17899	It is reasonably foreseeable that an additional 3,000 acres of wetlands within the watershed will be directly impacted by proposed new mining projects and expansions that are in active permitting and/or environmental review: the Project, U.S. Steel Minntac mine expansion; U.S. Steel Keetac expansion; United Taconite Tailings Basin 3 construction; and Cliffs Erie's mine pit expansion.	COOP01, CU02
17900	The SDEIS also fails to adequately analyze cumulative impacts to the water quality of the Partridge and Embarrass Rivers, much less the St. Louis River.	COOP01, WR024
17901	In fact, in Colby Lake (the community water supply for the City of Hoyt Lakes), aluminum, iron, copper, and mercury concentrations already exceed Minnesota WQS. Modeled concentrations of arsenic also exceed Minnesota WQS. This existing, large number of water-quality exceedences and the suite of constituents, particularly trace metals, that exceed WQS not only confirm the total lack of remediation for the previous mining activities at the LTVSMC site, but demonstrate the importance of evaluating the cumulative losses to water quality. Community drinking water wells, wetland degradation resulting from dewatering, and pollution of community and private drinking water aquifers by previous mining activity must be assessed throughout the St. Louis River watershed as part of this Project, as well as for all the other mining projects currently underway.	COOP01, WR042
17903	The SDEIS does not determine climate change implications of the proposed Project. But the Project has proposed the largest direct wetland fill ever permitted in this region and would disturb extensive areas of peat, which is known to be an important carbon and methane sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife seeks refuge as the climate warms. Nevertheless, to date, virtually all required wetland mitigation for mining impacts has been implemented out of the basin, representing a permanent loss of high quality ecological resources and functions. This omission undermines even the MNDNR's own work. The MNDNR's Moose Advisory Committee, which studies the decline of the moose population in northeastern Minnesota, has recommended preserving wetlands as sanctuaries for moose from heat stress related to climate change.	COOP01, WR077, WR180
17905	Furthermore, underestimation of storm size and frequency is a serious problem for capture and treatment of polluted water from the Category 1 wasterock pile and tailings basin, tailings basin stability, storm water run-off from the Overburden Storage and Layout Area ("OSLA"), and mine pit dewatering. Storm size and frequency is known to be changing. These and other cumulative effects of climate change must be addressed.	AIR01, COOP01, WR180

17916	Section 106 consultation between the USACE and Tribes is ongoing. Therefore, despite significant changes through recent, increased consultation with tribal cooperators, the Cultural Resources chapter of the SDEIS is still incomplete, and the requirements of the National Historic Preservation Act (“NHPA”)200 have not yet been fulfilled. The Project cannot proceed until they are.	COOP01, CR06
17919	Where, as here, there are historic properties affected, then there is an entirely separate level of adverse-effects assessment that must be performed, again in coordination with consulting agencies.207 In light of these rules, and as the chapter itself acknowledges, it is apparent that far more consultation and site work must be done to comply with Section 106.	COOP01, CR03
17925	The Bands remain skeptical of the Co-Lead Agencies’ claim that there will be no adverse effect to the Spring Lake Mine Sugarbush from the Project. Indirect effects, through dust deposition and unauthorized collection of historic objects, are anticipated because the sugarbush is situated immediately adjacent to the proposed plant site.	COOP01, CR02, CR05
17929	The three properties would benefit from additional investigation. The sugarbush has not been formally recorded. The trail has been adequately documented within the SNF proposed land exchange, but requires additional survey in the upland areas of the project area. Mesabe Widjiu should be considered in its entirety. All three should be formally nominated to the National Register of Historic Places.	COOP01, CR02, CR05
17932	The Project is predicted to increase mercury loadings in the Embarrass River, but decrease mercury loadings in the Partridge River: Treated effluent would be used to augment flow in several Embarrass River tributary streams and Second Creek in the Partridge River watershed that would otherwise experience reduced flow because of the groundwater containment system. Additional water for flow augmentation in the nearby tributaries would be pumped from Colby Lake at periods during mine operations and reclamation. On the face of it, stream augmentation mitigation seems like a good idea. Unfortunately, Colby Lake water has high mercury concentrations that exceed the Minnesota WQS for wildlife. Colby Lake water used for augmentation will add mercury to the Embarrass River watershed both directly and indirectly by drying and re-wetting peat.	COOP01, MERC12, WR184
17933	High mercury concentrations in fish is a significant concern in the Embarrass River now, and mercury will only increase if the Project is allowed to use Colby Lake water for stream augmentation.	COOP01, MERC02, WR184
17934	Dewatering peatlands will also amplify water table fluctuations because peat has high water storage capacity and releases water more slowly than other surficial deposits. Drying and re-wetting peat will increase mercury methylation and release. Peatlands store methane and carbon that will be released into the environment when overburden is removed from the mine pits or during periods of dewatering. This is important in the context of subsistence fisheries and climate change because the temperature of water directly affects the oxygen content and defines what fish can survive. Mercury is also known to bioaccumulate in fish at a faster rate in warmer water.	AQ16, AQ28, COOP01, WET03, WR086
17935	Several lakes and the Partridge River watershed are likely to be negatively affected, which will impact fish species and thus the Band’s 1854 Treaty rights to harvest fish in those water bodies. The SDEIS as written fails to mitigate the costs to fisheries and wildlife species that are protected under the 1854 Treaty...Treaty-reserved fishing rights cannot be fully exercised when fish consumption must be restricted for health reasons to one or two meals per week.	COOP01, CR01
17937	The SDEIS does not adequately address the potential impacts to Band members of a significant increase in mercury in fish harvested both on-Reservation and in Ceded Territory waters...Yet the SDEIS offers no mitigation for these known losses. The SDEIS must be revised to include sufficient analysis and mitigation.	COOP01, CR01
17939	Minnesota’s mercury TMDL process will not adequately address the fishconsumption impairment in these waterbodies, and any new discharges that would result in further degradation to waters with an existing water quality impairment are not be legally permitable under the CWA.	COOP01, MERC11

17940	The cumulative effects of invasive species, mining, and Project effects on sturgeon must be considered and the SDEIS revised.	AQ02, AQ26, COOP01
17944	Although the permitted area is significantly disturbed and will be for the foreseeable future, the closure and reclamation plans will have a significant effect on native vegetation as it is reintroduced. The prevalence of invasive, non-native species and their ability to outcompete native plants in disturbed areas, coupled with PolyMet's plan to introduce non-native and invasive species to this area, would result in significant impacts to cultural resources that have not been discussed in the SDEIS.	COOP01, VEG09
17945	While the SDEIS provides that displaced wildlife will face increased competition for resources, no mention is made whether the displaced animals may cause populations in adjoining territory to approach or exceed carrying capacity. The SDEIS fails to assess cumulative effects of wildlife population changes, not only in the project area, but the entire region.	COOP01, WI05
17948	the value of natural resources maintained in good condition is simply not represented in the SDEIS. Nor is the economic value of clean water provided or assessed.	COOP01, SO04
17949	The SDEIS also speculates that the tribes will benefit economically from the Project through additional visitation to Band-operated Casinos, but provides no data to back up the statement: "Increased employment and income associated with the NorthMet Project Proposed Action could increase visitation and revenues at [area tribal gaming] facilities." This statement is entirely unsupported by any market analysis and must be deleted from the socioeconomic assessment of the Project.	COOP01, EDIT01
20089	after an agency preferred alternative and the LEDPAs are identified, the USACE should re-notice the 404 permit and MPCA should re-notice the 401 certification.	COE04, COOP01

19496	The DNR should use the new data from the John Pastor research in setting a lower standard for sulfate impact on wildrice.	VEG04, WR152
<b>Sender Name (Submission ID)</b>	Great Lakes Indian Fish and Wildlife Commission (42952)	
2924	In the SDEIS or supporting documents, there is no discussion of tailings pond water exiting the basin into this topographically closed area. There is no accounting for contaminants moving eastward, and there is no description of their possible impact on receiving ground or surface waters.	COOP01, WR054, WR057
2925	Because of the no-flow boundaries, the model output files (Northmet Model Files DVD, BARR July 2012) show extremely unrealistic groundwater heads in the aquifer surrounding the east side of the FTB.	COOP01, WR093, WR097
2950	Staff continue to believe that the underground mine and west pit backfill alternatives have not been properly explored given the environmental benefits they could bring to the project. Our comments stand as detailed in Appendix C.	ALT03, COOP01
2951	In addition, there are a number of alternatives that the SDEIS fails to explore. These include paste backfill, immediate operation of the RO treatment facility at the mine site, etc. Additional details are found in the comments submitted by the Fond du Lac Band.	ALT06, COOP01
2952	Unfortunately the SDEIS has no serious analysis of a No Action Alternative. Section 5.2.2.4 is less than 1 page long and gives a very general and hypothetical discussion. It in no way represents a serious analysis of a No Action Alternative. The SDEIS needs to have modeling of a No Action Alternative	ALT14, COOP01
2953	The concerns regarding the cumulative effects analysis have not been resolved. The information provided in Appendix C is still applicable to the SDEIS.	COOP01, CU12
2959	The ACOE and Forest Service's position in the SDEIS is that these items can be addressed at a later time by the Minnesota Department of Natural Resources in the review of future mining permits. This action is an ill-conceived attempt to abdicate their federal trust responsibility to protect the habitats that support treaty harvests. Despite their attempts, the ACOE and Forest Service cannot delegate their federal trust responsibility to protect habitats that sustain treaty harvests to state of Minnesota when it undertakes the process of permitting the mine.	COOP01, CR01
2961	The superficial estimate of financial assurance provides inadequate detail as to how any of the cost estimates were developed. The DEIS provided a discussion about the options for financial assurance instruments however any substantial discussion of costs and assumptions on the metrics were not provided and instead postponed until the permitting phase of this Project.	COOP01, FIN05, FIN08
2963	The Executive Summary fails to provide: 1) an estimated cost for reclamation, 2) an estimated cost for post-closure maintenance and water treatment, 3) any realistic estimate as to the length of time that post-closure maintenance and water treatment would be required, or 4) information as to how financial assurance instruments would be structured to ensure the costs of post-closure maintenance and water treatment are paid for an uncertain amount of time and for which models indicate would be longer than 200 years at the mine site and 500 years at the plant site.	COOP01, FIN05, FIN06, FIN08
2964	The SDEIS Executive Summary failed to provide either an estimated cost of reclamation or an estimated cost for post-closure maintenance and water treatment.	COOP01, FIN05
2965	The Executive Summary also failed to explain how financial assurance instruments can be established to cover the cost of reclamation and post-closure maintenance and water treatment costs if "it is uncertain how long the NorthMet Project Proposed Action would require water treatment4".	COOP01, FIN08

<b>Sender Name (Submission ID)</b>	Great Lakes Indian Fish and Wildlife Commission (42952)	
2966	The SDEIS provides a listing of items for which costs must be included in the financial assurance instrument (i.e. demolition of all structures and remediation of sites [fencing the perimeters, sloping and seeding the overburden, constructing outlet structures, removing culverts, etc]) yet fails to provide any estimated costs or the basis for these costs.	COOP01, FIN05
2967	The SDEIS notes, PolyMet would ensure that the financial assurance amount is established as a function of at least three main variables: 1) extent of surface disturbance and potential releases from waste storage facilities, 2) reclamation and long-term care standards (including mechanical water treatment), and 3) reasonable assessment of the costs to execute the Contingency Reclamation Plan. The SDEIS provides no discussion as to how these variables are likely to impact overall costs of the financial assurance instrument and how large the variance of cost estimates are likely	COOP01, FIN05, FIN08
2968	The costs provided in Table 3.2-15 provide no basis for their estimation or other assumptions. The SDIES failed to provide detailed costs for the physical closure and reclamation of the mine site that will need to be covered by Financial Assurance Instruments – a detailed discussion as to how much money will be needed from financial assurance instruments and when.	COOP01, FIN05, FIN08
2969	Cost to be covered by Financial Assurance need to include detailed information and cover the following areas: 1) interim operations and maintenance for agencies when a company declares bankruptcy and leaves the site, 2) water management and treatment, 3) removal of hazardous wastes and substances, 4) demolition, removal and disposal of facilities and equipment, 5) earthwork (sloping, backfill, grading), 6) revegetation, 7) long-term operations and maintenance, 8) Monitoring costs, 9) detailed inflation estimates, 9) provide a cash flow analysis, and 10) detail assumptions in the determination of risk and uncertainty.	COOP01, FIN03, FIN05
2970	In addition to providing detailed cost estimation, the final EIS needs to clearly identify and communicate assumptions regarding inflation rates, rates of return, contingencies, and labor rates. Closure and maintenance costs will need to be covered years into the future, so a net present value must be included in the final EIS.	COOP01, FIN05, FIN08
2971	The SDEIS provides a listing of contingencies that may have to be covered by financial instruments... Unfortunately the SDEIS provides no discussion as to any of the costs of the contingencies that are identified. The SDEIS also fails to discuss how financial instruments would be structured to meet those contingencies or the assumptions made by PolyMet to ensure an adequate stream of revenue is available to meet closure and maintenance costs	COOP01, FIN05, FIN08
2973	The SDEIS notes, PolyMet may cancel financial assurance only upon approval by the MDNR after it is replaced by an alternative mechanism or after being released (in whole or in part) from financial assurance. The SDEIS fails to discuss any federal oversight of this process and how the federal government will meet its trust responsibility in protecting habitats that support off-reservation treaty harvests.	COOP01, CR01
3049	Depending on the exact placement of the drain cells, the modified modeling [glifwc conducted] resulted in an estimate of 588 to 847 gpm of flow through the east berm of the basin. This flow is on a scale similar to the flow predicted for the south berm discharge at SD026 (570 gpm, RS13B Draft-01; or 540 gpm, Polymet 2013j). That the predicted discharges at the south berm and at the east berm are similar is logical because both areas are underlain by bedrock valleys filled with high conductivity surficial deposits. In the context of the predicted total discharge from the FTB at year 20 (3340 gpm, RS13B; or 3230 gpm, Polymet 2013j) the 588-847 gpm prediction suggests that approximately 1/5 of the FTB water would exit through the east berm.	COOP01, WR102
3054	NorthMet water management plan version 2 states that the south side seepage capture facility is already operational. The SDEIS further states that the system is operating effectively and capturing all seepage out of the south end of the facility. This statement is factually incorrect.	COOP01, WR117

<b>Sender Name (Submission ID)</b>	Great Lakes Indian Fish and Wildlife Commission (42952)	
3055	The SDEIS discusses Cliffs Erie site, identifies 62 Areas of Concern (AOC's), and discusses PolyMets role in site remediation. The SDEIS failed to provide any information as to cost estimates for addressing the legal requirements for mitigating the AOC's as identified. This information is needed to ascertain if the proposed project would further contaminant AOC's and increase clean-up/remediation costs.	COOP01, HAZ05
12501	The importance of baseflow in understanding site hydrogeology is hard to overstate. Unfortunately, the quality of flow data collected at the Polymet site is poor and fraught with uncertainty. Because there has not been a Polymet stream gage at the site and Northshore pit dewatering has occurred into the Partridge at varying and uncertain times, all flow data from the site is suspect. Simple upstream, at-site, and downstream flow measurement would have provided higher quality data but was never collected by the applicant nor required by the state.	COOP01, WR003
12502	The mine site water modeling data package very clearly states (SDEIS reference Polymet 2013i, pg 123 & 133) that the 1 cfs added to Goldsim modeling was to account for constituents added to the Partridge by pit dewatering from Northshore; It is not relevant to baseflow calculations nor is it relevant to determination of aquifer conductivity or groundwater travel times.	COOP01, WR005
12504	Polymet Modeling of Flow from the Basin:Polymet modeling with MODFLOW (RS13 Attachment A-6 2007; RS13B Attachment A-6 2008; Polymet 2013j Attachment A 2011), for the FTB has prevented any discharge of basin water to the east by erecting a no-flow boundary at the surface of the berm and at the ground surface. This no-flow boundary is an artificial construct that has no basis in reality. In reality, flow to the east will be controlled by the relative head pressures and the conductivity of the materials in the FTB, beneath the FTB and in the berms.	COOP01, WR093
12510	Geology Beneath the East Berm:Examination of the geologic data for the site indicates that the east berm of the FTB sits on a bedrock valley filled with surficial material that is 25 to 50 feet deep. The bedrock valley under the east berm is the historical stream channel for Trimble Creek prior to the creation of the current tailings basins (Figure 1). The thickness of the surficial material under the east berm is indicated as 25 to 50 feet in the depth to bedrock map of the SDEIS Figure 4.2.2.-12 (Figure 2) and in the depth to bedrock map MN Geological Survey M-126. The distribution of bedrock under the FTB has been represented in 2 ways during Polymet MODFLOW modeling. Technical document RS13 of Nov. 16, 2007 Attachment A-6 Fig. 4-2 showed bedrock in the 2007 MODFLOW model as extending under the eastern quarter of the tailings basin. In technical document RS13b of Sept. 8, 2008 Attachment A-6 Fig. 4-7h, bedrock in the 2008 model did not extend under the basin but rather showed the basin to be underlain with surficial material. The text of RS13b, section 4.6.1 of Attachment A-6 states: "The location of the bedrock hills that flank the Tailings Basin to the east and south were updated. The location of the bedrock hills is used in the model to define the extent of the low hydraulic conductivity zone that represents the bedrock. Because the footprint of the Tailings Basin – Mitigation Design is closer to these hills on the southeast side of the footprint than was the footprint for the proposed design, it was important to get the location of these hills as accurate as possible. The location of the bedrock hills was defined using information from the Minnesota Geological Survey's map M-164. The resulting zones of hydraulic conductivity can be seen on Figure 4-7."The extent of the tailings basin footprint represented in RS13b is the same extent as currently proposed in the SDEIS. However, evaluation of flow from the basin using MODFLOW and Goldsim appears to have fallen back to the 2007 representation of the basin footprint and of the underlying bedrock (see GLIFWC comment re: SDEIS modeling and mitigation basin design). Wildlife Commission (42952)

12520 Conceptual Model of East Berm: A conceptual diagram of the east berm is provided below. The head difference between the top of the basin (~1720 ft), the head pressures expected in the surficial deposits below the center of the basin (1700 ft; RS13b, 2008), and the head pressure at the toe of the basin (1660 ft) will push water toward the toe of the east berm. The 25-50 feet of surficial deposits in the bedrock valley under the east berm will conduct water under the east berm and beyond. Revised MODFLOW Modeling of Discharge from East Berm: In order to investigate the approximate magnitude of discharge that would exit the east berm of the FTB, we conducted modified MODFLOW modeling of basin flows in year 20 of the project. To simulate the basin but without the no-flow boundary imposed in previous Polymet modeling, we used the 2008 Polymet MODFLOW model (RS13B Draft-01), with the sole modification being the placement of model drain cells at the east berm. The original 2008 model predicted flows of 3340 gpm from the basins, 570 of which was predicted to flow to the seepage barrier on the south side of the basins (SD026) but no flow to the east because of the no-flow boundary instituted in that model (RS13B Draft-01). Our placement of drain cells in the east berm area of the MODFLOW model enabled water to move east from the berm, rather than reverse flow to the north, west and south as was dictated by the no-flow boundary. The use of drain cells at the east berm to allow eastward movement of water is an identical approach as that implemented by Polymet for the south berm of the tailings basin where the discharge to SD026 is modeled by drain cells. Depending on the exact placement of the drain cells, the modified modeling resulted in an estimate of 588 to 847 gpm of flow through the east berm of the basin. This flow is on a scale similar to the flow predicted for the south berm discharge at SD026 (570 gpm, RS13B Draft-01; or 540 gpm, Polymet 2013j). That the predicted discharges at the south berm and at the east berm are similar is logical because both areas are underlain by bedrock valleys filled with high conductivity surficial deposits. In the context of the predicted total discharge from the FTB at year 20 (3340 gpm, RS13B; or 3230 gpm, Polymet 2013j) the 588-847 gpm prediction suggests that approximately 1/5 of the FTB water would exit through the east berm. Implication of Faulty Modeling of Discharge to the East: At least three problems arise from the current situation of SDEIS modeling of the FTB with a no-flow boundary on the east and inaccurate representation of bedrock: 1) There is no contaminant transport modeling or evaluation of the water leaving the east side of the basin. Without substantial engineering to remove the water, a lake toward the 1680 foot contour would form (Figure 4) until water spilled toward Spring Mine Lake. The Flotation Tailings Management Plan (Polymet 2013m, page16) discusses the need for a drainage swale to release stormwater from the topographically closed area to the east of cell 1E. In the SDEIS or supporting documents, there is no discussion of tailings pond water exiting the basin into this topographically closed area. There is no accounting for contaminants moving eastward, and there is no description of their possible impact on receiving ground or surface waters. 2) There are potential receiving surface waters near to the east berm; wetlands at the toe of the east berm, Spring Mine Lake & Spring Mine Creek to the east, and wetlands and an unnamed creek to the north of the proposed drainage swale. 3) The Polymet MODFLOW modeling was designed to prevent any water from leaving the east side of the basin by establishing no-flow boundaries on that side of the model. Because of the noflow boundaries, the model output files (Northmet Model Files DVD, BARR July 2012) show extremely unrealistic groundwater heads in the aquifer surrounding the east side of

12525	<p>SDEIS MODFLOW Modeling Appears to be of Fatally Flawed and Discarded Tailings Basin Design. Modeling in the SDEIS appears to be of a Flotation Tailings Basin (FTB) design that was discarded several years ago and does not model the currently proposed basin design. The 2007 FTB design, that is modeled in Attachment A (2011) of Polymet 2013j, was deemed to be "fatally flawed" by the MNDNR (Mitigation Table, Arkley email of 2008/12/09) and was replaced by the "mitigation" design developed in 2008. GLIFWC staff have posed a series of questions to the lead agencies regarding the modeling for water quantity and flow direction at the FTB. ERM has provided a series of written responses to those questions. The 2014-03-10 Response 4 from ERM re: the Plant Site MODFLOW modeling identified Attachment A of the Water Modeling Data package of March 2013 (SDEIS reference Polymet 2013j) as the documentation of the tailings basin flow modeling for the SDEIS. Careful examination of the scant information in the above referenced Attachment A (2011) indicates that the modeling done in 2011 for that attachment was not of the FTB as currently proposed. The footprint modeled for attachment A is the footprint of an early FTB proposal from 2007 (Figure 5) that was supplanted by the FTB design developed during the "Mitigation Options" process of 2008. The 2008 mitigation FTB design (Figure 6) is the current design footprint assumed in the text of the SDEIS (SDEIS Fig. 3.2-23). In addition to using a discarded FTB design footprint, the modeling in Attachment A also used a crude representation of bedrock that was supplanted by a more refined bedrock representation during the modeling of the 2008 mitigation design (RS13B Draft-01, 2008). The diagrams and model files supporting Appendix A (2011) further demonstrate that the modeled footprint is of the 2007 fatally flawed FTB design (see footprints in layer 1 of 2007 (Figure 7) and 2011 (Figure 8) models, attached), instead of the mitigation basin design (see footprint in layer 1 of 2008 model, (Figure 9)). The rejected basin design had a smaller footprint and did not extend as far to the south and south-east. Unlike the current design, the rejected design did not cover the ash disposal site in the south-east end of the FTB. It appears that the SDEIS Goldsim (water quality) modeling is based on MODFLOW (water quantity) modeling of an old FTB design that was deemed fatally flawed and is not modeling the currently proposed FTB design.</p>	COOP01, WR094, WR098

12541	<p>Perpetual Water TreatmentThe proposed Polymet project would require long term treatment of water at both the plant and mine sites. This treatment would be needed for centuries but the lead agencies have not required that the applicant provide an estimate of when treatment would no longer be needed. Therefore, as articulated in Chapter C, GLIFWC staff maintain that water treatment for the proposed Polymet mine is perpetual.GLIFWC staff are gravely concerned that the lead agencies are attempting to minimize the issue of perpetual/long term treatment by using vague and confusing language in the SDEIS. In addition, the language the lead agencies have used has changed during the development of the document even though the model results have not. The SDEIS states on page 5-7: “Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through monitoring requirements.” (Emphasis added)In response to comments on the PSDEIS (Comment GLIFWC1) the Co-Lead agency disposition states: “Modeling predicts that treatment activities will be a minimum 200 years at the Mine Site and a minimum of 500 years at the Plant Site. While long-term, these time frames are not necessarily perpetual. The owning company would be held accountable to maintenance and monitoring required under permit and would not be released until all conditions are met” (Appendix C SDEIS) (Emphasis added)It is impossible to reconcile these 2 statements. We agree that the duration of simulations were based on capturing the highest predicted concentrations of the modeled action. However, those concentrations require water treatment to avoid violating water quality standards. This treatment is at minimum 200 years at the mine site and 500 years at the plant site. As the lead agencies indicate, these time estimates are only minimums and there is no information that points to a time when water treatment would not be needed. Finally, while the maximum contaminant plume is predicted to occur at the 200 and 500 year mark for the mine and plant sites respectively, this does not mean that contaminants immediately drop to zero. The reduction would be gradual and perhaps last for another few centuries. In addition the SDEIS states on page 5-56: “The attenuation effect resulting from sorption is significant enough that arsenic, copper, and nickel are not predicted to travel from source areas to any evaluation locations or the Partridge River within the 200 year model simulation period (Barr 2013f). Analytical calculations suggest that the travel times for these solutes would be in the order of thousands of years.”This statement suggests that water treatment activities would be required far beyond the 200 year time frame at the mine site and would be on the order of thousands of years. Therefore, the only logical conclusion is that water treatment is perpetual at this project.It is also important to note that, in the response to GLIFWC comments on the PSDEIS, the lead agencies acknowledge monitoring and maintenance requirements during the same 200 (mine site) and 500 (plant site) year timeframe.The SDEIS requires substantially more transparency on one of the most fundamental issues at stake for this project. The fundamental question is: how long will the company be required to operate and maintain expensive mechanical treatment to meet water quality standards? This singular issue has significant repercussions for the public interest determination</p>	COOP01, FIN05, WR035, WR036, WR037

12544	<p>Indirect Wetland Impacts. The methods used in the analysis of indirect wetland impacts in the SDEIS are essentially the same as the 2009 DEIS. GLIFWC staff reiterate the comments we have provided in the past that the method is overly simplistic, based on a flawed conceptual understanding of hydrology at the mine site and inadequate for the NEPA process of a large scale sulfide mine. The SDEIS has underestimated baseflow at the mine site. The entire conceptual model of perched wetlands with hydrology that is completely decoupled from groundwater was supported by the use of unrealistically low baseflow numbers. Now that the applicants XP-SWMM model has been discredited and that it is obvious that the movement of groundwater at the mine site is 3 times greater than the SDEIS indicates, the assumption that wetlands will not be impacted by groundwater drawdown should be abandoned. The higher baseflow numbers support the independent analysis of indirect wetland impacts provided by the tribal cooperating agencies in Appendix C. The lead agencies have also based their analysis on the Bog Memo prepared by the Army Corps of Engineers (Eggers, Steve (2011) MEMORANDUM SUBJECT: Distinguishing Between Bogs That Are Entirely Precipitation Driven Versus Those with Some Degree of Mineral Inputs from Groundwater and/or Surface Water Runoff). This memo uses plant community information to determine the degree of hydrologic connectivity between a wetland and groundwater. The conclusions in the memo are appropriate for a system that is not experiencing depressurization of the aquifer (drawdown). However, when mine induced drawdown occurs, new downward pressure gradients are created. Whittington and Price documented that these downward hydrologic gradients can in fact dewater wetlands that are entirely surface water dependent under normal conditions (Whittington, PN and JS Price, The effects of water table drawdown (as a surrogate for climate change) on the hydrology of a fen peatland, Canada.) HYDROLOGICAL PROCESSES, 20(17), 3589-3600. 2006). The bog memo is not an assessment of the hydrologic conditions of wetlands in a dewatered state but rather an assessment of surface hydrology under normal conditions. The indirect wetland impact analysis should be performed using realistic hydrologic assumptions and appropriate mitigation should be required.</p>	COOP01, WET08, WR003, WR175

12566	<p>Seepage Capture Efficiency. As detailed in comments submitted to the lead agencies for the 2009 DEIS and for the current SDEIS, water quality analyses for the Partridge and Embarrass Rivers are inadequate. The results, be they deterministic (DEIS) or in the form of probability distributions (SDEIS) are based on a flawed understanding of hydrology at both mine site and plant site. This flawed understanding, reflected most prominently in the errors in baseflow calculations, is carried forward to the MODFLOW hydrologic modeling. At the mine site MODFLOW under-predicts the amount of water that would flow into the mine pits and thus under-predicts the amount of water treatment needed for both short and long term closure. At the plant site, the MODFLOW model is constructed in a way that is not representative of reality and therefore yields results that are not logical. The lead agencies appear to disregard these problems because there is faith that the seepage capture and treatment systems will work at over 90% effectiveness for centuries. The SDEIS claims of long term compliance with applicable water quality standards depend entirely on this leap of faith. On conference calls scheduled to discuss these issues, the lead agency consultants have stated that the effectiveness of the capture systems have not been questioned and the lead agencies have not been able to provide any references that would support their position. We suggest that there are substantial reasons for skepticism regarding capture efficiency for the flotation tailings basin, hydrometallurgical tailings basin, and category 1 stockpile seepage capture systems. This skepticism is based on available literature and the performance of other facilities in the immediate vicinity. The EPA conducted an analysis of the effectiveness of seepage capture systems (Evaluation of Subsurface Engineered Barriers at Waster Sites, United States Environmental Protection Agency (EPA), 1998). This analysis looked at capture systems at 36 facilities and evaluated their effectiveness based on the performance requirements at each site. It is difficult to extrapolate the results of this analysis to the Polymet setting because a) the required effectiveness varied from facility to facility; b) the way in which effectiveness was measured was different (i.e. water quality improvements downstream versus change in hydrologic head pressure) and c) data collection varied between facilities. Despite these difficulties, the report indicates that 10% of the reviewed containment systems failed to meet the desired performance objectives and required corrective action. An additional 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not. Furthermore, there is no information on the effectiveness of any of these facilities at timeframes remotely comparable to the needs at Polymet. In the EPA report, long term is considered 30 years whereas the water capture needs at Polymet are perpetual for the flotation tailings basin, category 1 stockpile and hydrometallurgical tailings basin. Finally, none of the facilities in the study are as large as the one proposed at Polymet. At the tailings basin, Polymet has proposed to install a seepage collection system around the north and west sides of the facility. The scale of this engineering control is extensive. It would be approximately 5 miles long and would have to be keyed to bedrock that is 25 to 50 feet below ground surface. The most likely pathway for leakage at this barrier will be in the vicinity of the key with bedrock (EPA 1998). This feature, and the similar containment system at the Category 1 waste rock stockpile are assumed to capture 93% of water leaving the facilities for an indeterminate period of time. As previously stated, there is no scientific justification for this number. The only examples we are able to identify at this time suggest capture rates that are lower. In t</p>	COOP01, WR003, WR009, WR010, WR013, WR018, WR019, WR020, WR099, WR117, WR123
12568	<p>Summary for Seepage Capture Comments. The prediction of water quality standard compliance for this proposed project hinges on the perfect operation of the water capture systems. The reliance on this engineered containment system that uses overly optimistic capture rates and must function in perpetuity is not scientifically supported and therefore is not appropriate for the SDEIS. The water quality and quantity impacts at both plant site and mine site should be remodeled by using a range of capture efficiencies. We suggest 60%, 70%, 80% capture rates be modeled for the tailings basin and category 1 stockpile. Water quality values for each of these capture rates should be reported. This will allow the public and decision makes to have a realistic picture of the risk and uncertainty for this project. Seepage capture at the flotation tailings basin does not account for seepage out of the east side of the basin. The seepage capture system should be expanded to account for this expected discharge. A MODFLOW model was developed to assess the amount of seepage that would flow out of the basin. As detailed in GLIFWC comments, that model is designed in a way that does not conform to reality and therefore the results are unreliable.</p>	COOP01, WR017, WR018, WR022, WR035, WR093, WR129, WR133

12573	Ability of Goldsim to Accurately Predict Contaminant Concentrations: We remain concerned about the inability of Goldsim to accurately predict current and future contaminant concentrations. This is particularly troubling in the lower Partridge River (e.g. SW005) and in Colby Lake where Goldsim predictions of current conditions appear to be inaccurate. In recent conversations with the lead agencies and ERM, there has been agreement that the modeling in the SDEIS does not accurately capture the environmental conditions at Colby Lake. Additional modeling of this waterbody is needed to assess impacts of the proposed project and to evaluate the suitability of Colby Lake water for use in augmenting the flow of other waterbodies. In addition, the discrepancies between modeled and observed data at SW005 should be addressed in detail.	COOP01, WR049
12575	The SDEIS does not adequately address mercury concerns.	COOP01, MERC01
12580	Wild Rice Standard. The concerns over the MPCA's interpretations and recommendations regarding the wild rice sulfate standard have not been resolved. The information provided in Appendix C is still applicable to the SDEIS. In addition, staff believe that water quality modeling underestimates the amount of sulfate at points of compliance. Even with this problem, contaminant modeling suggests that the sulfate standard will be violated in the Partridge River points of compliance approximately 10% of the time. While this may meet the lead agencies arbitrary evaluation criteria (standard met 90% of the time) it certainly is not enough to warrant the issuance of an NPDES permit. At the Embarrass River the standard is already exceeded at the point of compliance because of historic contamination from the tailings basin and the area 5 pits. It is not clear if the capture system around the tailings basin will function well enough to allow the standard to be met.	COOP01, WR152, WR153, WR154
12601	Impacts from Rail Car Spillage. The concerns regarding the hydrologic impacts of sulfide ore dust spillage along the rail corridor have not been resolved. The information provided in Appendix C is still applicable to the SDEIS.	COOP01, PD07, WR151
12602	Loss of High Biodiversity Significance Values Sites. The concerns regarding the loss of high biodiversity sites such as the 100 mile swamp, Lynx and Moose habitat and remaining wildlife corridors have not been resolved. The information provided in Appendix C is still applicable to the SDEIS.	COOP01, WI04, WR080
12604	The Supplemental Draft Environmental Impact Statement (SDEIS) NorthMet Mining Project and Land Exchange failed to adequately address closure and maintenance costs and length of time for post-closure treatment in the context of financial assurance requirements.	COOP01, FIN05
12605	Within the 54 pages of Executive Summary only a single paragraph addresses the issue of financial assurance as noted below:	COOP01, FIN08
12607	The SDEIS failed to clearly state how the State of Minnesota will determine the maximum bond requirements,	COOP01, FIN05
15020	In determination of baseflow, all GLIFWC's calculations have excluded Northshore pumping from the calculation. The Dec. 17th MNDNR memo (Attachment A) also picked a period when pumping for Northshore pit dewatering was not occurring so as to calculate true baseflow. The 1 cfs added to GoldSim modeling of the Partridge, mentioned in various DNR documents, is irrelevant to the calculation of baseflow and does not solve the modeling problems in XP-SWMM, MODFLOW and by extension GoldSim. Some of the implications of incorrect baseflow are highlighted on page 114 of the water modeling data package (March 2013), in our memo of 2012-03-02, and in GLIFWC's baseflow summary of 2014-02-13 (Attachments B, C, and D respectively).	COOP01, WR052

15021	Because the implications of baseflow are substantial when it comes to a basic understanding of the mine site hydrogeology, all modeling of flow and by extension contaminant transport must be re-calibrated to the higher baseflow numbers indicated by GLIFWC's analysis of 2013-07-02 (Attachment E) and DNR's 2013-12-17 analysis (Attachment A). Page 114 of the mine site Water Modeling Data Package makes it clear that re-calibration of the MODFLOW model generates new conductivity values that are then fed into Goldsim. It states: "The revised model calibration resulted in different optimized values for the horizontal hydraulic conductivity of the surficial aquifer and bedrock, which are used to establish the distribution of values used for the probabilistic groundwater flow path modeling (Section 5.2.3.1)." It is also clear that higher hydraulic conductivities for the aquifers result in faster contaminant transport to points of evaluation.	COOP01, WR003
15022	Although baseflow assumptions have significant effects on Goldsim modeling, the implication of re-calibrating the MODFLOW model go beyond the conductivities used in the GoldSim modeling. Higher baseflows imply higher conductivities that imply faster and greater groundwater flow rates. This affects:1) The amount of water expected to flow into the mine pit as it is excavated.2) The amount of drawdown of Partridge River flow that can be expected due to pit dewatering.3) The amount of wetland dewatering that can be expected due to pit dewatering.Given the uncertainty in baseflow numbers due to the poor quality flow data, it is reasonable to re-calibrate the MODFLOW model to a range of values that included the previously assumed baseflow and the newer, higher baseflow numbers.	COOP01, WR003, WR086, WR094, WR098, WR165, WR166
15023	Discharge From East Berm of Flotation Tailings Basin:Significance:The contaminant transport analysis at the Flotation Tailings Basin (FTB) does not include any accounting for discharge through the east berm of the basin. There are 3 reasons why discharge through the east berm will be enough to cause environmental concern:1) the flow distance between the final FTB pond in cell 1E and the exterior of the east berm is relatively short compared to flow distances from the pond to the north and west berms (SDEIS Figure 3.2-29).2) the east berm is underlain with 25-50 feet of conductive surficial material (SDEIS Figure 4.2.2.-12 and Figure 2 below).3) the basin pond level is 1720 ft, the land elevation east of the basin is 1660 ft (Lidar data: <a href="http://www.mngeo.state.mn.us/chouse/elevation/lidar.html">http://www.mngeo.state.mn.us/chouse/elevation/lidar.html</a> ). The elevation difference between the pond and the adjacent land surface is substantial; 1720 ft - 1660 ft = 60 ft.	COOP01, WR054
15024	Discharge From East Berm of Flotation Tailings Basin:Significance:Because there has been no prediction of discharge from the east side of the FTB, there was no flow path established or contaminant transport analyzed in the easterly direction. The SDEIS is completely devoid of any mention or analysis of flow from the basin toward the east. Receiving waters for the contaminated discharge would be wetlands adjacent to the basin, Spring Mine Lake, Spring Mine Creek and wetlands to the north if a proposed storm water drainage swale is constructed.	COOP01, WR054
<b>Sender Name (Submission ID)</b>	Great Northern Solar (43595)	
12503	The mine plan inaccurately describes wild rice waters, understating the area that supports stands of wild rice.	VEG04, WR154
15467	the mine plan claims to reduce sulfates, but that assumes that expensive water treatment will continue for hundreds of years. Millions of gallons of untreated polluted water will escape every year, and the mine plan predicts an increased chance that water exceeding the sulfate standard will be released at times, years after closure.	PD03
15469	The company's own computer models show that hundreds of years after the mine closes, water seeping into groundwater and flowing into streams and rivers at the site will be polluted with heavy metals and sulfates. Unless all of this water is captured and treated, the mine will pollute surrounding waters.	WR115, WR128
15472	Minnesota law requires that a closed mine site be "maintenance free," but PolyMet's mine plan calls for hundreds of years of monitoring and expensive water treatment. Worse, these models don't even show that the pollution stops after 500 years. They just stopped modeling at 500 years. In other words, the pollution could go on for even longer.	WR037, WR195

15474 PolyMet would be a huge consumer of electricity, much of it coming from the dirtiest coal power plants in Minnesota. PolyMet’s electricity supplier, Minnesota Power, got 85% of their power from coal in 2013.    AIR02, PD39

15480 The tax estimates in the PolyMet mine plan lack detail, are full of discrepancies and contain [un]explained changes. From one draft of the mine plan to the next the estimated taxes jumped 500% without explanation. This is important, since the state taxes that would apply to a copper-nickel sulfide mine have never been used before.    FIN05

15483 The copper-nickel mining industry is exempt from several state and local taxes, such as property tax and corporate income tax, and has its own unique tax structure. Therefore, the State of Minnesota should confirm these tax estimates, and not just rely on the company to provide them.    SO04

**Sender Name (Submission ID)**    Greg Allen (18106)

3349 PolyMet mining will bring in new jobs, which will bring in new families. School enrollments and our ability to add teachers, class offerings and new technology will increase as a result.    SO10

13472 Many districts have been forced into short-term borrowing to cover costs. Schools on the range do not receive property tax from the mines. They receive a taconite tax, when the mines are producing. This extra funding helps, but it is not stable funding. PolyMet mining will bring in new jobs, which will bring in new families.    SO10

**Sender Name (Submission ID)**    Greg bastien (43115)

11700 At the financial hearing conducted by the House it was clear that the review process for possible catastrophic events only takes in short term events. The failure of a holding pond or undetected ground water infiltration could leave the state with liabilities that extend to other states and Canada with only sufficient funds to handle short term plugging of holes. The \$2-4 billion down payment in a trust fund would be difficult to administer and with successors likely for the company in the future distributing any excess at the end of the period when the material from the mine is safe would be problematical.    FIN01, FIN05, FIN08

