly kept out of harm's way during such an enormous mining operation.	WR018, WR019
9409	I have trouble believing that 32,000 tons of waste rock produced every day, hauled in trucks, dumped on wetlands- every day for 20 or so years, will not have ample opportunity to leach devastating amounts of sulfide content, mercury, cobalt etc.	WET24
9410	PolyMet's SDEIS shows more "hopeful" predictions of water flow than are even realistic. Since the water flow data in the models used by PolyMet are now shown to be inaccurate, I have less faith in claims of "safe levels of toxins" to be emitted by PolyMet's mine operation.	WR003, WR189
9411	PolyMet has not shown us a feasible or plausible way to both mine copper/nickel, and keep the water from getting contaminated.	PD23

7506	The document says that 912.5 acres of wetlands located within the NorthMet Project area would be permanently destroyed	WET24
7508	Yet it turns out that the document's flow modeling is faulty. According to the DNR, the average flow of the Partridge River is 1.5 cubic feet per second (CFS), while the SDEIS model uses a 0.5 CFS average flow (...) water will travel through bedrock (...) It is just wishful thinking to assume that water movement through bedrock is 0.	WR003
7514	The SDEIS improperly discounts the important of mercury pollution (...) and even plans not to evaluate it as one of the constituents discharged into the Partridge and Embarrass Rivers (...) All waters potentially impacted by the PolyMet operation already exceed water quality standards for mercury (...)	MERC04, MERC16
7516	The north-south movement of many species across the Iron Range has long been difficult, and this new project would destroy one viable corridor.	WI03
7519	Copper, nickel, mercury and others will be constituents of the dust riding from the mine site (...) There would also be significant local deposition, with as much as ¼ of its settling directly on adjacent rivers and streams.	AIR09
7522	An operation that would generate new greenhouse gas emissions amounting to nearly .5% of all of the state's emissions, with arguably insignificant benefits, should not be permitted.	AIR01
7530	The SDEIS includes no plans for dealing with the kinds of failures and mishaps that routinely occur in mining operations. And because the provisions regarding financial assurance are so plainly inadequate, the SDEIS does not tell us how the costs of responding to such failures will be covered. This has huge implications for how much it will cost to maintain all the systems necessary to handle the contaminated water – for perpetuity.	FIN01, FIN05

7531	But it looks to me as if the entire proposed action, if carried out, would be in violation of the Minnesota Environmental Rights Law.	PER35
18713	The document fails to analyze the cumulative impact of similar deals involving transfers of public lands and access to minerals to the mining and drilling extraction industry across the nation.	CU10
18714	The SDEIS does not show that the transfer of 6,650 acres of the Superior National Forest (SNF) to NorthMet is in the public interest. It does show that the exchange would not be good for the health of the land USFS is entrusted to care for. With the possible exception of the MacFarland Lake parcel, which the SNF would acquire, there does not appear to be any benefit to the Forest or the public.	LAN01
18720	Wetlands that would be harmed or destroyed by the PolyMet mine are part of the headwaters of Lake Superior, and recognized by many people and by the EPA as being water resources of national and international importance. The USACE should deny the Section 404 Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest.	WET19
18722	I find nothing in the document that adequately addresses what these permanent losses [of biodiverse wetlands] would mean to the ecosystem, and to us.	WET05
19449	The PolyMet SDEIS should include a documentation of the time and money the Superior National Forest has invested in this exchange over the past decade and show how that weighs against impacts to ecosystem components and benefits/losses to the public...	LAN01
19450	...the document's flow modeling is faulty...the water modeling needs to match conditions in the real world.	WR058, WR071, WR086, WR087, WR088, WR091, WR092, WR093, WR096, WR098
19451	The complex hydrologic system underlying and surrounding the operations sites is not adequately described in the document or its technical reports...	WR023, WR071, WR087, WR098
19452	The technical content of the SDEIS, the Water Modeling Data Package, and other supporting information, is extremely hard for an ordinary citizen like me to understand, but it looks like the writers juggled factors so that the end result would be a rosy picture of no significant impact.	NEPA07
19453	Questionable strategies include using the natural presence of a substance in the environment (such as aluminum) to allow or ignore discharge of this substance by PolyMet; siting evaluation points along the Partridge River in such a way that no exceedance of standards can be shown; failing to site evaluation points where they are clearly called for; using the varying degree of "hardness" of the water to mask its discharge (such as lead).	WR064, WR071, WR072, WR083, WR107, WR108, WR177
19454	The SDEIS improperly discounts the importance of mercury pollution that would be generated by the project.	MERC17
19455	PolyMet must analyze the amounts of mercury that would enter both the Partridge and the Embarrass Rivers.	MERC16
19456	Wetlands lost or degraded by the project will no longer function to bind up mercury as they do now; as far as I can tell that deterioration of an important ecosystem function has not been analyzed, as it should be.	MERC09, WET07
19459	The SDEIS projection that the project will not increase sulfate levels is supported only by the faulty water flow models...The SDEIS should analyze impact to these resources [St. Louis River Watershed, wild rice, and fish] across a realistic range of discharge levels for sulfates and mercury.	AQ05

19461	...the SDEIS must analyze alternatives that could reduce wetland loss and water pollution.	ALT06, ALT13
19464	I don't believe the DSEIS examines how the project would impact existing transportation corridors and their current users, or potential new routes...	SO04
19466	Light pollution...obliteration of countless features of the night sky...should be analyzed.	LU04
19468	It seems shortsighted to fail to study the likelihood that this mine would produce the same dangerous fibers [asbestos-like] found in nearby mines that have caused such misery and expense.	HU01
19470	...the provisions regarding financial assurance are so plainly inadequate...	FIN08
19473	The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged.	HU03, WI04
19476	[The SDEIS] lacks basic information as to the costs of various treatment, containment, abatement, and mitigation measures...The lack of analysis of the likelihood of unforeseen problems...contributes to the failure of the SDEIS to provide what is needed.	FIN05, FIN11
19478	Please revise the SDEIS so that it shows calculations used to reach specific estimates of costs of closure and perpetual treatments, and how funds will be held so that they are available across the decades and in the case of bankruptcies.	FIN01, FIN05
19481	Please revise the document to include a detailed cost/benefit analysis that includes costs such as the loss of jobs associated with tourism and a healthy environment; declining quality of life in our region leading to depressed real estate values; taxpayer subsidies for the industry in the form of infrastructure development and tax breaks.	SO02
19485	Tribal rights to hunt, fish, and gather under the 1854 Authority would be impacted by the proposed action, and these must be included in a cost/benefit analysis as well.	CR01
19489	It looks to me as if the entire proposed action, if carried out, would be in violation of the Minnesota Environmental Rights Law.	PER35
<b>Sender Name (Submission ID)</b> Ellen Jones (46066)		
14573	Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules [6132.3200] requiring that mines be "maintenance free" at closure... The [NorthMet] mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule.	PER04, WR035
14576	Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment.	WR036
14577	Revise the SDEIS to address Minnesota Rules 6132.3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free."	PER04
14579	How will wildlife survive with polluted water?	WI04

14581	Who cares if there were jobs in this decade if the area is toxic in the next decade? The benefits of a few hundred jobs are simply just not worth these costs.	SO01
<b>Sender Name (Submission ID)</b> Ellen Lease (47780)		
8643	If it is true that this effort will produce only 90 highly technical jobs that locals will likely not be prepared to fill, it does not significantly decrease levels of unemployment in that county.	SO02
8645	If the estimates that water quality could be negatively impacted for as long as 500 years is accurate, there is no benefit to Minnesotans for allowing this to proceed. There is, in fact, great detriment.	WR195
<b>Sender Name (Submission ID)</b> Ellen Mork (43105)		
10088	This mine would destroy over 900 acres of high quality wetlands and indirectly harm up to 8,264 acres... It is my understanding that there has been no plan produced for the mitigation of the loss of these wetlands, according to Minnesota law.	WET01, WET04
10091	I have also learned that PolyMet plans to use the existing unlined tailings basin used for iron ore to hold the tailings from the sulfide ores. This is a plan for distribution of the sulfuric acid into the local streams, lakes and underground water supplies. It would be dangerous for those living within the range of these waters, as well as the fauna and flora in the vicinity.	WR060, WR108
10092	Since there are rivers near the mine and plant sites that flow into the St. Louis River, it is obvious that these rivers will all be polluted with acid mine drainage [and]... the St. Louis River is already heavily polluted.	WR109, WR111
10094	Regardless of the inflated figures provided by PolyMet for new jobs in the region, experts know that the numbers are more like 350-400, many of whom would be "imported" from Canada and other regions...The number of jobs available to Minnesotans of the Range will be minimal.	SO06
10117	I understand that this SDEIS still does not contain financial assurances of funding to cover the 200-500 years of required clean-up that will continue to be needed to ensure that Minnesota taxpayers are not left holding the bag.	FIN01
10118	Geologists have reported the existence of underground fractures that could increase in number by the blasting that would occur to break up the sulfide ores. Each fracture would have the possibility of transporting pollution into the ground water. I can see no mitigation from this problem	WR016
11406	[PolyMet] must be required to line that [existing tailings] basin!	PD10
11418	Minnesotans are recommended not to eat more than a certain number of fish caught in these waters due to the level of contamination. Adding more cannot help the situation!	MERC02
11424	the PCA has postponed their decision on sulfate levels in wild rice waters. I have no idea how this decision might impact the conclusions of the DNR, but I would suggest that when standards are still undecided, decisions pertaining to those standards ought not be concluded.	WR164
11429	The Arrowhead and surrounding areas have had remarkable success with tourism, an economic sector which would certainly decrease as mining increases. Tourists don't want to come and fish and hunt in areas with declining water quality and increasing pollution.	SO02

<b>Sender Name (Submission ID)</b>	Elton Brown (15535)	
696	The Minnesota Environmental Rights Act states that economic considerations alone cannot justify the destruction of our precious natural resources. Clearly the PolyMet plan will result in environmental destruction and degradation (loss of valuable wetlands, loss of an important wildlife corridor, the huge amount of electrical energy needed, and the seemingly-inevitable long-term leakage of heavy metals and toxic water).	NEPA09
698	Where are the company’s assurances of wage levels and benefits? Should there not be a realistic analysis of how many jobs will be offered to Iron Rangers ...? Further, is there any way to hold PolyMet (and its parent corporation) legally obliged to fulfill its promised local hires and wage levels?	SO06
702	If we permit this industry ..., should we not raise the meager percent of taxes they will return to the state? ... It makes no sense to sell off these world-class non-renewable resources so cheaply.	SO04
704	Will PolyMet be willing to set aside enough money to completely pay for the monitoring of containment barriers, the quick repair of leaks caused, say, by some unexpected flood or earthquake of the century, the maintenance (and eventual replacement) of reverse osmosis installations, etc?	FIN05, FIN11
705	Should not the public be told now how this huge sum of money will be paid and held safely in escrow for future maintenance and clean-up? Why is the SDEIS so vague on this critical and thorny issue? Any short-term financial benefits to Minnesotans will be more than negated in the long run if clean-up costs fall yet again on taxpayers.	FIN01, FIN10
707	I also wonder if there is a way to hold the parent corporation legally responsible for future clean-up costs once the PolyMet subsidiary declares bankruptcy or simply dissolves when the North Met project is no longer profitable?	FIN01
708	The PolyMet PDEIS is inadequate in its failure to include an analysis of the costs of this mining proposal to the local economy. Is there a realistic estimate of lost income from tourism, fishing and hunting licenses, etc, should a large hunk of the Superior National Forest be lost to heavy industry?	SO02
709	Also, what protections and compensations are in place for the well water and air quality of the rural Babbitt and Embarrass homes which are just a few miles north of the project? Will the mining corporation have the requirement and the assets to purchase private properties whose value and livability are compromised by the PolyMet operations?	SO03
710	Does the SDEIS adequately disclose how much fuel will be burned by the huge shovels, trucks, and machinery used in the extraction, crushing, and transportation systems? Are the emissions of these vehicles added into assessment of the impact of the project to our air quality and haze? ... does the SDEIS include adequate safeguards for the transportation and storage of gas and oil (as well as any other toxic agents used in the mining process)?	AIR10
711	Similarly, does this SDEIS adequately factor in the extra emissions put into our atmosphere by the power plants which must produce the huge electrical energy demand of the project?	AIR02
714	Given that many children on the North Shore already have higher than average mercury levels, how can we allow the PolyMet plan to be so vague on the amount of mercury they will be adding to the environment?	SO01
716	Given the recent revelation that the Partridge River actually carries a much larger average flow than the numbers used in the SDEIS modeling, should not the company at the very least redo its environmental impact predictions by using more accurate data?	WR003
718	should not the SDEIS include more details on what will happen when natural water levels are high? Specifically, when the mine experiences torrential rains ..., can we be assured ... that PolyMet has a foolproof plan to avoid all unwanted discharges during the ever-more-frequent “storms of the century”?	WR057, WR077, WR180, WR193

<b>Sender Name (Submission ID)</b> Emily M Brown (54671)		
17885	PolyMet's open pit form of copper/sulfide mining involves destroying hundreds of acres of wetlands in the Partridge River headwaters. Most of these wooded wetlands are of high quality and are key to providing mitigation for flooding, food for fish downstream, and maintaining water quality downstream. Also, these wetlands are an important habitat for waterfowl, moose and other wildlife. The US EPA notes that these wetlands may qualify as "aquatic resources of a national importance". That designation would require a higher level of protection than is currently planned.	WET19
17886	Thousands more [wetland] acres would be indirectly harmed by air and water pollution and by the redirecting of water that is needed to support wetlands. PolyMet does not plan to include compensation for these thousands of acres that would be indirectly harmed. Their "wait and see" approach means agencies may or may not mitigate later.	WET01
17887	Since PolyMet's mine plan did not consider any alternatives to reduce wetland destruction and water pollution, it is doubtful that any such solutions would be found.	ALT06, ALT13
17888	All reputable climate scientists tell us that extreme weather, long periods of drought, and events such as Duluth's dramatic flooding two years ago are the new normal. Therefore, I submit that new public policy should place an ever higher value on clean water, which is our greatest natural resource here in northern Minnesota. Any plan such as PolyMet's needs to take a more serious approach to accommodate extreme weather and inform the public on how they will prevent torrential rainfall from bursting dams and overflowing waste storage basins.	WR077
17889	we must stop the growing reality of climate change. The increase in CO2 parts per million pertains to the larger amounts of electrical energy that this kind of mining requires. At this point that energy source would be mostly coal. In addition, the fuel used by the huge trucks and heavy equipment proposed would add even more CO2 to the air we breathe. PolyMet's project should be postponed until we have energy sources that are not dependent on coal and gas.	AIR02
17890	There is already an issue of haze in the BWCAW. The problem of clean energy needs to be solved before PolyMet adds to the current level of pollution. The SDEIS needs to address this aspect of the project's environmental impact.	CU11
17891	an environmental impact statement that is responsible to future generations of Minnesotans needs to take into account the big picture of climate change and the long-term effects of adding an intensive industrial operation to our already endangered waters, forests, and air.	PD22

613	I am not at all convinced that the short term goal of mining is at all worth the inevitable pollution it will cause.	SO01
616	Nor am I convinced that PolyMet will be able to reverse the damage to water and land to it's original healthy state.	WR115
617	I am afraid the pollution will inevitably enter the near by Embarrass River and Partridge River which flows into the St. Louis River that then flows into Lake Superior.	WR111
<b>Sender Name (Submission ID)</b> Emmy White (20147)		
1739	I simply can not understand how the DNR could stand by a consider copper mining in our watershed area. To contaminate the waters for our generations to come is unthinkable.	WR115
<b>Sender Name (Submission ID)</b> Emrys Stramer (18192)		
4009	The PolyMet project would increase arsenic in Colby Lake by 38.5 percent. That is the drinking water for Hoyt Lakes.	WR043, WR123
4010	Arsenic also accumulates in fish and wild rice. Low-income people who fish and rice for food have the most cumulative risk	VEG04
4011	The SDEIS must be redone to make a cumulative assessment of arsenic and cancer risks for people in Hoyt Lakes, including people who rely on fish and rice for food.	HU01
4014	the EIS must analyze fully the impact of the PolyMet proposal on any animal or plant species relevant to any tribal property.	CR01, CR06
13428	The proposed mine is located within the 1854 Treaty on Ceded Territory, and three sovereign nations retain, never gave away, their hunting, fishing, gathering rights. Under federal case law, these rights are for the welfare and well-being of tribes, and federal caselaw provides that the ceded land must remain productive for the exercise of those rights.	CR01
<b>Sender Name (Submission ID)</b> Environmental Law & Policy Center (42967)		
5908	Because of the many significant impacts from the proposed project and flaws in the SDEIS, the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers and U.S. Forest Service should deny PolyMet's state mining and Clean Water Act Section 404 wetlands permit requests and the proposed land exchange.	PER35
5910	The Minnesota Department of Natural Resources, U.S. Army Corps of Engineers and U.S. Forest Service should choose the No Action Alternative and deny the requested permits and land exchange.	PER35
5911	At the very least, the agencies must update the SDEIS with required analysis that was not included and correct other significant flaws identified in the comment process before the agencies make a decision on the proposed mine.	NEPA04
5912	Water Quality. The SDEIS and mining plan do not reasonably assure that the mine will not result in significant, irreversible water pollution. The SDEIS and mining plan model mechanical or potentially other types of water treatment as being required for at least 200 years at the mine site and at least 500 years at the plant site to prevent sulfate and other water pollution to watersheds connected to Lake Superior.... No plan is presented that reasonably assures that water treatment will be possible and effective for the stated hundreds of years at a minimum.	WR035

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Environmental Law & Policy Center (42967)		
5913	Because of long timeframes that remain unknown, there is similarly no meaningful demonstration that mine closure and reclamation will actually be possible. It is simply not reasonable to determine – as the SDEIS does – that there are no significant sulfate and mercury water quality impacts from the proposed mine when the proposed treatment is not demonstrated as effective, when the water treatment relies on models that are projecting up to 500 years into the future and when significant impacts are almost certain if the proposed treatment is not effective for hundreds of years.	WR035, WR128, WR129, WR196
5914	The agencies should deny the project on these water quality impacts alone. It is unreasonable to approve a project that requires fully functioning water quality treatment for hundreds of years into the future to avoid serious harm to Lake Superior and the watersheds adjacent to the mine. Approval on these terms would constitute arbitrary and capricious agency action.	PER35
5915	The SDEIS' Cumulative Effects assessment is incomplete because it fails to include an analysis of the cumulative impacts of regional mining affecting Lake Superior... The SDEIS's Cumulative Effects assessment includes only mining and similar projects in Northern Minnesota. At 6-15; Table 6-1. However, there are a number other current and reasonably foreseeable mines near Lake Superior in Wisconsin and Michigan's Upper Peninsula. For example, large-scale existing and proposed mines include the Penokee Mine in Wisconsin, the Empire and Tilden Mines near Marquette, Michigan and the Eagle Mine in Michigan. These mines' cumulative impacts on Lake Superior and the watersheds on which it depends must be analyzed before the agencies can determine that there are no significant cumulative effects to Lake Superior.	CU18
5916	The SDEIS' Alternatives analysis is too narrow...the SDEIS considers only one alternative other than the No Action Alternative, and that alternative is just the same proposed mine, but with a smaller land exchange acreage...Considering just one marginally different alternative is too narrow of an alternatives range to satisfy NEPA and MEPA. The SDEIS should consider additional reasonable proposed alternatives, such as an alternative analyzing an underground mining proposal and an alternative requiring back-filling the mining pits with waste-rock after closure.	ALT01, ALT03
5917	The PolyMet mine would cause serious harm to the Endangered Canada lynx and the SDEIS fails to analyze impacts to Minnesota's moose population.	WI01
5918	The mine and its related activities would also further increase the fragmentation of remaining Canada lynx habitat. However, the SDEIS fails to include alternatives that would mitigate impacts, such as alternatives minimizing new roads and traffic increases in Canada lynx habitat.	WI02, WI10
5919	[T]he SDEIS' moose analysis does not meaningfully address how PolyMet's proposal will impact moose or moose habitat. The MDNR should insist on a thorough, specific analysis for this iconic Minnesota species before it issues any mining permits.	WI01, WI02
<b>Sender Name (Submission ID)</b> eric baldus (42219)		
6686	This is an extremely dirty process and a very disruptive method of mining. The tailings that are produced are full of toxic elements.	HAZ03
6691	The number of jobs created is negligible...It is extremely short sighted to think that the jobs created would be worth the [environmental] risk.	SO01
6693	To believe that the state will be able to escrow enough money for 200+ years of water cleanup is ridiculous	FIN05, FIN08

7986	I don't believe [the EIS] deals with ground water contamination to the extend that is necessary to protect this precious resource.	WR107, WR108, WR130
8009	[Materials produced by PolyMet] should read that they think they can capture up to 90% of surface water because this mine proposal is really a scientific experiment.	WR018
8011	Even if the mine were able to capture 90% of it's waste water from entering the ground water supply, the remaining 10% entering ground water represents hundreds of millions of gallons of contaminated water entering the aquifer.	WR107, WR108, WR129
8014	As bad as it would be for the proposed mine to contaminate surface and run-off waters surrounding the PolyMet mine site, it would truly be a tragedy to let hundreds of millions of gallons of water with toxic fibers and heavy metals contaminate our most precious resource, our ground water.	WR107, WR108
<b>Sender Name (Submission ID)</b> Eric Larson (9900)		
13123	It is critical that you responsibly reject the inaccurate PolyMet NorthMet SDEIS and acknowledge that PolyMet's open-pit sulfide mine plan would have enduring negative environmental impacts on surface and ground water quality past the lives of your great great great grandchildren...In absolute fact, the PolyMet SDEIS and the PolyMet sulfide mine plan still represent unacceptable risk to the incredible current and future asset of clean water that the world will value incredibly highly until well past the lives of your great great great grandchildren.	WR195
13429	In absolute fact, the PolyMet SDEIS and the PolyMet sulfide mine plan still represent unacceptable risk to the incredible current and future asset of clean water that the world will value incredibly highly until well past the lives of your great great great grandchildren. To take any risk with this, much less a high risk, demands your action to reject it.	SO01
13430	You must act to protect the environment from the money and political pressure that should not influence a thorough scientific assessment and conclusion. Your actions will have more long term impact that virtually any decision facing the state.	NEPA18
<b>Sender Name (Submission ID)</b> Eric Morrison (18177)		
3958	The wetland that PolyMet is seeking a permanent discharge into is called the 100-mile Swamp....It is an inconvenient fact that the authors of the Environmental Impact Statement simply do not want recognized that mining waste will flow to the Boundary Waters by way of the 100-mile Swamp and the Dunka River.	WR081
3959	Worse than just having the statement about the delineation of the 100-mile Swamp, they redo the maps of the 100-mile Swamp solely as to omit the part of the swamp that drains to the Dunka River. (Inaudible) this appears on page 472 of the SDEIS and at least five other maps.	WR080
3963	No baseline water testing was done in Langley Creek or in the Dunka River or any other part of the Boundary Waters Watershed. And nor would any testing be done if mining were allowed. This leaves the Dunka River and the BWCA completely and utterly unprotected.	WR081
3964	At a minimum I'm requesting Governor Dayton compel a bonded public review period of 180 days for this SDEIS; and compel a subsequent SDEIS, which has the correct geographical features in it and requires water testing for the Dunka River and the Boundary Waters.	NEPA07
8758	Mention of both the One Hundred Mile Swamp and the Dunka River as it relates to hydrology of the mine site is completely absent from the SDEIS and may be intended to obscure the impact of the proposed mining on the BWCAW wilderness area.	WR080, WR081

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Eric Morrison (18177)	
8759	Reverse osmosis its likely to be completely impractical because of short membrane lifetimes...other maintenance issues... non mechanical treatment methods proposed for the 200 to 500 year treatment are not only unproven, they do not exist today.	FIN05
10596	The safety of the Boundary Waters Canoe Area from mine drainage that will be created by PolyMet’s proposed NorthMet mine has not been established. The [SDEIS] ...makes no adequate statement about whether water discharged from the mine site can possibly enter the [BWCA] Wilderness ...Without a definitive statement and data about mine waste and the BWCA, the NorthMet Project SDEIS is inadequate.	WR081
10620	The proposed mine site is just south of and uphill from a wetland area named the One Hundred Mile Swamp which drains to both the Saint Louis River watershed and the Rainy Lake (BWCA) watershed. Because the mine site drains to the One Hundred Mile Swamp and the One Hundred Mile Swamp is geographically connected to the BWCA, the mine cannot possibly be isolated geographically from the BWCA. Hydrologically, the SDEIS includes no hydraulic conductivity testing for the One Hundred Mile Swamp which would indicate the extent to which the mine is hydrologically isolated from the BWCA.	WET19, WR024, WR071, WR080, WR081, WR111
10648	In US Government maps, the One Hundred Mile Swamp is a 10.4 mile long depression straddling the Laurentian Divide that drains to both the Partridge River which is a tributary to the St. Louis River and Langley Creek which is a tributary to the Rainy Lake (BWCA) watershed. Groundwater contours for the swamp are easterly descending towards Langley Creek which promotes movement of mine waste to the BWCA watershed while the closer proximity of the mine to the Partridge River drainage site would minimize flow to the BWCA... Estimating the proportion of mine waste that flows to the two watersheds requires lateral hydraulic conductivity testing in the One Hundred Mile Swamp. Over the time scale that mine site drainage will leach pollutants and furthermore considering likely excursions in weather and water levels, flow to the BWCA is almost certainly not zero.	WET19, WR024, WR071, WR080, WR081, WR111, WR175
10671	Not only does the environmental impact study fail to properly consider hydrology around the mine site, it includes incorrect information. A misleading statement was inserted into the Wetlands Section (4.3.3) of the SDEIS late in the drafting process regarding the unavailability of geographical information for the One Hundred Mile Swamp. The statement “however, no delineated boundary exists for the One Hundred Mile Swamp” on page 4-429 is false. Delineated boundaries for the One Hundred Mile Swamp do exist and are available at <a href="http://www.nationalatlas.gov/streamer">http://www.nationalatlas.gov/streamer</a> " <a href="http://www.nationalatlas.gov/streamer">www.nationalatlas.gov/streamer</a> [2].	WET19
10689	[SDEIS] maps represent the One Hundred Mile Swamp in a way that is contradictory to the US National Atlas. The portion of the One Hundred Mile Swamp that drains to the BWCA watershed is missing in SDEIS maps. Contradictory maps in the SDEIS support the implication that seepage of mine waste water to the BWCA watershed will not occur. In SDEIS maps, the One Hundred Mile Swamp is depicted as a 5.5 mile long body of water that exists only on the St. Louis River watershed side of the Laurentian divide as compared to the 10.4 mile long wetland in the National Atlas that exists as a depression straddling the divide and drains to both the St. Louis River and Rainy Lake Watersheds. The first incorrect map of the SDEIS appears as Figure 4.2.3-1 and there are at least five others. The periphery of the One Hundred Mile Swamp in SDEIS maps was marked with a dashed aqua colored line on a green satellite image background making it difficult to see, and the fact that geographical coordinates were also not provided makes it challenging to compare SDEIS maps to existing maps. It is a concern that the authors of the SDEIS appear to have intentionally obscured map features in support of the misrepresentation that mine waste water will not flow to the BWCA.	WET19, WR080, WR081, WR175
10698	On the basis of the re-drawn maps, attention has been diverted from the Boundary Waters. No baseline water testing was done in Langley Creek, the Dunka River or anywhere else in the Rainy Lake watershed nor would any water testing be done if mining were allowed. Absence of water testing in the Rainy Lake watershed leaves the BWCA and Quetico completely unprotected. Before permitting can move forward, addenda to the SDEIS are required including correct watershed mapping, hydraulic conductivity testing in the One Hundred Mile Swamp, water quality testing for the BWCA watershed, and a correct and unambiguous statement about the impact of the proposed mine on BWCA water quality.	WR024, WR071, WR080, WR081, WR111, WR175

<b>Sender Name (Submission ID)</b>	Erica TenBroek (12062)	
1521	It is certainly true that we all use products that require minerals obtained from mining. Nevertheless, the location of this mine and the potentially large environmental impact should make this an obvious choice.	GEN01
9850	As the world continues to grow, and demand for materials grows, we will continue to push the natural world into smaller and smaller spaces. In the end this will undoubtedly harm our way of life.	HU03
18507	Poly Met will not only dig up nearly 1,000 acres of high (biological) value peat bogs, but it will seriously damage a large part of the 100 Mile Swamp, a critical habitat for many plants and animals. This wetland has been designated an Area of High Biodiversity Significance in the Minnesota Biological Survey. ... The damage is almost always more than we can predict, and the suffering to individual animals has been glossed over or completely ignored. So much is unseen and subtle that we cannot calculate the true cost until the damage is done. We can't get back the organisms from these key habitats once they become extinct, and it goes without saying that such areas of high biodiversity are the most critical to preserve.	WET19
18509	I don't think copper and/or nickel are the limiting materials in cell phones and many green technologies. The same "green" products are dependent upon more limited supplies of scarce rare earth metals. These markets are typically private and so amounts available are not widely known. These rare earth (different from precious) metals are primarily mined in other parts of the world (e.g. China) and it's my understanding that we will run out of these long before copper and nickel supplies are gone.	NEPA03
18510	Although green energy and other forms of energy rely on mined minerals, it is oxymoronic if a "green" technology ultimately creates more ecological damage and/or pollution than it prevents. Do we take into account the true costs mining when considering what is "green?" Something seems wrong ourcost/benefit analysis.	SO01
18511	There is no debate that copper is currently used in many products, but does it need to be?	NEPA15
18517	This is an open pit mine. More people could be exposed than were ever exposed in history to such particulates. Any serious health effects on humans will take years to manifest, and the mining company will be difficult to hold accountable.	HU03
18520	The public is assuming MN regulates so well it will prevent long term damage to the environment. This is extremely short sighted and part of the reason there are so few speaking in opposition.	PER06
18522	Reverse osmosis is misleadingly presented by PolyMet to be our answer to preventing perpetual pollution. Reverse osmosis on a large scale is incredibly expensive and requires four or more (sometimes many more) gallons of water for every clean gallon produced. Even if Poly Met is able to pay, will this water be available as climate change progresses? The filters alone will require continual maintenance and the waste produced requires removal, treatment, and/or storage, or, as has been done by other mining companies, will the watershed end up being the dumping ground? Is this a cost effective, economically viable and truly non-polluting solution over the long haul?	PD03
18524	Require Poly Met to pay more for the biological loss. Know that the new wetlands will not reduplicate the biodiversity of those to be destroyed or contaminated unless the wetlands are completely transplanted to the new areas. There is very high value in biodiversity and the current plan does not require enough of PolyMet.	FIN11, WET05
18527	Require Poly Met to insure the replacements won't require 100 years to become true wetlands. Significant supplemental help will be required to achieve even close to the biological service the current wetlands are providing for Minnesota. PolyMet should not only restore but should support unbiased research to measure biological status of the surrounding areas during and following mining.	COE01

11886	If there are no plans for Polymet to treat the contaminated water there should be NO mine at this time.	PD05, WR070, WR143, WR195
11888	This mine would provide short term employment opportunities for a few residents. It is simply not worth the risk to ruin another park of Minnesota's natural heritage for short term extraction and financial gains to an industrial interest.	SO01
<b>Sender Name (Submission ID)</b> Erik Erie (42525)		
15533	I trust the process with the EIS in determining how the Polymet project can go forward in a responsible manner. The process however has been frustrating to watch as the time and money involved to get to this point has been excessive.	PER20
<b>Sender Name (Submission ID)</b> Erik Hinderlie (28150)		
16704	[I] am terrified at the havoc it would do to the marvelous jewel that is the Boundary Waters Canoe Area Wilderness, and what it could do to Lake Superior if leaks and drainage got out of control.	WR111
16707	I am sure as decision makers you have seen Glencore's terrible history, though handsome profits because environmental destruction, topsoil depletion and freshwater contamination is never calculated in GDP or economic indexes. But you will feel its terrible power if sulfide mining contaminates the North Woods, in polluted lakes, rivers and streams, massive deforestation and habitat fragmenting, reduced employment in tourism, outfitting, recreational hunting and angling and second home properties--it will be chaos for short-term economic goodness for one company, not the area.	SO01
16709	Let us not give away one of Minnesota's most critical assets---a billion dollar tourism, recreational and private property industry to one quick burst of mining metals.	SO02
<b>Sender Name (Submission ID)</b> Erik R. (58139)		
19937	In the end it comes down to this, the project as laid out in the SDEIS poses far too many risks and brings little in the way of benefits to the state and to the regions.	SO01
19939	It is clear from the report that [the West Equalization] basin will receive the "reject concentrate" from the plant that takes pollution from the tailings. What isn't clear in the SDEIS is exactly how polluted this basin will be.	WR175

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Erik R. (58139)		
19954	Not only does the SDEIS fail to describe the predicted levels of pollution in this basin, it offers little in the way of contingency plans for what would happen in the results of a catastrophic weather event. The extent of their existing contingency plan is that any overflow from this basin would simply flow into the mine pits, which are in no way designed to deal with the high levels of concentrated pollution present in the basin.	PD22
<b>Sender Name (Submission ID)</b> Erik Riesenber (18229)		
13567	What isn't clear in the SDEIS is exactly how polluted this basin [West Equalization Basin] will be. The only document that offers any indication as to these figures is the 2012 Mine Site Wastewater Treatment Design Plan, and this plan is neither listed nor referenced in the SDEIS...it [the plan] offers little in the way of contingency plans for what would happen in the results of a catastrophic weather event.	WR173, WR176
13568	We have seen over and over how these projects can go bad and then we the taxpayers are left to clean up the mess...it is that these corporations are corrupt and not bound by the legal framework that individuals are bound by. They purposefully structure themselves legally so as to minimize or outright avoid any liability in the event that anything goes wrong. There is no reason to believe that PolyMet or its investors would be any different. Therefore, there are no conditions or restrictions you could place on this project that these companies couldn't find a way out of, and that is why I ask you to reject the SDEIS.	FIN01, FIN03, FIN10
<b>Sender Name (Submission ID)</b> Erik Simonson (43130)		
15860	My particular concern is with the future quality of the river and the estuary with respect to excessive mercury content. Currently, there remains a fish consumption advisory in effect for game fish taken from the river and estuary.	MERC02
15861	MPCA is in the midst of a multi-year effort to determine, through science, why these mercury levels remain unusually high, especially given the reduction in airborne emissions over the past years. While it is unknown what the end result of this study will reveal, it should at the very least be considered as you review this proposal for compliance.	MERC01
15862	I understand you must consider current law, but it is entirely possible that the mercury standard may change in the near future. I ask you to consider the possibility that the proposal may have to be adjusted to a lesser discharge of mercury, and can the proposal be adjusted to meet that in the future?	PER06
<b>Sender Name (Submission ID)</b> Erika Carls (45153)		
8417	I would like to know what amount of water pollution from the PolyMet mine would cause our already poor quality water to change to unhealthy and to unpotable water.	PD03
8419	Is the current water quality in the area linked to problems such as cancer or other health issues?	HU05
8424	What health problems could be caused by the chemicals used in the mining process?	HU01
8426	Would pregnant mothers be more strongly impacted by water quality problems?	HU03
8429	Would the increased rate of mercury pollution in the Embarrass river effect any people or other organisms? How would the levels change in the case of a small leak, or in the case of a large leak?	MERC02
8433	How much leaching is predicted from this mine?	PD03

**Sender Name (Submission ID)**    Erin Manning (47894)

16202 Lack of tourists, which this mine would have a huge impact on in many ways, will harm our economy greatly. Many of our local businesses rely on the tourist economy. SO02

**Sender Name (Submission ID)**    Erin Ramberg (45597)

12809 Adding a hazardous practice mine to strip a few mineral for a 20 year duration seem senseless when considering the potential to damage the quickly diminishing clean fresh water we prize and the outdoors I've personally used and loved for 40 years of my 46 years of life. SO01

**Sender Name (Submission ID)**    Ernest and Beth Cutting (54476)

17560 The SEIS already makes it clear that wetland "restorations" will not take place in the Lake Superior watershed and are highly unlikely to replace bogs. The wetlands at the site have been rated as "having high wetland quality." How can they possibly be "replaced"? WET03, WET05

17562 chemical pollution, not just from sulfate and its acceleration of toxic mercury conversions, but also heavy metals like nickel and aluminum...kills fish. AQ05

17563 The long term need to clean up after from pollutants, possibly for 200years. How can that be assured, especially with more mines ready to ask for permits in that area? FIN01

17567 can such [post-closure water] treatment truly control all the sorts of pollutants that will come from the mine site? The SEIS predicts the company will excavate 307 million tons of bedrock in 20 years, at 70,000 tons per day. PD04

17570 We are concerned that a lot of the proposed PolyMet site area has been designated by MN DNR as "Sites of High Biodiversity Significance" and support eleven state-listed species of plants. Destruction of such an area cannot be rectified, nor justified. VEG01, VEG02

17571 There are other ways [besides mining] to create jobs in this fragile and unique area of Minnesota than this. One suggestion is to create metal recycling facilities and hire people to work on recovering the metals we need. NEPA06

**Sender Name (Submission ID)**    Ernesto Luna (58015)

19851 Our natural resources are too beautiful to risk. LU04

**Sender Name (Submission ID)**    erossow@gustavus.edu (41685)

2161 This project may create jobs and provide resources that are valuable to other industries. Although once the job is completed the only people that will be gaining income will be the companies that continue to get money off the land. The jobs will only last 20 about years then after that people will be back to where they were. SO02

2162 Also, from the negative impacts there will be health problems HU03

15224 Please do not allow the PolyMet mining to happen. I do not believe that this project will benefit the community or the environment in a positive way that would continue over time. Yes, there are pros and cons to this however, in the end the negative effects are much more prominent than the positive ones. CU11

14192	The SDEIS does not give any reasonable assurance that...environmental damage [from tailings leakage] can be addressed.	WR132
<b>Sender Name (Submission ID)</b> Esther Ouray (20070)		
14463	The modeling results provided in the SDEIS show that PolyMet and the DNR simply did not look beyond 500 years. The fact that the SDEIS does not say when the mine pit and tailings basin will stop polluting our water is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models - or require PolyMet to run the models - long enough to show when pollution of our water by PolyMet's mine would cease.	WR038
14527	PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long, long after the mining has stopped. It should be expected that mechanical systems like pumps, filters and pipes will eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality.	WR021, WR023, WR131
14528	Polymet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment.	PD22
14529	By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine.	NEPA14
14530	the existing tailings basin is already leaking millions of gallons of untreated water, yet the chemical composition of that large volume of leaking water has not been tested and characterized. The failure to test and account for known leaks of untreated tailings basin water from the existing LTV Steel tailings basin is another major problem with the SDEIS.	WR023, WR070, WR071
14531	the tailings basin and the dam holding it back from flowing downstream are recognized to be unstable. If the tailings basin dam were to fail, vast quantities of contaminated tailings, sulfates, and heavy metals would be released into the headwaters of the St. Louis River... The failure of the SDEIS to fully consider the potential for - and the consequences of - a tailings dam failure is a deadly flaw in the SDEIS.	PD22
14532	The SDEIS states that building an underground mine would have "significant environmental benefits" compared to an open-pit mine. However, the PolyMet SDEIS rejects underground mining, stating that in today's market conditions, underground mining is not considered economically feasible. The minerals will be there if and when the market prices are high enough to mine them right. Not fully considering the underground alternative is a major flaw in the SDEIS.	ALT01
14533	Long after the mining has stopped, PolyMet would pose an ongoing risk to fresh water... PolyMet should not be permitted unless, when the proposed mining stops, the groundwater and surface water is left in a clean condition, and surrounding streams, rivers, and Lake Superior are safe from risk of sulfide mine pollution.	WR037

7344	Sulfide mining may have a short-term economic benefit for Minnesota but at what cost? There is clearly an environmental price to pay in the short-term but there is also there very real potential that this could turn into a massive environmental problem in the long term as a consequent of toxic metal release and Acid Mine Drainage. This possibility should not be understated - it would negate any initial financial benefit that Minnesota would experience and could leave the environment damaged for hundreds of years.	SO01

2768	The Land Exchange Proposed Action, as described in the SDEIS, serves to confirm our concerns for permanent, unmitigated impacts to treaty resources in the 1854 Ceded Territory. The Band submitted comments on the Feasibility Analysis... including: A full consideration of the fair market value and future use of the federal land in the proposed PolyMet Land Exchange would recognize a private windfall instead of an equal exchange, in violation of federal statutes, rules and policies. ...The Band is also concerned that most of the non-federal land proposed in the PolyMet Land Exchange has a divided mineral estate. Divided ownership raises uncertainties about future benefits that that the non-federal surface could afford to the public, further diminishing the value of the non-federal lands, and is not consistent with Forest Service Conveyance policy (36 CFR 254.15)....Further, any proposed federal land exchange that is not consistent with forest resource management plans must be rejected under 36 C.F.R. 254.3....The Band expects that the U.S. Forest Service, in facilitating the PolyMet Land Exchange, would coordinate with the policies expressed in our plans to protect natural resources on the Reservation and in the Ceded Territories. ... The Band is extremely concerned about the loss of high quality, even exceptional, wetlands within the federal estate, without sufficient information to understand whether the proposed non-federal parcels provide equivalent functions and values. Access to treaty-protected resources is of prime importance to Band members. Loss of access to or use of public lands within the Ceded Territory can significantly impact exercise of treaty rights, and this issue should be thoroughly evaluated in the SDEIS process.	COOP01, LAN03, LAN04, LAN05, WET14
2782	Wetlands also function as thermal refuge for moose when summertime temperatures exceed 14oC, the point at which moose become thermally stressed, and wetlands provide an important forage resource for moose during the open water season.	COOP01, WI01, WI02

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
2788	In the co-lead agency evaluation of the underground mining alternative, the North Met Deposit is described as a “low- to medium-grade mineral resource” which is somewhat at odds with its description as “one of the largest untapped deposits of copper and nickel, and other precious metals” or “world class resource” as it is represented throughout the SDEIS and in continual media coverage. From the SDEIS, we are not able to determine whether mining this mineral deposit in accordance with environmental standards will be profitable enough to provide adequate environmental protections and financial assurance.	COOP01, PD25
2799	while the co-lead agencies stipulate in the SDEIS that PolyMet will bear liability through financial assurance[legacy contamination at LTV], it is troubling to see that apparently, they will not be required to complete remedial activities until closure, many decades from now	COOP01, LU02
2845	The mass balance does not take into account seepage from the saturated overburden at the OSLA, or the load of mercury from Colby Lake stream augmentation. Given the known concentrations of mercury in Colby Lake, which consistently exceed the GLI standard, this mitigation measure is clearly not permissible as a discharge that would contribute to an existing water quality exceedance.	COOP01, MERC20
2856	Hunting pressure has been ruled out as a major contributing factor to population-level declines, but the appearance of holding a hunt does not sit well with the public, so the DNR, 1854 Treaty Authority and Fond du Lac all closed the 2013 moose season.	COOP01, WI01
2860	The Band’s consistently expressed concerns for potential air quality impacts from the Proposed Project (a new source of mercury, visibility in a Class 1 airshed, fugitive dust impacts to terrestrial and aquatic resources, asbestos-like mineral fibers) from the Proposed Project remain largely unaddressed in the SDEIS.	AIR08, COOP01
2878	the Plant Site multi-pathway cancer risk for a farmer was found to be equal to the MDH additional lifetime cancer risk guidance level of 1E-05. Although this level is considered “guidance” and not a regulatory action level, the Band believes this value clearly indicates the potential for adverse health effects. The same result was found for the off-site worker inhalation additional lifetime cancer risk. The major drivers for these endpoints were cobalt, nickel, and dioxins (farmers only). Exposure to nickel has been linked with increased risk of lung cancer, cardiovascular disease, neurological and developmental deficits, and high blood pressure.	COOP01, HU05
2879	As shown in SDEIS Table 6.2-22, cumulative inhalation risks for non-cancer chronic and non-cancer acute effects from both the facility and existing sources are equal to the incremental acute risk guideline value of 1. This shows that the predicted impacts of NorthMet, when added to the toxic releases already prevalent in the area, have reached the level where health authorities begin to be concerned about cancer risks.	COOP01, HU05
2897	Cumulative effects result in a relentless, unmitigated diminishment of treaty resources and access to those resources. Yet across virtually all resource categories, the SDEIS predicts that there will be no adverse impacts...; this conclusion then enables the co-leads to determine ‘no cumulative effects’ from the project and the land exchange. ...over the course of the DEIS and SDEIS processes that support our misgivings for this circular logic. We presented a substantial alternative analysis of cumulative effects from the NorthMet Project Proposed Action as part of our commenting during the preliminary SDEIS review.	COOP01, CU11, CU12
2905	The Band’s comments on the 2009 DEIS related to impacts to the 1854 Ceded Territory stand.	COOP01, NEPA12
2906	The Band’s comments on the 2009 DEIS related to environmental justice impacts still stand.	COOP01, SO09
2907	The Band’s comments on the 2009 DEIS related to climate change impacts still stand.	COOP01, NEPA12

12909	The Band also shares concerns communicated by the Bois Forte Tribal Historic Preservation Officer: Mesabe Widjiu is correctly identified as a sacred landform, but needs to be considered in its entirety (see attached map as an example). The segment encountered within the project area is small, but integral to the property. Adverse affects to any portion impact the entire feature.	COOP01, CR02, CR05
13102	Multiple mine plan alternatives exist that could provide mitigation for or prevent long-term environmental damage... •paste or dry tailings disposal to reduce the project footprint and use less water (decrease risk of surface and groundwater pollution); •perpetual pumping of the west pit to prevent a pit lake from forming (protect surface and groundwater); •back-filling all waste rock into the east, central and west mine pits (reduce the mine foot print at closure, reduce contaminant runoff to surface and groundwater, reduce volume of water requiring perpetual treatment, restore mine site wetlands); •provide reverse osmosis treatment at the mine site immediately rather than waiting until year 40 (augment water loss in adjacent high quality wetlands in the Partridge River watershed), and; •underground mining (multiple environmental benefits).	ALT03, ALT04, ALT06, COOP01
13105	The Fond du Lac Band of Lake Superior Chippewa conducted meetings in February 2011 to discuss past and current traditional uses by the Band of the area in the NorthMet project. It was expected from the beginning that the distance between the NorthMet area and the Fond du Lac Reservation would reduce the chances of documenting specific use of the area by Fond du Lac Band members.	COOP01, CR01, CR05, CR06
18240	a comment I've been struggling to articulate, regarding how the ash dump is proposed to be dealt with under the proposed project; like many other issues in the SDEIS, it seems to be getting kicked down the road for future permitting discussions. But if the plant site model has been constructed to not incorporate the ash dump (which is full of toxics), when in fact it does, this is another significant potential source of contaminant loading that is not accounted for in the water modeling and water quality predictions.	WR028
16321	you might re-consider extending the comment period to allow all of us the time we need to truly understand how the models have informed environmental impact predictions.	NEPA07
16322	At literally the eleventh hour of a 90-day public comment period, we just shouldn't be trying to figure out basic model construction, source loads, and water quality impacts; it should be clear in the SDEIS.	PD29
19571	The NEPA "hard look" requires agencies to "exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project" when analyzing alternatives. Contrary to the explicit requirements of the Council on Environmental Quality (CEQ) rules, the SDEIS does not evaluate or examine in any substantive way potentially viable Project alternatives. Even the no action alternative is lacking in detail and analysis. Tribal cooperating agencies identified this deficiency in the DEIS, consistently brought it forward for discussions throughout the SDEIS process, and US EPA cited the lack of alternatives as a factor when issuing an EU-3 rating for the DEIS.	ALT14, ALT21, COOP01
19573	Although the SDEIS was revised to reflect the Project proponent's preferred action, the only alternative analyzed in any detail concerns simply the acreage of the proposed land exchange. This is not consistent with the CEQ regulations that require federal agencies to identify an agency-preferred alternative in a draft EIS. Yet the SDEIS states "At this time, the Co-lead Agencies have not identified a preferred alternative, and for the USACE, Appendix B of 33 CFR Part 325 supersedes the CEQ requirement to identify an agency-preferred alternative."	ALT21, ALT23, COOP01
19575	There is no evaluation or identification in the SDEIS of the 'least environmentally damaging practicable alternative' ("LEDPA") as required before approving a CWA §404 wetlands permit.	COE04, COOP01

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19577	A fundamental operational component of the Proponent’s preferred alternative analysis described in the SDEIS is to deposit their reactive slurry tailings on top of existing taconite tailings in an unlined basin that is currently required, under a Consent Decree, to remediate seepage that has already polluted the nearby ground and surface waters. The SDEIS analysis assumes a tailings basin seepage capture rate of 95% – a performance efficiency that has not been demonstrated anywhere in the US, nor is it feasible since the tailings basin was constructed (per standard Minnesota ferrous mining practices) without a liner. There is an existing seepage capture system installed at SD026 as a requirement of the Consent Decree, yet it has proven to be so ineffective that Cliffs Erie LLC (the responsible party) has proposed building an additional dam and capture system further downstream.	COOP01, GT02, PD12, WR020, WR117
19578	Dewatered or paste tailings placed on a liner and covered could substantially minimize the mass and concentration of pollutants reaching the Embarrass River watershed wetlands and the Embarrass River. This is a modern mine waste management technique used by many mines in the US and around the world, yet it has never been evaluated as an alternative for this project. “Converting to paste tailings technology from conventional slurry tailings at most mines makes sense, both environmentally and economically. Paste tailings use less water, require less land, do not require engineered containment dams, generate less acid and contaminants, reduce long-term costs and allow for early reclamation. Slurry tailings use and discharge large volumes of water, require dust control measures, require large land areas and containment dams for disposal, and create contaminated water that must be captured and treated.”	ALT10, ALT16, COOP01
19580	The State of New Mexico, Office of Natural Resource Trustee, requires perpetual pumping of the mine pits to prevent formation of a pit lake at the Chino and Tyrone copper mines, specifically for the protection of groundwater. The experience of numerous western mines discharging plumes of polluted water into the bedrock aquifer from leaking mine pits, tailings basins and waste rock piles, highlights a predictable problem that is not only difficult but expensive to fix. By requiring perpetual pumping [alternative not considered in the SDEIS] of the mine pit, the regulatory agencies would minimize leakage of contaminated water into the surrounding bedrock aquifer, and thereby protect groundwater that the State of Minnesota is required to protect as source of drinking water.	ALT04, COOP01
19581	In the 2009 DEIS, the co-lead agencies maintained that all waste rock should be considered reactive. SDEIS Table 3.2-8, Waste Rock Characterization Properties , acknowledges that the Category 1 waste rock (rock that is <math>0.12\%</math> sulfur), which constitutes 70% of the volume of waste rock, has a “low potential to generate acid, but may leach metals.” Back-filling all of the mine pits with all of the waste rock would reduce the final surface footprint of the mine at closure, and make possible 526 acres of wetland restoration where the Category 1 stockpile is now proposed to be stored in perpetuity. This alternative would prevent the need for a permanent separate seepage capture system around an unlined waste rock pile, as proposed in the preferred alternative, which would have to perform at an above-optimum capture rate in perpetuity to comply with Minnesota Water Quality Standards (“MN WQS”). Capping and re-vegetating the mine pits after backfilling with waste rock would prevent deep infiltration of precipitation and reduce mobilization of toxic metals.	ALT06, COOP01
19582	The SDEIS inexplicably removes the stockpile liner described in the 2009 DEIS for Category 1/2 waste rock in the current project proposed action. From Table 3.2-16 Comparison of DEIS and SDEIS NorthMet Project Proposed Action: DEIS: Category 1 and 2 waste rock would be stored in a permanent lined/covered stockpile (Category 1/2 Stockpile) north of the west pit (years 1-11) SDEIS: Category 1 waste rock mined from years 1-13 would be stored in an unlined, permanent stockpile north of the West Pit. The stockpile would have a geomembrane cover system at completion and surface water and groundwater collection system would encompass the entire stockpile and direct water to the Mine Site WWTF. If not backfilled, the Category 1 waste rock stockpile must be lined.	ALT07, ALT13, COOP01
19583	However, combining the two alternatives of perpetual pumping and backfilling the Category 1 waste rock pile would substantially reduce the risk of polluting groundwater and wetlands in the Partridge River watershed.	ALT04, ALT06, COOP01

**Sender Name (Submission ID)**    Fond du Lac Band (42920)

19584 The Minnesota Department of Natural Resources (DNR) and US Army Corps of Engineers (USACE) superficially evaluated and subsequently dismissed underground mining as an alternative to the proposed open pit Project for the 2009 DEIS. The co-lead agencies eliminated this alternative from further evaluation because it would have had “a significantly reduced rate of operation that would not be considered economically feasible, and, therefore, would not meet the Purpose and Need of the Project.” Tribal cooperating agencies urged the co-lead agencies, now including the US Forest Service (USFS), to do a more robust analysis of the underground mining alternative for the SDEIS, but the co-lead agencies did not “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing this alternative. This alternative was eliminated by the Project proponent based purely on an economic decision that underground mining would not be as profitable as open pit mining. The co-lead agencies claim that “it was not possible to undertake a quantitative, side-by-side assessment of the underground mining alternative.” An underground mine would have a reduced mining rate and life of mine, employed fewer workers for a shorter period of time, and reduced state and local tax revenues. Although the underground mining alternative would offer substantial environmental benefits (significantly less wetland destruction, less mine-generated waste, less groundwater and surface water pollution generated and requiring treatment and control, less reclamation and closure activities, less nuisance and reactive dust to be controlled, less noise and vibration impacts, less visual impacts), the economic and intrinsic value of those benefits are not even estimated. In addition, an underground mine project would not require a federal land exchange, resulting in lower start-up costs and avoiding the permanent loss of high quality resources (as discussed in later comments on Land Exchange impacts). Based upon an incomplete analysis of the benefits of an underground mine, the co-lead agencies determined that this alternative would result in reduced socioeconomic benefits, and; “PolyMet would not move forward with an unprofitable project, thus any potential environmental or socioeconomic benefits associated with this alternative are moot.”