11704 the reuse of the old mine facilities is economically prudent for the company the difference in sulfide mining and taconite mining is considerable and the safety net for water resources is and would be insufficient. All ponding would have to meet a 300-500 year impermeability standard. All processing would have to be contained with no release to outside air and water.    PD27, WR195

11707 While not impossible these safeguards would drive the cost so high that the promised 20 year window of production would close much sooner the short term gain would be that much less with fewer jobs and less payroll.    SO02

**Sender Name (Submission ID)**    Greg Benedict (26618)

15253 The more forest/protected land that goes to these giant excavations, the more pollution and disruption of natural processes will occur. ... Many push the idea of money over everything. Its never about the everyday people who make connections, memories, and above all harmony with the land.    SO01

15254 I would feel deeply disappointed if I witnessed any more significant damage to the places I love to visit like Superior National Forest and BWCAW. They aren't just places to go, they are places that facilitate spiritual growth and understanding. Places that are relaxing, slow, peaceful, and calm. The experiences of complete wilderness are beyond anything in a book.    WILD02

<b>Sender Name (Submission ID)</b> Greg T. Lehman, MD (42914)		
9505	The Minnesota Health Department found 1 out of 10 infants in Minnesota’s Lake Superior Region are born with unsafe levels of mercury in their blood.	MERC03
9506	We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue.	MERC02
9507	The lower reaches of the St. Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury.	MERC19
9508	We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury.	MERC20
9509	Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient.	MERC20
9511	he SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation.	MERC20
9512	The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	MERC15
9513	We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the Minnesota Health Department.	HU01
9514	An HIA would integrate human health into the environmental review for the PolyMet NorthMet proposal, allow consideration of mitigation measures, and involve the community in planning for the project.	HU01

CU04
<b>Sender Name (Submission ID)</b> Gregory Johnson (17713)		
1990	Reverse osmosis has three streams: plant feed stream and in this case, per miningtruth.org's web site, this is 6.5 million gallons a day; plant discharge stream which in this case would be less than 10 ppm sulfate discharge from the plant; and the reject stream which in this case would be 10-15 percent of the feed stream. This reject stream of 700,000 or so gallons per day would contain 98 to 99 percent of the feed sulfates. My concern is in how the reject stream is treated and whether this concentration effect over the life of the mine is being evaluated.	PD03, WR143
1991	The professors talked about the ability of the wetlands to diminish and treat the waste [discharge]. What is the proof of this? ... Absorbent systems have a finite capacity and I am concerned that this has not been addressed in a scientific way. My understanding from the presentation is that the flow rate used in the study is significantly lower than the actual flow rate at the site.	WR137
1992	The aquifer is very shallow, 20-60 feet, and digging several very large 700 foot deep pits has got to have an effect on the wetlands. I was dismayed by the assumption that this was not a factor that needed to be addressed. I think this project would impact far more than 900 acres of wetlands.	WET24

<b>Sender Name (Submission ID)</b> Greta Bergstrom (46344)		
8913	I am writing to request that you revise the draft EIS to address Minnesota Rules 6132.3200, clarifying to the public how the post-closure activities described in the mine plan are consistent with the mandate that the mine site be “maintenance free” upon its closing. It is my understanding that existing data in the water management plan supporting the SDEIS show that sulfates and metals will dramatically exceed water quality standards for hundreds of years after closure.	PER04
8914	As we know, releasing sulfuric acid into our water supply will taint it. The reverse osmosis water treatment that will be required for hundreds of years appears (to me) to be in conflict with Minnesota Rules requiring that mines be "maintenance free" at closure, bringing the project truly to a close without harm to our environment or excessive costs to state taxpayers. Please show how exactly PolyMet’s North Met mining project would meet applicable water quality standards upon completion/closure given these Rules.	PER04
<b>Sender Name (Submission ID)</b> Gretchen (45407)		
12807	The mining companies quickly disappear when the profits are gone and leave the ravaged environment for the taxpayers to clean up.	FIN01
12808	One has to look at the taconite mines past to realize the horrendous impact a copper mine would have on our state jewel-the boundary waters.	WR023

17451	I think that PolyMet Mining has a good plan in place. I think that this copper-sulfate mining process will benefit Minnesota. Some of the advantages that there will be are more jobs open for people for mining and mechanics. It could bring more businesses over, opportunities and industries too.	SO10
17592	Water and air pollution could be a problem if they are not treated right. Also some of the chemicals could harm the environment around the area too.	GEN01
17593	It could affect cultural resources by stunting the growth of the wild rice if not treat properly, same with the runoff water and rivers.	CR01
<b>Sender Name (Submission ID)</b> Hannah Maertz (43835)		
11852	Even the company acknowledges the large amount of water pollution that will occur for hundreds of years after the mining takes place.	PD01, WR115
14950	As a Minnesotan, I am proud of our states abundant water supply and our ability to ensure it's quailty. I believe this mine would greatly jeporadize that.	GEN01
17406	The proposed mine plan does not keep Minnesota's water safe and clean. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated.	WR070
<b>Sender Name (Submission ID)</b> Hannah Miller (45113)		
7644	There is no way that a few decades of questionable profit are worth a future of waste and pollution.	SO01
16740	Who has ever lived five hundred years?...What company has ever lived so long, to clean up the wreckage it has wrought?	FIN01
<b>Sender Name (Submission ID)</b> Hans Olsen (57543)		
19539	The SDEIS section on Cumulative Effects must include some high level analysis of the impact of multiple copper / nickel mines processing their ores in this immediate vicinity, and of PolyMet processing larger volumes for longer periods. There needs to be some conceptual analysis of the impact on these headwaters of multiple copper / nickel mines operating there for a hundred years.	CU13
19540	a specific analysis needs to be done of Twin Metals processing their ores using excess processing capacity at this same site. That possibility is too real and too imminent to be excluded from your analysis. At a bare minimum this EIS needs to identify one backup site for an additional tailings basin and needs to update the impact on the local hydrology assuming a doubling of the projected volume of ores processed in this same time frame. That analysis needs to consider refilling the West Pit at twice the forecast rate.	CU02
19541	The assessment of cumulative effects should not be limited to known specific planned mining in this area. The analysis needs to be expanded to consider the effect of a deliberate decision by the State of Minnesota to permit copper / nickel mining anywhere in the Duluth Complex, but restrict processing of such ores to the St Louis River drainage only.	CU13
19542	the SDEIS is the right place to begin assessing how the hydrology in the headwaters of the St. Louis River drainage would be impacted by concentrating all copper / nickel ore processing here and keeping it completely out of the Kawishiwi River drainage.	CU13
19543	The SDEIS should make a global assessment of the relative risk of mining this ore vs. processing the ore.	SO04

<b>Sender Name (Submission ID)</b> Hans Olsen (57543)		
19544	The Forest Service needs to consider precisely how the land exchange would be impacted by multiple mining companies processing ores in this same area. In particular they need to assess potential areas for additional tailings basins and storage stockpiles on what is currently Federal Land in these same headwaters.	CU10
19545	The hydrology projections need to be modeled considering the possibility of extreme rain fall events in the immediate vicinity of the plant. The model needs to be run assuming 1 inch of rain per hour for 24 hours immediately over the tailings basin.	WR077
19547	The SDEIS needs to include an analysis of a catastrophic failure of the containment systems for the NorthMet tailings basin.	WR202
19548	The SDEIS and the Army Corps of Engineers need to identify secondary and even tertiary containment areas that would be publicly funded in anticipation of failures of the corporate financed primary containment systems. This needs to include an analysis of various dams and dikes in the immediate vicinity of the plant and further downstream in the St Louis River system designed to contain spills that escape the plant area and that also manage extreme storm runoff efficiently.	WR130
19549	An alternative needs to be identified for using water from Colby Lake for ore processing in the event that use of such lake water is denied or withdrawn later. In particular, the efficacy of various proposed provisions to capture and retain spring snow melt for ore processing need to be assessed in the event no water from Colby Lake can be used.	ALT12
19551	The SDEIS needs to identify an alternative water supply for Hoyt Lakes in the event the current source is adversely impacted.	WR140
19552	The SDEIS needs to consider using solar panel arrays designed and equipped to channel and collect rainwater, as a supplementary cover to cap the tailings basin slopes and beaches, over class 2, 3, and 4 temporary stock piles, and over the Hydrometallurgical Residue Facility during active processing. Floating arrays could even be considered over the tailings pond.	ALT13
19553	The SDEIS should address potential threats to wild rice waters the same way wetlands are treated, i.e., as candidates for compensatory mitigation. The SDEIS would be substantively improved by simply assuming a fixed acreage of wild rice needs to be replaced just as wet lands are replaced.	WR155
19554	Two new roads need to be built at public expense to carry employee traffic to and from this massive work area that eventually will house multiple mining operations here... Both these road beds could become part of the dike system designed for the proposed Embarrass River containment area.	PD36
19555	Each relevant map in the SDEIS needs to have an overlay showing the location of the Laurentian Divide.	PD38
19556	It seems self evident that Colby Lake cannot be the sole source of processing water for multiple mines operating in this same area, and The Whiteface Reservoir cannot be the sole source of municipal water for a community in the direct line of impact from any catastrophic failures at these plant sites, though the proposals contained here for the Partridge River may well address the latter concern.	WR140
<b>Sender Name (Submission ID)</b> Harlan (43962)		
7042	The likelihood of a breakdown in PolyMet's proposed operations is great, and the consequences to the environment would be disastrous, especially in this fragile and water-rich part of the Lake Superior watershed.	PD22
7043	The short-term economic benefits of the mine would not be worth the price of the potential long-term harm.	SO01

<b>Sender Name (Submission ID)</b> Harold J Noyes (43218)		
15827	There is confusion in the public media about the impacts related to the potential for ground water or surface water contamination or a potential need for an extended, undefined term of mechanical treatment. It is my understanding that extensive lab leaching tests and related modelling have been conducted that address and resolve these issues, but I do not believe this has been made adequately clear to the public, since this remains a commonly cited objection and most people cannot reasonably understand a 2300 page technical document. I recommend in your approval of the project that you provide some better summary of this collection of issues.	PD03, WR035, WR190
<b>Sender Name (Submission ID)</b> Harold Nordin (43066)		
9994	The current SDEIS does not address the use of alternative methods for mining sulfide bearing ores that would reduce the impact on the environment—e.g. underground or subsurface mining operations which could significantly reduce adverse impact on the ecologically sensitive surface area and reduce the likelihood of water contaminants in the watershed.	ALT06
9995	The current SDEIS does not address the consequences of long terms exposure to water borne and airborne contaminants for individuals living and working within area which will be impacted by open-pit mining operations...	HU04
9997	The current SDEI does not adequately address the ability of ...(PolyMet) to provide the necessary financial assurances that site remediation issue can be addressed long-term	FIN01
15422	The current SDEIS does not adequately address the issue of water quality relative to the reproduction of wild rice in waters adjacent to mining operations. Current guidelines for water quality should be enforced as currently written and allowances for seasonal variations should not be allowed.	VEG04, WR153

**Sender Name (Submission ID)**    Heinecke (9576)

- 214 I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining.    WET24, WI01
- 1126 The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest.    LAN01
- 1127 The proposed mine poses unacceptable risks to our waters and communities    HU03, WR195
- 1128 I ask that the comment period be extended to 180 days, and I support the No Action Alternative.    NEPA07

**Sender Name (Submission ID)**    Helen Elizabeth Proechel (42803)

- 7014 4. Also I would like to ask, "Is sulfide mining for copper and nickel a good business decision?" a. Are there cheaper, less environmentally damaging ways to extract copper and nickel? b. Is the demand for new copper and nickel strong enough to merit risking Lake Superior, the Mississippi River watershed, and the aquifers underneath, not to mention surface soils?    ALT16
- 7017 2. The tensions between the needs of business/labor vs protecting pristine nature are very real; 3. I would like to take the pollution that once a fragile ecosystem and watershed are damaged it is difficult, if not impossible, to put "Humpty-Dumpty together again";    SO01

**Sender Name (Submission ID)**    helen forsythe (3115)

- 570 ... people living around this region would be detrimentally affected by any sulfuric acid released into watersheds as a byproduct of the proposed Polymet mine. To endanger the health of this sacred ecosystem for the benefit of corporate interests is to devalue the health of the people and other creatures that inhabit this region.    HU01
- 571 I recognize that this mine will create over 300 jobs for 20 years, which is a social benefit of the mines that I do not want to discredit.    SO10
- 18651 I believe the perceived economic benefits of these mines will be short-lived and will benefit only a few people so the dangers posed by these mines are entirely more significant than the benefits.    SO02
- 19935 I understand the significant economic opportunities offered by these new sulfide mining operations, but I believe the consequences to be for too dangerous for the economic argument to be valid. The potential water, soil, and air pollution effects from these mines pose major threats to the health of people in Minnesota. Our citizen's health will be compromised by this mine, and even those who receive the economic benefits will either be living away from the wastes created, or they will be experiencing the toxic qualities of mining for the period of time that they are employed in the mines. The use of the products received from those mines are not worth compromising our health in the form of our water, soil, air, co2 levels, etc.    HU03, SO01

**Sender Name (Submission ID)**    helen frigo (17665)

- 2112 The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for--information that is necessary to evaluate the environmental effects of this proposal.    FIN01, WR035, WR128
- 2113 More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts.    WET01

16126	the seepages of toxic chemicals such as mercury and all of the sulfides into the watershed will cause big problems for generations to come.	WR195
16127	once in the environment these metals could be converted to organometallic compounds which are extremely toxic at even lower concentrations than the inorganic form, the sulfides for example. Methylation of such compounds, which can occur in natural environments, increases their capacity to cross the blood/brain barrier causing all types of neurological problems as well as genetic anomalies.	HU03
16128	Are they willing to pay a "carbon tax" on all of the carbon dioxide it releases? Are they willing to put a cap on their profits and invest the rest into the community from which they are taking the minerals? Are they willing to invest a significant portion of the monetary gains towards researching methods of preventing and/or reversing the effects of the pollution caused by their mining techniques? ... Would PolyMet be willing to install solar power or wind power along the roads to the mining site?	PD01
16129	ould they be willing to dedicate a certain percentage of their employee's time to community volunteering? Or are they just going to give short term employment to a few people and then leave.	SO01
16130	What happens if [PolyMet is sold and] the [mitigation] responsibility is transferred to another company that is even more removed from our state? Will even more of the monetary benefits leave Minnesota? Would that company be even less concerned about the damage they can do to the environment? Would they be required to live up to the promises made by PolyMet, weak as they are?	FIN01
16131	there seemed to be no long term employment in the planning. Is this company going to guarantee there will be jobs for even twenty years? Even if there is employment for that length of time, what happens when the minerals are all extracted from the ground? Why not invest in real careers that will last longer.	SO01

16132	One fact that was brought up several times was we all use electronics and other products that require the very minerals found in the deposits in questions. Certainly there is truth to this but I have to wonder if we truly have done enough to streamline the needs. For example, a considerable amount of materials are sent to China for recycling. Instead of using fuel to ship them to China why not establish recycling facilities in those buildings from previous mining efforts that are no longer being used thus keeping the recycled metals here in this country and again provide some jobs to those who need them.	NEPA06

10896	I am aghast that those charged with the protection of Minnesota's environment, especially Lake Superior, would accept a "reclamation" plan from PolyMet that would require treatment of mining-contaminated water for hundreds of years post mine closure - perhaps in perpetuity.	PD09, PD35, WR111, WR115
10897	I would hope that the officials in command of this permit application would stand firm that mining should leave no legacy environmental problems with which to deal post closure.	PER06
10898	Those wishing to profit from the mining operations undoubtedly claim that such a guarantee cannot be made - that such a remediation plan cannot be set in place.	PD09, PD35
10899	It may be expensive, but in order to partake in Minnesota's subsurface mineral natural resources, PolyMet (or any other mining company wishing to do so) must be prepared to shoulder the true cost of extracting the minerals from the Earth.	FIN01
10900	Do not say "NO" to mining itself; say "NO" to mining when associated reclamation plans will leave legacy environmental problems.	PD09, PD35
10901	Please don't concentrate on the amount of the bond that PolyMet will set forth - whatever is decided, it will not be sufficient. Rather, concentrate on a requirement that the mining operations will leave no new legacy environmental problems.	FIN01
11720	I find this reclamation plan to provide grossly inadequate assurance of long-term protection of critical ecosystems and surface waters. The proposed necessity to maintain monitoring and treatment systems for seepage from the tailings basin and category 1 waste rock storage pile for 200 to 500 years post mine closure is preposterous.	PD09, PD35, WR035
11721	the proposed necessity, in perpetuity, to maintain the vegetative covers to prevent growth of trees and woody plants on the tailings basin, hydrometallurgical pit and category 1 waste rock pile caps is unthinkable.	PD09, PD16, PD35
11734	PolyMet's predictions suggest a period of up to 500 years during which mechanical treatment of tailings seepage would likely be necessary. PolyMet would not be around to perform this treatment, which if discontinued for any reason, would put sensitive ecosystems and water resources at significant risk. Generations well beyond ours would bear the ultimate brunt of these un-reclaimed tailings as would the ecosystems which undoubtedly would be adversely affected by this activity. This portion of the reclamation plan should be rejected as it provides wholly insufficient protection of water resources and the environment.	FIN01, WR037, WR128
11741	PolyMet should be directed to devise a means to accelerate the sulfide to sulfate reaction of the tailings during active mining and a short, well-defined, period thereafter, thus eliminating the reactivity of the tailings and providing the potential for alternative uses...Bench- and pilot-scale testing should be initiated if the literature does not yield sufficient information for system design... the best time for this to occur is during active mining when human and plant resources to deal with this side stream are present and abundant. Additionally, the tailings already existing in the tailings basin, if reactive, could be treated by the same methodology.	ALT06
11744	The discussions relative to the tailings basin refer to a probable maximum precipitation event. In such a case, the tailings dam could be breached and significant quantities of tailings carried downstream. The DNR should direct PolyMet to examine this potential happenstance in detail and to devise methodologies that would absolutely prevent breach or washout of the tailings containment in the event that a PMP event would occur.	GT05
11749	PolyMet plans simply to dewater and cover the contents of the hydrometallurgy pit, thinking that the double geomembrane liner beneath and a geomembrane cap over the pit contents would be sufficient to isolate the wastes therein in perpetuity.	PD17

<b>Sender Name (Submission ID)</b>	Henry Mott (28605)	
11750	The [hydrometallurgy pit] cap system probably would work for the first fifty years post-closure when efforts to prevent growth of woody plants and trees would remain effective. However, eventually, this program, necessarily carried out by "others" would fail. Trees would take root, tree roots would find their way into the subsurface and eventually the ability of the proposed geomembrane cap to prevent infiltration of water into the hydrometallurgical wastes would be compromised. Water would infiltrate into the hydrometallurgical wastes and produce leachate, which must then be captured necessitating treatment. All this would occur well after the means to provide such treatment would have been de-commissioned.	PD17, PD20
11764	The best means to provide for protection of critical ecosystems and water resources is to deal with the hydrometallurgical wastes during the mining and early post-closure period.	ALT09
11765	PolyMet should be sent back to the drawing board to determine how it will eliminate the need for long-term, above-ground, isolation/storage of the currently-proposed "witches' brew" of hydrometallurgical wastes. Perhaps means to recover valuable metals and to convert perceived wastes into usable by-products can be devised. PolyMet's plan for reclamation of the hydrometallurgical pit falls short of necessary, long-term protection of critical ecosystems and water resources.	PD17, PD19, PD20
11766	PolyMet's plan would leave category 1 waste rock in an unlined pile with a ground water collection system in place to capture leachate for monitoring and treatment. PolyMet is betting that the category 1 waste rock will be non-reactive. Realistically, perfect separation of reactive from non-reactive waste rock is impossible. Certainly, there will be hot spots in the proposed category 1 waste rock pile. This plan sets up the probable scenario that active (cutoff trenches and pumps) collection of seepage would be required in perpetuity.	PD16
11926	PolyMet's predictions suggest that mechanical treatment of seepage would be required for a period of 200 years post-closure.	WR128
11929	[The geomembrane cap system] design would serve merely to delay the inevitable conversion of sulfide to sulfate. Required maintenance (in perpetuity) of the cap system would involve vigilant action to prevent growth of deep-rooted brush and trees on the cap. This maintenance activity ultimately would fail, roots would penetrate the geomembrane liner and the contents of the pile would be subjected to infiltrating rain water and oxygen intrusion. Acidic seepage containing metals would again emanate from the rock pile long after any means to treat such drainage would have been de-commissioned. PolyMet's category 1 waste rock pile reclamation plan fails to provide adequate protection of sensitive ecosystems and water resources.	PD16, PD35
11930	PolyMet plans that category 2-4 waste rock be backfilled into the East and Central Pits and submerged as the pits fill, eventually underlying a wetland. The idea is that the resultant conditions will be anoxic (likely even anaerobic) and that the sulfide to sulfate reaction then will not occur. This portion of the plan does contain some correct thinking. However, PolyMet has not fully considered the potential for migration of ground water through and oxygen (or other electron acceptors) into the backfilled material. No mention of engineering the backfill to provide sure isolation of sulfide minerals from oxygen is made. While not a huge red flag, the plans to fill the East and Central Pits with waste rock could use some additional consideration leading to assurance that sulfide minerals will be properly isolated.	WR029, WR071
11933	The objective of the long-term reclamation process should be the absolute, complete prevention, in perpetuity of the oxidation of sulfides contained in reactive waste rock.	WR001, WR111
11936	The discussions within the SDEIS mention the implementation of corrective action, "...depending upon monitoring results." Certainly, by the time a problem with waste rock that has been backfilled is identified via monitoring, all that can be addressed are the symptoms of the problem. PolyMet should be directed to develop a means to ensure that oxidation of backfilled sulfide-containing waste rock will never occur.	PD15

<b>Sender Name (Submission ID)</b>	Henry Mott (28605)	
11948	slowly biodegradable electron donor materials, more thermodynamically preferred than sulfide, could be incorporated into the [East/central pits] backfill to scavenge electron acceptors such as oxygen and nitrate entering the backfilled pits. This would ensure that chemoheterotrophic bacteria would prevail over the chemoautotrophic bacteria responsible for conversion of sulfide to sulfate.	MERC06
11953	It is evident that PolyMet has no real plan regarding the reclamation of the West pit other than to let it fill and leave the responsibility, in virtual perpetuity, to others to monitor and treat the water that would emanate thereafter. In the absence of well-conceived plans to isolate reactive surfaces of the West Pit from oxygen, the proposed reclamation plan is absolutely unacceptable. PolyMet's plan that others monitor and treat as long as deemed necessary is absolutely ludicrous.	PD35
11956	Backfilling of the West Pit with category 1 waste rock has been suggested previously and rejected by PolyMet mostly on financial grounds, summarized [in]... section 3.2.3.4.2 of the SDEIS... In short, PolyMet's reluctance to backfill the West Pit is entirely financial... If the economics of mining coupled with effective reclamation are not sufficiently positive for PolyMet to obtain financing for the project, perhaps the project is indeed not economically beneficial.	ALT03
11969	Backfilling of the West Pit is key to the effective full reclamation of the mine and plant sites. The sulfide rock that is currently (in the absence of mining) present in the subsurface poses no adverse environmental consequences.	PD28
11983	PolyMet's proposed plan would leave reactive tailings (both new and legacy from previous activity), hydrometallurgical wastes, and category 1 waste rock (likely with significant reactivity) on the surface, eventually exposed to oxygen and infiltration leading to production of acidic, metal-laden leachate.	PD10, PD15, PD20, WR029
11985	Treatment of seepage (leachate) would be required for centuries after completion of mining activities.	WR035
11986	These deposits of mining spoils would be permanent scars on the environment and would require attention (by entities other than PolyMet) in perpetuity to ensure against significant degradation of local ecosystems and regional water resources.	FIN01
11988	PolyMet's plan would leave the reactive surfaces of the West Pit in contact with water that would flood the pit. Water would overflow and necessarily be mechanically treated perhaps in perpetuity.	WR173
11996	As currently envisioned, once PolyMet's financial gain has been realized, others would be left to deal with legacy wastes left behind by a short-sighted reclamation plan, for which minimization of financial outlay seems to certainly be a major driver. The plan for reclamation, as currently constituted, should be rejected, and hence, a permit to mine should be withheld, until such time as a suitable reclamation plan has been devised and presented.	FIN01, FIN11
12001	When the ore body has been exhausted, all the mine workers have moved on to other pursuits, and all the profits associated with extraction of the metals from the Earth have been realized by the mining companies comprising PolyMet, the mine and plant sites must be directly left in a condition compatible with the unique environment of Northeastern Minnesota.	PD01
12034	I urge the Minnesota DNR to direct PolyMet back to the drawing board to develop an environmentally sound reclamation plan that does not leave our posterity the responsibility to deal with the symptoms of the ugly mess that results from conventional practices applied in sulfide rock mining	PD01
12598	The proposed necessity to maintain monitoring and treatment systems for seepage from the tailings basin and category 1 waste rock storage pile for 200 to 500 years post mine closure is preposterous.	WR035

12609	The best means to provide for protection of critical ecosystems and water resources is to deal with the hydrometallurgical wastes during the mining and early post-closure period. The hydrometallurgical pit as proposed would be a catch-all for many processing byproducts. Once mixed, the options for recovery of saleable metals and other constituents become quite limited. PolyMet should be sent back to the drawing board to determine how it will eliminate the need for long-term, above-ground, isolation/storage of the currently-proposed "witches' brew" of hydrometallurgical wastes.	PD19
12611	The hydrometallurgical pit as proposed would be a catch-all for many processing byproducts. Once mixed, the options for recovery of saleable metals and other constituents become quite limited. PolyMet should be sent back to the drawing board to determine how it will eliminate the need for long-term, above-ground, isolation/storage of the currently-proposed "witches' brew" of hydrometallurgical wastes. Certainly, there will be hot spots in the proposed category 1 waste rock pile. This plan sets up the probable scenario that active (cutoff trenches and pumps) collection of seepage would be required in perpetuity.	ALT09
12615	PolyMet plans that category 2-4 waste rock be backfilled into the East and Central Pits and submerged as the pits fill, eventually underlying a wetland. However, PolyMet has not fully considered the potential for migration of ground water through and oxygen (or other electron acceptors) into the backfilled material. No mention of engineering the backfill to provide sure isolation of sulfide minerals from oxygen is made.	WR029
12772	East/Central pits: PolyMet should be directed to develop a means to ensure that oxidation of backfilled sulfide-containing waste rock will never occur. For example, slowly biodegradable electron donor materials, more thermodynamically preferred than sulfide, could be incorporated into the backfill to scavenge electron acceptors such as oxygen and nitrate entering the backfilled pits. This would ensure that chemoheterotrophic bacteria would prevail over the chemoautotrophic bacteria responsible for conversion of sulfide to sulfate. Further, means to reduce the permeability (hydraulic conductivity) of the backfilled materials could be included in the design such that ground water migration through and oxygen intrusion into the backfill would occur at rates sufficiently small to be effectively zero. Oxidation of sulfide to sulfate could then be virtually completely prevented.	PD15
12775	West pit: In the absence of well-conceived plans to isolate reactive surfaces of the West Pit from oxygen, the proposed reclamation plan is absolutely unacceptable. PolyMet's plan that others monitor and treat as long as deemed necessary is absolutely ludicrous.	PD35
14296	The proposed [reclamation] plan would simply allow the West Pit to fill without measures to isolate the reactive walls from oxygen. The pit would subsequently overflow requiring treatment (perhaps in perpetuity) of emanating water.	WR038, WR173
16467	The hydrometallurgical pit as proposed would be a catch-all for many processing byproducts. Once mixed, the options for recovery of saleable metals and other constituents become quite limited.	PD18
16490	means to reduce the permeability (hydraulic conductivity) of the [East/central pits] backfilled materials could be included in the design such that ground water migration through and oxygen intrusion into the backfill would occur at rates sufficiently small to be effectively zero. Oxidation of sulfide to sulfate could then be virtually completely prevented.	PD15
16492	Prior to issuance of mining permits, the DNR should require that PolyMet ensure that the sulfides contained in the reactive waste rock, backfilled into the mined pits will never be oxidized.	PER28
16608	Why should Minnesota's taxpayers now and in virtual perpetuity be the scapegoats for PolyMet's profits, to be gained in trade for significant expenditure of future resources and for the probability of significant degradation of key water resources of the State.	SO01

16616	Category 1-4 waste rock, PolyMet's tailings (treated to reduce reactivity), legacy tailings present on the site, bentonite, lime, perhaps even stabilized hydrometallurgical wastes, and slowly biodegradable electron donor materials could be combined into a backfill system sufficiently inaccessible to oxygen such that water treatment more than a few years post-closure would be unnecessary. The resultant reclaimed site would have no legacy footprints from the mining activity other than engineered wetlands and perhaps an engineered lake, were excavated materials of insufficient volume to fill all pits. In contrast to mining of sulfide rock in mountainous regions, where high-walls are virtually impossible to isolate from atmospheric oxygen, the proposed mine site would involve 100% below grade excavation. Then, the site offers the opportunity for reclamation to a level nearly commensurate with the pre-mining condition, leaving no legacy wastes on the Earth's surface to spoil the environment for future generations.	ALT06, ALT09, ALT10
17092	the proposed necessity, in perpetuity, to maintain the vegetative covers to prevent growth of trees and woody plants on the tailings basin, hydrometallurgical pit and category 1 waste rock pile caps is unthinkable	PD16
17115	PolyMet's plan calls for a geomembrane cap system to isolate the pile from infiltrating precipitation and atmospheric oxygen... this design would serve merely to delay the inevitable conversion of sulfide to sulfate... maintenance activity ultimately would fail, roots would penetrate the geomembrane liner and the contents of the pile would be subjected to infiltrating rain water and oxygen intrusion. Acidic seepage containing metals would again emanate from the rock pile long after any means to treat such drainage would have been de-commissioned.	WR127
17985	The proposed necessity, in perpetuity, to maintain the vegetative covers to prevent growth of trees and woody plants on the tailings basin, hydrometallurgical pit and category 1 waste rock pile caps is unthinkable. The proposed plan would simply allow the West Pit to fill without measures to isolate the reactive walls from oxygen. The pit would subsequently overflow requiring treatment (perhaps in perpetuity) of emanating water. This portion of the plan is unconscionable.	GEN03
17986	PolyMet proposes to cap the unlined tailings basin with bentonite layers. This action is intended to limit the entry of oxygen into the materials contained therein. The inevitable oxidation of sulfide to sulfate would merely be delayed beyond the time frame of mining operations. Then, post-closure, over time the sulfide to sulfate reaction would occur, creating acid seepage containing leached metals.	GEN01
17987	The acidic seepage water from the un-lined basin would necessarily be collected and treated well after active mining operations cease, until the entire quantity of sulfide contained in the tailings would be converted to sulfate. PolyMet's predictions suggest a period of up to 500 years during which mechanical treatment of tailings seepage would likely be necessary. PolyMet would not be around to perform this treatment, which if discontinued for any reason, would put sensitive ecosystems and water resources at significant risk. Generations well beyond ours would bear the ultimate brunt of these un-reclaimed tailings as would the ecosystems which undoubtedly would be adversely affected by this activity. This portion of the reclamation plan should be rejected as it provides wholly insufficient protection of water resources and the environment.	WR035, WR037, WR115
17991	It would seem prudent to devise a methodology, alternate to PolyMet's proposed "mining business as usual" approach for the tailings basin. PolyMet should be directed to devise a means to accelerate the sulfide to sulfate reaction of the tailings during active mining and a short, well-defined, period thereafter, thus eliminating the reactivity of the tailings and providing the potential for alternative uses. A large body of existing scientific literature addresses the characteristics and behavior of sulfide-oxidizing bacteria. Means to contact tailings with oxygen and other reactants in the presence of sulfide oxidizing bacteria to produce the acid and release metals prior to placement in the tailings pile should be devised. Bench- and pilot-scale testing should be initiated if the literature does not yield sufficient information for system design. Since acids will inevitably be created and metals thereby leached from tailings, the best time for this to occur is during active mining when human and plant resources to deal with this side stream are present and abundant. Additionally, the tailings already existing in the tailings basin, if reactive, could be treated by the same methodology to all but guarantee that tailings would pose no future risk for production of acid.	ALT10, ALT13, ALT17

<b>Sender Name (Submission ID)</b> Henry Mott (28605)		
18013	The discussions relative to the tailings basin refer to a probable maximum precipitation event. In such a case, the tailings dam could be breached and significant quantities of tailings carried downstream. The DNR should direct PolyMet to examine this potential happenstance in detail and to devise methodologies that would absolutely prevent breach or washout of the tailings containment in the event that a PMP event would occur. Although, as stated in the SDEIS, such an event is highly unlikely, should it occur irreparable damage would be inflicted upon the downstream ecosystems and water resources. Suggesting that a breach or washout is highly unlikely does not offer the sufficient protection that should be afforded the natural ecosystems of the region. As long as the legacy tailings from previous mining activity and those generated by the NorthMet proposal would remain on the Earth's surface danger exists that a catastrophic event could breach the tailings basin dams and permanently degrade downstream ecosystems and water resources.	PD11
18017	PolyMet plans simply to dewater and cover the contents of the hydrometallurgy pit, thinking that the double geomembrane liner beneath and a geomembrane cap over the pit contents would be sufficient to isolate the wastes therein in perpetuity. The cap system probably would work for the first fifty years post-closure when efforts to prevent growth of woody plants and trees would remain effective. However, eventually, this program, necessarily carried out by "others" would fail. Trees would take root, tree roots would find their way into the subsurface and eventually the ability of the proposed geomembrane cap to prevent infiltration of water into the hydrometallurgical wastes would be compromised. Water would infiltrate into the hydrometallurgical wastes and produce leachate, which must then be captured necessitating treatment. All this would occur well after the means to provide such treatment would have been de-commissioned.	WR099, WR127
18031	In short, PolyMet's reluctance to backfill the West Pit is entirely financial. Lip service has been paid to the real evaluation of the alternative. The cost of doing the reclamation job right, in PolyMet's view, is simply too high. Why should Minnesota's taxpayers now and in virtual perpetuity be the scapegoats for PolyMet's profits, to be gained in trade for significant expenditure of future resources and for the probability of significant degradation of key water resources of the State. If the economics of mining coupled with effective reclamation are not sufficiently positive for PolyMet to obtain financing for the project, perhaps the project is indeed not economically beneficial.	SO02
18034	Certainly PolyMet's engineers (either those currently retained or others who could be retained in the future) could custom design the backfill for the East/Central and West Pits to provide quite satisfactory isolation from the atmosphere. Category 1-4 waste rock, PolyMet's tailings (treated to reduce reactivity), legacy tailings present on the site, bentonite, lime, perhaps even stabilized hydrometallurgical wastes, and slowly biodegradable electron donor materials could be combined into a backfill system sufficiently inaccessible to oxygen such that water treatment more than a few years post-closure would be unnecessary. The resultant reclaimed site would have no legacy footprints from the mining activity other than engineered wetlands and perhaps an engineered lake, were excavated materials of insufficient volume to fill all pits.	ALT06, ALT10, ALT13, ALT17
<b>Sender Name (Submission ID)</b> Henry O Moore (42756)		
14452	[The mine project] will destroy nearly 1000 acres of wetlands and probably nearly 8,000 additional acres, all in violation of the EPA which requires that a project that destroys wetlands not be approved if pollution would violate the Clean Water Act. This applies to the "Section 404 Permit" as well as the SDEIS. Poly-Met admits water pollution at the site. How does Poly-Met respond to this concern, and will the EPA rule be enforced?	COE03
14453	Will Minnesota's own Department of Health regulations regarding limits for manganese be upheld? The current limit set by Poly-Met of 1506 micrograms per liter for manganese is fifteen times higher than the health limit set by the Health Department. Why? How will this be corrected since it induces brain damage in humans of all ages?	HU03
14454	What will be the effect of the toxicity of the plant on the workers? Will Poly-Met cover their health liabilities or leave it to Minnesota and the federal government to cover the long term costs? Why is nothing regarding worker health liabilities addressed in the SDEIS statement? Why is this glaring omission allowed?	HU04

14455	why is a project potentially allowed which will pollute the agricultural, fishing, wildlife, and drinking water for thousands of people in the northeastern Minnesota area and in the Lake Superior basin into perpetuity?	WI04
14456	Why should a most valuable tourist and vacation land for much of the Midwest be sacrificed for a few short lived high-tech jobs, a valuable product to be shipped overseas, and profits be provided to corporations located elsewhere around?	SO01
<b>Sender Name (Submission ID)</b> Henry Reich (10226)		
373	I am worried that the environmental impacts of such a mine are far too great and risky to be worth permitting the mine - in particular, the mine has great potential to seriously pollute the water in the Lake Superior watershed, especially in the long term, which has downstream effects on countless other states, provinces, and ultimately the Atlantic ocean.	SO01, WR111, WR115
374	I URGE YOU to protect our water and DO NOT ALLOW THE DEVELOPMENT OF A SULFIDE MINING INDUSTRY in Minnesota.	WR115
<b>Sender Name (Submission ID)</b> Herb Smith (18383)		
14724	I'm not for this. Few jobs. You know, you guys want to pollute the water -- these guys that want to use these chemicals, drink a gallon of that water in front of us and see how safe it is. Is it that safe? Are you guaranteeing that water is safe once they mix it in with that other water? It doesn't run one way.	SO01
<b>Sender Name (Submission ID)</b> Heyward Nash (2665)		
16441	Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness.	WET24
16442	Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred.	WR023
16443	I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining... The proposed mine poses unacceptable risks to our waters and communities.	WR115
16444	The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest.	LAN01
16445	I ask that the comment period be extended to 180 days...	NEPA06
<b>Sender Name (Submission ID)</b> Hillary Peterson (18318)		
4261	Water from open mines and processing plants will be contaminated with heavy levels of sulfide. PolyMet initially stated they would capture all the contaminated water on site and treat it before it was released. However, their own plan now shows that millions of gallons of polluted water will seep off the site before any treatment can be done.	WR070

<b>Sender Name (Submission ID)</b> Hillary Peterson (18318)		
4263	Minnesota law requires that sulfide mines be maintenance free at closure. This means a mine site cannot be ongoing with pollution when it is closed. The wastewater generated by sulfide mining is the source of dangerous pollution that by at least one mining company's own acknowledgement will be toxic for thousands of years.	PER04
9070	Trading 500 years of water pollution and immeasurable damage to the pristine environment of Northeastern Minnesota for a mere 20 years of mediocre jobs is desperately irresponsible.	SO01
9079	I ask the DNR to ensure financial assurance is in place for both a natural disaster and for the necessary treatment after the mine is closed...I also ask that this money is guaranteed to be easily accessed in full by the taxpayers of Minnesota when it is needed.	FIN10
9086	I ask the DNR to require extensive studies to explore the possible health risks for both works and the general public before this project is discussed any further.	HU04
9092	[T]here have been many legitimate concerns raised regarding: increased levels of mercury in animals, especially fish, destroyed habit for the rapidly diminishing moose population, the destruction of rare and pristine peat lands...and the destruction to wild rice plants. I ask the DNR to require extensive studies regarding how the mine will affect the destruction of these and other wildlife in the area before this project is considered any further.	AQ05, VEG03, VEG04, WI02, WI04
15208	Minnesota does not have a perfect track record, by any means, for regulating now existing taconite mines. ... Sulfide mining poses far more opportunities for environmental harm than taconite mining. If we are not able to fully regulate lower risk taconite mining, why should Minnesotans believe our governing agencies will be able to regular sulfide mining any more effectively? ... mining is extremely unpredictable and therefore particularly difficult to regulate.	PER06
15209	Especially given the fact there has never been a sulfide mine that has operated successfully and not polluted groundwater and negatively affected the ecology of the region where operation occurred, we should not be considering bringing this type of a project to one of the most water rich regions of the nation.	WR023, WR195
15210	I ask the DNR to require PolyMet to completely re-work their study of water flow in the area and new water modeling data be provided before this project is considered any further.	WR071
15211	I ask the DNR to not allow PolyMet to leave a mine behind that would require any type of maintenance or water pollution treatment.	PD01
15212	it would be truly helpful if discussion could be encouraged to talk about new ways to generate revenue in the area. For example, it is known there is a great deal of copper in this country that could be recycled and reused. I think it would be phenomenal if Northern Minnesota was known for a state of the art recycling plant for copper and other high demand metals.	ALT09, ALT16
15213	If this mine is built and operated as proposed, the Minnesota that we know andlove would be gone. Forever. Future generations will not be able to enjoy the absolute flawless wilderness that people from around the country and the world travel to experience. We owe it not only to ourselves but to generations and generation of Minnesotans to come to protect this sacred place.	WILD02
15214	I truly appreciate all the time and energy the DNR has put into this process thus far and I know everyone involved will continue to work tirelessly until the process is complete.	NEPA16

<b>Sender Name (Submission ID)</b> Howard Heath (54792)		
18042	Regarding the West Pit, Pg. 3-72 Reject concentrate would be "evaporated & solids disposed of off site." Where?! Pg. 3-63 Rail Transfer Demo.- acids and leachates to be placed in the West Pit. Pg. 3-65-the Partridge River in 20 years gets the sulfate concentrations after the RO upgrade?! Water will be clean, for years to come?!	WR143, WR145
18044	Pg. 3-72 According to the Gold Sim P90 model -200 years for monitoring? Polymet will monitor and maintain the water management for 200 years? Really?! This is not probable in today's mining world and way too costly!!	FIN01
18046	Water Sample Areas-Vol. I, Fig. 4.2.6-2 Map. The monitor spot, LCY-1 should be moved to "Un-named Creek" entry point into Colby Lake. Also samples should be taken where "Un-named Stream" enters the lake. Not a diluted sample out in the lake!!...Pg.5-219 States that only one location for Colby and one location for Whitewater Lake will be sampled during non-frozen conditions under the Monitoring Plan. This is not sufficient scientific sampling!	WR021, WR039, WR071, WR090, WR139, WR141
18053	Vol I, 3-112 Lists the extensive caustic materials that will be brought to the plant site, via rail and tanker truck. Nothing seems to be recorded as to retaining berms, railroad rails to be inspected, hazmat training for local fireman, etc- no secondary containment info? This plus 2-6000 gallon gasoline storage tanks on site,- with all drainage in area to the Partridge River & Colby Lake (Pg. 4-46).	HAZ01
18055	Drawing Raw Water, Pg. 3-114, from Colby Lake to plant site, "if needed"(Late Aug. the P. River is very low.) will concentrate all contaminates in the Hoyt Lakes water source.	WR181
18057	Emergency Overflow-from Tailings Pond, Pg. 3-117 to go to Partridge River, will be checked for contaminates and by pass? Where is the inspection info?	WR070
18063	Polymet should truthfully present some interesting environmental problems for the future. There is a difference between the SDEIS theory write up, and the actual operations on site. We have found this to be true, over the yearswith other environmental problems and mining considerations.	NEPA09
18065	If Polymet fails to meet their projections, and causes an environmental problem, the 2020 people in Hoyt Lakes will have their drinking water, bath and dish washing water, and clothes washing water, compromised!!	WR043
18068	Hoyt Lakes... will be economically stressed if property values drop, because of water problems caused by mistakes in mining. One must remember that public non- renewable resources are being utilized for corporate profit and what the cost my be, for future generations. Jobs are not our only consideration.	SO03
<b>Sender Name (Submission ID)</b> Howard Markus (18367)		
2547	Taconite mining does not use sulfuric acid. This mine will...It is ugly. It kills things. It is not what you want up here. It is going to seriously degrade the water resources up here.	PD27, WR025, WR195
2549	Right now the land proposed to be traded comes with the surface rights but not mineral rights. ... The EIS says all of these things are invaluable. Well, they're not valuable until they become valuable. I believe the Forest Service should reject the land trade and do it right by demanding both the surface rights and the mineral rights for all the lands traded or we're going to be in this circle where we have to go through all this again.	LAN04
2552	Really soon after the mine starts there is going to be discharges to impaired waters. .. This is going to be in ecosystems forever. It's going start out with no drainage and no pollution, and really soon there's going to be pollution, there's going permanent problems. ... There is just not enough limestone. It's all taconite.	WR109

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Howard Markus (18367)	
2553	we are trading upland valuable forest land and they are going to be traded for shrub forest wetlands. Not a fair trade.	WET14
18314	Pg. ES-11: "It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term." The need for perpetual wastewater treatment and perpetual financial assurance can not be overstated.	FIN01
18315	Pg. ES-23,24: "... the waste rock in the temporary Category 2/3 and 4 stockpiles would be moved into the East Pit for subaqueous disposal...Eventually, all of the Category 2/3 and 4 waste rock would be moved to the combined East Central Pit..." Considering this pit is unlined, why is this the preferred method and why isn't this going to result in polluted ground and surface water in perpetuity?	WR029
18316	Pg. ES-31: "...All of the non-federal lands except Tract 4 have severed mineral and surface ownership, which means that the mineral resources would not be acquired with the surface..." The U.S. Forest Service must deny this permit until both surface and mineral rights are non-severed with the lands being traded.	LAN04
18317	Pg. ES-36: "The NorthMet Project Proposed Action is predicted to increase mercury loadings in the Embarrass River Watershed but decrease mercury loadings in the Partridge River..." Even if this "net effect" assertion is true, the Clean Water Act does not allow "trades" wherein one water body that already has increased mercury suffers increases in mercury while an offset is proposed in another river. Increased mercury can not be allowed in the Embarrass River.	WR109
18320	The only testing of the plan to use RO that I know of was based on inputting relatively clean water into the RO facility; this "test" does not come close to simulating the relatively dirty input that will exist during mining...Running an RO system at full mine scale with a less than drinking water-equivalent source water will be extremely daunting and expensive; consistently meeting water quality standards will be very challenging. The SDEIS must be revised to include a far more robust explanation of how this RO system will meet water quality standards.	PD03
18321	Comparing Tables 4.3.3-4, Pg. 4-447 with Table 4.3.4-1, Pg. 4-465: It appears higher value lowland coniferous forests in the proposed mine area are being replaced with lower value coniferous swamp forests; this SDEIS must be rejected until an even trade of forest resources is proposed.	LAN03
18323	Pg. 5-103, Figure 5.2.2-18: "Mine Site GoldSim Model version 5 East Pit Backfill Pore Water Sulfate Concentration Based on P50 Inputs." The lower backfill pore water curve in red reaches an asymptote of approximately 250 mg/L, well above the WQS, at year 200; an example of the perpetual treatment needs and perpetual financial assurance needs. The SDEIS must be revised to state explicitly the perpetual need for treatment and that impact on financial assurance.	FIN01, FIN08
18326	Pg. 5-201: "Mercury was not included in the GoldSim model, as insufficient data and a general lack of definitive understanding of mercury dynamics prevented modeling mercury like the other solutes..." This section discusses mercury from only a water-concentration perspective; the potential effects of the NorthMet Project Proposed Action on the bioaccumulation of methylmercury in fish are discussed in Section 5.2.6. This is bogus reasoning; it is likely that there are far more mercury data than many of the parameters that were modeled. This SDEIS must be rejected until mercury is modeled by GOLDSIM for both the Embarrass and Partridge Rivers.	MERC13
18334	Pg. 5-202: "...data suggest that mercury present in rainfall or released by sulfide oxidation is typically adsorbed by other minerals present in the mine waste rock..." Because the mercury is adsorbed and not absorbed, several important issues come into play: [1] adsorption sites fill and, once filled, mercury will flow through the system unimpeded, and [2] adsorption sites are unstable- conditions such as changes in pH could cause a significant 'dump' of mercury from the adsorption sites, causing significant down-gradient pollution.	MERC20
18336	Both the Embarrass River (04010201-579, impaired for a poor fish community) and Embarrass Lake [ 69-0496-00, impaired for mercury in fish tissue] are on the MPCA draft 2014 List of Impaired Waters. Increased mercury can not be allowed in the Embarrass River or Embarrass Lake.	WR109

<b>Sender Name (Submission ID)</b> Howard Markus (18367)		
18338	In early 1990's, as staff of MPCA, I was the lead and coordinated the development of the Chapter 7050 Wetland Water Quality Standards. One guiding principle was that avoidance of wetland impacts was the preferred option. In this SDEIS, there are no realistic 'avoidance' option, such as an underground mine alternative that minimized and greatly avoided the massive amount of wetland loss proposed in this SDEIS. As such, this SDEIS must be rejected by the U.S. Army Corps of Engineers and the MPCA as failing the requirements of the Clean Water Act and Minnesota Rules 7050.0186.	ALT01, ALT13
18341	Pg. 5-373: "...Specific species such as loons, osprey, mink, and otter may be affected [by mercury exposure]...eagles may be less likely to be affected by mercury." There is no mention of loons in Section 5.2.6.2, as inferred from the PolyMet section above. It is disappointedly disingenuous to discuss at length eagles with less sensitivity to mercury and ignore the state bird -loons - that are known to be highly sensitive. The SDEIS must be withdrawn and rewritten to focus on mercury-sensitive wildlife, such as loons and mink, instead of relatively mercury-insensitive wildlife.	WI04
18342	There are no real alternatives in this SDEIS. As such the SDEIS must be rejected. An example of a real alternative would be to have an alternative in which all the pits lined, and then compare the improvements in water quality to the additional costs associated with lining all the pits.	ALT06
<b>Sender Name (Submission ID)</b> Howard Miller (21974)		
3307	This project will provide thousands of well-paid jobs and will help to provide North America with an inexpensive supply of copper and nickel plus ancillary precious metals.	SO10
<b>Sender Name (Submission ID)</b> Hser Hoo (54189)		
17207	The sulfuric acid will reduce the pH level and kill all the fishes. We won't get to fish in the river anymore.	AQ08, AQ12
17210	20 years... That's a long time to have to live through those loud machines.	N01
<b>Sender Name (Submission ID)</b> Hudson Mohawk Bird Club (20761)		
16163	More than 900 acres of wetlands will be directly destroyed by the mine, and an additional ten square miles of wetlands will be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts.	AIR09, WET01
16164	In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior.	AQ05, WI02, WI04
16165	The mine will threaten fish-eating birds like Belted Kingfishers, Common Loons, and Hooded Mergansers. Birds in need of conservation, such as the Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl, will lose suitable habitat if the mine is developed as proposed.	WI01, WI02
16166	The SDEIS is insufficient because it does not include a long-term water treatment plan, which is imperative to evaluate the environmental effects of this proposal.	WR035
<b>Sender Name (Submission ID)</b> Humphrey Kearns (3703)		
12345	Until it can be demonstrated that no contaminated water can leave the site, either in run-off or under ground, I can't support this type of mining in an area like the Arrowhead.	WR195

17004	Until it can be demonstrated that no contaminated water can leave the site, either in run-off or under ground, I can't support this type of mining in an area like the Arrowhead. Once you mess up a place it is pretty much messed up forever.	WR195
<b>Sender Name (Submission ID)</b> Hunter Maughan (46034)		
10615	Also because there are ecosystems, and this mining could endanger them. Or possibly destroy them for good.	NEPA15
<b>Sender Name (Submission ID)</b> Ian Kimmer (18320)		
4267	...I would like to see a more complete delineation of how we are going to pay for the water treatment facility that will be required to run perpetually in order to make sure that the water discharged from the site is not polluting our Northern Minnesota rivers, lakes, groundwater included.	FIN05
4268	So I respectfully request that we have the financial assurance piece, how we're going to pay for the long-term water treatment at the facility, included in the SDEIS process so that the public can participate, see how it's going to be paid for and come away with a reasonable assurance that if we are going to do this project that at some point the taxpayers are not going to liable for hundreds of years of water treatment.	FIN01, FIN05, FIN13
4269	As it is right now there doesn't appear to be any analysis behind the tax figures that are presented. In the original draft it was something in the neighborhood of 1.5 million. It is now 16 million. And as far as I understand it, the DNR did not do a tax analysis of the project.	FIN05
4271	Finally, there seemed to be some current conditions that are in the EIS that do not match what the actual monitoring stations read. And I would like to see that resolved. Because as we were looking at the future modeling, the models have never been accurate; however, they are good guidances and some of the current conditions anticipated by the model conflict with what we see at actual monitoring stations in the field.	PD29
12500	My first request, respectful request, of the co-lead agencies is that at over 2100 pages this document is an overwhelming conglomeration of information. And a lot of it is very difficult for a layperson or even many experts to understand. I first of all respect your request that we extend it from 90 days to 180 days for people to take in that information and review and provide comments.	NEPA07
<b>Sender Name (Submission ID)</b> Ian Wunder (19514)		
13282	The claim in the SDEIS is that PolyMet will decrease mercury and sulfate pollution in nearby waterways and will do this by operating water treatment systems that have not been detailed.	WR128, WR143
13283	The treatment plant designs have not been outlined in detail in this document, and this industry has a zero percent success record at containing waste toxins. Because of this detail, the SDEIS is insufficient and should not be approved. It does not provide this important information.	PD08
13284	Five centuries of water treatment will need to be paid for either by the mining company or by Minnesota taxpayers. These individuals in either case will be the future generations of Minnesotans and US citizens. They will be left with a legacy of pollution and wastewater that will need to be cleaned continually for more than half a millennium.	FIN01
13286	The mining industry as a whole is responsible for the largest and most costly environmental cleanups in our nation, and a large percentage of Superfund sites are the legacy of sulfide ore mining specifically. We do not need this legacy added to our Minnesota tax burden for so many future generations.	FIN01

14697	I believe that due diligence has been served; the public and the environment have been protected by a joint effort of MDNR, US dept. of Forestry, EPA, and Polymet. To the greatest extent possible the environment will be protected throughout this project and with that there will be a revitalization of the northern Minnesota economy especially in the iron range. We need this for Minnesota jobs and development! I encourage a permit to be granted for this endeavor.	SO10
14697	I believe that due diligence has been served; the public and the environment have been protected by a joint effort of MDNR, US dept. of Forestry, EPA, and Polymet. To the greatest extent possible the environment will be protected throughout this project and with that there will be a revitalization of the northern Minnesota economy especially in the iron range. We need this for Minnesota jobs and development! I encourage a permit to be granted for this endeavor.	SO10
19344	One, concern I have is of the failure of the infrastructure over the verylong life of the project and need for water control. The membranes being proposed for use have not been tested in reallife conditions to determine how they will hold up over a long time span. Also, the materials used for the pumps, indeed all the gaskets, sealants, wiring, joint compounds and such have unknown life spans and dependability. Most of these materials have not been in use in conditions such as these and for time periods as long.	WR129
19345	Another concern I have is that some of the information in the SDEIS has been provided by data from PolyMet itself. I have read reports of some of their data being in contradiction to data being provided by independent groups studying the issues. One example of this is amount of water flowage, believed to be very underreported by studies done that Nancy Schuldt was involved in.	WR071, WR189
19346	The last concern I will state ... is that some of the fact and figures are based on computer models which are not taking into account weather events, climate change, forest fires and such.	PD22
19347	I can not understand taking these huge environmental risks for a few hundred short term jobs to make money for a multinational corporation which will ship the copper mostly overseas.	SO01
19348	many years of copper are already stockpiled for use so what is the rush to build this mine with the risks involved.	NEPA03
<b>Sender Name (Submission ID)</b> Illegible, George (58002)		
19875	The cost to our future are not balanced with the short-term benefits that will be provided to private investors.	SO01
<b>Sender Name (Submission ID)</b> Illegible, Terry (58110)		
20017	This seems like a short-sighted project that could be very detrimental for our environment. There does not seem to be a reasonable plan for all the harm that could ensure. No one will be responsible for 500 years.	FIN01, GT01

<b>Sender Name (Submission ID)</b> Ilze Mueller (16278)		
10484	Instead [of the PolyMet Mining project] we should be working to further develop local jobs in the tourist industry on the North Shore decent jobs that do not jeopardize our precious environment.	SO02
<b>Sender Name (Submission ID)</b> Ingdal, Leisha (14886)		
1775	The people of Minnesota deserve better than a short term employment gain at the cost of polluted water for 200 years!	SO01
<b>Sender Name (Submission ID)</b> Iris Sinai (14184)		
14314	The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for--information that is necessary to evaluate the environmental effects of this proposal.	WR035
14315	More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts.	WET01
14316	sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons.	WI01, WI02, WI04
14317	four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02
<b>Sender Name (Submission ID)</b> Irv Berlin (30614)		
13996	To my knowledge sulfide mining has never been done without polluting the environment. Doing it in an area that could contaminate Lake Superior and the famed Boundary Waters Canoe Area seems to be the height of folly. Risking Superiors waters, the recreational economy of the area, public health, and the environment in general is not worth the profits to the company that proposes this disaster.	SO01, WR111
<b>Sender Name (Submission ID)</b> Isaac Anderson (42511)		
1823	One idea that I suggest is to examine the viability of opening a precious metal recycling plant that would preserve the environment, provide needed metals, and provide jobs and industry.	ALT09
15410	We as a nation need to grow and expand, and a project like this is a step in the right direction. We need to keep the great Midwest GREAT and supply jobs and livable wages to the hard working people of this great region/nation.	SO10
15411	As far as environmental impact is concerned; this is the 21st century. We have the tools, intel, technology, know-how, and man power to safely and cleanly build and run this mine in a efficient and environmentally friendly manner.	PD28
<b>Sender Name (Submission ID)</b> Ivan Zenker (11271)		
799	I just don't feel some jobs in the short run justify the danger to the watershed areas that surround the site.	SO01
1600	And I believe that asking for a company to promise stewardship many, many years into the future to treat the water long after the profits are gone is just not something we should count on.	FIN01

20024	We need to think about the 7th generation and what we may be leaving behind. As a society, we tend to be shortsighted. Jobs for 20 years! Sure they worth the travesty, wrecked on our environment which will impact us economically, physical – both health wise and topographically.	SO01
<b>Sender Name (Submission ID)</b> J. Alvey (41852)		
14096	This mine is an entirely different type of operation and has different environmental impacts than iron mining does. The risks are too great.	PD27
<b>Sender Name (Submission ID)</b> Jace Carlson (57139)		
16833	Sulfide mining in other states has been extremely detrimental to the water around the mines and in an area like the Superior National Forest with valuable peatlands, this kind of pollution would be unacceptable.	WR023
16834	The fact that there are no safeguards for when things go wrong makes this plan even scarier.	PD01
<b>Sender Name (Submission ID)</b> Jaci Christenson (47458)		
10532	PolyMet and the SDEIS do not acknowledge the true cost of the proposed PolyMet sulfide mine. PolyMet is a lean deposit of copper-nickel, therefore, 99% of what is dug out of the ground will be waste. For that 1% gain in metal, the true cost will be unfathomable. The toxic extraction process will be energy and water intensive (releasing 200,000 metric tons of carbon dioxide). Even more water and energy (generating 707,000 metric tons of carbon dioxide each year) will be used in processing; leaving us with even more waste that will need to be managed for 500 years. This is in direct opposition to Minnesota’s goal of reducing greenhouse gas emission by 30% by 2025.	SO02
10535	Lastly, it can no longer be ignored that fresh water is a precious resource and must be treated as such	WR195
<b>Sender Name (Submission ID)</b> Jack and Rhoda Liebo (4146)		
871	the decision to move forward past this ridiculous review shows a sense of panic on the part of the officials in government to produce(in the short term), good economic growth.	SO01
872	Externalizing toxic water soluble poisons, which are currently well insulated from doing us harm, into this glorious region of Minnesota, shows a complete absence of understanding.	WR111
948	they will extract our wealth, freeing deadly polluting poisons that will contaminate our environment, kill the fish and the precious watershed, leaving us, some time within the next 500 years to cover the cost of cleanup.	FIN01
949	[The NorthMet Project will negatively impact] land values... and the budding conservationists tourist industry.	SO02
1519	No matter what the industry suggests, there are no big breakthroughs that will suddenly make this type of mining safe for the local watershed.	PD32
<b>Sender Name (Submission ID)</b> Jack Brunell (15964)		
952	I feel the current State regulations adequately safeguard the Northern Minnesota environment.	PER34

190 This is a great project with huge economic impact for all of northern Minnesota. Tax revenues for the state, job creation, and much needed resource for all. SO10

**Sender Name (Submission ID)**    James Hall (15382)

14611 The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. PD23

14612 The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. FIN02

14613 Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. FIN02

14614 [The Co-Leads should] Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. PD23

14615 [The Co-Leads should] Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. FIN02

14616 [The Co-Leads should] Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. PER02

**Sender Name (Submission ID)**    James Hanske (11272)

800 This mine would significantly degrade the water quality of the boundary waters lakes and lakes in the surrounding area. WR111

801 It is our job as Minnesotan citizens to protect arguably the most precious natural resource in Minnesota which is our lakes and more specifically the boundary waters. It would be an outright greed driven crime for SNF lands to be exchanged to a mining company. SO02

8356 The EIS should state how the mine's production will be transported to customers. Whether by rail, ship, truck, or pipeline, the method and route of shipment is important as shipping corridors may be greatly impacted by an increase and concentration of shipping traffic along the corridors to be used. PD37

**Sender Name (Submission ID)**    James Hilgemann (39166)

12268 The sulfide mining is yet another example of the root-hog-or-die mentality behind the smoke-and-mirrors of this country's resources/energy conundrum.I think it's time to leave the 19th century mindset behind. This is the 21st century! It's time to evolve. SO02

<b>Sender Name (Submission ID)</b>	james koschak (43565)	
9493	Failure to raise this issue of past history of AMD drainage in the SDEIS raises serious questions about the commitment of PolyMet, the MPCA, and other responsible agencies for protecting our environment and health both during and after mining operations. [Regulatory agencies have allowed mining companies in] northeastern Minnesota to operate without being in compliance with environmental regulations and standards; to have variances from water quality standards; and/or be in violation of permits designed to prevent aquatic toxicity.	PER06
9495	There is no Financial Assurance plan provided. This is an integral part of the EIS proposal; yet, lead agencies do not currently require it until after the EIS is approved. No public comment period for the public to weigh in on this crucial piece of the PolyMet NorthMet Sulfide Mine Proposal.	FIN13
9502	“Adaptive Management Techniques”... is an interesting new terminology used throughout the SDEIS, but one that is most evasive... The SDEIS provides no factual assurance or details (only vague references and the need for “adaptive management techniques”) on the impacts to water quality, wildlife or human health if the treatment system fails or if there is a breakdown, which is inevitable....There are reasonable foreseeable problems that may arise in this project that would adversely impact waste water treatment and tailings management which are not reviewed.	PD01, WR130
9515	Lead agencies need to restore the comment period before proceeding further with the review process. The SDEIS says that PolyMet estimates initial closure costs of up to \$200 million and annual maintenance costs of \$6 million which are far lower than estimates from the Grand Portage Band of Ojibway that calculated that at the onset the financial assurances should be \$90.5 billion, at a minimum... Public comment would help inform the issues [and clarify discrepancies]... Why is there no public comment period in place for financial assurances?	NEPA07
14086	The PolyMet North Met Mine proposal SDEIS is filled with flawed data, inaccurate information, omissions of pertinent information and is overwhelming complex by design. It is inappropriately long at 2,169 pages, confusing to read, with many leading and unsubstantiated statements... Lack of evidence-based explanations for key conclusions is problematic.	NEPA07
14087	there are no reasons given why other alternatives that could reduce pollution and impacts on wetlands were not analyzed.	ALT13
14088	Details of models used to project pollutant estimates are often lacking and the basic assumptions and data inputs for models inadequate.	AIR07
14089	PolyMet’s proposed mine is not on the Iron Range.PolyMet’s SDEIS states:“The NorthMet Project area, including the Mine Site, Plant Site, and connecting infrastructure, would be in St. Louis County, Minnesota, and situated at the eastern end of the Mesabi Iron Range.”... the NorthMet Mine site has been misrepresented as being on the Iron Range, instead on in the Superior National Forest in the disseminated copper, nickel, sulfide bearing fractured rock of the Duluth Complex.	PD31
14092	in exchange for this irreplaceable wetland... We, the people of Minnesota, will receive five non-contiguous pieces of land in Cook, Lake, and St. Louis Counties. These lands are simply a fraction of the value of the lands we would be virtually giving away to PolyMet Corporation for their Mine Site.	LAN03
14094	Why doesn’t the SDEIS include a Cost/Benefit Analysis or Cumulative Effects Analysis for the total cumulative impact area of not only the Lake Superior Watershed, but also the Rainy River Watershed?	CU01, SO07
14097	The SDEIS does not indicate whether wages paid to mine employees will stay in Minnesota or whether they will primarily be transient employees, such as those in North Dakota. What fraction of wages paid to mine employees will stay in Minnesota?	SO06
14098	The SDEIS does not investigate the loss of jobs when the price of copper declines and mining is less profitable, but it does state that job loss is inevitable: “Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted.” SDEIS, 4-325---4-326. What will be the cost of unemployment benefits, health care, and other social services?	SO06

<b>Sender Name (Submission ID)</b>	james koschak (43565)	
14119	Historically, everywhere on the Earth where this type of mining has occurred, heavy metal pollution and acid mine drainage is a result. Nowhere in the SDEIS was there any acknowledgement of this fact. Nor was there any data substantiating that the proposed PolyMet Mining Corporation's North Met mining project would be unique in preventing what history tells us happens at each and every sulfide mine site, and will occur at the PolyMet site.	PD26, WR023
14120	How will this venture in Minnesota's water rich environment be done in such a unique manner, as to guarantee no pollution to our waters?	WR070, WR130, WR195
14125	PolyMet's proposed mine plan will pollute the Boundary Waters Canoe Area Wilderness.	WILD02
14126	How can it be in the Public Interest to accept this SDEIS's proposal of ongoing toxic pollution to our water rich environment, or to accept the agencies present and foreseeable continued lack of enforcement of regulations and standards as related to the mining industry?	PER06
14127	There is little, if any, information in the SDEIS that provides for contingency planning [if something goes wrong].	PD22
14130	Why is there no plan in the SDEIS for a 500-year storm, and other such disasters and/or accidents?	PD22
14132	Why are the same valid reasons to involve the public with comments related to the EIS not also critical to the public's involvement and comments for the 'permit to mine' process? This is illogical and raises more questions as to the validity, fairness, transparency, and credibility of the entire decision- making process.	PER01
14134	The SDEIS provides no credible information about the cost of monitoring, maintaining, and replacing equipment needed to treat polluted water for 500 years or more. No details are revealed about the nature of guarantees of a financial assurance scheme that would remain viable for 500 years or more...	FIN01, FIN05, FIN11
14136	The SDEIS admits that water pollution will last up to 500 years, or basically, into perpetuity, yet the financial assurance section is an exercise in generalities. Actual cost of water treatment, monitoring, maintenance, repair, and reclamation is unknowable.	FIN01, FIN05, FIN11
15983	there are no reasons given why other alternatives that could reduce pollution and impacts on wetlands were not analyzed. Why is that?	ALT13
15984	The PolyMet North Met Mine proposal SDEIS is filled with flawed data, inaccurate information, omissions of pertinent information and is overwhelming complex by design. It is inappropriately long at 2,169 pages, confusing to read, with many leading and unsubstantiated statements.	NEPA07
15986	Details of models used to project pollutant estimates are often lacking and the basic assumptions and data inputs for models inadequate. Lack of evidence-based explanations for key conclusions is problematic.	PD29
15987	If permitted, PolyMet NorthMet Mine, along with Twin Metals Minnesota and other such toxic sulfide mines "waiting in the wings" would effectively turn our lakes recreational district into a mining district devoid of a beautiful wilderness landscape, solitude, wildlife, including the iconic moose, clean water, clean air, and peace and quiet.	LU04
15988	It is quite evident as to why the NorthMet Mine site has been resoundingly misrepresented as being on the Iron Range, instead on in the Superior National Forest in the disseminated copper, nickel, sulfide bearing fractured rock of the Duluth Complex. It is easier to sell this "bag of goods" to the public when it is described as being on the Iron Range, which has been mined for over a century.	PD31
15990	Many even refer to the Mine Site as being a "brown field". Wrong again. The PolyMet NorthMet Mine would be in our lands of the Superior National Forest in the middle of one of the most valuable wetlands in all of northern Minnesota, the 100 Mile Swamp.	WET19

15991	If the PolyMet proposal is permitted, it would result in the largest destruction of wetlands in the history of our state. For it to happen, PolyMet needs 6,650.2 acres of land that, we the people of Minnesota, own in the Superior National Forest, with some 913 acres being of very high quality, irreplaceable wetlands in the St. Louis River watershed.	WET23
15992	This priceless wetland area has been named an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the U.S. EPA has stated that it is likely an Aquatic Resource of National Importance because of the high level of biodiversity.	VEG02
15993	We, the people of Minnesota, will receive five non-contiguous pieces of land in Cook, Lake, and St. Louis Counties. These lands are simply a fraction of the value of the lands we would be virtually giving away to PolyMet Corporation for their Mine Site.	LAN03
15994	he 600-700 foot deep, open pit mine comes with a plan to remove more than 530 tons of ore and waste rock, causing utter destruction of Minnesota's largest tract of high-quality wetlands with more than 4,000 acres of wildlife habitat degraded, including two square miles of critical habitat for the Lynx and important habitat for our dwindling moose population.	WET23, WI01, WI02
16000	Why doesn't the SDEIS include a Cost/Benefit Analysis or Cumulative Effects Analysis for the total cumulative impact area of not only the Lake Superior Watershed, but also the Rainy River Watershed?	CU01, SO07
16001	By inaccurately placing PolyMet's NorthMet Mine on the Iron Range, the entire SDEIS is skewed. This is not even the same geological formation. The public has been basically lied to that this Mine Proposal is on the Iron Range.	PD31
16004	How does the USFS think the destruction of some 913 acres of prime wetlands and thousands of acres of Superior National Forest will serve the Public Interest?	LAN01
16005	How does the USFS think that replacing a Lake District, with the potential to be inclusive of the Boundary Waters Canoe Area, with a Mining District to be in the Public Interest?	LAN01
16006	How does the USFS think that the creation of a land exchange that goes directly against the 1911 Week's Act will serve the Public Interest?	LAN01
16007	How does the USFS think that benefiting a multinational sulfide mining company through the removal of strip mining protections will serve the Public Interest?	LAN01
16008	How does the USFS think that setting precedence for ease of land exchange with foreign mining companies to eliminate the "conflict" between the mineral and surface estates will serve the Public Interest?	LAN01
16009	Will the proposed benefits of the projected mining operations significantly outweigh the risks and harms to the environment, to population health and the economy? There is no comprehensive analysis in this SDEIS that incorporates short-term, moderate-term, long-term and very long-term (hundreds of years) estimates of costs and benefits. Why?	SO01
16011	there are only a total of 427 new mining jobs projected in the copper-nickel sector by 2016. And, most of the projected 1,000 temporary construction jobs will last less than two years. The indirect, or spin off jobs from the copper-nickel sector, which mining boosters have also touted as high-paying is false.	SO01
16012	These mining advocates ... have literally exaggerated the economic benefits of sulfide mining to the region and our state. ... with its limited economic benefits, [the project] would be too controversial for mining boosters to push upon the proponents of a healthy natural environment.	SO01

16013	The SDEIS does not indicate whether wages paid to mine employees will stay in Minnesota or whether they will primarily be transient employees, such as those in North Dakota. What fraction of wages paid to mine employees will stay in Minnesota?	SO06
16014	The SDEIS does not investigate the loss of jobs when the price of copper declines and mining is less profitable, but it does state that job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325---4-326. What will be the cost of unemployment benefits, health care, and other social services?	SO04
16015	What will be the cost of increased crime rates, and other societal costs associated with volatility in employment? What is the cost of social upheaval to nearby communities?	SO04
16016	What will be the cost for public infrastructure?	SO04
16017	The model used to calculate the alleged economic benefits doesn't take into account the costs of degradation to the environment. Short-term; moderate-term and long-term (into perpetuity)? What will be the cost of the loss of our clean water? The loss of our clean air? The loss of our wilderness lands? The loss of the 100 mile swamp and our wetlands?	SO04
16018	What will be the costs of displacement of other economic activity, incompatible with mining?	SO04
16019	What will be the impacts and cost on tribal rights to hunt, fish, and gather under the 1854 Treaty?	CR01
16021	What would be the cost to the tourism industry for loss of business due to sulfide mining and its incompatibility with the recreational industry that needs clean air, clean water, and an intact wilderness for enjoyment of visitors to the area?	SO02
16022	What would be the cost of lost recreational opportunities on wilderness lands?	SO04
16023	What will be the cost of depressed real estate values for landowners due to mining? Presently, real estate values have plummeted for properties near exploratory drill sites. What will be the done to offset the loss of real estate value for landowners due to mining?	SO03
16024	What will be the cost of the unpredictable influx and outflow of mine employees?	SO04
16025	What would be the cost of perpetual clean-up that the public would be required to bear when the financial assurances go bust?	FIN01
16026	Do we want more of what the Iron Range presently is? Why don't our regional politicians work toward other sustainable industries to improve the economy of this area?	NEPA02
16027	Why did the clients for the Skurla study only request a Benefits Analysis of this Project?	SO04
16029	everywhere on the Earth where this type of mining has occurred, heavy metal pollution and acid mine drainage is a result. Nowhere in the SDEIS was there any acknowledgement of this fact. Nor was there any data substantiating that the proposed PolyMet Mining Corporation's North Met mining project would be unique in preventing what history tells us happens at each and every sulfide mine site, and will occur at the PolyMet site.	PD26
16030	How will this venture in Minnesota's water rich environment be done in such a unique manner, as to guarantee no pollution to our waters?	PD03

<b>Sender Name (Submission ID)</b>	james koschak (43565)	
16034	Dunka is closed, so why are there operational permits with variances given by the MPCA? Why is the MPCA giving Cliffs Natural Resources a permit to pollute?	PER06
16043	Dunka should be designated a Superfund Site. Furthermore, Langley Creek exits the 100 Mile Swamp and drains into Dunka River which flows into Birch Lake, and onward into the BWCA via the South Kawishiwi River. ...PolyMet’s proposed mine plan will pollute the Boundary Waters Canoe Area Wilderness.	WR024, WR080, WR081, WR111, WR175
16045	Why doesn’t the SDEIS, with modern technology and knowledge, address these two Minnesota sites which continue to have AMD runoff into our watersheds, threatening the health of our birds, our wildlife, our wells, and ultimately our human health? ... Failure to raise this issue of past history of AMD drainage in the SDEIS raises serious questions about the commitment of PolyMet, the MPCA, and other responsible agencies for protecting our environment and health both during and after mining operations.	PD01
16048	I have no confidence or reason to believe that our agencies will enforce our so-called strong environmental standards as related to the PolyMet project given their past history ... as well as allowing every taconite mine in northeastern Minnesota to operate without being in compliance with environmental regulations and standards; to have variances from water quality standards; and/or be in violation of permits designed to prevent aquatic toxicity.	PER06
16050	How can it be in the Public Interest to accept this SDEIS’s proposal of ongoing toxic pollution to our water rich environment, or to accept the agencies present and foreseeable continued lack of enforcement of regulations and standards as related to the mining industry?	PER06
16051	Minnesotans have the right to protections of these natural resources. ... How can a sulfide mine be permitted if it causes destruction of our natural resources?	NEPA02
16053	There is little, if any, information in the SDEIS that provides for contingency planning.	PD22
16056	“Adaptive Management Techniques”. ... It is a new way to frame: Let’s see how things go and experiment with what might work if we run into an “unforeseen circumstance”. This is not good enough for Minnesotans who treasure our clean waters and our 10,000 lakes. There are reasonable foreseeable problems that may arise in this project that would adversely impact waste water treatment and tailings management which are not reviewed. Daily operations are planned to treat some 6.2 million gallons of polluted water daily. Broken pipes, human error causing accidents, equipment malfunction, and severe weather related disasters.	PD22, WR130
16057	Why is there no plan in the SDEIS for a 500-year storm, and other such disasters and/or accidents?	PD22
16058	To be told by the agencies, and specifically by Jess Richards, “that emergency planning also will be included in the mine’s permitting” is irresponsible and inadequate, as there will be no opportunity for public comments at that step in the process.	PD22
16060	There is no Financial Assurance plan provided. This is an integral part of the EIS proposal; yet, lead agencies do not currently require it until after the EIS is approved. No public comment period for the public to weigh in on this crucial piece of the PolyMet NorthMet Sulfide Mine Proposal.	FIN13
16063	Why are the same valid reasons to involve the public with comments related to the EIS not also critical to the public’s involvement and comments for the ‘permit to mine’ process? ... This is illogical and raises more questions as to the validity, fairness, transparency, and credibility of the entire decision- making process.	PER01

<b>Sender Name (Submission ID)</b> james koschak (43565)		
16064	The SDEIS provides no credible information about the cost of monitoring, maintaining, and replacing equipment needed to treat polluted water for 500 years or more. No details are revealed about the nature of guarantees of a financial assurance scheme that would remain viable for 500 years or more, yet it does acknowledge the possibility of events such as “unanticipated liabilities” and “failure or limitations on the ability of third parties to pay.” ...Actual cost of water treatment, monitoring, maintenance, repair, and reclamation is unknowable. How can the DNR and the Governor possible make an informed decision unless the gaps are filled and the public has the opportunity to review the project in its totality?	FIN05, FIN11, FIN13
16066	Lead agencies need to restore the comment period before proceeding further with the review process. The SDEIS says that PolyMet estimates initial closure costs of up to \$200 million and annual maintenance costs of \$6 million which are far lower than estimates from the Grand Portage Band of Ojibway that calculated that at the onset the financial assurances should be \$90.5 billion, at a minimum. The Band concluded that PolyMet’s numbers are vastly below the actual amounts required. Why are there such glaring discrepancies? Public comment would help inform the issues.	NEPA07

19285	There are no plans in the SDEIS for extreme rainfalls such as June 2012 when 10 inches fell in Duluth	PD22
19289	The plan proposes cleaning contaminants from our waters for 200 to 500 years. I know of no way to meaningfully calculate the cost of acid and heavy metal mitigation for those periods of time. I believe there have been no calculations made public so they could be evaluated.	FIN05
19291	I know of nothing to prevent the owners of the mine, who do not live in Minnesota, from closing it down and letting Polymet go into bankruptcy as was done by the original owners of Tulsequah Chief mine in Canada	PER02
19293	The current operating costs of water treatment for the Canadian [Tulsequah] mine are four times the estimates made by the new owners.. They are still not in compliance with their water treatment permits	PD26
19294	As a citizen of Minnesota and part owner of the natural resources, I feel the DNR should require that the sulfuric acid and other heavy metals must be separated from the runoff and groundwater and exported out of state.	GEN01
19303	The public deserves to see a complete document which includes full financial assumptions and calculations as well as proof it meets the state law [to leave the site] "clean and maintenance free"	FIN14
<b>Sender Name (Submission ID)</b> James Nygard (54509)		
18759	The current situation is not a national emergency with most if not all the profits going to an international company delivering copper to China. The long term legacy costs to the state and possibly the nation will be diminished pristine wilderness, degraded water lasting perhaps hundreds of years, human health and health expenses over short and long term intervals, recovery at the bust of the cycle with over extended schools, hospital, government infrastructure, roads and supporting businesses, homes with significantly reduced income to support.	SO06
18761	Human health concerns by exposure to metallic sulfides (Copper, Arsenic, Methyl Mercury, lead sulfuric acid) in drinking water, in food, by contact with contaminated soil. This concern is short and long term Examples of food may include mercury levels from fish, possibly arsenic from wild rice, etc.	HU03
18762	Wildlife health concerns including birds....	WI04
18763	Incidental failure of a liner or catastrophic event (tornado, flooding, explosion) causing major leakage over a large area. A small example may be a failure of a containment pond along the North shore of Lake Superior a number of years back.	PD11
18764	Impact on Wild Rice, fishing and hunting as related to treaties and culture with Native Americans.	CR01
18766	Impact of acid rain on forests and plants including not only the mining but also the massive amount of energy required to be provided by older coal fired electric utilities to support mining. Estimated by U of M to be 47 trillion BTU over 20 years. This information is not included in the study so far.	VEG06
18767	From an environmental perspective there have been no successful metal sulfide mine operations and closures without releases of toxic materials without significant releases of toxic materials to air, water and land. Wisconsin law denies approval of any metal sulfide mining permits until a successful, environmental mine operation has been demonstrated. All interlocking companies should be cosigning responsibility for clean up, remediation and restitution for all environmental damages and health related issues.	PER02, PER25