ALT01, COOP01

19585 The co-lead agencies determined that underground mining was considered technically feasible, but concluded that “PolyMet is a private sector and for-profit company, the value of the saleable material would need to provide sufficient income to cover operating cost (which includes, but is not limited to, the cost of mining, processing, transportation, and waste management), capital cost (to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. An underground mining project would leave most of the NorthMet Deposit unmined because of its low metal value relative to the cost of mining and mineral processing. Other material would have to be left in place for safety reasons, to prevent collapse.” Therefore, “the Co-lead Agencies found that while underground mining is technically feasible, available, and would offer significant environmental benefits over the proposed NorthMet Project, it would not be economically feasible and would not meet the Purpose and Need. Since the underground mining alternative would not meet all of the screening criteria, it is not considered to be a reasonable alternative. Therefore, the underground mining alternative was eliminated from further evaluation in the SDEIS.” The SDEIS does not contain the appropriate level of detail required to eliminate this alternative. The conclusion that underground mining is neither viable nor preferable remains substantially unjustified, despite repeated requests by the tribal cooperating agencies for further analysis.

ALT01, COOP01

19587 The Project Proponent, without considering the economics of perpetual treatment, the purchase of thousands of acres of land for the federal land exchange, direct and indirect wetland mitigation costs, etc., concludes in their economic analysis that underground mining is “[n]ot economically viable” while simultaneously claiming that backfilling the west pit would create encumbrances not allowed in their mineral lease due to mineral resources located below the west pit that could only be accessed through underground mining. This is not the appropriate rigor in a cost-benefit analysis for thoroughly evaluating an EIS alternative. The CEQ regulations require that, where a cost-benefit analysis is “relevant to the choice among environmentally different alternatives,” there are a variety of additional requirements, including “analysis of un-quantified environmental impacts, values, and amenities,” in addition to other CEQ alternatives rules.

19588	As already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS offers no new discussion of the reasons for rejecting the alternative. The economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings management, and waste rock disposal. A study of this particular deposit was performed by the prior owner of the site, US Steel, which actually recommended underground mining. PolyMet is well aware of this study, given that the company included it in a filing with the Securities and Exchange Commission in 2003. In fact, by examining geologic cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine.	ALT01, COOP01
19589	The environmental costs of open-pit mining and the requisite wetland mitigation and above-ground disposal of tailings and waste rock are immense. These environmental costs, combined with the most current understanding of deposit ore grades, reasonably potential metals prices, and the costs associated with perpetual treatment must all be evaluated to determine the feasibility of this alternative.	ALT01, COOP01
19594	Even the No Action Alternative analysis is deficient: nder the NorthMet Project No Action Alternative, the NorthMet Project Proposed Action would not occur. The consideration of a No Action Alternative is required to be evaluated in the SDEIS in accordance with NEPA and MEPA.	ALT14, COOP01, WR108
	If the NorthMet Project Proposed Action is not approved, the Mine Site would be returned to pre-exploration conditions under the requirements of exploration approvals to reclaim surface disturbance associated with exploratory and development drilling activities. Other existing surface uses would be allowed to continue consistent with the Forest Plan. No further upgrades or new segments would be constructed along the existing power transmission line, railroad, or Dunka Road, which would continue to be used by their private owners. At the brownfield Plant Site, Cliffs Erie would continue to complete closure and reclamation activities as specified under state permits and plans and the Cliffs Erie Consent Decree. This would include completing activities for the localized affected areas under the Minnesota Voluntary Investigation and Cleanup (VIC) Program, removal of the former Plant Site building, and management of seepage at the Tailings Basin embankment. This evaluation must also acknowledge that there would be no direct disturbance of over 900 acres of high quality wetlands, thousands more wetland acres that would not be indirectly affected, no loss of high quality forested uplands, no further diminishment of wildlife habitat, no permanent loss of treaty resources under the land exchange, no cumulative effects to resources and environmental quality. In fact, water quality should improve substantially under the No Action Alternative, as the Cliffs Erie Consent Decree requires that the closed tailings basin ultimately achieves compliance with MN WQS.	
19595	The SDEIS is approach to considering less environmentally degrading alternatives is fundamentally inadequate. CEQ rules require that the EIS “present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public.” The SDEIS must be revised to fully evaluate reasonable alternatives in the SDEIS, including identifying the federal agency preferred alternative and the LEDPA.	ALT20, COOP01
19597	The Land Exchange Proposed Action, as described in the SDEIS, serves to confirm our concerns for permanent, unmitigated impacts to treaty resources in the 1854 Ceded Territory.	COOP01, LAN05
19599	The Land Exchange Proposed Action does not meet the need of the Bands in the 1854 Ceded Territory. It results in a permanent loss of 382 acres, does not protect fish and wildlife habitat within the Mine Site, does not protect important cultural resources such as wild rice beds, historic trails, and a substantial portion of the Mesabi Widjiu, does not protect the Embarrass, Partridge or St. Louis River watersheds, does not consolidate mineral interests in the private parcels that would be conveyed to the federal estate, does not promote multiple-use values, or fulfill public needs.	COOP01, LAN05
19600	maintaining public land ownership is critical for the exercise of treaty rights. There are 382 acres of Lake County land proposed for the land exchange (Tract 2). This means a net loss, through the exchange, of publicly accessible land for band members exercising their treaty rights.	COOP01, LAN05

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19601	The Forest Service should consider exchange for private lands only in order to maintain - or better yet, increase - the total public land acreage within the 1854 Ceded Territory.	COOP01, LAN05
19603	This language and description [SDEIS 3.1.2, Land Exchange Overview] is misleading; it downplays the largely undisturbed nature and ecological and biodiversity significance of most of the contiguous lands (i.e., the Hundred Mile Swamp, St. Louis River Headwaters Site).	COOP01, LAN06, VEG02
19611	Of the approximately 6,025 acres of MBS Sites of High Biodiversity Significance under the Land Exchange Proposed Action, nearly 2,000 acres of coniferous bog wetlands will be lost to the federal estate and therefore effectively to the Bands, if the Land Exchange Proposed Action is implemented. This is significant because many tribally harvested resources are only available in coniferous bogs (e.g. cranberries, soft-leaved blueberries, sweet flag), and mitigation for coniferous bogs is simply not feasible.	COOP01, CR01, WET05
19612	The exchange of thousands of acres of high quality wetlands and forests containing some of the few remaining wildlife corridors in northeastern Minnesota available to the Bands to exercise reserved 1854 Treaty rights, for lands that have moderate diversity is inconsistent with fiduciary responsibilities that are shared by all federal agencies.	COOP01, CR01, LAN05
19613	The SDEIS attempts to diminish the significance of the loss of these high quality lands by stating “Given the existing lack of overland public access and actual use of the federal lands, as well as historic use of this area for mineral exploration (see Section 4.2.9), the Land Exchange Proposed Action represents little to no change in the actual level of recent or current use of the federal lands.” In fact, historic trails connect what is now Beaver Bay with Lake Vermillion. These trails “are associated with the lives of persons significant in our past” including John Beargrease, Peter Gagnon, and Alec Posey. In more recent history, Bois Forte Band members used a sugarbush near the plant site and harvested wild rice in the Embarrass River near the LTVSMC tailings basin.	COOP01, CR04
19614	The SDEIS does not provide adequate discussion of the adverse effects of the proposed land exchange on wetlands and headwater streams within the St. Louis River watershed/Lake Superior Basin, where the loss of first-order headwaters streams, second-order streams and wetlands have the potential to significantly adversely impact downstream water quality, fisheries, and wildlife that are important to the Bands. The Land Exchange Proposed Action would relinquish water resources within the Lake Superior basin for wetlands and surface water resources outside the Lake Superior basin and the St. Louis River watershed, although still within the 1854 Ceded Territory. Federal lands include 4,164 acres of wetlands within the Lake Superior basin; non-federal lands contain 4,669 acres of wetlands, of which only 373 acres are within the Lake Superior Basin, demonstrating there would be a permanent loss of 3,791 acres of federally managed wetlands within the Lake Superior Basin. It is well known that wetlands play an important role in protecting the quality and condition of downstream waters by retaining floodwaters, sediment, nutrients, and other pollutants. Wetlands also function as thermal refuge for moose when summertime temperatures exceed 14oC, the point at which moose become thermally stressed, and wetlands provide an important forage resource for moose during the open water season.	AQ29, COOP01, CR01, WET14, WR114
19615	the SDEIS concedes that the land exchange will cause irretrievable losses of resources for the Bands	COOP01, CR01
19616	the wild rice waters in Tract 1 are already accessible to the Bands via the Pike River; adding Tract 1 to the federal estate does not provide additional wild rice harvesting opportunities to Band members in the 1854 Ceded Territories even though it would add an additional 126 acres of wild rice beds to the federal estate.	COOP01, LAN05, WR155
19617	This is the essential argument against Alternative B, from the Bands’ perspective. The additional lands would essentially be permanently removed from tribal access, habitat and resources would be degraded, and there would be no compensation via conveyance of lands to the federal estate.	COOP01, LAN05

19618	The desire to resolve “conflict” between the USFS and the Project proponent, whose goal to develop an open pit mine is barred due to deed restrictions on the federal estate, should not prevail over the federal fiduciary responsibility to the Bands. The potential for more roads and hiking trails may provide more access to the public, but does nothing to promote habitat diversity and long-term ecosystem sustainability that are requirements for the preservation of tribal usufructuary rights. Although the Land Exchange Proposed Action may increase acreage in the federal estate, the countervailing permanent loss of critical wildlife corridors, high quality and diverse land and water resources that would result is simply not in the public interest.	COOP01, LAN05
19619	federal land exchanges are discretionary, and federal agencies cannot approve permits that will have impacts to treaty resources without additional evaluation and mitigation. No mitigation has been identified in the SDEIS for this permanent loss of lands and resources (natural and cultural) to the 1854 Ceded Territory. The public interest determination must include a specific finding that “The intended use of the conveyed Federal land will not substantially conflict with established management objectives on adjacent Federal lands, including Indian Trust lands” (36 C.F.R. 254.3(b)(2)(ii)). This threshold has not been met, and the Fond du Lac Band objects to the implementation of the Land Exchange Proposed Action.	COOP01, CR01, LAN05
19620	in the SDEIS, no detail is provided regarding the estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the Project... , the SDEIS provides neither a timeline nor a discussion regarding financial assurance for the existing contamination associated with previous mining activities at the site.	COOP01, FIN05
19621	The financial assurance costs for long-term treatment identified in the SDEIS range from \$3.5 to \$6 million, but appears to be an estimate for monitoring activities only without any long-term wastewater treatment costs.	COOP01, FIN05
19622	The cursory estimate of financial assurance provides little detail about how the cost estimates were derived. Instead, specific discussions about the scale and appropriate instruments for financial assurance have been postponed until the permitting phase of this Project. This approach fundamentally contradicts federal and state environmental policy and the SDEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates.	COOP01, FIN13
19623	Long-term treatment of contaminated water; consistency with maintenance-free closure goals: The SDEIS lists the sulfur concentrations of Project waste rock ranging between 0.01 - 5.0% with an average mass-weighted concentration of 0.15%. The Virginia Formation has the highest concentrations of sulfur at 0.4 - 5.0%, and the Duluth Complex 0.13 – 0.6% sulfur. These concentrations are at least equal to, or in some instances significantly higher than the Zortman-Landusky mine waste rock (0.2% sulfur) that requires perpetual wastewater treatment. Just as Zortman-Landusky predicted for their mine project, PolyMet has suggested that “most (70%) of the NorthMet waste rock would be the low-sulfur, non-acid-generating” and will never cause acid mine drainage. Yet the SDEIS speaks to the need for at least centuries of wastewater treatment at both the Mine Site and Plant Site: “Once the West Pit is full (approximately year 40), discharge of treated water from the WWTF to the West Pit would be terminated. The WWTF would be upgraded to RO and include evaporator/crystalizers to convert the RO reject concentrate to residual solids, which would be disposed of at appropriate off-site facilities.”...Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site”...Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through monitoring requirements.”The tribal cooperating agencies have provided substantial evidence that the modeling for the NorthMet Project Proposed Action potentially underestimates those “highest predicted concentrations.” This will affect both volumes of water requiring treatment and duration of the need for mechanical treatment.	COOP01, PD03, WR056

19624 After refill, the West Pit water level would be controlled by pumping to the WWTF to prevent surface water overflow from the pit lake. However, release of pit lake water to the West Pit Surficial Flowpath would continue. The WWTF would also receive low flow rates from the Category 1 Stockpile groundwater containment system. The WWTF effluent would be discharged into a tributary channel that flows into the Partridge River at the location shown on Figure 5.2.2-15. Mine site: The WWTF would continue to operate during long-term closure, treating excess water from the West Pit and discharging the effluent to the small Partridge River tributary. The typical discharge rate from the WWTF is predicted to be 285 gpm. The water balance model predicts periodic temporary higher treatment/discharge rates to account for conditions when the freeboard in the pit becomes too small. By pumping pit lake water to the WWTF, the pit water level would be managed to always provide sufficient freeboard to absorb extreme precipitation events without overflowing. The estimated discharge for this condition is 570 gpm. In the water balance model, the occasional switch to the “high” treatment flow pushes the long-term average discharge rate to 290 gpm. Plant Site: During long-term closure, the WWTP would continue to treat water collected by the Tailings Basin containment systems. Some of the treated effluent would be used for flow augmentation to Unnamed Creek, Mud Lake Creek, Trimble Creek, and Second Creek. It is predicted that Colby Lake water would no longer be needed for augmentation (Barr 2013a). Tailings seepage bypassing the containment system (approximately 19.4 gpm) would continue to enter the North, Northwest, and West Surficial flowpaths, and migrate slowly toward the Embarrass River. By year 200 in closure, which reflects when effects would have peaked and would be decreasing, the WWTF would be discharging and all groundwater contaminant loads would have reached the Partridge River (except negligible contributions from the bedrock flowpaths). Whatever the long-term goals to transition to non-mechanical treatment, this acknowledges a minimum of 200 years of operation of the WWTF. It is clear that the NorthMet Project Proposed Action would require long term treatment of water at both the Plant and Mine Sites. The minimum duration of this treatment is on the order of centuries, but the SDEIS does not provide an estimate of when mechanical treatment would no longer be needed to meet MN WQS. Therefore, as provided in multiple comments on the preliminary SDEIS, Fond du Lac conservatively assumes that water treatment for the proposed PolyMet mine is perpetual and the SDEIS should be clear on this issue.

COOP01, WR035, WR036

19625 However, instead of clarifying this factor, it appears that the co-lead agencies are attempting to minimize the significance of the necessity for long term/perpetual treatment by using vague and confusing language in the SDEIS. The specific language describing long term water treatment has changed during the development of the document, even though the model results have not. The co-lead agencies use creative wording to obscure the results of the modeling; this is misdirection at best and highly inappropriate for the co-lead agencies to present to the public.

19626 In addition to water treatment, there will also need to be a substantial investment in long-term or perpetual operation, maintenance and replacement of other environmental controls for the Project, including seepage capture and pumping at multiple locations at both the mine site and plant site, repair and replacement of liners, managing appropriate stream augmentation and Tailings Basin pond elevation, and pumping, treating, and disposal of seepage from the HRF: The Tailings Basin pond would primarily receive solute loadings from the tailings, treated Mine Site process water (primarily during years 1 to 11, and possibly through year 20, depending on the NorthMet Project Proposed Action water budget), and captured seepage from the groundwater containment system. The Tailings Basin pond, in turn, would become a primary source of contaminants as its water seeps into the tailings. Therefore, the composition of the Tailings Basin pond, which would be a permanent feature of the Tailings Basin, would be an important component in the quality of water that would be discharged from the Tailings Basin. Thus, PolyMet proposes to use the WWTP to treat the pond water during reclamation, and as necessary during closure, to maintain the design water level and prevent overflow. The presence of the pond in closure would provide benefits as it would create a saturated layer that would permanently reduce the oxygen flux and associated solute release in the underlying tailings. The groundwater containment system would continue to operate during reclamation and closure, although in those phases, the seepage could not be reused as process water, but would be treated at the WWTP and used to accelerate filling of the West Pit (during reclamation) and for streamflow augmentation (during closure). Although it is designed to capture all of the Tailings Basin seepage, the groundwater containment system is assumed to capture 90 percent of the groundwater flow that approaches the system (PolyMet 2013g). During reclamation, all WWTP effluent would be used to help flood the West Pit; therefore, during this phase, all augmentation water would come from Colby Lake (approximately 1,600 gpm). In closure, it is expected that effluent from the WWTP alone (estimated at approximately 2,000 gpm) would be sufficient to meet the minimum flow augmentation requirements of the tributaries without requiring additional water from Colby Lake.

COOP01, PER03, WR035, WR037

19627 The Tailings Basin pond would primarily receive solute loadings from the tailings, treated Mine Site process water (primarily during years 1 to 11, and possibly through year 20, depending on the NorthMet Project Proposed Action water budget), and captured seepage from the groundwater containment system. The Tailings Basin pond, in turn, would become a primary source of contaminants as its water seeps into the tailings. Therefore, the composition of the Tailings Basin pond, which would be a permanent feature of the Tailings Basin, would be an important component in the quality of water that would be discharged from the Tailings Basin. Thus, PolyMet proposes to use the WWTP to treat the pond water during reclamation, and as necessary during closure, to maintain the design water level and prevent overflow. The presence of the pond in closure would provide benefits as it would create a saturated layer that would permanently reduce the oxygen flux and associated solute release in the underlying tailings. The groundwater containment system would continue to operate during reclamation and closure, although in those phases, the seepage could not be reused as process water, but would be treated at the WWTP and used to accelerate filling of the West Pit (during reclamation) and for streamflow augmentation (during closure). Although it is designed to capture all of the Tailings Basin seepage, the groundwater containment system is assumed to capture 90 percent of the groundwater flow that approaches the system (PolyMet 2013g). During reclamation, all WWTP effluent would be used to help flood the West Pit; therefore, during this phase, all augmentation water would come from Colby Lake (approximately 1,600 gpm). In closure, it is expected that effluent from the WWTP alone (estimated at approximately 2,000 gpm) would be sufficient to meet the minimum flow augmentation requirements of the tributaries without requiring additional water from Colby Lake. These statements indicate the need for perpetual WWTP operation, if for no other reason than needing clean water for stream augmentation, which will be required in perpetuity to compensate for the hydrologic impacts of the Tailings Basin.

19628	The rate of drainage would decrease over time as the pore water within the hydrometallurgical residue is collected and removed. Once the entire facility is closed, the volume of water from the drainage collection systems would decline. In the long term, the volume of water requiring treatment would decline to the point that the remaining reclamation activity may consist of periodic pumping of remaining drainage into tank trucks for transportation, treatment, and disposal, as appropriate, and of inspection of the closed cells to verify integrity of the reclamation systems...The water quality of both mine pits, however, is predicted to improve over time as the pits become flooded, thereby effectively eliminating oxidation of the pit walls, the primary source of solutes, except for the upper few feet where water levels may fluctuate. Figures 5.2.2-37, 5.2.2-38, and 5.2.2-39 show how the water quality in the West Pit is predicted to improve over time for three representative solutes: cobalt, nickel, and sulfate. It is expected that eventually the solute concentrations in the pits would stabilize to more or less steady-state values, although the timeframe for this would likely be greater than 200 years as indicated by Figures 5.2.2-37 to 5.2.2-39, which show solute concentrations continuing to decrease at year 200, although still above water quality standards. These predicted improvements in water quality suggest that the WWTF may not need to operate permanently, but that at some point, non-mechanical treatment systems may be sufficient to meet water quality standards. The SDEIS frequently states the long-term goal is to transition to non-mechanical treatment, but there is little evidence to suggest that current treatment technologies can consistently treat large volumes of water to meet WQS.	COOP01, PD06, WR137
19629	Furthermore, constructed wetlands would require substantial acreage to handle the volume of wastewater that will perpetually be collected, and do not function well in our cold climate for at least half of the year (when vegetation is not actively growing). They are not likely to be able to treat wastewater sufficiently to consistently meet water quality standards, including the wild rice sulfate criterion. But perhaps most the most significant factor to consider for the likelihood of successfully transitioning is that non-mechanical treatment, at least at the Mine Site, necessitates the seasonal application of the wild rice sulfate criterion: "...However, the non-mechanical system will be designed to discharge only during a portion of the year, to comply with the seasonal discharge criterion for wild rice downstream of the Mine Site. The design of the West Pit Overflow Non-Mechanical Treatment System is based on a discharge period of two months, September and October."	COOP01, WR137, WR153
19630	"However, the non-mechanical system will be designed to discharge only during a portion of the year, to comply with the seasonal discharge criterion for wild rice downstream of the Mine Site. The design of the West Pit Overflow Non-Mechanical Treatment System is based on a discharge period of two months, September and October." As described in the AWMP, this type of non-mechanical treatment system cannot meet the 10mg/l sulfate criterion. At this time, the continued implementation of the seasonal application of that criterion is highly questionable as recent research conducted by the University of Minnesota on behalf of the MPCA indicates excess sulfate loading is detrimental to wild rice regardless of the time of year.	COOP01, WR137, WR153
19631	The SDEIS requires substantially more public transparency and less equivocation on what is arguably one of the most fundamental issues at stake for this project: how long will the company be required to flawlessly operate and maintain expensive mechanical treatment to comply with MN WQS? Clearly there are other engineering controls and management actions that will absolutely have to flawlessly operate and require maintenance in perpetuity (seepage collection, liners, pumps, waste rock stockpile cover systems, waste disposal, stream augmentation, Tailings Basin pond elevation management). This singular issue has significant repercussions for the public interest determinations and the scale of required financial assurance.	COOP01, PD03, WR036
19632	The SDEIS identifies 29 Areas of Concern (AOCs) that are now PolyMet's legal responsibility, but still does not provide the necessary clarity about the status of remedial investigations and/or actions necessary to clean up the contamination that occurred over decades of taconite mining and processing.	COOP01, HAZ05
19633	The SDEIS does not provide sufficient information for the public to understand whether the NorthMet Project Proposed Action will be required to remediate these and other AOCs before commencing project operations, or be allowed to defer remediation until closure. It is not clear in the SDEIS how the Voluntary Investigation and Cleanup ("VIC") program requirements will be applied to PolyMet	COOP01, HAZ05

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19634	Cliffs Erie (now Cliffs Natural Resources) was party to a Consent Decree and approved work plan(s) with MPCA regarding their remedial responsibilities, but there is little information in the SDEIS for the public to be assured regarding the need for PolyMet to enter into a legally binding agreement and develop approvable work plans to address their responsibilities.	ALT14, COOP01
19635	It seems reasonable to expect PolyMet to clean up all legacy contamination as quickly as possible; in fact, remedial actions should be integrated with the ‘refurbishing’ actions they plan to do to re-tool the taconite processing facilities to accommodate their processing needs.	COOP01, HAZ05
19636	the public may not realize that the actual cleanup of LTV’s legacy contamination may be deferred until reclamation and closure of the NorthMet Project. This timeline is not acceptable, and the SDEIS should not be vague about the pace of fulfilling remedial requirements.	COOP01, HAZ05
19637	Inadequate hydrologic and geochemical characterizations using all existing data; insufficient new data to support modeling and assumptions. Many of the deficiencies in site characterization and water modeling from the 2009 DEIS persist in the 2013 SDEIS despite some new data collection (not all of which was used) and new modeling (using unrealistic or unsupported assumptions and neglecting to consider critical features). As detailed in extensive comments submitted by tribal cooperating agencies to the co-lead agencies over the past seven years, water quality analyses for the Partridge and Embarrass Rivers are inadequate. Water modeling results, whether deterministic (DEIS) or in the form of probability distributions (SDEIS) are based on flawed understanding of hydrology at both the mine site and plant site. One example of this flawed understanding is the error in baseflow calculations, which is carried forward in the MODFLOW hydrologic modeling. At the mine site, MODFLOW under-predicts the amount of water that would flow into the mine pits and thus under-predicts the amount of water treatment needed for both short and long term closure. At the plant site, the MODFLOW model is constructed in a way that is not representative of the site’s physical conditions and therefore yields results that are not logical.	COOP01, WR011, WR058, WR060, WR071, WR093, WR103, WR176, WR179
19638	"Hard rock mining affects fresh water through heavy use of water in processing ore, and through water pollution from discharged mine effluent and seepage from tailings and waste rock impoundments." Acid mine drainage (“AMD”) is one of the greatest environmental liabilities associated with mining, especially in pristine, water-rich environments like the Project mine site, that have economically and ecologically valuable natural resources. There are no hard rock surface mines that exist today that can demonstrate that AMD can be stopped once it occurs on a large scale. Inaccurate pre-mining characterization and interpretation often results in a failure to recognize or predict impacts to water quality and aquatic life. Evidence from literature and field observations suggests that permitting large scale surface mining in sulfide-hosted rock with the expectation that no degradation of surface water will result due to acid generation imparts a substantial and unquantifiable risk to water quality and fisheries. In a report comparing predicted and actual water quality at hard rock mines, two types of characterization failures were identified that led to differences between the predicted water quality in EIS documents and the actual water quality either during or after mining began. These included: (1) insufficient or inaccurate characterization of the hydrology. The authors reported primary causes of hydrologic characterization failures as overestimations of dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size. (2) insufficient or inaccurate geochemical characterization of the proposed mine. The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy. The primary causes of mitigation failures were that mitigation measures were not identified, were inadequate, or were not implemented; waste rock mixing and segregation was not effective; liners leaked; tailings were spilled; or embankments failed, and land application discharge was not effective. The NorthMet Project Proposed Action, as defined in the SDEIS includes all of these characterization failures.	COOP01, PD01, WR128
19639	The Project overestimates dilution of polluted water by underestimating baseflow in the bedrock surficial aquifer at both the mine and plant sites.	COOP01, WR165

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19640	A fundamental lack of hydrologic characterization enables PolyMet to reach a fictitious conclusion that there will be no water pollution resulting from the Project. No bedrock monitoring wells were installed near the tailings basin. The number of groundwater samples used to model the Mine Site included three or more samples from each of 23 monitoring wells in the surficial aquifer (a 24th well was dry after the first sampling, so it only provided a single sample). Of these, 12 were new monitoring wells installed in the surficial aquifer in 2012, yet data collected from them was not used to model and predict potential impacts to water surrounding the Project. Storage coefficients used to model the entire Plant site area are not consistent with any peer reviewed scientific literature.	COOP01, WR071, WR095
19641	The hydrology model that was applied used outdated data collected at a significant distance from the site. The Project XP-SWMM model is based on a stream gauging station for the Partridge River that is seventeen miles from the mine site and the data from that station are twenty years old ; and stream gauging data for the Embarrass River that is based in data that is more than fifty years old from eleven miles downstream. Therefore, the results are highly unlikely to be representative of current conditions at the mine or plant site. This baseline hydrologic data deficiency has been carried forward from the 2009 DEIS, despite ample time and opportunity to collect sufficient new hydrologic data.	COOP01, WR003, WR071, WR086, WR091, WR175
19642	Underestimation of storm size and frequency is a serious problem for capture and treatment of polluted water from the Category 1 waste rock stockpile and tailings basin, tailings basin stability, and stormwater run-off from the Overburden Storage and Layout Area (OSLA). Project estimates were based on one-hundred-year storm events. Before recognition of climate change impacts, this would have been a reasonable assumption. Now, storm severity and frequency suggest that what was previously considered a one-hundred-year storm event may occur once every ten years.	COOP01, GT15, WR077, WR180
19643	Many mitigation measures were not identified or evaluated using the required NEPA “hard look”. Those mitigation measures that have been identified and carried forward as the Proposed Project are inadequate, especially the tailings basin seepage capture system. The tailings basin is unlined, and the seepage capture system has not been designed to collect any seepage from the east side of the tailings basin. This flow path for project pollutants to reach surface and ground water has not been addressed at all. The waste rock mixing and segregation has not been demonstrated to be effective at other similar projects. Liner leakage rates are very optimistically estimated using solid waste landfill average leakage rates (lined solid waste landfills are much smaller).	COOP01, NEPA14, WR054, WR126
19644	There are no predictions or contingency plans addressing the potential for tailings piped from the processing plant to the tailings basin could be spilled, or that tailings embankments may fail. The Hydrometallurgical Residue Facility (HRF) is proposed to be constructed in an area that is currently under water, and has a prominent historic drainage channel that has not been accounted for in project design or water modeling.	COOP01, WR066, WR131, WR132
19645	Project baseline data used for both the Mine Site and the Tailings Basin are still insufficient, even though this deficiency was highly criticized by many commenters on the 2009 DEIS. A comparison of hydrologic data that was collected for two other projects in the region demonstrates that the PolyMet project is data-poor in the area of basic hydrology, much less mitigation.	COOP01, WR023, WR071
19646	there is no explanation for the failure to use pre-mining flow and sulfate data available through DNR fisheries reports to determine potential water quality and quantity impacts, or cumulative effects to flow and water quality in the Embarrass, Partridge, or St. Louis Rivers. In fact, decades-old flow data (1942 – 1964) was used instead of recently collected data in the Embarrass River watershed even though that historic flow data precedes any mining. Surface water and groundwater quality and quantity data collected for the Minnamax Project, LTVSMC Dunka Pit, and the VIC program were listed in SDEIS, but largely ignored in water quality and quantity predictions.	COOP01, WR003, WR023, WR071, WR175
19647	Extensive experience from other hard rock mines and their faulty predictions of water quality impacts should compel the co-lead agencies to recognize the need for significant improvements to the modeling evaluations.	COOP01, PD26, WR023, WR071, WR189

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19648	Inadequate water quality impacts analysis. From SDEIS 5.2.2, Water Resources: With the proposed design modifications and engineering controls, the water quality model predicts that the NorthMet Project Proposed Action would not cause or increase the magnitude of an exceedance of the groundwater and surface water quality evaluation criteria at the P90 level for any of 28 solutes at 29 groundwater or surface water evaluation locations within the Partridge River and Embarrass River watersheds, with two exceptions: Aluminum...Lead...Evidently, the public is expected to uncritically accept the project proponent’s assertion that a 700-ft deep open pit sulfide mine, a 526-acre permanent reactive waste rock stockpile, a pit lake requiring water treatment in perpetuity, a tailings basin that has already contaminated ground and surface water that now will host reactive sulfide tailings, and a permanent hazardous waste facility constructed within a wetland, will collectively result in only two exceedances of water quality standards – and they are not even directly attributable to the Project Proposed Action! This stunning conclusion is a result of flawed modeling assumptions (baseflow, hydraulic connectivity, etc.), dubious decisions on data usage (omitting ‘outliers’, concentration caps, etc.), fuzzy compliance thresholds, and inordinate reliance on engineering controls that must perform flawlessly, most of them in perpetuity.	COOP01, WR003, WR056, WR071, WR072, WR082, WR128, WR129
19649	Surface water quality remains insufficiently characterized or left uncharacterized, and the defects in analysis are profound in this area.	COOP01, WR003, WR017, WR018, WR021, WR115
19650	There have not been any water samples collected from lakes in proximity to the tailings basin (Hiekillilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies.	COOP01, WR064, WR075, WR109, WR197
19651	The monitoring wells that do exist near the tailings basin have concentrations of pollutants including iron, sulfate, manganese, aluminum, and fluoride that exceeded drinking water standards. But because of the limited distribution of monitoring wells, the extent of the existing contaminant plume is not known. No bedrock monitoring wells have been drilled in the vicinity of the tailings basin. However, domestic wells near the northern property line show substantial contamination of the groundwater aquifer.	COOP01, HU03, WR008, WR064
19652	Regardless, modeling of PolyMet contaminants at the tailings basin did not take existing pollutant concentrations into account, and pretends that existing contamination is an acceptable “baseline” from which only new contamination should be measured.	COOP01, WR082, WR109
19653	The assumption that 93% of the seepage from the tailings basin can be captured is unrealistic. Tribes requested the co-lead agencies or their contractor to provide any references for the 90% or greater capture efficiency rate they were confident could be achieved; they were not able to provide a single example from anywhere in the world.	COOP01, WR018
19654	The primary purpose of the seepage capture at the Proposed Project is to achieve compliance with MN WQS, but it is not likely to be successful, based upon limited but relevant regional experience.	COOP01, WR018, WR020
19655	On pages 5-121 and 5-158, the SDEIS maintains that the seepage collection system installed at the south side of the existing tailings basin has “essentially eliminated the flow of Tailings Basin seepage into Second Creek”. This statement is clearly not supported by the facts. PolyMet and the state regulatory agencies are fully aware that that this seepage pumpback system is not nearly as effective as claimed in the SDEIS.	COOP01, WR101, WR117
19656	There is simply no evidence to support the rosy scenario that PolyMet will be able to capture 97% of the shallow seepage and 90% of the deep seepage from an unlined, purposefully ‘leaky’ tailings basin, despite the co-lead agencies’ assurances. The SDEIS must be revised to accurately describe the ineffectiveness of the current seepage collection system, and the need for a redesigned system or additional mitigation must be clearly stated. The SDEIS must evaluate the impacts of polluted tailings basin seepage to Second Creek and the Partridge River.	COOP01, PD08, WR018, WR117, WR118, WR133

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19658	The SDEIS claims that construction of a groundwater containment system along the north, northwest and west sides of its unlined tailings basin “would capture virtually all of the Tailings Basin seepage presently flowing in those directions to restore water quality” (SDEIS p. 5-174). Without even a single bedrock monitoring well installed to confirm or deny this assumption, the SDEIS maintains that this is prediction is “conservative”, because the modeling done by PolyMet assumes that bedrock hydraulic conductivity is “negligible” (SDEIS, pp. 5-68 - 5-69). Disturbingly, the tailings basin model uses storage coefficients that are not found anywhere in peer reviewed scientific literature.	COOP01, PD08, WR008, WR018, WR071, WR095, WR099
19659	The storage coefficient incorporated in the plant site model (including the tailings basin) for bedrock is 0.20, and for the surficial deposits 0.0002 (SDEIS p.5-41), suggesting that the bedrock contains several orders of magnitude more water than the surficial deposits.	COOP01, WR095
19660	the modeled hydraulic conductivity and/or modeled storage coefficients cannot be relied upon to estimate the amount of seepage that will bypass the seepage capture system, or the amount of time before seepage upwells to surface waters in adjacent wetlands and the Embarrass River, where MN WQS must be met.	COOP01, WR019, WR128
19661	Another major deficiency in the plant site model is that seepage capture at the flotation tailings basin, as modeled with MODFLOW and GoldSim, does not account for any seepage out of the east side of the basin. SDEIS Figure 3.2-27, that indicates continuous bedrock on the east side of the tailings basin, is incorrect and must be corrected.	COOP01, WR054
19662	The modeling approach used by PolyMet has placed an artificial and unrealistic no-flow boundary on the east side of the tailings basin, when a critical evaluation of hydraulic head clearly shows the potential for substantial groundwater movement to east. Because of this this flawed assumption, there has been no contaminant transport modeling or water quality impacts analysis for seepage leaving the east side of the tailings basin.	COOP01, WR054, WR102
19663	Also, according to the plant site surficial geology and depth to bedrock figures , the thickest layer of glacial till for the entire Proposed Project occurs around the tailings basin, representing, essentially, the biggest “pipe” for conducting contaminated tailings basin seepage to downgradient wetlands and eventually the Embarrass River. Tribal agency re-analysis using MODFLOW for the east side of the tailings basin reveals that this is likely the most significant discharge area for the entire tailings basin.	COOP01, WR093
19664	The SDEIS maintains that mine pit dewatering impacts will be very limited or non-existent based on an assumption carried forward from the DEIS that there is little or no connection between the bedrock and surficial aquifers. This assumption is based solely on an unsupported “professional opinion,” when in fact there is ample evidence that there may be substantial connection between the bedrock and surficial aquifers. Such a connection indicates that dewatering the mine pits could cause significant drawdown of the water table in the surficial aquifer, potentially dewatering wetlands and ephemeral streams.	COOP01, WR010, WR012, WR013
19665	Both tritium and unionized ammonia are classic indicators for a strong connection with surface water...Unionized ammonia and tritium in the deep boreholes suggest that travel time of contaminants through bedrock fractures will be on the order of decades, not the hundreds or thousands of years that are assumed in the SDEIS.	COOP01, NEPA09, WR010, WR013
19667	The lack of fracture and fault analysis is a major deficiency of this SDEIS.	COOP01, WR007, WR008, WR012, WR013
19668	predicted water quality impacts and ineffective mitigation methods referenced in the [Copper-Nickel] Study were ignored when the technical documents and SDEIS were drafted for PolyMet.	COOP01, WR023, WR203
19669	The SDEIS also diminishes the lessons learned from the Dunka Pit, located on the former LTVSMC site approximately five miles north and east of the PolyMet Project mine site.	COOP01, WR023

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19670	The SDEIS has not adequately evaluated the potential for impacting drinking water sources, and it is clear from the state regulatory agencies' uncertainties about the frequency, volume, and water quality of other mine discharges (i.e., the Peter Mitchell Pit) even while regulated under permits, that this issue remains a significant deficiency in the SDEIS analysis.	COOP01, WR041, WR042, WR110, WR154
19671	The tribal cooperating agencies have consistently raised concerns about reactive dust and ore fines along the Transportation and Utility Corridor, and potential for water quality impacts to the three streams and wetlands that are crossed within the corridor. Yet these concerns have been repeatedly kicked back and forth between the Air IAP and Water Quality IAP work groups, with neither group ultimately resolving the information and risk analysis gap. The end result of this 'oversight' in the SDEIS is that no consideration, discussion, or proposed management of this potential water and wetland quality impact is provided for the public to review.	COOP01, WET11, WR151
19672	It is unacceptable to dismiss the likely water quality impacts of twenty years of ore spillage and dust/fine deposition with a casual statement and zero analysis. It is especially disheartening to the tribal cooperating agencies that have attempted to elevate this issue for so many years, that the co-leads have been completely unwilling to consider giving it the analysis it requires, or to even provide examples from other sulfide mines where this has not proven to be a concern.	COOP01, WET11, WR023, WR151
19673	Regardless of the 'footprint' of the equalization basins, the liner leakage estimate of 5 gallons per acre per day (gpad) is not consistent with what we have found in the literature for the maximum allowable, or "Action Leak Rate", above which a leak must be found and repaired.	COOP01, WR126
19674	The Band has consistently raised concerns for the NorthMet Project potential to increase mercury concentrations in fish within the St. Louis River watershed, where we exercise water quality jurisdiction, and within the 1854 Ceded Territory where Band members can exercise treaty fishing rights.	AQ05, COOP01
19675	There has not been significant "ground-truthing" of mercury deposition rates that were used in the modeling assessment. Tribal cooperating agencies note that no studies have been conducted within this region of active mining to determine why fish tissue mercury concentrations are so high if the local sources mainly emit 'non-locally polluting' forms of mercury.	AQ28, COOP01
19676	The Band concurs with the letter recently signed by 19 Duluth health care professionals expressing concerns that the SDEIS fails to define the human health effects of increased mercury emissions, exposure to asbestos-like mineral fibers, and arsenic.	COOP01, HU01, HU02, HU07
19677	The SDEIS states that the current fish tissue concentrations in the five local lakes that were studied result in Hazard Quotients (HQs) that exceed 1 (page 6-63), but gives no further information. The Cumulative Impacts Analysis, Local Mercury Deposition and Bioaccumulation in Fish (July 2012) (Barr report) showed modeled contributions from both the Mesabi Nugget LDSP and PolyMet; this information should be included in the SDEIS for public review. The Barr report provides the actual HQs, rather than just saying "they exceed 1". The SDEIS should state clearly that in one case, the existing HQ equals 46.2, which is 46 times as high as the number where action is recommended. This is an unacceptable situation.	AQ03, COOP01
19678	The SDEIS does not provide any rationale for more mercury to be added to a system that is already so high in mercury, but rather only suggests that the TMDL should take care of this.	COOP01, MERC22
19679	The background site-specific analyses and data presented in the SDEIS for total mercury and methylmercury in surface and groundwater is not sufficient to adequately describe existing conditions or evaluate the potential for impact due to changes in hydrology and water quality as a result of the NorthMet Proposed Project.	COOP01, MERC02
19680	There is very little methylmercury data included in the analysis for any waterbodies, and there is no sediment mercury or methylmercury data used to evaluate and understanding existing conditions. For the data that is presented, there are numerous inconsistencies in reporting limits and method detection limits, casting doubt on data quality and its utility for critical analysis of project impacts.	COOP01, MERC04

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19681	The SDEIS also fails to evaluate other scientifically documented factors that affect mercury methylation and bioaccumulation. The SDEIS approach to evaluating mercury impacts of the Proposed Project avoids addressing complex but well-studied environmental processes by modeling, and instead relies upon an incomplete mercury mass balance to predict future conditions. It superficially references some of the large body of literature related to sulfate, pH, dissolved organic carbon, iron, and microbial activity, but in some cases erroneously interprets it.	COOP01, MERC13
19682	Given the lack of confidence in predicted seepage capture rates, Tailings Basin seepage is another source that has been greatly underestimated in the SDEIS analysis.	COOP01, PD08, WR018, WR021
19683	The SDEIS evaluation of mercury impacts is deficient, and the conclusion of no mercury impacts downstream in the St. Louis River watershed is not supported by the information presented. This issue remains a significant impact to reservation and treaty resources.	COOP01, MERC19
19684	recent research does not support seasonal-only restrictions on sulfate loading. There is no time of year when high sulfate discharges do not result in the generation of highly toxic sulfide in the sediments, and consequently, no time of year when wild rice is not susceptible to high sulfate.	COOP01, WR153, WR154
19685	The wild rice sulfate standard must apply throughout the Embarrass River watershed.	COOP01, WR154
19686	The scant remaining stands[of wild rice] in the upper reaches [of the Embarrass River] have already been severely impacted by previous mining disturbances and continued releases of high-sulfate water, and are in need of restoration.	COOP01, PER10, WR154, WR157
19687	The NorthMet Project Proposed Action must meet MN WQS, including the sulfate criterion to protect wild rice.	COOP01, PER10, WR153, WR154
19688	We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarrass River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact.	COOP01, PER10, WR156, WR157
19689	The SDEIS does not adequately discuss impacts to traditional uses such as hunting and trapping, nor does it adequately discuss impacts to traditional game and furbearer populations. This is a major discrepancy in these documents as healthy wildlife populations, particularly game and furbearer species, and access to them is critical for the exercise of treaty rights for tribal members.	COOP01, CR01
19690	Fond du Lac's comments on the DEIS regarding the existing wildlife corridors are still applicable: they are fundamentally inadequate to maintain habitat connectivity across the heavily disturbed Mesabi Iron Range. As evidenced from aerial photographs, they're narrow and often heavily intruded upon by roads, utility corridors, mine pits and urban development. These features serve as barriers to many kinds of wildlife. While the existing corridors may function well enough for large, mobile species like deer or wolves, they are inadequate for smaller, less mobile species	COOP01, WI03, WI04
19691	The SDEIS concedes that increasing development of urban areas alongside the corridors will render some of the existing corridors less suitable for wildlife in the future. Increased urban development and associated transportation and utility infrastructure should be expected if the project provides the economic benefits stated in the SDEIS. Yet there is no mitigation proposed or even evaluated in the SDEIS for this environmental impact.	COOP01, WI03, WI04
19692	The Band specifically requests that state and federal regulatory agencies work with the tribal agencies to establish dedicated and protected wildlife corridors and enhance reclamation of existing mine lands to mitigate wildlife impacts within the 1854 Ceded Territory.	COOP01, WI03
19693	from the Band's perspective, perhaps the most significant deficiency in the SDEIS analysis of wildlife impacts is its failure to critically analyze potential impacts to moose.	COOP01, WI03