<b>Sender Name (Submission ID)</b>	James Schulzetenberg (36539)	
13778	The SDEIS also states that an additional 7,350 acres or more of wetlands could be destroyed because of air and water pollution resulting from taking water from the mine site to the tailings pile and changing the water patterns at the existing old LTV tailings site. However, according to the SDEIS, PolyMet will only have to replace about 27 acres, not the full amount of 7,350 acres!	WET04
<b>Sender Name (Submission ID)</b>	James Seme (42561)	
2569	Is a junior mining company headquartered in VanCouver, Canada. They have never operated a mine before. Backed by the Swiss Company GLENCORE 20% and has Exclusive Agreement to sell the Mine Metals on the Global Market.	PD23
<b>Sender Name (Submission ID)</b>	James Stout (43053)	
17504	sulfide mining is a dirty activity. It's just inherent to the business. In everyoperation I am aware of, there is or has been significant environmental pollution. The negative impacts of sulfide mining on the quality of water, air, soil and plant life are exceptionally well documented in the literature.	VEG06
17505	The... risk in Minnesota will be to the flourishing recreation industry centered on the BWCA and Superior National Forest. The economic benefits of this use of our resource is guaranteed in perpetuity in contrast to proposed mining operations in that area. I believe strongly that mining is not the best use of our resources in N. Minnesota.	SO02
<b>Sender Name (Submission ID)</b>	James Thompson (52440)	
17033	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17
<b>Sender Name (Submission ID)</b>	James Vigiotti (38983)	
17654	Hello. I would like to comment that a federal-level review should be done of the proposed PolyMet mine's SDEIS particularly regarding the incorrect maps as seen on <a href="http://www.bwcasulfidemining.org/mine-site-drainage-to-bwca/">http://www.bwcasulfidemining.org/mine-site-drainage-to-bwca/</a> .	WR080
<b>Sender Name (Submission ID)</b>	James W Larson (54867)	
19355	I have major concerns with long-term wastewater discharges from the mine site...The water residues from the Polymet mine could impact one of our largest freshwater systems in the world; Lake Superior and the Great Lakes.	WR111
19356	Due to well-documented climate changes, I have concerns with exceptionallocalized rainfall events (such as the Duluth 10 inch rain event of June 20, 2012) over whelming the proposed water treatment plants located both at the mine site and the processing plant. Past weather data on 50 and 100 year storms may no longer be reliable in predicting the probability and frequency of such weather events. Knowing the final discharge water into the St. Louis River Watershed will need to be treated into perpetuity, will capacity to do so adequately under extreme weather events be constructed into the treatment system?	WR077, WR180
<b>Sender Name (Submission ID)</b>	James Watson (18113)	
13477	we need jobs. We have so many of our young people that have left the area...There's no one with family that I can think of that is capable of supporting a family on \$10-an-hour wage. It looks like PolyMet is going to be one good payer of good wages and benefits. They already have a facility that is pretty much already built.	SO10

2519	It is known that it will directly impact the moose habitat and that the MN moose is a species of concern. It has not been addressed in the EIS and has been an area of public concern since the first proposal.	WI01, WI02
18363	That's my concern...the polluted water spreading further than they are saying it is going to.	WR010, WR081
<b>Sender Name (Submission ID)</b> Jamie Bartzen (38038)		
13720	Please do not give approval to them, too much is unknown	GEN01
<b>Sender Name (Submission ID)</b> Jamison Tessneer (43744)		
11792	One concern that has not been addressed is the adequacy of Minnesota law to protect landowners that could potentially have their land polluted by sulfide mines. The Minnesota Environmental Rights Act exempts permitted projects like the Northmet project from private causes of action from landowners whose groundwater or surface water may become contaminated. Will causes of action under public/private nuisance laws give landowners adequate recourse if their property is damaged? Will causes of action couched in theories of negligence or trespass give landowners adequate recourse if their property is damaged?	PER35
15085	What if that land [contaminated by mining] is a resort or business and the owner loses business? What recourse will they have?	SO03
<b>Sender Name (Submission ID)</b> Jan Greenfield (43965)		
14937	The days of digging up the earth for quick-term gain should be OVER! There's NO CONTEST between a few short-term jobs & the 500-year-predicted clean-up schedule for Minnesota's blessed natural resources.	SO01
<b>Sender Name (Submission ID)</b> Jan Kaeter (43694)		
10938	PolyMet is only a shell company and will file bankruptcy as soon as the minerals are extracted, then it will be up to the tax payer to pay for the clean up costs. They say reverse osmosis is their plan to clean up the waste, they estimate it will cost 6 million dollars per year: If the clean up lasts 500 years we are looking at 3 billion and that is not including inflation, PolyMet must agree to put up 3 billion dollars + inflation up front to protect us the tax payers.	FIN01, FIN05, FIN08, FIN10
10942	I also do not agree with the wetland swaps the current wetland, draining wetland in one part of the state and digging a pothole in another does not replace a wetland and it's value to a watershed and the wildlife that depends on it.	WET05
10943	And speaking of wildlife our moose population has been stressed and been in decline in the last decade, we can ill afford to remove any more habitat from it's range.	WI01, WI02
10953	There is no way I can see that they can totally seal off the waste in our water rich environment when sulfide based mining in the drier western states have all ended up being environment disasters requiring us the tax payer to clean up the mess.	WR017, WR018, WR020, WR070
10958	The potential cost to Minnesota tax payers and the natural environment is just too high and the SDEIS doesn't address the problems adequately.	NEPA15
10959	From what I understand the Minnesota rule 6132.3200 requires all mines to be maintenance free upon closure, and PolyMet doesn't even come close to meeting that rule.	PER04

16845	PolyMet should not be allowed to get their mine just because they've already spent millions of dollars	NEPA15
16850	PolyMet's - and the public's - short-sighted vision on profits overlook our long-term needs. Life cannot survive without water.	SO01
16851	We can live without gold, copper, nickel. We must look to recycling for our metal needs.	NEPA06
18696	Before the state approves any mining project - such as this sulfide mine proposed by PolyMet - it should be able to point to a mine somewhere in the world where its safety and maintenance-free closure are an example. It cannot.	PER35
18700	We can't afford to sell tomorrow for today. We have no right to sell our children's future. PolyMet is about to commit a crime against nature and humanity. They have admitted their mine will leave contaminated water for 500 years!	SO02
18702	This mine is unconstitutional. Minnesota law clearly states that a mine must be left maintenance-free when closed. PolyMet, meanwhile, says the water, after mining, will have to be treated for at least 200 years! How could anything be less "maintenance-free"?	PER04
18705	PolyMet has not clearly stated how they would great our waters to ensure drinkability, safety for fish, wild rice, etc. Or how they will keep treatment facilities in place for 200 years or more, or how they will [pay] for them.	WR128
18706	If this mine - God forbid - should be approved, it should not come without a strict "damage deposit" required of PolyMet, to insure that taxpayers will not be burdened with the (very likely - the admitted) clean-up, which will cost in the millions and millions of dollars over centuries!	FIN01, FIN10

18708	If an individual caused our water supply to have to be treated for 200 years, polluting it willfully, we would call him a terrorist and imprison him. PolyMet will be doing exactly the same, and yet will be rewarded with enormous gain, at the public's expense and detriment to health.	SO02
18711	With clean water sources dwindling the world over, it is very foolish to destroy one of the last remaining large areas of unpolluted water. Scientists predict future wars will be fought over drinking water. Do we really want to destroy a commodity that will be – and I believe really is now – more valuable than gold.	SO02
<b>Sender Name (Submission ID)</b> Jane Gilbert-Howard (9615)		
1139	I do NOT believe the EIS addresses the long-term environment effects of this proposed copper/nickel mine.	NEPA09
1140	What a tragedy for PolyMet to put a mining operation so close to the BWCAW—the only remaining wilderness of its type on the planet—especially when the forecast for “handling contaminated water” is estimated to be 200-500 years—OMG how can the permitting agencies even consider such an insult to the environment.	WILD02
<b>Sender Name (Submission ID)</b> Jane H Kulas (54805)		
18160	I don't believe that [PolyMet] will capture the contaminated water (a day rarely goes by that we don't hear about a leakage or spill...).	WR018, WR019
18161	The idea of filtering this water for 200-500 years is insane!	WR195
18162	Allowing PolyMet to destroy 900 acres of wetlands is... insane! The idea of "creating" new, replacement wetlands is just plain stupid!	WET24
<b>Sender Name (Submission ID)</b> jane johnson (39232)		
5455	I do not believe that they will ever be able to prove that there will not be pollution of the waters that are so important to this area.	WR195
5457	Jobs are important but cannot take precedence over preserving our clean water resources!	SO01
5458	There are so many endangered species in this area. So many times in the past we have allowed industry to take priority over preservation. This time lets make a different decision - lets learn from the past.	VEG01
<b>Sender Name (Submission ID)</b> Jane Koschak (42544)		
2555	...the copper and nickel deposits, which are proposed to be mined, are located within the Duluth Complex, which is not on the Iron Range.	PD31
2561	Heavy metal leaching is one of the greatest environmental liabilities associated with mining,...How is the SDEIS going to address this environmental liability?	PD01
2562	Metals, such as manganese at the tailings pile...arsenic at the tailing pile...arsenic in Colby Lake drinking water...How is the SDEIS going to prevent this dire situation to our waters from occurring; to preventing human health risks of cancer and other diseases and ailments?	HU01, WR123, WR130
2563	Under the Minnesota Environmental Policy Act 116D.04 Subd.6...The proposed PolyMet plan will seriously degrade the quality of our environment. How will the SDEIS address this?	AIR11

<b>Sender Name (Submission ID)</b>	Jane Koschak (42544)	
2564	This proposed sulfide mine project features requiring perpetual maintenance and monitoring, which is in violation of MN Rule 6132.3200, is absurd and unachievable, as it requires this to go on for centuries. It should not be allowed. How will the SDEIS attempt to counteract this?	FIN14
3110	One being that mining would totally occur on the Iron Range where typically iron and taconite mining have occurred. However, the copper and nickel deposits, which are proposed to be mined, are located within the Duluth Complex, which is not on the Iron Range.	PD27, PD31
3120	Birch Lake would be negatively impacted by this mine plan....There are resorts, house boat businesses, campgrounds, cabins and homes dotting the shoreline of Birch Lake. There are vast areas of forest, wildlife habitat, treaty-protected resources within the 1854 ceded territory and cultural sites...	LU06
3122	Most, if not all, will be impacted and permanently degraded by noise pollution and air pollution from the proposed sulfide mine.	N01
3127	Perception of noise, air, water pollution and degradation of the wilderness land in the minds of the travelers will negatively impact their decision to recreate in the Arrowhead region of Minnesota; therefore, economic loss for tourism.	SO02
3129	Figure 5.2-8.2 of the SDEIS illustrates air blast contours from the blasting at the mine site. This documentation is flawed and inaccurate. It does not take into account impacts to residents that do live on Birch Lake near the proposed mine site, to recreational sites to the Birch Lake pine forest just outside of Babbitt with biking and hiking trails, and to the 14 federal camp sites on Birch Lake	N02
3130	Wind blown dust particles containing sulfite compounds that are emitted from mining and beneficiation activities could contaminate wetlands, lakes, and streams near the project site and could cause harm to the species of concern that have been found in this area and to animals that depend on these foods or these plants for foods....These wind blown dust particles could be hazardous to human health of those living in the region of the proposed NorthMet. How is the SDEIS going to address this concern?	VEG07, WI04
3132	Under the Weeks Act, open-pit mining is not allowed on federal land. But instead of rejecting this proposed mine the United States Forest Service is proposing a land exchange so that their consideration of the surface land is eliminated. These lands and these waters that are proposed to be exchanged to PolyMet by the USFS belong to all the citizens of this country. This is wrong. This is our land, our wetlands, our water. This should not be allowed. Why is the Weeks Act not being enforced?	LAN02
3133	Heavy metal leaching is one of the greatest environmental liabilities associated with mining, especially in pristine environments like the project mine site that have economically and ecologically available natural resources....Metal, such as manganese, at the tailings pile will have 15 times more manganese per liter than the limit set by the Minnesota Department of Health to prevent brain damage in infants, children, and adults. There will be an increase of arsenic at the tailings pile by up to 417 percent. An increase in arsenic in Colby Lake drinking water by 38.5 percent, which would increase the risk of cancer for Hoyt Lake residents above the level of concern in Minnesota's cancer risk rule.	HU05
3139	Perpetual treatment. Minnesota rule 6132.3200 does not allow perpetual treatment. ...A, the PolyMet SDEIS states that long-term -- meaning greater than 500 years at plant site and greater than 200 years at the mine site -- treatment of wastewater is needed, which means the site will not be maintenance free at closure....B, 526 acres of lands covered by more than 167 million tons of waste rock would be covered by a plastic sheet and surrounded by a system that would supposedly by collect contaminated seepage. All would require monitoring and maintenance constantly for hundreds of years to fix leaks, repair perforations, and remove deep rooted plants....C, a mining pit lake would require pumping to prevent the toxic brew of acid and heavy metals from spilling into the nearby Partridge River and the tailings basin pond would require pumping to prevent spillage into the tributary of the Embarrass River....And finally D, the polluted water collection system, which includes miles of pipes, would require monitoring and maintenance for centuries	PER04

3142	This SDEIS proposal is not in the public's best interest. It is inadequate, contains falsehoods, and omissions related to moose, mercury, and other concerns...What is the reason that important concerns related to moose and their habitat and mercury as related to aquatic species and human health were not fully addressed in the SDEIS?	WI01
6836	Most if not all, will be impacted and permanently degraded by noise pollution and air pollution from the proposed sulfide mine. I have 1500+ resort guests each season, and when they boat, fish, canoe, kayak, picnic, and swim on Birch Lake, they do so with the expectation of listening to the loons and watching eagles, fishing in peaceful coves, and picnicking on islands studded with pine trees and a canopy of clean air. Instead, with this plan, my guests, and most who live and recreate on Birch Lake, will be receptors for mine noise and air pollution. [Figure 5.2-8.2] does not take into account impacts to residents that DO live on Birch Lake near the proposed mine site, to recreational sites, to the Birch Lake Pine Forest, just outside of Babbitt, with biking and hiking trails, and the 14 federal campsites on Birch Lake...no mention of the privately owned recreational tourism businesses based on Birch Lake.	N01
6838	Perception of noise, air, water pollution and degradation of the wilderness lands in the minds of the traveler will negatively impact their decision to recreate in the Arrowhead region of Minnesota	SO02
6840	Figure 5.2-8.2 of the SDEIS illustrates air blast contours from the blasting at the mine site. This documentation is flawed and inaccurate. It does not take into account impacts to residents that DO live on Birch Lake near the proposed mine site, to recreational sites, to the Birch Lake Pine Forest, just outside of Babbitt, with biking and hiking trails, and the 14 federal campsites on Birch Lake. It is important to remember, that noise and air pollution have no barriers, not matter how many charts and tables may be drawn up to state otherwise. Why was documentation related to the aforementioned items not included in the SDEIS?	N02
6841	Wind-blown dust particles containing sulfate compounds that are emitted from mining and beneficiation activities could contaminate wetlands, lakes, and streams near the project site and could cause harm to the Species of Concern that have been found in this area and to animals that depend on these plants for food. These wind-blown dust particles could be hazardous to human health of those living in the region of the proposed NorthMet Mine.	AIR10, HU03, WET24, WI01, WI04
6843	This Environmental Rights Act [MN Environmental Rights Act 116B.01] gives its citizens the right to protection of our land, our water, our air and our natural resources. How can this proposed mine plan move forward when it will degrade and destroy air, water, land and other natural resources within our state?	PER35
6847	In return for this possible land exchange ...with the tradeoff of destroying the forested land that belongs to us, perpetual water pollution, and increased human health risks, including increased neurological damage to our children from mercury pollution.	GEN03
6848	There will be an increase of arsenic at the tailing pile by up to 417%; and increase in arsenic in Colby Lake drinking water by 38.5%, which would increase the risk of cancer for Hoyt Lakes residents above the level of concern in MN's cancer risk rule.	HU05
9035	This SDEIS fails to adequately address the human risks of exposure via air, water, soil, skin contact, and food consumption, to increased emissions of highly toxic chemicals and metals including: iron, copper, arsenic, mercury, lead, cadmium, chromium, cobalt, zinc, manganese, aluminum, thallium, asbestos like fibers, radon, fine particulate matter; silica, sulfate, diesel exhaust, among others, which acting singly or in combination with synergistic effects have been shown to cause disease, death and impaired quality of life in humans.	HU01
9043	There are no data regarding the toxicity of toxic pollutants for vulnerable citizens, including the unborn, children, the aged, those with chronic diseases, the immunosuppressed individuals, all of whom will likely be exposed to PolyMet pollutants.	HU01

9045	Fine particle air pollution increases morbidity and mortality and reduction of such pollution improves life expectancy...It is the cumulative effects of air pollutants and toxic chemicals in water, soil, and food, predict the likelihood of human disease. I found no estimates of such cumulative effects in the SDEIS.	AIR07
9048	The heavy metals arsenic, nickel-chromium and other toxicants such as fine particles, silica, and diesel exhaust among others cause lung and other cancers in workers and the general population...[T]o what extent will the PolyMet mining add to this chemical burden and risks to health?	HU04
9943	PolyMet would also destroy thousands of acres of very high-quality, irreplaceable wetlands, (the largest destruction of wetlands in the state of Minnesota).	WET23
9944	To create the Mine Site, our public lands within the Superior National Forest of Minnesota would be traded by the U.S. Forest Service for lands in Cook, St. Louis, and Lake County that are non-contiguous with a fraction of the value of the lands we, the people, would be virtually giving away to PolyMet Corporation for their Mine Site.	LAN03, LAN06
9945	This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin.	WR111, WR115
11637	PolyMet's water treatment system provides no details for what happens in the event of catastrophic accidents or failure of the system to operate over the 500+ years during which polluted water is being discharged... Scientific studies suggest that this facility must be designed for the 500-year storm, because the 1980's 500-year storm is now occurring almost as often as the 100-year storm.	PD22
11644	[The SDEIS has a] Lack of information regarding mercury contamination of fish and ultimately methymercury in humans. This area, home to 6 operating taconite mines, already has an alarming concentration of mercury and other pollutants far exceeding the regulatory standards.	MERC02
11646	[The SDEIS has a] Lack of alternatives to the probable permanent destruction of some 8,263 acres of wetlands, with some 913 acres being of very high quality irreplaceable wetlands in the St. Louis River watershed.	ALT13, ALT23
11653	This 600-700 foot deep, open pit mine comes with a plan to remove more than 530 million tons of ore and waster rock, causing utter destruction of MN largest tract of high-quality wetlands with more than 4,000 acres of wildlife habitat degraded, including two square miles of critical habitat for the Lynx and an important habitat for our dwindling moose population. Mines presently in operation have created a significant barrier for wildlife migration with only 18 narrow corridors within the Range to move from north to south.	WI02, WI03
11656	The proposed PolyMet mine site is located in the Superior National Forest. Under the Weeks Act, open pit mining is not allowed on federal land.	NEPA04
11659	Metals, such as manganese at the tailings pile that will have 15 times more manganese per liter than the limit set by the Minnesota Department of Health to prevent brain damage in infants, children and adults. There will be an increase of arsenic at the tailing pile by up to 417%; and increase in arsenic in Colby Lake drinking water by 38.5%, which would increase the risk of cancer for Hoyt Lakes residents above the level of concern in MN's cancer risk rule.	HU12, WR043, WR204
11661	Mining cannot be permitted if it causes destruction of our natural resources. PolyMet's proposed sulfide mine threatens Minnesota's clean water and public health. Under MN Environmental Policy Act 116D.04 Subd.6: "Economic considerations alone shall not justify such conduct." This proposal is not in the Public Interest.	GEN03
11662	I endorse the "No Action Alternative" because I believe that this DEIS is a testament to falsehoods, omissions, and claims without fact.	NEPA15

11663	Nothing in this DEIS demonstrates that we need the copper or the jobs.	PER35
13227	Furthermore there is no mention of the privately owned recreational tourism businesses based on Birch Lake for decades. There are three resorts, a canoe outfitter, two houseboat businesses, and one campground that will be sound and air receptors of the proposed NorthMet Mine. It only mentions the federal camp area.	SO02
13365	Not only will there be 500 years... of water pollution from sulfuric acid and heavy metals...not all of the polluted water will be captured for treatment. Some 11 million gallons, annually, of polluted seepage from the tailings basin will enter our groundwater without treatment. And, further some 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated.	WR070, WR117, WR156
13368	PolyMet's water treatment system provides no details for what happens in the event of catastrophic accidents or failure ...The SDEIS provides no assurance or details on the impacts to water quality, wildlife or human health if the treatment system fails or if there is a breakdown, which is inevitable.	PD22, PD29
13369	Lack of information regarding mercury contamination of fish and ultimately methylmercury in humans. This area, home to 6 operating taconite mines, already has an alarming concentration of mercury and other pollutants far exceeding the regulatory standards.	MERC02, MERC03
13372	There is no plan to compensate for thousands of acres of wetlands that would be "indirectly" harmed. These wetlands have been named an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the U.S. EPA has stated that it is likely an Aquatic resource of National Importance ...In return for this area that includes black spruce, cedar, and tamarack wetland, and also includes a lake, the Yelp Creek, and the Partridge River flowing through it, we the people" will receive five non-contiguous pieces of land in Cook, Lake, and St. Louis Counties. These lands are simply a fraction of the value of the lands we would be virtually giving away to PolyMet Corporation for their Mine Site.	WET19
13374	Mines presently in operation have created a significant barrier for wildlife migration with only 18 narrow corridors within the Range to move from north to south. PM would further degrade what is a marginal, but important corridor for our wildlife.	WI03
13375	The proposed PolyMet mine site is located in the Superior National Forest. Under the Weeks Act, open pit mining is not allowed on federal land. These lands and these waters that are proposed to be exchanged to PolyMet by the USFS belong to all the citizens of this country. But instead of rejecting this proposed mine, the USFS is proposing a land exchange so that their consideration of the surface land is eliminated.	LAN02
13376	MN Environmental Rights Act 116B.01 states: "The legislature finds and declares that each person is entitled by right to the protection, preservation, and enhancement of air, water, land, and other natural resources located within the state and that each person has the responsibility to contribute to the protection, preservation, and enhancement thereof. In return for this possible land exchange with the federal government, PM plans to destroy the land that belongs to the Public, and forevermore, into perpetuity, pollute our waters with mercury, acid mine drainage and other heavy metals.	PER35
13378	Metals, such as manganese at the tailings pile that will have 15 times more manganese per liter than the limit set by the Minnesota Department of Health to prevent brain damage in infants, children and adults. There will be an increase of arsenic at the tailing pile by up to 417%; and increase in arsenic in Colby Lake drinking water by 38.5%, which would increase the risk of cancer for Hoyt Lakes residents above the level of concern in MN's cancer risk rule.	HU05
13379	Under MN Environmental Policy Act 116D.04 Subd.6: "Economic considerations alone shall not justify such conduct." Nothing in this DEIS demonstrates that we need the copper or the jobs.	PER35

15017	If approved, this first-ever sulfide mine in Minnesota would open the door for multiple sulfide mining companies, "waiting in the wings", that would endanger the Boundary Waters Canoe Area Wilderness (BWCAW).	CU04
15018	We have two tourism recreational businesses (resort and canoe outfitting). We are threatened by the advent of turning our Lake District into a Mining District....from turning a vibrant Wilderness area into a dead and barren Minefield of toxic destruction, not only to the landscape, but to our most valuable resource....our WATER.	SO02
15562	There are no data presented to indicate how the PolyMet proposed sulfide mine operation will prevent leaching into the environment and intake into the body of heavy metals which are among the key promoters of oxidative stress in humans that promote metal-induced and metal enhanced formation of free radicals in the body with resulting toxicity and carcinogenicity.	HU01
15569	Reproductive pathology: is caused by metals and toxic chemicals commonly found in sulfide mining operations. Such chemicals cause damage or death to human embryos and fetuses, neurological damage in the fetal and neonate brain; recently researchers at Harvard have discovered the association of air pollution with Autism Spectrum Disorder (ASD) in a major study (>320 cases and >22,000 control subjects) of the perinatal exposure to metals lead, manganese, mercury, and diesel exhaust and other pollutants. There is no mention in the SDEIS of potential risks to pregnant women regarding reproductive pathology.	HU01
15606	The proposed mine site is in the Superior National Forest. Birch Lake is part of the Duluth Complex area and is located in the Superior National Forest. Birch Lake would be negatively impacted by this mine plan.	WILD02
15607	Under the Weeks Act, open pit mining is not allowed on federal land. But instead of rejecting this proposed mine, the USFS is proposing a land exchange so that their consideration of the surface land is eliminated. These lands and these waters that are proposed to be exchanged to PolyMet by the USFS belong to all the citizens of this country.	LAN02
15608	Under the Minnesota Environmental Policy Act 116D.04 Subd.6: "No state action significantly affecting the quality of the environment shall be allowed, nor shall any permit and natural resources management and development be granted, where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state, so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air, water, land, and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct." The proposed PolyMet plan will seriously degrade the quality of our environment. How will the SDEIS address this?	PER35
15609	Minnesota Rule 6132.3200 does not allow perpetual treatment: "to receive a permit to mine, the permittee must be able to close the mine in such a way that it is stable, free of hazards, minimizes hydrologic impact and release of substances, and is maintenance free."	PER04
15610	The PolyMet SDEIS states that "long-term" (>500 years at the Plant Site and >200 years at the Mine Site) treatment of wastewater is needed which means the site will not be maintenance free at closure.	PER04
15611	526 acres of land, covered by more than 167 million tons of waste rock, would be covered by a plastic sheet and surrounded by a system that would supposedly collect contaminated seepage. All would require monitoring and maintenance constantly for hundreds of years to fix leaks, repair perforations, and remove deep-rooted plants.	PD01
15612	A mining pit "lake" would require pumping to prevent the toxic brew of acid and heavy metals from spilling into the nearby Partridge River, and a tailings basin pond would require pumping to prevent spillage into the tributaries of the Embarrass River. The polluted water collection system, which includes miles of pipes, would require monitoring and maintenance for centuries.	WR037, WR131

15613	This SDEIS proposal is not in the public's best interest. It is inadequate, contains falsehoods, and omissions related to moose, mercury and other concerns. The word "moose" does not appear at all in the SDEIS cumulative effects analysis. What is the reason that important concerns related to moose and their habitat and mercury, as related to aquatic species and human health, were not fully addressed in the SDEIS?	WI01, WI02, WI08
16087	Not only will there be 500 years, or basically into perpetuity, of water pollution from sulfuric acid and heavy metals, as indicated by PMet's own DEIS, but in addition, not all of the polluted water will be captured for treatment... What would be the long-term effects of the release of this untreated water to your health, your neighbor's health, and the health of the land and nearby lake?	HU01, WR064, WR107, WR108, WR177
16088	PolyMet's computer model may actually understate the actual pollution impacts, because it has been shown to be inaccurate in representing current conditions for water quality by the mine site.	WR049
16089	The SDEIS provides no assurance or details on the impacts to water quality, wildlife or human health if the [water] treatment system fails or if there is a breakdown, which is inevitable.	WI07, WI13, WR129, WR141
16138	There is no plan to compensate for thousands of acres of wetlands that would be "indirectly" harmed. These are not lands on the Iron Range, as the SDEIS falsely states. These are lands in the Superior National Forest...the public's land... These wetlands have been named an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the U.S. EPA has stated that it is likely an Aquatic resource of National Importance because of the high level of biodiversity.	WET01
16140	In return for this area that includes black spruce, cedar, and tamarack wetland, and also includes a lake, the Yelp Creek, and the Partridge River flowing through it, "we the people" will receive five non-contiguous pieces of land in Cook, Lake, and St. Louis Counties. These lands are simply a fraction of the value of the lands we would be virtually giving away to PolyMet Corporation for their Mine Site.	LAN03
16175	These lands and these waters that are proposed to be exchanged to PolyMet by the USFS belong to all the citizens of this country. But instead of rejecting this proposed mine, the USFS is proposing a land exchange so that their consideration of the surface land is eliminated. This is wrong. This is public land.	LAN04
<b>Sender Name (Submission ID)</b> Jane L Soukup (54834)		
18679	Yes, we need jobs, but we shouldn't be forced to accept the contamination of our lakes & streams. Our groundwater is precious -- once it is poisoned we will never get it back.	WR115
18683	500 years of site management & clean-up? ...That's a tremendous price to pay for the capital gains of a few wealthy (& in some cases, foreign) investors.	SO02
<b>Sender Name (Submission ID)</b> jane piegras (47417)		
17584	We have read the proposal carefully yet are left with the genuine concern that long term environmental protection especially for the area waters, can not be assured. Our fears are substantiated by the fact that there is no existing sulfide mine, even the most contemporary such as Flambeau in Wisconsin, which have not ultimately caused leakage of toxic metals and sulfuric acid into the water table and surrounding earth.	PD01
17585	Northeastern Minnesota's precious natural resources must not be jeopardized for future generations by approval of mining which is based on unproven technology, false premises and self serving promises from an industry with such a terrible track record worldwide.	SO02

9393	Water is needed for Life & is therefore of far more value than all the ore that can be mined.	WR195
<b>Sender Name (Submission ID)</b> Janet Draper (42821)		
7284	I am writing to ask you to reject the PolyMet NorthMet SDEIS because it is inadequate. The calculations are optimistic and do not accurately predict the environmental impacts of the proposed open-pit sulfide mine. The model used to predict impacts to water quality is flawed. And there are no contingency plans for expected accidents at such mines such as pipeline spills, accidental releases, failures of water collection and treatment systems and tailings basin failure....500 years of pollution – or more – are. Our water is one of our most important resources, and this will become truer as water shortages increase worldwide. We in this part of Minnesota will go from being in an enviable position to being in an unenviable one.	WR115, WR128, WR129, WR130, WR131, WR132
7284	The model used to predict impacts to water quality is flawed. And there are no contingency plans for expected accidents at such mines such as pipeline spills, accidental releases, failures of water collection and treatment systems and tailings basin failure....500 years of pollution – or more – are. Our water is one of our most important resources, and this will become even truer as water shortages increase worldwide.	WR115, WR128, WR129, WR130, WR131, WR132
7286	The necessity for at least 500 years of active water treatment should be a red flag to us all. Who will be conducting the treatment and where will the money come from? The revised plan does not give details about financial assurance – about how much Polymet will pay and whether that will be enough. The state of Minnesota and its taxpayers will undoubtedly pay the bill.	FIN01, FIN05
7286	The necessity for at least 500 years of active water treatment should be a red flag to us all. Who will be conducting the treatment and where will the money come from? The revised plan does not give details about financial assurance – about how much Polymet will pay and whether that will be enough.	FIN01
<b>Sender Name (Submission ID)</b> Janet Frigstad (16888)		
11018	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Janet Johnson (44768)		
7269	500+ years of treating polluted water... should be enough to open our eyes and say no. Water is our most precious resource and in a world where potable water is scarce and disappearing why are we endangering one of our last great supplies of clean water (this watershed goes into Lake Superior)	WR115
<b>Sender Name (Submission ID)</b> Janet Magree (11590)		
2248	The threat of bio accumulation from release of sulfides to air and water, and the drying of wetlands, will add to the incidence of neurotoxicity that causes damage to the brains of developing fetuses.	MERC03
2249	Adding more permanent waste rock to the existing, already leaking LTV pile, will exacerbate bio accumulation of mercury for future generations.	MERC20
<b>Sender Name (Submission ID)</b> Janet Neville (3745)		
9657	It must be proven absolutely safe before any permits are release[d].	PER06

17005	t is our responsibility to see that it is protected. This means practicing the "precautionary principle" when making decisions that can irrevocably damage our planet. It must be proven beyond a shadow of a doubt that sulfide mining will not degrade the environment or tip the ecological balance.	SO01
<b>Sender Name (Submission ID)</b> Janet Petri (43102)		
11074	... I am very concerned about the effects of the sulfide runoff into the watershed. Northern Minnesota and the BWCA are VERY watery environments.	WR111
11076	The reverse osmosis water filtration seems pretty cool, but it has not been tested on this scale. What happens when (not if) there is a 10 inch rain on the site? Who will be maintaining the reverse osmosis system in 500 years - 480 years after the mine shuts down? A giant barrier is needed, down to bedrock, to keep the untreated, polluted water from flowing down stream. In 500 years, who will be maintaining this barrier? For that manner, who will be maintaining and funding the barrier in 50 years, or 100?	PD03, WR023, WR128, WR143, WR144
11077	Why not require an underground mine, which would present fewer risks to water resources? ... The company says that copper prices are not high enough to make underground mining pay. However, I think it is worth it to wait to mine until it can be done right. The copper will still be there.	ALT01, ALT06
11079	What happens when the former LTV Steel's tailings basin, which was developed in the 1950's, fails after sulfide-bearing tailings are dumped on top of it?	PD10
11082	I have seen places polluted with mine tailings. I don't want northern minnesota to go that route. Clean water is essential for life.	WR195
<b>Sender Name (Submission ID)</b> Janet Spring (9987)		
324	Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever	NEPA09, WR115
497	...PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion.	WR003, WR115
500	Neither the SDEIS nor the sulfide mine project are based on good science.	NEPA09
503	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
504	The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.	WR058, WR064, WR177
513	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump.	WR010, WR061, WR099, WR168

<b>Sender Name (Submission ID)</b>	Janet Spring (9987)	
514	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards	WR189, WR202
551	Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR195
915	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish	WR189
917	[The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on]... Human health	SO04
918	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR017
1400	Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
1401	The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:•The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.•The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.•The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.•The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.	WR003, WR010, WR018, WR019, WR064, WR111, WR177, WR189

16399	The world don't need more that's why they invented recycling for we can' do no more harm in the world I gess people just don't get that we have to protect what grows in the world for that we can still be living there so many other places were you can get copper, metal and other minerals pleas don't destroy our home the land of 10 thousand lakes we need our lakes and we need animals.	NEPA15
<b>Sender Name (Submission ID)</b> Jared Yakk (54539)		
19173	Please keep the BWCA as is. 20 years of job creation isn't worth the hundreds of years of disaster this will cause. Use your mind not your wallet.	SO01
<b>Sender Name (Submission ID)</b> Jason Carr (43562)		
8164	I encourage the MN DNR to carefully balance the short term benefits and localized economic impact of this mine against its potential long term harm to our state's citizens and brand.	SO01
<b>Sender Name (Submission ID)</b> Jason Etten (10295)		
482	Do we really have a concept of the length of time and the cost involved in this cleanup effort? This could be two to three times longer than this state has been in existence.	PD25
483	Those who argue about the positives this will bring to the economy are looking only at the short term. Twenty years of mine work doesn't even provide jobs for a career for a miner. That would be half a career and then we would be back to start with an environmental disaster waiting to happen. This is not a sustainable or wise way to provide jobs and a future for those living in the Iron Range.	SO01
<b>Sender Name (Submission ID)</b> Jason Finley (5925)		
1927	Mining creates the possibility to poison a Minnesota water supply.	WR195
1928	Therefore, mining permits should not be issued.	PER35
<b>Sender Name (Submission ID)</b> Jason Fisher (7617)		
804	I am conviced that PolyMet's NorthMet project can be done in an environmentally friendly manner. The SDEIS is a detailed, independent review; federal, state and tribal agencies shaped the development of the draft EIS, which was written by an independent, third party. I believe this is a sound process. The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them. The public can be confident that the draft EIS offers regulators the information they need to issue permits so that PolyMet can operate in a way that protects natural resources.	NEPA16
<b>Sender Name (Submission ID)</b> Jason George (18180)		
13398	I believe that we can have these jobs and protect the environment.... I keep hearing about 300 jobs. Nobody is talking about 2 million construction hours, which is what it's going to take to build this project. ...we're talking about a stadium-sized project in Northern Minnesota that is desperate for jobs.	SO10

1877	there is [not] yet a good method of [water, in particular sulfate] treatment that well not lead to long-term serious negative effects.	WR128, WR145
1878	I [do not] believe any amount of money held in escrow for reclamation well be enough to suffice for future needs. We are not sure what they well be nor do we know costs of treatment 150-200 years from now.	FIN01, FIN05
1880	[sedge/wet meadows, coniferous bogs, and open bogs] are of significant importance on their filtration and hydrologic values to the area in which they occur.	WET24
1881	Moose are quickly disappearing in NE MN. Wetlands provide a food source for moose and are an important habitat component.	WI01, WI02
1882	I request you deny Polymet permits to continue on with their project due to impacts on water quality, wetlands that are difficult to mitigate and replace and the impacts on water quality and animal habitat resulting from their destruction.	PER35, WET24, WR195
1955	in order to have water that meets release standards for sulfate levels treatment would need to take place anywhere from 200 years to perpetuity.	WR035
1956	It states in the wetland section 912.5 acres of wetlands would be directly affected and between 6,498 and 7,350 indirectly affected... these wetland types [sedge/wet meadows and both coniferous and open bogs] develop over 100s of years and the likelihood of mitigating them with like wetlands is unlikely.	WET24
<b>Sender Name (Submission ID)</b> Jean Christopherson (19079)		
15650	I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this.	NEPA07
15652	Please... consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014. PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't... reasonable.	NEPA10
15654	[More time to comment and to prepare for public meetings is needed because:] The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents.	NEPA07
15655	[More time to comment and to prepare for public meetings is needed because:] The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying.	NEPA07
15656	[More time to comment and to prepare for public meetings is needed because:] The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed.	NEPA07
15657	[More time to comment and to prepare for public meetings is needed because:] No data is provided to support the level of financial assurance proposed.	NEPA07
15660	The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase.	MERC02, MERC20

<b>Sender Name (Submission ID)</b> Jean Christopherson (19079)		
15663	[More time to comment and to prepare for public meetings is needed because:] The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense?	NEPA07
15666	[More time to comment and to prepare for public meetings is needed because:] The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings.	NEPA07
15671	Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions.	NEPA07
<b>Sender Name (Submission ID)</b> Jean Greenwood (9616)		
1329	I understand treatment will be required at the mine for 200 years and at the plant site for 500 years. All this for a mine that lasts 20 years, creates few jobs, and puts our land, water, air, health at risk.	PD01, WR115
<b>Sender Name (Submission ID)</b> Jean Johnson (57174)		
18685	Minnesota has clean water and beautiful clean lakes. Why would we permit a company to ruin all our water. They say it will bring more jobs. We need more jobs, but we need clean water to survive. Any mining that will harm our water is not wanted in Minnesota.	SO02
<b>Sender Name (Submission ID)</b> Jean Oberle (43120)		
15875	I am strongly opposed to the Polymet mine project in the Babbitt/Hoyt Lakes area due to the long term environmental ramifications.	GEN01
<b>Sender Name (Submission ID)</b> Jean Watson (19789)		
15703	I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for -- information that is necessary to decision-makers.	WR035
15704	PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota.	WI02
15705	sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons.	WI01, WI02, WI04
15724	four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02
<b>Sender Name (Submission ID)</b> Jeanette Curphy (19893)		
1497	For the few hundred jobs offered for this project, that would last approximately 20 years, the damage appears to outweigh the benefits.	SO01

14835	It bothers us that Polymet is not an American Company but a Canadian company. Do they really care about our environment?	PD23
14836	The history of copper/nickel mining companies is that they do their mining, file bankruptsy, and leave the citizens to pay for the clean up, and their is no known way to clean up sulphur material in the water.	PD01
<b>Sender Name (Submission ID)</b> Jeanette Trushsess (18247)		
13650	Even with the best technology and state-of-the-art methods for capturing sulfide, eventually, perhaps several generations from now, those chemicals will leach into the watershed and Lake Superior. The mining company is not going to take responsibility, even if it still exists as an entity 100 years from now. And even if it were to take responsibility, it would not be possible to reverse the damage.	PD01
13651	No amount of money would compensate the people relying on Lake Superior for their potable water. Fresh water is going to be a necessary condition for quality of life in Minnesota, long after the miners and the minerals have come and gone.	FIN05
<b>Sender Name (Submission ID)</b> Jeanine Allen (43706)		
15399	Minnesota has only been a State for 156 years, and to commit future generations to this amount of supervision, and resultant costs, is absolutely irresponsible. In addition, I have yet to find any such pollution control measures that actually work in the real world.	FIN01
15401	It has been noted in news articles that copper mining will expose and release into the environment sulfate, mercury, possibly asbestos-like particles, and other toxic metals into the water, and possible the air. ... To prevent such pollution from happening, we are told that extraordinary pollution control prevention measures must be implemented, and sustained, for a period of at least 500 years.This is absolutely mind-boggling to me that we would even consider approving a project that gives us 20 years of mining and jobs, in return for more than 500 years of State oversight and maintenance of the mine site.	PD01
15402	Minnesota is known world wide for our Minnesota grown wild rice. Native Americans have been harvesting wild rice for centuries, and will probably continue to do so, "if" we don't ruin the environment which is necessary for its continued survival. As far as I can tell, we have not fully determined the "safe" level sulfides in the water which will allow for the sustainability of our wild rice crop. I feel we should not endanger wild rice production in our State in return for 20 years of copper mining; it just doesn't make sense.	WR156
15403	We've been trying to reduce mercury levels in Minnesota waters for years. Every summer I hear reports that people should limit their fish intake to so many fish per week due to mercury contamination. And now, we're to consider increasing adding more mercury to Minnesota waters, in return for 20 years of copper mining. Once again, this doesn't make sense.	MERC02, MERC22
15404	I imagine people in Duluth and many other communities and individuals up and down the North Shore who obtained their water from Lake Superior had been subjected to [asbestos fiber] contamination [due to mining in the area] for years before it was discovered. I also imagine it will be years before the direct negative impact on public health this pollution has, and will, cause. For years I have wondered what will be the eventual impact this will have on my family. People should not have to worry about problems like this.	HU03
15405	Our government's, including the DNR, primary objective should be protecting Minnesotans and our environment, not catering to foreign corporations.	PER02
15406	I don't want to see the Minnesota environment getting ruined to provide 20 years of profits to a corporation and then get stuck with the cost of cleaning up the mess for the next 500 years; it just doesn't make sense.	FIN01