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19694	The tribal cooperating agencies have consistently raised impacts to moose as an issue of critical importance throughout the DEIS, SDEIS, Section 106 consultation, and ‘sieve list’ meeting processes. It is not acceptable to defer full consideration of this culturally significant species until the FEIS. We have valid concerns about the project’s impact on moose habitat at a time when their population is crashing, and they should be addressed immediately.	COOP01, CR03
19695	the Band’s concern for project impacts to moose is not simply potential effects to hunting zones and seasons; we are gravely concerned about protecting sustainable moose populations for future generations	COOP01, WI03
19696	This discussion [in the SDEIS] contains substantially outdated information regarding sturgeon reintroduction, both in the St. Louis River estuary and upstream of the Minnesota Power dams on the Fond du Lac Reservation.	AQ02, COOP01
19697	Uncontrolled contaminant loading from existing mine facilities, along with elevated constituents from the Proposed Project, have the potential to affect the successful establishment of a sustainable lake sturgeon fishery throughout the St. Louis River. This potential impact should be fully evaluated in the SDEIS.	AQ02, COOP01
19698	The SDEIS states that the property boundaries at both the Plant Site and Mine Site are used to define the maximum extent of NorthMet air impacts that would have the potential to affect historic properties, because the project is predicted to meet ambient air quality standards at those boundaries. The Band asserts that these property boundaries cannot arbitrarily be used for acid dust and metal deposition boundaries because there are no ambient air quality standards for these pollutants.	AIR04, AIR08, COOP01, WR151
19700	it is inappropriate to use areas that show compliance with ambient air quality standards to show “no effects from dust and metal deposition”, because ambient air quality and impacts caused by deposition are two separate concepts.	AIR04, COOP01, WR151
19701	it is simply not true that “modeling does not indicate potential effects on historic properties from dust deposition”. Figure 4.2.9-4 shows areas where the Fugitive Dust Area of Potential Effect extends outside both the Plant and Mine Sites.	AIR04, COOP01, WR151
19702	The SDEIS states that modeled annual dust deposition rates were compared to an “annual effects-level deposition rate” (background) of 365 g/m2/yr. This same “annual effects-level deposition rate” was given in the PSDEIS in May of 2013, but without providing a reference for how this number was derived.	AIR04, COOP01, WR151
19703	direct physical effects of mineral dusts on vegetation can be seen at a surface load of 7 g/m2 and chemical effects of reactive materials can be seen at 2 g/m2 . These levels indicate that the proposed “impact” level of 365 g/m2/yr may be too high.	AIR04, COOP01
19704	Further, as the Band commented on the PSDEIS, the modeled deposition rates do not include the effects of contamination from other sources, such as pit leaks and seepage, nor are cumulative impacts from all of these sources included in Chapter 6.	COOP01, CU12
19705	The SDEIS statement that “all of the receptor nodes with the highest model-estimated deposition rates were located within the ambient air boundary” is incorrect, especially given that the following paragraph contradicts this statement by saying “of the 234 acres of wetlands, (that could be potentially indirectly affected) 228 acres would be located within the Mine Site ambient air boundary”. While only 3% of the affected acres are outside of the boundary, these two statements should be reconciled. This same comment was made by the Band previously while reviewing the PSDEIS. The inaccuracy serves to diminish consideration of any impacts.	AIR05, COOP01
19706	SDEIS Figure 5.2.3-22 depicts receptors outside the plant site that are predicted to receive dust deposition rates higher than 50% of background. Since the SDEIS asserts that only those areas receiving deposition greater than 100% of background will be affected, it is unclear why Figure 5.2.3-22 shows areas receiving more than 50% of this value.	COOP01, WET18

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19707	SDEIS Figure 5.2.3-23 depicts receptors outside the plant site that are predicted to receive metal deposition rates higher than 100% of background, but there is no discussion regarding monitoring or management actions to quantify or mitigate affects. Other SDEIS text is confusing or contradictory; from SDEIS 5-302: “all receptors have model-estimated dust deposition of 50% or less of the effects-level background of 365 g/m2/yr”, but the very next sentence states “At the Plant Site, there would be two locations showing model-estimated deposition rates greater than 100% of background deposition”. Later in the same paragraph “...the modeling only indicated those areas that had deposition rates greater than 100% of background deposition”. It appears as though one statement may address dust deposition and the other metals deposition, but this is unclear.	COOP01, WET18
19708	The SDEIS discussion on fugitive dust is quite often confusing. There should be clarification between when the text is referring to sulfide dust and when it is talking about metallic dust. The text apparently switches between the two without explanation. Also, the text is not clear which air emissions sources were modeled with regard to fugitive dust.	AIR12, COOP01, WR151
19709	From the SDEIS, “90% of the receptor nodes with the highest model-estimated deposition rates are located within the ambient air quality boundary”. As the Band has commented before, this is impossible to verify, as no map of the location of the receptor nodes has been included. Also, 90% of the area predicted to be impacted does not lie within the ambient air quality boundary; it appears to be only about 60% contained to the ambient air quality boundary (SDEIS Figure 5.2.3-22).	AIR05, COOP01
19710	the co-lead’s only ‘mitigation’ for fugitive sulfide dust is recommending future wetlands monitoring.	COOP01, WET18
19711	the Proposed Project suggests water spraying for areas of fugitive dust release during dry periods as mitigation. In the case of dust that may have high acidic content, this would be a poor choice for management action, as the addition of water to the dust would likely create or accelerate toxic run-off.	COOP01, WET18, WR151
19712	The Band does not agree with the statement that “no significant reactive airborne fugitive dust from the rail transport is expected”. The SDEIS minimizes the potential adverse impacts from constant rail corridor spillage during the life of the mine project by claiming “Any spillage of the ore fines is expected to be within 2 meters of the rail line, along the path”. The Band is concerned with the effect of any spillage on water run-off, as has been seen with other mines in the US	COOP01, WR151
19713	There are other invalid and/or inconsistent statements throughout the SDEIS related to air quality. The SDEIS states “The Northmet Project area has been designated by the USEPA as attainment for all air quality pollutants”. To be clear, attainment designations for the new short-term standards for NOx and SO2 have not yet been completed for the State of Minnesota. Also, 90% control efficiency is assumed for haul roads at the Mine Site, but only 80% control is assumed for unpaved roads at the Plant Site.	AIR12, COOP01
19714	The Band has continually questioned the Page 5-411 states that “The modeling results for the Mine Site receptors...indicate that the highest modeled 24-hour H2H PM-10 concentration was 27 ug/m3 for the year 8 operating scenario and 29 ug/m3 for the year 13 operating scenario”. Yet the 29 ug/m3 result not shown in Table 5.2.7-11, even though this value is nearly the PM-10 24-hour increment limit (30 ug/m3).	AIR12, COOP01
19716	From Table 6.2-22, cumulative inhalation risks for cancer are four times greater than the guideline of 1E-05. Although much of this risk comes from existing facilities, this number indicates that the area cannot sustain pollution that adds to what is already there without compromising health.	COOP01, HU05
19717	The Band has also continued to raise concerns for amphibole fibers, and what we perceive as insufficient analysis in the SDEIS. According to the SDEIS, the BACT-like fine particulate controls will control the release of more than “99.9% of amphibole fibers that are emitted from controlled sources”, not “99.9% of fibers in the ore”. The second statement is incorrect, because some sources of fibers from the ore are uncontrolled, like blasting operations, or are unable to be controlled up to 99.9%, like haul roads, tailings, crushing and screening, and stockpiles.	AIR03, COOP01

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19718	The SDEIS states that the Biwabik Iron Formation (which has been found to contain amphibole fibers) slopes under the Duluth Complex at the Mine Site, coming within 100 feet of the area that is planned to be mined. The Band’s previous comments regarding unexamined hydrological connections between geologic layers or formations are also applicable in this instance. With fractured bedrock present, that could establish a hydrological connection, and 100 feet would be an insufficient barrier.	COOP01, PD21, WR012, WR107
19719	The SDEIS maintains that the Minnesota Department of Health has reported that males within the area of the taconite mining and milling industry had more than two times the mesothelioma rate than the rest of the state. Actually, the report from the epidemiologic study of Minnesota iron mine workers states that it is three times the rate found in the rest of the state.	COOP01, HU05
19720	Page 5-443 The SDEIS assures that ambient air monitoring for amphibole fibers would be conducted following facility start-up. While no schedule of frequency or duration for amphibole fibers monitoring has been proposed in the SDEIS, the Band continues to assert, as we have throughout the environmental review process, that monitoring will need to continue over the life of the mine, as no one can predict when fibers might be contacted and released.	AIR03, COOP01
19722	The tribal cooperating agencies were not permitted to participate in the Geotechnical Stability IAP workgroup, so we are at a disadvantage for understanding how some of the profound geotechnical stability risks identified for the PolyMet project as defined in the 2009 DEIS were resolved for the 2013 SDEIS.	COOP01, GT14
19723	we do not share PolyMet’s confidence in being able to virtually eliminate leakage to groundwater from any type of containment system. Some leakage must always be assumed, and given the site-specific conditions for the proposed location of the HRF, the risk for highly contaminated seepage to exit the HRF and flow to wetlands in the Embarrass River watershed.	COOP01, WET12
19724	[A] 'natural low point in the topography' is an open water wetland (as prominently displayed in the left photograph on the cover of the SDEIS) with distinct natural drainage channels .	COOP01, WET17
19725	The SDEIS simply does not address the potential lack of integrity or risk of failure when constructing a hazardous waste facility within a wetland. Assumptions about hydraulic head being removed from the lower liner are not reassuring when the lower liner (geosynthetic clay) has been installed within a wetland and natural drainage ravine.	COOP01, PD18, WR126
19726	The potential for substantial volumes of seepage flowing from the Tailings Basin to the HRF has not been addressed in the SDEIS; this represents a potential structural hazard.	COOP01, GT11, WR066
19727	But we have no assurance that the HRF is designed to structurally withstand thousands of gallons per day of Tailings Basin seepage along the dikes that do not have seepage capture features installed.	COOP01, GT11
19728	the co-lead agencies’ approach to predicting indirect impacts to wetlands and their resulting conclusions, [is] an overly simplistic method based upon a flawed concept of hydrology at the mine site.	COOP01, WET08
19729	The purpose of an EIS is to be “forward looking” by predicting potential impacts and adequate mitigation for those impacts; this SDEIS is deficient in that respect. The USACE has not yet developed a monitoring plan to assess after-the-fact Project impacts to wetlands, but maintains that will be the way to best determine and mitigate indirect wetland impacts. The Band is not aware of any previous instance for which the USACE St. Paul District Office has required reasonably foreseeable indirect wetland impacts to be later mitigated as direct effects based upon monitoring.	COE02, COOP01, WET02
19730	Given the persistent major differences of opinion between the co-lead agencies and the tribal cooperating agencies, the Band specifically requests that financial assurance for potential indirect wetland effects and monitoring be secured.	COOP01, FIN03

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19731	Nearly 2,000 acres of coniferous bog wetlands will be directly impacted by mine pit(s) and stockpiles, or indirectly impacted due to drawdown and/or pollution. This is particularly significant to the Band because many tribally harvested resources are only available in coniferous bogs, and restoration of coniferous bogs is a very difficult and long process that has extremely low success rates.	COOP01, WET13
19732	The proposed mitigation plan is inadequate; it allows for the vast majority of mitigation and/or restoration credits to come from outside the Partridge, Embarrass, and St. Louis River watersheds. There is no justifiable reason to permit out-of-watershed mitigation when in-watershed opportunities still exist...	COOP01, WET03
19733	The Band objects to the approval of any further out-of-watershed mitigation credits or restoration for impacts to irreplaceable high quality aquatic resources of national importance, which include all remaining unimpacted wetlands within the St. Louis River watershed/Lake Superior Basin.	COOP01, WET03
19734	Tribal cooperating agencies believe the CEA for land use should encompass the 1854 Ceded Territory, as the signatory Bands have lost access to substantial portions of the 1854 CT and the resources within.	COOP01, CU01
19735	The tribal cooperating agencies believe the water quality and hydrologic cumulative effects analysis should incorporate the entire St. Louis River watershed. This watershed has experienced substantial historic, current and proposed expanded mining activities, as well as other industrial, agricultural and urban development. In addition to the direct surface water and wetland impacts (loss and/or degradation) from these activities, nearly half of the watershed has experienced hydrologic alteration from extensive ditching.	COOP01, CU01
19736	Tribal cooperating agencies consider a 216,300 acre area bounded by the St Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources.	COOP01, CR03, CR04
19737	The tribal cooperating agencies' review of the water modeling data packages for the NorthMet Project Proposed Action led to our conclusion that GoldSim did not accurately predict existing conditions, and cannot be relied upon to accurately predict future project conditions.	COOP01, WR044, WR045, WR049
19738	While any individual mine may not have significant impacts on plants, wildlife or the landscape, the cumulative impacts of thousands of acres of habitat loss and degradation correspond to a legitimate, significant concern for treaty-protected resources and access to them.	COOP01, CU11
19739	General reluctance to share information with non-Band members is often prevalent [at NorthMet Project meetings] as well as cultural restrictions on who (inside and outside the Band) can legitimately and safely be trusted with sensitive information.	COOP01, NEPA14
19740	The Area of Potential Effect (APE) for cultural resources divided the project into two separate sections surrounding the proposed mine site and the proposed plant site should be revised. "Figure 4.2.9-1, Cultural Resource Analysis-Area of Potential Effect" needs only to have the two areas joined to compose an APE that reflects an undertaking as defined in Section 106 of the National Historic Preservation Act of 1966...]" An APE that encompasses the Mine and Plant sites and surrounding area affected by operations would better describe the undertaking for cultural resource investigations.	COOP01, CR02
19741	The Beaver Bay to Lake Vermilion Trail requires further clarification...There has been no rigorous attempt to research the BBLVT by the Bands or Lead Agencies, although the Superior National Forest Heritage Program reviewed the GLO plats and conducted field investigations on SNF land. Additional fieldwork should be conducted in the spring or fall when ephemeral features such as foot trails are less easily concealed by vegetation and more easily discerned.	COOP01, CR04
19742	The proximity of the plant site to the Sugarbush and the cumulative effects of dust on leaves, trees and understory flora have not been examined in detail and their long term effects may well be detrimental to vegetation, other than maples, that comprise the Sugarbush."	COOP01, CR02, CR03, CR05

<b>Sender Name (Submission ID)</b>	Fond du Lac Band (42920)	
19743	The SDEIS must be revised to fully evaluate reasonable alternatives in the SDEIS, including identifying the federal agency preferred alternative and the LEDPA.	ALT20, COE04, COOP01
19744	No mitigation has been identified in the SDEIS for this permanent loss of lands and resources (natural and cultural) to the 1854 Ceded Territory. The public interest determination must include a specific finding that “The intended use of the conveyed Federal land will not substantially conflict with established management objectives on adjacent Federal lands, including Indian Trust lands” (36 C.F.R. 254.3(b)(2)(ii)). This threshold has not been met, and the Fond du Lac Band objects to the implementation of the Land Exchange Proposed Action.	COOP01, CR01, LAN05
19745	The SDEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates. The SDEIS requires substantially more public transparency and less equivocation on what is arguably one of the most fundamental issues at stake for this project: perpetual treatment.	COOP01, FIN06, PER03, WR035, WR037
19746	The SDEIS does not provide sufficient information for the public to understand whether the NorthMet Project Proposed Action will be required to remediate these and other AOCs before commencing project operations, or be allowed to defer remediation until closure.	COOP01, HAZ05
19747	Based upon our extensive evaluation of the SDEIS and supporting technical documents, we conclude that there will undoubtedly be significant and unmitigated impacts to natural and cultural resources that the tribal cooperating agencies have consistently elevated to the attention of the co-lead agencies. There will be significant and unmitigated tribal resource losses within the 1854 Ceded Territory and the Lake Superior basin, including the St. Louis River watershed. The NorthMet Project Proposed Action and Land Exchange Proposed Action would decrease the amount of land available for public access and use, and would decrease portions of the 1854 Ceded Territory available for use by the Bands... There is a demonstrated need for significant improvements to the modeling evaluations. The lack of fracture and fault analysis is also major deficiency of this SDEIS.	COOP01, WR012
19748	Based upon our extensive evaluation of the SDEIS and supporting technical documents, we conclude that there will undoubtedly be significant and unmitigated impacts to natural and cultural resources that the tribal cooperating agencies have consistently elevated to the attention of the co-lead agencies. There will be significant and unmitigated tribal resource losses within the 1854 Ceded Territory and the Lake Superior basin, including the St. Louis River watershed. The NorthMet Project Proposed Action and Land Exchange Proposed Action would decrease the amount of land available for public access and use, and would decrease portions of the 1854 Ceded Territory available for use by the Bands... We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarrass River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact.	COOP01, WR115, WR157
19749	The SDEIS evaluation of mercury impacts is deficient, and the conclusion of no mercury impacts downstream in the St. Louis River watershed is not supported by the information presented.	COOP01, MERC19
19750	We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarrass River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact.	COOP01, PER10
19751	The most significant deficiency in the SDEIS analysis of wildlife impacts is its failure to critically analyze potential impacts to moose.	COOP01, WI01
19752	Uncontrolled contaminant loading from existing mine facilities, along with elevated constituents from the Proposed Project, have the potential to affect the successful establishment of a sustainable lake sturgeon fishery throughout the St. Louis River. This potential impact should be fully evaluated in the SDEIS.	AQ02, COOP01

<b>Sender Name (Submission ID)</b> Forrest Petersen (42938)		
9921	the 90 percentile probability used in the water quality models is below established scientific standard for modeling water quality standards. Most statistical models, including those for the MODFLOW modeling program, and the Regional Water Authorities use the 95 percentile probability threshold for making predictions in order to ensure accuracy. The 95% probability ensures greater confidence in the statistical results and equates to a 5% chance of the water quality standards being exceeded (Crabtree et al. 1987).	WR192
9922	1,741.1 acres of Minnesota Biological Survey Sites of High Biodiversity Significance, 698.2 acres of vulnerable native plant communities, 2 acres of secure vegetation, and 912.5 acres of USFS wetlands would be lost or directly affected by the NorthMet Project. Although there are no federally listed plant species in the area, 11 state-listed species would be impacted due to their position on and near the proposed mining location.	VEG01, VEG02, WET24
9924	The impact [of the PolyMet mine] to the surrounding environment could be even larger as mine drainage has been shown to exert chemical and physical stressors on the surrounding environment causing loss of diversity and reduced aquatic life.	AQ05
9925	In addition to loss in diversity, mine drainage, especially aluminum oxide, has been shown to significantly reduce algal biomass in nearby streams (Niyogi et a. 2002).	VEG06
9926	Records exist of historically high lynx in Minnesota; however, they experienced a decline during the 1900s due to hunting and are currently in the recovery stages. Research has determined that extensive contiguous habitat is necessary for viable lynx population to occur. The inclusion of the land exchange aspect helps alleviate some of the effects of reduced habitat for wildlife. However, with the allowance of selective logging on the newly acquired land, many of the state-listed animals that require extensive habitats, such as the Canadian lynx and gray wolf, are unlikely to persist in the fragmented areas proposed in the land exchange (Ruggiero et al. 1999).	WI01, WI02
9929	I know that economic development is necessary to create jobs and provide raw materials for societal needs, I simply suggest using the best available scientific methods for determination of the environmental consequences, and utilizing all available resources to mitigate negative impacts. Issues such low statistical thresholds on water quality models, effects of mine seepage, and the destruction of critical habitat should be addressed more thoroughly before the NorthMet Project is allowed to continue.	SO04
<b>Sender Name (Submission ID)</b> Fort JK (47327)		
12186	The Supplemental Draft Environmental Impact Statement fails to adequately address the negative impact of the proposed copper sulfide mine. [Acid Mine Drainage and heavy metal contamination] would pollute and ruin the St. Louis River and watershed from it's northernmost regions all the way to Lake Superior... as well as all the groundwater in its wake, groundwater that we citizens rely on to be safe and healthy to drink. For Duluth, or any cities/towns who get their drinking water from Lake Superior, it would be a negative impact as well.	HU03
16701	we must also mention the terrible, direct devastating effect the pollution from the mine would cause concerning wildlife and birds who use the St Louis River and Lake Superior to drink from and obtain food from. I include the Embarrass River and any other body(ies) of water that would be harmed by the mine as well, such as the lake that is over the presumed deposit.	AQ05
16746	It would pollute and ruin the wild and beautiful St. Louis River and watershed from it's northernmost regions all the way to Lake Superior, which is another body of water that would be so negatively impacted as well as all the groundwater in its wake, groundwater that we citizens rely on to be safe and healthy to drink.	WR042, WR081
16747	For Duluth, or any cities/towns who get their drinking water from Lake Superior, it would be a negative impact as well.	WR011, WR041

<b>Sender Name (Submission ID)</b> Frank Jossi (11268)		
1590	We have one of the largest concentrations of fresh water in the world, both in our interior lakes and with Lake Superior. This seems far valuable to the country than copper nickel, especially in time when droughts have impacted different parts of the country for at least the last two decades due to global warming. This legacy is worth preserving and this mine, and others proposed, would like end it	SO02
1591	I find it hard to imagine the monitoring of water for 500 years. Copper nickel mining has an atrocious international record so I would certainly plan on necessity for long-term monitoring. The chance for pollution due to heavy rainfall, poor planning, breached liners and unforeseen weather events seems likely. Where is the mitigation plan for worse-case scenarios?	PD22
1593	What are the details of the proposed water treatment systems?	PD03
1594	Who will pay for five centuries of monitoring? If Polymet goes under, what is the liability to the taxpayer?	FIN01, FIN10, FIN11
1595	How much will Polymet put up annually to pay for cleanup in case of a disaster?	FIN05
1596	Are you going to correct the inaccurate water flow model?	WR003, WR086, WR091
1597	Will there be more work on the impact to wetlands? Seems under-represented.	WET24
1598	There is significant habitat loss not well documented in the report.	VEG03
1599	Finally, Polymet is a small company, frankly not all that well capitalized to take on such an enormous undertaking. It is not Kennecott. I fear any kind of even minor disaster will likely put it out of business, or it may decide to put itself out of business. Of course, the taxpayer will be left with the environmental and financial damage of such a result.	FIN01, FIN02, FIN10
<b>Sender Name (Submission ID)</b> Frank Korpi (54645)

1799 Please don't let a foreign entity ... leave the taxpayers holding the bag for generations. FIN04

1885 [The NorthMet Project will have] short-term monetary gain which probably will not even provide a high percentage of benefit to Minnesota SO02

1888 Far more money can be made in the long run by keeping the area wild and pristine and focusing on smaller projects with less negative effect ALT13

**Sender Name (Submission ID)**    Frank Wood (20193)

1781 We think the time has come to plan for sustainable employment rather than relying on jobs in mining which have a limited duration. We are disappointed that anyone is ready to risk the health of the entire region for a few hundred jobs. SO01

15197 Previous mining has already done damage. Consider the pollution of the St. Louis River. Look at the isolated instances of damage where sulfide bearing ores have been mined. We do not believe there is a “safe” way to manage the poisonous residue from such mining. Concentrating the poison using the filtration process proposed does not solve the problem. Consider the history of Butte MT, particularly the Berkeley Pit. What responsible person would place such a pool of poison in the midst of a network of lakes and streams? Just recently we have seen a tank leakage in West Virginia and a slurry dam failure in Georgia. In the first case, the corporation involved sought protection in bankruptcy—a move that is not unusual for firms in a tight place. Promises do not last when the profits are gone. FIN01

**Sender Name (Submission ID)**    Fred Hickox (30296)

12878 Sulfide mining can not be performed safely without causing long term pollution and environmental damage. PD01

12879 In the long term the tax payers will be paying for this mine with lost tourism jobs, health care costs, and clean-up costs. It would be more cost effective for the tax payers to pay the mining companies millions to just go away. FIN10

13988 The Federal land exchange of protected Superior National Forest land is not in the public interest. LAN01

**Sender Name (Submission ID)**    Fred Rogers (58043)

19881 What is very clear is that the jobs are relatively short term - 10-20 years - and the environmental risk and degradation are very long term - 100-500 yrs. SO01

<b>Sender Name (Submission ID)</b> Frederick K Campbell (54784)		
19386	The discussions of environmental consequences in several sections of Chapter 5 are incomplete because they do not adequately consider catastrophic weather- and/or climate-related events, such as flooding, wind- and electrical storms.	AIR01
19387	The SDEIS does not provide adequate contingency plans for catastrophic natural events or for catastrophic human-caused events (e.g., train derailments or accidents).	PD22
19388	Chapter 3 mentions the potential need for post-closure water treatment for up to 200 years at the mine site and up to 500 years at the plant site. Other chapters and sections of the SDEIS should discuss the potential implications and repercussions of such an extended period of post-closure water treatment.	NEPA05
19389	The discussion of saline groundwater on page 5-113 and 114 concludes that the risk of encountering saline water is low. However, this is based on evidence from 12 monitoring wells, which represent only a very small portion of the total project area. Based on the scope and nature of the proposed actions at the Mine Site, and based on published information about the nature of the Duluth Complex and other formations of Keweenaw age, it seems probable that saline groundwater will be encountered.	WR078
19390	Section 4.2.2 .1.3, which discusses wild rice, is incomplete, because it does not sufficiently discuss the potential impacts of the Proposed Project on wild rice, the Ojibwe community or wildlife.	VEG04, WI01
19391	The SDEIS uses modeling to predict water quality impacts, and does not use any empirical data to evaluate these potential impacts. The SDEIS should be updated with information from the latest studies by the Minnesota Pollution Control Agency and other researchers.	WR023, WR073
<b>Sender Name (Submission ID)</b> Freds Gmail (6712)		
1104	Where is the money coming from in order to support the operations that prevent any negative environmental impact for the next 200-500 years? Is there going to be a reserve set up in order to support monetarily the operations that prevent any negative environmental impact for the next 200-500 years? Who is responsible in supporting the operations, and watch-dogging the operations, that prevent any negative environmental impact for the next 200-500 years?	FIN01, FIN08
1300	...all monies need to be placed into a non-accessible reserve (non-accessible by any present or future State Governments) that will support all environmental operations for the next 200-500 years.	FIN08
<b>Sender Name (Submission ID)</b> Freshwater Future (42995)		
9144	...the Supplemental Draft Environmental Impact Statement suggests centuries of pollution may occur from this mine. The MDNR, however, has stated it did not evaluate how long polluted water may need treatment. Knowing how long pollution may occur is a fundamental part of evaluating environmental impacts. We request that you re-run the water analysis to provide such estimates.	WR036
9148	The Water Impact Analysis if Faulty and Needs to be Fixed. The proposed mine plan uses inaccurate and incomplete information in the model for water quality impacts. As such, this flawed model likely under-represents the amount of water pollution and how far and fast it spreads.	WR189
9151	The mining company has provided no plan for dealing with common accidents, spills, leaks, or mechanical failures that occur at mines of this type... The SDEIS needs to include contingency planning for the most likely mishaps.	PD22

9152	...we ask that you include information regarding financial assurances as part of the document...The NorthMet proposed mine plan provides no information about the expenses of water treatment, what will be included in the costs, and how taxpayers will be protected from potentially paying for environmental clean-up the mining company leaves behind.	FIN01, FIN05, FIN10, FIN13
<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
4883	A mine plan that anticipates creating centuries of water pollution does not sufficiently protect Minnesota’s waters. The SDEIS must more fully examine mine design alternatives, such as the Underground Mine Alternative and the West Pit Backfilling Alternative, that could reduce pollution risks.	ALT01, ALT03, ALT06
4884	The SDEIS should clearly state that active water treatment will be needed for at least 200 years at the Mine Site and for at least 500 years at the Plant Site, or give a revised measured length of treatment time needed, instead of vague references to “it is expected to be long term.”	PD03
4885	the SDEIS should include graphs and other depictions of water quality data, similar to what is found in the water modeling data packages. These graphs are ways to help the public understand the information, and they should not exclusively reside in technical data packages that most of the public will never read.	PD03
4886	The SDEIS needs to contain a full and accurate accounting of the amount of uncaptured polluted water that is expected to seep from mine and plant site features. The water model needs to be corrected and re-run with accurate information about baseflow and bedrock fractures, and revised results for pollution seepage and travel times clearly presented.	WR003, WR168
4888	The SDEIS does not present information about what is in the polluted water that is sent for treatment at the Mine and Plant sites. ... Also missing is information about the make-up of Tailings Basin water, Hydrometallurgical Facility water and contents, the content of the waste sludge and solids, and the make-up of Reject Concentrate that is transported from the Plant Site to the Mine Site by rail car....The SDEIS should analyze and state how long active water treatment is needed and what the makeup and concentration levels are of all water on the Mine and Plant sites, including water collected for treatment, water after treatment, water that is expected to escape capture, contents of the mine pits, the Tailings Basin and Hydrometallurgical Residue Facility, waste solids and sludges, and the Reject Concentrate.	PD03, WR035, WR037, WR128, WR147
4892	The SDEIS does not consistently characterize the pollution risks from Category 1 waste rock. Table 3.2-8 on page 3-45, Waste Rock Categorization Properties, identifies Category 1 waste rock as having the “low potential to generate acid.” But in Table 3.2-2, Key Phases and Activities (Mine Site) on page 3-17, Category 1 waste rock is identified as “non-acid-generating waste rock.” Page 5-52 states that Category 1 waste rock “would not produce acidic leachate.” ...The acid generating potential of all waste rock should be accurately and consistently characterized throughout the SDEIS and should include its potential to leach metals and sulfates, given that waste rock pollution is not limited to acidic conditions.	PD15
4893	The SDEIS notes that the concentrations of certain contaminants in the pits are expected to exceed water quality standards but, without any supporting data, the SDEIS suggests that the need for water treatment may cease. ... The SDEIS should remove statements that are not supported by data or other information. If solute levels do not decline to below water quality standards, the SDEIS should not suggest that the need for water treatment may cease. Any discussions of non-mechanical water treatment effectiveness need to be based on information and evidence from case studies, and not on hopeful but unsupported projections.	WR035, WR137

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
4894	But Section 3.2.2.1.8 does not describe anything about the Treated WaterPipeline. The figures in the SDEIS do not appear to depict the treated water pipelines running into or out of the plant site. ... All treated and non-treated water conveyances should be fully described and portrayed in figures in the SDEIS. Pipeline failures and breaks are among the common mishaps at mines of this type, with associated risks of spreading contaminated water. The SDEIS needs to fully describe and depict these features for the public to better evaluate the proposed project.	PD22, PD38
4895	The SDEIS does not present water quality information in a transparent fashion. Many graphs, charts, and tables that could help explain information are either missing completely, or found in technical data packages and supporting documents to the SDEIS, but not in the SDEIS itself.... there is no graph showing what is in the water before treatment and what the concentration levels look like over time. There is no chart that compares pollution levels in pre and post-treatment water. There is no table that shows what the contents of the Hydrometallurgical Residue Facility are, a basin that is double lined for safety. ... The SDEIS should include graphs, tables, charts and other depictions of water quality data to help the public understand the information. We suggest: contents and concentrations of contaminated water over time, side-by-side comparisons of pre and post treated water, contents of mine pits, Tailings Basin, Hydrometallurgical Residue Facility, and the Reject Concentrate.	WR063
4896	The SDEIS needs to describe [the] chemical make-up of pit and nearby well dewatering water. It should describe how treatment methods will address any constituents of concern. And the SDEIS should re-evaluate the volume of dewatering water anticipated, and how it might manage a situation where the volume exceeds the need for mine processes.	PD03
4898	The SDEIS fails to describe and analyze a significant mitigation measure that is briefly discussed in the Water Modeling documents but referred to only obliquely and with no details in the SDEIS (pg. 5-102). ... The failure to describe this mitigation plan in the SDEIS is a significant omission. The SDEIS needs to fully explain this plan, analyze the potential for this to desaturate the backfill, and account for potential impacts.	WR130
4899	the baseflow numbers used in the model for basic site surface water flow hydrology at the Mine Site are lower than measured data suggest for the site....The SDEIS used modeled estimates of baseflow rather than measured values from flow gaging stations nearby. ... The SDEIS must present a substantially revised water model that has corrected the fatal flaws found in the current version. ... The SDEIS should reconsider if the GoldSim model is the appropriate model for assessing this project's impacts. ... The model should be re-calibrated with targets based on observed baseflow numbers and new water level data from newly installed mine site wells.	WR003
4901	In modeling water quality impacts, the SDEIS makes the assumption that the Duluth Complex and the bedrock at the Mine and Plant Sites are not fractured. ... If the U.S. EPA and others are correct about the presence of fractures, the SDEIS has made a critically flawed assumption about the permeability of the site, with potentially disastrous pollution transport implications. ... In addition, the SDEIS does not examine the potential for blasting activities at the minesite to create new fractures and pathways for contaminated water to move off site.... The degree of bedrock fracturing should be more thoroughly analyzed and this information incorporated into re-running the water model for more accurate results on pollution transport from all mine and plant contaminant sources.	WR010, WR016, WR087
4903	the SDEIS uses a higher evaluation criteria for these constituents [beryllium, manganese and thallium] than the U.S. EPA's maximum contaminant levels or the State's Health Risk Limit (SDEIS 5-11 to 5-12). ... The SDEIS should either provide evidence to support using elevated levels of beryllium, manganese and thallium as naturally occurring, or adjust the water model to use evaluation criteria set at Minnesota's water quality standards.	PD29

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
4905	The SDEIS uses a P90 Criterion to determine if water evaluation criteria are being met. ... But the SDEIS notes that this is not equivalent to howwater quality-based effluent limits (WQBELs) would be developed for National Pollution Discharge Elimination System (NPDES) permitting (SDEIS 5-77). ... It would make more sense and make for better understanding of the project’s impacts, if the SDEIS used the same evaluation method as will be required in permitting. ...The SDEIS should use the same water quality based effluent limits as will be used in NPDES permitting to enable the public to understand and evaluate impacts.	PER06
4907	After about 60 years from the onset of mining, sulfates reach the Partridge River at concentrations that exceed the legal standard. This occurs at year 60 if the West Pit’s re-filling is assisted by pumping water into it. If the West Pit is allowed to refill on its own, sulfates reach the Partridge River at about year 75, also in concentrations exceeding the standard. The SDEIS predicts the project would cause no significant effects.	WR115
4908	Copper concentrations reaching the Partridge River would also exceed the water quality standard “by large amounts after 60 to 80 years” (Myers 2014). The SDEIS predicts the project would have no significant effects.	WR171
4909	PolyMet has underestimated recharge rates by three to five times what is to be expected. “Higher recharge rates lead to higher conductivity...” (Myers 2014).	WR003, WR052, WR091
4910	Dewatering rates in the East and West Pits would be about twice that predicted by PolyMet due to higher recharge and conductivity. Higher dewatering rates have the potential to impact river flows and wetlands far more than have been predicted in the SDEIS. “Based on the simulation herein, the Partridge River reach above the confluence with the South Partridge River is most at risk from dewatering and that risk continues for years during reclamation and closure if the pit refills naturally” (Myers 2014).	WR086, WR087, WR088, WR171
4911	During some periods, drainage from the Category 1 Stockpile would flow north to the Partridge River, and not solely toward the West Pit as the SDEIS predicts. This is significant, in that the SDEIS counts on contaminants flowing from the Category 1 Stockpile to the West Pit and through waste water treatment as a way of containing pollution.	WR089
4912	During reclamation, the East Pit water would be pumped, treated to bring sulfate levels down to 250 mg/L, and then redistributed to the East Pit, all while supposedly keeping the backfill waste rock in the East Pit saturated. Dr. Myers questions the ability to successfully do this. ... The effort would likely cause large areas of the backfill to become desaturated. Pumping may even facilitate the movement of oxygen and moisture through the backfill, conditions involved in the development of acid mine drainage. “PolyMet assumes it can work without presenting a design or model” (Myers 2014).	WR088
4915	PolyMet should provide a list of mines for which GoldSim has been used to simulate contaminant transport. ... The PolyMet GoldSim model contains “inaccuracies with the parameters, the assumptions, the conceptual model, and even the equations used in the model to solve the transport. It indicates the overall results are inaccurate and probably give a false sense of security” (Myers 2014).	WR189
4916	The assumption of a lack of bedrock fractures is incorrect, demonstrated even by PolyMet’s own data. Dr. Myers points out that the low conductivity values arrived at by PolyMet are the result of extremely low values for three wells pulling the mean in a direction that suggests a low conductivity, while 9 of the wells showed higher conductivity values. “...it would be better to consider that 70% of the site had bedrock K greater than 0.1 ft/d” (Myers 2014). ... A 30-day pump test conducted to assess the connection between the bedrock and surficial aquifers was done on well P-2, the well with the second lowest conductivity value. Had this test been done on any one of the 9 wells showing higher conductivity, results may have been different. “This is far too little data with which to assume little connection between the bedrock and surficial aquifers” (Myers 2014).	WR009

4923	“PolyMet relies on perfect engineering to limit the seepage rates through three waste stockpiles, an ore surge pile, and the tailings impoundment” (Myers 2014). ... “If their many modeling assumptions do not fully manifest or their engineering designs do not work as well as expected...this load will reach the river and cause the project to exceed many standards” (Myers 2014).	WR128
4924	In its analyses, PolyMet frequently uses mean values for model inputs, resulting in an underestimation of the potential environmental impacts. ... In addition, PolyMet’s modeling places limits or “concentration caps” on the concentrations leached from mined wastes. This approach results in the high end of potential contaminant concentrations being excluded from consideration in the model (Maest 2014). And the model assumes that “essentially all contaminants will be adsorbed or otherwise removed as mine-affected waters travel along prescribed flowpaths to receptors” (Maest 2014). ... Given the lack of site-specific information on these factors that affect contaminant adsorption along potential groundwater flowpaths, a modeling run with no adsorption should be conducted and included in the modeling results presented in the FSEIS” (Maest 2014).	WR058, WR060, WR173
4928	The evaluation of mercury impacts in the SDEIS is critically inadequate... No claims should be made about mercury reductions, increases, stabilizing levels, travel times, impacts to wildlife without data and information to support those claims. The SDEIS should include analysis of potential mercury sources that have not been addressed, including all constructed wetlands, the West Pit, and the Overburden Storage and Laydown Area. Mercury air emissions must be evaluated from the generation of electricity for the proposed project and from mining vehicles and equipment.	AIR05, MERC04, MERC17, MERC21
4930	Mercury was excluded from evaluation in the GoldSim water quality modeling.... The failure to model a contaminant of major concern for this proposed project is a significant shortcoming of the SDEIS. Even more troubling is that even without this evaluation and without evidence, the SDEIS claims mercury contamination will not be an issue for the proposed mine. ... With limited understanding of the mechanisms affecting mercury methylation and bioaccumulation, the SDEIS cannot and should not make claims about the project reducing mercury loadings in the St. Louis River. ... The St. Louis River is acknowledged to have a complex and unique mercury dynamic that is the subject of ongoing research. This should be recognized in the SDEIS and assertions about the NorthMet project’s mercury impacts should be supported with relevant data. The agencies overseeing the NorthMet proposed mine need to insist on the collection of more data before drawing conclusions about mercury’s impact on the watershed.	MERC04, MERC13
4933	The SDEIS assumes that mercury will be “sequestered in the LTVSMC tailings,” with the Tailings Basin acting like a sink for mercury (SDEIS 5-205). GLIFWC scientists highlight a number of flaws with this assumption... The SDEIS must include data to support the claim that the Tailings Basin would function as a mercury sink. The evaluation should answer questions that include: Are there conditions under which the tailings would shift from a sink to a source of mercury? Is the mercury permanently and irreversibly adsorbed to the tailings? Are there data to support the claim that 95 percent of the mercury is expected to be adsorbed to the tailings and hydrometallurgical residue?	MERC06
4934	The SDEIS... suggests that the impacts from increasing mercury loadings in the Embarrass River can be overlooked because loadings in the Partridge River are expected to decrease. ... If any of these conditions are not met [i.e., a nearly perfect polluted water capture system, and the uninterrupted treatment of contaminated water for centuries], the amount of mercury contamination could be significantly higher. The potential for this should be examined. ... Mercury loadings to the Embarrass River from the proposed NorthMet project should be fully disclosed, the impacts fully evaluated, and mitigation measures proposed.	MERC16, MERC18
4939	The SDEIS fails to assess or properly evaluate potential mercury issues to wildlife. The Wildlife Section and the Aquatic Species Section of the SDEIS do not review mercury contamination impacts to species that could consume mercury contaminated food sources. ... Stating that risks may exist to wildlife does not fulfill the obligation of the SDEIS to fully evaluate the threats and propose mitigations. ... The SDEIS needs to include evaluation of impacts to wildlife and aquatic life from mercury contamination. All mine features should be fully assessed for their potential to contaminate wildlife. Mitigation responses should be provided.	WI01, WI04

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
4940	Mercury impacts to the Partridge River are inconsistently characterized in the SDEIS, creating confusion about what the likely impacts may be. ... The mercury impacts to the Partridge River and the wildlife that use it should be consistently and accurately reflected in the SDEIS.	MERC04, MERC23
4942	Mine and Plant Site Water Data Packages show sulfate concentrations in mine and plant water far above water quality standards hundreds of years after the mine closes. High sulfate concentrations can stimulate the methylation of mercury in the environment. Given that the SDEIS acknowledges significant amounts of polluted seepage will escape capture and treatment, the SDEIS cannot assume that mercury deposition ceases at closure. ... Descriptions of mercury contamination risks beyond the life of the mine should be fully and accurately described, and supporting data provided.	MERC17
4945	Unclear in the SDEIS is what would trigger the decision to add underdrains and the feasibility of adding them if the need arises. What if circumstances occur that cause the groundwater to be more elevated than when the stockpile liner system was being built? The SDEIS is not clear how this would be managed to ensure ground and surface waters are not impacted. ... Triggers for potential changes to designs to collect and manage polluted drainage at the mine site should be outlined in the SDEIS. Why or how underdrains would be added to certain stockpiles should be fully described.	PD03, WR130
4947	The plan in the SDEIS calls for creating a cutoff wall around the Category 1 Waste Rock Pile.... The SDEIS does not describe how or why this determination would be made. What are the differences in capture efficacy? This information should be provided. ... The SDEIS states that performance modeling was done that showed a greater than 90 percent efficacy in the capture rate with this system (SDEIS 3-46). The SDEIS does not indicate if this was ever field-tested. No supporting data is given for the efficacy of such a system at another mine or similar structure. Nor does the SDEIS describe a contingency plan for if the containment system does not capture 90 percent of polluted drainage. This information is necessary to properly evaluate the potential effectiveness of a major pollution-control engineered design for the mine. ... The Category 1 Stockpile Containment System should be field tested at an appropriate scale to assess the efficacy of this vital pollution control system. Results should be fully described in the SDEIS. Examples of the use of this method at mines or other operations at a similar scale should be found and their success rates described. Contingency plans should be developed for scenarios of water capture that are less than 90 percent, and these plans outlined in the SDEIS.	PD15, PD22
4948	The failure of the SDEIS to account for these fractures means the bedrock is more permeable than PolyMet's model has accounted for, and that the Category 1 collection system will likely not experience a 90 percent efficacy for water capture. This would result in a much greater transport of pollution than the SDEIS has anticipated. ... The SDEIS should include a re-worked water model that assumes the presence of bedrock fractures and fully analyzes what this means for the transport of polluted water off-site.	WR010
4950	The SDEIS has little information about the process to separate the different waste rock types into their appropriate stockpiles. Any mistakes made with this process have potential for pollution risks. ... However, the SDEIS does not describe this waste rock management plan that is critical to reducing water pollution risks. ... The Rock and Overburden Management Plan should be described in the SDEIS. So too should the SDEIS describe the waste rock separation process.	PD15, PD35
4952	the waste rock piles may also represent a fugitive dust source of contamination to surrounding waters and lands. ... Waste rock fugitive dust should be analyzed to ensure it is not a hazard or threat to human health or the environment. The SDEIS should contain a plan for managing waste rock fugitive dust if it is determined that this is a pollution risk.	PD15, PD35

*Alphabetical by sender's first name*

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
4953	too few samples were analyzed in characterizing the waste rock for the volume of waste that is predicted to be generated. ... Proper characterization of waste rock is essential for identifying reactivity potential and for managing the rock to limit its pollution risks. ... The SDEIS characterization of Category 1 Waste Rock as not acid generating could be wrong. ... The SDEIS should reanalyze the characterization of waste rock and provide supporting evidence for its findings.	PD15
4954	The SDEIS states that while groundwater has been impacted by the existing tailings basin, the data suggest that the concentrations of the pollutants are not increasing or decreasing (SDEIS 4-111). ... It is unknown if concentrations have increased or decreased over the past nine years. A full and current understanding of existing pollution issues at the Tailings Basin is essential given that PolyMet plans to add additional waste to the basin with additional seepage of contaminants expected. ... New data measuring existing contamination at the LTV Tailings Basin should be collected and the results fully described in the SDEIS.	PD10, WR071
4957	the NorthMet plan calls for developing a pollution containment system that would involve the construction of a cutoff wall down to bedrock to divert and collect drainage from the Tailings Basin. ... The SDEIS does not indicate if this was ever field-tested. ... The Tailings Basin Containment System should be field-tested at an appropriate scale to assess the efficacy of this vital pollution control system. Results should be fully described in the SDEIS. Examples of the use of this method at tailings basins at other operations should be found and their success rates described. Contingency plans should be developed for scenarios of water capture that are less than 90 percent, and these plans should be outlined in the SDEIS.	PD13, WR018, WR023
4962	These are modeled assumptions [100 percent effectiveness surface seepage capture and 90 percent for groundwater seepage] that seem to lack field-testing and that do not take into account bedrock fractures or containment system failures or inadequacies. This is an example of the SDEIS making assertions about low probability of water quality impacts without providing supporting data. The SDEIS should provide supporting data from similar engineering designs at other mines that have proven efficiency rates of 90 to 100 percent. ... The SDEIS should include a re-worked water model that assumes the presence of bedrock fractures and fully analyzes what this means for the transport of polluted water off-site.	WR008, WR019
4963	The SDEIS also makes unsupported assertions about the engineered design of the Tailings Basin. ... The SDEIS should provide supporting evidence that a pond at the Tailings Basin will reduce the oxygen flux and associated solute release in the underlying tailings. It should describe the depth of the pond and how wind action will not introduce oxygen to the system.	PD08
4964	The SDEIS describes a plan at closure to try to limit downward seepage from the Tailings Basin. ... Yet the SDEIS does not describe if this technique has been applied elsewhere and with what success. This is an important plan to limit water pollution, but the SDEIS does not show it can work or has worked elsewhere. ... Supporting evidence needs to be provided in the SDEIS about the functioning of the bentonite layer that will be added to the Tailings Basin at closure. Examples of this application and its success rate at other tailings basins should be provided.	PD07
4965	The design for the Tailings Basin calls for the construction of a channel should storm events or other issues risk water escaping the basin. ... Yet details about this channel are not provided in the SDEIS. The public does not know the capacity of the overflow channel or if it is intended to be lined. If it is an unlined channel, what measures will be in place to prevent contaminated seepage from escaping the channel? Has such a method been used at other mines and with what success rates? ... The SDEIS needs to contain more information about the emergency channel for the Tailings Basin, how it would function, and how seepage of contaminated waters would be prevented from this feature.	PD07
4966	The SDEIS calls for Hydrometallurgical Residue Facility to be double-lined to protect water quality. ... The SDEIS should clearly state that “long-term” likely means centuries of management, given the results of the modeling as revealed in the Plant Site Water Data Packages. ... The SDEIS needs to clearly state how long water collection systems and monitoring will be required based on modeling results.	PD29

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
4967	The need to double line the Hydrometallurgical Residue Facility is because the contents of this basin are expected to contain high concentrations of contaminants. The SDEIS starts to describe a contingency plan for unexpected issues with the facility, but then fails to address the issues in a meaningful way.... The SDEIS needs to develop and fully describe contingency plans for all components of the Tailings Basin and Hydrometallurgical Residue Facility. Scenarios should be developed looking at impacts of capture rates less than 90 percent. Capture rate expectations need to be supported with data and examples from other mine operations.	PD08, PD09, PD11, PD17
4970	ore spillage and the release of ore fines [from being transported via open rail cars over a route that crosses wetlands and three creeks] pose significant water quality threats to water systems along this route. Fallen ore and fugitive dust have the potential to contaminate wetlands and soils along the rail line, leading to acid drainage and metal leaching in nearby water bodies. ... But these designs are not adequate to ensure spillage does not occur. ... The SDEIS provides no supporting data to show the centerline loading method will adequately contain spillage.... While the SDEIS calls for monitoring of spillage along the rail line, this too is an inadequate response given that contamination will have already occurred. ... The risk of widespread and localized contamination from ore spillage and fugitive dust during uncontained rail transport is unacceptable and avoidable. The SDEIS needs to include a transport plan that calls for enclosed rail cars. The Rail Transfer Hopper and rail car loading conveyor and platform should be in an enclosed structure.	PD36
4972	there is also the potential for spills from transporting Reject Concentrate by rail tank cars and from transporting waste sludge and solids by truck along the corridor's roadway. ... The SDEIS does not discuss the possibility of accidents, derailments, or spills that could result in the contents of these transports being released into the surrounding environment. Nor does the SDEIS describe safeguards to deal with this possibility or any plan for how to manage potential spills. ... The SDEIS does not describe how the rail line will be safely shared between the cars transporting ore and the tank cars transporting Reject Concentrate. ... The SDEIS needs to describe how the transportation corridor will be shared between the cars transporting ore and the tank cars transporting Reject Concentrate. The SDEIS needs to disclose the contents of the Reject Concentrate and the sludge and solid wastes, and give the concentration levels of the contents. It should provide a contingency plan for managing spills and accidents from the transportation of Reject Concentrate and sludge and solid wastes. The SDEIS should include modeled impacts of the distribution of fugitive dust.	PD36
4979	Increases in constituent loadings to the area's water systems should be evaluated for their impacts when combined with existing and foreseeable future contributions from other sources. The Twin Metals project should be included in this evaluation. Water quality models need to be re-run with corrections made to faulty assumptions (see Friends' comments about Major Flaws with the Water Model, Section I.E.) and the cumulative effects re-evaluated using the new results. Cumulative effects analysis for water resources should include the St. Louis River and should include areas north and east of the NorthMet proposed project. The relationship between the development of the NorthMet project and the development of other mining projects should be analyzed and discussed in the SDEIS.	CU01, CU02
4983	The SDEIS needs to thoroughly review the RO technology and how it intends to address the project's issue of contaminated water. The SDEIS does not provide the information or level of confidence that the public needs about this critically important technology that is central to managing pollution. The SDEIS needs to give detailed examination that shows how this has been applied successfully elsewhere and how it will avoid the problems encountered elsewhere. Without such detailed examination, the entire ability of the project to manage polluted water is called into question. The SDEIS needs to describe if and how the treatment process and RO can manage water issues in addition to sulfate, such as hardness, TDS, and specific conductance. All the issues identified in the Barr memo [May 31, 2011] must be explained.	PD03
4997	The SDEIS needs to address all of the engineering design problems of the Category 1 Stockpile system identified in the experts' reports [attachments to the Friends' submission].	PD15
5001	The SDEIS needs to address all of the engineering design problems of the Tailings Basin collection system identified in Dr. Malusis' report.	PD07

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5002	The SDEIS should take into account the many geotechnical stability concerns identified in the Chambers and Levit report and implement the recommendations to ensure engineered designs that provide stability and protection. ... Dynamic modeling should be performed for both the Tailings Basin and the Hydrometallurgical Residue Facility.	GT02, GT11
5003	The SDEIS needs to address all of the engineering design problems of the Hydrometallurgical Residue Facility collection system identified in Dr. Malusis' report. The SDEIS should describe a rigorous construction quality assurance process that includes continuous observation during installation. The SDEIS should include an electrical leak detection system for the liners.	PD17, PD19
5004	The SDEIS needs to address all of the engineering design problems of the Category 2/3 and 4 Stockpile liners identified in Dr. Malusis' report and the Chambers and Levit report. The SDEIS should include a rigorous construction quality assurance process that incorporates the elements in both the Malusis and Chambers/Levit reports. The maximum allowable hydraulic conductivity for the Category 2/3 stockpile liner should match that for Category 4.	PD15
5005	The SDEIS should include a full Reclamation Plan that provides details about goals, methods, financial surety, reclamation techniques that have been demonstrated, and timing of activities. ... The reclamation plan must include a plan to address the oversteepening of the Cell 2W embankments and the associated seepage. Chambers and Levit make other reclamation activity recommendations that should be included in the SDEIS including characterization of waste disposed of in the East Pit, evaluation of abandoned pipelines, and a tracking system for hazardous materials to ensure appropriate disposal and compliance with laws. In addition, the Reclamation Plan should describe the water balance desired for the pits post-closure. The SDEIS should contain details about wetlands construction.	PD35
5007	the acid generating potential for the project has been under-reported.... The SDEIS must re-examine the potential for all waste rock to generate acid and other leachate. It should incorporate the recommendation by Dr. Maest to backfill all the waste rock, including Category 1 wastes. The SDEIS should accurately portray data that indicate the acid generating potential of waste rock.	PD15, WR001, WR088
5010	The SDEIS must contain descriptions of the most likely unplanned events, such as pipeline breaks, spills, failure of treatment or collection systems, mechanical problems, liner and cover failures. The SDEIS also needs to outline responses to these types of events. ... The public needs to see this response plan in order to assess the range of environmental impacts that may occur. ... The SDEIS needs to include supporting evidence for the success of responses at managing unplanned events, including examples from other mines. ... probabilistic modeling should be expanded to include assumptions that liners and containment systems work poorly. "Instead of 99% capture, they should test what occurs with as little as 10% captured. Also they should consider what occurs if the capture fails for a given period of time" (Myers 2014). He suggest modeling explore what happens if the cutoff wall and pump systems do not perform as designed.	PD22
5011	Minnesota should not approve a mine plan that cannot comply with Minnesota's existing laws [Minnesota Rules 6132.3200, Minnesota Rules 6132.4800, Minnesota Rules 6132.1300, Minnesota Rules 6132.1200, Minnesota Rules 6132.1100]. The SDEIS describes a mine that, as presently conceived, could not comply with Minnesota's Rules for nonferrous mining. The SDEIS should include a revised mine plan that can meet these laws.	PD02
5034	The PolyMet project anticipates centuries of water treatment and the SDEIS should include the necessary financial assurance calculations for the public to assess risks and impacts. The financial assurance disclosures should include closure costs, estimated bond amounts needed for each closure and reclamation activity, and how the bonds should be modified should additional temporary, long-term, or perpetual treatment and/or remediation needs be determined during operations. Disclosed information should include capital replacement costs and frequencies and assumptions on interest rates.	FIN05, FIN08, FIN13

Friends of the Boundary Waters  
 (42984)

- 5035 Financial assurance calculations need to include the costs of unexpected events, accidents, developing pollution problems, and the staffing needed to maintain equipment and manage the site. ... Calculations of financial assurance need to include funding for contingencies such as an increased rate of release of metal contamination. ... Financial assurance costs should include the number of employees necessary to maintain the plant and mine sites for the centuries of management activities that are anticipated. The SDEIS must include detailed information about financial assurance with transparency about what the estimates include. The SDEIS should indicate that the calculations and estimates have all been reviewed and verified by the Co-lead Agencies. Calculations initially should be based on predicted worst-case scenarios until operational data can prove conditions to the contrary. Because the interest and return on investment rates can result in financial assurance variations that are hundreds of millions of dollars different, the SDEIS must make the assumptions and calculations available for comment. Financial assurance calculations should include mitigating indirect wetland impacts and should be fully described in the SDEIS.
- 5036 the SDEIS provides no meaningful consideration as required by law of alternative means to achieve the project Purpose and Need. ... Serious evaluation is only give to an alternative that would convey fewer acres in the land exchange, and the No Action Alternative. ... The SDEIS fails to show adequate evaluation of two other proposed alternatives that are feasible and offer the potential for reducing environmental impacts. Limiting the scope of alternative evaluation to the No Action Alternative and a minor change in the land exchange does not meet the legal requirement for alternative evaluation.
- 5041 The SDEIS acknowledges these potentially significant environmental benefits from an underground mine: ...An underground mine would alsoeliminate the need for a land exchange with the U.S. Forest Service and allow the landscape to continue to be available for public use. ... the SDEIS dismisses the underground alternative without any further examination.... The economic feasibility was evaluated using a model called InfoMine. Neither theSDEIS nor the Underground Mining Alternative Assessment provide details of this model or its assumptions. Nor is it clear that the Co-lead Agencies reviewed the model and its assumptions. It appears the co-lead agencies have accepted PolyMet’s assertion without verification that an underground mine is not economically feasible. ... GLIFWC notes that the co-leads have not included in their analysis that an underground mine would not require a \$4 million land exchange with the Forest Service, and that the alternative would also provide economic benefits from wetlands that would no longer need to be destroyed with the creation of an open pit mine. Additionally, an underground mine could provide economic benefits by potentially not requiring perpetual water treatment and maintenance (SDEIS, Appendix C, GLIFWC Comments, Underground Mine and West Pit Backfill Alternatives). ... This alternative deserves full analysis in the EIS. An underground mine is technically feasible and offers the potential for economic benefits and significant environmental benefits. This alternative deserves full analysis in the EIS. ... Details about the economic modeling and the model’s assumptions for the Underground Mine Alternative should be given to the Co-lead Agencies, thoroughly reviewed by the agencies, and described in the SDEIS for the public. The evaluation must include reviewing the economic benefits that would transpire from not doing the land exchange, from not destroying the wetlands, and any changes in the need for long-term water treatment. A metals cost sensitivity analysis should be included in the evaluation of the Underground Alternative to verify that the option is not economical with higher metals prices.
- 5053 Backfilling the West Pit with the Category 1 waste rock has been proposed as a method to help limit water pollution risks. ... The SDEIS must fully evaluate the benefits of backfilling the West Pit. The evaluation should not include arguments or assertions that have no evidence or information to support them. Claims about needing longer water treatment with this alternative must be supported with evidence or be dropped. If this assertion is retained, it must be applied in an evaluation of backfilling the East/Central Pits as well. The SDEIS needs to include a complete evaluation of the water quality impacts from the Backfill Alternative in the GoldSim modeling. It should include detailed cost/saving estimates for longterm water treatment and maintenance under a backfilled condition.

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5060	As the SDEIS acknowledges, “The majority of wetlands that would be affected by the NorthMet Project Proposed Action would be ‘difficult to replace’ (coniferous bog, open bog, coniferous swamp, and hardwood swamp)” (SDEIS 5-313). But the SDEIS does not fully disclose how unique these wetlands are. ... The industrialization of this area would be an irrevocable loss to the State of Minnesota. Habitat fragmentation, loss of biological diversity, loss of representative habitats types, and climate change are threats to Minnesota’s natural resources that only make sites like the 100 Mile Swamp more valuable. ...The SDEIS should acknowledge the high quality habitat that this proposed mine would destroy and that these wetlands are irreplaceable. Their value and loss should be placed in a statewide and regional context within the EIS.	WET05
5063	The SDEIS does not provide an adequate mitigation and replacement plan for the significant wetlands losses that are expected. ... The SDEIS should acknowledge that its replacement plan cannot compensate for the loss of centuries-old peatlands and their unique functions. ... Mitigation of indirect wetland impacts is not even described in the SDEIS. In addition, it is unclear where the compensatory wetlands might even be found [for both direct and indirect]. ... The SDEIS fails to describe what this adaptive management plan might include. The absence of information leads to worries that many impacted wetlands may never be compensated. ... the U.S. Army Corps of Engineers (USACE) has not yet made a determination about the wetlands compensation ratios required for the project. This is also information important to have in the EIS to evaluate the environmental impacts of this proposed project. ... The SDEIS should include a mitigation plan for both direct and indirect wetlands. It should include analysis of possible compensatory wetlands for direct and indirect wetlands. A framework should be described for how any additional effects to wetlands may be mitigated. Wetlands compensation ratios need to be included in the SDEIS. The SDEIS should also analyze the wetland identified in Dr. Glaser’s report as a possible mitigation site and explain any reasons to exclude it as an option.	WET01, WET02, WET04, WET05, WET06
5067	The SDEIS uses no hydrologic data to support that the wetlands are “perched” and disconnected from interaction with groundwater. This is important because if a connection exists, the potential for mine dewatering to create greater wetland impacts exists. No data were collected at the site to show that all the ombrotrophic wetlands on site are perched and would remain perched under mine induced drawdown conditions.... The SDEIS should use hydrologic data to characterize the wetlands and identify groundwater connections with the wetlands. The SDEIS should address all the issues identified in Dr. Glaser’s report and use the scientifically supported methods he describes for wetland characterization. Hydraulic testing needs to be conducted at the Tailings Basin and this information shared in the SDEIS.	WET10
5068	In the analysis of impacts, the SDEIS relies on an “analog” method.... Analog information can be useful, but it should not be the sole source of assessing impacts. ... The SDEIS should use hydrologic data to characterize the wetlands and identify groundwater connections with the wetlands. The SDEIS should address all of the issues identified in Dr. Glaser’s report, and use water level measurement tests to assess the connectivity with groundwater. Analog data from other mines should be used as supporting information but not the sole source of information.	WET08
5070	The SDEIS does not give a detailed analysis of potential indirect wetland impacts. ... The SDEIS should contain a much fuller evaluation of drawdowns and their impacts. ... The SDEIS needs to contain a more complete evaluation of indirect wetland impacts, drawdowns, and impacts to river baseflows and riparian wetlands. The recommendations made in Dr. Glaser’s report for monitoring wetland impacts from the mine operations should be incorporated in the SDEIS.	WET07, WET10
5071	The SDEIS should more thoroughly examine the potential impacts from fugitive dust on wetlands. The SDEIS should include an evaluation of the transport of solutes during the spring snowmelt flush.	WET11
5072	the mine would severely impact a area known as the 100 Mile Swamp which has been identified as an area of high biological significance. ... The SDEIS should examine and describe how it justifies the destruction of an area of high biological significance and the loss of rare plant species associated with this project. The State of Minnesota should provide an explanation to the public of why areas of biological significance are identified and species are placed on our threatened and rare species lists, if they are not to be protected even when on public lands.	VEG01, VEG02

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5075	The SDEIS should include the USFWS findings of the Biological Assessment and the Biological Opinion for lynx impacts. The EIS is incomplete without it.	WI11
5077	The SDEIS states that while the project would decrease critical lynx habitat, restoration of the mine area after operations might provide habitat once more. But the mine area is expected to remain fenced-off and highly polluted for centuries. It is unlikely that the area would be suitable for lynx for a very long time. The SDEIS needs to provide a restoration plan to support any claims that the area could be made suitable for lynx again. I[n] addition, the SDEIS does not consider alternatives like the West Pit Backfill and Underground Mine Alternative that may help limit impacts to lynx habitat. ... The SDEIS should include a full evaluation of alternatives, such as underground mining, that would disturb less of the area and impact lynx and other wildlife habitat less. The SDEIS should include a restoration plan for lynx habitat once operations cease, with realistic evaluations about the restoration capacity for parts fenced-off and contaminated.	WI02, WI10
5081	Mining activities would destroy about 1,454 acres of suitable lynx habitat, and the proposed land exchange would result in further loss of lynx habitat within identified LAUs. While the federal lands within LAU 12 comprise 6,500 acres, the non-federal parcels combined only equal 2,149 acres within LAUs. This represents a total loss of 4,752 acres within LAUs. Tract 1 proposed for the exchange is not located within an LAU at all (SDEIS 5-629 and 5-630). ... The SDEIS should insist that a land exchange include acquiring enough acres within lynx LAUs to equal the losses of acres in LAU 12.	WI02
5083	These statements are in contradiction with findings in the Draft Biological Assessment (BA) by the USFWS. ... The SDEIS should acknowledge the use of roads by lynx, use this information to fully evaluate the risk of vehicular collisions, and provide estimates of the amount of collision deaths anticipated. The SDEIS should also consider and describe mitigation measures such as underpasses and fencing to reduce the collision risk to lynx.	WI01, WI10, WI11
5086	The SDEIS needs to correctly describe the Canada lynx as a Minnesota Species of Special Concern. The SDEIS should present all relevant lynx surveys and show that the best available information has been used in assessments of impacts rather than relying on incomplete or outdated information. Included in the SDEIS should be a table and map revealing the locations of lynx tracks, sightings, scat, or kills between 2000 and 2014.	WI01
5089	The SDEIS makes almost no mention of the project's impact on moose populations and moose habitat, despite the state's alarming moose population decline. ... The SDEIS provides no data or survey information to support the claim that the loss of habitat would not impact the species population numbers. The SDEIS does not appear to include any analysis of the project's impacts on this species. The SDEIS fails to even note that the moose on August 19, 2013, was designated a State Species of Special Concern. The alarming declines in this species population, even before its recent designation, should have been reason for the SDEIS to include a full evaluation of the project's potential impacts on this species. ... The SDEIS should include a full evaluation of the project's impacts to moose populations and moose habitat. Statements about the likelihood of impacts must be supported by data. The SDEIS should eliminate references to moose as regionally "common" as the status has changed to a Species of Special Concern.	WI01, WI02
5090	The loss of Corridor 17 and restricted use of Corridor 16 due to the NorthMet project should... be acknowledged as a significant loss in the SDEIS. In addition to the loss of these Wildlife Corridors, the SDEIS should, but does not, evaluate the project in light of impacts that may have occurred to the other 13 corridors. ... A Biological Assessment and consultation with the USFWS must be conducted to assess impacts to wildlife travel corridors. The SDEIS must analyze the loss of Corridors 16 and 17 with the loss of other regional corridors as part of its assessment.	WI03, WI11

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5096	Contaminated mine pits and the Tailings Basin present a risk to wildlife, especially waterfowl, that may attempt to use the area. Other risks to wildlife come from exposure to mine contaminated waters off-site. ... But the SDEIS does not describe a plan to discourage wildlife use of contaminated areas. The SDEIS also fails to adequately address the mercury contamination of nearby waters, ...But the SDEIS concludes that the proposed project will not adversely impact wildlife. ... The SDEIS should include a plan to discourage the use of mine pits and the Tailings Basin by wildlife. The SDEIS should more adequately assess and mitigate potential mercury pollution issues..	WI04
5097	Particularly at risk is the plant species Floating marsh marigold... The NorthMet project would directly impact, destroy, about 8 percent of its Minnesota population (SDEIS 5-350 and 5-346). This constitutes a risk to the entire population of this plant in Minnesota. Neat spike-rush ( <i>Eleocharis nitida</i> ) is another rare plant species threatened by the project. ...The project puts entire populations of some of these rare plants at risk. ... The SDEIS must examine the potential risk to entire populations of state-listed rare plant species, and assess if this complies with Minnesota's endangered species law. ... The SDEIS should examine how this loss would be mitigated.	VEG01
5099	The SDEIS fails to acknowledge the risk to wild rice from sulfate drainage.... ... The NorthMet project's sulfate drainage will be adding additional loads to a watershed already impacting wild rice. This must be acknowledged and more thoroughly analyzed in the SDEIS.	VEG04, WR156, WR157
5100	The use of non-native invasive species to reclaim the mine site is unnecessary and irresponsible with respect to the wide-scale problem of non-native species in Minnesota, and the efforts to contain their spread by federal and state agencies. ... The SDEIS should include a requirement that non-native plants will not be used in reclamation activities or for temporarily stabilizing disturbed areas. Only the use of native, non-invasive species should be permitted.	VEG05
5102	The recommendations of both the Climate Change Advisory Group and the Terrestrial Carbon Sequestration Initiative should be heeded, and no significant losses to the state's peatlands should be permitted. The SDEIS should clearly identify this project as significant contributor to Minnesota's statewide carbon emissions. The SDEIS needs to include a thorough narrative discussion of the amount of carbon expected to be released from the loss of peatlands and the statewide consequences. The SDEIS should also acknowledge that wetland mitigation will not replace the carbon sequestering abilities lost with the destruction of the 100 Mile Swamp peatlands.	WET13
5103	It is irresponsible for the SDEIS to fail to incorporate an analysis and discussion of the climate change impacts from greenhouse gas emissions that include the contribution from power generation. ... In addition, the lifetime greenhouse gas emissions for the project have been significantly underestimated. ... The SDEIS must include analysis of the project's expected greenhouse gas emissions both on a yearly and life-time basis – and this analysis must include indirect contributions from the generation of electricity. It is not adequate to say that 15 metric tons or more of greenhouse gas emissions cannot be analyzed for climate change impacts. A full written narrative of the climate change impacts from emissions that include power generation must be included in the SDEIS. Estimates of emissions must be based on the need to generate power for centuries to operate the two water treatment facilities. The climate change impacts of this proposed project should be described in terms of what it contributes to state, regional and national carbon emissions.	AIR02
5105	The SDEIS gives contradictory information, citing high levels of visibility impairing emissions and the expected failure of Minnesota to meet Regional Haze reducing goals, while at the same time asserting the project will have no impacts on Class I area visibility. The SDEIS must be corrected and should provide a full explanation for any assertion that Class I areas will not be impacted. Analysis of visibility impacts must include the emissions from power plants supplying energy to the project. The SDEIS should explain why conclusions differ from those in the 2009 DEIS. The SDEIS needs to explain how visibility improvements will occur in light of the state not on target to meet Regional Haze goals.	AIR08

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5107	The SDEIS also fails to adequately evaluate the cumulative effects on air quality of the NorthMet project when combined with foreseeable projects. Not included in the analysis are the impacts from on-going and future hardrock mineral exploration in and near the Superior National Forest. The nonferrous mine project by Twin Metals, one that is in an advanced stage of development, was not evaluated for its impacts to air quality and visibility. ...Cumulative effects analysis must include all reasonably foreseeable projects, including the Twin Metals project and on-going and expected exploration. The SDEIS needs to provide mitigation measures and show how they achieve the goal of reducing this project's air quality and visibility impacts.	AIR07
5109	The SDEIS describes a voluntary anti-idle program for the operation mine vehicles, trucks, equipment and rail transportation. The SDEIS should insist on a commitment from the company to an anti-idle approach to maximize the reduction of Nox and SO2 emissions. ... The SDEIS should include a firm commitment from the mining company to an anti-idle program for its own vehicles and equipment as well as for outside delivery vehicles.	AIR07
5115	The SDEIS should describe the total amount of mercury in the process stream and that the autoclave scrubber waste will be disposed in the Hydrometallurgical Residue Facility. The potential for this mercury to be a pollution risk must be examined. Autoclave mercury emissions should be monitored more frequently than once a year. The SDEIS should contain a monitoring plan that allows for statistically reliable data on the autoclave mercury emissions.	AIR05
5117	The SDEIS analysis of the range of potential impacts to human communities, economies, cultures and health is incomplete. The analysis largely focuses on employment benefits, with no attention to negative socioeconomic impacts that can occur with mining and with changes to communities. When the SDEIS does identify potential negative impacts, it fails to analyze or mitigate the social, economic and cultural impacts. ... The SDEIS must contain a full evaluation of the socioeconomic impacts from this project.	SO04
5118	The SDEIS needs to include a more robust analysis of social, economic, cultural and health impacts from the proposed project. This section of the EIS is extremely incomplete. The SDEIS needs to fully analyze the impacts to subsistence users, recreationists, outdoor-related businesses, band members, and children from expected mercury contamination in fish. Impacts should be fully described and mitigation plans provided. The potential for bioaccumulation in fish to continue after the mine closes should be fully described and mitigation plans provided.	SO04
5119	The SDEIS needs to fully analyze and describe impacts to water quality and quantity for Colby Lake. Management approaches of arsenic and other contaminant levels should be based on supporting information. The cumulative impact of additional contaminants to Colby Lake need to be analyzed and described in the SDEIS. Potential impacts to the lake and the City of HoytLakes should be fully assessed should water quality or quantity issues occur. Mitigation plans should be described for scenarios in which exceedances or water quantity issues occur.	WR024, WR043, WR046, WR056, WR140
5120	The NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the ore at the mine site. ... The SDEIS does not provide information to support the assertion that a 9percent amphibole fiber content should be considered "small" and of little concern. Additional data or studies are needed to know if this percentage represents a minimal health risk or a significant health risk. ... The SDEIS should include a formal health assessment of the risks to workers at the NorthMet mine from amphibole fibers. The assessment should analyze asbestos-like fibers smaller than 5 microns in length. The SDEIS should include details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure.	HU04
5122	The SDEIS should include an HIA [Human Health Assessment] to review the scope of impacts possible to the human communities affected by the proposed mine.	HU01

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5124	the report by Edison Investment Research Limited, which relied on data and information that PolyMet provided, suggests that a major job-creating component of the project may never happen. The Edison report indicates that Phase II, the development of the autoclave process to produce nickel precipitate, is likely to not take place. ... The SDEIS needs to explore the option of Phase II of the project not taking place and what this would mean to the beneficial impacts expected for the project.	SO04
5126	The SDEIS presents confusing and potentially inaccurate information about mining tax revenue that can be expected from the NorthMet project. Particularly confusing is the discrepancy between the 2009 DEIS information on estimates of federal and state and local taxes anticipated to be paid by the mining company and the current SDEIS. No explanations are provided for these differences and no changes in the project that could account for the differences are obvious. ... The SDEIS needs to present a more clear and consistent picture about expected tax revenue. Any differences from the 2009 DEIS should be explained. An explanation of where the \$64 million comes from is needed. Without a clearer and consistent portrayal of the information, the public cannot have confidence in these revenue expectations.	SO04
5139	The SDEIS describes an exchange without supporting evidence that it is in the public's best interest [due to]...Failure to Meet USFS Exchange Objectives... The SDEIS indicates that benefit of the land exchange for the public and the Superior National Forest is that: "The Land Exchange Proposed Action represents a transfer of surface rights...to eliminate the conflict between federal surface and private mineral estate" (SDEIS 5-577) But this land exchange fails to accomplish this goal. ... While the NorthMet exchange would eliminate the mine site from federal ownership, thus divesting the public of lands with a split estate, the proposed new lands that would be acquired also have split estates. Of the five tracts of lands considered for acquisition, four have split estates (SDEIS 3-163). Four of the five tracts fail to meet the Forest Service objective of reuniting mineral and surface rights. Future mining on these lands cannot be ruled out as possible, and thus the public could be acquiring lands that carry the risk of future land-use conflicts.... Claims that the project consolidates mineral and surface rights should be dropped, as the majority of the acquired parcels do not meet this criteria.	LAN01
5142	The roles and responsibilities should be clear. But the SDEIS includes Purpose and Need statements from the agencies that suggest some of the Co-leads may be confused about their roles and responsibilities regarding this project. ... These [SDEIS Purpose and Need] statements [for each of the agency Co-leads] suggest the agencies have confused their roles and responsibilities with that of the mining company's. This is extremely troubling. The public relies on these agencies to impartially evaluate the mine project, to fully examine potential environmental impacts without bias. The public does not expect the Co-lead Agencies to review the proposed mine project with the same goals as PolyMet Mining Company. Indeed, the Co-lead Agencies have been tasked with very different responsibilities. It is alarming that these mandates are not readily apparent in the way the Co-lead Agencies have characterized their roles in this SDEIS.	NEPA02
5145	The Category 1 Stockpile cutoff wall is not constructed at first around the west end of the stockpile. Why is this? If the plan is to wait until Year 11 of the project when that stockpile footprint is complete, what is the plan for collecting and managing the drainage off the west end of the growing stockpile in Years 1-11?	PD15
5146	The SDEIS contains no discussion about the network of pipelines conveying untreated and treated water. How many miles of pipelines are there? What are the contingency plans for breaks/damage to the pipelines? The SDEIS does not describe information about pipeline layout, engineering, or the pumps needed to push the water to various mine and plant locations.	PD04
5147	Water is conveyed between the Mine and Plant Sites via a pipeline. Treated water will be moved from the Mine Site WWTF to the Tailings Basin, and in turn, water from the Plant Site may be moved to the Mine Site to help flood the West Pit. Are there two pipelines along the corridor between the sites, or a single pipeline that must provide multiple functions?	WR131

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5148	The SDEIS notes that, "The design of the WWTF is based on the predicted water loads and constituents modeling (see Section 5.2.2)" (SDEIS 3-52). But a read of Section 5.2.2 provides no information about what that constituent make-up is, nor does any other part of the SDEIS.	PD29, WR143
5150	If the reverse osmosis (RO) is not being added until Year 40, how are sulfates being removed before then? Some may be removed through the chemical filtration, but this won't remove down to a level that meets the standard. Is the "treated water" (but not gone through RO) being sent to the Tailings Basin and it is assumed that sulfates will be dealt with by either being deposited in the Tailings Basin or getting treated again in the RO system at the Plant Site? If so, does this mean the "treated water" flowing in the pipelines from the Mine Site to the Plant Site is high in sulfates? And what is the contingency plan if this pipeline breaks??	WR131, WR143, WR144, WR147
5152	Why doesn't the WWTP at the Plant site include the evaporator/crystalizers to convert the RO to reject concentrate? Why transport it to the Mine Site?	PD07
5153	The SDEIS describes contingencies for a power outage at the Plant processing site: "In the event of a power failure, all process fluids would be contained within the concentrate dewatering and storage building and recycled to the process when power is restored" (SDEIS 3-101). But similar statements are lacking for the WWTF and WWTP. What happens in the event of a power outage at these facilities?	PD22
5154	The SDEIS provides a list of hazardous materials the project would use in construction, operation an closure phases of the project (Table 5.2.13-1; SDEIS 5-528). But the SDEIS does not specify how these various chemicals exit the NorthMet operations, if they leave the system via water, air, solid waste, or remain stored in tailings waste. If they remain on site, is there risk that they could seep into the surrounding waters through uncollected seepage? What is the plan for addressing such an occurrence? More information is necessary about these hazardous materials in the SDEIS.	HAZ01
5185	The SDEIS should include an analysis of adding water containment systems to the East Pit, with the necessary adaptation to the wastewater treatment facility to handle this additional water treatment.	WR088, WR143
5186	The SDEIS needs to be clear if it is the WWTP or the WWTF that is intended to treat East Pit water, and if it is the WWTP a full description of the process for piping the water needs to be included. The SDEIS needs to reveal if pumping rates will go higher than 1,750 gpm and provide details of that rate and how the backfill will remain saturated under such pumping conditions. The SDEIS should include examples of mines that have used this rinse method and had success at bringing sulfate levels to 250 mg/L.	PD29
5194	Particular attention should be given to reevaluating claims that the discharge of sulfates and metals will not impact wetlands and will not exceed water quality standards.	WET11, WR112, WR120
5388	In screening for alternatives, one criteria used is whether an alternative can "meet the Purpose and Need for the project" (SDEIS 3-140). But the SDEIS is not clear what the project Purpose and Need is. The SDEIS provides an Applicant's Purpose and Need, and it provides Co-lead Agencies' statements of Purpose and Need. It does not say which of these is used to screen for alternatives. ... The SDEIS needs to be clear about what the project Purpose and Need is for use in screening alternatives.	NEPA02
5389	The SDEIS should cease using the "minerals encumbrance" issue in its evaluation and rejection of the backfill alternative. It is not the responsibility of the regulatory agencies or the Minnesota public to provide potential future projects with access at the expense of useful alternatives to this current proposed project. The SDEIS must include real and meaningful evaluations of all alternatives and not limit the scope of alternatives to those that are simply what the applicant prefers.	ALT06
5391	The SDEIS should include financial assurance for indirect wetlands mitigation and should describe this fully.	FIN11

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5392	The SDEIS should seek to replace wetlands within the affected watershed. If appropriate acreage cannot be located, the SDEIS should clearly acknowledge that these wetland functions are permanently being lost within the affected watershed. The SDEIS needs to contain a discussion of what cumulative wetlands impacts this has within northeastern Minnesota and at a state level.	WET03, WET05, WET18
5394	The SDEIS is inconsistent about the intent to apply the wild rice sulfate standard seasonally. ... GLIFWC scientists disagree with the concept of a seasonal application of the standard, citing a lack of evidence or scientific basis for doing so. Research has not shown that the wild rice seed avoids impact from high sulfate levels while it is dormant. The SDEIS should be clear and consistent that the project would not apply a sulfate standard seasonally. ... The SDEIS must contain language that clearly indicates Minnesota's sulfate standard of 10 mg/L is scientifically defensible and will be applied for the NorthMet project. The SDEIS should insist that the standard is applied all year and not seasonally.	WR153
5395	Designation of wild rice waters applicable to the NorthMet project should include historic information from elders and should not exclude waters where wild rice once grew but due to human-caused sulfate levels no longer exist. Wild rice at low densities also provides important food to wildlife, and so low-density wild rice waters should also be included for application of the standard for this project.	WR154
5396	The SDEIS is also lacking in analysis of the cumulative effects of additional amphibole fiber exposure in the area. Given that rates of mesothelioma on the Iron Range are already high, the SDEIS should evaluate what the additional release of these fibers could mean for human health.	HU05
5402	When the Minnesota DNR's purpose and need in the SDEIS is exactly that of the mining company's, it appears that the agency is no longer performing its legally mandated role to evaluate the project for its ability to be "consistent with sound natural resource conservation and management principles." ...When the USACE's purpose and need in the SDEIS is exactly that of the mining company's it appears that the agency is no longer performing its legally mandated role to evaluate the project for its ability to cause only minimal adverse environmental impacts. ... Also confusing and troubling is that the SDEIS is not clear which of the Purpose and Need statements represents the overall Purpose and Need for the project. ...The statements of Purpose and Need by the USACE and the Minnesota DNR in the SDEIS are inappropriate and undermine the public's confidence in the impartiality of the Agencies and the performance of their legal mandates. The SDEIS should include statements that reflect the legal requirements of each agency and reflect an impartial review of the environmental impacts of the proposed project. The SDEIS should be clear what the "project Purpose and Need" is.	NEPA02
5981	the SDEIS for the PolyMet proposal fails to meet any of the four clean water principles and fails to match the commitment made by Mining Minnesota to adhere to these principles. We also believe the state and federal Co-lead Agencies reviewing this project can and must make substantial changes to the SDEIS so that they too can comply with these clean water principles.	PER09
5983	Given this level of risk and the failure of the mine design to meet basic clean water principles, the Friends cannot support the PolyMet project as proposed. We recommend the Co-lead Agencies either select the "No Action Alternative" for this project, or make substantial revisions to the design of the proposed mine and re-submit for public review.	PER35
5988	Approving a mine that leaves future generations with significant pollutionproblems for hundreds of years is not responsible stewardship of our natural resources, and the Minnesota Department of Natural Resources (Minnesota DNR) should reject any mine proposal that has this as part of its design.	PER35

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
5990	The SDEIS does not clearly nor fully present information to the public about the water quality impacts expected with the proposed NorthMet project. Despite more than 2,000 pages of information, the document lacks key information, does not present information clearly, presents sometimes inconsistent information, and fails to answer critical water quality questions. In an Environmental Impact Statement of this type, the public wants to know the answers to questions such as: How long water treatment is needed, what is in the polluted water before treatment, what is in the water after treatment, and how effective is the water treatment? However, the SDEIS does not contain this fundamental information.	WR035, WR036, WR060, WR063, WR146, WR176
5991	Explanations in the SDEIS and agency statements have often made it confusing to know what the Minnesota DNR intended to model.	WR189
5992	According to the Minnesota DNR, the agency did not ask or try to answer a fundamental question that the public wants and needs to know: How long will water treatment be necessary? This is a key question that an environmental impact statement should examine and seek to answer. Understanding environmental impacts and crafting financial assurance decisions depend on analyzing this question.	WR035, WR036
6005	The SDEIS describes the potential to transition to “non-mechanical water treatment” at some undefined time in the future. However, the SDEIS provides no documentation, case studies, or data to support the feasibility of non-mechanical treatment successfully working for the volumes of water anticipated. The SDEIS has a responsibility to present evidence that methods of water treatment can successfully operate to protect human health and the environment. . . The SDEIS should provide documentation and supporting data for the use of non-mechanical water treatment or eliminate the idea from consideration.	PD06
6015	This proposal appears to be critical to the reclamation plan, but it is not explained, analyzed, or presented in the SDEIS. In over 2,000 pages in the SDEIS, the only reference to this plan is this vague sentence about the East Pit and the Waste Water Treatment Plant (WWTP):	PD09, PD35
6019	Dr. Maest also identifies problems with the “Monte Carlo” simulations that were run in the model: “Monte Carlo simulations used in the water quality model do not simulate the timing or characteristics of natural processes or the potential environmental consequences of the interaction of these processes with mined materials” (Maest 2014). This is a troubling issue, given how much of the SDEIS evaluated impacts relies on a model that simulates natural processes and interactions.	WR189
6020	Dr. Miller’s report (see attached) also highlights issues with the modeling that have likely underestimated water quality impacts. “The SDEIS for the PolyMet mine, and accompanying documents have uncertainty estimates for sulfate release, and they utilize the 90-95% confidence estimates for sulfate release. This same type of Monte Carlo simulations have been completed for many mines in Nevada, but are still wrong by sometimes over an order of magnitude, primarily a result of utilizing an incorrect basic conceptual model. I believe that this is the case for the East and West pits of the PolyMet mine” (Miller 2014). He also notes regarding the modeling for the West Pit and the cone of depression that will form, “I believe that the physical model proposed for the PolyMet West Pit Lake to be fundamentally incorrect, and certainly not consistent with pit lakes formed in gold bearing deposits in Nevada” (Miller 2014).	WR088, WR149, WR171, WR173
6023	The SDEIS should incorporate the issues identified in the Minnesota DNR’s own memo identifying incorrect flow numbers, and collect the additional data needed to calculate a more accurate flow.	WR003
6041	The SDEIS should examine mercury impacts if polluted water collection systems fail to meet capture expectations (perhaps assess various capture rate scenarios) and if water treatment is interrupted or functions at a lower than expected rate.	WR017, WR022, WR067
6042	The SDEIS should revisit the analysis of flow level fluctuations in the Partridge River and more thoroughly examine the potential for drying and re-wetting cycles to release mercury.	WR112

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6052	The design should include the use of a geosynthetic barrier in the wall, and the use of geomembranes with a low-permeability, soil-bentonite backfill. The maximum hydraulic conductivity of the cutoff wall should be adjusted in the SDEIS to a much lower threshold of 10-6 to 10-7 cm/s.	PD07
6053	Modeling needs to be re-run to include scenarios under which the efficiency of the groundwater collection system diminishes over time due to clogging, and a response plan needs to be identified to address this.	WR017, WR018, WR021
6054	The design must include keying the cutoff wall into bedrock to prevent underseepage, and the cover system slope should be adjusted to 2 to 5 percent.	PD07, PD15
6055	The SDEIS should describe the plan for the Category 1 Stockpile liners to degrade and how this will be addressed and financed in the future.	PD16
6056	The SDEIS should evaluate backfilling the West Pit with the Category 1 waste rock, to avoid pollution issues associated with degrading liners.	PD15
6057	“Overall, the long term stability of the wasterock deposited in the pits and covered with water is a much lower long-term risk than leaving it on the surface with a plastic sheet over it” (Miller 2014).	PD15
6058	The design plan needs to commit to maintaining the inward gradient essential for the functioning of the system. The minimum depth of the keyed cutoff wall should be described.	PD08
6059	The SDEIS needs to consistently describe the thickness of the bentonite-amended layers on the tailings waste.	GT08
6060	The SDEIS should include bench-scale tests to determine the percentage of bentonite necessary to form an effective oxygen barrier.	PD07
6061	The SDEIS needs to present evidence to show that a greater than or equal to 90 percent saturation level would be maintained in the long-term for the waste cover system. And case study evidence of the bentonite seal application method for the Tailings Basin pond must be demonstrated as working for similar projects.	PD07
6062	The SDEIS should explore the option of draining the pond before applying the bentonite seal, or explain why this option is not considered.	PD07
6063	Underlying original ground and taconite waste should be removed from beneath the Hydrometallurgical Residue Facility and an engineered stable baseinstalled.	PD19
6064	Additionally, the Co-lead Agencies need to insist that any planned expansions from the West Pit be incorporated into this environmental review process for evaluation as a connected action.	PD30
6080	The SDEIS states that a 2006 survey of the Mines Site and nearby area showed “no lynx were identified” (SDEIS 5-365). But the USFWS Draft BA disagrees, and notes, “Tracks and scat of three female lynx were identified during the survey within the study area, concentrated in areas approximately 5 miles east and south of the Mine Site...” (USFWS November 2013).	WI01, WI11
6081	The Draft BA also describes a lynx survey conducted 12 miles northeast of the Mine Site for the Birch Lake Project and Maturi Project for Franconia Minerals that discovered several lynx using the area based on scat and tracks. This survey is not mentioned in the SDEIS.	WI01, WI11

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6083	The SDEIS also incorrectly states that the Canada lynx is not on the state’s Endangered, Threatened and Species of Special Concern list (ETSC). “However the species is not listed as an ETSC species in Minnesota...” (SDEIS 4-201). This statement is inaccurate. On August 19, 2013, the species was placed on the list of Minnesota’s Species of Special Concern. The SDEIS should accurately portray the state and federal status of this species for the public’s full assessment of risks to its well-being from this project.	WI01
6086	In addition, the project would result in the degradation of 698 acres of black spruce-Jack pine woodlands, systems which are considered “imperiled -vulnerable” by the Minnesota Biological Survey. The impacts would represent a 20 percent loss of this forest type within the Laurentian Uplands. ... The impacts to vulnerable forest communities must be more thoroughly described and their loss evaluated at a state-wide level. The SDEIS should examine how this loss would be mitigated.	VEG02, VEG03
6087	PolyMet’s job projections may be inaccurate due to the influence of mechanization. ... The analysis of jobs over the life of this project needs to incorporate the likelihood of foreseeable technology replacing human labor. ... The analysis of jobs over the life of this project needs to incorporate the likelihood of foreseeable technology replacing human labor.	SO04
6088	Confusing and Misleading Information About Where The Jobs Come From... The SDEIS should present clear information about direct and indirect job expectations and where these jobs would be expected to come from geographically. Direct and indirect jobs should be presented separately, preferably in table format.	SO04
6089	No Transparency on the Kinds of Jobs... The 2009 DEIS provided information about the kinds of jobs the project was expected to create (e.g. management, mine operations, mine technical, railroad operations, plant operations). But the SDEIS provides no such information. ... The SDEIS needs to include a table similar to Table 4.10-13 on page 4.10-18 in the 2009 DEIS that shows the types and numbers of jobs expected to be created from the project.	SO04
6090	No Information About Jobs at Key Phases...The SDEIS fails to transparently describe employment expectations over the life of the mine. ...The SDEIS should include a table similar to Table 3.2-2 on page 3-17, Key Phases and Activities (Mine Site), that describes expected employment at both Mine and Plant Sites at key phases of the project.	SO04
6091	Confusing Information about Jobs After Closure... The SDEIS does not provide a percentage expectation of numbers that would need to leave the area or be seeking alternative employment locally. This is important to know to fully assess the socioeconomic impacts to the community once mining has ceased. In addition, the SDEIS does not assess how many employees will be needed to conduct the long-term post-closure work of running the treatment facilities, maintaining pipelines and collection systems, pumps and waste rock piles, the long-term maintenance that is going to be needed for centuries.	SO04
6092	Failure to Meet USFS Forest Plan Goals...The SDEIS fails to demonstrate that the Forest Plan’ goals can be met with this exchange. ... The SDEIS must document how the proposal meets both USFS land exchange objectives and the Superior National Forest’s Forest Plan Goals and Objectives. ...The public should be fully informed that a land exchange will result in an actual loss of wetlands in Minnesota. Indirect impacts need to be more fully characterized. ...The SDEIS needs to explore the significance of not mitigating the wetlands losses within the same geographic area, with the same wetland type, and how the wetland mitigation plan would affect greenhouse gas emissions. ...The SDEIS needs to examine how the [land] exchange helps it meet the Forest Plan Goal of providing a variety of uses, values, products and services for present and future generations by managing within the capability of sustainable ecosystems, in light of climate change issues associated with this proposal. The SDEIS should fully analyze the potential negative impacts to communities, employment, and the economies of the area from the loss of the federal lands and this project. It must evaluate the region’s reliance on environmental amenities such as tourism and recreation. This assessment should include the potential impacts from scenarios that include water contamination that could extend into the watershed.	LAN04

6093	The [Land] Exchange and Climate Change...The [land] exchange will result in operations that will emit carbon in significant amounts. ... The SDEIS should be clear that the exchange will result in a loss of carbon sequestering environments. The SDEIS should address how this exchange addresses the recommendations of both the Climate Change Advisory Group and the Terrestrial Carbon Sequestration Initiative.	AIR01
6094	If analysis of alternatives relies on the Purpose and Need statements of the Co-lead Agencies, it is all the more vital that their statements reflect the legal mission mandates and not the objectives of a mining company.	NEPA02
6097	The engineering design and planning to calculate detailed financial assurance is available at the point a project reaches the Draft EIS stage. For a company to reach this stage without having this information available, and without having performed this calculation internally, would be fiscally irresponsible to the company's shareholders and board of directors. ... A detailed financial surety calculation, based on the project as proposed by the applicant, should be presented in the SDEIS.	FIN05, FIN13
6098	An initial calculation of a financial surety must necessarily be based on worst-case water quality predictions – until operational data can prove conditions to the contrary.	FIN05
6099	The high transfer rate both with the haul trucks dumping to the hopper, and the conveyor loading the rail cars, will generate a significant amount of dust in the vicinity, and in the predominant downwind direction of the Rail Transfer Hopper. And, since the rail cars are open-top, there will be an accumulation of dust along the rail corridor between the mine and mill. ... The Rail Transfer Hopper and rail car loading conveyor and platform should be in an enclosed structure, and the rail cars fitted with a top that would limit the loss of ore-dust along the rail line between the mine and mill.	AIR07
6100	A cutoff wall would be constructed to enclose the Category 1 waste rock pile to prevent metals leaching contaminants from reaching groundwater. ... A permeability of 1x10-6 [cm/sec] or less should be the goal of the cutoff walls for the Category 1 waste rock and the tailings cutoff wall.	PD16
6101	Geosynthetic clay barriers can significantly increase the effectiveness of a cutoff wall, but it is not clear exactly what would trigger the use of this barrier. And, if installed, the barrier is likely to decrease the permeability of the section of the cutoff wall significantly over sections that do not have the barrier. It would be more consistent to use a barrier for the entire wall, or not at all. Recommendation: More definition needs to be provided in when a geosynthetic clay barrier would be employed.	PD07
6103	In Table 3.2-9 Summary of the Stockpile Liners and Covers (SDEIS, p 3-51) the liners that will be employed for the 3 categories of waste rock and the ore surge pile are described. The Category 2/3 Stockpile liner: "12-inch compacted (1x10-5 cm/s) subgrade overlaid by 80-mil LLDPE geomembrane, covered by a 24-inch overliner drainage layer." The other liners have (1x10-6 cm/s) subgrades. Even though the effective permeability of the total liner system is governed by the permeability of the 80-mil LLDPE geomembrane, since 1x10-6 cm/s is essentially the minimum standard for a liner, for sake of standardization the Category 2/3 Stockpile liner should also have a 1x10-6 cm/s subgrade. Recommendation: For standardization, both on the project and with most other liners, all liners made of natural materials should have a permeability of 1x10-6 or lower.	PD15
6104	"...The concentrate is expected to be 8 percent to 10 percent moisture, which is not expected to generate dust during loading." (SDEIS, p 3-116) ... Concentrate ALWAYS creates dust at some point. If the rail cars are loaded in an enclosed building, this should limit the escape of dust to the environment, but to assume that dust will not occur, or that there will no leakage of small amounts of concentrate along the transportation corridor, would be an oversight.	AIR10