<b>Sender Name (Submission ID)</b> jeff durfee (38127)		
8802	Because of the water rich environment, why not use under ground mining methods. This might help with the water run off problems.	ALT06
<b>Sender Name (Submission ID)</b> Jeff Evans (46072)		
10566	I am opposed to the plan to mine copper nickel in Northeastern Minnesota [because of the] lack of transparency on the financial assurance calculations. Not providing the assumptions or contingencies is short sighted. I realize this by law is to be part of the permitting process but the DNR and other agencies should've realize the lack of faith citizens would have in this process and provided that information.	FIN13
10570	I am opposed to the plan to mine copper nickel in Northeastern Minnesota [because of the] lack of a mercury/sulfate standard for wild rice. How can the state make a wise decision if the rules for sulfate standards haven't been decided on yet or updated?	HAZ01
10572	What are the health risks from this type of mining? Has it been studied?	HU01
10574	How much of the technology has been tested in the field rather in the laboratory? Reverse osmosis operates differently in a controlled environment of the lab.	PD32, WR143
10578	What is the cost to the state and local communities on the infrastructure? Crime will increase so will heavy loads on highways. Is this considered? How this project will be taxed has not been determined. Let's solve that problem first.	SO04
10580	What are the costs of 200 to 500 years of pollution compared to twenty years of a few jobs?	SO01
10583	Modeling should be revised. The new information on water flows indicate that the models are incorrect and need to be substantially revised. The state should make an informed decision with the best information possible, not a hurried political one.	WR003
<b>Sender Name (Submission ID)</b> Jeff Hanson (44301)		
11840	The Dunka Pit of Erie LTV Mining... is a prime example of the sulfate and acid mine drainage problems that can result from any type of mining where sulfide ores such as copper sulfide or iron sulfide (pyrite) are present. ... To this day seepage from this site is treated before being discharged into Birch Lake, and it still exceeds some contaminate limits.	PD01, WR023
11842	I am extremely well impressed by the level of concern and the depth of the review that has been conducted by the PolyMet SDEIS process. This is exactly the type of review that is needed to rationally anticipate and mitigate the environmental impacts that could happen.	NEPA16
11847	With reverse osmosis PolyMet should be able to meet the stringent standards for sulfate discharges. ... It is important that the PolyMet project proceeds with all the appropriate precautions to meet all standards, but also to continue the studies and research to learn about how we can do mining with the absolute minimum of impact on the natural environment.	PER34, WR190
11848	We can debate until we are blue in the face whether, or not, all of the data and technologies presented in the PolyMet SDEIS is all correct or valid. But we know that it was put together with the best minds and talents available today. We should consider this expert analysis and proceed in the least risk manner possible.	NEPA16
15015	I am further impressed and pleased that the MPCA through their water permits and the SDEIS process have required that PolyMet and Erie evaluate methods for the reduction of sulfates, sulfides and dissolved metals in mining impacted water discharges.	GEN02

<b>Sender Name (Submission ID)</b>	Jeff Hanson (44301)	
15016	I believe that it is absolutely essential to proceed with the SDEIS process. It has been conducted seriously and in great depth. It mandates on-going monitoring and testing to learn the most and assure that it keeps on track. It is hard to imagine a better situation and scenario for learning and proving out how we can develop these types of mining in an environmental responsible manner.	PD28
<b>Sender Name (Submission ID)</b>	Jeff Heikkinen (38105)	
13712	A few hundred jobs and 20 years of work compared to 500 years of possible ecological impact doesn't make sense	SO01
<b>Sender Name (Submission ID)</b>	Jeff Iisakka (18333)	
13910	I'm very confident that with today's high technology, strict environmental regulations that the PolyMet mining facility will be highly successful and we'll be enjoying the fruits of their labor for many years.	SO10
<b>Sender Name (Submission ID)</b>	Jeff Lentsch (42150)	
6371	Due to the economic gain, and environmentally friendly procedures, mining in Minnesota should stay... So let us keep those good paying jobs here in Minnesota. There have been plenty of health impact study's done on the poor, and their not as healthy when compared to the wealthy. Wealth is the only thing we can invest in the technology that make these procedures more environmentally friendly.	SO10
<b>Sender Name (Submission ID)</b>	Jeff Mogush (38466)	
13764	If this were just about economic benefits, it would be difficult to argue against permitting Polymet's proposed mine. The fact that this process has never been done safely along with the need to treat the polluted water for 500 years, should make any thoughtful person skeptical. The fact that the SDEIS assumes that nothing will go wrong is not defensible. The risk to the abundant water in the area makes this project a poor choice for our State.	SO01, WR195
<b>Sender Name (Submission ID)</b>	Jeff Pearson (45063)	
7546	How can you PLAN to pollute a pristine area like this with 500 years of pollution?	PD01, WR195
7549	What company will be around in 500 years?	FIN01
16776	Don't do this to the BWCA....	WILD02
<b>Sender Name (Submission ID)</b>	Jeff Rupp (40743)	
14041	how can a company and the DNR be certain waste water won't find hidden cracks and fissures at the mine site and percolate to unexpected areas contaminating lakes or groundwater in unforeseen locations, making water treatment very difficult? Also, during the mining process and after how would they handle water treatment if for example they had another very intense prolonged rain event with record setting amounts of rain in short period of time like what occurred last summer??	WR010, WR011, WR057, WR180, WR193
14042	I want to mention that not all mining results in a economic boost for the surrounding communities!...most economic benefits occur mainly in the early stages of mine construction-- not as much during mine operation!!	SO02

*Alphabetical by sender's first name*

<b>Sender Name (Submission ID)</b> Jeff Rupp (40743)		
14043	I am afraid if this type of mining is allowed here, it will open the door for the next mine planed just south of Ely Minnesota -- even bigger mistake!!	PER07
<b>Sender Name (Submission ID)</b> Jeff Scharlau (46027)		
10423	Nothing that comes out of that mine is as important as fresh water and the unspoiled beauty of the Superior National Forest. Cancel plans for the mine.	WILD02
<b>Sender Name (Submission ID)</b> Jeff Soderstrom (45165)		
8733	EIS makes clear that treatment of contaminated water will be perpetual (arbitrarily defined as 200 or 500 years)...EIS should state how the treatment mechanisms will be maintained for hundreds of years.	WR128, WR143, WR144, WR148
8736	Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. Mitigation plans for these seepages must be accounted for.	WR070
8740	There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills.	WR130
15453	It does not state how long geomembrane covers and liners will last, how they will be replaced and what replacement will cost. It doesn't state how long the equipment doing the treatment is projected to last and how it will be replaced when it fails. It doesn't state how Polymet will maintain the physical plant after operations. In general, it doesn't provide adequate information for the public, voters and regulating agencies to evaluate whether Polymet will be able to treat contaminated water as projected.	PD09, PD35
15454	Polymet having ... no present financial capacity to develop and maintain a copper mine and because it is clear to any business person that control of their decisions and ultimate operations would fall to the established mining entities that would ultimately fund the operations, why is Minnesota not requiring the controlling company or companies from making the commitments required of such a massive mining operation?	FIN01
15456	The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment? ... It would be reasonable to expect some reasonable mitigation plans for these events.	WR144
15457	While the area will benefit from increased economic activity, a move to sulfide mining at this time is highly likely to significantly degrade what makes this area of Minnesota such a popular destination.	LU04
<b>Sender Name (Submission ID)</b> Jeff Sullivan (9960)		
323	I support the Polymet project because I am involved with advances being made in the waste water treatment industry and believe that there are effective, practical, and environmentally responsible developments available that will help meet the needs of this project now and far into the future. <b>Sender Name (Submission ID)</b> Jeff Treptau (54878)		
19546	I am looking for a response related to the fault tolerance and backupcontingencies if something goes wrong in the system, to prevent non-treatedwater from escaping the site. For example, an approximately 5 mile long tailings impoundment wall, also known as a cutoff wall or slurry wall is proposed on the site. There is a reasonable concern that with the slurry walls that are this large, it is necessary to ask, "How can PolyMet guarantee that the project will successfully be able to anchor that slurry wall in bedrock along that whole perimeter?"	PD22
19550	It is also possible that the bedrock could fracture beneath the [slurry] wall during installation, which could allow untreated water to seep through.	WR019
19559	the SDEIS mentions pumping a large volume of water from one of themine pits during reclamation but does not provide supporting documentation.What happens if the pit goes dry, exposing it to air and making the rock reactive and therefore a potential threat to the environment?	WR202
19562	...please provide examples of reverse osmosis (RO) systems that have beenintegrated into mining waste water treatment at the same large scale ofimplementation as is being proposed for the North Met project. While RO is aproven technology, how can the citizens and taxpayers of Minnesota be certain that the membranes used in RO are protected for the duration of treatment needed (which could be decades or centuries)? These membranes, which are subject to fouling and scale build up and abrasion, can break down fairly quickly. What is the guarantee that this will be monitored and treated for the duration of proposed actions at the site? What is the backup plan if the RO system fails in the future?	PD03
19563	There are several alternatives that should be considered and evaluated in thePolyMet mine that have been simply discarded. These include whether thePolyMet proposal could operate as an underground mine instead of an open pit, and whether all of the waste rock created by PolyMet should be backfilled into the mine pits after closure.	ALT01, ALT03, ALT06
19567	...the necessary financial assurances needed by the State of Minnesota have not been detailed. The plan commits Minnesota to many years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance, a "damage deposit" the company provides, are not outlined in the revised mineplan. The public does not know what the duration of water treatment will be, how much it will cost, how the company will be held responsible for potentiallycenturies of costly water treatment, or how the public will be protected fromliability.	FIN01, FIN05, FIN10
<b>Sender Name (Submission ID)</b> Jeff Wilson (17081)		
2087	If you want to create jobs, start extracting valuable materials from our waste streams. People throw old appliances into the trash, and they go into a landfill. To make their new appliances, we go mine more copper, iron, nickle, chrome, etc.	NEPA06
3445	We've managed to keep the Arrowhead pristine up till now. Why even take a chance of destroying it?	WILD02
3466	If you want to create jobs, start extracting valuable materials from our waste streams [instead of mining].	ALT09, ALT16
<b>Sender Name (Submission ID)</b> Jeffery Kane (36458)		
11560	PolyMet would dig up nearly 1,000 acres of high value peat bogs, part of the 100 Mile Swamp, a critical habitat for many plants and animals. This wetland is designated an Area of High Biodiversity Significance by the Minnesota Biological Survey.	VEG02, WET19, WI02
11563	... over 6,000 acres of wetlands could be damaged or destroyed by PolyMet changing the water flow...PolyMet is required to replace lost wetlands, but they understate the area of wetlands they would affect, they fail to replace the unique habitat offered by peat bogs, and they propose replacements that are far from the mine site.	WET01, WET03, WET05

17169	The “technology” to prevent polluting our waters are not new and have not proven to be safe.	PER35
17170	We have the largest source of fresh water in our hands to protect for our children and grandchildren – please do not risk contaminating it.	WR195
<b>Sender Name (Submission ID)</b> jennifer p (49991)		
12987	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won’t end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN10
<b>Sender Name (Submission ID)</b> Jennifer Pearson (4222)		
12519	I have grave concerns about not only the long term health and environmental impacts of this mining to our region, but also the socioeconomic realities this may bring	HU03
12521	Will Minnesota’s water stay safe and clean? PolyMet claims it will, but there is NO track record with sulfide mining that allows us to believe this. PolyMet would create polluted water requiring expensive treatment for 500+ years after they stop mining, and leave millions of gallons of untreated, polluted water that could seep from the site every year into the groundwater and nearby rivers.	WR023, WR037, WR070, WR195
12523	I also have grave concerns about the long-term health impacts this mine will impart... The proposed mines will release toxins that will inevitably eventually make their way into our ecosystem.	HU03
12527	The bottom line is that we would trade a healthy ecosystem of air, water, fish, deer, etc. from this region that our children and grandchildren deserve to have, for a couple decades of mining.	SO01
12528	I would like to comment on the long term socioeconomic impact that mining would have. I agree that there would be short term gain, although from all of the sources I’ve read, it would be much less than PolyMet would like us to believe. Many of the highest paid jobs will go to outsiders from around the world that will be brought in to “teach” us how to do this type of mining. Even PolyMet’s initial job predictions have been repeatedly scaled back.	SO06
12530	On top of this, if one looks at similar mines elsewhere in the country, one see’s a pattern of fluctuating employment even when mines are operating. Northern Minnesota relies on pristine wilderness to support its current economy... Sulfide mining would put all of this economic backbone at risk for the potential of short term, volatile gain.	SO02
13143	We are well aware from sulfide mines elsewhere on the planet that metal contaminants that result from sulfide mines can be extremely unsafe for human health at certain exposure levels. Arsenic, manganese, thallium and others are known carcinogenic compounds. Other contaminants such as mercury, copper, lead, cadmium, selenium, zink and nickel also have other known deleterious effects on health. PolyMet SDEIS admits that metals will seep out of the mine pits, waste rock piles and pollution sump ponds on the mine site through the superficial groundwater flow.	HU03
13144	The SDEIS also states that most of the wetlands in these mine site flowpaths are affected by the groundwater, so that contaminant pollution could well up at any time.	WET10
13146	We know that sulfates that are discharged from sulfide mining operations when sulfides are oxidized. Sulfates have been shown to facilitate turning non-toxic forms of mercury into toxic forms- the process known as mercury methylation. We all know that this form of mercury is a bioaccumulative toxin. It does not break down in our environment or in our bodies, as it makes it’s way into our food chain.	MERC08

<b>Sender Name (Submission ID)</b>	Jennifer Pearson (4222)	
13147	Methyl mercury is toxic to the brain and kidneys, and can cause known impairment in reproduction, growth, neuro-development, and learning abilities. We know that those most sensitive to the effects of methyl mercury are developing fetuses and newborns. In a health study of newborn babies in the Lake Superior Basin collected from 2007-2011, the MN Dept. of Health found 8% of tested newborns had mercury levels above the safe dose limit for methylmercury as set by the EPA. We also know that mining is the largest source of mercury contamination to the Lake Superior Basin. In a region already affected by mercury contamination, sulfide mining will inevitably contribute to the toxicity, and affect the health of our future generations. The PolyMet SDEIS doesn't tell us how much mercury pollution will be seeping out of the PolyMet tailings into superficial water flowpaths right next to the huge new tailings piles.	MERC03, MERC17
13149	The SDEIS has several tables and charts that show predicted pollution from PolyMet tailings before the pollution gets diluted from other sources. (see Table 5.2.2-38, 5.2.2-42, and 5.2.2-43) There are other metals that show huge increases over existing conditions but there are no listings in any of these charts or tables for mercury.	MERC06
13152	What is PolyMet trying to hide? Mercury contamination is already one of our biggest concerns in this region. The SDEIS is inadequate in revealing how much mercury seeping out of mine pits, waste rock pile, and liners to surface water flowpaths starting at year one of the mining process. The SDEIS must be redone to reveal how much mercury will be released directly or indirectly from the mine site into surface waters. The developing brains of our babies and children in this region depend on this.	HU01
13153	It has also become evident that the water model at the heart of PolyMet's SDEIS is flawed. How could this even be considered marginally acceptable within an environmental review document? As people of this region, we demand that accurate water flow data be obtained. The SDEIS does not provide this. ALL of these contaminants mentioned above and the reality of how they will insidiously seep into our water, our environment and eventually our bodies need to be based on accurate, accountable science. The health of future generations depends on this.	HU03, WR003, WR165, WR189
13158	There are grossly sub-standard safeguards in place in the SDEIS to assure that our water can be kept safe for the centuries that it will take to rid this region of all of the contaminants exposed from this type of mining process. I've addressed above the day to day insidious seepage that is unaccounted for. But what also happens in the case of natural disasters such as the recent flood? What happens if there's equipment failure in the treatment plant? What happens when there's malfunction that allows leakage of toxic contaminants into the surrounding water-rich watershed? If water treatment is going to be required for centuries, we had better have accurate, accountable plans for all of the "accidents" that will inevitably occur.	PD22, WR130
13163	As a regulatory agency, your responsibility is to assure that each and every contaminant has been accurately and effectively accounted for by PolyMet...And included in this, we need detailed accountability for all of the unpredictable ways that these contaminants can leak into our environment through natural or mechanical mishaps. It is unfathomable to me that as a state and region, we are willing to gamble on the future of our natural environment and clean water. As much as many of us would like to open our arms to the jobs this would create for our region, the SDEIS is woefully inadequate in assuring us that our region will be safe from the toxic affects of mining.	HAZ01
14588	We are well aware from sulfide mines elsewhere on the planet that metal contaminants that result from sulfide mines can be extremely unsafe for human health at certain exposure levels. Arsenic, manganese, thallium and others are known carcinogenic compounds. Other contaminants such as mercury, copper, lead, cadmium, selenium, zink and nickel also have other known deleterious effects on health. 14589	The SDEIS also states that most of the wetlands in these mine site flowpaths are affected by the groundwater, so that contaminant pollution could well up at any time. I could write a 10 page letter exploring the deleterious effects on health of each of these contaminants, but let's choose one to look at as an example- mercury. We know that sulfates that are discharged from sulfide mining operations when sulfides are oxidized. Sulfates have been shown to facilitate turning non-toxic forms of mercury into toxic forms the process known as mercury methylation. We all know that this form of mercury is a bioaccumulative toxin. It does not break down in our environment or in our bodies, as it makes it's way into our food chain... We also know that mining is the largest source of mercury contamination to the Lake Superior Basin. In a region already affected by mercury contamination, sulfide mining will inevitably contribute to the toxicity, and affect the health of our future generations. The PolyMet SDEIS doesn't tell us how much mercury pollution will be seeping out of the PolyMet tailings into superficial water flowpaths right next to the huge new tailings piles.	HU03, WR120, WR158, WR189
14590	Mercury contamination is already one of our biggest concerns in this region. The SDEIS is inadequate in revealing how much mercury seeping out of mine pits, waste rock pile, and liners to surface water flow paths starting at year one of the mining process. The SDEIS must be redone to reveal how much mercury will be released directly or indirectly from the mine site into surface waters. The developing brains of our babies and children in this region depend on this.	MERC20
14591	It has also become evident that the water model at the heart of PolyMet's SDEIS is flawed. How could this even be considered marginally acceptable within an environmental review document? As people of this region, we demand that accurate water flow data be obtained. The SDEIS does not provide this. ALL of these contaminants mentioned above and the reality of how they will insidiously seep into our water, our environment and eventually our bodies need to be based on accurate, accountable science.	WR003, WR165, WR189
14592	Lastly, there are grossly sub-standard safeguards in place in the SDEIS to assure that our water can be kept safe for the centuries that it will take to rid this region of all of the contaminants exposed from this type of mining process. I've addressed above the day to day insidious seepage that is unaccounted for. But what also happens in the case of natural disasters such as the recent flood? 8665	In addition...rational assessment requires evaluation of pollution by many other potential contaminants that are being ignored. This includes not only mercury, arsenic, and other chemical pollutants, but also both air and water pollution with small mineral fibers.	AIR10
8667	Financial guarantees should require indemnification not just for the estimated minimum \$450 million cost for closing the project, but for potential costs of chronic or catastrophic failures of safety systems.	FIN05
8674	The legislature should pass laws to ensure this [indemnification], requiring bonding guarantees in the billions of dollars. Mining companies [PolyMet] should be held responsible or not be allowed to operate.	FIN01, FIN14
8681	Good quality on-going monitoring and assessment of [NorthMet's] environmental impact and pollution will be critical from day one until hundreds of years in the future, in order to assure public safety.	PER06
8695	To provide [on-going monitoring and assessment of NorthMet]...we will need to hire many trained technicians and invest in scientific instruments to perform continuous monitoring on an independent basis. Funds to pay for this should come from taxes on the mining operations themselves, and should not be passed off to general taxpayers. These new taxes should be passed by the legislature to pay for independent monitoring now and for centuries to come.	FIN01, FIN10, FIN11, FIN14
8699	...new mining should include a comprehensive, unbiased economic cost-benefit analysis. Benefits of new jobs created [by NorthMet] and new taxes generated must be weighed against the costs of pollution and costs to existing businesses and residents, including the impact on the recreation and tourism industry.	SO04
8708	Safety elsewhere is not sufficient; we need our own guarantees, standards, and monitoring, some of them scientifically specific to Northeastern Minnesota.	PER06
<b>Sender Name (Submission ID)</b> Jennifer Stattelmann (19891)		
1492	We are worried that the thirst for new jobs on the Iron Range and the desire for tax revenues is driving this with little regard for the burden the natural environment and the taxpayers of Minnesota and, possibly, the United States, might have to bear in the coming years, decades, centuries.	SO02
1493	We canoe, wild rice, and fish and are concerned that the possible increase of sulfates in the St. Louis watershed will impact these activities.	WR156
<b>Sender Name (Submission ID)</b> Jenny Brude (42820)		
7276	How much should the state need to protect taxpayers? That is, how large should a fund be? This is a great unknown. \$500 million, a billion? What could 500 years of impacted waters really cost us? The two figures I previously mentioned seem, in that context, abysmally small. Corporations that have polluted the environment have long gone out of business as a mechanism to escape the costs of reparation. What we have here is 20 years, at most, of local employment (and how much would actually be local is uncertain) against 500 years of devastated, contaminated waters, and all the losses that come with that.	FIN01, FIN05, FIN10

<b>Sender Name (Submission ID)</b> Jeremy Reichenberger (9477)		
943	People ask, can we trust PolyMet? It's not PolyMet we need to trust. It is Glencore Xstrata, the primary owner of PolyMet, which [reportedly] will buy the rest of PolyMet once all the permits are in place. So, who is Glencore Xstrata?	PER02
944	Glencore Xstrata has run up a long list of labor and environmental abuses, including 58 mining fatalities between 2008 and 2010, over twice the number reported by any other mining company over that period. Just in 2012, their environmental and labor record includes dumping raw acid in waterways in the Congo, failure to provide a vapor barrier to keep an acid mist from descending on 3,000 people in Zambia, utilizing child labor as young as 10 years old in mines in Congo, and causing environmental damage at its McArthur River mine in Australia.	PER02
<b>Sender Name (Submission ID)</b> Jeremy Swanson (39363)		
13070	My wife and I are already researching other states to move to that value natural resources and human life and wildlife more than money. We'll be prepared to move when and if these mines are approved, it will be disheartening, but we literally and physically and mentally cannot support such disdain for the wildlife and nature of this state and country.	SO02
13072	We've seen programs where PolyMet 'claims' they're environmentally safe and have cleaned up their act. They say they'll implement cleaning acts to help with ground water contamination [a clear admission of fault in and of itself] once their new mining facilities are opened...	FIN08
<b>Sender Name (Submission ID)</b> Jerome (54733)		
18838	There is already concern about the level of carcinogens and minerals that cause nervous tissue damage around Lake Superior. The proposed mining will release more of these minerals into both air and water. These by-products of sulfide mining have not been adequately studied. They will enter our natural systems for hundreds of years.	WR107, WR108, WR111, WR115
18839	Although the SDEIS acknowledges that 912 acres of wetlands will be directly destroyed by the mining digging and another 7, 413 acres will be impacted so that land exchange must be arranged, the proposed "mitigation" replacement land is not the same fragile ecosystem which is at the proposed PolyMet site. The Minnesota Biological Survey has termed the land at the proposed mining site to be vulnerable and of "high biological diversity." It is clear that life forms in this fragile area will not survive and will be lost forever.	WET15
<b>Sender Name (Submission ID)</b> Jerome A Challman (42763)		
14520	The PolyMet SDEIS "health risk assessment" doesn't include any analysis of the effects of the project on on-site workers. This is completely unacceptable. To not have competent analysis of the effects on the actual people that do the work on-site is unconscionable. These will be the people most directly involved.	HU04
14521	SDEIS p. 5-438 to 439 show that PolyMet ore and wastes will include asbestos-like fibers. Approximately 9% of the fibers in ore, tailings, and process water are amphibole fibers and about 2% of the waste rock minerals are serpentine. In the U of M study, Northshore workers in the crushing process had particle exposures over the safe exposure limit. PolyMet SDEIS says they'll take air exhaust from the crushing plant and vent it back into the plant to reduce heating costs. The study shows the danger of this plan.	AIR03
<b>Sender Name (Submission ID)</b> Jerome Ekre (57560)		
19560	If the local and State-Federal governments allow the Poly-Met mining project the investors and the employees will benefit.	SO10
19561	The land exchange sounds to be a reasonable action.	LAN11

<b>Sender Name (Submission ID)</b> Jerri Ann Walseth (54150)		
16041	I think it will lead to pollution that no one will want to pay to clean up.	FIN01
<b>Sender Name (Submission ID)</b> Jerritt Johnston (44701)		
7431	The models used to predict water flow are inaccurate and do not match actual rate of water flowing from the site.	WR003, WR052, WR086, WR091, WR105
7439	no amount of financial assurance that a company will be willing to pay will cover the costs of maintaining this site in perpetuity.	FIN01
7440	Minnesota state law requires that closed mines be maintenance free. Two hundred years of water treatment at one location and 500 years of treatment at the other do not meet that requirement.	PER04
7442	There is not enough attention paid to cumulative effects of this project in relation with past iron and taconite mining in the area.. cumulative effects need to be addressed in relation to other copper-nickel mining projects moving forward in this region of the state.	CU02
7443	[The socioeconomic-section] was prepared using an IMPLAN model, which has been shown to overestimate the impact of new economic activity.	SO04
7445	the document states that employment will only be increased by about one percent in the region. This is not a compelling reason to move forward with a project that will cause this much damage.	SO02
7450	To destroy[the Superior National Forest and the woods in northeastern Minnesota] to mine for possibly 20 years is failing the DNR's mission to manage our resources and is in direct conflict with the Forest Service's responsibility to manage the forest for multiple uses.	LAN01
<b>Sender Name (Submission ID)</b> Jerry & Nancy Irsfeld (42783)		
6772	We fear water contamination in the form of nitric acid will leach from this mining site and make its way to Lake Superior.	WR111
<b>Sender Name (Submission ID)</b> jerry and Shirlee maertens (45301)		
9176	True natural areas are becoming less and less and what often replaces them are the scars and contaminations left on the land for future generations to deal with.	LU06
9178	the 300-400 permanent jobs that this mining project provides for only 20 years is a small number in the long-term scheme of things. It really is not worth the uncertainty and cost of possible consequences to the waters and land in that area at this time.	SO01
9187	I am concerned that this process of chemical extraction in order to separate copper and other metals from the sulfide rock material requires vast amounts of water that have the potential of polluting or contaminating surface and ground water quality.	WR156
9192	Another problematic finding regarding water after the SDEIS was released in December 2013 is the the discrepancy in the water flow under and near the proposed Poly Met copper mine in the area north of Hoyt Lakes. So what does this new info do the the models using different hydrological input	WR003, WR004, WR091
9195	there is a certain amount of risk and that most likely some pollution, leaching, contamination of surrounding environment will occur.	WR129

6839	As a wild rice harvester and a First Nations person who depends on subsistence living I am most concerned about the legacy that sulfide mining... would leave behind.	CU11
<b>Sender Name (Submission ID)</b> Jesse Peterson (18133)		
3456	The PolyMet SDEIS artificially limited cumulative-effects discussion of water quality to just the Partridge and Embarrass Rivers. The St. Louis River was left out completely. This cuts out anyone who be fishes or eats fish caught downstream in the St. Louis River and Lake Superior and ignores the impacts on the Fond du Lac Tribal Waters.	WR159
3457	The PolyMet Project would increase mercury in the Embarrass River and could increase mercury methylation near the mine site, as well. Increases in mercury or sulfates at PolyMet could increase mercury in the fish in the St. Louis River.	MERC02
13510	I'd like to just speak to Glencore a little bit. I think it's highly inappropriate to do business with a company that's manufactured famines as a way of doing speculative trading to inflate the price of food and they've also been implemented sitting on ore to inflate the value. And so they're a criminal organization. They're invested in PolyMet and I think it's highly inappropriate to be working with them	SO02
13511	Both existing LTV tailing seeps and the other mine discharges flowing into the St. Louis River also carry high levels of specific conductance which the EPA has found can be toxic to fish. Tribal research shows that specific conductance is the water chemistry signature for mining discharge that can take more than 100 miles to dissipate.	WR064
13512	Cumulative analysis of water quality impacts in the SDEIS must include the St. Louis River and must specifically analyze impacts on mercury contamination of fish and impacts of specific conductance levels on fish.	AQ14, MERC02
<b>Sender Name (Submission ID)</b> Jessica Eberl (57353)		
18362	The EIS should be redone to make a cumulative assessment of arsenic exposure and cancer risks for people in Hoyt Lakes, including formula fed infants and people who rely on fish and wild rice for food.	HU02

<b>Sender Name (Submission ID)</b> Jessie Kruchowski (38176)		
13703	If Polymet opens their doors we anticipate we will employ anywhere from 20-30 employees, that is 20-30 families right here in our community that will be supported by just one small business.	SO10
<b>Sender Name (Submission ID)</b> jfalk (3276)		
9	... the (SDEIS) document is too complex and lengthy for me to make an informed analysis based on my own knowledge.	NEPA07
10	any jobs for Minnesotans (created by this Project) are temporary.	SO02
11	the bulk of the profits (from this Project) will flow out of the local economy.	SO06
12	the “toxic legacy of damaged waterways” (from the Project) will remain permanently here in Minnesota.	WR115, WR195
13	there is zero evidence to back up the claim that sulfide mining can be done without causing devastating watershed pollution.	WR023
14	Only if and until, the mining industry has a demonstrated track record that it has the means and the willingness to invest the effort and the capital necessary to mitigate all present and future environmental costs, the benefits of the mine cannot possibly outweigh the damages to Minnesota’s water resources, resources that may require treatment for more years into the future than can be accurately predicted.	SO01, WR023, WR115, WR195
19572	To be frank, the document is too complex and lengthy for me to make an informed analysis based on my own knowledge.	NEPA07
19574	...any jobs for Minnesotans are temporary, the bulk of the profits will flow out of the local economy, and the “toxic legacy of damaged waterways” will remain permanently here in Minnesota.	SO01
19576	“Mining without harm” and “environmentally safe mining” have been promised, but there is zero evidence to back up the claim that sulfide mining can be done without causing devastating watershed pollution. In fact, mining of sulfide-metal ore has never been accomplished without causing eventual acid-metal leachate pollution of ground and surface waters. As a result, Wisconsin wisely placed a moratorium on sulfide mining operations in 1997, until it could be demonstrated that such a mine would not pollute the water.	WR195
19579	The construction of [the PolyMet] mine...violates the Precautionary Principle: “if an action or policy has a suspected risk of causing harm to the public or to the environment ... the burden of proof that it is not harmful falls on those taking an action.” Only if and until, the mining industry has a demonstrated track record that it has the means and the willingness to invest the effort and the capital necessary to mitigate all present and future environmental costs, the benefits of the mine cannot possibly outweigh the damages to Minnesota’s water resources	NEPA09

<b>Sender Name (Submission ID)</b> Jim Butcher (48163)		
12094	We are also being assured that steps will be taken in the way of “financial assurances” to ensure that Minnesotan taxpayers will be not held liable for environmental clean up. I am not sure how that statement can be made with any clear conscience when the negative impacts resulting from only 20 years of mining is expected to require hundreds of years of mitigation action.	FIN10
12105	The Polymet project should not be approved until some form of methodical and acknowledged risk assessment such as a fully detailed FMEA is performed and made public. This exercise should include local citizens and environmentalists as well as sulfide mining experts	NEPA15
12109	Today’s financial “penalties” for environmental damage obviously do not work. Minnesota should develop special criminal penalties for failure to comply with permitted effluent discharges for such major and long-term projects as the proposed Polymet project.	PER06
12113	As scientific knowledge continues to develop and our understanding of the interaction between released chemicals and humans and the environment improves, permitted standards should be regularly updated and incorporated into Polymet operating requirements	PER06
17323	Polymet has not managed any mining operations, let alone a sulfide mining operation. Others who have, have by all accounts, left in their wake monumental clean up problems, the mitigation of which in many cases will end up being funded by taxpayers for generations to come. We are getting all too familiar with the plot for this movie, the privatization of profits, and the socialization of losses.	FIN01
17324	... it doesn’t matter what promises and guarantees Polymet makes. With the best of intentions there WILL be serious mishaps. ... We MUST have in place an independent oversight organization with real teeth, really big teeth. We cannot rely on industry to police itself and do the right thing...One suggestion I have is that Minnesota law surrounding environmental damage be revised, such that evidence showing that adequate steps to minimize environmental damage were either not taken or were ignored become CRIMINAL offences, and, if proven, will result in significant jail sentences.	NEPA15
17325	In the engineering world, there are many techniques that have been developed to minimize risk and uncover potential sources of failure... One such widely established technique is known as “Failure Modes and Effects Analysis,” or FMEA ... it would seem prudent to insist on completing and publishing such analyses on all aspects of the proposed Polymet project. ... This [would] provide evidence to the general public that there has been serious and deliberative efforts to failsafe the project, [and] provide a framework for developing “financial assurances.” ... “Adaptive Management” ... is not in my opinion a demonstration of adequate planning to address future as yet unidentified problems. This is MBA speak for we did a lousy job of planning and we will figure it out on the fly as we go along.	FIN05, FIN08, FIN12
17328	Minnesota needs to insist that... we will have an independent authority with adequate powers to oversee all activities which might occur at the Polymet or similar operations should they be approved, and that this authority has the power to shut down operations which have the potential to harm worker or community safety, or cause unpermitted environmental damage. And along with this cessation in operations, this body should have the necessary resources available to immediately authorize and begin any necessary mitigation measures at Polymet’s expense.	PER24
17330	approval for the Polymet project should only be given if ...There is a well-demonstrated need for the minerals that will be recovered during the planned mining operation.	NEPA02
17332	approval for the Polymet project should only be given if ...The projected economic benefit exceeds the cost of long term effluent treatment and any costs associated with future “environmental events”.	SO01
17333	approval for the Polymet project should only be given if ...All long term treatment and contingency expenses will be at the expense of Polymet and its investors or successors, and will not be presented to future Minnesota or Federal taxpayers.	FIN01

7127	I would like the following issues addressed before approval is granted for the project:1.Where does the 100 mile swamp drain? Does it drain into the BWCAW? What plans are in place to prevent pollution from going into the BWCA?...4.As we all know, catastrophes happen. What plans are in place if we get a 500 year rain? If a pump fails?	PD22, PD38
7131	I would like the following issues addressed before approval is granted for the project:...2.There is talk of a land swap with Northmet draining wetlands at the site and swapping other wetlands are the wetlands the state is receiving the same quality?	WET14
7135	I would like the following issues addressed before approval is granted for the project:...3.No[r]thmet will be burning coal to power the plant. What type of scrubbers will be used to minimize the CO2 going into the atmosphere?	AIR01
14425	I have read numerous articles online and in the Star Tribune about the proposed Polymet mine and cannot fathom the idea of having to mitigate water pollution for 200 plus years. Our lakes and rivers area cherished treasure here in Minnesota.	WR195
<b>Sender Name (Submission ID)</b> Jim Ferstle (43373)		
12282	If some company proposed drilling under Lexington Pkwy, for example to bring out some precious metal resource there and tried to justify it based on “creating jobs,” or mining the product in the US rather than having some other country grab the profits from this exercise it would be dead on arrival, as they say about doomed legislation in the legislature.	SO02
12285	any company promising to pay “costs” of cleanup is something goes wrong is akin to the proverbial huckster joke about selling somebody worthless swampland in South Florida.	FIN01
<b>Sender Name (Submission ID)</b> Jim Fitzpatrick (58094)		
19999	The SDEIS does not reveal the levels of contamination that will be placed into the HRF nor does it admit that this highly toxic dump will leak, even if it is lined.	HAZ02
20000	The SDEIS is full of holes.	NEPA09
20003	The SDEIS says there are no fractures of underground bedrock at the site. I saw a map built by Minnesota History Society that shows the site is riddled with fractures...These fractures will allow onsite pollution to get into the ground water.	WR010
20026	Wetland impacts are unacceptable. 913 acres of direct loss, 7531 acres of indirect impact = 8264 acres of wetland damage. The study of hydrology at the site is inadequate. There is an under estimate of the Partridge ground water base flow. It should be 200 to 300% higher. This is the largest Wetlands destruction project ever proposed in the U.S Army Corps of Engineers Region.	WET23
<b>Sender Name (Submission ID)</b> Jim Foti (43495)		
15540	Unlike the desperately poor areas of the United States and the world that embrace extraction projects, Minnesota is fortunate to have the choice to invest in its future in more economically and environmentally sustainable ways. Let us not conduct this massive science experiment in our beautiful north woods.	NEPA15
15541	I ask that the comment period be extended to 180 days....	NEPA07

<b>Sender Name (Submission ID)</b> Jim/Janet (44114)		
15034	The SDEIS contains no credible information about the actual cost of monitoring, maintaining, and replacing the equipment needed to treat polluted water for 500 years or more. It provides no details about the nature or guarantees of a financial assurance scheme that would remain viable for 500 years, yet it does acknowledge, disturbingly, the possibility of events such as “unanticipated liabilities” and “failure or limitations on the ability of third parties to pay.” It does not attempt to explain how a corporate entity could realistically be held accountable over such an absurdly long period of time.	PD22, PD25
15035	even though the SDEIS admits that water pollution will last for a minimum of 500 years, its financial assurance section is an exercise in generalities. The actual cost of water treatment, monitoring, maintenance, repair, and reclamation is completely unknowable. ... The Grand Portage Band of Ojibway concluded that PolyMet’s numbers are vastly below the actual amounts required. The Grand Portage Band calculates that the minimum amount that should be set aside for financial assurance at the outset, assuming a 3% return on the amount, is \$90.5 billion.	FIN05, FIN08, FIN11
<b>Sender Name (Submission ID)</b> jkohnen (46934)		
10864	The Polymet mine could continue to pollute our waterways long, long, long after any benefit is garnered from the mine. There is NO WAY to guarantee the waterways of Minnesota won't be polluted long after the mine has closed and Polymet no longer exists.	WR115
10865	The number of sustainable jobs is minimal as compared to the long term expense. It is very short sighted thinking to allow this mine.	SO01
<b>Sender Name (Submission ID)</b> Jo Morse (38596)		
14057	My husband and I are both tech workers who have chosen to relocate to and live in Minnesota because of the wonderful outdoor recreation opportunities in the Arrowhead region...I think that the state of Minnesota will lose people like us if Polymet Mining is allowed to pollute the BWCA and that will ultimately affect the state's ability to attract and keep educated people	WILD02
<b>Sender Name (Submission ID)</b> Joan Beard (54849)		
19020	What company/corporation/business concern has a track record of keeping its promises 500 years?...Especially after what they've wanted has been taken/exploited/utilized for company gains.	FIN01
19023	...you would allow [mining] ...for 20 to 50 jobs? Lasting 20 years? Have you forgotten that tourism is the main economic engine of Northeastern Minnesota?	SO02
19024	...you would allow a mining practice with the potential to ruin groundwater -- which runs laterally for miles underground! -- ...Have you forgotten ...that our watershed is Lake Superior? -- One of the largest fresh water bodies in North America on a planet where only 1 to 3% of water is non-saline?	WR111
19028	Why is it okay for Polymet to extract minerals using a process you know will contaminate freshwater systems for many years to come...for copper which can be recycled?	NEPA06
<b>Sender Name (Submission ID)</b> Joan Christensen (9287)		
13721	•The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN01, FIN10

<b>Sender Name (Submission ID)</b>	Joanie Davis (42957)	
7185	The SDEIS should be rejected for its ... failure to include ...the affected Tribes who ceded the territory to the United States by treaty in 1854... The Tribes and their technical representative The Great Lakes Indian Fish and Wildlife Commission (GLIFWC) should have been included while developing the scoping document. Had these entities been at the table the underlying testing of current conditions at the LTV site and surrounding waters would have been more rigorous, far-reaching and complete... [and] a completely different look would have been given to the overall scope of the investigation and to the Underground Mining, and No Action Alternatives.	SO04
7188	Wouldn't a closed underground mine offer less risk to this water rich area? Polymet says if they mine underground they won't return enough profit. But...did [Polymet] do in to the cost the number of water treatment plants, pipelines, liners, constant landscaping and re-landscaping to try to keep out unwanted plants in the 'restoration' areas they will have to build and maintain over the 500 years that they will have to be monitoring on this 6000 plus acre site? How can this be a true comparison, if these costs are not factored in?	ALT01
7193	The SDEIS should be rejected because the additional load of another 4.6 pounds per year of mercury to an area encompassing the Great Lakes Basin can not be tolerated by already compromised water, waterways, and natural areas, and people	MERC08
7197	This proposed land use will require "we the People" to monitor the contamination and treatment of our water in perpetuity...Do the State of Minnesota, the MDNR, the MPCA and other entities that will have to monitor, and monitor the monitors for a "minimum of 500 years" make enough money to cover this monitoring?	FIN01, FIN05, FIN11
7246	It appears from provided maps, that the proposed PolyMet "mine site" is but one of many copper nickel deposits in the Duluth Complex. The deposits stretch all the way up the edge of Superior National Forest, into the forest and up to the Boundary Waters Canoe Area Wilderness, suggesting that watersheds on either side of the nearby Laurentian Divide will be affected... Reject the SDEIS because it does not contemplate the entire scope of environmental disturbances and far-reaching potential disturbances of other mining actions.	CU02, CU04
7253	The EPA Rejected the first draft of the EIS. This draft should be Rejected as well, because it fails to address financial assurances. PolyMet has stated it was not able to obtain Insurance; it is too new a company. Much of PolyMet's start up money is apparently from a deep-pocketed private Swiss company called GLENCORE.	FIN02
7257	Chapter three mentions off-site disposal of residual solids more than once. What does this mean? Where is this "off-site" located? Not in the glossary. Reject the SDEIS.	WR145
7259	As the Tribal Cooperating Agencies point out, in Appendix C, "inadequate information on current water quality and base flow, makes future water quality impossible to predict." The assumptions made for the groundwater quality are based on models that were repeatedly called into question by the Tribal cooperating agencies. Why were the tests and models not re-run using the Tribal/GLIFWC mode, and also as requested at the Dunka Road site?	WR003, WR052, WR071, WR086, WR091
7262	Why are the waters, swamps and marshes, and soils along the eight-mile shipping route NOT being carefully tested, and their current quality included in the permit? Monitoring after the fact does not give you a base model	PER09, WR071
7264	An underground mine, if a mine is to be contemplated for permitting would be the only possible option.	ALT01
14967	The SDEIS should be rejected because it condones re-use of an old leaking, existing basin without first emptying it, lining it and putting in collection facilities so that leaking water can be sent to the on-site water treatment facility	PD07, PD10

*Alphabetical by sender's first name*

<b>Sender Name (Submission ID)</b> Joanie Davis (42957)		
14968	...deliberately adding mercury to our already degraded resources is unconscionable. The U.S. Forest Service and the MDNR should Reject the SDEIS because it seems bad practice, if not illegal, to destroy or contaminate a property that “we the people” purchased for the safe use by all for generations to come.	MERC22
14969	The Proposed Action will include the destruction of high quality forest and wetlands, and the 100-mile swamp, and because the 100-mile swamp (though not depicted as such in the SDEIS) actually straddles the Laurentian Divide, polluted water will flow south to the St. Louis River and Lake Superior but north as well to the Boundary Water Canoe Area Wilderness (BWCAW).	WILD02
14970	The U.S. Forest Service and the MPCA and the USACE should reject the land exchange, and the permits as a bad deal for “we the People”...Could PolyMet and the USFS really believe that exchanging tiny parcels of land scattered throughout the Superior National Forest “eliminates (the) conflict between PolyMet’s desire to surface mine, and the United States citizens’ rights, and the USFS’ rights to the administration of the NFS land?”	LAN04
14971	...at what cost to the land and water... does this exchange and permitting come at? What PolyMet proposes in return for this “right” that they desire and need seems to pale in comparison to the riches they will obtain and the damage they will inflict, the cost of which will be born by all who remain when the mine is closed.	LAN01
14972	With all the potential mine sites all within Ceded Territory and it appears, mainly within the Superior National Forest, why was the Underground option given such short shrift?	ALT01
14973	What happens if something goes wrong even in the early years? Is PolyMet going to declare bankruptcy and stick the rest of us with the bill?	FIN01, FIN10
14974	Of the remaining existing tailings basins leftover from Cliffs Erie and LTVSMC do any of those tailings have the potential to continue contaminating the water? ...Those “Cells” or tailings basins were built many years ago...how can you justify PolyMet using those “Cells” for even their Category 1 waste? Shouldn’t they at the very least, be emptied and lined? Reject the SDEIS for failing to address this additional pollution waiting to happen.	PD10, WR023, WR070, WR126
14975	I particularly feel that disrupting such a large contiguous wetland such as the 100-mile Swamp with its calcareous fens violates Minnesota Statutes 103G.223 of the Minnesota Wetlands Conservation Act, and Minnesota Statutes 84.0895 because of Minnesota’s endangered species law. The MDNR should reject the SDEIS on these grounds	WET19
14978	...the Tribes uncovered a 2007 document that “Further [documents] the high quality and ecological function of this landscape in ‘An Evaluation of the Ecological Significance of the Headwaters Site, Northern Superior Uplands Ecological Land Classification System Section; Laurentian Uplands Subsection Lake and St. Louis Counties, Minnesota, March 2007: “The headwaters Site straddles the continental divide, with water from the Site flowing both east through the Great Lakes to the Atlantic Ocean and north to the Arctic Ocean....The Site is the headwaters of four rivers: Stony River, Dunka River, South Branch Partridge River, and the St. Louis River, which is the second largest tributary to Lake Superior...”	REF01
14980	Losing and not replacing with like kind within the same watershed is too big a loss for this watershed, and potentially other watersheds. Water comes out from everywhere in the Swamp.	WET03

<b>Sender Name (Submission ID)</b> Joe Knaeble (40871)		
10361	How is PolyMet's proposal different from past sulfide mining operations that have become a liability to the public and have done damage to the environment?	FIN01
10363	Problems that exceed environmental standards will occur and when they do it should be solely PolyMets responsibility to clean them up and restore the environment to its original state, or as close as possible as determined by outside sources.	FIN01
10366	How is PolyMet's proposal able to insure their storage piles, ponds and pits will not fail in extreme weather situations?	WR202
10369	The proposed mine is projected to run for approximately 20 years and yet the danger of the by waste created from this project will remain in the area for centuries with the potential of causing serious pollution problems to the entire watershed which includes Lake Superior. If any of the other similar mines being planned in the BWCA/Quetico watershed are permitted and start to operate these dangerous waste products will remain as potential pollution problems for centuries in this international treasure.	WR111, WR115
10395	The Poly Met mine is proposing to operate in an area that is extremely fragile to the very byproduct created and stored, on site, for centuries by PolyMet. It is unacceptable to permit a mine that creates pollution that is extremely harmful to the ecosystem especially when the soil and subsoil of the area are not prone to containment of water borne pollutants.	PER35
10400	Alternative strategies that would create more jobs and permanent jobs by increasing the reuse and recycling of our current stock of copper, nickel, platinum and other semi precious metals from the metals that have already been mined and processed.	NEPA06
13966	Due to the past track record of sulfide mining it seems only reasonable to deny a permit to PolyMet since that track record shows environmental damage occurs and the responsibility of clean ends up being paid for by the public.	PER35
16641	Mitigating pollution problems after they happen is always only partially effective. If there is a pollution incident then damage is bound to occur that cannot be corrected. Mitigation only lessens the damage.	PD01
16642	I did not find adequate research or justification to warrant granting a permit. There was no analysis of need other than a simple statement alluding to the need for copper, nickel and platinum by the world market. There was no mention of the current stock of these metals and if it would be adequate to meet the needs of the world market by alternative strategies that are less environmentally harmful.	NEPA06

259	I do not believe current mining techniques can safely remove the copper and nickel without causing great harm to the environment.	PD32
<b>Sender Name (Submission ID)</b> Joel Hoffman (44764)		
7652	Based on the NorthMet SDEIS, the proposed project would result in large-scale disruption and degradation of forested wetlands in the headwaters of the St. Louis River.	WET24
7659	The project also represents a serious threat for heavy metal leaching into surrounding ground and possibly surface waters to an area that is already recognized by the state for persistent mercury pollution.	MERC16
7682	the project will severely impact about 6,000 acres and potentially impact about 20,000 acres of wetlands, including pristine wetlands and high-value forested wetlands whose functionality could be severed degraded by changes in hydrology associated with the mining operations.	WET24
7683	the mitigation target is far less (<2,000 acres), and would not necessarily restore the lost functionality to headwater streams or to the St. Louis River watershed.	WR114
7694	The resultant changes in hydrology and ecological function of these wetlands represent a significant impact to the watershed, and would add to the cumulative stress placed on the St. Louis River.	WET24
7698	The wetland loss is unacceptable at this scale, especially in light of the large expense committed by the federal and state government to restore wetlands in the lower reaches of the St. Louis River.	COE01
7706	As the executive summary notes, mercury pollution in the St. Louis River is of particular concern and potentially represents a serious public health threat.	HU03
7720	[The water quality] models are reliant on two critical assumptions: a lack of groundwater leaching from the pit and tailings basin, and successful water treatment. It seems likely that at least one failure in the applied technologies will occur during the operational period of the mine. This potential is not evaluated in the SDEIS.	PD29, WR010, WR128, WR129
7722	the mine pit will require a large load of electrical power, likely causing an increase in power generation in the region. Presuming the power will come from a coal-fired power plant, this would likely add to the atmospheric mercury loadings to the region.	AIR02
7725	the SDEIS details substantial environmental impact to the region but fails to adequately consider the full effect of these impacts.	NEPA15
7738	the executive summary presents an oversimplification of the environmental impact of the mine	GEN01
<b>Sender Name (Submission ID)</b> Joel K Hoelz (54890)		
18823	I am against sulfide mining in our beautiful northeastern Minnesota lands. I believe likelihood of permanent damage to our lands are great! We should avoid opting for quick gains opposed to long time damage.	SO01
<b>Sender Name (Submission ID)</b> Joel Mamedov (17330)		
1970	Yes, [this project] will create some jobs. But, the people who earned some money will spend that money to their cancer treatment or treatment of their children.	HU03

<b>Sender Name (Submission ID)</b>	Joel Roberts (42887)	
17620	...no explanation is given for the choice of [the] particular values of hydraulic conductivity for the cutoff walls [in the SDEIS].	PD29
17621	PolyMet is modeling only a best---case scenario, because it does not allow for the possibility of less than optimal performance of the cutoff wall. It is unrealistic not to plan for other contingencies.	PD29, WR130
17622	It would appear, however, that many of the recommendations in EM 1110---2---1901 have been disregarded in the SDEIS and the references.	PD07
17624	Difficulties posed by the local geology, and the failure to follow the guidelines in the USACE Engineer Manual are likely to significantly reduce the percentage of tailings basin seepage that could be captured by the proposed Flotation Tailings Basin cutoff wall. The modeling of water quality in the Embarrass River watershed should take this situation into account by incorporating a probabilistic approach, using a wide range of seepage capture percentages.	PD07, PD08, PD29
17625	As a more feasible alternative, the modeling of water quality in the Embarrass River watershed must be redone under more realistic assumptions. This would involve a probabilistic approach. In particular, the assumptions about the seepage capture rate must be adjusted to cover a sufficiently wide range of assumed seepage capture rates...the modeled range of groundwater seepage capture rates should extend downward...perhaps to 35% or 40%. If the modeling is set up so that the seepage capture rate is not an input variable, then there must be a sufficiently robust probabilistic modeling of the variables that determine the seepage capture rate.	PD29, WR022
17626	The MinnTac tailings basin experience indicates that the modeled range of groundwater seepage capture rates should extend downward at least to 50%. In order to have a more complete picture, the range should extend somewhat further downward, perhaps to 35% or 40%.	PD03
17627	If the modeling is set up so that the seepage capture rate is not an input variable, then there must be a sufficiently robust probabilistic modeling of the variables that determine the seepage capture rate.	PD03
17628	A computer simulation of a natural process or engineering design cannot be expected to produce realistic results if it is based on unrealistic assumptions. The modeling process that is used must be based on assumptions that can be verified, and the modeling must include a range of values for each parameter that is wide enough to be realistic.	PD29
17630	PolyMet claims that 100% of the surface seepage will be collected. This is an unrealistic claim, and there is hardly any explanation at all relating to their plan for doing this	PD03, WR017, WR018, WR021
17633	Therefore, the SDEIS groundwater modeling must be re---done in order to provide estimates of the probable exceedances for individual pollutants.	PD03, WR059, WR060, WR173, WR177
17634	It is likely that the increase in predicted surface water pollution also would be quite substantial under more realistic assumptions. Therefore the SDEIS surface water modeling also must be re---done to reflect a range of values for the escape of surface seepage.	PD03, WR056, WR093
17635	Since the water quality modeling was based on unrealistic assumptions, it needs to be redone with the assumption that important parameters – especially the hydraulic conductivity of the slurry wall – are probabilistic parameters rather than determinate parameters.	PD29
17636	The range of values for the hydraulic conductivity of the slurry wall must reflect actual site conditions, including accurate information about the geology of the site. Realistic allowances also should be incorporated relating to the escape of surface seepage, to provide a more complete picture of the effects of Tailings Basin seepage.	PD07

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Joel Roberts (42887)		
18369	In the case of the Flotation Tailings Basin, the claimed value of the hydraulic conductivity for the cutoff wall is smaller than the average value cited (in Table 3-1 of PolyMet 2013f, Att. C) for the nearby surficial deposits by a factor of 2x10 <sup>-5</sup> (or 0.00002)...no explanation is given for the choice of these particular values of hydraulic conductivity for the cutoff walls.	WR072
18378	[there are] several sources of uncertainty in the performance of the slurry wall, and therefore in the overall performance of the seepage containment system. Accordingly some form of probabilistic modeling should be used instead.	WR022
18385	PolyMet's assumption of the capture of nearly all seepage may have been necessary in order for the modeling to show compliance with water quality standards, and conceivably could be an unstated explanation as to why the modeling was deterministic rather than probabilistic.	WR022
18386	The bedrock is granite. This effectively rules out the possibility of keying the slurry wall into the bedrock. The presence of the boulder-rich Rainy Lobe till under the surface also presents difficulties for slurry wall construction. In particular, if a large boulder is encountered during the excavation, it could prevent the trench from even reaching the bedrock.	PD07
18387	Since everyone agrees that boulders and cobbles are present at the Mine Site and also at the Plant Site, it is not dear why PoiyMet now has chosen to follow a slurry wall approach which they rejected in 2007.	PD07
18389	There are discrepancies among the various descriptions of this construction in the SDEIDS and the relevant references. These should have been resolved before the SDEIS was released.	EDIT01
<b>Sender Name (Submission ID)</b> Joel Vlaminc (40742)		
6676	I don't want our state's water sources being polluted for generations to come. Without a plan in place for proper clean-up, I'm concerned of the irreversible damage that will be done to the surrounding ecological systems.	HU01, WR115, WR195
14045	For the benefit of current and future Minnesota residents, please insist on a more thorough plan for keeping the waters safe and clean. If it isn't possible or feasible to keep the waters clean with this mining project, then it shouldn't be done.	NEPA15
<b>Sender Name (Submission ID)</b> Joel Weisberg (45191)		
11195	It is especially unrealistic to expect that the polluted water flowing from the site will be environmentally monitored and treated "in perpetuity," or even "for 500 years," which would be required according to numerous studies (e.g. DNR Fish and Wildlife).	WR037, WR129
11197	The SDEIS environmental study suggests a number of practices that would be harmful to the environment, including dumping the enormous amount of wastes into unlined pits that would leach dangerous chemicals into the water, harming streams, wetlands, and fisheries; while containing insufficient detail in other cases to determine whether or not the proposed practices would be harmful.	AQ05
<b>Sender Name (Submission ID)</b> Johann Chemin (9752)		
292	500 years of pollution legacy is not worth 20 years of labor	SO01
1380	Who will foot the bill for the 500y of cleanup when the company folds (because it will, like everything): Minnesotans!	FIN01

8837	I'm sure many citizens are expressing disapproval of the obvious threat [from the Polymet project] to our water and boreal woodland environment. The leaching of mercury from waste rock that is far beyond our water quality standard; the questionable scientific calculations of water movement carrying sulfates; the inconceivable amount of years that contaminated water must be treated by an expensive mechanical process; the enormous potential loss of wetlands (how is that 'mitigated'?) which naturally help keep the ground water, and Lake Superior, 'clean'...these are	MERC20, PER26, WET05, WET24, WI02, WI03, WR005, WR035, WR126, WR189, WR195
8837	I'm sure many citizens are expressing disapproval of the obvious threat [from the Polymet project] to our water... The leaching of mercury from waste rock that is far beyond our water quality standard; the questionable scientific calculations of water movement carrying sulfates; the inconceivable amount of years that contaminated water must be treated by an expensive mechanical process..these are serious issues.	MERC20, WR005, WR035, WR126, WR189, WR195
8842	The State of Minnesota has declared a pro-active sentiment and established greenhouse gas reduction goals for 2015 and 2025...It is calculated that Polymet would contribute 0.44% of our state's greenhouse gas emissions in exchange for employing approximately 0.012% of Minnesota's workforce (assuming the jobs promised to Minnesotans actually are given to Minnesotans). How does 'permitting' this industry comply with our state's stated goals, goals which are already unlikely to be met?	AIR01, PER32

<b>Sender Name (Submission ID)</b>	John Crampton (39091)	
12092	The constant alteration of drought and flood conditions caused by climate change in Minnesota could put strains on the whole water treatment process which wasn't even taken into account in the SDEIS's water modeling (which didn't even taken into account the seasonality of flows in the rivers, streams, wetlands and groundwater) The model which put the flow of the Partridge River at 1/3rd of its actual flow is not fit to be the basis for predicting needs to treat water pollution under climate change scenarios for the next 500 years!	WR003, WR077, WR091, WR148, WR176, WR180, WR196
12629	Almost all of the examples of technologies that PolyMet provides are from dry climate hard rock mining in Utah, Arizona and Montana. There are no actual real life examples of sulfide mining being done in an environmentally-safe manner in water-rich environments.	WR023
12634	The PolyMet SDEIS does not provide any contingency planning for catastrophic occurrences, other than mantras about “adaptive management.” What will PolyMet do if there’s a 10”-12” in three hour rainfall like there was in Duluth on June 19-20, 2012? What will they do when this overwhelms the pumps and pipelines and treatment facilities and floods the tailings ponds?	WR202
12636	What will PolyMet do if there is a prolonged drought? Or a straight line wind storm as there was in the region in July, 1999 with winds in excess of over 90 mph that knocks out power to the site or damages water treatment facilities?	WR202
12639	The PolyMet project will be a huge generator of carbon emissions from fossil fuel sources, thus hampering Minnesota’s efforts cut harmful greenhouse gas emissions. By destroying or degrading thousands of acres of wetlands and forests, the PolyMet project will decrease the significant carbon sequestration that these valuable forests and wetlands provide.	AIR01
12644	The PolyMet SDEIS does not adequately consider alternatives to open pit sulfide mining such as underground mining. It doesn’t adequately consider the alternative of backfilling the open pit to benefit long term water quality.	ALT06
12645	Why is there no formal public health impact assessment being done by the Minnesota Dept. of Health for this project?	HU01
12648	PolyMet’s claims that no asbestos-like fibers will be released are unproven. These fibers, over long periods of exposure, cause mesothelioma, a form of fatal lung cancer that is very common on the Iron Range because of the releases of these fibers from other mines in the area. The cumulative effect of the PolyMet mining project will be to add more releases of these fibers into the air and water of the region.	AIR03
12673	The so-called economic benefits of PolyMet sulfide mining project are exaggerated and the costs grossly undervalued in the SDEIS.... The main question that the SDEIS does not address, is what negative impacts will sulfide mining in Northeast Minnesota have on tourism, on small businesses, on service and/or tech industry employment, new business formations, and on the future economic diversity and sustainability of the NE Minnesota area?	SO02
17182	The surface water flow calculations for the Partridge River underestimate the baseflow conditions by a factor of 3. This is a fatal flaw since the computer model calculations of water flow are at the heart of hydrological estimates of the flow through the mine, tailings ponds, pipelines, water treatment facilities. Will PolyMet need to make the water treatment facilities bigger? Will they have to treat the water for 1,000 years or 2,000 years or forever? We can’t tell because all the calculations are derived from a water flow model based on inaccurate data. The SDEIS should be completely redone or rejected for that reason alone.	WR165
17183	PolyMet is proposing to mine for twenty years and then leave to the next 20 generations of Minnesotans the task of keeping its ...technologies running at a high levels of performance (and without any financial assurances) in order to ward off disastrous acid mine pollution dumping into the Partridge, Embarrass, and St. Louis Rivers and ultimately Lake Superior, the world’s largest body of fresh water. The risk of this is far too high. For this reason alone, the PolyMet project should be rejected.	FIN01

17185	Mark Seeley...member of the DNR Working Group on Climate and Ecology predicts that the Boundary Waters area will be an oak savannah biome by the end of the 21st century. This unprecedented change in rainfall and climate caused by greenhouse gases will result in a large probable increase in severe weather events ---- floods, droughts, more severe storms, increased fracturing of bedrock caused by deeper and more frequent freeze-thaw cycles. How will this affect PolyMet’s proposed liners and slurry walls and other engineered controls in the mine and tailings ponds that may already be inadequate to the task of sealing off the seepage and leaching of toxic pollution into the many fractures and fissures in the rock formations underlying Northeast Minnesota?	WR128, WR180
17186	The PolyMet project will destroy 1,000 acres of high quality, high biodiversity wetlands. PolyMet’s open pit will totally destroy a pristine, high value wetland... The proposed mitigation is restoring old sod farm fields in Aitken County to make old ditches “swampier.” ... these so-called “restored wetlands” will not adequately replace the function and value of the destroyed real wetlands, and they will be in another watershed. PolyMet will also indirectly impact another 6,000 acres of high quality wetlands that will be seriously degraded through hydrological changes and pollution. ...the Army Corps of Engineers should require equivalent mitigation in acreage, location, function and value of both direct and indirect wetland impacts	WET01, WET03, WET05
17187	The PolyMet SDEIS does not adequately address the harm that will be done to wild rice throughout the region even with the proposed engineered controls. To comply with the wild rice sulfate standards all engineering controls that capture and treat water will have to function perfectly for hundreds of years, which is neither reasonable nor realistic.	VEG04, WR115, WR157
17188	How many of the 360 operating jobs will there be if the 2nd PolyMet processing plant is not built? Of these remaining 300 or so jobs, how many will be full-time and how many will be seasonal? How many will be decent, benefits-paying jobs?...If the history of mining is any guide, automation will chew away at any operating jobs there are in 2017 so there will be half that number in a matter of 10 years	SO01
17189	The SDEIS predicts that the PolyMet project will increase overall employment in NE Minnesota by 1% But how many jobs and small businesses will be destroyed or not created because of negative perceptions of people who might want to come to the area but are turned away because of sulfide mining’s terrible impact on the natural environment and livability of the area?	SO01
17190	areas that are dependent on mining and other extractive industries have higher unemployment, a higher degree of socio-economic problems, and lower quality of life than non-boom-or-bust regions. ...it is a battle between the old, dying, largely-automated mining economy vs. the new economy based on sustainable, livable communities.	SO01
17191	The Financial Assurance section of the PolyMet SDEIS is a very short exercise in double-talk and deception that fools no-one except those who are willing to be fooled. PolyMet is going to talk about financial assurances only at the time of permitting once it has passed environmental review? Nonsense!!!	FIN01
<b>Sender Name (Submission ID)</b>	John Doberstein (18364)	
2542	And I would please ask that we reevaluate the 500 years of proposed water treatment needs to be addressed. And it is not adequate. It says that it will happen. It does not say how that will be funded, how it will be paid for...I feel that should be part of this supplemental draft so that the public, the potential entity that will shoulder the responsibility of this cleanup, the public, that we have a chance to comment directly on what the plan is and the cost. How much is this going to cost? What is the dollar amount? How can we do it?	FIN01, FIN05, FIN08, FIN13
2543	And there is also no contingency plans outlined for expected accidents that occur at all mines of this type. Mishaps such as pipeline spills and accidental releases, failures of water collection, and treatment systems, tailings and basin failure.	PD22, WR130

11038	The SDEIS essentially describes all of the water containment systems that will be utilized in connection with the Project the same way and to the same 90% modeling standard. Read as a whole the language “greater than” should be disregarded. It is clear that the standard of “capture” for waste water treatment and environmental protection is 90%.	WR018
11039	is it all right and safe enough, in light of the hoped for returns to the people and communities of Northeast Minnesota, the State of Minnesota and the United States that 10% of the waste water from the PolyMet Project will escape capture into the environment? I think not. I can’t escape the simple equation that over the expected 20-year Project life before closure, the 90% capture rate is just like operating the Mine and Project facilities for two (2) years without any waste water containment or treatment whatsoever.	WR070
11040	Of course, the relevant period is not just the 20 years that the Project will produce the sought after copper, nickel and other non-ferrous metals. The 10% release will continue in perpetuity, albeit with very gradually less pollutants should PolyMet’s mechanical Reverse Osmosis (“RO”) and non-mechanical filtering systems actually prove to be effective (though nothing on this scale has ever been done in connection with any non-ferrous sulfide hard rock mine anywhere in the world).	WR023, WR035
11044	What is perhaps even more disturbing is the recent public admission by a MDNR environmental review official that the flow rates of the Partridge and Embarrass Rivers, on which PolyMet’s waste water containment modeling is based, may understate the flow rates by a factor of two to three (i.e., 200 to 300%). One of the tribal commentators suggests that the error may be as high as a factor of five or 500%. News reports suggest that the Co-Leads have been aware of this modeling error for a period of years.	WR003
11045	The engineered waste water containment systems are clearly among the most important environmental and human health protection systems required of the PolyMet Project. The waste water capture efficiency, in my opinion, should be as close to zero tolerance as can be engineered. A 10% escape factor is simply way too dangerous. If substantially 100% of all of the Project’s waste water cannot be contained, treated and neutralized, the Co-Leads should select the No Action Alternative.	WR018, WR022
11046	the Co-Leads have already concluded that the substantially safer underground mine alternative is not reasonably economically feasible (though it apparently may be just 20 miles to the north in connection with the proposed Twin Metals project).	ALT01
11047	The possible flow rate error may mean that the 90/10 modeling standard is also incorrect and that a greater percentage of the Project’s waste water, without re-engineering and re-modeling, can be expected to escape, thereby exasperating the environmental and human health risks to a woefully dangerous and unacceptable level. On this basis alone the Co-Leads cannot consider the SDEIS as presently written the basis for a final EIS.	WR003, WR018
11048	“Adaptive management” to monitored exceedences to which the SDEIS so often refers, will not suffice.	WR130
11049	As is the case with many other pollutants dealt with in the SDEIS, it concludes that “it is not expected” that fugitive dust releases will violate any Minnesota or federal water quality, air emission or visibility standards.	AIR10
11050	Notwithstanding the PolyMet Fugitive Dust Containment Plan (any real explanation of which does not appear to be set forth in the SDEIS), in my mind it defies credulity that the cumulative effects of these fugitive dust releases will not violate applicable standards at any time, from time to time or often.	AIR10
11051	At page 3-117 the SDEIS refers to probable maximum precipitation (PMP) rainfall events, but there are many other weather events which cannot be adequately accounted for by modeling (witness the derecho blow down storm in and around the BWCAW in 1999, the other squall, straight-line, wild fire and sustained high velocity winds we are now experiencing with climate change and tornadic and seismic events which most certainly will strike the Project site over time).	PD29

11052	Whether water and air quality standards are actually violated does not mean that there will be no adverse environmental and human health impacts from the Project's fugitive dust releases. Depending on the particulate size and weight of the dust swept into the air, disposition may be within the Project boundary, into the Watershed rivers or carried by the wind in all directions many, even hundreds of miles of miles away.	AIR11
11053	Fugitive dust releases are already occasionally a problem from the operations of the taconite mines near the PolyMet Project area.	AIR10
11054	The fugitive dust releases from the PolyMet Project would be additive. The sulfides in the dust may result in harmful acid rain and/or acid drainage, including the formation of methyl mercury. Over time the adverse effects may well change our environment and lead to a panoply of respiratory and other human health problems. Here again the least offensive alternative is the No Action Alternative.	AIR10
11055	I have also reviewed the "Major Differences of Opinion" or "MDOs" expressed by some or all of the Tribes and other Cooperating Agencies in Chapter 8 of the SDEIS...In almost all cases I find the corresponding Co-Lead Response to be inadequate or not believable, especially where the Co-Leads say that monitored exceedences can be dealt with after the fact through adaptive management actions that could be taken.	NEPA12
11056	The Project combined actions described in the SDEIS have appropriately evolved from inputs by the Cooperating Agencies, with the advice of the USEPA and prior public comments to the Co-Leads. To a great extent the extended EIS period results from the complexity of attempting to undertake a sulfide hard rock mining project in the midst of a water rich environment where, in my opinion, just as with the Pebble Mine in Alaska, it should never be undertaken or even considered.	NEPA15
11057	The impatience of those awaiting the hoped for enhanced socio-economic development the Project would allegedly bring, be they local residents, municipal officials or the MDNR charged with maximizing the return on the States' natural resources, is quite understandable...PolyMet and Glencore have been and are the pacing factors. They appear to be seeking to design, construct, operate and close the Project at the lowest possible cost for the greatest profit and with inadequate regard for the environment and human health.	SO02
11058	This is not to say that the SDEIS is a complete failure or that the attempted Project is not a virtuous objective. They can perhaps be saved, but not without a great deal more re-engineering, re-modeling and effort by PolyMet and Glencore and the good faith and patience of the Co-Leads, all to fashion a final EIS that will protect and enhance the interests of the State and all of its citizens.	NEPA15
11059	I have no quarrel with the number of direct and indirect construction and Project operating jobs generally described in the SDEIS, except to say that the numbers pale in comparison to the diversified economy jobs added in the Arrowhead since iron ore and taconite mining started to decline in the 1960s. By some estimates that number may exceed 25,000, exclusive of many other direct and indirect tourism jobs, offsetting the loss of mining jobs to a very substantial extent.	SO02
11060	What I do quarrel with, however, whatever the numbers of PolyMet mining jobs described in the SDEIS, is that the numbers are not immediate, nor are they constant throughout the 23-year construction and Project operating life.	SO02
11061	Just as it takes far fewer miners to produce a ton of taconite today than it did 20 years ago, it will take far fewer and fewer PolyMet miners to produce a ton of constituent mineral products over the life of the Project. These jobs are not the permanent career path jobs portrayed by PolyMet in the SDEIS. Moreover, the SDEIS does not address PolyMet's commitment, if any, to retrain the miners it will lay off as miner productivity marches inevitably along.	SO02

11062	Most of the folks testifying at the SDEIS public hearings clearly believe PolyMet would hire most of its workers from the several communities located within daily commuting distance of the Project boundary, but this is not actually what the SDEIS says. Rather it says that PolyMet expects to hire a majority of its workers from within the Arrowhead region. Most of the Arrowhead is beyond a reasonable daily commute which means these folks will be disappointed. Moreover, it's not at all clear that most of the pool of potential workers within the nearby communities even have or will be able to acquire the necessary job skills and qualifications to be hired by PolyMet or the suppliers and providers to the Project.	SO06
11066	The SDEIS does not set forth the proposition of some non-ferrous mining proponents that tourism cannot support survival of the communities in Northeast Minnesota. However, the SDEIS does say that non-ferrous mining is not expected to adversely impact tourism in Northeast Minnesota. This is a disingenuous position, because all past mining history shows us that mining tends to become dominant where it is established to the detriment of a diversified local economy, in this case significantly including tourism.	SO02
11067	[E]ven more disingenuous is the assertion in the SDEIS that at the end of the 20-year Project productive life when job numbers fall toward zero and many of the workers must leave the area to look for work elsewhere, the tourism industry supported by the magnet retirement community will be on hand to step in to moderate the socio-economic adverse impacts to the mining communities.	SO02
11068	Many of my environmental concerns could be addressed by pursuing the underground mine alternative which could avoid many of the adverse impacts in the Watersheds. But since PolyMet and the Co-Leads have determined that this alternative is not reasonably economically feasible and must be eliminated from further consideration, I will not discuss it further except to say that, if engineered and developed properly, it might well be preferable to many opponents of the PolyMet Project as contemplated in the SDEIS.	ALT01, ALT06
11075	The SDEIS describes in some detail the reclamation and remediation procedures required of PolyMet before and after Project closure and estimates the costs thereof from \$125 million to \$200 million +. One tribal commentator estimates the same costs to be as high as \$86 billion over the extended period that PolyMet and its successors will need to remain active. Just as I believe \$86 billion is a vast overstatement, I believe the SDEIS in all likelihood significantly understates the true costs in today's dollars.	FIN05
11078	PolyMet and Glencore will have received most of their profits from the Project before their reclamation and remediation responsibilities even begin.	FIN01
11080	[R]eclamation and remediation costs are likely to approach the total profits realized from the PolyMet Project. That tells me that there is no way PolyMet or any successor can afford to perform as described in the SDEIS.	FIN01
11083	[C]onstruction of the much vaunted RO addendum to the Waste Water Treatment Plant is deferred to year 20 at the start of Project closure even though it could be well utilized much earlier. By possibly understating the water flow factor noted above, PolyMet is better able to defer the cost of the RO addendum for the full life of the Project.	PD03
11084	The SDEIS never says who will do the monitoring and reporting required by the SDEIS during and after the life of the Project, but it appears to me that these tasks will be performed by or on behalf of PolyMet, not the Co-Leads who will simply review and perhaps act upon or penalize exceedences.	PD24
11085	The SDEIS describes the required financial assurance instruments only in a general way, stating that the specific amounts and instruments will only be appropriately determined in the Project permitting process.	FIN08
11086	[T]he means by which discharge of PolyMet or its successors in bankruptcy might be avoided is not explained in the SDEIS. Perhaps it should be, at least in general terms.	FIN01

11087	among the risks which must be addressed by the financial assurance instruments is the “failure of the mining company”. This is the only such reference I noted in the SDEIS. All other references are to PolyMet as the mining company. ...the public can not trust in continuity of PolyMet management over time, because it is likely to change with ownership of the PolyMet Project assets. It is good that the SDEIS has identified this risk, but it should be developed to clarify for the proponents what the Co-Leads may understand to be the case.	FIN01
11089	PolyMet is a publicly owned corporation with an active trading market in its stock. The cost of build out and operation of the Mine and the Project facilities will require substantial additional public investment. It is unlikely that the required investment can be obtained without one or more public offerings...I frankly don’t see how PolyMet can fashion a prospectus and registration statement for its required financing in compliance with applicable state and federal securities laws on a basis consistent with the SDEIS, and vice versa.	FIN14
11091	Should Polymet stock significantly decline in value, as it most certainly will at some near point to any such public offering, plaintiffs’ lawyers will be lined up to sue for alleged damages for misrepresentations in the prospectus and registration statement. PolyMet and Glencore, if it can be found within federal jurisdiction, will be defendants, together with any other affiliate control persons who can be identified. Though sovereign immunities may apply, plaintiffs’ counsel may well argue that the Co-Leads, by virtue of the final EIS and permitting of the Project, are proper defendants in such civil actions.	FIN03
11092	Please select the No Action Alternative so that our non-ferrous minerals in Northeast Minnesota can remain in the ground and our environment protected for the centuries it will take before, if ever, the United States needs them strategically.	ALT14
<b>Sender Name (Submission ID)</b> John Gappa (40282)		
9696	The point of the matter is that given the significant length of time that remediation will be required, estimating the upfront investment needed to fund the remediation is highly uncertain and very small differences in assumptions have a dramatic impact on the total funding required. Moreover, the detail behind PolyMet’s estimates must be disclosed in the final EIS in order for the public to assess the viability of remediation and necessary financial assurance.	FIN05, FIN08, FIN13
14147	I have struggled to figure out how the numbers can work with a model that has 20 years of benefits and hundreds of years of costs. My conclusion is that the only way the PolyMet model works is to inflate the benefits, underestimate the costs and shift the risks to someone else.	SO01
14149	What I also found is that the financial assurance model is highly sensitive to very small changes in inputs. For example, · A \$1 million increase in annual operating costs results in a \$37 million or 13% increase in the future value of funding required· A one percentage point decrease in the reinvestment or discount rate used results in a \$83 million or 30% increase in the future value of funding required· A half a percentage point increase in the inflation rate results in a \$71 million increase or a 25% increase in funding required.	FIN05, FIN08
14154	Since Glencore is the primary beneficiary of this mine, they should be named on all permits and be directly liable to the State of Minnesota for all future remediation.	PER02
14156	My request to the scientists reviewing this project is to be wary of overestimated benefits and underestimated costs and risks. Once PolyMet and Glencore exposes the sulfur laden ore to the elements, Minnesota does not want to be facing our own “too big to fail” scenario, at tremendous cost to our taxpayers and to our environment.	FIN10

1239	Will the final design and permits receive public review?	PD24
1256	Such potential expansion of mining [beyond the planned NorthMet pits] would be addressed in Chapter 6, Cumulative Effects.	CU02
1258	Why separate Categories for 2 and 3? Will they be mixed, or segregated, and why (in each case)?	PD15
1259	Why is there a need to capture the drainage from Cat. 1 stockpile if it is so low in S? Why else was the 0.12%S cutoff established? ... If the cutoff value were reduced to 0.10%S, would this eliminate the “necessity” to capture and treat seepage? Lowering the cutoff value to 0.10%S would increase the size of the Category 2/3 stockpile, but if no permanent capture and treatment is required wouldn't this dramatically lower the long-term post-closure costs?	PD15, WR134
1260	What is the experimental evidence for the long-term integrity of the geomembranes used in the waste rock stockpiles for Cats 2,3,4?	GT10
1262	Would peat beneath the [pit rim] dikes present stability problems?	GT06
1263	The WWTF would include “equalization and treatment basins/ponds”. What is “equalization”? This facility is to be maintained “as long as necessary”, including possibly adding to its capabilities if found necessary (perhaps including reverse osmosis, RO). Question: Hundreds of years?	PD04, WR032
1270	Reject concentrate from the WWTF to be evaporated/crystallized and disposed of offsite. Needs explanation: Where? How? By whom? Moving a pollutant elsewhere doesn't eliminate it.	PD03
1273	Water Management I recommend overdesigning for extreme weather/climate events or conditions (drought, 200 year precipitation event, snowmelt).	PD22
1278	Reclamation and Closure. Recommend: lime or limestone should (not “could”) be added to East Pit as it is backfilled with Cat. 2,3,4 waste rock to help neutralize pore water.	ALT06
1279	West Pit: Question: Where is the rationale for flooding to a pond? No liner or bentonite? Won't the water react with mineralized pit wall rock? What is the predicted water quality of this water over time? Such pit lakes in other mining districts with sulfide mineralization are often highly acidic and toxic.	PD03, PD15, WR002, WR088, WR173
1281	Category 1: well-engineered cap with local soils, vegetation, and geomembrane to lessen infiltration – but hazard of long-term succession to forest in this climate, with deep roots that could penetrate geomembrane. Needs a discussion! Question: What is the risk associated with such root penetration over centuries? PolyMet plan is to cut woody vegetation in perpetuity, apparently! This issue needs to be investigated at depth.	VEG05
1284	Water Management (p. 3-72): “When all reclamation activities required by the Permit to Mine are completed, a Request for Release . . . would be submitted.” By whom? In yr 2200?	PER13
1289	Post-closure activities “PolyMet has committed to conduct demonstration projects during the Life of Mine and Reclamation phases (total of est. 40 years) to establish non-mechanical water treatment systems to be used at the Mine Site.” Comment: They should have started long ago! How will this commitment be enforced?	PD06, WR137
1292	Table 3.2-11. Why does the Concentrate dewatering output (660 stpd) equal the input? No dewatering after all?	PD03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	John Green (16120)	
1299	Table 3.2-12. Several chemicals will be used in the Flotation process that might be deleterious or dangerous if released to the environment (e.g. Flotation Collector (PAX), Frother (MCBC and DF250), Flocculant (MagnaFlox10), and Gangue Depressant (CMC). Questions: Where will these chemicals end up? In the tailings? Will there be release to the Embarrass River watershed? What is the toxicity of these materials?	PD03, WR030
1301	Tailings Management: Rock buttresses along north tailings basin dam seem much too small to be effective for stability. Comment: Re-do stability modeling?	GT03
1302	Hydrometallurgical process Comment: Description of process incomplete. How would the Au/PGE recovery produce a sulfide precipitate from the leach residue thickener overflow? How would the Cu concentrate be precipitated as sulfide?	PD21
1303	Table 3.2-13. Question: what will be the fate of the potentially noxious chemicals Sulfuric and Hydrochloric acids, liquid SO <sub>2</sub> , and Sodium Hydrosulfide? Same question as for flotation chemicals above.	HAZ01
1305	Hydrometallurgical Residue Facility Reclamation (p. 3-130)- Dewatering sounds complicated and difficult ... Questions: Slime? How will this be dealt with?	PD18
1306	Reclamation and Long-term Closure Management ... Revegetation also includes yearly mowing “or as needed”. Again, rationale for no woody succession? For 200 years?	VEG05
1307	Hydrometallurgical Residue Facility Reclamation ... Inspection for plugged inlet structures and piping systems (p. 3-131) also perpetual?	PD20
1311	West Pit Backfill ... Several arguments presented for not backfilling, but others not explained ... The economic factors (potential inaccessibility of mineral value; cost of moving waste rock for fill) seem to have trumped others.	ALT03
1313	[Silicate minerals would help neutralize some acid] Question: then why collect and treat seepage?	PD03
1314	Question. Is it the [MPCA standard] SO <sub>4</sub> limit not the acidity that requires long-term treatment?	PD03
1322	Post-closure non-mechanical treatments ... are “considered a long-term goal for closure”, and therefore should be thoroughly described and discussed well ahead of time (in the EIS).	PD06, WR137
1328	Question: does this also mean that the SO <sub>4</sub> standard is the limit driving the whole seepage treatment plan? What dilution factor (from tributaries) is valid for the St. Louis River between the Embarrass River and Fond du Lac Reservation? And river rice beds upstream from the Reservation?	WR035, WR060
1331	Surface Waters. Hydrology ... What baseline information is available on “existing aquatic ecology”? It’s impossible to judge this “requirement” without known present conditions baseline.	AQ01, WR071
1349	Groundwater Hydrologic Modeling ... Question: Did anyone examine the miles of bedrock drillcore or core logs thereof for fractures?	WR014
1355	Surface water Hydrologic Modeling One input factor is a “rainfall database” (p. 5-45). Questions: How long-term is this? How sensitive is the model? Does it consider 200 years? Climate change? In Table 5.2.2-13, only the 20-year annual low and high flows are modeled. This EIS should be valid for MUCH longer.	WR071, WR077