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6105	An example of a reclamation plan with an appropriate level of planning detail and cost estimates is the Pogo Project Reclamation and Closure Plan, December 2002. The document is available digitally through the Alaska Department of Natural Resources, Anchorage, AK, and was is titled the Final Environmental Impact Statement, Pogo Gold Mine Project, USEPA, Region 10, September, 2003.	FIN05
6106	A “preliminary” reclamation closure cost estimate is presented in SDEIS Table 3.2-15 Preliminary Cost Estimate for Closure (SDEIS, p 3-138). However, this "preliminary closure cost estimate" is not supported by calculations and/or detailed information. ... In order to develop a ballpark estimate of the financial surety that might be required for the NorthMet project, CSP2 developed a Net Present Value (NPV) spreadsheet to estimate the NPV of the long-term costs. Table 2 [see full comment letter for table]: Assumptions for NorthMet Net Present Value Calculations, contains a list of the basic assumptions made for this model. ... The spreadsheet calculations are most sensitive to variation in the Real Interest Rate. This means that long term management of the financial surety corpus is very important, and that uncontrollable variations in the Real Interest Rate could significantly impact the corpus if it remains low for a significant period of time. ... Recommendation: Because the interest and return on investment rates, and the operating costs, can make hundreds of millions of dollars difference in the financial surety required for the NorthMet mine, these assumptions/calculations should be made available for comment in the SDEIS.	FIN05, FIN08, FIN13
6107	In a discussion of the 2W tailings cell, it is noted: "...in Cell 2W, rapid construction in later years of development resulted in oversteepened dams on all sides of Cell 2W. Some seepage has occurred from the dam in this and other areas along the dam embankments. Other points along the dam embankments have been subject to erosion of the perimeter dam due to the leaking and failure of LTVSMC discharge pipes, and from the natural geomorphological processes such as melting snow, precipitation runoff, soil creep, wind erosion and others." (SDEIS, p 4-371) There is no indication that this issue will be addressed as a part of reclamation. Recommendation: A plan to address the oversteepening of the embankments of Cell 2W should be included in the closure/reclamation plan.	GT09
6108	Water alone can help suppress dust but for roads and similar flat wind-erosive surfaces it is recommended that calcium or magnesium chloride or similar suppression enhancer be required in the water used for dust suppression to extend the durability of the treatments. The Air Quality Management Plan similarly calls for “water and/or MPCA approved dust suppressants” Recommendation: Unless there is a compelling environmental or safety reason, water (or snow) should not be used alone as a dust suppressant and instead magnesium chloride or similar suppression enhancer should be added to water to enhance dust suppression. Recommendation: The mine should investigate and, where appropriate, mitigate reports of airborne dust that come from any entity, whether a mine employee or observer off the minesite.	AIR07
6110	Annual averages are convenient for permitting purposes but it will be critical as part of the air quality permitting process and during mine monitoring to ensure that short-term air quality criteria are not exceeded. Recommendation: The mine’s air quality permit and air monitoring protocol should ensure that short term and peak air quality conditions are measured, representative, and reported to the public and regulatory agencies to ensure that short-term peaks, whether or not they violate standards, are considered as part of air quality degradation.	AIR13
6113	the Mine Plan should review and analyze the reactivity of fugitive dust from waste rock sources (piles, handling, transport, etc.). If this review and analysis indicates the potential for degraded air quality or the potential for fugitive dust to contaminate lands or waters it travels to, then the regulatory agencies should take appropriate steps to halt such fugitive dust. Recommendation: Waste Rock fugitive dust should be reviewed and analyzed to ensure that it does not pose a special hazard or threat to human health or the environment (beyond the typical opacity or other visual considerations).	AIR10
6135	Recommendation: The SDEIS should detail PolyMet’s actual commitment to an anti-idling program that maximizes reduction of vehicle-based NOx and SO2 emissions while accommodating mine-based requirements for productivity and safety.	AIR07

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6136	It is important to know how much mercury is in the system, where it is going, and how stable it will be in its final form. This information should be disclosed in the SDEIS, and not buried in technical documents. The scrubber mercury waste will be placed in the hydrometallurgical tailings facility, but this is not mentioned in SDEIS, only in the reference documents. This is significant process step and should be discussed in the SDEIS. Recommendation: There should be a discussion in the SDEIS of the total amount of mercury in the process stream (bulk tailings, hydrometallurgical tailings, or autoclave scrubber waste), and where the autoclave scrubber waste will be disposed.	AIR05
6140	Once a year measurements will not provide enough data to ensure statistically reliable measurements of the efficiency of the mercury capture systems. Recommendation: In order to ensure that the mercury capture systems on the autoclaves are functioning as designed, a monitoring scheme should be required that will provide statistically reliable data on the autoclave mercury emissions.	AIR05
6146	Recommendation: The SDEIS should include noise contour maps depicting offsite noise contours from mine activities (including transportation to and within the site) and cumulative noise impacts [particularly to federal and state recreational lands].	N03
6152	1. Tonality. Tonal noises which have a narrow sound frequency, such as the whine of an electric motor or an electric saw. A tonal audibility or annoyance factor may be calculated by comparing the tone level to the level of the surrounding spectral components.2. Low Frequencies. Low frequency noise emits from machinery, all forms of transport and turbulence, turbines, exhaust gas, compressors, etc., and can travel greater distance than audible noises. Low frequency noise may cause notable human disturbances even when the decibel level (the sound pressure level) is below 30 dBA.3. Fluctuating Noise. Fluctuating or intermittent sounds are inconsistent in time and/or duration. Examples include generators or machinery operated in cycles, etc. Fluctuating noise has been shown to increase the annoying aspects/annoyance factor of the noise (notably when compared to average sound levels).4. Impulsive sounds. Impulsive sounds are brief, abrupt noises that can cause startling effects that cause greater annoyance levels than may be expected from just measuring the sound level. An impulsive sound at mine sites would be blasting noises, but could also include metal on metal, rock on rock, or rock on metal noise (such as dumping rock from a loader onto a transport truck, railcar, or rock pile).Recommendation: In addition to decibel (volume) impacts, the SDEIS should consider the potential for impacts from tonality, low frequency noises, fluctuating noise, and impulsive sounds. The focus should consider the Boundary Waters recreation areas but could also consider other land uses around the mine site.	N06
6165	The PSHA [Probabilistic Seismic Hazard Analysis] should have used the Maximum Credible Earthquake (MCE) as the design earthquake. ... Since a tailings dam must stand in perpetuity, the design earthquake should be equivalent to the Maximum Credible Earthquake. ... If the MCE/10,000-year event is used for the analysis of the 2,475-year event, the horizontal acceleration (horizontal g-force the dam is subject to) will increase significantly.	GT05
6171	Probabilistic determination for the size of the largest earthquake is appropriate, but the assumption of 100 miles for nearfield is going to make the horizontal acceleration used to design the dam lower than what it should be. ... probabilistic methods are the more conservative way to determine the magnitude of a Maximum Credible Earthquake for dam analysis. For tailings dams the most conservative choice for the location of the Maximum Credible Earthquake would be what is sometimes referred to as a 'floating earthquake' on an undiscovered fault that passes very near the site of the dam. This is a way of recognizing that we do not know the present, future, and even the past locations of significant faulting, and associated earthquakes. The conservative choice for a Maximum Design Earthquake would be a Maximum Credible Earthquake that ruptures the ground surface on which the dam is built.	GT05

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6179	Dynamic analysis is the most rigorous method of evaluating dam survivability under seismic loading. Typically a dynamic analysis will use finite element or finite difference programs such as TARA (Finn et al 1986), FLAC (Itasca Group 2002), or PLAXIS (PlaxisBV 2002) in which dynamic response, pore-pressure development, and deformations can be fully coupled. These tailings dams must contain this material in perpetuity. If not, the cost of collecting spillage due to an earthquake-related failure, and rebuilding the containment structure, would be many millions of today's dollars. ... If these containment structures are going to be built, the assumptions used to check the design should be conservative, and the models the best available.	GT02, GT05
6185	the geotechnical analysis of the dam should be conservative, and as with the bulk tailings dam, dynamic modeling should be performed. In addition, it is proposed that the hydrometallurgical facility be placed on a residual layer of taconite tailings. Even if this material will be "well-compacted" it would be safer to remove the original peat and silty sand/gravel, and the taconite tailings and slimes, and replacing this material with compacted fill, so that the hydrometallurgical facility is built on a well prepared and verifiably stable base. This is the conservative approach. Recommendation: The underlying original ground and the taconite waste should be removed from underneath the hydrometallurgical tailings facility, an engineered stable base installed, and dynamic modeling performed on the hydrometallurgical dam.	GT11
6189	The table [Table 2 in Appendix B Underground Mining] is fine as far as it goes, but there is no discussion of the sensitivity to change in metals prices. For example, what if the price of gold increased \$500/oz. or copper increased \$0.50/lb (both reasonable assumptions), how would that affect the net extracted metal value? Would this make the underground mine economic? If so, then an evaluation of an underground mine as an alternative would be warranted. Recommendation: A metals cost sensitivity analysis should be added to the Underground Mining Alternative Assessment to verify that the underground option is not economical with higher metals prices.	ALT01, ALT06
6199	Recommendation: All wastes that could be disposed in any pit, and the pits themselves, should be characterized to ensure that there will not be regular or seasonal contamination directly or indirectly to surface or ground waters.	WR071
6200	Recommendation: All pipelines proposed for abandonment in place should be evaluated to ensure that their residual contents will not cause contamination and that their presence cannot facilitate connectivity between otherwise isolated bodies of surface and/or ground water, whether constant or intermittent.	PD09, PD35
6201	Recommendation: The Reclamation Plan should expressly state the applicable federal and state laws, regulations, and rules that apply and that will be complied with in the testing, handling, storage, and disposal of all hazardous, toxic, nuclear, and related materials and wastes. Recommendation: The Reclamation Plan should require a tracking system that demonstrates that materials are actually disposed-of according to the Reclamation Plan and applicable laws. The tracking system should include not only affirmation but documentation that certifies proper materials disposal.	PD09, PD35
6217	The Reclamation Plan should more clearly predict the water balance desired in the East and West Pits and the conditions that could impair it from being achieved...Recommendation: The Reclamation Plan should ensure that water management in both the East and West pits do not require long term volumetric management until they reach their steady-state/full/overflow condition. The Reclamation Plan should ensure that specific goals for pit pools are established and achieved.	PD35, WR173
6222	Recommendation: The Reclamation Plan should provide sufficient detail about wetlands construction and associated decision-making processes to allow regulatory agencies and the public to reasonably understand what is likely to happen and what criteria will be employed to determine reclamation success, and what steps will be taken in the event that reclamation does not achieve established criteria.	PD09, PD35
6224	Recommendation: The Reclamation Plan should establish specific fencing goals to ensure that the barriers proposed in the Mine Plan will achieve an appropriate, reasonably achievable barrier to access by people, including children, and wildlife.	PD35

6226	Recommendation: The Reclamation Plan should plan for measures to allow animals to expressly rescue themselves should they fall into the pits or excavated channel between them. This should also include predicting the impacts and express protections for both terrestrial wildlife and birds that may land on contaminated waters. If contaminated waters present a reasonable threat to animals then additional measures should be committed-to and employed (such as hazing or surface netting for birds) to ensure that the pits do not become wildlife death traps.	WI04
6287	Recommendation: The Reclamation Plan should establish clear, measurable erosion goals including success criteria(such as less than x-feet of rilling per y-area and no erosion wider or deeper than z-inches) and responses to failure to meet those reclamation criteria, including but not limited to treatment protocols; long-term protection from postreclamation disturbances; timeframes over which success will be measured and how criteria failure or re-treatment activities will re-start timeframes, etc.	PD09, PD35
6303	The Reclamation Plan should predict the likely compaction caused by the waste rock and overburden piles and thereby calculate the necessary treatments needed to return them to productivity. The reference to scarification may not reach the depth of compaction without additional measures. The Reclamation Plan therefore should model/predict compaction rates and depths and commit to ensuring that reclamation activities reverse this compaction. The Reclamation Plan should further commit to adequate testing and removal of contaminated soils to a 'clean' depth (depth at which contamination no longer exists) below the waste rock and overburden piles. This will be particularly important for the Class 1 waste rock but should apply to all materials that contain contaminants. Finally the Reclamation Plan should establish wetland function goals that will be achieved...Recommendation: Constructed wetlands should be not be presumed successful for any footprint until they are constructed and successfully functioning, at the desired type and level, for at least 5-10 years. The Reclamation Plan should establish wetland size/volume and function goals that will be achieved. The commitment to try to re-establish buried wetlands should to be substantive and measurable, not simply a 'commitment to try.'	PD35
6319	Recommendation: The Reclamation Plan should specify in detail the wetlands reclamation and restoration (and wetlands 'replacement') activities that will occur. It should further establish specific goals and standards that will be met, and establish specific responses to goals that are not met. Finally, it should establish the criteria to be used to determine that it is not possible or practicable to restore on-site wetlands so that the regulatory agencies and public can know in advance just what will happen and how decisions will be made.	PD09, PD35
6320	Recommendation: The Reclamation Plan should commit to removing all waste rock and overburden pile facilities and all underlying materials that are contaminated or contain contaminated materials.	PD35
6322	Recommendation: All reclamation plans should be subject to full public and regulatory review prior to permitting and establish clear success criteria and responses to failure to meet those reclamation criteria. This should include, but not be limited to, plan-specific goals, objective criteria for each goal, timeframes over which success will be measured and how criteria failure or re-treatment activities should re-start timeframes, etc. Recommendation: The reclamation plans should be reviewed and updated on a regular schedule, such as every 5 years, which will allow regulatory agencies and the public to monitor and predict reclamation success and issues and also allow for appropriate bond recalculation.	PD01
6323	Recommendation: The Reclamation Plan should identify clear revegetation goals and methods, including revegetation standards, timetables, etc.	VEG05
6324	Recommendation: The Reclamation Plan should comprehensively identify all roads and clearly state how they will be reclaimed, including their short term and long term uses (or lack thereof).	PD36

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6330	the Reclamation Plan should establish specific requirements for soils. This includes, but should not be limited to, pH, fertility, microbial biota, ratios of: sand/silt/clay, and nutrient cycles, such as for nitrogen and organic matter. Prior to mining, and based on pre-mine conditions, the Reclamation Plan should characterize the existing soils to guide the standards for post-mine soils. Specific topsoil requirements should be established to ensure that all growth media is suitable and will maximize the potential for revegetation success. ... Recommendation: All soil material should be salvaged, stored, accounted for, and distributed to maximize revegetation potential.	VEG05
6331	Recommendation: The Reclamation Plan should establish general criteria and guidance to ensure that materials placement where topsoil is replaced does not allow small size materials to be placed on materials that have much larger size particles. Where this could happen, an interlayer of mid-size materials should be placed between them.	PD09, PD35
6335	To preserve soil integrity (including organic materials, microbes such as mycorrhizae, promote aeration, reduce weed introduction, and reduce erosion, the Reclamation Plan should identify specific steps that it commits to employ to establishing ‘nurse’ crops on the topsoil salvage piles. These plants should be consistent with, and not compete, with the planned postmine revegetation, especially agricultural seeding/planting. Recommendation: The Plan should develop detailed topsoil salvage and storage plans to ensure that the maximum amount of materials is salvaged for reclamation. These materials should be stored to maximize soil health and reclamation efforts. To ensure that all viable growth media is salvaged, characterization of materials should include field observation and not solely rely on a ‘standardized’ depth measurement.	VEG05
6343	Recommendation: Inspection of reclamation at all sites should be based on a decreasing schedule of frequency that begins with a monthly or every-other-month schedule and reduces to quarterly after one year and semi-annually after two years of each inspection schedule without the need for remedial actions. If remedial actions are required then the inspection schedule should re-start for that site.	PD09, PD35
6344	Recommendation: Establish clear noxious species/weed criteria, including the lowest amount of weeds that will trigger treatment and the highest allowable percentage of noxious weeds that will be allowed for bond reduction/release. Recommendation: Establish minimum percentage vegetative cover goals of at least 50% after three years and 80% for five years before determining “success” or allowing relevant bond release. Recommendation: Establish clear alpha and beta diversity requirements for vegetative cover. Recommendation: Revegetation success should be measured no sooner than five years after revegetation goals have been met - without additional treatments or activities. If additional treatments or activities are undertaken, the 5-year clock should restart to ensure that revegetation and long-term plant establishment has actually occurred.	VEG05
6345	Recommendation. A weed-prevention program should be developed and implemented. At a minimum, this plan should include, but not necessarily be limited to: Certification of weed-free seed; Processes to prevent weed introduction (such as washing vehicles entering the site); Weed-response plan identifying how weeds will be controlled if they do come to the site.	VEG05
6346	Recommendation. Contaminant release and incident reporting structures should require that the company provide environmental data and reports to the public. There should be full transparency and the company should commit to informing the public and government about any unplanned or unpermitted releases as soon as it becomes known - not just during the regular document/reporting cycle. Annual or even quarterly reports do not adequately address the public’s right to know about problems at the mine. These are essential for good operating procedures and public trust.	PD24
6558	The number of samples of NorthMet Project material in the waste characterization program is inadequate for the volume of wastes predicted to result from mining.	PD15

6559	Assumptions about the lack of or delay in acid generation and the lack of substantial metal/contaminant leaching are poorly substantiated and conflict with actual results. The SDEIS and associated documents declare that Category 1 wastes will “never” generate acid. Given operational realities and existing characterization results, this seems like a poor assumption and does not consider the potential to leach other contaminants, including those added by mining.	PD15, WR025
6560	Category 4 and some Category 2/3 wastes will likely go acidic more quickly than predicted in the model. If this is the case, submerging them in the pit may not be an effective management strategy.	PD15, PD35, WR029
6561	The SDEIS and associated documents do not discuss or even mention the need to dewater the area around the pits (using pumping wells) during mining. Dewatering wells will likely be required – not just sumps in the pits themselves – and no plans are in evidence for the treatment of pumped dewatering water during operation. At a minimum, the dewatering water is expected to have elevated concentrations of ammonia, nitrate, and sulfate and will require treatment. The treatment pilot tests assumed dewatering water would have nearbackground levels of nitrate and ammonia, so the effectiveness of the methods for removal of these constituents under mining conditions is not known.	PD03, WR013
6563	The Category 1 wastes are the only wastes that will remain on the surface in perpetuity. No liner is proposed for the facility, and the mine plan assumes that seepage collection and treatment will no longer be necessary at some unspecified time after mine closure. The leaching results for this waste category and the closely associated Category 2/3 wastes, and the likelihood that small differences in percent sulfur can readily be separated, suggest that releases from the pile could be more problematic than assumed in the SDEIS. Category 1 wastes will likely include wastes currently designated as Category 2/3 wastes, which will leach higher concentrations of contaminants.	PD15, WR017, WR134
6567	The modeling approach uses Monte Carlo simulations, which in theory cover a wide range of possible inputs and outcomes. However, because of limits placed on concentrations leached from the wastes and mined materials and the use of averages, the high end of potential contaminant concentrations has been excluded from consideration in the model.	WR026, WR060, WR173
6568	Monte Carlo simulations used in the water quality model do not simulate the timing or characteristics of natural processes or the potential environmental consequences of the interaction of these processes with mined materials.	WR189
6570	The model assumes that essentially all contaminants will be adsorbed or otherwise removed as mine-affected waters travel along prescribed flowpaths to receptors. The model does not simulate natural processes that could cause elevated concentrations of mine-related contaminants to reach groundwater or surface water resources, including flushes of leached contaminants during early snowmelt or other hydrologic events or movement along preferential pathways.	WR058, WR173
6572	Given the uncertainties in modeling, it is likely that mercury loads could increase to the Embarrass River (as stated in the SDEIS, p. 5-8) and the Partridge watershed. At a minimum, an independent review of potential mercury loadings and a nondegradation demonstration should be completed as part of the Supplemental Final Environmental Impact Statement (SFEIS).	MERC23
6573	The use of RO treatment during closure allows for more protective targets. It strikes me as odd that the better, more expensive, and more operationally difficult treatment methodology would be applied after the mine closes. ... a contingency should be included for discharge of treated water during operation that meets the most stringent water quality standards and criteria.	WR143
6576	According to the SDEIS (Chapters 2 and 4) and the Water Management Plans (Polymet Mining, 2013b), groundwater and surface runoff flowing into the pits during mining will be collected in sumps and transported to the waste water treatment facility ... There is no mention of dewatering using wells around the pits. Without dewatering wells, the degree of hydrologic control outside the pit is uncertain. Even with dewatering wells, mine water capture is uncertain because of the fractured nature of the bedrock.	WR010

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6581	The Pilot Testing Report (Barr Engineering Company, 2013) does not address removal of nitrate or ammonia and lists no treatment targets for these parameters. The water used for testing of the treatment process had very low nitrate and ammonia concentrations (generally at or below detection), and the testing program therefore did not adequately investigate removal of these constituents. Additional treatment pilot tests should be conducted to evaluate the removal of nitrate and ammonia at reasonable expected concentrations (at least 100 mg/L as N of each).	WR013
6585	The work plan also states: Fractured bedrock, such as is found at the mine site, is inherently difficult to simulate and predict even when extensive hydrogeologic data is available, which is not the case for the mine site. Even with this admission of large uncertainty, there is no contingency plan for pumping of groundwater surrounding the pit or for discharge to surface water if volumes exceed those needed or able to be stored.	WR130
6587	The mine water balance should be recalculated with the volume of dewatering water from pumped groundwater wells included. An estimate of dewatering water quality and a plan for treatment of dewatering waters should also be included in the SFEIS. Figures showing the volumes of water for each component of the water balance, under low stream flow/groundwater elevation and high stream flow/groundwater elevation conditions should be included in the main body of the SFEIS.	WR181, WR182
6592	It is important that the water balance issue, especially whether discharge of treated water will be needed during operation, be sorted out before the SFEIS is completed. If discharge is required during operation, at a minimum, a contingency NPDES permit will be required well before mining begins.	WR182
6593	Polymet Mining repeatedly makes the argument that stratigraphic units within the deposit, and even within the Duluth Formation as a whole, are so similar in terms of their environmental behavior that distinctions should not be made ... This may be true based on geology, but they do not have the waste characterization information to reliably back up these statements in terms of environmental behavior.	WR025
6594	Based on the acknowledged difficulty in excluding material from higher-sulfur waste categories and the uncertainty associated with the leaching characteristics of any waste category, it is reasonable to assume that leachate concentrations from the Category 1 and other stockpiles could be higher than predicted. If this is the case, the environmental protection of groundwater, surface water, and aquatic biota relies on the optimal functioning of the engineered mitigation measures.	WR127, WR128, WR134, WR173, WR178
6595	Seasonal flushing of contaminants from the waste rock piles and the pit walls should be evaluated in terms of concentrations generated in leachate and the effects on downgradient groundwater and surface water, using concentrations and flows that reflect observed and predicted seasonal flows and concentrations.	WR173
6596	Large Table 3 in the Polymet Mining (2013a) shows that most release rates for non-acidic conditions in waste rock were derived from HCT data. However, in the main body of this document (p. 54), it states that non-acidic release rates for Category 1 and 2/3 wastes and ore are instead based on %S values in solid samples. If this is the case, and it should be clarified in the FSEIS, it means that sulfate release rates for all Category 1 waste rock are based on an approach that ignores measured solution concentrations of sulfate in laboratory or field leach tests.	WR025
6597	Additional runs of the water quality model should be conducted for the FSEIS that capture the higher range of laboratory and field sulfate concentrations, especially for Category 1 waste rock simulations.	WR026
6599	Using a linear regression, the R2 values for Category 1 and 2/3 waste rock are only 0.60 and 0.34, respectively. Polymet then applies a fixed-zero intercept, and the R2 values increase to 0.89 and 0.81, respectively. This approach yields an average release rate for all non-acidic Category 1 and 2/3 wastes and ignores higher sulfate release rates that would produce higher sulfate concentrations. This averaging approach also ignores initial flushes of sulfate, which occur over and over again under field conditions (see SRK Consulting, 2007, p. 12).	WR025

6601	The poor correlation (without adjustment) and lack of inclusion of higher values suggest that the approach used to estimate sulfate release rates would underpredict maximum sulfate concentrations for Category 1 and 2/3 wastes and should not be used.	WR025
6603	Polymet Mining (2013a, Section 8.1) goes on to discuss a complex set of approaches for calculating release rates for constituents other than sulfate. These approaches are summarized in Large Table 3 and include using the following: for copper - the Cu:S ratio from aqua regia results; for nickel in Category 1 wastes- the Ni:S ratio from Category 4 aqua regia results and the Ni:Mg ratio in olivine from microprobe results; and for zinc - the Zn:Mg ratio in aqua regia results. The multitude of approaches for generating model release rates in different waste categories seems enormously unnecessary, generates confusion, and lacks transparency. Some of the approaches also seem scientifically indefensible.	WR025
6604	Even more importantly, I could find no convincing evidence was presented regarding why the Ni:S ratio in solid Category 4 waste rock is relevant to the Ni release into solution from Category 1 waste rock, whether Ni occurs primarily in olivine, or why ratios (e.g., Ni/S, Ni/Mg) are the appropriate measure to use to estimate nickel release. The inputs to the water quality model should be recalculated in a way that honors the available field and laboratory leachate information and avoids using ratios of constituents in solids that have not been shown to predict environmental behavior.	WR025
6606	The pH-dependent concentration caps for acidic and non-acidic Duluth Category 2/3, 4, and ore samples mimic the 95th percentile and maximum values for the AMAX pile leachate and seem to be reasonably conservative (see Polymet Mining, 2013a, Large Tables 4, 13, and 14). However, the caps proposed for Category 1 waste rock are not conservative enough because they assume that pH values in the leachate will only go as low as pH 7	WR001
6607	To better reflect the measured and likely pH conditions of Category 1 stockpile leachate, pH-dependent concentration caps should use AMAX pile leachate concentrations for pH values between 6.0 or 6.5 and pH 7.5.	WR033
6608	Polymet Mining (2013a) “proves” that submerging wastes will stop the oxidation of sulfide minerals and the associated release of contaminants using equations (Polymet Mining, 2013a, p. 117). A better approach would be to conduct laboratory column tests that submerge already-acidic NorthMet or Duluth Complex rocks and evaluate the effect of subaqueous conditions on contaminant release.	WR025
6609	A more conservative scenario should be run in the model that does not include adsorption along flowpaths. As discussed in Section 4.1.2 of these comments, a scenario should also be run that includes seasonal flushing of contaminants from waste piles and pit walls to downgradient groundwater and surface water.	WR058, WR173
6611	Polymet should provide a concise summary of the changes in characterization approaches and model input values over time and state clearly which results were finally used to estimate water quality in the model. The original geochemical and water quality data should be presented on the MDNR website in a user-friendly electronic format, with transparent information on the sources of all data.	WR025, WR189
6612	An independent review of potential mercury loadings and a nondegradation demonstration should be completed as part of the Supplemental Final Environmental Impact Statement (SFEIS).	MERC23
6613	All treated effluent during all phases of mining should meet the most stringent applicable water quality evaluation criteria for the NorthMet Project. Water with project-relevant nitrate and ammonia concentrations should be tested for treatment. A plan for treatment and discharge of dewatering water during operation should be in place in the SFEIS.	WR013, WR115
6614	The mine water balance should be clearly spelled out with volumes of water generated at the mine site and needed at the plant site – under low streamflow/groundwater elevation and high streamflow/groundwater elevation conditions at different points in the mine life. The estimates should include ranges that consider the need to pump groundwater around the pits and the effects of changing climate.	WR056, WR060, WR181, WR182

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6615	Category 1 wastes should be lined or backfilled into the West Pit upon closure.	PD15
6616	Submerged column tests should be conducted on Category 2/3 and 4 wastes that have gone acidic, and the results should be used to evaluate the effectiveness of submerging wastes in the pit.	PD15, WR025
6618	The manipulations that occur to leachate chemistry to get it into the model are opaque at best. A clearly written explanation should be provided that takes the reader through an example for one or two contaminants of concern (e.g., copper or nickel), for all waste rock/ore categories, under non-acidic and acidic conditions, that includes: (1) Initial concentrations, based on the release rates or method(s) used (some will be a function of pH); (2) concentrations after applying the four scale-up factors (water contact, particle size, temperature, and acidity); and (3) actual input values used in the model representing waste rock leachate concentrations.	WR025
6619	Release rates should be based on field or laboratory HCT measurements rather than on complicated combinations of solid and solution values.	WR025
6620	Factors of safety could be included relatively easily to ensure that potential environmental effects are not being underestimated.	NEPA14
6621	The pH-dependent concentration caps for Category 1 wastes should use AMAX pile leachate concentrations for pH values between 6.0 or 6.5 and pH 7.5.	WR025
6622	Scale-up factors for Category 4 wastes should be re-evaluated.	WR025
6623	Time to onset of acidic conditions for at least Category 4 wastes should be re-evaluated.	WR025
6624	The model should be re-run with more protective assumptions, including an assumption of no adsorption along flowpaths and seasonal flushing of contaminants from waste rock and pit walls. A scenario should also be run that considers transport along a preferential flowpath to surface water. Model results should also include the pH in the pit, along flowpaths, and in the Partridge River.	WR056, WR173
6643	The appearance of fen indicator species (e.g. northern white cedar <i>Thuja occidentalis</i> ), bog birch ( <i>Betula pumila</i> var. <i>glandulifera</i> ), balsam fir ( <i>Abies balsamea</i> ), alder ( <i>Alnus</i> sp.), and willow ( <i>Salix</i> ) in the coniferous bog type at the NorthMet site clearly indicates that these peatlands are minerotrophic fens and not ombrotrophic bogs. ... This distinction between ombrotrophic and minerotrophic peatlands is important since this ombrotrophy was used to evaluate the vulnerability of the NorthMet wetlands to mining activities.	WET09
6646	The datasets that supports the NorthMet wetland classification does not allow an explicit critique of whether the wetlands within this site are ombrotrophic bogs or minerotrophic fens. These data should have been reported for well defined vegetation plots so it would be possible to discern actual plant assemblages, the relative abundance of all species, and the linkage of species assemblages to surface water chemistry. The surface water chemistry from each vegetation plot should have been analyzed with a pH meter and major cations particularly Ca.	WET09
6647	Perched recharge mounds are likely to occur within wetlands of the NorthMet site but no convincing evidence is provided to support their presence. A convincing test would be water level measurements in piezometer nests installed above and below the hydraulic confining layers that demonstrate the existence of a perched water table mound. It should be kept in mind that water levels will quickly respond to precipitation events in any piezometer installed within an unconfined aquifer. It should also be kept in mind that, the magnitude of the pumping tests performed for the EIS is probably orders of magnitude lower than that of actual mine dewatering operations.	WR071, WR120

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6648	Wetlands in recharge zones (areas where surface waters move downward and recharge the underlying groundwater system) would be much less vulnerable to contaminant plumes transported through groundwater flow systems. However, all wetlands within the study area could still be vulnerable to contamination transported by runoff during the flush of spring runoff. This source of contamination would be greatest after winters with a deep winter snowpack and an abrupt spring thaw.	WET24
6651	I think we are missing a golden opportunity to preserve and restore one of the most outstanding peatland complexes in northwestern Minnesota. This wetland complex is found in the Saint Louis River watershed and has been previously disturbed by drainage ditches, roadways, and a railroad crossing. However, it contains excellent examples of raised bogs, the most outstanding patterned fen in northeastern Minnesota, and populations of several rare, endangered or threatened plant species including <i>Carex exilis</i> , <i>Rhynchospora fusca</i> , <i>Xyris montana</i> , and <i>Juncus stygius</i> . Moreover, the site is presently tax-forfeit land and can be purchased, restored, and donated to the Minnesota DNR to be operated as a Scientific and Natural Area. The peatlands within this tract are more comparable to those of the NorthMet site with the principal exception of their larger size.	WET03
6652	The wetlands within the NorthMet site should be monitored by repeat sampling of permanent plots that are laid out prior to the onset of mine development. I would suggest using standardized relevé plots (100 m <sup>2</sup> for nonforested sites and 400 m <sup>2</sup> for forested sites) following the procedures described by Glaser et al. (1981; 1990) and adopted by the County Biological Survey of the Minnesota Department of Natural Resources. The vegetation within these plots needs to be documented prior to the onset of mine development in order to provide baseline data for evaluating any future changes that may be produced by mining operations. All species within the plot need to be identified (not just the dominant species) and assigned a semi-quantitative or quantitative measure of abundance and dispersion. In each plot water samples should be collected from the peat surface (if there is standing water) or shallow pits. These samples should be analyzed according to standardized procedures. It is strongly recommended that pH measurements should be made at the time of sampling or the end of each sampling day with a pH meter that has been calibrated with appropriate pH buffers. The water samples should then be filtered and acidified for analysis of cations (but not anions). In addition to the metals and anions most likely to be contaminants from mining operations these measurements also need to include Ca.	WET22
6657	I think the EIS statement would have been a much stronger document with respect to the wetland section if the vegetation data was also presented for relevé plots or randomized grid of sample points	WET24
6659	I would also highly recommend some data on peat depths (which can be quickly compiled with a probe). The periodic re-sampling of these plots would provide the best and most cost-efficient indicator for major impacts of mining operations on the wetlands in the NorthMet site.	WET09
6661	Please explain how a perched recharge mound could develop over a sandy textured aquifer. This statement does not seem reasonable according to the description of perched recharge mounds in Todd & Mays (2004)	WR120
6663	Surface flow laterally across the wetland complexes is negligible because of the flat slopes and surface roughness [What about during the flush of spring snowmelt when the winter snow pack melts? The meltwaters must drain downslope ... What about during the flush of spring snowmelt when the ground is still partially frozen?]	WR148
6665	Have any perched water tables been documented by hydraulic head measurements from nests of piezometers?	WR071, WR120
6666	But there could still be significant infiltration and solute transport over time through both the peat strata and the silty sand. There is a difference between slow rates of flow and no flow.	WR107, WR108

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
6669	What was the pH and Ca concentrations of the surface waters in these peatlands? A raised bog, which is ombrotrophic (solely nourished by rain) has a pH less than 4.2 and Ca concentrations less than 2 mg/l. In Minnesota raised bogs have surface waters with a very narrow range in pH (3.6-4.2), whereas the pH range for fens (4.3-7.3) barely extends into the basic range of the pH scale. Even rain water is typically acidic in Minnesota with a pH of about 5.0-5.6 (MPCA). Given the small size of the peatlands in the NorthMet site and the absence of any evidence that these peat deposits are mounded (with interior elevations higher than their margins) it appears that these peatlands are mostly poor fens (pH range of 4.3-4.8 and Ca concentrations of 3-8 mg/l) or even rich fens (pH 5.2-6.7).	WET09
6670	Even though the hydraulic conductivity of the peat can be several orders of magnitude higher in the near-surface peat (acrotelm) than in deeper layers (catotelm) there could still be significant lateral or vertical flow and solute transport within the deeper peat. The assumption of "perched" conditions needs to be verified by profiles of porewater chemistry and more detailed profiles for hydraulic head	WR120
6671	Vertical seepage losses from wetlands without peat soils would only have the potential to occur in isolated areas of contiguous, high hydraulic conductivity bedrock faults and fracture zones located under isolated areas of high hydraulic conductivity glacial till and aligned with wetlands containing high hydraulic conductivity soils (Barr 2010d; Barr 2011j).[What about wetlands underlain by sandy textured aquifers?]	WET10
6677	I have not seen any definitive evidence presented that true "ombrotrophic" raised bogs occur within the NorthMet site	WET09
6678	A pumping and isotope test conducted in 2006 indicated that the groundwater pumped during a 30-day pump test was derived from aquifer recharge rather than surface water seepage from surface water features such as the Northshore Mine Pit or wetlands. ... [What isotopes were used as tracers? Tritium? I would like to see their data if it is available].	RFI01
6681	Water levels in piezometers installed in unconfined aquifers should respond rapidly to precipitation events regardless of whether they are located in zones of recharge, discharge or lateral flow.]	WR021, WR071
6683	Evapotranspirational losses would be limited by the xeromorphic features of the conifer trees and ericaceous shrubs	WET24
6684	If the peatland has balsam fir and more than the occasional tamarack it is probably not a true ombrotrophic (raised) bog ... Northern white cedar never grows in a true raised bog! This species is a calciphile (calcium-loving plant) and is considered an indicator of an extremely rich fen in Minnesota; The so-called swamp birch ( <i>Betula pumila</i> var. <i>glandulifera</i> ?) is also a fen indicator species and never grows in the true raised bog ... This community seems typical of a fen	WET09
6685	There seems to be confusion regarding the relationship of ombrotrophic raised bogs to groundwater flow systems. Siegel and Glaser and their co-workers have repeatedly published direct evidence that raised bogs (in addition to fens) are directly connected to groundwater flow systems in the underlying mineral sediments both in large peat basins (Siegel & Glaser 1987, Siegel et al. 1995; Glaser et al. 1990, 1997; 2004ab, 2006) and smaller peatlands (McNamara et al 1992). These publications demonstrate that peatland development (to bog or fen) is determined by the local hydrogeologic setting rather than surface processes as suggested here (e.g. see Glaser et al 1997, 2004b, 2006). Ombrotrophic raised bogs can therefore be susceptible to alterations of groundwater flow and solute transport as was demonstrated in the Lost River bog-fen complex in northern Minnesota (Glaser et al 1990 but also see Siegel et al. 1995). In addition, this report does not provide direct evidence for the occurrence of ombrotrophic raised bogs within the NorthMet site. The EIS needs to specify that some peatlands at this site have the following features: 1) are in fact mounded (i.e. raised) 2) contain no fen indicators 3) have surface waters with a pH less than 4.2 and Ca less than 2 mg/l Otherwise a discerning reader might assume that the conifer bog class represents poor fens.	WET09

6688	<i>Juncus stygius</i> is a fen indicator species and never occurs on an ombrotrophic bog. It is characteristic of poor-fens located around the marginal fringes of raised bogs and poor fen water tracks. (see Glaser 1992bc). It is widespread across the boreal region of North America but usually in very small and highly localized disjunct populations.	VEG01, VEG09
6689	These peatlands are clearly minerotrophic fens and not ombrotrophic bogs. Alders, swamp birch, catabils etc are fen indicator species and in fact alders are most abundant at peatland margins (laggs) or in non-peat wetlands. In addition: willows ( <i>Salix</i> ), marsh cinquefoil ( <i>Potentilla fruticosa</i> ?) are restricted to minerotrophic fens. Poor fens with high cover of <i>Sphagnum</i> are common across northern Minnesota and elsewhere.	WET09
6690	The description of the "conifer bog" class [on Tract 1] includes fen indicator species and therefore represents either a poor or rich fen forest or a mixture of a raised bog with the poor fen plant assemblages along its margins. The fen indicator species listed are alders, bog birch, catabils and other taxa ( <i>Iris</i> and raspberry). The presence of <i>Sphagnum</i> , black spruce and shrubs of the <i>Ericaceae</i> is not indicative of a raised bog because these species have broad ecological tolerances and can be dominants in both bogs and fens. The wording of this paragraph may be misleading since the aerial photograph of this area presented in Figure 4.3.2-1 (Tract 1 Hay Lake Lands) contains a wetland in sections #17 and 20 that has the radiating forest patterns typical of a raised bog that may have been burned in part. However this polygon is classified as conifer swamp in Figure 4.3.3-3. ... Figures 4.3.2-3 Tract 2 Lake County North Lands and Track 3 Wolf Lands 1. The landscape in this aerial photograph is marked by flutes (or drumlins) with wetlands in intervening flutes (sections 34, 35 and 3 and 2) However, the wetlands marked are probably swamp forests and not bogs. Fig 4.3.2-4 Wolf Lands 2 (looks like conifer swamp.....not a bog.	WET17
6697	How can an earlier section of the s EIS be so certain that fracture-flow through fractures, joints, or other discontinuities in the bedrock is not likely to be important within the study area? These data are suggestive that such features may affect the hydrology of the wetlands within the NorthMet site.	WR010
6705	Unless the bogs were in fact perched (which is probable but not supported by data included within this memorandum) they would still be connected to underlying groundwater flow systems and could be affected by drawdown.	WET09
6708	The NorthMet EIS does not provide reliable criteria for separating ombrotrophic bogs from minerotrophic fens. The key criteria for distinguishing bogs are a) landform type (surface elevations are always higher toward the interior of a peat deposit than at the peatland margins), b) the absence of fen indicator species, c) surface waters with a pH = 4.2 and Ca concentrations =2 mg/l. In contrast, several fen indicator species (e.g. alder, willow, bog birch etc) were listed as components of the "coniferous bog" type within the NorthMet site. The report seems to rely on high cover values for <i>Sphagnum</i> and black spruce, which can characterize poor fens as well as bogs. In addition, it should be kept in mind that most fens have acidic surface waters but fen waters consistently have a pH higher than 4.2 (typically 4.3-6.8 for poor to rich fens). If the authors of this report wish to lump raised bogs and poor fens within the same class they should say so explicitly and not make erroneous inferences about hydrology such as ombrotrophy. The scientific literature is very explicit about this matter and they can check some of the references at the end of this critique.	WET09
6712	Dust deposition could have potential impact on both ombrotrophic bogs and minerotrophic fens depending on the chemical and mineralogical composition of the dust.....either as acidifying agents (in fens) or by the supply of inorganic solutes and nutrients (bogs). Also, overland transport of solutes derived from dust is possible during the flush of spring snowmelt.	WET11
6723	This assumption would only be valid if the bogs in question were perched recharge mounds (which is not documented within this EIS). Otherwise ombrotrophic bogs would be connected to groundwater flow systems and responsive to transient and long-term changes in the hydrology of the watershed.	WET09
6732	What are multiple analog impact zones?	WET10

6734	Groundwater drawdown would be expected to have a greater effect on smaller than larger wetlands.	WET10
6736	Another potential impact to consider is the effect of trace metals (e.g. Ni, Mb etc) on nitrogen fixation and methanogenesis since Ni and Mb are key components of the enzymes regulating the N and CH4 cycles in anoxic peat profiles!	AIR01
6740	over longer timescales (e.g. decades) the effect of solute transport could be significant. (e.g. see Siegel, D.I., A.S. Reeve, P.H. Glaser and E. Romanowicz. 1995. Climate-driven flushing of pore water in humified peat . Nature 374: 531-533)	REF01
6746	Figure 5.3.1-1 Tracts 1, 2 and 3 Roads Tract 1 - Hay Lake LandsThe northeastern boundary of this tract cuts across the crest of a well developed raised bog (=radiating forest patterns)	WET17
6761	The authors of this [Eggers 2011 memorandum] report did not consult the scientific literature on this important subject and therefore reached erroneous conclusions on both the criteria for distinguishing ombrotrophic (i.e. solely rain nourished) from minerotrophic (nourished by both rain and waters that have percolated through mineral soil) peatlands and the status of peatlands within the NorthMet site.	WET09
6763	In retrospect, the members of the wetland working group should have consulted the scientific literature on northern peatlands in Minnesota as well as the treatment of the acid peatland system in the Minnesota Department of Natural Resources (2003). Field Guide to the Native Plant Communities of Minnesota. The Laurentian Mixed Forest Province. Ecological Land Classification Program, Minnesota County Biological Program, MNDNR, Saint Paul,MN pp. 215-221. This treatment defines the pH range of raised bogs as less than 4.2 and also explicitly states that bogs are recognized by the absence of fen indicator species.	REF01, WET09
6768	Given the uncertainties with respect to sampling (with regard to both the vegetation and the water chemistry) I would strongly recommend re-doing the ground surveys using standardized procedures for both the vegetation and water chemistry) if the distinction between bogs and fens sensu stricto are important for the NorthMet EIS. At best, the occurrence of these fen indicator species and pH values well within the range typical of rich fens should raise red flags about the use of ombrotrophy in this [Eggers 2011 memorandum] report.	WET09
6780	It is important to consider whether the simplifications required in Goldsim are accurate and true to the hydrology of the site. ... They ignore the uncertainty that arises due to scale. ... The modeling therefore uses K values that are too small.	WR087, WR096, WR189
6787	This reviewer has reviewed many environmental documents for mining projects all over the country and somewhat globally and has never seen the [GoldSim] model used. To justify the claim of wide use, Polymet should provide an extensive list of mines on which Goldsim has been used to simulate contaminant transport.	WR189
6789	The [GoldSim] model fails the transparency requirement because it is proprietary and it is not possible to review or run the model without purchasing the model platform. Without this capability, it is not possible for the public to independently test Polymet's assumptions.	WR189
6793	most of Polymet's discussion does not distinguish among the hydrology and its Goldsim implementation. Polymet treats the bedrock as far more impermeable that it actually is, and that is based on their pump test data. ... Only three of the twelve observed Ks are less than the geometric mean, with one being just 0.01 ft/d less than it. Well P-1 was essentially dry, but the data resulted in a 0.0024 ft/d value which controlled the geometric mean and essentially drives discussion of bedrock being non-conductive.	WR168
6806	There is a need for better information regarding vertical gradients and the connection between the surficial and bedrock aquifers. ... For modeling, Polymet has not justified their assumptions of no connection among aquifers.	WR058, WR061, WR071, WR167

6808	Polymet should model a scenario w/o continued discharge from PMP because it dilutes some constituents and causes some to have exceedences even without this project.	WR006
6809	Baseflow for the Partridge River may be incorrectly estimated. ... Polymet estimates river flow based on a distribution of monthly flows at SW006 as shown in Table 5---13 (p 127). A problem with this scheme is that it is a random selection by month without regard to the previous month. A dry month could follow a wet month, which is unrealistic. The model then distributes the SW006 flow to other evaluation points according to area draining to them and the year of mining.	WR003
6910	Recharge rates for the watershed have been underestimated. ... It is common to set recharge equal to river baseflow so the error comes in how baseflow is estimated. ... Polymet simply set baseflow equal to the lowest 30---day flow in this watershed. ... Myers (2014, Part 1) reestimated recharge for both Partridge and Embarrass River watershed and found that Polymet underestimated it by three to five times. ... The recharge rates should be reestimated considering the above and Myers (2014). Everything in the model that depends on the recharge rate should be reestimated, including the basic groundwater model used to estimate Goldsim parameters.	WR171, WR189
6913	Polymet should address whether there should be pathways north to the river. None of the model pathways discharge north even though there is a groundwater divide under the Cat 1 stockpile in pre-mining conditions.	WR071, WR089
6918	The flow calculations rely on an assumption that the surficial aquifer is 5-m thick rather than on reality that the piezometric surface along “an aquifer receiving recharge is parabolic in shape” (Id.). In other words, they have assumed constant thickness where in reality the thickness is not constant. Polymet also ignores the actual variability in thickness caused by the actual depth to bedrock ranging to almost 20 m, as seen in Large Figures 4 through 10.	WR058, WR167
6926	The GoldSim modeling also uses K values randomly chosen for each 1-d flow path; it is unclear whether there is a separate value for each flowpath during each simulation.	WR058, WR167
6928	GoldSim constructs flowpaths using adjacent cells and models the water balance simultaneously among each cell. It apparently utilizes one K for the entire flowpath. This assumption violates any realistic conceptual model of flow in the aquifers by ignoring heterogeneities. The K could vary along the flow path but the modeling as proposed here fails to account for that. If possible, the GoldSim modeling should use different K estimates for each cell but they should be selected with spatial correlation considered.	WR058, WR167
6929	The process of dispersion in the Goldsim model, by instantaneously spreading contaminant through a cell, differs from actual dispersion by which contaminants disperse continuously through the entire domain. If the time step used in Goldsim is significantly shorter than the time normally required for contaminant to disperse over that distance, it may be moving contaminant too quickly which would dilute the contaminant.	WR058
6930	the lateral and vertical dispersion is usually 0.2 and 0.1 times the longitudinal dispersion. This excessive horizontal dispersion dilutes the contaminant along its pathway more than would be estimated with standard transport equations (Fetter 1999). This would inappropriately dilute the estimated concentration for contaminants arriving at the monitoring points or the river.	WR058
6936	A necessary conclusion is that the assumptions about the engineering, geochemistry, the hydrology, and the geological conceptualization combine to provide predictions suggesting that the project will not degrade waters.	WR190
6940	Rather the model assumes that all water entering the stockpile during a year also exits it. ... By not considering storage, the model does not allow water to accumulate so that large amounts could seep all at once. ... the model also ignores the potential additional seepage that would occur during subsequent wet months. ... The assumption could limit the effect of high precipitation years, when leftover storage from the preceding year combines with infiltration during the current year to cause a larger of water reaching the liner or containment system.	WR173

6954	The method for modeling evapotranspiration (ET) from bare and reclaimed stockpiles does not appear to be correct). ... The better way to model this would be to select an ET proportion from the observations using the sample rather than population standard deviation.	WR175
6964	Polymet (2013) assumes that discharge into groundwater begins when the water level rises above the bedrock into the surficial aquifer. ... Polymet should complete a more realistic analysis of flow from the West Pit into the groundwater. ... Inflow to and from the pits should be determined as a function of depth using MODFLOW and then adjusted for uncertainty based on a probability distribution. The basis for this distribution should be described.	WR168, WR179
6966	most of the load simulated by Polymet to be in the lower river is already there, with the WWTF load representing only a few percent of the total load at SW006. The load simulated as contributed by the mine is on the order of tonnes per year or only a few percent of the natural load. River concentrations are very near the background groundwater concentrations which are shown below. Again this reflects the fact that natural conditions control the simulated concentrations in Polymet's modeling.	WR175
6974	The lack of mine-induced SO4 in the river occurs even though the mine adds very significant SO4 loads to the system. Considering the East Pit only, over 30,000 tonnes are added during year 11 from backfilling category 4 waste rock. By year 22, over 50,000 tonnes have been added just to the East Pit from various sources as shown in Figure I-01-24.1. This load obviously does not reach the river, so the question is where does it go?	WR060, WR150
6979	[PolyMet's] modeling assumes the caps will work perfectly, but it is important to question what must be done to make the assumption realistic. The addition of lime/limestone and proper mixing would have to occur during the initial backfill. Inadequate mixing could result in volumes of waste with much higher SO4 concentrations.	PD29, PD34, WR027, WR127
6986	[PolyMet's] estimated SO4 loading to the East Pit beyond year 20 does not include any WWTF return flow or a load from the backfilled waste rock (Figure I-01.24.2 below). This means they are accounting for no load from any water added to the pit to keep it saturated but they are assuming the pit remains saturated so there is no continued oxidation. It appears therefore that Polymet is missing two large components of load to the East Pit.	WR173
6992	Essentially, [PolyMet] assume and model that the combination of pumping from the WWTF and the percolation of meteoric water would counter the pumping of 1750 gpm and allow the backfill to remain saturated. Polymet presents no plan as to how this would work in practice even though it underpins their modeling.	WR173
6996	Myers (2014) simulated a pump and treat scenario for the East Pit and found that concentrations at various points in the backfill would be highly variable and in some areas would exceed the target even 100 years after the end of mining.	WR171
6998	Polymet appears to rely on the pit being a sink that prevents constituents from flowing into surrounding groundwater. Because they are keeping the pit full of water even while pumping from it, there may be gradients allowing flow from the pit to the surrounding groundwater. Polymet should describe at some place in the SDEIS how this would work in practice and consider what could happen if it does not work.	WR173
7006	Sorption as modeled by Polymet is the primary factor preventing Cu from reaching the river (Myers 2014). Polymet's model treats Cu sorption as deterministic, meaning they do not examine any scenario except for full sorption. They do not model any of the factors which could affect sorption, such as pH, contact time, or the relative particle surface areas. As found by Myers (2014), if sorption does not occur or occurs in a much smaller amount, Cu will reach the river at rates which could violate the standard. In addition to the engineering features, Polymet's assumed sorption essentially prevents any Cu from the mine from reaching the river. They have not justified that this will occur nor test what could occur if their assumptions are wrong.	WR058

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
7044	The model assumes that all waste rock covers, liners, and containment systems will work perfectly. The probability distributions do not account for substantial failures. If the seepage through one or more stockpiles is double that planned, there would be substantially higher load reaching the rivers.	WR127, WR138
7046	The model assumes sorption for four contaminants, including copper, which causes the model to predict that effectively none of the contaminant reaches the river. This sorption occurs even though the high background load continues to flow to and discharge into the river.	WR058
7048	The model assumes that plans to keep backfilled waste in the East Pit saturated during operations and to pump and treat it during reclamation will prevent all contaminants from escaping the pit and reaching the river. This is a very optimistic. Polymet should analyze a scenario which does not rely on this assumption.	WR029, WR089
7049	The modeling does not consider two loads to the East Pit – the load from pumping water from the WWTF to the pit to keep it saturated during reclamation and the load caused by oxidation of backfill if perfectly saturated conditions are not maintained.	WR173
7050	Pumping the West Pit full of water causes a mound which allows water and contaminant load to escape and flow from the pit to downgradient groundwater.	WR173
7053	The agencies should consider how the realistic modeling completed by Myers (2014) differed from Polymet’s and give particular consideration as to whether Polymet’s modeling was physically realistic. The agencies should further consider that Polymet’s modeling includes assumptions that prevent much of the transport that may actually occur. The agencies should ultimately reject the results of Polymet’s modeling and require them to complete more physically and conceptually realistic models	WR189
7060	West Pit Backfill was rejected without substantial argument or technical analysis because they claim it would not offer substantial environmental benefits (p 3-151). ... Recommendation: Polymet should give the West Pit backfill option a thorough evaluation with the Goldsim model so that there could be a comparison of concentrations with and without backfill.	ALT03
7071	They also note there are “additional mineral resources in the West Pit that would effectively be lost if the pit was” backfilled (p 3-149). ... Recommendation: Discuss the difficulties associated with pumping out a pit lake, and treating the water, to recover ore at the bottom of the pit. Consider these difficulties in discussion and decision as to whether to consider this as an option.	ALT03
7075	Polymet has not prepared a mining and reclamation plan (p 3-5), so the exact timing of activities must be considered imprecise; this applies in particular to the water quality modeling as presented throughout the SDEIS. Recommendation: Acknowledge that the times for various management activities during reclamation and closure are approximate because the reclamation plan has not been prepared.	PD09, PD35
7080	The conductivity values (Table 4.2.2-5) are provided in a not-useful way. Without knowing the number of samples, simply providing a range and a geometric mean is not meaningful. It would be better for the table to simply list all observations especially since they range over several orders of magnitude. ... The SDEIS overstates the roll of gouge in filling the faults in the areas (p 4-45). ... Recommendation: The analysis that relies on low permeability bedrock just under the till should be reconsidered and potentially redone. Additional fracture analysis should be completed to better consider the potential for fractures or faults being connected to more distant resources.	WR011, WR012, WR014, WR071, WR087, WR099, WR168
7091	Recommendation: Recalibrate the MODFLOW model based on higher recharge which would yield more realistic conductivity parameters (see comments elsewhere).	WR086, WR091, WR165
7096	The SDEIS claims there is very little transport in the bedrock flowpaths, primarily because of its “very low bulk conductivity” (p 5-53). ... Recommendation: Consider a much higher range of bedrock conductivity in the Goldsim modeling.	WR061, WR168

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
7107	The description of how they determine the P90 value from a Goldsim run, described in the third paragraph of p 5-77, appears wrong. Recommendation: Describe the processing of model output to obtain the P90 value correctly.	WR192
7108	There is controversy over the estimate and use of baseflow on the two rivers draining the project site. ... It is not proper, however, to assume the 30-day low flow equals the average basinwide recharge in this watershed because it is not possible to assume the entire watershed is contributing during baseflow conditions. The baseflow may be recharge but only from a portion of the watershed. By setting recharge equal to the 30-day low flow, Polymet's recharge estimate was about 0.8 in/y, which is not correct because it is based on only a small portion of the watershed contributing baseflow. ... Recommendation: Polymet should reconsider their recharge estimate for modeling based on Myers (2014a and b) and recalibrate the MODFLOW model based on that correct recharge value.	WR003, WR052, WR086, WR091, WR165
7124	The predicted relative rates of groundwater inflow from bedrock and surficial aquifer (p 5-114) are based on very incomplete knowledge of conditions at depth which would control inflow from depth, including of saline groundwater. Recommendation: Polymet should establish a series of deep groundwater monitoring wells, screened at locations in the 500 feet below the pit bottom, to assess both changes in head and water quality. There should be continuous electrical conductivity monitoring so that salinity changes can be quickly detected.	WR007, WR071, WR078
7130	Recommendation: Reconsider the modeling of the surface water quality considering the comments in this review, Myers (2014 a and b), and the review documents prepared by Ann Maest, Glenn Miller, Dave Chambers, and Mike Malusis.	WR189
7137	Recommendation: The SDEIS should describe both the groundwater monitoring system and better describe how the contingency plans could actually work. They should demonstrate with their MODFLOW model that pumpback or other groundwater treatment can work. They should demonstrate using Goldsim that they can actually time the groundwater discharges to surface water so as they can actually increase the WWTF discharges for dilution.	WR139
7139	Surface water quality on the Embarrass River will change as a result of the project, though Polymet claims no standards will be violated. ... Recommendation: The SDEIS should discuss why the WWTP cannot treat the water so that degradation to the river will not occur.	WR064
7140	Recommendation: In cases where the natural background exceeds published standards, the project should not be permitted to cause any increase in concentrations or further degradation of the resource. This means any discharge (seepage) much have a lower concentration than natural so that the net effect is dilution.	WR059, WR064, WR082
7150	Polymet suggests it will stabilize in the West Pit Lake at 0.9 ng/l, or slightly below the standard. They indicate the load to the Embarrass River will increase due to seepage from the tailings but that reductions in the Partridge R will offset the increase for the St Louis watershed as a whole. They also claim that 92% of the Hg in the tails will remain there; this claim must be considered. Recommendation: Polymet should better justify the claim that 92% of the mercury will remain in the tails.	MERC06
7160	The SDEIS essentially argues that the MODFLOW--predicted drawdown is inaccurate (p 5-92). If that is correct, that drawdown estimates from MODFLOW are inaccurate, then dewatering estimates are also inaccurate. Recommendation: The SDEIS should acknowledge there is a large uncertainty in the estimated dewatering, and provide an estimated range of dewatering rates.	WR179
7162	Recommendation: The SDEIS should identify what the dewatering water will be used for or whether it will simply be discharged. Unless there is a water quality problem, the dewatering water should be reused onsite.	WR181
7165	Myers (2014) demonstrated that the groundwater discharge could be decreased much more than predicted in the SDEIS, therefore the predictions in the SDEIS are likely wrong. Recommendation: Use the MODFLOW model to predict decreases in the discharge to the river or to predict water drawn from the tributaries or wetlands which could reduce river flow.	WR086

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
7167	The SDEIS claims the analogue model was based on pit lake recovery measurements, not on actual dewatering results (p 5-92). This renders the results suspect so they should not be used in the SDEIS. Recommendation: The MODFLOW results for drawdown should be included in the SDEIS, either to supplement or replace the analogue discussion.	WR071, WR119, WR171, WR179
7171	Recommendation: Polymet should run their MODFLOW model in steady state mode with the water level in the pits controlled at the proposed levels. Polymet should also disclose in the SDEIS that maintaining the water level below the natural levels will require pumping/diversions from the pits essentially forever; this would include a requirement to treat the water.	WR105
7181	The description of the reduction in seepage to the Embarrass River watershed during closure is very misleading – it claims there will be a reduction from the estimated current rate of 2020 gpm to 1320 gpm but that since the groundwater containment system remains in place there will be only 21 gpm of seepage bypassing the containment (p 5-160). It is therefore inaccurate to claim that 1320 gpm will reach the watershed. Recommendation: Change the discussion of tailings seepage to acknowledge that the containment system prevents seepage from reaching the watershed.	WR018
7182	Recommendation: The SDEIS should describe the flow augmentation in Embarrass River better so that its effectiveness can be considered and the proposal can be assessed as to whether it will cause the wetlands to dry.	WR112, WR183
7196	The wetlands receive minimal runoff because the soil texture allows rapid infiltration, but the interaction between the surficial and bedrock aquifers is assumed to be insignificant (p 4-149). The SDEIS bases this idea on a reference to Siegel and Ericson, but their interpretation is wrong. ... These extensive fractures would enhance a connection between the bedrock and surficial aquifers, not render it insignificant. The SDEIS assumes there is little connection throughout, but is incorrect. See also Myers (2014a). ... The SDEIS suggests that wetland hydrology monitoring would be conducted only during the operations phase. This is not correct because pit lake development will draw water from the wetlands far beyond the end of dewatering. This applies whether the Polymet pumps the pit full, as described, or whether it fills naturally, as analyzed by Myers (2014a). ... The SDEIS has also not adequately considered the hydraulic connections between the wetlands and underlying aquifers. Recommendation: The agencies should require Polymet to install shallow piezometers near and at distance from the mine site to consider whether there is a layer separating the surface from the aquifers.	WET22
7217	Recommendation: Polymet should expand their probabilistic modeling to include results assuming the liners/containment systems work poorly. Instead of 99% capture, they should test what occurs with as little as 10% captured. Also, they should consider what occurs if the capture fails for a given time period; this would be the equivalent of considering what would occur if a significant slug of contaminants escapes for a reasonable time period.	WR022, WR202
7223	Recommendation: The modeling should include a flowpath north from the Cat 1 stockpile to the Partridge River. The flow path might be temporary, only existing early during operations and later during closure. Polymet should use their MODFLOW model to assess these time periods. See Myers (2014a).	WR089
7225	Recommendation: Transport from the tailings should be modeled with two potential failures. The first is that the cutoff wall and/or pump system does not perform as designed. The modeling should consider the potential for the pump system to fail temporarily. The second is that the bedrock underlying the tailings could have higher conductivity than assumed for this modeling.	WR019, WR104, WR131

7229	SDEIS Figure 5.2.2-3 ... This is the wrong way of modeling the cutoff wall because the thickness of the model cell would control the conductance through the cell. ... The variable size of the DRAIN cells might also affect the modeled ability to remove water because the conductance could be set equal to the product of the long length of the cell and modeled conductivity, a value which could artificially increase the model's ability to remove water. Recommendation: The cutoff wall should be simulated using the horizontal flow barrier package in MODFLOW. The DRAIN cell conductance should be set specifically avoiding the potential problems outlined herein.	WR088, WR093, WR100
7230	Recommendation: The temporary stockpiles should be simulated assuming the liner performs poorly to set a bound on the potential contamination. The MODFLOW model should be used to test assumptions that seepage from the Cat 4 stockpile will flow to the East Pit.	WR022, WR171
7232	Recommendation: Polymet should run a scenario wherein the concentration caps do not apply, because they depend on the correct addition of amendments to control the pH in the pit. Adding amendments after backfilling is complete is very difficult.	WR033
7235	Recommendation: The SDEIS should compare the pros and cons of pumping the West Pit full with a clear explanation of why they are doing it. It could be considered an alternative mine plan.	ALT03, ALT04
7237	Recommendation: The SDEIS should include a discussion about how the water quality of temporary runoff ponds, such as pond PW-OSLA, will be monitored. This would include frequency of sampling and constituents to be sampled.	PD05
7241	Recommendation: Provide evidence in the form of peer-reviewed studies or other assurances that bentonite amendments and covers can prevent the entry of oxygen to underlying material. This should prove that it will work essentially in perpetuity since that is the claim being made by Polymet and relied on by the agencies.	WR057
7245	Recommendation: Polymet should redo the modeling to accurately account for flow among subareas and use the amended bottom seepage rates for inflow to the Goldsim modeling.	WR057
7252	The evaluation threshold for water quality has been chosen to be the P90 value, or 90% exceedence (p ES-35). This means that 90% of the simulated results were less than this value. However, the SDEIS describes it as there being "at least a 90 percent probability that a constituent would not exceed water quality evaluation criteria" (p 5-7). This requires the huge caveat that it applies only if all of the conceptualizations of flow and transport are accurate and all of the probability distributions are accurate. Recommendation: The SDEIS should not call the P90 value the value for which there is a 90% chance it will not be exceeded without adding "based on the assumption of the modeling".	WR192
7254	Recommendation: The agencies should require detailed monitoring of the water levels in the shallow aquifers to provide advance warning of any impacts as they are occurring or before they affect the water level on the surface.	PER17
7256	Flow changes due to the project could cause concentration evaluation criteria to be exceeded but the water quality modeling (Polymet 2013a and b) does not simulate changes in flows due to the project. Recommendation: If it is not being done, the concentration modeling should account for decreased flow in the river and streams.	WR047, WR148
7261	The assumptions are essentially the problem with this SDEIS. ... Very little consideration is given to what could occur when something goes significantly wrong, as it inevitably does. This SDEIS does not consider the full range of potential problems that could occur at this site, especially considering that the design features must operate as designed in perpetuity. It does not adequately disclose the potential range in water quality and water quantity impacts that could result from this project over the next 200 to 500 year and beyond.	PD01

7432	While the sulfide content is not high in much of the waste rock, the buffering capacity is also very low and the release of metals and sulfuric acid will be substantial, as recognized in the SDEIS. Most of the mitigation measures rely on very large water collection and treatment processes that are unparalleled in modern mines. While the treatment technology (e.g. reverse osmosis treatment) has been shown to be effective in much smaller treatment facilities, it has not, to my knowledge, been utilized on such a grand scale and certainly not for centuries, as is projected in the SDEIS.	WR001, WR128, WR143
7437	Particularly for the East Pit, the plan to rinse and withdraw the expected highly contaminated water from the pore spaces in the waste rock is untested, and very likely to fail due to the extreme difficulty of efficiently rinsing rock that has been added to the pit.	WR171, WR173
7451	Both from the refilled East Pit and the West Pit Lake, sulfate and metals loading is very likely to exceed the groundwater standards of the State of Minnesota. This plume of contaminated water will migrate long distances and potentially be a source of contamination to groundwater and surface water for centuries.	WR107, WR109, WR115
7453	Also, as discussed by others (see the Maest comments), the water from the East Pit will almost certainly contain large amounts of nitrate and ammonia from the blasting activities from residues of ANFO(ammonium nitrate-fuel oil). Removal of these substances is largely untested.	WR013, WR032
7472	The water quality in the ultimate West Pit Lake is estimated to contain 800 mg/L sulfate (range of 500-1200 mg/L). The basis for this estimate is on rinsing of wall rock that has been exposed to air. The actual concentration is likely to be considerably higher, and is likely to approach gypsum (calcium sulfate) saturation (probably supersaturation), similar to what is found in almost all pit lakes in Nevada. Concentrations of sulfate can vary from about 500 mg/L to over 3000 mg/L, depending on conditions at the specific site (see attached Nevada Division of Environmental Protection file in Appendix 1 that provides limited data on some of the Nevada pit lakes).	WR141
7473	Modeling of pit lake water quality has typically assumed that sulfate will come from wall rock oxidation very near the surface of the pit lake, as is apparently the case for the West and East pits. This so-called “rind” model neglects what actually happens when a cone of depression is created as water is pumped (or flows into the pit) to lower the groundwater table to the bottom of the pit. The water is replaced by air that is brought into the cone of depression created by removal of water; the result is oxidation of sulfides that are present in the large volume of rock distant from the actual pit faces. Concentrations of sulfate present in the water draining into the pit are effectively impossible to predict, since there have been no estimates made of sulfides in the rock surrounding the pit that will exist in the dewatered cone of depression.	WR173
7475	This issue is fundamentally important to both the refilled East Pit and the West Pit Lake. If sulfate concentrations are much higher than predicted, the water treatment requirements and sludge production will be much higher than expected and the cost requirements (via bonding and long-term treatment expectations) also much higher.	WR176
7483	A second aspect of this type of oxidation is that sulfate concentrations will be elevated far into the future, since rinsing of those surfaces will continue until the entire cone of depression is rinsed, and would include any gypsum that may have precipitated in the aerated pores where sulfides had been oxidized, and the solid gypsum redissolved. Thus, the concentration of sulfate in the pit lakes remains highly uncertain, although they are likely to be much higher than the concentrations predicted. No discussion of this source of sulfate and contaminants was presented.	WR001
7484	This same type of Monte Carlo simulations have been completed for many mines in Nevada, but are still wrong by sometimes over an order of magnitude, primarily a result of utilizing an incorrect basic conceptual model. I believe that this is the case for the East and West pits of the Polymet mine.	WR088
7491	Removal and treatment of water at a rate of 300 gal/min thus is unlikely to result in sufficient dilution of the contaminants (particularly sulfate) for a much longer period than predicted. Instead of 200 years to dilute the pit lake to approximately 35 mg/L (Fig. 6-61 in the Water Modeling Data Package – Mine Site), the time frame could be much longer, and prolong treatment for additional centuries.	WR035, WR037

7492	The water treatment plan has the term “adaptive management” in several sections, and the data on which to base adaptive management decisions should involve groundwater monitoring at various distances down gradient from the East and West pits. For example groundwater monitoring wells should be established 5, 20 and 100 meters from the expected groundwater flow path.	PD22
7510	The SDEIS should thoroughly evaluate the alternative of putting all of the Category 1 Waste material into the East Pit, or potentially, the West pit, or a combination of the various pits. Leaving the reactive rock on the surface provides an in perpetuity water treatment requirement, and a very likely long term management problem when the plastic liners degrade.	ALT13
7520	The arguments that it will increase water treatment needs if deposited in the East Pit (section 3.2.3 in the SDEIS) and the remaining rock in the West Pit have some level of validity; however, once the Category 1 waste material is submerged, oxidation processes will largely stop, and the water treatment required for the East Pit will be temporarily increased, but over the long term (centuries) the water treatment requirements will be much less, and limit the threat that reactive rock drainage will have on surface and groundwater.	WR035
7534	Treating a huge volume of water to discharge standards using membrane processes is more expensive than moving the previously mined rock out of a pit by conventional methods. In fact, removing of a rock-filled pit is probably more likely than pumping and treating a pit lake full of water.	ALT03
7562	Bonding and long-term water treatment estimates are major environmental issues. No estimates of bonding for reclamation and long-term water treatment and management were provided, and this is a major deficit of the analysis presented in the DSEIS. ... Thus, those discussions on the long-term closure costs should have been part of the environmental analysis. These should include the costs for long-term treatment, the cost of repairing the covering on the Category 1 Stockpile (if not put back in the pits), and the replacement/upgrading of the various water treatment facilities every 50-75 years. The discount rate(s) to be used for the estimate of treatment funds should also be included, since the ultimate water treatment and management of the facility will directly depend on the funds that are generated and available in the centuries ahead, assuming that a functioning society still exists.	FIN05, FIN08, FIN13
7574	any passive biological system can[not] reliably allow a walk away solution from any site, for two reasons. First, biological treatment is highly variable, depending on a variety of conditions, including temperature, flow, contaminant load, and treatment objectives. Second, while sulfate concentrations can be reduced, I am not aware of any single passive (no pumping or added reagents) system that is sustainable over the long term. These systems may start out working well, but the treatment efficacy drops off after weeks to months of operating. The available organic reducing sources are simply consumed, and those systems plug rapidly with metal sulfides and microbial mass. The plugging is observed in effectively every completely passive biological system of which I am aware. None of these systems that I have observed can reduce sulfate to under 30 mg/L.	WR137
7581	some of the treated water [from the WWTF] will be used to flood the pits to reduce further sulfide oxidation. This treated water will come from a variety of sources, including the east pit water that has rinsed off acids and metals from the oxidized rock. Thus, it is likely that the sulfate loadings will generally be above 2000 mg/L and potentially much higher. ... I was unable to locate any data that indicated that sulfate could be reduced from 2000-3000 mg/L to 250 mg/L using this approach. I seriously doubt that sulfate can be reduced by this amount, and in the absence of any scalable data for a continuous process, the MDNR should assume that it cannot. ... So how is the water in the East Pit going to be treated during mining of the West Pit, and how much will be treated during the latter half of mining the West Pit? ... The contaminant load in the water in the East Pit will be very high, and a portion of this water is likely to penetrate the pit wall surface and be delivered to groundwater	WR147

7587	Essentially no mention is made (at least that I could find) of where the thousands of tons of precipitated sludge will be deposited, other than it will be moved offsite. This is a serious deficiency of the SDEIS, since the precipitated sludge is a major component of the water treatment process, and this sludge contains contaminants that are water soluble and will readily leach in the Minnesota climate. At a minimum, the following questions should be answered? a. What is the expected contaminant load in the waste? While this will vary, depending on the type of sludge that is generated, some general description should be required for each type of waste transported off site. b. What is the legal characterization of the waste - will it be accepted by municipal waste repositories? c. How much will be generated each year, and what is the total amount expected over the long-term? d. How will it be transported? e. What specific sites will accept the waste? What is their capacity and what are the design characteristics of those facilities? Are there agreements in place at sites that will accept the sludge waste?	WR145
7595	While [chloride is] not particularly toxic, it will increase the total dissolved solids concentration, and with sulfate (and the associated cation) combined together will present a total dissolved solids concentration that is potentially greater than 300 mg/L. How is chloride being used (calcium chloride or hydrochloric acid) and can it be eliminated?	WR002
7607	Rinsing the East Pit refilled pit is going to be a major problem. To my knowledge, a refilled pit has never been completely rinsed, and will threaten groundwater from the initial period when waste rock is submerged in the East Pit, but even more so when the groundwater table rebounds and the hydrologic gradient towards groundwater is re-established. If water is removed from the base of the refilled pit, treated and released back into the refilled pit, this will indeed reduce concentrations. However, the expectation that the sulfate concentrations will be reduced to less than 250 mg/L is overly optimistic. ... At the least, a thorough monitoring plan should be developed that requires collection of water samples at various distances from the refilled pit and at regular time intervals. If the rinsing is unsuccessful, as I expect, and contaminants exceed maximum allowed concentrations, how will the MDNR respond to this groundwater degradation?	WR090, WR147, WR173
7610	While the water collected during the period when the pit is deepened and water pumped to maintain a dry pit, the reference to how the water will be collected is unclear. ... If the pit dewatering calculations are incorrect, the volume of water needed to be removed could substantially exceed the capacity of the needs for mining and milling, and would need to be discharged. Sulfate, ammonia and nitrate (as well as other contaminants) could be in higher concentrations than the discharge limits and exceed the capacity of the treatment system to handle the contaminated water. While this possibility is admittedly speculative, the volumes of water that will be pumped appear low, and if the dewatering rate is 2-3 times higher, the water treatment, as proposed, will not be sufficient to manage this water, as well as the volumes indicated in the SDEIS.	WR147, WR176, WR179
7760	Three methods yielded substantially different annual recharge estimates for the study area. Reconstruction of baseflow yielded 7 and 12 cm/y for the Partridge and Embarrass River watershed, respectively. Regional regression yielded the highest values ranging from 24.2 to 30.3 cm/y for the area. The water table fluctuation method yielded about 23 cm/y. Polymet had estimated basinwide (for the Partridge River watershed) recharge to be just over 2 cm/y (Polymet 2013a) or 1.7 cm/y (Barr 2008b) primarily based on the average annual 30-day low flow at the Partridge River above Hoyt Lakes gage for the entire watershed. Barr (2012) broke it down further to 4.6 cm/y for till and 0.9 cm/y for wetland areas, although their maps do not show where they applied these values. The much higher recharge estimates completed herein using three different methods indicates that the recharge estimated by Polymet is too low. Polymet's error was to assume that the entire 67,000 acre basin would be contributing recharge to baseflow during low flow periods at the end of the winter season.	WR003, WR052, WR062, WR165

7781	The purpose of this [numerical flow] modeling effort is to provide a different independent assessment of flow and transport in the area. It provides an alternative explanation to the modeling proposed by Polymet. In addition to the differences caused by recharge rates, this model differs from those of Polymet by including both the mine site and plant site and the two watersheds in which they lie, the Partridge River and Embarrass River (Figure 1). At the plant site, the model includes estimated seepage from the tailings impoundment. At the mine site, the model simulates pit development including dewatering, backfill, and pit lake development under two scenarios, natural pit lake filling and induced pumpage. ... The strategy is to develop a numerical model that accurately represents the flow and transport through the system and compare the conceptualization with Polymet's. Additionally, this model is used to test the effect of varying Polymet's parameter and seepage assumptions.	WR062, WR171
7803	The final SSR was slightly higher than 330, so the MODFLOW-2000 automated calibration decreased the variation by about 13 percent. The mean residual was essentially zero and the scaled standard deviation and absolute mean were 0.04 and 0.03 of the head range of 53.97 m (Table 3 [see full comment letter]). The means by layer cluster near zero. The only tendency observed in the residuals is a slight tendency for the observed groundwater levels to be higher than simulated at higher elevations for all model layers (Figure 12). The simulated groundwater levels and potentiometric surfaces reflect that groundwater flows away from the ridges toward the river discharge points, as expected (Figures 13 through 15 for layers 1 through 3, respectively). There is no obvious spatial trend in the residuals except for a slight under prediction of groundwater level near the Partridge River in layer 1 east of the mine site (Figures 12 through 15). This may have been due to the river being several meters lower than the nearby ground surface.	WR062, WR171
7813	One reason that calibrated K values (Table 2 [see full comment letter]) increased from their starting values could be scale. Model cells represent a much large volume than the pump or core tests used for some of the cited estimates (Schulz-Makuch et al. 1999). A cell would represent a full range of fractures which pass the majority of flow in fractured bedrock. Studies have consistently shown that model parameters can be up to several orders of magnitude higher than other estimates (Schulze-Makuch et al. 1999; Garven 1995; Bredehoeft et al. 1992).	WR062, WR087, WR099, WR171
7838	The model achieved water balance with outflow, to DRAINS and the GHB, being within 0.0026% of the inflow, all of which is by recharge. The discharge from the Embarrass River watershed was about 2% higher than the recharge to that basin because the calibrated groundwater divide was a small distance south of the topographic divide which diverted a small amount of recharge from the Partridge watershed. The Partridge and South Partridge River (reaches 5 and 6) received most of the discharge from the Partridge River watershed (Figure 16 [see full comment letter]) and the Embarrass River (reach 10) had most discharge from that watershed.	WR062, WR171
7946	[The groundwater flow model's] substantive differences with the Polymet modeling are primarily the higher recharge which led to higher bedrock conductivity estimates. The transient calibration used in this model development, but not Polymet's, estimated storage coefficients to be significantly lower than had been used by Polymet. Lower storage coefficients mean that less water will be released for a given change in groundwater levels. If the project involved pumping a set amount, this model would predict more drawdown and more distant impacts. Because the goal of dewatering is to lower the groundwater level to a target level, this model will predict that less water would be removed than as simulated by Polymet. However, the higher bedrock conductivity will draw water from further away thereby expanding a zone of impacts. This could increase the reach from which groundwater discharge to the river will be decreased, thereby increasing the impacts on the river. The higher bedrock conductivity and higher recharge could cause a higher contaminant load to reach the rivers especially through advection. However, higher recharge could dilute the contaminants so that exceedences are rarer. Because of the complexities of the mine site development, it is not possible to have more specific expectations of the differing parameters will affect the model results.	WR062, WR086, WR171
8135	Much of the discharge lost to the [Partridge] river apparently occurs south of the minesite. The recovery (Figure 14 [see full comment letter]) occurs along the path of natural groundwater flow, which is also followed by the contaminants as will be discussed in the next section. The pit naturally begins to overflow, as described above, at about year 87 (from the start of mining, at rim elevation c 480 m amsl) (Figure 12). A long-term surface outflow occurs in about 8 years (year 95 from the start of mining).	WR062, WR086, WR171

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
8152	The amount of discharge from the pit lake into bedrock is significant equaling about two-fifths of the flow into the bedrock to the south and about four-fifths of the flow into the bedrock to the west. This reflects the higher bedrock conductivity discussed in Part 1 and calibrated in Part 2 and also indicates that Polymet’s (2013c) assumption of extremely low bedrock conductivity may have biased the bedrock flow estimate.	WR009
8165	Variable nearby sources and sinks as found near the mine site complicate the solving of the transport equation. It specifically can cause numerical dispersion and oscillations which can cause the concentration in areas to actually go negative, a physical impossibility (Konikow 2011, Herrera and Valocchi 2006). This does not cause problems with mass balance and the results remain accurate (meaning the solution is not affected by the negative concentrations) away from the affected areas (Konikow 2011), but the simulation of negative concentrations is disconcerting. The primary means of eliminating the problem is to decrease concentration time steps or change the dispersion coefficient.	WR171
8226	There are two primary differences between the modeling completed herein and the proposed project and modeling of that project (Polymet 2013c). First, this model does not simulate the cap on the concentrations which could result if Polymet adequately controls the pH in the East Pit. ... The simulated concentration in the East Pit exceeds Polymet’s cap by two to three orders of magnitude (Figure 32) but should be considered representative of the SO4 modeled as stored in the pit and not an actual concentration that could be measured in the field. ... Second, this model does not simulate pumping from the East Pit which probably allows the overall load in the system to reach the river as in Figure 44. The results should possibly be considered what would happen if Polymet does not actually pump back from the East Pit for up to 38 years (Polymet 2013c) or if it is only marginally effective.	WR171, WR173
8341	The simulations of seepage from the tailings impoundment demonstrate why Polymet (2013d) predicts there will be no increases in load to the Embarrass River caused by their project. Their modeling assumes that their engineering will reduce seepage rates from 1 to 10% of the existing rate. Comparison of the 1/10th and 1/100th seepage rates with the full seepage rate demonstrates just how much less load enters the environment with these assumptions. Assuming that sorption occurs decreases the load to the environment even more. If the seepage controls fail in anyway, the load reaching the river would likely be much higher.	WR018, WR129
8343	The simplistic modeling completed by Polymet (2013d) ignores important transport properties by basing transport through deeper layers only on the lower flow rates. Dispersion into deeper layers will increase the concentrations so that the load flowing toward the river will increase.	WR010
8345	Groundwater levels downgradient from the tails are reduced because of the decreased seepage and will likely negatively affect wetlands.	WR056, WR093
8378	The primary conceptualization difference is the estimated recharge being higher than estimated by Polymet as described in Part 1. Higher recharge rates lead to higher conductivity values as described in Part 2. This model was calibrated to a given rate (Part 2) which cannot be tested in long-term simulations because either extensive drawdown or mounding would result and make the results unrealistic and render any comparison not useful. Qualitatively, higher conductivity allows flow and contaminants to pass faster, the effects of drawdown to spread further, an increased connectivity between surficial and bedrock aquifers, and more dewatering effects on the rivers and possibly the wetlands.	WR003, WR062, WR171
8386	The dewatering predicted by the model developed herein is about twice that predicted by Polymet due to the higher recharge and conductivity. ... This model simulates more dewatering effects on the river because it simulates more of a connection between bedrock and surficial aquifer, based on their being more recharge flowing through the system. ... Based on the simulation herein, the Partridge River reach above the confluence with the S Partridge River is most at risk from dewatering and that risk continues for years during reclamation and closure if the pit refills naturally. Pumping the pit full (the “with pumping” scenario) allows the discharge to the river to return to pre-mining rates within about 10 years, when the pit is full.	WR171

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
8388	A potentially larger difference in flow paths is the delineation between the surficial and bedrock aquifers. Polymet treats them as completely separate but the transport modeling herein allows constituents to disperse vertically among layers because the bedrock herein is more conductive. Groundwater and contaminants may be simulated herein to flow more rapidly and at a higher flux through bedrock that estimated by Polymet.	WR168, WR171
8395	The plume moving north and west from the tails [in the author's model] disperses horizontally more widely than allowed in the Polymet modeling.	WR062, WR171
8396	The general differences between concentrations simulated herein and in the Polymet model are that herein groundwater reaching the river has concentrations that exceed standards after 60 or 80 years whereas Polymet's simulations of SO4 and copper is mostly a horizontal line meaning the project would cause no significant effects.	WR171
8398	Polymet relies on perfect engineering to limit the seepage rates through three waste stockpiles, an ore surge pile, and the tailings impoundment. ... Polymet must also pump from the East Pit and treat all of the porewater that has high constituent concentrations; they must prevent essentially all of it from escaping. ... While pumping this water, they claim they will keep the backfill submerged to prevent further oxidation. Considering that the required pumpage vastly exceeds the rate required to dewater the pit, this seems infeasible. ... Polymet assumes it can work without even presenting a design or model.	WR128, WR173
8400	The simulations showed that SO4 concentrations in portions of the pit did not reach the target for 110 years after the cessation of operations. The efficacy of this pump and treat plan is critical to Polymet's overall project plans but the modeling and discussion herein indicate it will probably not work.	WR089, WR128, WR173
8402	Another major assumption regarding copper (and three other constituents), Polymet assumes that sorption will occur. This essentially prevents all copper loading in the groundwater from reaching the river. Without sorption, as shown above, copper will exceed standards within 60 to 80 years depending on the pit recovery.	WR058, WR167
8406	Polymet's plan to pump water into the West Pit to hasten pit lake recovery causes major differences with a natural pit recovery scheme. Pumping has the effect of changing gradients which cause contaminant loads to reach the river more quickly. Pumping also adds very significant loads to the groundwater system on the west end of the mine site for SO4 (and is the primary source of load for many other constituents because the bulk of the water is from the tailings impoundment). If their many modeling assumptions do not fully manifest or their engineering designs do not work as well as expected, as modeled herein, this load will reach the river and cause the project to exceed many standards.	WR173, WR177
8648	No commitments are made regarding the nature of the soil materials that will comprise the [groundwater containment system] wall, and no details are provided regarding the proposed construction method, other than that the soil material will be compacted.	PD04
8650	it is unclear whether or not a geosynthetic barrier will be used in the [groundwater containment system] wall and, if so, what type of geosynthetic barrier will be used and whether or not the geosynthetic barrier will be used in conjunction with soil (i.e., a composite barrier).	PD04
8651	The absence of such commitments [in the groundwater containment system] and details is problematic, as the options proposed are not commonly employed for long-term containment of contaminated groundwater and do not have a strong track record of success in these applications. The materials and construction method need to be specified and thoroughly described.	PD04

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
8653	the phrase "geosynthetic clay barrier" is used in the SDEIS, implying that this barrier would be a geosynthetic clay liner (GCL) rather than a conventional geomembrane. However, there is no readily available evidence in the literature indicating that geosynthetic barriers other than geomembranes have been used in vertical barriers. Also, research indicates that walls containing a geomembrane alone (as opposed to a composite wall containing a geomembrane and a low-permeability, soil-bentonite backfill) are not likely to be effective for controlling underseepage, even if the geomembrane is placed in direct contact with the confining unit at the bottom of the aquifer	PD07, PD15
8654	Compelling evidence needs to be provided that demonstrates the viability of a compacted soil or geosynthetic wall in lieu of the widely used and well proven soil-bentonite slurry trench method. This demonstration should include valid references/web links to relevant case studies and must address the following construction issues: (a) how trench stability will be maintained during construction; (b) how the soil material will be processed and placed to ensure that the wall is homogeneous, meets the design hydraulic conductivity, and is free of high-permeability defects; and (c) how the geosynthetic barrier (presumably a geomembrane), if used, would be installed to ensure the integrity of the panels/interlocks and adequate control of underseepage.	PD07
8658	The maximum allowable hydraulic conductivity of 10-5 cm/s for the cutoff wall is 10 to 100 times higher than the typical hydraulic conductivity requirement for vertical barriers used in long-term hydraulic control or geoenvironmental containment applications (10-6 to 10-7 cm/s...). If constructed at 10-5 cm/s, the wall likely would be ineffective as a long-term barrier unless a sufficient inward head difference is maintained continuously to prevent outward advective transport and adequately reduce outward diffusive flux of miscible contaminants in the groundwater.	PD07, PD15
8660	there does not appear to be a commitment to maintaining a particular minimum gradient at all locations along the wall, and the cross-sectional schematics ... indicate that an inward gradient will not be maintained on the south side of the stockpile adjacent to the West Pit. The model simulations also do not appear to consider the possibility that the efficiency of the groundwater collection system could be diminished over time	PD15, WR021, WR133
8662	PolyMet should commit to maintaining a particular magnitude of inward gradient or head difference across the wall, to ensure that the containment system functions as intended based on consideration of both advection and diffusion as viable transport mechanisms for contaminants leached from the waste rock.	PD15, WR021
8663	a soil-bentonite slurry wall, with a maximum hydraulic conductivity no greater than 10-6 cm/s, should be employed for this containment system (as appears to be the case for the vertical barrier to be employed around the tailings basin). A maximum hydraulic conductivity of 10-6 cm/s is a reasonable design criterion for a soil-bentonite backfill, as backfill hydraulic conductivities of 10-6 to 10-8 cm/s are easily achievable for a wide range of native soil compositions.	PD07
8671	The groundwater modeling assumes that no groundwater from outside the containment area will be captured by the containment system ... However, there is no indication in the text of the SDEIS or other project documents that the wall will be keyed into the underlying bedrock. Likewise, schematics showing the conceptual cross section of the containment system (i.e., Figures 3.2-11 and 3.2-16 in the SDEIS ...) indicate that the wall will not be keyed into the bedrock, but rather will terminate at the top of the bedrock.	WR019
8676	The key is one of the most important aspects of cutoff wall design, and specifications generally call for a minimum depth of key (typically 3 ft, or deeper in fractured bedrock) into the lower confining bed to ensure an adequate seal that minimizes underseepage ... Without a proper key, significant underseepage could occur, either into the containment area or out of the containment area (i.e., at locations where an inward gradient is not maintained). The text and schematics should be revised to reflect an appropriate minimum depth of the key into the bedrock.	PD07, WR019
8677	Although the minimum required thickness of the cutoff wall is not explicitly stated in the text of the SDEIS, the groundwater flow model assumes a wall thickness of five feet. Therefore, the thickness of the constructed wall should be at least five feet. Please confirm.	PD16

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
8678	According to the Adaptive Water Management Plan ... a minimum surface slope of 1.0 % is proposed for the final cover system. The justification provided for such a flat slope is insufficient. ... The surface slope must be sufficient to promote runoff and minimize ponding of water on the cover surface, thereby minimizing infiltration.	PD04
8679	It is unlikely that a loosely compacted vegetation layer can be sloped uniformly at 1 % without creating areas where ponding will occur. Indeed, solid waste landfill covers typically are designed to have a minimum inclination of 2 to 5 %, after accounting for settlement ..., to promote runoff and minimize ponding ... Based on this consideration, the minimum cover slope should be at least 2 %.	PD04
8680	Also, monitoring and maintenance provisions should be included in the closure plan to repair localized areas of grade reversal or subsidence.	PD09, PD35
8683	PolyMet should commit to (a) maintaining a particular magnitude of inward gradient or head difference across the [TB groundwater containment system] wall, to ensure that the containment system functions as intended based on consideration of both advection and diffusion as viable transport mechanisms for contaminants released from the tailings, and (b) establishing a minimum depth of the key into the underlying bedrock. Regarding the latter, there is a mention in the SDEIS that the wall will be keyed into bedrock, but the minimum depth of the key is not specified. Also, schematics in the SDEIS and ... indicate that the wall will be constructed to the top of the bedrock, but will not penetrate into the bedrock.	PD07, WR019, WR021
8684	According to Attachment C of [Water Management Plan - Plant], a thickness of one foot was specified for the slurry wall in the groundwater flow model simulations. While a thickness of one foot is conservative from a modeling standpoint, a wall this thin will be too difficult to construct and backfill properly	PD08, WR019
8686	Thus, in addition to being imprudent from a technical standpoint, construction of a 1-ft-thick wall likely would not result in significant cost savings relative to a 3-ft-thick wall. As such, a wall thickness of three feet is highly recommended, which would be consistent with conventional practice and provide a factor of safety from a groundwater flow perspective.	PD07, WR019
8688	There appear to be inconsistencies between the SDEIS and [Flotation Tailings Management Plan] regarding the thickness and embedded depth of the bentonite-amended layers to be installed on the dam raises. According to page 5-162 of the SDEIS, PolyMet proposes to cover the embankments with a 12-inch-thick bentonite-amended soil layer, followed by an 18-inch-thick vegetated soil cover. However, page 33 of [Flotation Tailings Management Plan] states that the bentonite-amended layer will be 18 inches thick and overlain by a 30-inch vegetated layer. These differences need to be resolved.	PD07
8690	The design criteria for the bentonite-amended layers need to be defined. For example, what design hydraulic conductivity and moisture retention characteristics will be required for these layers to function effectively as oxygen and water infiltration barriers?	PD07
8691	The likelihood that a uniform barrier with low hydraulic conductivity could be created by amending predominantly coarse tailings with only 3 % granular bentonite is small, as many of the flow paths within the barrier will likely be devoid of bentonite. ... Bench-scale tests need to be performed using materials with gradations representative of those anticipated for the bentonite-amended layers to determine the percentage of bentonite required to meet the relevant design criteria	PD07
8694	On page 5-162 of the SDEIS, the text states that the objective of the two-layer cover systems is to maintain the bentonite-amended layer at or above 90 percent saturation so that the layer would operate as an effective oxygen barrier. However, no evidence is presented in [Flotation Tailings Management Plan] to show that a saturation = 90% would be maintained in this layer over the long term. Unsaturated flow modeling is needed to evaluate the potential for changes in saturation of the bentonite-amended layers over time.	PD07, PD08

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
8696	In addition to evaluating the potential for loss of saturation, PolyMet needs to address the potential for the hydraulic and moisture retention properties of the bentonite-amended soil layers to change over time due to development of soil structure caused by wet-dry cycling and other pedogenic processes, most notably freeze-thaw cycling and plant root penetration. Root penetration likely will occur after some period of time, and there is no evidence provided to support the suggestion by PolyMet in [Flotation Tailings Management Plan] that adding 3 % granular bentonite will provide adequate protection against root penetration. Likewise, there is no evidence provided to indicate that an 18-inch (or even 30-inch) vegetated layer will provide adequate protection against freeze-thaw cycling.	PD08
8697	What field performance benchmarks and associated monitoring methods will be employed to demonstrate that the bentonite-amended layers function as intended over time?	PD09
8700	Three possible methods are proposed for creating a bentonite seal at the bottom of the tailings pond, viz. (1) subaqueous broadcasting of bentonite pellets or bentonite-coated sand; (2) in-situ mixing (with bentonite injection) from a barge; and (3) subaqueous placement of a GCL. ... these proposed options are, at best, experimental. Although it is noted that PolyMet proposes a field demonstration to prove the efficacy of the chosen method, case-study evidence should be provided to indicate that these methods (particularly the broadcasting and in-situ mixing methods) have been implemented successfully on similar projects.	PD07
8702	PolyMet should explain why alternatives that involve draining the pond prior to installation of the bottom seal are not being considered as potentially more prudent options relative to the subaqueous installation methods.	ALT10, ALT13
8704	The GCL hydraulic conductivity reported by the manufacturer should not be assumed to be representative of the field hydraulic conductivity. If a GCL is to be placed on the tailings pond bottom, the selected GCL should be subjected to laboratory testing (ASTM D6766) with the pond water to determine the expected hydraulic conductivity in the field. Likewise, the hydraulic conductivity of a broadcast bentonite layer or in-situ mixed bentonite layer to the pond water should be verified by laboratory or field testing.	PD07
8710	The values of compression index (Cc) and swell index (Cs) for the LTVSMC tailings, peat, and residue that were used to determine the analogous parameters ? and ? for the MCC model do not appear to have been reported in the SDEIS or the relevant data package [Geotechnical Data Package – Vol 2]. Please report these values along with the calculations producing the values of ? and ? for these materials as given in Table 4.2 of [Geotechnical Data Package – Vol 2]. The values ? = 0.05 and ? = 0.01 seem too low for fine tailings and slimes.	GT13
8714	According to the SDEIS and [Geotechnical Data Package – Vol 2], the settlement analysis for the subgrade yielded a maximum strain of 0.20 % in the liner system. However, the LTVSMC tailings appear to have been modeled in the settlement analysis as homogeneous, with a single value of ? and ? used in the analysis for the tailings and slimes. The assumption of homogeneity needs to be further justified. While this assumption may yield conservative estimates of total settlement, it is not clear that this approach would yield conservative values of differential settlement and strain in the geosynthetic layers.	GT11, GT12
8722	Consolidation test results for the LTVSMC tailings do not appear to have been included in [Geotechnical Data Package – Vol 2]. How many consolidation tests have been performed on the tailings/slimes? Have multiple consolidation tests been performed on samples collected at various locations and depths within the footprint of the proposed disposal facility? If so, how much variability in the compressibility parameters is evident? Have any analyses been performed to demonstrate that material variability in the tailings does not lead to greater differential settlement and strain in the liner?	GT11, GT12
8724	The potential for spreading and separation of the GCL panel overlaps due to the anticipated settlement of the subgrade and elongation of the liner needs to be addressed in the geotechnical analysis.	GT10, GT12