<b>Sender Name (Submission ID)</b>	John Green (16120)	
1358	NorthMet Waste Rock Geochemistry. PolyMet claims that “Within the pit walls the blasting effects (om fracture permeability) are limited in terms of lateral extent and do not have much effect on solute transport in bedrock”. Question: What actual measurements support this statement? Any data – or a hunch?	WR167
1370	“Category 1 waste rock . . . is predicted to never generate acidic leachate” Question: Then why collect and treat drainage/seepage from the Cat. 1 waste rock and tailings?	PD15, WR134
1371	Question: Where would this material [Virginia Formation rock] be encountered in these pits? Virginia Formation not found on the pit cross-section diagrams. Would it be inclusions in the Duluth Complex? Would it be combined with Cat. 4 waste rock and disposed of in the East Pit, or how? Why isn’t it simply included in Waste Rock Category 4?	PD15, PD31
1375	PolyMet states that “not all sulfide sulfur has the same potential for release” Explain, including management implications.	WR001
1378	On p. 5-54 the concept of “concentration caps” is introduced, on the basis apparently of empirical field and lab observations and relied on to minimize solute loadings of effluent in the modeling calculations. Question: what is the theoretical basis or rationale for such “concentration caps”? Is it a valid concept on which to base environmental standards?	WR033
1383	“...four solutes are assumed to be attenuated by adsorption in the aquifer: As, Sb, Cu, and Ni.” ... Question: Do the media through which these leachates pass never become saturated in these solutes? This seems unlikely. Therefore how can this adsorption process be counted on to act on the long term of this project?	WR058, WR167
1387	Modeling predicted much higher solute loads for many components than observed empirically, apparently due to adsorption, and models were adjusted correspondingly by “calibration factors” (fudge factors) to produce results closer to those measured. Comment: This should be explainable scientifically.	WR030, WR050, WR060
1388	Questions: What is the rationale for the size of the pond on top of the tailings? What is the basis for the rates of recharge given in Table 5.2.2-17? This certainly would be seasonably variable. Have weather/climate extremes been taken into account? Global warming? What is the “closure beach” as opposed to the others?	PD08, PD11, WR057, WR180
1393	Question: isn’t [probabalistic modeling for contaminant transport] a big loophole for future enforcement? Of course, it also could be economically beneficial if long-term experience shows permit requirements to be stricter than necessary to maintain water quality. Can we trust Agencies to enforce the permits?	PER37
1399	What is [the West Equalization Basin]? What is its function?	PD04
1402	East, East-Central Pit to be flooded so waste rock and pit walls are water-saturated, reducing acid production. Questions: What will be the oxygen content of this flooding water? Won’t it be at least initially oxidized as it contacts waste rock and pit walls? This will generate acid immediately. What do experiments show for this with time? How will the pore water in the pit be kept from diffusion or replacement by lateral infiltration of more oxygenated groundwater, thus continuing acidification?	WR029
1404	Will there be no surface overflow [in West Pit flooding]? ... Will there be no attempt to minimize reaction with wallrock sulfides? What predictions have been made for water quality in this unlined pond in mineralized rock? ... Add limestone? Bentonite?	WR027
1405	What modeling has been done for water balance in the Tailings Basin? Will pond require augmentation during drought? If so, where from? Or is this not important? If so, why not?	WR056, WR057

1406	Possible modification of dikes and surface water flows [at Mine Site] “as necessary”. Question: As necessary according to whom? Could high pumping rates of excess West Pit water exceed capacity of the WWTF?	PD04, WR148
1407	Using the “MN-fiber” definition would be a highly conservative standard, since in my experience the great majority of particles likely to cleave with that aspect ratio in igneous rocks such as the Duluth Complex would be hornblende, the most common amphibole and one that is not implicated in health issues (see list on p. 5-436-437).	AIR03
1408	Considering the intensive sampling that has been done of the rocks proposed to be mined, by drill core and for bulk metallurgical testing, the amphiboles should have been – and must be – identified to evaluate their potential carcinogenicity. Then any necessity for treatment could be better evaluated.	AIR03
1409	Again, a “small fraction of <2.5 micrometer fibers have been identified as amphibole” from flotation pilot testing. These should have been identified as to amphibole type. Questions: a) What is PSD (p. 5-440)? b) (last line p. 5-441) “. . . wet and minimize wind erosion.”	AIR03
1411	What is the long-term (100 year, 300 yr) empirical basis for such [geomembrane] specifications, under saturated, in-ground conditions? Of course, great care must be taken in laying down these geomembranes to prevent punctures and local strains.	GT10
1412	what is the angle of repose for each [Category 1 Stockpile] lift? How is it to be determined for modeling/planning? Empirical observation during construction? Long-term stability?	GT04
1413	Stability analyses of stockpile cross-sections “indicated that all sections analyzed met the minimum required Factors of Safety”. Question: What Factors of Safety are required?	GT04
1414	[Would the DNR] only monitor the waste cover [during monitoring/maintenance]? Not the face/flanks?	GT09
1415	[A Factor of Safety of 1.1 minimum for materials deemed subject to liquefaction] seems much too low!	GT02
1416	Will these small-looking [North and South slope] rock buttresses be large enough to confidently maintain stability post-closure? Where would the LTV tailings to be used in adding to the dams come from? The adjacent W cell?	GT03, GT08
1417	Modeling results for Factor of Safety during construction and long-term closure are given in Table 5.2.14-1; they appear adequate.	GT04
1418	Potential for this extreme hazard [liquefaction] was evaluated under various scenarios, showing that the “design would meet the minimum Factors of Safety deemed acceptable by the Co-Lead agencies” (see Tables 5.2.14-3, 5.2.14-4) However, those minimum Factors of Safety seem dangerously low to this reviewer.	GT02
1419	since these [NorthMet Project Proposed Action] tailings are supposed to be non-acid-forming, why is it necessary to keep them water saturated [in long-term closure]?	WR057
1420	Dam safety reports should be done more often than every 5 years.	PER21
1422	Actual possible physical modifications to the Tailings Basin in case of a problem are not described.	GT07
1423	Preparation includes installation of a granular drainage layer and wick drains, then temporary loading with imported material (What kind? Where from?) to compact the substrate and increase stability.	GT08

1424	Design Cross-sections ... show waste to be underlain by potentially unstable saturated LTV slimes and fine tailings and peat	GT01
1425	Differential compaction would stress the liner system, but modeled strain would fall “within acceptable limits of most geosynthetics.” (p. 5-575) Comment: need better assurance than this.	GT10
1427	Liquefaction analysis was not performed. Question: what is the strength of the HRF residue/waste? Might it not be at risk of liquefaction?	GT11
1430	Again, will the synthetic geomembrane and geocomposite drainage net deteriorate over the long term? With what effects on the Factors of Safety?	GT12
1440	The discussion of potential cumulative effects assumes the successful implementation of the best management practices and mitigation measures discussed throughout this SDEIS . . . “ (p. 6-2). Comment: This is a too-restrictive definition	CU05
1442	Although the mineral resource projects listed here have not developed to the public proposal or scoping stage, a great deal of drilling, sample analysis and other exploratory work and engineering studies have been invested in many of them, and proposed development is likely within the active period (40 years?) of the NorthMet Project. At the least, this Chapter [Chapter 6] should show on maps the mineral holdings of each of the eleven companies or projects mentioned under Speculative Actions.	CU02
1443	This discussion appears to limit the CEAA to projects “located within the portion of the Mesabi Iron Range encompassed by St. Louis County (see Figure 6.2.2-1)” (p. 6-14-5) Since the NorthMet Project is geologically contained within the Duluth Complex, not the Iron Range, this is an illogical limitation.	CU01
1444	clearly the CEAA should also cover the area south and east of the Iron Range underlain by the Duluth Complex (outside of the BWCAW), and would include, for instance, the Twin Metals, Teck, Cardero, and Encampment projects.	CU01
1445	The farther-afield Kennecott Tamarack and Cooperative Mineral resources projects, located in Aitkin and Crow Wing Counties, would not appear to be spatially related to NorthMet. And the Cumulative Effects also clearly extend all the way down the main stem of the St. Louis River to St. Louis Bay.	CU01, CU02
1451	more analysis should be done on the surface impacts of underground mining versus the open pit plan. The benefits of underground mining may not be as great as claimed	ALT01
1453	[Regarding west pit backfill alternative] Where would this material (especially the water) be disposed of? Again, wouldn't this water be degraded (acidified to some extent) by contact with mineralized rock? What would be the water quality impacts to the receiving stream (Partridge R.)?	ALT03
1454	While adaptive management is essential, it depends on a high level of trust. Such actions could be necessitated well after the Closure period, and thus come under the responsibility of the State through Financial Assurance funding.	FIN01, FIN05
6866	[The authors] do not provide a map of the Sites of Biodiversity Significance or any detail on the criteria for the different levels of biodiversity significance. The omission of a map and criteria must be rectified in the final EIS.	VEG02
6867	Proposed mitigations for biodiversity loss should be part of this environmental impact study in accordance with the policies in Minn. Statutes 116D.02, Subd. 2.	WI01
17594	The NorthMet SDEIS PolyMet Mining Inc. Project fails miserably in analysis, alternatives and mitigation for most environmental issues raised in this document as will be documented in the myriad of public responses.	ALT21

17605	The Land Exchange for the federal ownership at the mine site for other non-federal lands within the Superior National Forest (SNF) only compensates for the acreage of federally managed land lost. It does nothing to mitigate the actual loss of biodiversity function at the landscape scale.	LAN03
17606	Although biodiversity is not a USFS assessment requirement, the state of Minnesota, as a partner in this SDEIS, is not precluded from assessing the loss of biodiversity and wetland ecological function in this SDEIS, and should do so under the policies of the Environmental Policy Act.	VEG02, WI02
17607	Also mitigations for biodiversity loss are not even explored in any meaningful way, for example, through more protected public land, either federal or state, in designated areas like parks, scientific and natural areas, or wildlife management areas.	ALT13, VEG02
17608	Because substantive information about financial assurance was not covered in this SDEIS and was put off until the permitting process, the regulatory agencies must make the decisions about the amount and type of financial instrument needed in a transparent and accountable way. That means adequate public notice to all interested parties, particularly those that took the time to offer meaningful comments to this SDEIS, by establishing an electronic database of these interested commentators and giving them the opportunity to be on a timely notification list for all permitting steps.	FIN13
17609	...Polymet, a Canadian company, has no mining experience and their capital assets do not show any capacity to fund needed financial assurance. For these reasons, their largest shareholder, Glencore Xstrata, who ultimately controls PolyMet operations, must also be a permit holder for state and federal permits for the PolyMet NorthMet project.	FIN01, FIN02
<b>Sender Name (Submission ID)</b> John Grillo (12959)		
106	The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for	WR035, WR128, WR143
107	sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior.	AQ05
108	Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02
<b>Sender Name (Submission ID)</b> John Gustafson (47365)		
11402	the lifetime of the negative environmental impacts for the proposedmine far exceeds the economic viability of the mine	SO01
11408	no human or mechanical method exists to guarantee treatment of themine's pollution for the time beyond the economic viability of the mine. How does one guarantee that people four hundred years in the future will even know how to operate the water treatment systems, let alone will be able to afford to do so	FIN01
11411	the majority of the economic benefits of the proposed mine are shortterm and will flow out of the State, going to entities that have no interest or personal investment in Minnesota's livelihood.	SO01

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> John Herbst (33031)		
12179	Learn from the [historic mining legacy in Wisconsin]. This tailings pile would rupture its containment device before 100 years elapsed after mining operations ceased, and the company, would be long gone and difficult to get remedies in court. This sulfide mine will present long-term contamination issues...we don't need another failed attempt at siting a sulfide mine which will only give minimal assist to the local economy but will damage the region's long term economic stability due soil/groundwater pollution, impacts to recreational activity and environmental ruin.	SO02, WR023
<b>Sender Name (Submission ID)</b> John Herold (42751)		
14438	Please consider the dangers posed by any sulfide mining in northeast Minnesota – the environmental damages and the lost tourism jobs.	SO01
14439	the cost of trying to keep the waters clean would be a financial hardship to taxpayers.	FIN10
14440	Fugitive dust emissions from Polymet’s proposed mining will not be contained, and they will not be prevented. These emissions pose serious health issues, something that Polymet will cause and will ignore.	HU03
18958	Polymet’s proposed mining will cost the citizens of Minnesota tremendous financial resources. For 500 years? How long do you think Polymet will pay for 500 years of water treatment?	FIN01, FIN10
<b>Sender Name (Submission ID)</b> John Ingham (7765)		
850	Even with the best technology and state of the art methods for capturing sulfide. eventually, perhaps several generations from now, those chemicals will leach into the watershed and Lake Superior. The mining company is not going to take responsibility, even if it still exists as an entity, 100 years from now. And, even if it were to take responsibility, it would not be possible reverse the damage. No amount of money would compensate the people relying on Lake Superior for their potable water.	WR111, WR115
<b>Sender Name (Submission ID)</b> John Ipsen (40880)		
10640	most of the money generated [by the mining operatins] will go to foreign investors whose environmental records are lamentable, that when the mines are exhausted there will be no more mining jobs, that the resources will largely be sent to overseas markets, and that the mining operations will be very energy intensive and are likely to pollute the environment and pose a risk to human health in workers as well as civilians in local and distant communities.	SO06
10646	Even if able to comply with the 10 mg/L sulfate standard, because of the huge volumes of water the process will produce, operations will actually discharge hundreds of tons of sulfate annually to the St Louis watershed. This will result in methylation of mercury in the St Louis that will bioaccumulate in fish of the estuary and in Lake Superior. ...The SDEIS is deficient in addressing this physical and biochemical reality.	MERC02, MERC08, MERC10
10651	PolyMet does not have a good enough plan in place to control dispersal of these [Amphibole] fibers from multiple fugitive sites. The SDEIS does not specify the actual amount of fiber that will be released and indicates the true risk to mine workers and those affected by the plume cannot be adequately assessed.	HU04
10654	During the lifetime of Polymet’s proposed operations and cleanup there is a very real threat of major flooding occurring and causing overflows that could result in catastrophic exceedence of expected discharges. How has engineering dealt with the potential for what we know as a 500-year flood?	WR057, WR077, WR180, WR193
10658	And what of the potential for contaminating deeper aquifers, considering both natural faults and those created by the mining process?	WR012

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> John Ipsen (40880)		
14574	Having reviewed the PolyMet SDEIS I am left with the impression there are many uncertainties and a very real potential for Polymet (and the other planned mines waiting in the wings) to harm to the land and the public. ... The SDEIS in many places essentially directs the reader to have faith in what the co-lead agencies (CLAs) have concluded without providing adequate concrete and believable science to back the conclusions.	PD01
14578	has the engineering dealt with the possibility of serious drought? Having waste rock stored under water is one of the means proposed to limit the production of toxic leachate. The process intends to draw water from the surrounding wetland to keep the waste rock submerged. What would happen if water became so scarce there wasn't enough available to maintain coverage? Then what if flooding followed this?	WR077
14580	What I glean overall from reading the SDEIS is that the science behind Polymet's plans is imperfect and not adequately tested, and the real effects of going ahead with the proposed mine are not predictable enough for such a high-risk proposal. It is apparent from the presentation and language in the SDEIS that the CLAs have chosen to accept models that predict what they (the CLAs) hope to be the outcomes so the mine can proceed.	PD29
14582	The SDEIS points to a 90% confidence interval as an industrial standard. 90% certainty means 10% uncertainty. I am surprised to see such a low set of the bar, particularly when an error on the other side could cause a calamity that would be impossible to control and when so much taxpayer money is at risk (monetary assurance doesn't cover unforeseen disasters).	FIN08, FIN10
14583	I'd love to see an industry established in northern Minnesota that would provide quality long-term employment. I also appreciate there is a great demand for copper in the world. Currently the SDEIS does not show that we have developed the ability to mine hardrock metals without harm in this setting.	SO01
<b>Sender Name (Submission ID)</b> John J Weber (54717)		
18508	Many profoundly-important questions have been raised about 1) the proposed mine itself, 2) waste-rock stockpiles and 3) tailings basin. Before "the genie is let out of the bottle", so to speak, wiser answers are needed than are currently available from applicant, DNR or mining industry. I contend that the gravity of the many unknown consequences at this point in time in 2014 heavily argue against granting a favorable E.I.S. conclusion at this time.	NEPA09
<b>Sender Name (Submission ID)</b> JOHN KENNEDY (44317)		
10354	We stand to lose the beauty of the area, the wildlife, the health of the watershed, the clean air, and the ability of Tribal Nations to carry out their guaranteed rights to hunting, fishing, and gathering wild rice in the region.	LU06
11403	Simply stated, water is precious. As demand for drinking water increases due to population growth, global warming, and loss of other clean water sources, it would be unconscionable to put this source of clean and abundant water at risk.	WR195
15716	Think about it: Who at the United States Forest Service is authorized to "swap" our public land with mining companies?	LAN02
15717	These lands in the Superior National Forest were purchased under the Weeks Act of 1900 in order to preserve watersheds. Open pit mining is forbidden on such lands. To open these lands to sulfide mining would be a betrayal of the public trust and is clearly illegal.	LAN02
15718	Although they were forced to cede their lands to the invading miners and loggers, the native populations are guaranteed hunting, fishing, and subsistence rights on Ceded Territories. When we look at the impacts sulfide mining would likely have on wild rice, fish, and game, we can clearly see that these guarantees are meaningless.	CR01

<b>Sender Name (Submission ID)</b> John M Roth (54492)		
18074	The proposed mine, furthermore, is in a highly valuable and ecologically significant region. It has nearly 1 ,000 acres of wetlands, thousands of acres of mature forest lands, and habitat for rare and threatened species, including the Canadian Lynx.(...) They are not for us to use at the expense of our children, or at the expense of future generations. And they certainly must notbe exploited by a few, the 350 or so workers for 20 or so years and a foreign corporation, at the expense of the rest of the state for generations to come.	SO01
18076	The proposal calls for the creation of a permanent two-mile wide waste rock and tailings pile filled with highly toxic manganese, arsenic, lead and mercury. In addition to the extreme risk of leakage of those toxins into the groundwater and air, the tailings pile and surrounding area will become an inhospitable wasteland, unsuitable for any outdoor recreation activities forgenerations.	WR126, WR195
18079	It must be further stated that PolyMet/NorthMet has not stated how it, much less future generations, will pay for the necessary water pollution treatment, which could be required for 200 to 500 years.(...) They have no plans for long-term pollution treatment, and they don't have the funds, and never will, to cover the costs.	FIN01, FIN05
18082	The Minnesota DNR cannot gamble with our natural resources or our future. It cannot subject our children and future generations to a polluted landscape and the costs for treating it. The DNA has a legal and moral imperative to protect our resources.	SO01
<b>Sender Name (Submission ID)</b> John Mischke (42458)		
6797	There has to be other ways to help Northern Minnesota economically [other than the PolyMet project.]	SO02
<b>Sender Name (Submission ID)</b> John Mugford (38629)		
9955	I do not think it is in the best interest for the citizens of Minnesota tobe responsible for future tax burden as a result of cleanup costs forpollution that will result from poly mets project...Financial assurances that need to be in place for 200 to 500 years have not ever been proven.	FIN01
9956	There is some discrepancy as to the amount of water being released from theproject. I would believe the tolerances were put into the model for a goodreason therefore it would make sense that the correct numbers be put in andthe model be rerun.	WR086, WR093, WR105, WR178, WR183, WR189
14073	The land swap between the forest service and poly met in my mind needs tohave its own separate review... The use of the national forest hasrestrictions put on it for a reason. We need to respect that and not put theneeds of a corporation ahead of the rights of the citizens of the UnitedStates.	LAN10
14074	I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners... I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country.	SO02
14075	[The mine plan should] account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx	WI02
14076	[The mine plan] should call for a detailed plan for financial assurances thatprotect current and future taxpayers	FIN10
14077	[The mine plan] should accurately assess health risks to the public	HU01
14078	[The mine plan should] address the risks of mercury pollution for our children as well as future generations	MERC03

14079	[The mine plan] should improve wetland protection and replacements	WET04
14080	[The mine plan should] provide Minnesotans with accurate information about how long polluted waters will require treatment	WR035
14081	Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet	PER02
14082	Fix the inaccurate water data used in the model and redo the water model	WR003, WR189
14083	the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage and pollution nonferrous mining will cause to Minnesota's environment.	SO01
14084	Our fresh water in Minnesota is the envy of many areas of the United States. Why on earth would we want to take any chances that it could be compromised. Our fresh water is our most Important and valuable resource.	WR195
<b>Sender Name (Submission ID)</b> John Munter (41920)		
2520	The problem is that the mine becomes a superfund site requiring perpetual treatment for the run-off of antimony (similar to arsenic), sulfates, and heavy metals. DNR admits that the Mine Site will require water treatment for more than two hundred years and the Plant Site will require water treatment for more than five hundred years.	WR035
2576	The DNR seems more interested in preserving Polymet's profit margin than discussing what should be a fundamental requirement of a study: the worst case scenario.	PER35
2577	It is a telling signal of the bias of the DNR that we do not know what the IRR would be for underground mining and the West Pit Back-fill option. Underground mining would have significant benefits such as no need to pay four million dollars in a land exchange, no need to destroy a wetland, and no need for perpetual maintenance.	ALT01
2578	It isn't clear why DNR isn't requiring Polymet to choose one of the underground or underwater sequestration options if this project is going to be done at all.	ALT01, ALT06
2579	It is difficult to see how all the tremendous rock blasting on the site won't widen old cracks in the bedrock and open up new ones for toxic leachate to begin gradually seeping into the aquifer and beyond.	WR016
2580	The argument is that Northern Minnesota has always been an industrial area with some water pollution and some air pollution and we have to accept it for good paying jobs...	SO10
2581	Do we really want a good-paying job so badly in Northern Minnesota that we are willing to destroy the very reason why we are here? Is this something we can brag to our children about? Is this a job where we will lay awake worrying at night about the effect on our neighbors and our progeny?	SO01
3212	One of the problems, for example, is the DNR should require PolyMet to buy, not lease, the mineral rights for the south -- the west pit so that it can be back filled from that 20-story tailing pile and so it can be under water, then, when the financial assurance collapses at some point.	FIN08
3213	And the peak pollution won't happen in the sulfur mining -- sulfide mining for 500 years and then there's the downside of the Bell Curve after that. So it's in perpetuity, basically.	PD03

<b>Sender Name (Submission ID)</b>	John Munter (41920)	
13214	You cannot guarantee financial instruments for 500 years or a thousand years in perpetuity. It's going to cost \$3-and-a-half billion -- \$3-and-a-half million to \$6 million a year for two water-treatment plants. That comes out to \$1-and-a-half to \$3 billion over 500 years, and of course, we're looking at 1,000 years.	FIN01, FIN05
13460	I'll be darned if I want my kids to work on a 500-acre, 20-story slag pile, superfund toxic waste site straddling the continental divide on wetlands surrounded by rivers over an aquifer at the headwaters of the St. Louis River Basin. I think this project is going to fail	SO01
16551	Even if the forty-six lbs a year of airborne mercury PolyMet creates during the twenty year mine is not judged to be a burden on a region where one in ten babies born already has too high a mercury level—there is a problem.	AIR04, MERC03
16556	Even if all the plastic is replaced regularly over the five hundred acre site, and all the leachate is collected from the twenty story tall reactive waste rock, and the pipe leaks are repaired quickly, and a fund is established by PolyMet to fund the two water treatment plants that will cost between three and a half to six million dollars a year—there is a problem.	FIN05
16560	Even if the estimated minimum sixteen million gallons of escaped toxic seepage a year into the ground and surface waters isn't considered a problem—there is still a problem.	WR113
16565	PolyMet seems to be thinking of spending something on the order of two hundred million dollars that would probably be set aside in some kind of a trust fund. Taking the high end of cost estimates by the DNR of six million dollars a year this would run out in about 40 years depending on how much interest was garnered.	FIN05, FIN08
16568	The biggest part of the problem is that to think that any funding mechanism could be guaranteed for perpetuity or even a good way towards it is insane.	FIN01
16576	Tribal experts have suggested design changes that would reduce potential toxicity exposure. One idea would be to require underground mining.	ALT01
16578	Tribal experts have suggested design changes that would reduce potential toxicity exposure...The other idea is called the West Pit Back-fill. This is also more expensive but the twenty-story tall and least reactive Category 1 rock pile would be completely back-filled into the West Pit which would then fill with water. This literally entombs the rock under water and away from the oxygen source of the atmosphere that it needs to become reactive.	ALT03
16580	DNR is hoping the fractures in the granite are small enough to prevent much leachate flow but they cannot know this because they do not have an adequate study and they cannot know what the future blasting will open up.	WR007, WR012, WR016
16581	If PolyMet can demonstrate that all the doom-and-gloomers were totally wrong in a short time frame and there has been no major pollution in the first two decades then they might push to open up more mine sites or others might and rent out the PolyMet processing facility.	CU04
16582	It is crystal clear, now, that we cannot trust the DNR to produce an unbiased study that looks for the most environmentally-friendly mining alternative, that is receptive to Tribal input, that looks out for the future of local residents, and that is even grounded in reality in proposing perpetual waste treatment.	NEPA15
16681	This is a nutty 'plan' when you are polluting ground water forever and presuming that financial instruments will be around in perpetuity to save downstream residents from perpetual pollution and that the cost of these financial instruments will never in perpetuity negate the value of the ore being mined for a few decades.	FIN05, FIN08

128	PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR035
131	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.	PD29
132	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed.	WR003
133	The SDEIS must be redone to calculate whether PolyMet’s seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands.	WR064
135	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number.	WR018, WR022
136	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump	WR010, WR061, WR069, WR168
137	It is a biased document that relies on unjustified assumptions, conceals important facts, and won’t allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR038, WR071, WR110, WR130
1175	Why must we support the small communities through a short-term effort (20 years or less) of copper-nickel mining, which will result in long-term loss of environment (200 years or more)?	SO01
1176	This will impact not only the pristine waters of northern Minnesota but, over time, may impact our water quality down the Mississippi River basin.	WR111
1177	Northern Minnesotans are anxious for jobs and delusional over the possibility of mining and construction jobs. Polymet is promising high-paying jobs, but how many folks who live up there will actually be hired?	SO06
1178	Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR107, WR108
1180	The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts.	NEPA09
1182	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
1184	The SDEIS must be redone to calculate whether PolyMet’s seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the “evaluation locations” used in the SDEIS.	WR120
1185	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures.	PD29

<b>Sender Name (Submission ID)</b> John Pugh (9343)		
14725	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR018, WR022
14726	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	NEPA07
14727	Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
<b>Sender Name (Submission ID)</b> John Quimby (41314)		
9315	Please use the utmost caution in approving any mineral extraction that would compromise either water resources or other environmental factors.	WR195
<b>Sender Name (Submission ID)</b> John Reynolds (47520)		
7061	The [groundwater flow] model uses a base flow estimate which significantly underestimates flow. As a result, the model likely underestimates the amount of sulfates and heavy metals carried to the Partridge River and Lake Superior.	WR003
7077	Water channels which is what fractured bedrock is need to be closed to prevent the outward migration of heavy metal laden water...The fractures need to be sealed or the entire basin needs to be lined with peat in adequate thickness to adsorb the heavy metals to prevent their migration from the site.	PD04, WR090
7082	Adequate monitoring and mitigation procedures need to be in place and ready to go if monitoring shows migration from the site. That will require an ironclad financial commitment that is lacking on this project.	FIN01, FIN08
7095	Monitoring must be part of the permitting process. The permit must require a robust monitoring plan with financial assurances to fund it.	PER06
7097	The public should be afforded an additional 30 days to take into account the new information.	NEPA07
7102	If mineral rights are severed from USFS land swap the project needs to assume that mining will occur on those lands and that needs to be included in this permitting process instead of permitting this as a stand alone project.	LAN04
<b>Sender Name (Submission ID)</b> John Roth (42900)		
10121	The proposed land exchange is totally flawed for at least two other reasons. First, land exchanges can only occur legally if the lands obtained by the Forest Service are in the public interest and their appraised value equals or exceeds the federal land being transferred.	LAN01, LAN03
12911	... land exchanges can only occur legally if the lands obtained by the Forest Service are in the public interest and their appraised value equals or exceeds the federal land being transferred. A land exchange, in fact, should not even be considered until a full "Yellow Book" appraisal of the lands have been completed and furnished to the public.	LAN03

13018	"Land exchanges can only occur legally if the lands obtained by the forest service are in the public interest and the appraised value equals or exceeds the federal land being transferred.	LAN03
13030	A full "yellow book" appraisal of the lands must be completed and furnished to the public	LAN03
17294	I am asking you to reject the proposed exchange of 6,650 acres of Superior National Forest land for the PolyMet/NorthMet sulfide mine project. Sulfide mining has never been done anywhere in the world without causing significant water pollution... The mission of the Forest Service is to "sustain the health, diversity and productivity of the Nation's forests and grasslands to meet the needs of present and future generations." That is your charge as Supervisor of the National Forest. Exchanging land to allow a sulfide mine within the boundaries of Superior National Forest...would be a direct violation of the Forest Service's mission.	LAN02
17296	The needs of some people for the next 20 years cannot be given greater value or preference over the needs of the future. ...the needs of... the country as a whole always should be given greater consideration. I think that the founders of the Forest Service all believed the same, since it is inherent in the reason for establishing and maintaining the National Forests.	LAN01
17297	...even if the appraised "fair market" values for the lands are comparable, the land PolyMet/NorthMet is offering is of insufficient ecological value. The 6,650 acres of federal land PolyMet/NorthMet is seeking is a single block of land that includes over 2,000 acres of mature forest and approximately 1,000 acres of irreplaceable wetlands. ... The federal land also has critical wildlife habitat for moose and Canadian Lynx, and several other threatened species.... The land PolyMet/NorthMet is offering, on the other hand, is scattered in various parts of the forest. It lacks the ecological and management value of a large continuous tract of land. It has split mineral rights, mostly immature forest, and it lacks the valuable wetlands and rich biodiversity of the federal land.	LAN03, LAN04
19009	Proponents of the PolyMet/NorthMet mine have claimed that the mine will bring needed jobs for the next 20 or so years, but that is only a short term benefit, and one that is limited only to a relatively modest number of individuals in Northeastern Minnesota.	SO01
19010	...the land PolyMet/NorthMet is offering is of insufficient ecological value. The 6,650 acres of federal land PolyMet/NorthMet is seeking is a single block of land that includes over 2,000 acres of mature forest and approximately 1,000 acres of irreplaceable wetlands. Those wetlands are vital to the water quality of the entire watershed, which includes large areas of Superior National Forest and flows into Lake Superior.	LAN03, WET14
19011	As you know, Section 404 authorizes the Administrator to deny a permit to discharge dredged or filled material into a watershed if it will cause "unacceptable adverse effect on municipal water supplies, shell fish beds and fishing areas (including spawning and breeding areas), wildlife, or recreation areas." The proposed PolyMet/NorthMet mine will have all of those adverse effects for potentially 100s of years	COE03
19012	It also must be stated that PolyMet/NorthMet's SDEIS is fundamentally flawed because it fails to provide alternatives that would eliminate or reduce the adverse impact on the wetlands. It doesn't offer ways to restore or clean up the mine site, and it fails to offer adequate mitigation or compensation for the lost wetlands within the Lake Superior basin.	WET01, WET03, WET20
19013	[PolyMet will] directly destroy 913 acres of highly valuable wetlands in the Partridge River headwaters and 100 Mile Swamp, and indirectly harm over 7,000 acres of nearby wetlands due to air and water pollution from the mine's waste rock and tailings pile;	WET24
19014	[PolyMet will] cause highly toxic mercury that is currently bound up in the wetlands at the proposed mine site to be released into the waterway, harming all fish in the watershed and any person who eats such fish, particularly young children;	MERC02, MERC03
19015	[PolyMet will] produce at the mine's tailing site 1,506 micrograms of manganese per liter, which is 15 times higher than the health risk limit set by the Minnesota Department of Health to prevent brain damage for humans;	HU03

<b>Sender Name (Submission ID)</b> John Roth (42900)		
19016	[PolyMet will] increase arsenic at the tailing site by up to 417% and as much as 38.5% in Colby Lake drinking water, greatly increasing the risk of cancer for all nearby residents;	HU12
19017	[PolyMet will] destroy over 6,000 acres of vital habitat for moose, Canadian Lynx and other threatened species;	WI02
19018	[PolyMet will] create a permanent wasteland at the mine site and tailing pile - a toxic no-man's land unfit for humans and animals for generations to come; and	LU06
19019	[PolyMet will] produce a toxic unlined Category 1 waste rock pile that will have to be monitored for pollution seepage for hundreds of years with no plan or funding for such monitoring, and no funds for any pollution cleanup should the pollution occur.	WR128, WR129
19021	The proposal calls for the creation of a permanent two-mile wide waste rock and tailings pile filled with highly toxic manganese, arsenic, lead and mercury. In addition to the extreme risk of leakage of those toxins into the groundwater and air, the tailings pile and surrounding area will become an inhospitable wasteland, unsuitable for any outdoor recreation activities for generations	LU06
19022	The proposed mine, furthermore, is in a highly valuable and ecologically significant region. It has nearly 1,000 acres of wetlands, thousands of acres of mature forest lands, and habitat for rare and threatened species, including the Canadian Lynx. (...) They are not for us to use at the expense of our children, or at the expense of future generations. And they certainly must not be exploited by a few, the 350 or so workers for 20 or so years and a foreign corporation, at the expense of the rest of the state for generations to come.	SO01

3465	Send it back and get it right. And don't advance this project until all of those flaws have been fixed and we have an environmental impact statement that actually accurately assesses the impact of this project.	NEPA15
13559	Now we have a Supplemental Draft Environmental Impact Statement only to find out that the water quality model is inherently flawed. It's going to have to be redone again. So the water quality model was a base for a lot of the other aspects of the Draft Environmental Impact Statement. If that has to be redone, then a lot of other (inaudible) has to be redone.	WR003
13560	We're looking here at the potential for 500 years of water quality treatment, which in my mind, and I think in the mind of the law, is essentially permanent pollution to Minnesota that would require to be treated permanently.	WR035
<b>Sender Name (Submission ID)</b> Johnna Hyde (19003)		
14339	I live in the heart of the experimental drilling area and the new SDEIS is important to me, but to date I have only made it through about 150 pages. I support the Water Legacy request as follows. Please give us more time!!	NEPA07
19522	I would first like to comment on the style of the SDEIS itself. I find it tedious to read, with what seems to be irrelevant data ( 4.2.2.1 on precipitation and air temperature has as its most recent data records from 1986, although with climate change, more recent records are more relevant and are easily available); reference errors ( 4-29 refers the reader to section 4.3.6.4 which could not be found); unjustified assumptions ( eg. that the water flow model is accurate); confusing presentation of facts ( eg. 4-17 4 contains apparently contradictory statements about the presence of invasive species and needs to be read many times to figure out just what each sentence refers to); vague statements ( eg.S-538, and many other references to contaminants being shipped off site, but no indication as to where that would be and the impact in that location and necessity for future monitoring); inadequate consideration of important factors (eg. human health issues for employees and the general public residing in the area); misleading wording (eg. using "constituents" instead of"toxins," "contaminants" or "pollutants"); and unnecessary complexity ( 4-45 to 4 7 is incomprehensible). I am giving only one example of each, but it is easy to find many more. My first concern for a revision is that it be shorter, accurate, specific, consistent, and relevant so that it can fulfill its purpose to "inform the public and decision makers of the proposed actions ... " Such a long document as this does little to inform the public and decision makers as most people do not have the time to read it all. I find the "Fact Sheets" provided by the D NR that theoretically summarize the contents to be so biased in favor of the project as to be worthless.	NEPA07

- 19524 This proposal exchanges High Biodiversity sites as identified by the Minnesota County Biological Survey (MCBS), which are rare in the state of Minnesota and already severely diminished by development and industry, and which include 53% of the 100-Mile Swamp and hundreds of acres of jack pine/black spruce, an imperiled ecosystem in Minnesota struggling with effects of climate change. This exchange is not in keeping with good environmental stewardship or with the 2004 Forest Plan for Superior National Forest (SNF). The exchanged land may have an equal value for real estate, but that does not address its value as an ecosystem. A strip mall would have a high real estate value, but it's not what the USFS is designed to protect and manage. Real estate value is not an adequate measure of the value of land. A revised EIS should find more relevant and quantifiable measurements to compare land exchanges, perhaps something like the percentage of the total of equivalent land types in the state, as identified by the MCBS. The DNR has put a lot of effort into the MCBS; it should use this information for this kind of assessment to a much larger degree. The exchange also diminishes an already highly restricted wildlife corridor, and is likely to impact moose and lynx populations as well as amphibians that now use this for their reproductive spring migrations. Mitigations suggested in the SDEIS are inadequate, given the extensive nature of existing mines and the expansions in mining activity currently planned and permitted. The final EIS needs to consider the combined activity of this project along with other sulfide ore mining proposals and the current expansion of iron mining activity. Since the proposed land exchange involves important watersheds, I believe it may also violate the Weeks Act of 1911. Creating tailing dumps on wetlands and upper waterways that feed major rivers and Lake Superior does not seem in keeping with this law. (Since the index does not list the Weeks Act and I haven't yet found any references to it, I'm unsure if the SDEIS addresses this.) The destruction and likely degradation of thousands of acres of wetlands is also unacceptable and will be a result of this land exchange. The transfer of other wetlands to public jurisdiction for conservation is not adequate justification for the destruction and contamination of existing healthy wetlands that are now in use by waterfowl and other wildlife, and home to protected and threatened species. Those species are not going to move to the transferred area. More likely many will simply die off or experience reproductive failure. The final EIS and Section #404 need to address provisions of the Weekds Act and consider other alternatives that do not have such a severe impact on wetlands. LAN03, VEG02, WET14, WI01, WI02, WI03
- 19525 I can not be certain of this from reading relevant sections in the SDEIS, but it seems to me that one of the ways the proposal plans to replace impacted wetlands is to put soil on top of the original wetland rea that will be destroyed during production, and replant it with some wetland species. It is not possible for humans to recreate a wetland ecosystem. Cattails do not a wetland make. Wetlands are not well understood even now by scientists who have devoted their lives to studying them, but there is a general recognition of their complex, interactive components and their importance in preventing flooding and otherwise contributing to things humans value. Hence the Wetland Conservation Act. I find the wetland management proposals in the SDEIS to be in violation of Minnesota's laws, at least in spirit if not in absolute fact. ... The final EIS needs to include a way to eliminate this wholesale destruction of wetlands. COE01
- 19526 The model used for predicting groundwater contamination is completely inadequate. If even the ACE found it inadequate for their contribution to the SDEIS, it must be seriously flawed as I believe the DNR has acknowledged. It does not predict even the current conditions, and severely understates likely water flowage at sites during operations. It most certainly doesn't allow for the extreme weather events that the area has been experiencing recently – heavy spring melt-off and torrential rains. ... as I understand it the model accounts for only 5% of the current precipitation at the site. WR049, WR057, WR176, WR180
- 19527 The need for water treatment after mine closure is in violation of the law as well, which specifies that a mine must be “maintenance free” at closure. There seems to be a step down from the DEIS in groundwater protection with the unlined Category 1 tailings pit, which had plans to be lined in the previous EIS. The final EIS needs to include linings for all waste storage. WR037