8727	The computed factors of safety presented in the SDEIS for slope stability along the interfaces of the various liner system components for the HRF (Table 5.2.14-5, page 5-576) are based on values of interface friction angle reported in the literature. Citations and references for the sources in which these values are reported should be provided.	GT12
8730	Also, although PolyMet proposes project-specific interface shear testing if the anticipated material types change, geosynthetic-geosynthetic and geosynthetic-soil interface friction angles vary among different geosynthetic products of the same type. Site-specific and material specific tests should be performed for final design	GT10, GT12
8734	A slope "on the order of 1.0 percent" is proposed for the top of the cover system [Residue Management Plan]. As mentioned previously for the Category 1 waste rock stockpile cover (see Comment 5 above), landfill covers typically are designed to have a minimum inclination of 2 to 5 %, after accounting for settlement, to minimize ponding while also promoting runoff and minimizing erosion ... A minimum cover slope of least 2 %, after accounting for residue settlement caused by placement of the gradefill and cover, is recommended.	GT04
8742	PolyMet should commit to employing a rigorous CQA [Construction Quality Assurance] program that includes continuous observation during installation, nondestructive testing of all seams, periodic collection and testing of seam samples for shear and peel strength, and elimination of wrinkles. In addition to the routine CQA practices ... electrical leak detection should be considered as part of the CQA program for the geomembrane installations.	GT10, GT12
8748	PolyMet should commit to employing a rigorous CQA [Construction Quality Assurance] program for geomembrane installation that includes continuous observation during installation, nondestructive testing of all seams, periodic collection and testing of seam samples for shear and peel strength, elimination of wrinkles, and possibly electrical leak detection (highly recommended...). Otherwise, the predicted leakage rates, which are based on a 90th percentile frequency of only 4 defects per acre, may grossly underestimate the true leakage through the liners.	GT10, GT12
8750	There do not appear to be any provisions in the liner design to protect against puncture of the geomembrane in the liner system. Will any restrictions be imposed on the maximum size and angularity of the drainage layer material (proposed to be crushed rock or gravel) or soil liner material? Such restrictions should be considered, along with installation of a cushion geotextile between the geomembrane and drainage layer, to minimize the potential for defects created after the geomembrane is covered	PD07, PD15
8752	Although PolyMet is correct that the composite liner systems proposed for these stockpiles are similar to those used for modern heap leach facilities, a maximum hydraulic conductivity of 10-6 cm/s is generally recommended for the compacted soil component of heap leach pad liners ... While this is indeed the case for the Category 4 stockpile, a maximum hydraulic conductivity of 10-5 cm/s is prescribed for the Category 2/3 stockpile liner. This difference in the two designs seems arbitrary and is not well justified.	GT10
11587	[Request 30-day extension of comment period]...I am emailing you with a big concern about our attempts to get geochemistry leachate data and other relevant water data from the MN DNR regarding PolyMet. I am hoping you might work with Brenda to urge the MN DNR to grant a 30-day extension to the comment period, and that the DNR would be encouraged to fully share the data that has been requested repeatedly	NEPA07

*Alphabetical by sender's first name*

<b>Sender Name (Submission ID)</b>	Friends of the Boundary Waters (42984)	
11592	[Requesting 30 day extension to comment period] MCEA requested technical documents of the DNR were not provided in a timely fashion. The first document: "Wetland Impact Assessment Technical Memorandum - Appendix B" was requested from the DNR on January 23, 2014. MCEA did not receive a copy of it until February 24, 2014. This technical memo was the sole basis for the sensitivity analysis that determined the extent of the potential indirect wetland impacts that could occur as a result of groundwater drawdown.... The second document, PolyMet 2013k, was cited 14 times in Chapter 5 of the SDEIS and should have been included on the SDEIS reference disk but was not. This document provided data on potential indirect impacts that may occur as a result of the augmentation of Second Creek. MCEA requested the data from the DNR on February 20, 2104, and received it on February 24, 2014. The delay in receiving these documents resulted in delays to our technical expert's review of the information.	NEPA07
11598	MCEA made several requests for [geochemistry leacheate] documents that were cited in reference documents. The path has finally led to documents from 2007, which MCEA requested. The database MCEA received this week is incomplete and has many empty cells in the Excel spreadsheet. Many of the missing cells appear that they would have contained leachate concentrations above water quality standards. For example, a plot of nickel concentrations in one document shows a great many samples of test pile leachate to be above the 10 mg/L for Ni. But in the database that accompanied it, only six samples with concentrations above that limit are shown. Most of the entries in the database are filled with "#N/A." It seems odd that the higher values for Nickel are missing. This occurs for many constituents - not just Nickel. We still need a database with all the entries included.	WR071
11604	[Requesting more time to review] MCEA and Friends of the Boundary Water Wilderness have hired experts to support review of documents. Issue with the SDEIS because the information used to analyze the geochemistry of the project has changed in significant ways over time. Some of the changes have included changing the approach to characterizing the waste, the inputs to the water quality model, and grouping and cutoff values for reactive waste. When the data were finally received, the concentrations were in 89 individual spreadsheets rather than in a single database which would have facilitated the separation of the samples according to waste category.	NEPA07
11608	our experts have identified a significant mitigation measure that is discussed in the Water Modeling documents but referred to only obliquely and with no details in the SDEIS (pg. 5-102). The proposal includes pumping water from the East Pit backfill for treatment in the WWTF. PolyMet proposes pumping water at 1750 gpm during years 22-31. Not only is 1750 gpm a large volume of water to be treated, it may imperil the ability of the East Pit to remain saturated. If the East Pit is not saturated, it no longer offers the benefits of subaqueous disposal. Pumping this volume of water from the pit may risk exposing it to air, causing reactivity. This proposal appears to be critical to the reclamation plan, but it is not explained, analyzed, or presented in the SDEIS. Our experts need time to evaluate if this proposal is feasible.	WR088
14295	Overall, the long term stability of the waste rock deposited in the pits and covered with water is a much lower long-term risk that leaving it on the surface with a plastic sheet over it.	ALT06, ALT07

18052	The acidity in the discharges and seepages will reduce the viability of wild rice beds that are downstream and that are used by Native Americans as well as being an important source of food for waterfowl.	CR01
18054	The PolyMet/NorthMet project will lead to increased acidity of streams and rivers, especially the Partridge River which flows into the St. Louis River. (...) The acidity leads to increased methylation of mercury, which is known to harm fish, and other aquatic forms of life. This will lead to increased fish consumption advisories and have a direct impact on fishing, recreational opportunities, tourism, treaty rights and human health.	WR113
18056	Several endangered or threatened species will be impacted by this project including but not limited to the wood turtle, black sand shell mussel and the floating marsh marigold. The project is proposed to be located in habitat currently inhabited by Canada lynx, a threatened species, and moose, a species of special concern.	VEG01, WI01
18058	The proposed PolyMet/NorthMet project would impact thousands of acres of forest and wetlands that will not be available for other uses for generations even with reclamation.	LU06
18059	Serious contamination of the ground and water due to acid rock and mine drainage will impact areas far removed from the mine and tailings basin sites. After closure the flooded mine pit will be a large body of water but will not be available for any recreational purpose and will be harmful to waterfowl that land there.	WR141
18060	The economic benefit of this project has been over-estimated by PolyMet and its promoters because the short-term gain of 200 to 400 jobs has to be balanced against the loss of jobs and revenue for the state from recreation, tourism and related activities over a much longer period of time.	SO01
18062	The SDEIS does not provide specifics regarding financial assurances from PolyMet.	FIN01, FIN08
18064	PolyMet has yet to provide a scientifically-valid plan to mitigate the disastrous long-term environmental effects of their proposed sulfide mining project.	NEPA14
18512	Although the SDEIS provides an analysis of the land exchange it does not acknowledge the full impact on tribal rights, plant and animal habitat, and public assets.	CR01
18514	The proposed replacement wetlands are not of comparable quality and are not even in the same St. Louis River watershed.	LAN03
18516	The scattered parcels of land being proposed as an exchange are not an adequate replacement for the high-quality habitat that would be lost.	WI02
18518	The discharges from the mine pit and waste rock piles, seepages from the tailings basin and overflow from the uncovered flooded mine pit after closure are likely to pollute local ground water and water in the Partridge and Embarrass Rivers as well as downstream in the St. Louis River which empties into Lake Superior.	WR107, WR108, WR111
18523	The surface aquifers to the north of the tailings basin are already saturated by contaminated water from the old LTV tailings. This means that there will be little or no dilution of the polluted groundwater from additional rainwater and that more polluted water will be added to the same area by putting PolyMet's tailing slurry on top of the old LTV tailings.	WR059
18525	Sulfate, manganese, and aluminum discharges from the existing LTV tailings are already in serious violation of water quality standards. PolyMet claims that the discharges of these known pollutants from their tailings will be removed through as yet untested methods in a project of this size and duration.	PD10

<b>Sender Name (Submission ID)</b>	Gary Anderson (46956)	
10799	PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act!... The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact...• Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.• Deny the PolyMet Section 404 permit unless all “compensation” mitigation for wetlands is provided within the Lake Superior Basin.	COE01, COE02, WET01, WET03, WET19, WET23
10800	Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species.	WI02
10802	Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St. Louis River and Lake Superior fish.	MERC09
10804	Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance...Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.• Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.	WR195

<b>Sender Name (Submission ID)</b> Gary Anderson (46956)		
10805	• Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.	COE03
10807	The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. ...The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. ... Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered:1. Underground mining, looking at the full ore deposit and PolyMet's real costs;2. Putting a liner under the Category 1 waste rock stockpile;3. Placing all tailings on a new completely lined facility;4. Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres;5. Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.	ALT01, ALT06, ALT07, ALT10
<b>Sender Name (Submission ID)</b> Gary Boelhower (44854)		
10141	wetlands [affected by the proposed Project] are irreplaceable...The significant function that the wetlands play in this region would be lost to both plant life, animal life, and the natural processes related to purification, sedimentation, and natural water regulation.	WET24
10143	[Polymet's] plan to purify the water is inadequate. Reverse osmosis systems need to be significantly expanded. It is ridiculous to make the assumption that there will not be significant leakage and seepage in several directions.	WR143
10150	With the immense amount of blasting in the area, it is likely that significant rock fractures will occur. PolyMet has not substantiated its claims that nearly all seepage could be captured by pumps at one end of the 2-mile wide tailings basin. Fractures already known to exist at the PolyMet mine and plant site would transport pollution. There is geological evidence to suggest that seepage must be treated in several locations, and there must be back-up systems in the event of failure.	WR010, WR012, WR016, WR018, WR090, WR144
10154	The PolyMet project would degrade Minnesota surface water quality, increasing arsenic by 55% and copper by two-thirds; more than doubling concentrations of lead, antimony and selenium, and increasing levels of cobalt to 300% and nickel to 500% of "no action" levels. These effects are unacceptable.	WR108
14171	[The] old LTV basin already violates water quality standards. The SDEIS does not adequately address leach out from this basin.	WR070, WR105
14173	PolyMet's 526-acre permanent, unlined Category 1 waste rock pile would be less protective than its old proposal, which would have provided lined stockpiles for long-term waste heaps.	WR017
14174	we must seriously ask the question whether or not it is environmentally responsible to propose a mining process in a water-rich environment that will require water purification systems to operate effectively for 100 or 200 or 300 or 400 years	WR035
14175	seepage and run-off would affect wild rice growth--a sacred food for tribal members of the region	VEG04
14176	seepage would make its way to Lake Superior and raise the mercury level in fish which when eaten raises the level of mercury in humans.	MERC03
14177	Polymet's own analysis allows 1506 micrograms per liter (ug/L) criterion of manganese at the plant which is 15 times higher than the health risk limit set by the Minnesota Health Department to prevent brain damage in infants, children and adults.	HU05

<b>Sender Name (Submission ID)</b>	Gary Clements (16502)	
1547	It seems incredibly irresponsible to put off the discussion of financial assurances until later in the permitting process	PER03
1551	I see no figures about the cost of constant monitoring and operating the filters and pumps and equipment that will be needed ... Parts will fail and wear out and need to be replaced.	WR128
1552	Why is there no inclusion of potential weather disaster related potential for spillage, and the cleanup costs from that? The experience just two years ago in Duluth, and the flooding elsewhere due to increasing weather extremes MUST be taking into account.	FIN05
1554	I realize [weather disaster cleanup costs] is difficult math, and perhaps is overbearingly expensive to contemplate ... And that expense should be clearly identified, even if it is extreme, and be done in a bonded way whereby the necessary income is guaranteed.	FIN05, FIN08
1555	Minnesota's current financial assurances law, and the current Polymet proposal using it is totally inadequate.	FIN14
1564	On balance, the risks and dangers ... are much greater than the short-term gains.	SO01
2030	It is clear to me that the original legislation that created the Superior National Forest recognized the undesirable nature of mining for sulfide bearing ores. The proposed exchange clearly violates the intent of that legislation, if not the letter of it.	LAN02
3439	The first [concern] is the question of the proposed land exchange. It is clear to me that the original legislation that created the Superior National Forest recognized the undesirable nature of mining for sulfide bearing ores. The proposed exchange clearly violates the intent of that legislation, if not the letter of it.	LAN02
3440	The second major question that has not been answered for me is the question of water treatment, both from the current LTV plant tailings pit, which is already known to be leaking, and the area where the sludge that is to eventually be captured from the reverse osmosis process is to be dumped. In fact, it seems inconclusive just where that sludge, which contains an even more highly toxic mix of pollutants, will wind up. Is it to be in some off-site landfill, where it poses even more untreated harmful potential, or is it to be in the area shown on the map near the mine site itself?	WR145
3441	A third major question is the one of the reverse osmosis procedure itself. I know that this procedure has been used on small scales to take particulate matter out of drinking water, but to use, again, a computer model rather than hard actual experience somewhere to extrapolate that this process will actually work on this massive scale across this massive time period totally stretches the imagination. The Flambeau mine in Wisconsin that is cited as an example is known to have been in violation at several points during its operation, and does not give us the scale of experience we need in order to have confidence that this kind of system will actually work in an operation the size of which Polymet contemplates.	WR023, WR128, WR143
3442	Finally, as a Minnesota taxpayer and grandfather of two who will be around long after the proposed operation is finished, I am appalled that there is not a more complete explanation of the financial assurances needed to guarantee that the costs of centuries of treatment and/or cleanup will not fall on Minnesotans.	FIN01, FIN10
3443	On balance, this project proclaims to promote employment in Minnesota, some as short term as the construction of the plant, some for a few years longer, and it proposes to reap millions and millions for the mining companies who are already committed to selling the copper to China for a number of years. On balance, the risks and dangers to the long term health of the forest, the waters of the Lake Superior watershed, and the creatures who live there, including the human creatures, are much greater than the short-term gains.	WI13, WR111, WR115

16255	I believe that the proposal also would be in clear violation of Section 404 of the Clean Water Act, because of the total imbalance of the wetlands acreage that Polymet’s operation would destroy, and also because I cannot find any definitive study of the relative assessed valuation of the two parcels. I believe that such a valuation is required as part of any land exchange. Therefore I believe that it would be wrong, if not illegal, for the Forest Service to go ahead with this exchange as proposed.	WET14
16256	[Mining sludge] is the worst of the worst, and the plan for its long term treatment protection is very unclear.	PD01
16257	Even worse is the totally inadequate study of the ground water flowage in the area. The Minnesota Geological Survey studies show fracturing beneath the mine and plant site areas that go well beyond what is stated by Polymet, and to use only “computer models” as a definitive statement of how much leakage there might be out the bottom of the system, and exactly where that groundwater flows, is pretty much ridiculous. Let’s see an actual physical study of what waters are down there and where they feed. Do they feed the Partridge River? Do they supply Colby Lake, a source of city water for Hoyt Lakes? Do these ground waters supply a number of area rural wells? The Polymet estimations include millions of gallons that will escape treatment. Just how much magnesium, mercury, and arsenic will end up being leached from the earth as these waters flow into that ground water?	WR011, WR012, WR041, WR043, WR061, WR070, WR071, WR087, WR099, WR107, WR108, WR168, WR169
<b>Sender Name (Submission ID)</b> Gary Duggleby (46209)		
8854	To build its mine, PolyMet proposes to directly destroy 913 acres of high quality headwater wetlands and indirectly harm up to an additional 7,351 acres of headwaters wetlands due to air pollution, water pollution, and water diversions. These wetlands are in the headwaters of the Partridge River, an important tributary to the St. Louis River and ultimately Lake Superior.	WET24
8856	Most absurdly, PolyMet’s plan includes NO replacement of any indirect wetland losses.	WET01
16161	To build its mine, PolyMet proposes to directly destroy 913 acres of high quality headwater wetlands and indirectly harm up to an additional 7,351 acres of headwaters wetlands...Most absurdly, PolyMet’s plan includes NO replacement of any indirect wetland losses.	COE02
16162	There are many, many, many more different industries that would bring a lot more jobs, that would not compromise on the Nation's finest canoeing and camping wildlife areas.	SO02
<b>Sender Name (Submission ID)</b> Gary Fifield (46920)		
10825	We cannot afford the risk that is inherent in this project. ... The people living in the area, many of them, see jobs and livelihood resulting from the project. I do not think the number of jobs or the time they will last is adequate to justify the risk involved. We must not let the large absentee corporations make our future for us if it is too risky for those living here.	SO01
<b>Sender Name (Submission ID)</b> Gary Geisler (39356)		
12841	Clean water will become an increasingly rare resource for the future generations that survive. Do you really think they'll be able to maintain another poisonous legacy of our short sighted folly for many centuries to come without the equipment and know-how to do so?	FIN08, WR195

11725	The Land Exchange facilitates the project's implementation and permanent conversion of the forest and wetland areas into unusable waste lands of toxic drainage generating waste rock piles, a pit-lake lagoon which could become a chemo-stratified, toxic water waterfowl trap, and a pit-filled with millions of tons of reactive sulfide-containing rock capable of generating millions of pounds of toxic chemical concentrations.... The land exchange should not be done unless and until the major flaws in the project design are remedied and the land surface area is entirely planned... to be reclaimed for future productive uses.	LAN01
11728	The West Pit lake most certainly will become stratified with a chemocline and/or thomocline.. When that happens, oxygen will be depleted from the bottom waters and toxic metal concentrations and toxic gasses including hydrogen sulfide will be generated and will seep into adjacent water aquifers, and, over time, move off site into tributaries of the Saint Louis River. The East Pit burial site could also become major source of toxic metals, acid reactants, and toxic gas including hydrogen sulfide, through both chemical and biotic mechanisms, and similarly pollute surface and ground waters. All bore holes, wall and bottom fissures, cracks and crevasses must be sealed against water escape through pit walls and bottom surfaces as a precaution to limit seepage out of the pits.	WR002, WR173
11732	The first chapter sets out eleven major "constituents of interest" (pages 1-19-20) for the proposed project. Many more constituents are needed to properly deal with the actual and potential impacts from 355 million tons of mined rock	NEPA14
11736	Mercury as a major "constituent of interest" is covered in four of the eleven bullets: Hazardous Air Pollutants, Mercury, mercury compounds (Hg), Metals/Metaloids, and Methylmercury. With this emphasis, however, the quality of the data presented to document and evaluate the impacts is majorly flawed and lacking. Sampling protocols providing adequate numbers of samples to represent 355 million tons are inadequate. Specific details of what has been done are incomplete, lacking documentation, lacking certified sample analysis, lacking normal reporting of quality assurance checks and controls, and are unacceptable for scientific use and administrative evaluation.	AIR10
11738	Testing methodology for rock sample analysis appears to be flawed, preventing accurate results from being obtained due to inadequate quality control and quality assurance procedures, see SRK 2007b. The data set reported in Appendix D.4 pg 419 omits lines of data, reagent blank data omitted, and omits certified sample analysis data... ICP-MS mercury analysis show 20 samples out of 92 have mercury at 1 ppm with the rest at < 1 ppm. These data have a mean of 0.6 ppm Hg using half the detection limit to represent the less than values. The mean is 0.22 ppm Hg using zero for the blank values.... If the 92 samples are representative of the 533 M tons mined, and the mercury content 0.22 ppm Hg, then the annual total quantity of mercury mined would be 7,810 pounds per yr, or 21.4 pounds Hg per day. These estimated values are substantially larger than those sighted in the various chapters. In order to resolve this difference, more careful work and quality assured analysis must be done on the saved splits of samples to quantify the mercury content accurately for the 92 rock samples selected to represent the 355 million tons of ore and waste rock to be mined. Mercury levels and hazards from mercury exposure are significantly understated in the present SD EIS and DEIS, and must be corrected.	MERC04
11745	Sulfide sulfur is also acted on by natural bacteria Acidithiobacillus ferrooxidans.... which lives in pyrite deposits, and is capable of metabolizing iron and sulfur, and producing sulfuric acid .... This natural process seems to have been ignored in the recommended testing protocol and study results omitted in this SD EIS. Sulfide sulfur once oxidized by abiotic or biotic processes is soluble, acidic, and can move long distances in surface and ground water aquifers. In contact with stream and lake sediments oxidized sulfur is converted back to sulfide sulfur forming solid metal sulfides and dissolved, gaseous hydrogen sulfide which is as toxic as cyanide to aquatic plants... and to aquatic animals.	HAZ01
11748	Because millions of tons of sulfur compounds are being proposed to be processed, a common, neutral, and gaseous form of sulfur, hydrogen sulfide, should be identified as a constituent of interest because of its roll in the processing of the ore, and its toxicity and probable contributions the aquifers of the proposed project site. Modeling work should have included anoxic conditions and the parameters controlling sulfide sulfur reactivity, especially where hydrogen sulfide is stable and will be present.	AIR10

11751	The existing LTVSMC Tailings Basin is an important component of the proposed project and should be identified as a significant constituent of interest for several important reasons: ...the existing tailings basin is built on peat soil and is not stable and leaks into the ground water aquifer requiring a yet-to-be proven "slurry-wall" sealed to bedrock to prevent ground water leakage necessary if reactive sulfide mine tailings are deposited as well. This "slurry wall" is a major undertaking and has not been proven or shown to be cost effective;	WR018
11763	the responsible party for the LTVSMC tailings basin should be required to deal with the existing problems and final closure and recovery of the tailings basin area for productive future uses, and not used to deposit sulfide tailings which most likely will create an acid-generating source of sulfuric acid increasing the leaching of toxic metals from BOTH sulfide mineral tailings and LTVSMC taconite tailings, causing environmental pollution.	LU02
16760	If worse case conditions were to develop, toxic metal concentrations and toxic gasses including hydrogen sulfide would seep into surface and ground water aquifers of tributaries to the Saint Louis River polluting the river and waters of Lake Superior. No recovery plans are presented for the most impacted land areas, and no provisions are provided to protect against any probable or worse-case water pollution scenarios. Proper plans to address probable scenarios and related resources must be provided.	NEPA05
16763	Modeling and mass inventory results in various chapters of this SD EIS are significantly flawed by the omission of mercury and mercury compounds, oxygen and anoxia, sulfide-metal complexes, hydrogen sulfide, and the resultant impacts in the mathematical modeling and inventory of all mercury- and sulfide- containing components. Mercury is one of the most studied elements and data are available for modeling in the same fashion that other metals of less known character are modeled.	MERC04, MERC11, MERC13
16768	The lack of quality data pertaining to the mercury content of the ore and waste rock also pertains to the other solid earth and soil components of the proposed project. In the absence of quality assured mercury data, little can be concluded with confidence.	MERC04
16769	The leach-testing methodology for rock sample leaching treatment appears to be seriously flawed and resultant sampling could underestimate volatile mercury and mercury compounds because the air-drying steps used during 6 days of every 7 days of each treatment cycle in the test procedure. There is no indication that precautions were taken to assure mercury analyte was not being lost during the 6 days of air drying cycles used in the "humidity test" procedure. Mercury compounds are known to sublime and have a positive vapor pressure that would facilitate their volatilization and loss from the solid sample surfaces during the air-drying and air-humidifying cycles (CRC Handbook of Chemistry and Physics, 69th Edition, 1989 CRC Press, pg. D-194).... Post leach-test solid samples should be analyzed for mercury depletion to confirm mercury content change.	MERC04
16774	Post-test sample analysis were not conducted to determine the "depletion" of constituents or the degree of reactive sulfide consumed during the leach testing, as provided for in the test protocol. The need for this is especially true for the reactive components of the solids to validate the extent of the reaction process that occurred during the time period of the tests, and to confirm possible mechanisms of dissolution. Measurements of chemical oxygen demand on the solids before and after the leach testing should be done to determine the degree of reactive sulfide "depletion." Without actual measurements of post-test solids indicating the degree of element "depletion," no time predictions can be made. (SRK 2007b, pg 97).	WR001, WR025, WR034
16777	The "humidity test" leaching chamber conditions simulate rock pile air-rain exposures, and do not simulate in-lake or in-ground saturated conditions. Because of this the results are "procedure specific" and not meaningful other than qualitative predictions... None of the leach-testing solid sample conditions impose anoxic conditions or biotic exposure expected to be present in the East-pit disposal volume, or in the West-pit lake under probable stratified conditions (Aquatic Chemistry W. Stumm & J. Morgan, 3rd Ed., Wiley-Interscience 1996, 1022 pp.)	WR002, WR034, WR173

16778	Assessments for impacts of mercury emissions are understated because localwashout and dry deposition uptake due to foliar uptake by plants and trees seemingly were not considered...The original estimate of emissions understated the amount of mercury in both the total mass of rock being mined and the amounts processed.	MERC17
16779	Measurements of sulfide reactivity including chemical oxygen demand are mostly missing from the characterization studies and leachate studies used for impact analyses. Sulfide sulfur is the single most abundant reactive constituent, millions of tons, and should be evaluated from this perspective. Sulfide sulfur reactivity influences most all of the dissolution processes that can cause environmental concern and harm. Yet no measures of reactivity have been elevated to a "constituent of interest." Sulfide sulfur reacts with oxygen in air producing sulfuric acid which mobilizes metals to toxic concentrations and can adversely affect fish and aquatic life.	WR060
16782	Metals/Metaloids also omitted Selenium, Manganese, and Iron, all of whichplay important rolls in assessing toxic exposure and responses of the proposed project, and should also be included in the significant "Constituents of Interest."	WR204
16783	Hazardous Substances and Hazardous Waste Generation. These omittedconstituents of interest are conspicuous by their absence in chapter one; denied in section 4.2.13, but admitted to in section 5.2.13. There is no specific approved disposal site identified for the permanent disposal of hazardous wastes generated as described in section 5.2.13. Clearly this is a major omission and must be corrected in detail for each and every hazardous waste created. Hazardous Wastes are omitted as a primary focus and must be added because of high levels of toxic metals and cancer causing materials present in the ore, tailings, and waste rock, including mineral fibers, dust containing high levels of nickel, chromium, and arsenic exceeding levels mandated protective controls.	HAZ03
16784	The existing LTVSMC Tailings Basin is an important component of theproposed project and should be identified as a significant constituent of interest for several important reasons:...the known hazards from toxic dust generated from moving and building dams from LTVSMC tailings which are known to contain hazardous asbestiform mineral fibers should be avoided,	PD10
16785	The potential future recovery of residual mineral resources from NorthMet tailings must be protected and maintained for re-processing to recover residual metals expected to be in the tailings (Ni, 510; Cu, 547; Cr, 310; Zn, 548; Mn, 1400; all ppm), uncontaminated by mixing with LTVSMC tailings. NorthMet tailings require a more secure and leak-proof basin, and should not be located in an area of uncertain dam stability or where aquifers are connected or at risk. The NorthMet tailings basins should be kept isolated intheir own specifically designed enclosure to assure all possible future acid and toxic generation of sulfuric acid and resultant metal mobilization including gaseous emissions are permanently captured to prevent any possible exposure outside of secured containment areas. Other safer, proper, more controllable and less hazardous options must be found and evaluated.	ALT10
16786	Mining 355 millions of rock in 300.000 ton blocks, blasting through layers of minerals and non-minerals with explosives using an open pit approach will undoubtedly mix small amounts of high sulfide inclusions with rock categorized as "waste." Tests of mixtures of small amounts reactive minerals with waste rock were not done but the expectation is that small quantities of reactive minerals will dominate and determine the chemistry of the pore water, and result in higher than expected metal and acid concentrations in, and from, the waste rock storage areas than are predicted from tests of lower reactivity rocks. The resultant drainage and runoff must be completely collected and treated everywhere mined reactive solids are deposited and stored exposed to air and precipitation, including areas where dust will collect along the haul roads and tracks. Tests show reactive sulfides are capable of acid formation for centuries(SRK 2007b, pg 97) and must be treated with appropriate caution to prevent structural and environmental damage by minimizing any possibility of exposure.	PD15

10316	I believe we should demand more accountability from PolyMet before approving the mine.	FIN01
<b>Sender Name (Submission ID)</b> Gary Horning (22374)		
3422	the state should realize that PolyMet will hire the best attorneys available to negotiate clean up and water treatment costs. So should the state. If we simply rely on DNR regulators, we will lose. We need to go outside and hire very aggressive and skilled negotiators that will watch out for the taxpayer.	FIN09, FIN10, FIN13
<b>Sender Name (Submission ID)</b> Gary Huss (43450)		
15711	Northeastern Minnesota, and the BWCAW in particular contain some of the greatest natural places not only in Minnesota, but in the entire nation. Clean air, beautiful forests, and magnificent lakes and streams with high water quality are why people live in this state and why countless numbers of people want to visit here.	WILD02
15712	People don't visit Minnesota and spend their tourist dollars so that they can see how wonderful the open-pit mines are. ... The NorthMet deposits are located on National Forest System (NFS) lands. NFS land by definition is co-owned by all of the people of the USA, not just Minnesotans. Therefore, this is a decision that can not exclude what is in the best interests of ALL stakeholders involved (not just the less than 2000 people of northeast MN that might get jobs).	SO02
15713	According to the NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) 'it is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be a very long time'. The 'models' estimate that the water at the mine site will have to be mechanically treated for a minimum of 200 years and at the plant site for a minimum of 500 years (of which you will not be demanding the money to pay for the 500 years of water treatment up front and placed into an escrow account prior to starting the project).	WR035, WR036
15714	Your number one priority for all of the stakeholders in the state of Minnesota should be to protect the high quality forests, air and magnificent water resources of this region and state. What you are proposing to do is to sell out these things out for a minute percentage of the population of this state for a meager 2000 jobs. The estimated 2013 population in Minnesota is 5,420,380. That is .0004 of the jobs in the state.	SO06
15715	On 3/12/2014, the MPCA was supposed to recommend new standards for sulfate emissions for the protection of the wild rice crop in Minnesota. ... But, they stated that until they analyze the actual data more thoroughly and more scientists look at it they aren't willing to make any conclusions or set any new standards at this time.	WR164
<b>Sender Name (Submission ID)</b> Gary Johnson (43719)		
11940	The PolyMet mine will provide a few good jobs for 20 years, or so, and then it will leave behind 500 years of devastation. It would be impossible to escrow enough money to deal with that aftermath.	FIN10
15092	it would be absolute insanity to permit something which will leave behind such a huge need for toxic cleanup. Not to mention all the issues that are more important than money--such as the health issues this mine will cause in the while it's in operation.	HU03
<b>Sender Name (Submission ID)</b> Gary Maciejewski (20075)		
1708	I believe that any sulfide mining in Northeastern Minnesota will not only destroy surface [water] in the area including Lake Superior, but it will also destroy much of the ground water in that area.	WR115

11780	I also believe from an economic standpoint, that expediting the current processes so Polymet could begin construction immediately would bring a desperately needed, immediate economic boost to the Iron Range....	SO10
15088	I have reviewed the SDEIS for the Polymet Project, and fully approve of the proposed processes and mitigation systems as well as the science used in designing them, and ultimately constructing them.	PD28
<b>Sender Name (Submission ID)</b> Gene (3437)		
212	The assurance money that is supposed to be set aside to clear up the pollution and damage caused by mining, won't be there for pollution clean up and restoration of the pristine treasure. Like the tobacco settlement money that was for stop smoking campaigns and to help people quit smoking, the legislature will use that assurance money for other purposes.	FIN08
647	How will they even start to clean up the pollution this will cause to the ground water?	WR090
648	Like the tobacco settlement money that was for stop smoking campaigns and to help people quit smoking, the legislature will use that assurance money for other purposes.	FIN08
<b>Sender Name (Submission ID)</b> Gene Betts (18091)		
3222	One of the other reasons I think PolyMet will do this is because they're going to spend between \$400 million and \$500 million before they make a nickel. If they don't do their environmental work, they will be shut down and somebody's going to lose \$400 million or someplace along that.	NEPA16
13908	think it's really important to not just look at the environmental impact statement for what it is. It's really important to look at the regulatory agencies that are going to enforce what PolyMet says it's going to do. Because I truthfully don't trust PolyMet...But I do trust these regulatory organizations.	NEPA16
13909	So I support PolyMet. I support their good jobs. Part of the quality of life in this area is good jobs. Good paying jobs. Part of the tourist industry survives because I'm here in the winter to pay for going to the restaurant and going to those other places.	SO10
<b>Sender Name (Submission ID)</b> Gene Champagne (45593)		
12829	As a Special Education Teacher and Consultant I am keenly aware of the link between heavy metals and learning difficulties in children. I am also aware of the increased risk of cancer from living in the mining ranges of the Upper Great Lakes / Lake Superior Region. We cannot afford to recklessly go forward for a quick economic fix that will not only cost millions and possibly billions of dollars down the road in remedial education and menial job skill training due to health impacts on the central nervous system.	HU03
15898	PLEASE, conduct a Health Impact Assessment before moving forward with this or similar future projects. Best practices net best results.	HU01
<b>Sender Name (Submission ID)</b> Gene Christenson (39260)		
5510	There is no real need, except profit motive, to create tailing ponds that need decades to treat. Why isn't the water treated in real time like other industries? Why are the tailings not put to beneficial use at some other location instead of creating an environmental nightmare that everyone knows PolyMet will eventually walk away from? If proper operations are not financially viable for PolyMet then they should not be doing this project.	NEPA01, WR037

<b>Sender Name (Submission ID)</b>	George R. Dunn (42992)	
8981	The shortened public comment period should be extended to at least the customary length of time... Information has come out since the release of the draft EIS calling into question issues of hydrology assumptions, effectiveness of the reverse osmosis process, and the plan for future water treatment. These issues are of such significance that meaningful public input can only be achieved through an extension of the current comment deadline.	NEPA07
15220	The applicant's failure to explain the plan for long-term water treatment is a fatal defect in the proposal...all parties agree that water treatment will be needed for essentially an indefinite period of time (e.g., 500+ years). It is sobering to think that the State of Minnesota would even contemplate relying on a corporation to treat water for 500+ years in connection with a mining project that is scheduled to last 20 years.	COE04
15221	...there are no legally binding mechanisms to get a commitment from PolyMet ... to treat the water for the length of time that will be necessary. The inevitable conclusion is that the financial responsibility for treating the impacted water will fall on the shoulders of the taxpayers of the State of Minnesota	FIN10
15222	...the EIS fails to outline what sort of financial assurances and security PolyMet would be required to post in order to go forward with the project. I would submit that there are no financial assurances or security that PolyMet could offer that could possibly balance out the future cost of water treatment and, more importantly, the future cost of remediation that would be required in the case of an environmental disaster.	FIN01
15223	...independent experts call into question the effectiveness of the reverse osmosis process proposed by the applicant. The technology... for water purification is untested on the type of scale that is proposed for this project. Questions have arisen regarding the ability of the applicant to ramp up the technology to the level that would be necessary to process the vast quantities of water that will need to be treated. ... As it stands now, the information provided by the application is insufficient to support the EIS.	WR143
15225	...The EIS fails to explain how the project will meet the statutory requirement regarding wild rice water quality standards... wild rice is symbolic of our water quality and the health of aquatic ecosystems and riparian communities.	VEG04, WR163
15226	Minnesota statute requires the practical alternatives must be vigorously explored and objectively evaluated. Alternatives to the proposed land exchange and consideration of the possibility of underground mining as opposed to open pit mining were not explored in the EIS.	ALT01, ALT21
15227	The EIS is incomplete in its representation as to who is really going to run the proposed project and how it will be done....PolyMet has never operated a mine before and it is totally dependent on its largest investor, Glencore, for money and industry advice. ... Glencore has a history of causing environmental catastrophes around the world	PER02
15228	The PolyMet proposal will ... add unwanted mercury to the ecosystem. Already 1 in 10 Minnesota newborns in the Lake Superior basin are born with unsafe levels of mercury in their blood, according to the Minnesota Department of Health.	HU03
15229	The coal that will be used to power this very energy intensive proposal is a dirty energy source from the standpoint of carbon pollution, mercury emissions, particulate emissions, and acid rain. The consequences of the combined effect of all of this additional pollution have not been adequately considered in the EIS.	AIR07

14408	Recent Minnesota Public Radio discussions explained the potential for release of sulfide chemicals as a result of mining these metals. These MPR discussions clarified the "500 year" estimate for possible environmental danger. My second source is a retired chemist and friend who points to continuing sulfide and arsenic pollution from old mines (old technology) in South Dakota and Arizona.	PD01
<b>Sender Name (Submission ID)</b> Geraldine Davidson (57349)		
18383	They said that this pollution being created is a new type of pollution to this area. According to the studies, they say it's in compliance. My concern is the accumulation or the cumulative effect of all of these different pollutions that are in compliance, but added together, what types of health complications are there? Especially since it is new, they just probably don't know yet.	CU15
18384	There is a study out of Canada that methylmercury, a byproduct of mining, is in our streams. They have now made a link that it suppresses your body's natural ability to break down plaque. And so now they are finding that methylmercury is contributing to cardiovascular disease because of the plaque not being able to be broken down. So what responsibility will the company have when they do make this link in the future, 50 years from now, when they make a link of the different health problems that are created by this new pollution?	MERC03
18388	The mineral rights, how much are they paying? The mineral rights that they are mining? Because they are going to be destroying that land. How much are they going to be making in the open market versus how many union jobs will there be for the total number of jobs that are created? How many of those are going to be union wages, with benefits, compared to their profits?	SO04
18390	My concern, too, is the quality of the air. They claim that they are going to be cleaning it, but are they going to have natural ways to clean up the land? Other than the usual methods of pollution control, such as probably having filters and that kind of stuff. But what other efforts or measures will they take to help clean the air and clean the water from all of this? Like planting more trees.	AIR01

18391 I know they say they will have containment measures in place, in reservoirs, and all of their safety containment, but who is responsible 50 years from now when it breaks down and all of that pollution is brought out into the environment? Who is going to be paying for that? Who is going to be paying for the health complications that people just don't know are there? Like mesothelioma, they didn't know about it back when those minors were working. Now, is the mining company paying for their health or is it the government; us, the taxpayers? FIN01, FIN10

18392 some of the land that they want to mine is next to the Boundary Waters Canoe Area. I oppose this Land Exchange because it will ruin that pristine area. WILD02

**Sender Name (Submission ID)**    geri (44087)

14911 Take a look at the Cuyuna Iron Range in Crosby MN which is now a state recreation area. The mining started here in the early 1900 and ended in 1985, and is now a state recreation area with Trout fishing, boating, canoeing, and Mountain Biking. If the mining industry could do there job and leave us this wonderful rec area with old and outdated technology just think what we can do today. SO10

**Sender Name (Submission ID)**    geri Jensen (20205)

12467 As a major retirement destination with an ever increasing tourism industry northern Minnesota depends on a sustained natural environment with exceptional fresh water quality which is in direct conflict with the proposed mining. Creating the mine itself would first destroy thousands of acres of living plant and animal life and jeopardize the fresh water system which supports all life. There is no acceptable land trade or replacement of such destroyed communities. SO02, VEG10, WI13

13948 PolyMet would have a few decades at best and would begin and end leaving a wake of destruction. There is no proven, safe and lasting containment method nor treatment, and there are always mishaps, accidents, acts of God, and mistakes made. The cost of any is far greater than the benefits. Money can't fix it. SO01

**Sender Name (Submission ID)**    Geri Wellems (39317)

8045 Our environment is more important than jobs. SO02

8047 the mining companies will take what they want and leave us with environmental damage that will be with us for eternity. FIN01

PER35, WET14
12296	To me it comes down to the extensive – and potentially permanent – damage to wetlands, watersheds, animal habitat and human health that such a mine (like all other copper mines) would inflict. This is balanced against the possibility of a handful of comparatively short-term jobs and the efficacy of an untested mining conglomerate operate to avoid this damage.	SO01
12298	reverse osmosis and other improved technologies remain unproven at the scale and duration required for industrial mining. In the case of Minnesota, copper mining situated in sensitive wetlands would add to the potential disaster.	WET24, WR112, WR143
13906	What I would add is that we really have to accept what PolyMet says on faith, because PolyMet has never operated a copper mine before. That's right. A fledging untested company is going to experiment with the health and safety of our water as part of its learning curve.	PD23
14804	I recognize the benefits of the tools and technologies of modern life that are enabled by exploitation of natural resources, including that of mining. But having said that, the public interest demands that a mining operation must prove it is appropriate to the terrain and location and that it can minimize risk to the natural habitat and to human communities.	WI02

18283	Wetlands cannot be "made whole" once they are impaired. They can, however, be damaged, altered, even erased in this method of sulfide mining. Reclamation can never fully restore their functions. This damage is PERMANENT.	WET05
18954	the proposed structures to contain toxic substances are inadequate. Fractures are already known to exist at the proposed Poly Met mine and plantsite would transport pollution. Blast vibrations would cause more rock fractures and permit further leaking.	PD07
18955	The EIS presents a fantasy world in which it operates in perpetual optimal conditions. It claims to be able to capture 99% of the seepage from its huge tailings pile, something no other known copper mine has achieved...Polymet has never operated a copper mine before. Its calculations are pure conjecture.	PD23
18956	it is a given that the mining method Polymet proposes will destroy wetlands. Just 5 years ago the citizens of this state voluntarily agreed to raise their owntaxes to fund a 25-year effort to "enhance, protect, and restore" water quality in Minnesota. Preserving wetlands and their crucial role in our northernecosystem/watershed must be considered crucial to this goal...A sulfide mining project of the complexity, magnitude and duration proposed puts this goal at risk and is NOT in the public interest.	WET24
19586	I have concluded that validity of the scientific projections of the project is deficient. The assumptions about the mine is based on the work of a consulting company, Barr Engineering, that was hired and paid for by Polymet. Where was the independent research and review of its findings?...The research carried out by the Great Lakes Indian Fish and Wildlife Commission, which is unfortunately segregated to an appendix of the SDEIS, contradicts the Barr conclusions and contains 18 major points of contention. It cites numerous points on which the conclusions are based on deficient modeling.It is unacceptable that the scientific findings of the Commission are not reflected in the body ofthe SDEIS.	NEPA12, NEPA15
19590	... it's clear that the NorthMet project would be very water intensive... But --how much water will be used? And for long will treatment continue? We're not told. Additionally, recent research has confirmed that the Polymet water use estimates were incorrect.	WR181, WR182
19591	Where, in this SDEIS, is the basic information about how much toxic wastewater is going to flow back and forth over 9 miles of pipes?	WR181, WR182
19592	what is extent of pollution in the waste rock piles and pits and tailings basin and the waste dump? Will the so-called mitigation measures address this adequately?	HAZ05
19593	the estimates on how long mitigation and monitoring protocols would have to be in place keeps morphing - from perpetuity, to 500 years, to an indeterminate amount of time. On what fact-basis were these shifting timelines calculated and recalibrated?	PD03
<b>Sender Name (Submission ID)</b> Gerrit Crouse (7135)		
471	1,000 acres of high-quality wetlands would be eliminated in the region, which has already lost many 1000s of acres of wetlands to iron ore & taconite mining.	WET24
472	The region of the proposed mine is now home to dramatically declning lynx & moose. The sdEIS vaguely acknowledges the mine would "adversely impact" 4,000 acres of wildlife habitat, which is critical lynx habitat. It barely mentions moose, except to acknowledge the mine "will affect moose individuals." Affect, as in extirpate.	WI01, WI02
473	Lakes & streams near & downstream of the mine site already violate state water-quality standards. To meet standards for sulfates, mercury, & other chemical poisons & pollutants, the sdEIS acknowledges PolyMet would need to mechanically treat its wastewater for 500 years. But it doesn't explain just how PolyMet can assure funds will be available for 100s of years after the mine has closed.	FIN01

<b>Sender Name (Submission ID)</b> Gerry Willmar Chamber of Commerce (54636)		
18033	Minnesota has a proven record of applying innovative approaches to mineral extraction. Our mining history has provided regulatory agencies with the expertise to vigilantly protect Northern Minnesota's precious and fragile natural splendors by enforcing some of the toughest mining regulations in the world. We understand the apprehension of some that this project will have consequences for the environment, but the rapid advances in technology and methods used in mining mitigate these risks. We have confidence that our state agencies have both the expertise and capacity necessary to ensure those consequences are mitigated.	PER34
<b>Sender Name (Submission ID)</b> Gib Ahlstrand (47507)		
17603	I completely agree with [my state representative's] concerns [regarding financial assurance] and urge that they be given serious consideration before this project is approved or even allowed to go ahead into the Permit to Mine phase.	FIN08
<b>Sender Name (Submission ID)</b> Gil Baldich (18356)		
2539	At the LTV tailings basin, manganese is far above Minnesota's health risk limit, but that is also expected to increase by 45 percent (phonetic)...Lead (phonetic) in drinking water is known to cause brain damage. Manganese can cause neurological damage and reduce IQ in children. (Reading.)	HU03
2540	The SDEIS must be redone to analyze any impact from the tailings basin groundwater of the wells my family and friends drink from. Why has there not been an analysis of the pollution of the drinking water of the Minnesota citizens just downstream from the tailings basin? What is protecting the water that my family and friends and daughter drink from year-round and day after day.	WR040, WR041, WR059, WR064, WR142
14640	I would like to start off by saying this is not a project, it is an experiment. It has never been done in Minnesota.	PD32
<b>Sender Name (Submission ID)</b> Giminon Nahgahnub (11597)		
2259	The most recent EIS is inadequate because it is based on flawed data regarding the water flow from the Partridge River on a magnitude of 3X.	WR003
2259	The most recent EIS is inadequate because it is based on flawed data regarding the water flow from the Partridge River on a magnitude of 3X.	WR003
<b>Sender Name (Submission ID)</b> Gina Everett (44868)		
8071	[The SDEIS] does not adequately look at reducing impacts to wetlands by considering underground mining vs. open pit mining.	ALT01, ALT06
8072	What evidence is there that the proposed treatment of contaminated water by reverse osmosis actually works on projects of this scale?	WR143
8073	The water treatment process is not specific enough. What are the plans for the toxic sludge generated by reverse osmosis? How is the reverse osmosis system guaranteed to keep up with the quantity and continuous supply of contaminated water?	WR143, WR145
8074	The proposed wetland reclamation and regeneration would not equal the high quality wetlands that the mine will destroy.	WET05
8075	What are the effects on human health, especially in the unborn and very young, of exposure to the pollutants emitted into the air and water, especially as these pollutants accumulate to higher levels?	AIR07

<b>Sender Name (Submission ID)</b> Gina Everett (44868)		
8076	What insurance is there against underground drinking water contamination and what procedures will be followed to clean up any contamination that occurs?	WR042
8077	As abundant clean water becomes more scarce world-wide and thus more valuable, this resource should be weighted higher for impact considerations the farther the timeline of impacts goes into the future.	NEPA03
8079	What are the health risks to employees who are exposed to sulfide mining conditions?	HU04
8082	What is the potential for soil contamination away from the mine site and what health risks are present for people who come into contact with this soil, especially for those growing their own food?	HU01
8083	The Superior National Forest is a national asset and the proposed land exchange is not adequate compensation for U.S. citizens.	LAN03
8084	How will the survival and reintroduction of rare species found in the disturbed wetlands be assured after mine closure?	WI01
8087	Adequate funding is not guaranteed in the event of any environmental accidents while the mine is still operating or for the extensive period of water treatment needed after the mine closes.	FIN01
<b>Sender Name (Submission ID)</b> Gina Holje (38539)		
9678	Any environmental impact assessment ... that fails to comprehensively analyze the issue of "financial assurance" in the context of addressing pollution remediation / treatment work for up to the 500-year period ...is a completely inadequate review.	FIN08
<b>Sender Name (Submission ID)</b> Gina McKenzie (5676)		
14324	PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied.	CU11
14326	Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining.	WET24
14327	The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat -- much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals."	WI01, WI02
14384	a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed.	FIN01
14385	According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different? The SDEIS supplies no answers.	PD01
14386	the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest.	LAN01, LAN02

484	the Copper Mine were built it would be right by the Boundary Waters. ... the pollution will run through very important and cherished national parks. The Boundary Waters are beloved by Minnesota and if the water and air become polluted we could loose them.	WILD02
<b>Sender Name (Submission ID)</b> Grace Sheely (45039)		
7129	Any mining error or contamination would damage and impact tourism and the MN quality of life.	SO02
7132	I also do not believe that the company behind the operations will be solvent and financially able to manage any mishap or its contamination costs.	FIN01
16794	I believe that water resouces are too scare and this project is an unnnecessary risk to the MN waters. The MN waters that would be affected are entirely upstream from everyone in the state.	WR024, WR111, WR158, WR159
<b>Sender Name (Submission ID)</b> Graham Murdock (33503)		
12280	Sulfide mining in and of itself may not be considered dangerous in many areas. However, when such action is taken in an area, any area, close to one of our most precious natural resources, fresh water, it must not be permitted.	WR195
<b>Sender Name (Submission ID)</b> Grand Portage Band (42994)		
2362	Regardless of the time taken to prepare it, the Band is reissuing many of the same comments on the SDEIS that it has issued on the last DEIS calling for basic evaluation of Project impacts and application of wellestablished CEQ standards for EIS preparation, and incorporates all those comments byreference here. See Band's Cmts. on DEIS at Ex. A (Band's Cmts. on June 2008 PDEIS) and Ex. B (Band's Cmts. on Jan. 2009 PDEIS).	COOP01, NEPA12
2364	the co-lead agencies have refused to extend the 90-day comment period on the SDEIS, despite repeated requests.	COOP01, NEPA07
2365	The SDEIS does not take the required "hard look" at all the environmental consequences of the Project, including polluting surface and groundwater resources and drying up or inundating thousands of acres of wetlands in the 1854 Ceded Territory.	COOP01, NEPA14
2366	The lead agencies must significantly supplement the SDEIS [with study of the adverse effects and determination of possible mitigation measures] and provide a full opportunity for agency and public review before issuing a final EIS.	COOP01, NEPA09
2372	In the SDEIS's evaluation of the underground mining alternative, the North Met Deposit is characterized as a "low- to medium-grade mineral resource," a far cry from the "one of the largest untapped deposits of copper and nickel, and other precious metals" or "world class resource" that is repeated throughout the SDEIS and in media coverage. The distinction is critical, as mining must provide sufficient profit to cover costs for adequate environmental protections and financial assurance.	COOP01, PD25
2373	The financial assurance for long-term treatment presented in the SDEIS, ranging from \$3.5 to 6 million appears to be an estimate for monitoring activities only, without any long-term wastewater treatment costs.	COOP01, FIN05
2374	Perpetual operation and maintenance of mechanical wastewater treatment is an additional cost that must be represented in the estimate of financial assurance.	COOP01, FIN05

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Grand Portage Band (42994)	
2375	The cursory estimate of financial assurance in the SDEIS provides little detail about how the dollar amount was derived. Instead, discussions have been postponed for the permitting phase of this Project. This approach fundamentally contradicts federal and state environmental policy and the SDEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates.	COOP01, FIN13
2377	Although the SDEIS was revised to reflect the Project proponents' preferred action, still, the only alternative analyzed in any detail concerns the acreage of the proposed land exchange. This failure is a serious violation of NEPA and must be remedied before the SDEIS can be finalized.	ALT20, COOP01
2389	Colby Lake water is also proposed for stream augmentation. However, because Colby Lake water exceeds WQS for many pollutants including mercury, it would also need to be RO-treated before being used for augmentation.	COOP01, WR124, WR125, WR184
2391	In order to ensure compliance with Minnesota WQS, and based on the Projects own modeling, adequate financial assurance must be set aside to maintain and operate perpetual RO treatment at both the mine and plant sites.	COOP01, FIN05, FIN06
2395	While the use of RO is encouraged, further analysis and application is needed.	COOP01, WR143
2399	The conclusion that underground mining is not viable, or preferable, remains substantially unjustified, despite repeated requests for further analysis... As the Band already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS offers no new discussion of the reasons for rejecting the alternative.	ALT01, COOP01
2422	Exchanging thousands of acres of diverse, high-quality land--land with some of the few remaining large game corridors in northeastern Minnesota that are available to the Bands to exercise reserved 1854 Treaty rights--for lands that have moderate diversity and lack big-game corridors is inconsistent with the fiduciary responsibilities that are shared by all federal agencies.	COOP01, CR01, WI02, WI03
2655	It is well known that wetlands play an important role in the condition of downstream waters by retaining floodwaters, sediment, nutrients, and other pollutants, thereby benefitting the quality of downstream waters.	COOP01, WET24
2656	Wetlands may also function as thermal refuge for moose whensummertime temperatures exceed 14 o C, the point at which moose become thermally stressed. Additionally, wetlands with aquatic vegetation provide an important forage resource for moose during the open-water season.	COOP01, WI01, WI02
2658	[The SDEIS (Pg 5-643)] underestimates the impacts [to aquatic species due to the decrease of first-order streams to the federal estate]. While greater diversity is desirable, protection of headwater streams is critical because they powerfully influence both the character and functions of downstream waters. Headwater streams transport vegetation, woody debris, organic matter, macroinvertebrates, and other organisms downstream, while providing spawning areas for brook trout. Headwaters provide most of the water to rivers, which in turn provides temperature mitigation and oxygenation which are necessary for healthy fish communities.	AQ29, COOP01
2660	the loss of critical wildlife corridors, along with high quality and diverse land and water resources, directly connects the federal regulatory agencies' trust responsibilities to the Bands. The land exchange, and the Project, cannot proceed where they require the agencies to approve permits that will have impacts to treaty resources without additional evaluation and mitigation.	COOP01, CR01
2686	Also ignored [in the design of the Project] was experience with the Dunka Pit, located on the old LTVSMC site approximately five miles north and east of the PolyMet Project mine site.	COOP01, PD26

<b>Sender Name (Submission ID)</b>	Grand Portage Band (42994)	
2689	The cumulative public information regarding risks to area hydrology from mining the PolyMet site cannot be dismissed by inserting extrapolated data in place of measured data, or by cherry-picking measured data. Impacts to surface waters, groundwater, and wetlands for a project of this size and complexity demand a scientific, data-driven approach, rather than one based on opinion and selectively used data.	COOP01, WR072, WR073
2694	Some of the wetlands that will be directly and indirectly impacted at the mine site are part of the 100 Mile Swamp, identified by a United States Fisheries Service biologist in 1997 as “lacking ecosystem representation in protected areas.”	COOP01, WET19
2697	The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include: (1) the PolyMet proposed mine pit will be hundreds of feet deeper than any of the “analogue” mine pits;	COOP01, WET08
2700	In response to the Co-Lead Agencies desire to use only analogue data to determine the Project dewatering effects, GLIFWC provided an independent analysis using information from other mine pits located on the Mesabi Range...The only substantial changes in GLIFWC’s method of analogue assessment were to use all available drawdown data for the Mesabi Iron Range, and to not automatically exclude wetlands classified as ombrotrophic from being considered impacted by drawdown...All analogue data must be used to estimate wetland impacts, and additional hydrologic data collected from the mine site should be required.	COOP01, WET08
2701	The CWA does not allow a permit when there are practicable alternatives that would have fewer adverse effects, when the Project would lead to a violation of state water quality standards, or when a permit would cause or contribute to significant degradation of waters of the United States.	COE03, COOP01
2702	An agency-preferred alternative must be provided in addition to the LEDPA’s before wetland impacts resulting from the Project can adequately be assessed, and before a 404 permit can be issued.	COE04, COOP01
2707	During the EIS scoping process for the Project, the Co-Leads failed to ever identify any cumulative impact issues associated with cultural resources, and Tribal Cooperating Agencies were not invited to participate in scoping. The Band’s and other Tribal Cooperating Agencies’ comments on the June 2008 PDEIS, the 2009 CPDEIS, and the 2009 DEIS detailed the nature of these substantial cumulative impacts and the need for further analysis, and are forced to do so yet again here.	COOP01, CR03
2713	This omission [the SDEIS does not determine climate change implications of the proposed Project] undermines even the MNDNR’s own work. The MNDNR’s Moose Advisory Committee, which studies the decline of the moose population in northeastern Minnesota, has recommended preserving wetlands as sanctuaries for moose from heat stress related to climate change.	COOP01, WI01, WI02
2715	a substantial moose population has been identified in the mine site area by aerial and ground surveys. Moose are likely to be impacted by the disturbance of two of the few wildlife corridors remaining along the Mesabi Range, not to mention by the massive wetland impacts of this project...There is no basis to dispute that the Project will have cumulative effects on the moose herd and Tribal harvest in the 1854 Ceded Territory. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should have been done as part of this SDEIS.	COOP01, WI01, WI02, WI03, WI09
2721	The cumulative impacts assessment deficiencies identified above and within Appendix C are not exhaustive. Instead, they are solely an attempt to illustrate the incredible lack of cumulative effects analysis in the SDEIS. Profound revision is needed to this section.	COOP01, CU12
2723	Additionally, the lead agencies must consult with any tribes that attach “religious or cultural significance to historic properties that may be affected by an undertaking,” regardless of the location of the historic property.	COOP01, CR06

<b>Sender Name (Submission ID)</b>	Grand Portage Band (42994)	
2729	Mesabe Widjiu is correctly identified as a sacred landform but needs to be considered in its entirety instead of looking at only the area within the Project. The segment that is within the project area is small, but vital to the property. Adverse effects to any portion of the Mesabe Widjiu will negatively impact the entire feature.	COOP01, CR02, CR05
2738	Any increase of methylmercury bioavailability in the Embarrass River, Partridge River, or St. Louis River watersheds constitutes a significant adverse impact to a critical trust resource [(subsistence fisheries)]. Not only must this impact be fully evaluated, but it must be fully mitigated	COOP01, CR01
2742	Wild rice waters are not only protected under the 1854 Treaty but under Minnesota State law. Given the obviousness of the threatened impact to such wild rice beds, additional analysis and mitigation must be included throughout the SDEIS.	COOP01, WR156, WR157
2745	The Project will certainly do nothing to aid in the recovery of moose and is likely to reduce available habitat, impact travel corridors, and increase greenhouse gases. Impacts on moose and habitat are impacts on the Band's cultural resources and must be analyzed as such in the SDEIS.	COOP01, WI01, WI02, WI03, WI09
2746	The APE for the Project was not determined until August 11, 2009, after tribal cooperators insisted upon it, and tribal consultation is ongoing. Since 2009, the size of the APE has been significantly diminished to the point of being the Project permitted area and nothing more.	COOP01, CR02, CR06
3039	the land exchange will cause irretrievable losses of resources for the Bands [including loss of the land itself, SDEIS pg 7-10]... Further, the SDEIS provides that the land exchange proposal could have direct and indirect effects on tribal cultural resources by creating noise, impeding access to area that are traditionally or culturally important to the bands and affecting species of importance to the Bands.	COOP01, CR01, CR05
3098	[The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include:] (2) PolyMet mine pit walls will be crystalline and sedimentary bedrock versus the analogue mine pits in sedimentary bedrock only;	COOP01, WET08
3099	[The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include:] (3) data collected from the site would be relatively inexpensive and should be used to inform impact assessment;	COOP01, WET08
3100	[The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include:] (4) relying on only a partial set of available "analogue" data as the source of information to estimate dewatering impacts is selective and not scientifically robust.	COOP01, WET08
3112	The SDEIS also does not provide any rationale for more mercury to be added to a system that is already so high in mercury, only suggesting that a future TMDL should take care of the problem. A more through cumulative effects analysis is required for mercury and the appropriate spatial scale for considering cumulative impacts includes the entire St. Louis River watershed.	COOP01, MERC10, MERC22
3117	While the incremental risk [of mercury loading] from the Project may be small, the existing risk is large and has not yet been addressed through a total maximum daily load ("TMDL") or other reduction program.	COOP01, MERC22
9007	In the SDEIS, there is no discussion regarding the type of financial assurance that would be used. No detail is provided regarding the estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the Project. Even though the MNDNR has stated that PolyMet financial assurance will include clean-up costs for contamination resulting from LTVSMC operations, the SDEIS provides no discussion regarding financial assurance for the existing contamination associated with previous mining activities at the site.	COOP01, FIN01, FIN05, FIN08, FIN11

9008	Mining need not be synonymous with pollution: “In the right place – and with conscientious companies, new technologies and good planning – many of the potential impacts are avoidable. In fact, most mine pollution arises from negligence, not necessity.” The NEPA “hard look” requires agencies to “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing alternatives. The SDEIS does not evaluate or examine Project alternatives in any substantive way; even the no-action alternative is lacking in detail and analysis. Instead, the SDEIS states: Consistent with the CEQ regulations, the federal Co-lead Agencies are required to identify an agency-preferred alternative in a DEIS, if one exists, and in the FEIS unless another law prohibits the expression of such a preference. At this time, the Co-lead Agencies have not identified a preferred alternative, and for the USACE, Appendix B of 33 CFR Part 325 supersedes the CEQ requirement to identify an agency-preferred alternative. Part 57(4) of 33 C.F.R. Part 325 at Appendix B, NEPA Implementation, only states: Alternatives. See 40 CFR 1502.14. The Corps is neither an opponent nor a proponent of the applicant's proposal; therefore, the applicant's final proposal will be identified as the “applicant's preferred alternative” in the final EIS. Decision options available to the district engineer, which embrace all of the applicant's alternatives, are issue the permit, issue with modifications or conditions or deny the permit. To the extent this limits USACE's obligation to identify an agency-preferred alternative, which is not clear, nothing there limits the USFS's obligation to do so. Moreover, Part 57(4) of Appendix B does require that “reasonable alternatives” must be considered in detail, along with “geographic alternatives, e.g., changes in location and other site specific variables, and functional alternatives, e.g., project substitutes and design modifications.” The Band has long cited this defect in its comments, 21 and EPA cited the lack of alternatives as a factor when issuing an EU-3 rating for the DEIS. Although the SDEIS was revised to reflect the Project proponents' preferred action, still, the only alternative analyzed in any detail concerns the acreage of the proposed land exchange. This failure is a serious violation of NEPA and must be remedied before the SDEIS can be finalized.	ALT01, ALT03, ALT14, COOP01
9011	No effort was made to discuss or evaluate the least environmentally damaging practicable alternative (“LEDPA”) required before rendering a Clean Water Act Section 404 Permit.	COE04, COOP01
9014	The SDEIS failed to substantively consider many alternatives that may provide mitigation for, or prevent long-term environmental damage. Some of these alternatives include: paste tailings to reduce the project footprint and use less water thus decreasing risk of water pollution; perpetual pumping of the mine pit to prevent a pit lake from forming and by doing so protecting groundwater; back-filling waste rock into the east, central, and west mine pits to reduce the mine footprint and restore wetlands; engineered liners; providing reverse osmosis treatment at the mine site beginning in year one of operations to augment water loss in nearby high quality wetlands in the Partridge River watershed; and underground mining.	ALT01, ALT04, ALT06, ALT10, ALT13, COOP01
9020	The SDEIS summarily dismissed the possibility of backfilling: The opportunity to reclaim wetlands and vegetation at the Category 1 Stockpile footprint area would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, because of the temporal effect that the stockpile would have, those effects would be required to be mitigated regardless of future backfilling or not. Furthermore, the potential environmental benefit is moot or outweighed because encumbrance is not allowed in PolyMet's private mineral leases and because the costs associated with backfilling, additional water treatment (rates), and encumbrance compensation determined in revised lease agreements may affect the ability of PolyMet to secure financing (MDNR et al. 2013b). As such, the option to backfill the West Pit was eliminated from further consideration in the SDEIS. Back-filling all of the mine pits with waste rock would reduce the surface footprint of the mine and make possible 526 acres of wetland restoration where the Category 1 stockpile is now proposed to be stored without a liner in perpetuity.	ALT03, ALT06, COOP01
9022	Engineered liners for the Category 1 Waste rock Stockpile and the Overburden Storage Layout Area (“OSLA”) would ensure that seepage would not migrate into fractures below the storage facilities and increase the effectiveness of seepage capture... If the Category 1 Stockpile were lined, seepage capture efficiency would increase and less water carrying pollution would migrate from the pile into the fractures below the storage area thereby protecting groundwater.	COOP01, PD16

9025	RO-treated water should be used to augment stream flow at both the plantsite and mine site. Colby Lake water should not be used for stream augmentation unless it is RO-treated first. RO will not cause waters in the vicinity of the plant site to comply with WQS due to low seepage capture efficiency at the tailings basin.	COOP01, WR018, WR124, WR184
9029	The MNDNR and USACE considered underground mining as an alternative to the proposed open pit(s) for the DEIS in 2009, but eliminated it because it would have had “a significantly reduced rate of operation that would not be considered economically feasible, and, therefore, would not meet the Purpose and Need of the Project.” Even though underground mining was reconsidered for the SDEIS, the Co-Lead Agencies did not “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing alternatives. The Project proponent eliminated the alternative based solely on an economic decision that underground mining would not be as profitable as open pit mining. The co-leads state that “it was not possible to undertake a quantitative, side-by-side assessment of the underground mining alternative.” <sup>37</sup> An underground mine would have a reduced mining rate and life of mine, employed fewer workers for a shorter period of time, and reduced state and local tax revenues. Conversely, although the underground mining alternative would offer environmental benefits, the SDEIS includes no economic analysis of those benefits. Still, the Co-Lead Agencies determined that underground mining would result in reduced socioeconomic benefits, and “PolyMet would not move forward with an unprofitable project, thus any potential environmental or socioeconomic benefits associated with this alternative are moot.”	ALT06, COOP01
9031	Although underground mining was considered technically feasible, the Co-Leads provided that:PolyMet is a private sector and for-profit company, the value of the saleable material would need to provide sufficient income to cover operating cost (which includes, but is not limited to, the cost of mining, processing, transportation, and waste management), capital cost (to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. Using underground mining would result in most of the NorthMet Deposit left unmined because of its low metal value (i.e., less value than the cost of mining and mineral processing). Other material would have to be left in place for safety reasons, to prevent collapse. Therefore...the Co-lead Agencies found that while underground mining is technically feasible, available, and would offer significant environmental benefits over the proposed NorthMet Project, it would not be economically feasible and would not meet the Purpose and Need. Since the underground mining alternative would not meet all of the screening criteria, it is not considered to be a reasonable alternative. Therefore, the underground mining alternative was eliminated from further evaluation in the SDEIS.In no way does this constitute an appropriate level of detail. The conclusion that underground mining is not viable, or preferable, remains substantially unjustified, despite repeated requests for further analysis. Without considering the economics of perpetual treatment the economic analysis provided by the Project proponent concludes that underground mining is “[n]ot economically viable,” while simultaneously claiming that backfilling the west pit would create encumbrances not allowed in their lease due to minerals located below the west pit that can only be accessed through underground mining. This is not the appropriate use of a cost-benefit analysis for purposes of analyzing an EIS alternative. The CEQ regulations require that, where a cost-benefit analysis is “relevant to the choice among environmentally different alternatives,” there are a variety of additional requirements, including “analysis of un-quantified environmental impacts, values, and amenities,” <sup>42</sup> in addition to other CEQ alternatives rules.	ALT01, COOP01
9033	Additionally, the SDEIS does not provide adequate discussion of the adverse effects of the proposed land exchange on wetlands and headwater streams within the St. Louis River	COOP01, WET14
9036	The SDEIS attempts to diminish the significance of the loss of these high-quality lands by stating that “[g]iven the existing lack of overland public access and actual use of the federal lands, as well as historic use of this area for mineral exploration (see Section 4.2.9), the Land Exchange Proposed Action represents little to no change in the actual level of recent or current use of the federal lands.” In fact, historic trails key to both the exercise of treaty rights and of historic significance connect what is now Beaver Bay with Lake Vermillion.	COOP01, CR05
9037	data collected specifically for the Project was selectively used, with several well and surface water monitoring stations’ data completely excluded from the water quality models used to predict Project impacts.	COOP01, WR008, WR071, WR072

9046	The baseflow rate predicted by XPSWMM is three times lower than flow data indicates, and implies recharge to the groundwater system from precipitation that is not consistent with published literature.	COOP01, WR003, WR175
9051	the SDEIS indicates that mine pit dewatering impacts will be very limited or non-existent based on the assumption that there is little or no connection between the bedrock and surficial aquifers. This assumption is not supported by the data used to characterize mine site hydrology; instead, it is based on an unsupported "professional opinion."	COOP01, WR010, WR012
9052	data indicates that the PolyMet mine site is already hydrologically connected to the Peter Mitchell Pit through fractures.	COOP01, WR010, WR011, WR012, WR013, WR061, WR071, WR087, WR099, WR168, WR169
9054	the SDEIS entirely skirts the question of overall impacts on the groundwater aquifer from putting an already-contaminated [tailings basin] site back into production...Blasting and shoveling ore will increase both the number of fractures and the connectivity of fractures potentially increasing baseflow and pit leakage into the bedrock layers below the bottom of the pit	COOP01, WR016, WR030, WR060, WR071
9056	A comparison of hydrologic data that was collected for two other projects in the region demonstrates that the PolyMet project is data-poor in the area of basic hydrology, much less mitigation. Moreover, given the utility of the many existing studies of area hydrology, it is perplexing that the preparers have continually refused to use them, even as tribal cooperating agencies have repeatedly requested that they be used.	COOP01, WR023, WR071
9059	The proponent's claim that 90 percent of the seepage from this tailings basin can be captured is unrealistic...Tribes requested any example of the "90 percent or better" capture efficiency rate to be provided by the Co-Lead Agencies, but they were not able to provide a single example anywhere in the world. Actual examples in northeastern Minnesota, from U.S. Steel Minntac126 and the LTVSMC tailings basin seep SD0026 (the very tailings basin PolyMet proposes to re-use), demonstrate capture rates of less than 60 percent.	COOP01, WR017, WR018, WR020
9062	Contrary to SDEIS claims, all of the seepage from SD026 is not being captured and therefore must be considered further in the SDEIS and project modeling.	COOP01, WR117
9063	The SDEIS provides that construction of a groundwater containment system... "would capture virtually all of the Tailings Basin seepage"...without installing a single monitoring well in the bedrock to test this assumption...the SDEIS's conclusion that the method would be effective essentially is unsupported.	COOP01, WR010, WR018, WR061, WR071, WR079, WR090, WR099, WR108
9069	the tailings basin model uses storage coefficients that are not found anywhere in peer-reviewed scientific literature...this model simulates a bedrock storage tank where lots of water goes in and virtually nothing comes out. Because this is not possible, these modeled hydraulic conductivity and/or modeled storage coefficients cannot reliably estimate the amount of seepage that will bypass the seepage capture system, nor the amount of time before seepage upwells in nearby wetlands or in the Embarrass River.	COOP01, WR018, WR019, WR093, WR095, WR097
9073	Without any examples worldwide of such high seepage capture efficiency, the SDEIS alleges that [the slurry wall] is a fail-safe method of seepage collection able to collect 97 percent of the surficial aquifer seepage and 90 percent of the deep seepage through bedrock, and that no polluted water will seep from the tailings basin on the east side because bedrock conductivity is very low and the bedrock storage coefficient very high.	COOP01, WR019, WR020, WR102

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Grand Portage Band (42994)	
9074	“Semi-analytical flowpaths” for the tailings basin have been constrained in the Modflow model so that water cannot seep out of the east side of the tailings basin. However, winding underneath the east side of the tailings basin is a bedrock valley that used to be the headwaters of Trimble Creek...More water likely flows out of the east side of the tailings basin than does out the southern toe at monitoring site SD026. Therefore, without constructing the slurry wall containment system around the east end of the tailings basin, hundreds of gallons per minute of polluted water will drain into the Embarrass River watershed.	COOP01, WR102, WR104, WR133
9077	Even though the PolyMet project proposes to use a double-liner to prevent leakage from the [HRF], head pressure from the existing seeps and springs at this site mean that the liners, even installed perfectly will not last long before rupturing.	COOP01, PD17
9081	20 feet of pit wall will never be submerged and as such constitutes a perpetual source of mine related contaminants. Because of continued inputs from the stockpiles, the tailings basins, and the pit walls, the pit lake could exceed surface water quality standards for thousands of years.	COOP01, WR035, WR036, WR173
9083	As stated previously, many mitigation measures were not identified in the SDEIS, including the LEDPAs, nor are they evaluated using the required NEPA “hard look.” There is no agency-preferred alternative identified in the SDEIS either. Combined, this makes it exceptionally difficult, and meaningless, to provide any input on the 404 permit or the corresponding 401 certification.	COE04, COOP01
9091	There has been no analysis of the 1854 Ceded Territory as a discrete area of impact. The Band continues to ask that it be included. Tribal Cooperating Agencies believe the Cumulative Effects Analysis for land use should encompass the 1854 Ceded Territory	COOP01, PER08
9093	Tribal Cooperating Agencies consider a 216,300 acre area bounded by the St. Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources.	COOP01, CR04
9097	The SDEIS also fails to analyze cumulative effects on water quality and quantity. The relevant spatial scale for water quality and hydrologic cumulative effects analysis is the entire St. Louis River watershed.	COOP01, CU01
9101	Also missing is cumulative-impacts analysis of culturally-important plant and animal species that are listed as “Species of Concern.”..There is no basis to dispute that the Project will have cumulative effects on the moose herd and Tribal harvest in the 1854 Ceded Territory. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should have been done as part of this SDEIS.	COOP01, WI03
9104	The Cumulative Effects Assessment Area defined by the Co-Leads for impacts to aquatic species is overly limited. It includes only the Partridge and Embarrass Rivers...The appropriate spatial scale for considering cumulative impacts to aquatic species is the entire St. Louis River watershed and Lake Superior Basin.	AQ26, COOP01
9105	The SDEIS states that the current fish tissue concentration in five local lakes results in Hazard Quotients (“HQs”) that exceed 1, but gives no further information...In fact, Barr Engineering’s July 2012 “Cumulative Impacts Analysis, Local Deposition and Bioaccumulation in Fish” showed modeled contributions from both the Mesabi Nugget Large Scale Demonstration Plant (“LDSP”) on the site and PolyMet. And the Barr report further provides the actual HQs, rather than just saying “they exceed 1.”...This information should be explicitly included in the SDEIS for public review.	COOP01, MERC02
9107	Meeting ambient noise standards is a different question than assessing impacts. Impacts should be fully characterized and contour maps showing overlapping noise pollution from different projects provided. Without this information, it is not possible to review the cumulative impacts of noise.	COOP01, N03
9109	The cumulative risk analysis of transportation of hazardous materials has not been analyzed. This should include rail car spills, pipeline ruptures, and truck transport accidents.	COOP01, HAZ06

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Grand Portage Band (42994)	
9111	Post-closure impacts should also be included in the cumulative effects analysis because some mine features (e.g., pit lakes) would become permanent features of the landscape.	COOP01, CU16
9115	A key piece of the work that still has not been completed, despite some progress, is the traditional cultural property (“TCP”) studies...An appropriate investigation of the Project site using this standard, and in cooperation with all involved THPOs, must be performed and properly documented. As noted in the chapter, consultation is underway on this topic, but is far from complete.	COOP01, CR05, CR06
9117	The SDEIS must include language to the effect that the Band continues to take the position that the Ceded Territory is itself a TCP and does not agree with the USACE’s determination that it is not.	COOP01, CR02, CR05, CR06
9120	The Project Area of Potential Effect (“APE”) for cultural resources is divided into two separate sections surrounding the proposed mine site and the proposed plant site. These areas do not encompass the true extent of the APE...Until the cumulative effects analysis of the Project is better represented, the agency preferred alternative is defined, and the LEDPAs identified, it is premature to delineate the APE.	COOP01, CR02, CR03
9124	the Beaver Bay to Lake Vermilion Trail (“BBLVT”)... is “associated with the lives of persons significant in our past”...To date, the BBLVT has not been fully researched or rigorously field-verified within the project area. Additional fieldwork should be conducted in the spring or fall when ephemeral features such as foot trails are less easily concealed by vegetation and more easily discerned.	COOP01, CR05
9132	The Band fundamentally disagrees with any seasonal sulfate release in wild rice waters, whether now or later. There is no scientific basis for stating that seed is not affected by high sulfate levels while it lays dormant over the winter, or that the effects of high-sulfate water would not remain or continue into the summer.	COOP01, VEG04, WR152, WR153, WR157
9135	There still has not yet been sufficient evaluation of Band member use of vegetation and other usufructuary resources in the APE, and there is no permissible basis to omit such evaluation where the USACE and other federal permitting agencies have a trust responsibility to the Band to maintain treaty resources in the 1854 Ceded Territory.	COOP01, CR01
9138	in the SDEIS Socioeconomics chapter, none of the issues identified [in Executive Order 12898] Executive Order have been addressed...It is theBand’s position that any impacts to natural resources will disproportionately affect tribes due to their subsistence consumption of wild rice, fish, and other wildlife, and gathering of traditional plants and medicines within the 1854 Ceded Territory.	COOP01, SO09
17731	the tailings basin seepage capture rate of 90 percent assumed in the preferred alternative has not been demonstrated anywhere in the U.S. and is simply not possible because the tailings basin was built without a liner.	COOP01, PD08, WR018
17732	In fact, at the Project site, the existing seepage capture system that was installed as a requirement of the Cliffs Erie Consent Decree for SD026 is so ineffective that Cliffs Erie is proposing to build an additional dam and capture system further downstream. Therefore, paste tailings placed on a liner and covered could have a profound, minimizing effect on pollution reaching the Embarrass River watershed wetlands and the Embarrass River. The SDEIS does not even mention this modern technique used by many mines in U.S. and around the world, without justification: Converting to paste tailings technology from conventional slurry tailings at most mines makes sense both environmentally and economically. Paste tailings use less water; require less land; do not require engineered containment dams; generate less acid and contaminants; reduce long-term costs and allow for early reclamation. Slurry tailings use and discharge large volumes of water, require dust control measures, require large land areas and containment dams for disposal, and create contaminated water that must be captured and treated.	ALT06, ALT16, COOP01

17733	Perpetual pumping of the mine pits to prevent formation of a pit lake is required by the State of New Mexico, Office of Natural Resource Trustee, for the Chino and Tyrone copper mines expressly to protect groundwater and waterfowl. <sup>29</sup> Numerous western mines have discharged plumes of polluted water into the bedrock aquifer from leaking mine pits, tailings basins and waste rock piles, a problem that is not only difficult but expensive to fix. Requiring perpetual pump out of the mine pit would minimize leakage of contaminated water into the surrounding bedrock aquifer thereby protecting groundwater that the State is required to protect as source of drinking water.	ALT04, COOP01
17734	This alternative would prevent the need for a separate seepage capture system around an unlined waste rock pile, as proposed in the preferred alternative, that would have to work at an above optimum capture rate in perpetuity. Capping and re-vegetating the mine pits after backfilling with waste rock would prevent deep infiltration of precipitation. In combination, perpetual pumping and backfilling the Category 1 waste rock pile would substantially reduce the risk of polluting groundwater and wetlands in the Partridge River watershed.	ALT04, ALT06, ALT13, COOP01
17735	The OSLA will contain peat that has sequestered mercury. When water flows through the OSLA the seepage will transport some of the mercury from the peat.	COOP01, MERC24
17736	As the Project is currently proposed, after operations, the mine site wastewater treatment plant will be converted to RO to treat the west mine pit lake and Category 1 stockpile seepage for discharge to the west pit outlet creek that flows into the Partridge River. An alternative that was not considered in the SDEIS would use RO at the plant site to begin with to treat storm water, mine infiltration, and waste rock pile seepage. Using RO treated water for stream and wetland water augmentation in the Partridge River watershed would provide mitigation for the some of the adverse effects of mine pit dewatering.	ALT13, COOP01
17737	As the Band already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS offers no new discussion of the reasons for rejecting the alternative. The economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings, and waste rock disposal. A study of this particular deposit was performed by the prior owner of the site, U.S. Steel, which actually recommended underground mining. <sup>43</sup> PolyMet is well aware of this study, given that the company included it in a 2003 filing with the Securities and Exchange Commission. In fact, by examining cross-sections showing the distribution of ore by depth, <sup>45</sup> it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, and the costs associated with perpetual treatment must be evaluated to determine the viability of [the underground] alternative.	ALT01, COOP01
17738	the SDEIS does not disclose appraisal information [for the Land Exchange]	COOP01, LAN03
17739	Of the approximately 6,025 acres of MCBS Sites of High Biodiversity Significance under the Land Exchange Proposed Action, <sup>51</sup> nearly 2,000 acres of coniferous bog wetlands will be lost to the federal estate, and therefore effectively lost to the Bands, if the proposed land exchange takes place. This is significant because many tribally harvested resources are only available in coniferous bogs (e.g. cranberries, labrador tea, creeping snowberry), and restoration of coniferous bogs is a very difficult and long process that has extremely low success rates.	COOP01, CR01, WET05, WET14
17740	The proposed action land exchange would trade water resources within the Lake Superior Basin for wetlands and surface water outside the Lake Superior Basin [resulting in] a loss of 3,791 acres of federally-managed wetlands within the Lake Superior Basin under the proposed exchange.	COOP01, WET15

17741	<p>Furthermore, the SDEIS acknowledges that the Land Exchange Proposed Action would create a “net increase of third-order streams and decrease in first- and second-order streams which would likely add more habitat diversity to the Superior National Forest.” But the SDEIS underestimates the impact of this increase: “Headwater streams are the smallest parts of river and stream networks, but make up the majority of river miles in the United States. Many headwater streams have been lost or altered due to human activities ... and this can impact species and water quality downstream.” The SDEIS states that the decrease of first-order streams to the federal estate would “slightly reduce the amount of available spawning habitat for some aquatic species as headwater streams provide specialized spawning habitat for some species.” Again, this underestimates the impacts. While greater diversity is desirable, protection of headwater streams is critical because they powerfully influence both the character and functions of downstream waters. Headwater streams transport vegetation, woody debris, organic matter, macroinvertebrates, and other organisms downstream, while providing spawning areas for brook trout. Headwaters provide most of the water to rivers, which in turn provides temperature mitigation and oxygenation which are necessary for healthy fish communities.</p>	COOP01, WR114
17742	<p>The SDEIS also erroneously concludes that no known cultural resources exist on the nonfederal lands, despite impacts to wild rice waters, and the proposed exchange will not sufficiently compensate for the loss. The Land Exchange Proposed Action would result in additional wild rice beds by the acquisition of Tract 1. Tract 1 contains Little Rice Lake, which supports a continuous population of wild rice. Wild rice also grows along the Pike River south of Little Rice Lake and in isolated populations on Hay Lake. The wild rice waters in Tract 1 are accessible to the Bands via the Pike River. Therefore, adding Tract 1 to the federal estate does not provide additional wild rice harvesting opportunities to Band members in the 1854 Ceded Territory.</p>	COOP01, LAN05, VEG08, WR155
17743	<p>It is commonly acknowledged that “[w]ater has been called ‘mining’s most common casualty’ .... Mining affects fresh water through heavy use of water in processing ore, and through water pollution from discharged mine effluent and seepage from tailings and waste rock impoundments.” Acid mine drainage (“AMD”) is one of the greatest environmental liabilities associated with mining, especially in pristine environments like the Project mine site, that have economically and ecologically valuable natural resources. There are no hardrock surface mines that exist today that can demonstrate that AMD can be stopped once it occurs on a large scale. Inaccurate pre-mining characterization and interpretation often results in a failure to recognize or predict impacts to water quality and aquatic life. Evidence from literature and field observations suggests that permitting large scale surface mining in sulfide-hosted rock with the expectation that no degradation of surface water will result due to acid generation imparts a substantial and unquantifiable risk to water quality and fisheries. In a report comparing predicted and actual water quality at hardrock mines, there were two types of characterization failures that were key to explaining differences between the predicted water quality in EIS documents and the actual water quality either during or after mining began. These included: 1. Insufficient or inaccurate characterization of the hydrology: The authors reported primary causes of hydrologic characterization failures as overestimations of dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size. 2. Insufficient or inaccurate geochemical characterization of the proposed mine: The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy. The primary causes of mitigation failures were that mitigation measures were not identified, were inadequate, or were not implemented; waste rock mixing and segregation was not effective; liners leaked; tailings were spilled; or embankments failed, and land application discharge was not effective. The SDEIS suffers from all of these characterization failures. An egregious lack of hydrologic characterization allows PolyMet to pretend that there will be no water pollution resulting from the Project. In fact, the SDEIS arbitrarily concludes water quality will actually improve as a result of the Project. The following is a short list of the problems with water modeling in the SDEIS.</p>	AQ12, COOP01, WR071, WR126, WR128, WR134, WR136

17744	Moreover, data collected specifically for the Project was selectively used, with several well and surface water monitoring stations' data completely excluded from the water quality models used to predict Project impacts. Specifically, all data collected from groundwater monitoring wells GW008 (13 sampling events), GW009 (12 sampling events), and GW010 (9 sampling events), were excluded from the models. These monitoring wells are northeast and north of the tailings basin between the tailings basin and the Embarrass River. Furthermore, none of the nine surface water quality sampling events collected at PM 11, a sampling station on unnamed creek located northwest of the tailings basin half-way between the tailings basin and the Embarrass River, were used in the Projects models. Also excluded from the models were data from nine sampling events collected at Station PM 12.1 in the Embarrass River upstream of the tailings basins. Instead, the model includes 53 sampling events in the Embarrass River at PM-13.85 PM- 13 is 7.3 river miles downstream of the northwest corner of the tailings basin, and 16.2 river miles from monitoring location PM-12.2 - long past the first water quality compliance points in the Embarrass River.	COOP01, WR072, WR076
17745	An additional problem is that the models intended to predict impacts from the Project were not calibrated to existing water quality in Colby Lake. Most of the data used to represent Colby Lake in the model was extrapolated from sampling sites well upstream in the Partridge River.	COOP01, WR046
17746	Despite this selective use of water modeling data, the SDEIS claims “[t]he NorthMet Project Proposed Action is also not predicted to result in any significant changes to groundwater and surface water flows when compared to existing conditions.” To achieve this prediction, the hydrologic models for the Project were built using modeled inputs rather than actual measurements or estimates from scientific literature. This makes the Project models unable to accurately characterize groundwater flow direction, water tables, potentiometric surface in the aquifers, fluxes to rivers and streams drawdown mounding impacts to the water tables or surface waters, or to predict water quality impacts. The models for the Project must be re-calibrated using all available measured data and scientifically credible basic model inputs.	COOP01, WR056, WR071, WR086, WR105
17747	Chapter 5 of the SDEIS acknowledges that “[t]he NorthMet Project Proposed Action would have the potential to affect groundwater and surface water hydrology and quality in both the Partridge River and Embarrass River watersheds.” However, the hydrology model that was developed to determine Project impacts relied on outdated data collected too far from the site. Because the Project proponent was not required to install stream gauges at the site, they used a model (XP-SWMM) to extrapolate baseflow far upstream from where the data was collected to the areas where the proposed mine pit(s) and tailings basin would be located. The extrapolated baseflow used twenty-year-old stream gauging data collected seventeen miles downstream of the mine site in the Partridge River, and stream gauging data that is more than fifty years old collected eleven miles downstream of the plant site in the Embarrass River... Therefore, the results are highly unlikely to be representative of current conditions at the mine or plant site.	COOP01, WR003, WR052, WR071, WR073, WR086, WR091
17748	During subzero temperatures January 25-26 and February 15-16, 2011, the minimum baseflow measured by the MNDNR in the Partridge River at the point nearest the proposed mine pits was of 3.4 cubic feet per second (cfs). Values calculated by staff from Great Lakes Indian Fish and Wildlife Commission (“GLIFWC”) and MNDNR from low flow stream gauge data in the Partridge River ranged from 1.2 to 1.8 cfs, while the XP-SWMM model predicted a baseflow of 0.5 cfs. Not only is the Project modeled baseflow inconsistent with published literature, none of the measured data supports the baseflow predicted by XP-SWMM at SW003 of 0.5 cfs. XPSWMM's extrapolation of unrealistically low baseflows was used to calibrate the MODFLOW model and therefore influences virtually all aspects of the Project water quality and quantity characterization and impact prediction, including: groundwater flow rates and pit inflow, dewatering impacts to the rivers and wetlands, water treatment needs, contaminant transport times and concentrations, and contaminant dilution. Higher baseflows in the Partridge River indicate that the wetlands and river are connected to the groundwater aquifer, that mine pit inflow will be greater; and that groundwater will travel through the aquifer will occur at a much faster rate. During subzero temperatures January 25-26 and February 15-16, 2011, the minimum baseflow measured by the MNDNR four miles south of the LTVSMC tailings basin 13.9 to 15 cfs in the Embarrass River. Model estimated the average annual baseflow for the Embarrass River, based on data more than 50 years old, at 8.7 cfs.	COOP01, WR003, WR004, WR091

17749	<p>Surface water quality at the Project remains insufficiently characterized or left uncharacterized, and the defects in analysis in this area are profound. The limited data the SDEIS uses indicates that surface waters have already been adversely impacted by mining activity--which should give rise to more scrutiny, not less. Contaminant transport modeling suggests that the Project will cause manganese, aluminum, and sulfate to exceed Minnesota Water Quality Standards (“MN WQS”). Mercury, sulfate, and specific conductance have already exceeded surface water criteria in surface water samples collected near the tailings basin at nearby Area Pit 5, and mercury and aluminum exceed surface water criteria in the Partridge River downstream of Colby Lake. Aluminum, iron, manganese, and mercury all exceed MN WQS in Colby Lake. Contaminants from the Project will likely contribute additional loading to these existing exceedences of MN WQS in the Embarrass River, Colby Lake, and the Partridge River. And, as a result of the Project, it appears that arsenic will exceed drinking water standards in Colby Lake. No water samples have been collected from lakes near the tailings basin (including Hieckilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies. The SDEIS even acknowledges current exceedences: “...the existing LTVSMC Tailings Basin is not lined and currently releases seepage with elevated concentrations of sulfate, TDS, and hardness, among other constituents.” It just does not propose any effective means of remediating them.</p>	COOP01, WR064, WR075, WR109, WR123, WR197
17800	<p>The Band is profoundly concerned at the preparers’ refusal to consider past state agency experience with this site that had disastrous consequences for water quality. The Band has located an MPCA document from the Minnamax Exploration Project, a test shaft drilled into the Duluth Complex, the rock formation where the mine would be sited, by AMAX Corporation in the 1970s, approximately three miles from the Project mine site. This document states that water was encountered 147 feet below the surface infiltrating into the test shaft at approximately 14 gallons per minute and identified another potentially water bearing fracture zone at 900 feet below the surface. This means that the volume of bedrock groundwater that may be encountered by the Project mine pit has been vastly underestimated.</p>	COOP01, WR007
17802	<p>Other MPCA documents detail an unexpected saline water discharge that resulted as part of the AMAX Exploration Project from a water pocket 1,391 feet below the surface. The large quantities of saline water discharged, as much as 275 gallons per minute to Langley Creek, killed much of the vegetation en route. Data show severe impacts to wetlands in the vicinity of the project. Water from stockpiles that were minuscule in comparison to the stockpiles proposed for the PolyMet Project drained water with very high concentrations of nickel, cobalt, copper, zinc, and sulfate, and discharged that water into Langley Creek and the Partridge River. The project polluted streams, groundwater, and a large wetland complex in its vicinity in order for the MNDNR to study potential impacts and mitigation strategies for non-ferrous mining. Yet the data collected from the AMAX project was not used to predict water quality or wetlands impacts presented in the PolyMet SDEIS.</p>	COOP01, WR007

17807	<p>Also ignored was experience with the Dunka Pit, located on the old LTVSMC site approximately five miles north and east of the PolyMet Project mine site. In the Dunka Pit, LTVSMC contacted the Duluth Complex and the Virginia Formation while mining for taconite in the Biwabik Iron Formation. By 1991, LTVSMC had removed about 50 million tons of Duluth Complex material from the Dunka pit and placed it in “gabbro” stockpiles. Monitoring of the drainage from these stockpiles beginning in 1976 revealed a decrease in pH and an increase in trace metals. Copper and nickel concentrations as high as 1.7 and 40 mg/l respectively were observed in seepage/run-off from the Duluth Complex waste rock stockpiles and pH was observed as low as 5.0 at seep 1 between 1976 and 1980.157 Most of the seepage from waste rock piles at the Dunka site was discharged to Bob’s Bay in Birch Lake via Unnamed Creek. A 1976-1977 study of trace metals in Bob’s Bay found that concentrations of copper, nickel, cobalt, and zinc in the water of the Bay were higher than regional average concentrations and decreased with distance from the mouth of Unnamed Creek. Additionally, it was determined that Unnamed Creek contributed more than 90 percent of the trace metals to Bob’s Bay load. The October 2001 NPDES permit for this discharge expired in 2005 and another variance request is expected. The 2001 Dunka mine area permit has a variance provision allowing toxic pollutants to exceed the final acute value. A Waste Water Treatment Facility (“WWTF”) located at the site has been inactive because Cliffs Erie, LLC, the owner after LTVSMC, declared bankruptcy and claims it is simply too expensive to continue running. Unfortunately, the passive wetland treatment system did not function well enough to remove nickel and copper in waters still discharging from the mine pit and stockpiles to a concentration that comports to comply with Minnesota WQS, and was rebuilt in 2010. Unfortunately, by 2012, copper, nickel, zinc, sulfate, and hardness concentrations from the treatment wetlands discharges (SD 8 and SD 9), were exceeding WQS. In accordance with a Consent Decree with the MPCA, Cliffs Erie is required to submit a plan for compliance with toxicity final concentration limits at SD008 and SD009 without a variance. Water quality impacts from prospecting and mining operations that have contacted the Duluth Complex are well known to the MNDNR and MPCA. The State of Minnesota spent \$4.3 million over three years in the late 1970s to produce the Regional Copper-Nickel Study, a 5-volume compilation of technical information regarding the potential impacts of copper-nickel mining in the Duluth Complex. Nevertheless, predicted water quality impacts and ineffective mitigation methods referenced in the Study were ignored when the technical documents and SDEIS were drafted for PolyMet. Therefore, water quality impacts have likely been underestimated and the mitigations proposed may not be effective.</p>	COOP01, CU06, WR023
17811	<p>Similarly, the Mining Simulation Project (funded in part by a Minnesota Legislative appropriation of \$185,000 to the MNDNR and MPCA) was a cooperative study to identify and resolve environmental issues associated with non-ferrous mining and to anticipate industry and government data needs to address those issues before commercial development occurred in Minnesota. The study clearly identified those state ground and surface water quality regulations that would apply to copper-nickel mining operations in Minnesota, including applying the 10 mg/l sulfate criterion to effluent discharges where wild rice is present, and prioritized nondegradation of both surface and groundwater and protection of groundwater as a drinking water source, and rejected using natural wetlands for mine effluent treatment (“as a toxic metals dumping ground”).</p>	COOP01, WR110, WR154
17812	<p>Finally, the SDEIS lists the sulfur concentrations of Project waste rock ranging between 0.01-5.0% with an average mass-weighted concentration of 0.15%. The Virginia Formation has the highest concentrations of sulfur 0.4 - 5.0%, and the Duluth Complex 0.13 – 0.6% sulfur. These concentrations are much higher than in Montana’s Zortman-Landusky Mine waste rock (0.2% sulfur)170 that has required perpetual wastewater treatment. And, like Zortman-Landusky, the Project proponent has suggested that “most (70 percent) of the NorthMet waste rock would be the low-sulfur, non-acid-generating” and will never cause acid mine drainage. However, the north wall of the east pit is composed of the Virginia Formation meaning that it will be exposed to both air and water and will likely contribute a substantial load of sulfate and metals to mine pit water.</p>	COOP01, WR173
17867	<p>The USACE has not developed a monitoring plan to assess after-the-fact Project impacts to wetlands, but claims that will be the way to best determine and mitigate indirect wetland impacts...So the SDEIS simply lacks sufficient detail even to comply with NEPA, and contains much less detail than is required to permit sufficient evaluation of potential wetland impacts.</p>	COE02, COOP01
17870	<p>the mitigation measures that the SDEIS does identify are inadequate as towetlands, just as they are for purposes of water modeling.</p>	COOP01, WET01, WET04

17873	The SDEIS's failure to properly model and mitigate seepage and baseflow rates could result in profound impacts on wetlands...The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections...Without a quantitative assessment of the mine-related drawdown of the regional watertable, there is no mechanism to develop an adequate indirect impact assessment method for wetlands.	COOP01, WR071, WR120
17874	the Co-Lead Agencies suggest ombrotrophic bogs...have no connection to groundwater, and therefore assume that drawdown will not affect these wetlands. But data supports at least a partial connection between ombrotrophic wetlands and groundwater...a vertical hydrologic connection between ombrotrophic wetlands and the surficial aquifer is likely and the extent of the hydrologic connection should be investigated.	COOP01, WET09, WR058, WR071, WR166, WR167, WR177
17875	Despite specific and repeated requests from tribal cooperating agencies, the Co-Leads did not elect to utilize a tool developed in 2011 by the EPA in cooperation with tribes, Applying Cumulative Impact Analysis Tools to Tribes and Tribal Lands, in order to discern potential cumulative effects to resources important to the tribes who retain usufructuary rights within the 1854 Ceded Territory.	COOP01, CU03
17877	The SDEIS failed to take into account most of the issues cited [in Appendix C of the SDEIS].	COOP01, CU12