19528	The assumption that the bedrock will not fracture further with all the blasting and drilling is unsupportable. Resulting leakage into groundwater, local wells and water supplies is not addressed in the SDEIS, and thorough analysis of current drinking water supplies, including wells, has not been done. A revision needs to include the possibility of bedrock fracture and the impacts that would have, take into account the greater depth of mining activities than past activity, and include the possibility of contaminated water reaching local drinking water supplies and the Rainy River Watershed.	WR010, WR016, WR040, WR041
19529	The likelihood of failure of the water containment structures is not addressed, nor is there a plan for managing such an event, which is essentially inevitable giving the long-term duration of contaminated water. The recent occurrences of newsworthy environmental disasters involving unexpected spills and subsequent contamination of drinking water point to the need for including such events in an EIS, in more detail than the table that indicates probability is low and passes on responsibility to local fire and emergency responders and the state.	PD22
19530	The revised EIS needs to address how it will pay for clean-up without putting the burden on Minnesota taxpayers.	FIN01, FIN10
19531	The SDEIS is short on dealing with contaminant levels that exceed standards. History of mining in this area, including current exploration, suggests variances could be issued to permit the higher levels. There is not mention of the impact when this happens, and no suggestion that such variances would not be provided. Although standards and enforcement procedures may be set during the permitting process, they need to be addressed more thoroughly in a revised EIS, as they are critical to determining likely environmental impacts. I would suggest standards that reflect current Minnesota law, no variances, and a requirement that mining operations be stopped while maintaining payroll for any violations, with no legal recourse that could delay fixing a problem immediately.	PER06
19532	Mercury contamination is one of the most serious issues in the Lake Superior watershed, with international implications on human health. Already there is excessive mercury in the blood of 10% of newborns in the St Louis River area. Adding mercury directly (even in "very small" quantities) and adding acid to the water, wich will leach existing mercury from the rocks, will exacerbate an already serious problem.	MERC03, MERC22
19533	Since leakage at the mine site is already exceeding water quality standards for sulfates, it would be in the best interest of the citizens of Minnesota to clean this up before production starts, partly to insure that it can be done, and partly to forego court claims on the part of mining companies that they have not worsened the situation. ... The revised EIS should include an alternative that brings water quality up to the Minnesota standard before new construction is done.	WR109
19534	There seems to be a large section of the Partridge River that is unmonitored. It lies between the place where potentially contaminated water enters the river and a place just downstream of a source of clean water, a small tributary stream. With this, the contaminants will be diluted and no monitoring of this stretch that is most polluted will occur. A revised EIS should include monitoring of this stretch so that corrections can be made before the polluted water reaches the tributary stream.	WR039
19535	The contention that no contaminated water will reach the Boundary Waters, or cross over the divide between the Lake Superior Basin and the Rainy River Basin, is inaccurate. ... The environmental consequences are not addressed in the SDEIS, since such an occurrence is not even considered. It could result from fracturing, flooding, or an accidental breach of dams and dikes, and most certainly will occur within the centuries that contaminants must be managed.	PD38
19536	The Next Generation Energy Act of 2007 has as its goal of total GHG Emissions of 32 million CO2-equivalent metric tons per year. According to the SDEIS this single project will produce 707, 342 CO2-equivalent metric tons per year, that is 2.2% of the state's total! This project at best is going to contribute a small fraction of one percent to the state's GDP, employment and tax base. ... The project could end up costing the state taxpayers dearly.	SO01

19537	Recycling copper and other metals that the project proposes to mine uses much less energy than this kind of mining and processing. The next EIS should justify the impacts of mining versus recycling to meet the copper demands of the market, or include a recycling plant as one of the alternative actions. ... There is no mention of incorporating solar power, wind generation, or geothermal energy to mitigate the enormous energy demands this project will require. ... The next EIS must contain their plans to use renewable energy sources for at least their offices and other non-production buildings.	ALT16
19538	Given the current ability of mining operations to manage the pollutants, a reasonable alternative is to revisit sulfide ore mining in 100 years if new technology has provided better ways to extract the minerals without such a high risk of contaminating our precious waters and degrading wetlands and human health.	ALT16

8140	Despoiling our priceless ground and surface water, destroying wetlands and other wildlife habitat, and ruining natural beauty in return for mere metals is almost more than I can comprehend.	SO01
17104	[Our land is being] squeezed by increasing populations and demand from extractive industries, industries which have a long history of exploiting people and the environment, making themselves and their investors wealthy, then moving on and leaving residents and taxpayers across the country to clean up and pay for their messes.	FIN01
<b>Sender Name (Submission ID)</b> Jon Shern (43693)		
11919	I would like to see a job breakdown for the PolyMet mine to understand what jobs will be in state vs. out of state, and what pay range each job would have.	SO06
11920	I would like to see more thorough evaluation of the Sulfuric Acid Pollution. What is value of our water resource vs. benefits of the PolyMet mine.	WR001
11921	The computer model seems to make various assumptions around current conditions.	WR049
11922	What happens when failure occurs?	PD22
<b>Sender Name (Submission ID)</b> Jonathan Fribley (43309)		
15775	There is simply no precedent for maintenance of toxins for any time span remotely close to the one proposed here - 200-500 years. To make projections that far out can simply not be justified scientifically without enormous error bars. ... In short, there is simply far too little knowledge to make an informed decision about the risks and costs for the time span that this mine would remain a danger.	PD01
15776	Despite the best efforts of the DNR, it is entirely possible that time will reveal errors in thinking. This is all the more likely because of the timespan involved. In this instance, the consequence of failure is pollution of the Lake Superior watershed - too high a price for such little gain for anybody except a few Polymet stockholders.	GEN01
15777	As you are undoubtedly aware, this proposal is almost certainly to be the first of many more, should it be approved. Because of that, it cannot be accurately considered in isolation. The consequences of approval include enabling mining across northern Minnesota, including into the BWCA drainage. The EIS should properly consider the environmental costs of that larger condition of mining across the north of Minnesota.	CU04
<b>Sender Name (Submission ID)</b> Jonathan Homans (47294)		
12864	This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water.	HU03
12865	Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	MERC16, MERC20

11139	[The proposed project] compromises one of our great natural resources over the long term for a small benefit in the short term.	SO01
11140	No doubt Minnesota will be left with final financial responsibility for 500 years of clean up.	FIN10
<b>Sender Name (Submission ID)</b> Josh G (42973)		
7961	the proposal is to have PolyMet collect only 90% of the water seepage from the tailings basin and treat the water at a Waste Water Treatment Facility (WWTF) at the Mine Site. Why was 90% of the water seepage used as the basis? Why wouldn't this rate to be higher? Why should any seepage into the environment be accepted?	WR018
7963	During construction and mine operation, an open pit proposal would remove wetlands and other parts of the ecosystem. Once mining ends after approximately 20 years, part of the reclamation process is that PolyMet would restore parts of the Mine and Plant Sites and the surrounding ecosystem to native habitat. Why wait until mining ends? ...This would then be approximately 20 years that the ecosystem is not active in removing and/or filtering out environmental contaminants, i.e. CO2, Nox, and Sox.	WET13
7968	...the proposal is to backfill the East Pit with category 2 – 4 waste rock (highest in sulfide concentration). With the idea that this will mitigate sulfates and metals from entering the environment. Why is backfilling the East Pit and then flooding it a consideration for the highest sulfide content waste rock? Is there an alternative disposal process that is better? It seems as though there's a high risk in backfilling and flooding the East and Central Pit (once merged) for environment contamination and ecosystem damage.	PD15
7973	Mercury emissions to the air are estimated to be 4.6 lbs./year from the plant site; emissions are estimated at less than 1.0 lb. /year from the mine site. How far can this mercury spread throughout the environment via air transmissions? Has there been any computer modeling to predict where and how much this mercury may concentrate? This would add mercury emissions to the surrounding environment that are currently not present in this area; how large of an area may be impacted?	AIR05
7975	Would PolyMet monitor air quality before and during operations to understand if there's a difference? Would dust/particulate matter be regulated?	AIR13
7977	Are there other potential air pollutants not noted in the SDEIS? The nearby Northshore mine has fibrous (similar to asbestos) like materials within the rock formation. Does the rock that would be mined here contain asbestos like materials?	AIR03
7981	For lack of better terms, what is the total carbon footprint of the NorthMet project? By carbon footprint, I mean everything from electricity needs, furnace, vehicle fuel and emissions, etc	AIR01
7983	Regarding mercury in the water, it is stated for the Embarrass River there's a potential increase by 0.6 ng/L, while decreasing mercury concentrations in the Partridge River by 1.2 ng/L...Why would there be any allowed increase, whether there is a net decrease downstream? Are the tributaries to the St. Louis River not important by themselves? What impact would the increase of the Embarrass River have on fish, wildlife and humans?	MERC18, MERC22
7985	Within the SDEIS, I have not been able to find how much of an increase of [Lead and Aluminum] will be introduced into the watershed. What is the increase of these metals into the watershed	WR060, WR064

*Alphabetical by sender's first name*

<b>Sender Name (Submission ID)</b>	Josh G (42973)	
15127	PolyMet will be responsible for monitoring and measuring of air and water quality to ensure compliance to all environmental standards. Will there be oversight from government agencies, such as the Minnesota Pollution Control Agency (MPCA), Minnesota Environmental Protection Agency (MNEPA), or others? Will there be random sampling of water and air within the direct area of the Mine Site, Pit Site, and surrounding areas to guarantee compliance?	AIR13
15129	Even with the proposed Land Exchange, there would be a net loss of wetlands, river habitat, forests, and plant life within the state of Minnesota. Currently the land in the proposed Land Exchange is doing the same, but we still also have the land at the Mine site as a functional wetland. To compensate for the net loss, PolyMet should actively restore displaced habitat even if they help fund restoration elsewhere in the NE portion of the state.	LAN06
15132	...up until the time which the East Pit would be backfilled, the proposal is to store category 2 – 4 waste rock on liners. What is the potential impact of these high concentration sulfides interacting with the oxygen in the atmosphere throughout this time? Is the only impact that there can be seepage through the waste rock via water and then it would be caught by the liner(s)? Also, the category 1 waste rock should be stored on liners to alleviate any seepage.	PD04, PD15, PD16
15133	How would the different category waste rock be separated successfully at the Mine Site? What are the environmental consequences if they are not properly separated?	PD15
15136	When mining operations end, the status of the mine site would be that the East and Central Pits would have been backfilled with category 2 – 4 waste rock then flooded. The West Pit would then be flooded creating a pit lake. What is the risk that there will be seepage from the interior of the pit(s) to the ground water? The SDEIS is not clear if there is a risk of aquifer contamination post mining. Is there a risk for aquifer contamination from the seepage of polluted water, sulfates, and/or metals from the pit(s) or pit lake once active mining ends? What is the risk of acid mine seepage?	WR173
15137	When looking at the Berkeley Pit in Butte, it seems as though the flooded pit is now a toxic waste area with water contamination concerns, etc... How will the NorthMet project be different once mining ceases onsite? I understand that there will be a WWTF at both the Plant and Mine sites, but is there a similar risk that this may end up similar to the Berkeley Pit?	PD26
15138	Why is Best Available Control Technology (BACT) or Maximum Achievable Control Technology (MACT) not required for the NorthMet project? This is one of the only in the foreseeable future that doesn't require it.	NEPA08
15139	Within the SDEIS there is also discussion that there may be an increase in sulfate levels within the local watershed. What are the impacts of increased sulfates on fish, wildlife, and humans? Again, why should the public opt to allow increased contaminant levels in the watershed? This needs to be quantified in the SDEIS and the potential impacts.	WR108, WR149
15140	How long would the WWTF need to operate at the Mine and Pit Sites? Will the Financial Assurance fully cover this duration? The taxpayers must not be liable to cover any aspect of the mining activities.	FIN05, FIN06
15141	Water is proposed to be piped between the Mine Site and Plant Site via a pipeline along the utility corridor, how will spills and leakages be avoided and prevented?	WR131
15142	What is the risk that Ammonia compounds pollute the land and waters from blasting agents used during this mining proposal?	WR013
15143	Has the United States Environmental Protection Agency (USEPA) reviewed the contents and potential impacts of this SDEIS under the Clean Water Act?	PER14

<b>Sender Name (Submission ID)</b> Josh G (42973)		
15144	Who owns the mineral rights below the lands that PolyMet proposes to be exchanged for the United States Forest Service (USFS) lands? Would the USFS also have mineral rights on the lands acquired in a proposed land exchange? Is there a future potential, if the proposed land exchange occurs, but PolyMet (or other) owns the mineral rights that there may be future mining proposal(s) on the exchanged lands?	LAN04
15145	During and up until the time which the East Pit would be backfilled, the proposal is to store category 2 – 4 waste rock on liners. While the category 1 waste rock would be covered with a geomembrane. It seems as though it would be very advantageous to cover the category 2 – 4 waste rock pile in addition to placing it on liners. This could help minimize the sulfides from oxygen exposure within rain, snow, and other water sources. Has this been considered?	PD04, PD15, PD16
15146	Has underground mining been considered? Why is only open pit discuss within the SDEIS? Shouldn't we look at all possible options to ensure no or the very least intrusive environmental impact?	ALT01
15147	In my review of the SDEIS I have not seen any data discussing how floods or other acts of nature will not impact this project. The SDEIS does not include how floods and other acts of nature will be included to avoid catastrophic tailings dike breaches or other problems that would have significant environmental impacts.	WR202
15152	The SDEIS lacks a detailed monitoring plan for air and water quality and a detailed analysis of what adaptive actions could be undertaken if various assumptions are incorrect. The SDEIS should examine the environmental consequences of several scenarios by continually monitoring these parameters.	AQ30
15154	Alternatives to an open pit mine are not thoroughly investigated nor discuss in this SDEIS. All methods of mineral extraction should be reviewed for everyone to clearly understand which poses the least risk.	ALT21
15155	Detailed information surrounding the financial assurance of this project must be included. The SDEIS does not contain enough of the details or facts.	FIN08
15156	Waste water treatment plans must be studied to completely understand the duration required. Please incorporate this into the SDEIS.	WR035, WR128
<b>Sender Name (Submission ID)</b> Josh Hoban (47023)		
10922	The clean up moneys is always about a 1000th of what is actually needed. The pollution fines are just drops in the bucket, never even making them change their practices.	FIN05
10923	O yeah and all that about the jobs and community, of course this will be the usual boom and bust. 20 good years of a couple thousand jobs and forever in bad years and billions in cleanup after Polymet makes their money and moves on. ... I don't know why people would even consider 20 years of money for a private company, vs endless years of tourism to a beautiful place and money going directly into the economy and forever making it stronger.	SO02
10924	Those resources most likely will not even benefit the US, just sell them to the highest bidder, polymet cares nothing about Minnesota or the US for that matter.	FIN04

18188	It could also cause a decrease of 11 different plant species in the area.	VEG01
18189	it could make more jobs, and it could help with our mineral capacity, but I still think that wildlife is more important	WI01
18190	Copper-sulfate can kill roots, bacteria, plants, and other organic things.	VEG06
18191	If anything goes wrong, then lots of animals could die.	WI04
18192	Copper-sulfate could also affect the water, killing many organisms, in the water and otherwise.	WR107, WR108, WR115
18193	Certain cultural resources can be affected. The Mesabe (Wid) (or Laurentian Divide) would be affected, and Beaver Bay would also be affected. Areas given to the Bands, (multiple Native American Tribes), would be affected.	CR01, CR05
18194	I do not agree with the land exchange offers. It occurs in a National Forest, which should be left alone. It also only benefits one company.	LAN01
18195	If something went wrong, and the lands were polluted, then it could cost my family a lot of money to help the state clean it up.	SO02
<b>Sender Name (Submission ID)</b> Josh Skelton (18145)		
3580	The first relates to the executive summary and whether water quality standards could be met with this project, and that mechanical water treatment as part of the model of the PolyMet proposed action for the duration of the simulations in 200 years for the mine site and 500 years for the plant site. The intent of the statement and the modeling was not to predict the actual duration of water treatment but rather to determine the impacts of water quality at key points in the watershed over stated periods of time in the model. 200 and 500 years, respectively. The outcome of the model actually is stating that water quality standards will be met well into the future, not defining the timeframe for treatment.	PD28
3581	A second area of address relates to the recent measured deviation in water quality models for the Partridge River...instead of distracting from the validity of the model of the sulfate, more credence should be given to the sensitivity analysis done with the model. Simulations were run with flow as lower in the basin than 0.5 and as high as 2.4 CFS, and they still showed water quality standards will be met.	WR003, WR091

<b>Sender Name (Submission ID)</b> Josh Williams (43103)		
10083	In order to adequately evaluate the potential impacts of the proposed project, the SDEIS needs to consider the financial feasibility of remedial activities at and around the mine site. As the project proposer will, of course, be financially responsible for the remedial activities, the SDEIS therefore needs to evaluate whether or not NET profits from the mine (eg. after all capital, labor, operating expenses etc. are covered) will be sufficient to cover remedial costs, and how the required financial assurances for remedial activities will be structured. To be adequate, this analysis needs to consider a wide range of scenarios for mine output, metal prices, and start-up and operational contingency costs. The analysis also needs to consider, in sufficient detail to allow evaluation of feasibility, the mechanism by which sufficient funds for remediation will be held (or access to sufficient funding otherwise secured), how continued access to sufficient funds to covers costs of remediation over time will be ensured (given the potential for hundreds of years of remedial costs), how and at what rate funds will be set aside during the projected 20-year operational life of the mine, and how this last relates to projected profit during the period of mine operation.	FIN01, FIN05, FIN08
11583	As the project proposer will, of course, be financially responsible for the remedial activities, the SDEIS therefore needs to evaluate whether or not NET profits from the mine (eg. after all capital, labor, operating expenses etc. are covered) will be sufficient to cover remedial costs.	FIN01
16141	The analysis [of remedial activities] also needs to consider in sufficient detail to allow evaluation of feasibility the mechanism by which sufficient funds for remediation will be held (or access to sufficient funding otherwise secured), how continued access to sufficient funds to covers costs of remediation over time will be ensured (given the potential for hundreds of years of remedial costs), how and at what rate funds will be set aside during the projected 20-year operational life of the mine, and how this last relates to projected profit during the period of mine operation.	FIN01, FIN05, FIN08
17779	The mine will operate for 20 years, and the impacts to water coming of the site will last 100s. Any evaluation of the potential environmental impacts of the proposed project needs to include consideration of how control of these impacts will be paid for when the mine--and the company that wants to develop it--is long gone.	FIN01
17781	An EIS that fails to consider costs of mitigation--in the form of engineering controls for site remediation and short and long term water quality treatment--as a function of projected project profits would not achieve the statutory purpose of environmental review to inform permitting. As part of permitting once environmental review is completed, permitting agencies will need to ensure that sufficient financial assurances are in place to cover the cost of mitigation measures identified by the EIS. Such considerations will be of sufficient complexity that they will be impossible to adequately evaluate during a time-constrained permitting process without a thorough analysis, as outlined above, during environmental review.	FIN11

- 13677 This project is not going to impact the entire -- as the mayor of Hoyt Lakes indicated, empty region, economically-depressed region. Another comment was the entire population of, you know, Tower, Ely, Virginia, Biwabik, the major Iron Range cities, would not currently reach the capacity of the Excel. Well, 400 jobs isn't going to make an impact on such a diverse problem. SO06
- 13679 The company is a Canadian company. The majority of the profits will leave the state in terms of reinvestment. Yes, you would have short-term environmental -- excuse me, economic improvement for a very limited amount of people, SO06
- 13680 I would make is that if you added up, my assumption is of the average wage, if every one of those 400 workers made on average \$75,000 a year, you still would get less money over a 20-year period of time, gross, than it's going to cost to build the Vikings stadium. SO06

**Sender Name (Submission ID)**    josie nelson (45166)

- 8744 I am very concerned that the SDEIS is flawed, and that this project will seriously harm water that we all must have to live WR071, WR189
- 8745 I am also saddened that it will destroy a beautiful resource in our state and habitat for animals. WI02
- 8746 Native people will also likely be harmed, since wild rice is sensitive to sulfur VEG04
- 8747 The jobs created by this project will be temporary, but the project will harm generations to come. SO01

**Sender Name (Submission ID)**    Josie Winship (10761)

- 610 I am not at all convinced that the short term goal of mining is at all worth the inevitable pollution it will cause. SO01
- 611 Nor am I convinced that that PolyMet will be able to reverse the damage to water and land to it's original healthy state. WR115

**Sender Name (Submission ID)**    Journey Roberge (15453)

- 678 sulfide mining for copper should not be allowed in Minnesota because ... PolyMet, has never operated a mine before. They are going to use unproven techniques to extract the copper from the ground. PD23
- 683 When it rains on sulfide ore waste, sulfuric acid is produced ... [and] can contaminate lakes, rivers, and groundwater but also harm human life, aquatic life, wildlife and damage whole ecosystems. WI04, WR001
- 684 mining companies often abandon their mines and leave the cleanup to taxpayers. Even though Minnesota requires companies to provide financial assurances for the cleanup, many mining companies go bankrupt FIN01

**Sender Name (Submission ID)**    Joy Barth (28695)

- 10916 they give the figure of 500 yers before the water would be salvaged again and that is likely questionable since we don't have a period of time that length to presenty prove that. At this rate we won't have any pristine water and we'll all depend on the expensive process of desalination. WR035, WR037

<b>Sender Name (Submission ID)</b>	Joy Schochet (46208)	
8780	According to Gavin Mudd (International Journal of Sustainable Development, 2013), the price of copper has steadily declined since 1900. He states in an email to the journal Science: “The critical issues already constraining the copper industry are social, environmental and economic issues. Any process intended to extract a kilogram of metal locked in a ton of rock buried hundreds of meters down invariably raises issues of energy, water consumption, pollution, and local community concerns. And such environmental and societal constraints are getting stronger” (Science, 343:722-724, 2014).	REF01
8812	Thus, the consequences of copper mining in an environmentally-sensitive and economically-fragile area are such as to preclude such mining activities, particularly in a downward-trending market for the metal. Under such circumstances, copper mines are a risky investment, and mining companies could well close or fail to undertake remediation and restoration as promised, leaving the mining site environmentally compromised at best or destroyed ecologically.	SO02
8813	The Superior National Forest (SNF) covers 3.9 million acres, of which over 445,000 acres are water, some 2,000 lakes and rivers and more than 2,000 miles of streams. It is a national treasure in that, while it is only 0.2% of the contiguous USA land mass, it is home to a disproportionately large fraction of the US’s fauna and flora. In addition, it hosts a great number and variety of transient species and provides them with sustenance, shelter, and breeding areas. Moreover, the diversity of landforms in the SNF, compared to its area, is unmatched. The impact of mining on the Superior National Forest and the Boundary Waters, as well as the Quetico Park and Lake Superior, would be substantial and detrimental. The environmental degradation, water and air pollution, the local, national and worldwide impacts of this proposal have been neither adequately appreciated nor discussed in the PolyMet SDEIS.	VEG02, WI02
8815	One of the major impacts of the PolyMet mine would be on wetlands, of which nearly 1000 acres would be completely destroyed. While PolyMet states that they will convert other (distant) areas to wetlands, it has been established by many scientific studies that such “restitution” wetlands are not at all the same as natural wetlands. They are much less biodiverse and provide much less habitat, nutrition and water services than natural wetlands. Therefore, no amount of reconstitution will suffice to replace the destroyed wetlands. Moreover, the new “wetlands” will be in entirely different areas from the ones lost. For these and other reasons, the Section 404 permit for wetlands should be denied.	COE01, WET03, WET09
8819	Degradation of water quality will be inevitable, substantial and in perpetuity. The SDEIS itself acknowledges that the water effluents and leakage from the mine site, tailings pit and processing will be polluted by heavy metals, sulfur-containing compounds and other toxic chemicals, and that remediation of water will be required in perpetuity. Water quality impairment and the discharge of pollutants into the water will have immediate, as well as long-lasting, effects on wildlife, recreation, wild rice, vegetation and humans in the entire area of the watershed.	WR115
8820	The SDEIS does not adequately address how PolyMet will cope with these issues, even for its stated period of 200 to 500 years of necessary remediation. What will be the costs of such remediation to the company, to the taxpayer, and to the environment?	PD01, PD25
8822	Since mining companies often close after a mining project is completed, no amount of assurance from the company about financial responsibility for remediation in the long term guarantees that the company will actually take such responsibility until the mine site is satisfactorily restored. That there are hundreds of Superfund sites in this country which are being treated with taxpayer funds (many billions of dollars), one has little confidence in PolyMet’s assurances.	FIN01
8823	The proposed mine would have a great impact on wildlife, concerns which are inadequately dealt with in the SDEIS. The proposed mining area is one of high biodiversity, habitat which would be completely destroyed by the mine. The negative impact on migration, breeding, and well-being of wildlife would be significant over a very large area of forest, beyond the immediate mine and tailings sites.	WI01, WI02
8824	The plant community of a large area would also be degraded. The mine would fragment the forest.	VEG03

<b>Sender Name (Submission ID)</b>	Joy Schochet (46208)	
8825	The mine would fragment the forest. The negative consequences of fragmentation have been well-documented in many scientific studies. The damage to the fragile ecosystems of northern Minnesota would be incalculable. Any discussion of the significance and protracted effects of mining activity on the ecology of the area is minimized in the SDEIS.	VEG03
8828	The social consequences of mining activities would also be significant. Most of these issues are not addressed in the SDEIS. Among the problems which attend mining - which attracts transient workers not rooted nor invested in the area - are an increase in alcohol consumption (and bars), drug usage, prostitution, conflicts with residents, sharp increases in rental and food prices. One article documenting the negative social effects of resource extraction is "This is your town on fracking", by Elizabeth Royte, in On Earth, June, 2013.	SO04
8829	The detrimental effects of heavy metals on human health are well-documented. The proposed mine would release significant amounts of mercury, arsenic, and lead, as well as sulfuric acid and other sulfur compounds, into air and water. These pollutants are highly toxic, and have been implicated in neurological conditions and many other diseases. I	HU03
8831	In addition, there would be emission into the air of particulate matter, such as asbestos fibers and dust, which can lead to serious lung disease. Sulfuric acid itself is dangerous in that it lowers the pH of water (affecting all aquatic organisms) and it releases mercury from rock in a form which is easily absorbed by these organisms.	AIR03, WR001
8832	The proposal by PolyMet to exchange high-quality contiguous wetlands and forest land in the SNF for a variety of scattered and poorer-quality land elsewhere is unsound. No such exchange should be countenanced because of the disproportionality of the exchange. The proposed mining area is of much greater ecological value than the land for which it would be exchanged.	LAN03
8834	The rationale for mining and prospecting in the Superior National Forest appears to be i) as a source of (scarce) minerals in a relatively accessible site and ii) as a source of profit (albeit short-term) for companies and employed individuals. There would certainly be no long-term benefit for the local economy, particularly when one considers that many property owners would leave the area rather than exist with the noise, pollution and loss of natural values which would ensue. These residents provide a significant economic benefit to the communities in this area.	SO02
8835	It would also seem that little or no profit would redound to the American public, which in fact owns the SNF [Superior National Forest].	SO06
8836	Rather than continuing on the heedless path of mineral exploration, it would seem wise to consider the rationale for abstaining from mineral development within the SNF and near designated wilderness areas. We need to consider alternatives to mining rather than continuing our reckless "development" of formerly untrammled regions. For instance, we should develop recycling programs for minerals, support research to find alternatives to the use of rare metals, and energetically promote conservation of these metals.	ALT09, ALT16
8840	As frequent visitors to the BWCAW, our opportunities for a wilderness experience (the main impetus for buying property here) would be greatly diminished by the actions proposed in PolyMet SDEIS.	WILD02
8843	Additionally, the value of our property would undoubtedly be affected adversely by the possibility of extensive metallic sulfide mining in the area.	SO03
8844	As we see it, the noise and pollution generated by mining activities, the heavy traffic, and the potential damage to water and land will affect not only property values but also the present excellent quality of our experience in northern Minnesota, which is due in very large part to the relatively pristine environment of the Superior National Forest and the BWCAW.	SO02
8845	We regard the current SDEIS as inadequate and insufficient to support PolyMet's claims that it could mine without significant and permanent damage to the northern Minnesota ecosystem.	PD01

<b>Sender Name (Submission ID)</b> Joyce Harrington (33155)		
12165	I would like their children to be able to have their wilderness trips in northern Minnesota, too, as generations of the family have. However, I am concerned that that might not happen if sulfide mining is done in the area.	WILD02
<b>Sender Name (Submission ID)</b> Joyce Klees (54484)		
17989	PolyMet's humidity cell testing indicates that mercury will leach from waste rock at more than four times the water quality standard. PolyMet proposes not to conduct an analysis of the amount of mercury that will enter either the Partridge or the Embarrass River from leakage from waste rock, disturbed peat, mine pits, or tailings. An analysis was done for 28 other constituents, many of which have nowhere near the potential for impacts that mercury does. Why is this analysis not being done?	MERC20
17993	The 90-day period is insufficient time for the public to study, analyze, and comment on such a complex document.	NEPA07
17995	The mine would destroy at least 1, 700 acres of ecosystems, including precious wetlands, which provide habitat for many wildlife species. These lands are located within the Superior National Forest and the land exchange proposed would not be of equal value.	LAN03
17996	The PolyMet Project will have an irreversible effect on the environment and will negatively impact many people's economic livelihood and aesthetic enjoyment of nature. It is not worth the risk for the short term and limited benefits of sulphur mining.	SO01
<b>Sender Name (Submission ID)</b> Jspence3 (21986)		
3311	I support the PolyMet Mining project in Minnesota. It will (...) provide numerous jobs.	SO10
<b>Sender Name (Submission ID)</b> Juan M (54224)		
16733	The map [in the EIS] should be carefully looked at, and re-examined because there is a creek connected to the swamp that leads to the boundary waters, and it will pollute the water and diminish the cleanliness of it.	PD38
17357	The water should be tested to make sure that if this event were to happen, we would be able to fight it. Therefore, this should all be looked at and reviewed so we don't have to face this in the future.	WR021, WR080
<b>Sender Name (Submission ID)</b> Juanita Nelson (47514)

11281	I have read [Polymet] will be here for 20 years but it will take 50 years to clean up. That is not worth it!!!	SO01
<b>Sender Name (Submission ID)</b> Judi (44357)		
14832	Minnesota would be “penny wise and pound foolish” to give up so much for a couple hundred jobs for 20 years. ...We’re ready to pollute the Boundary Waters, of which there is no other place on the planet like it, for a few hundred jobs?	SO01
14833	It’s not worth the risk involved when PolyMet packs their bags and moves on to rape and pillage another wilderness area, leaving Minnesota taxpayers with the cost of cleaning up their mess.	FIN01
14834	This mining has NEVER been done without leaving toxic waste in river, streams and lakes EVER.	WR023
<b>Sender Name (Submission ID)</b> Judi Mikolai (45145)		
9721	PolyMet should have to show proof that the mining can be done without contaminating the site [where] the minerals are, the millions of gallons of water that would have to be used to extract the target products, and the storage ponds that would be used to try to hold the water until it can be cleaned.	PER06, WR128
16729	Until we have the technology to truly contain water, we cannot produce contaminated waters that endanger our ecosystems, groundwater and surface waters.	PD32
16730	Other mining sites where the same processes are used are described as a "moon-scape." We love to go to northern MN. We love to camp, canoe and recreate in the quiet and beauty of the wilderness. But, I have to say, if the wilderness WERE to be damaged, we would not be visiting there like we do now.	LU04
16732	there is a surplus of copper and some other substances that are to be mined by PolyMet in Northern MN. The company would greatly, because of the high prices they could get for the minerals and metals, but the price of MN's wilderness is too high a price. The company is not even MN-based - most of the money would follow the company. There would be some taxes paid to MN, but the profits would go to another country. There would be some local jobs, but are the locals going to land the jobs.	SO01
<b>Sender Name (Submission ID)</b> Judie Carlson (57949)		
19861	There is already evidence that privately held land is being destroyed and the owners are suffering the effects of the noise and pollution.	NEPA15
<b>Sender Name (Submission ID)</b> Judith Derauf (54673)		
17880	In the short term the promise of jobs is attractive, but in the long term the environment will be irreversibly degraded. A finite number of jobs would be created for a limited number of years by the mine, with the big beneficiary being the PolyMet Corporation. Currently many businesses and jobs are dependent on tourism. ... I believe the economy, in the long run, will be negatively impacted by mining projects that are not environmentally sound.	SO01
17881	People visit the BWCA and the North Shore largely because of the pristine wilderness and natural beauty the area has to offer. The proposed mine would be located close to these national treasures and share the same water shed.	WILD02

13626	Our natural resources is the crown jewel we have. Not those in the ground you cannot see, but the hills, the forest, the lakes, the forest animals, but mostly the people who make this state great.	GEN03
<b>Sender Name (Submission ID)</b> Judy Ostendorff (54747)		
19124	The proposed Poly Met mine should not go forward because the SDEIS, which is seriously flawed, has not shown that mining of precious metals in rocks with sulfide can be done safely in this environment, without serious watercontamination and destruction to wetlands and habitat.	NEPA09
19125	Recent DNR documents agree that the water flow model of the current SDEIS is inaccurate. This calls into question many of the forecasted impacts to water quality, wetlands, and rare habitats. With more water moving through the site,polluted water from pits and waste rock will more easily and quickly reach lakes and rivers. It is thus likely that more area will be polluted, and that the pollution will be greater than anticipated.	WR052, WR060, WR071, WR091, WR173
19129	The SDEIS seriously underestimates the destruction of wetlands, and has an almost "fantastical" proposal for mitigation. The size of the potential wetland destruction (up to 6000 acres) is breathtaking. Much of the modeling wasbased on inaccurate water flows, so more wetlands would likely be destroyed. Secondly, bogs and coniferous swamps which will be affected, are extremely difficult to restore.	WET04, WET07
19131	the land swap is not a swap of equal value.	LAN03
19134	Habitat destruction is also not adequately addressed. In addition to the issue of more water flow than expected destroying more wetlands than expected, the number of trucks going back and forth, the 24/7 noise and vibrations ofrunning the plant and the mine will disrupt habitat.	N01
19135	The assumed performance of water capture systems in the SDEIS is of 90% or greater. This high level of performance is not realistic. Engineering controls include the seepage capture system at the flotation tailings basin, the cap and liner system and the hydrometallurgical tailings basin, and the discharge control feature for the west pit lake. Failure or under-performance of any of these features will result in water quality impacts that are not described in the SDEIS.	WR018
19136	How can we know we can treat polluted water for several hundreds of years, let alone into "perpetuity"?	WR035
<b>Sender Name (Submission ID)</b> Judy Urban (28951)		
13873	My family has fond memories of many camping trips to the Boundary Waters area. To think that our state is willing to irrevocably change the pristine nature of this very special area for the benefit of a multinational corporation whose only goal is profits is unconscionable.	WILD02
13874	No government entity has the right to make decisions that would negatively affect the health, and economic well-being of people for the next 500 years. Do not approve this threat to our state's greatest natural asset.	SO01

<b>Sender Name (Submission ID)</b> Julia Wilber (39678)		
7368	I am also concerned that the proposed economic good that will come of the mine won't be seen by the communities that so hope for it... it is very likely that most of the jobs will be filled by professionals from overseas. This does not allow for economic prosperity to come to the communities in Northern Minnesota, and it also endangers another source of income for the community--the Boundary Waters...[The PolyMet mine] endangers the economy of those who depend on tourism.	SO06
7369	the [Boundary] Waters that are already at risk from invasive species and climate change will face another threat, and it... endangers the environment that both wildlife and humans need	WR111
14150	People from all over the state, country, and world enjoy the Boundary Waters. This protected wilderness area is a great pride of the State and a resource that should not be treated lightly.	WILD02
<b>Sender Name (Submission ID)</b> Julian Sellers (43024)		
12485	The habitat requirements of [the northern goshawk and Boreal Owl] are similar, and the proposed mine would affect them similarly. The Supplemental Draft Environmental Impact Statement does not adequately address the status and outlook for these species in Minnesota.	WI01, WI02
12490	Section 4.2.5.1.2, Species of Greatest Conservation Need, of the SDEIS contains the following:Mature upland and lowland forest is the most common habitat type at the NorthMet Project area (primarily at the Mine Site). Section 4.2.4 provides a more detailed discussion of vegetation cover and habitat types. Northern goshawk, spruce grouse, black-backed woodpecker, and boreal owl were observed in these forests (ENSR 2005). These species represent a group that generally requires large forested blocks and/or minimal human intrusion.	WI01, WI02
12493	Section 4.2.5.1.3, Regional Forester Sensitive Species, misstates the status of northern goshawk and boreal owl in Minnesota. That section states:Four of these RFSS species are state-listed ETSC species (i.e., gray wolf, bald eagle, wood turtle, and eastern heather vole) and are discussed above. Seven other species are on the SGCN list and are discussed by habitat type in Table 4.2.5-1. These species include the boreal owl ...And: The northern goshawk ( <i>Accipiter gentilis</i> ) is not federally or state-listed....In fact, the Minnesota Department of Natural Resources added both species to the list of Special Concern species in August, 2013.	WI01
12630	Audubon Minnesota believes that the Northern Goshawk should be listed as Threatened. Listing this species on the Special Concern list, as proposed by the DNR, does not properly reflect the current status of this bird and will not provide an appropriate degree of protection to ensure its future in the state.	WI01
12633	Audubon Minnesota believes that the Boreal Owl should be listed as Threatened. The proposal by the DNR to list this species as Special Concern does not adequately address the needs of this species in the State nor ensure its survival. It is reasonable to believe that this species has never occurred in high numbers in the State, and the decline in numbers over the past decade indicates that the population is in danger of becoming Endangered.	WI01
12635	With such a low population in Minnesota, and requiring such large tracts of mature and old upland forest within larger areas of other forest types, it is clear that projects such as the proposed NorthMet mine (which would actually destroy land on which northern goshawks have nested in recent years per 5.2.6.2, Biological Evaluation for the Proposed NorthMet Mining Project and Land Exchange) could push the northern goshawk toward Endangered status in Minnesota.	WI01, WI02
12638	The Determination in 5.2.6.2 ("The Proposed Action and Alternative B may impact individuals but are not likely to cause a trend to federal listing or loss of viability for northern goshawk.") does not acknowledge the precarious status of this species [northern goshawk] in Minnesota.	WI01

<b>Sender Name (Submission ID)</b> Julian Sellers (43024)		
12641	Section 5.2.6.3 of the Biological Evaluation for the Proposed NorthMet Mining Project and Land Exchange states: “East of the Rocky Mountains, breeding by boreal owls has only been confirmed in Minnesota and primarily in northeastern Minnesota.”	WI01
12642	Section 5.2.6.3 concludes that: There should be no cumulative effects to individual boreal owls from the Project, but there would be a cumulative loss of potential boreal owl habitat. About 640 acres of mature lowland coniferous forest and upland deciduous forest habitat that could be used by this species on the federal lands would be directly affected by the Project. The conclusion that there would be no cumulative effects to individual boreal owls is derived from the lack of any detections of the species on the project’s federal lands.	WI01, WI02
12643	Considering the specialized requirements and rarity of this species in Minnesota, the only state east of the Rockies where nesting has been confirmed, the Determination in 5.2.6.3 that, “The Proposed Action and Alternative B may impact individuals but are not likely to cause a trend to federal listing or loss of viability for boreal owl” does not acknowledge the precarious status of this species in Minnesota.	WI01
16998	... there is strong evidence suggesting that large patches of mature forests are very important to the Northern Goshawk. This habitat is currently in decline in Minnesota, and recent land management decisions are likely to exacerbate this slide.	WI02

16764	[The SDEIS] doesn't analyze the effect of pollution our Northland's most precious resource: WATER. What are the mine's effects on drinking water, surrounding wetlands and/or the rivers and streams we love to fish from (not to mention the contamination of the fish we then eat from them)	AQ06
16765	Stating that pollution from the mine would need to be treated for 500+ years and saying that they would responsibly do this is pure science fiction. Where would the money come from and where are the guarantees.	FIN01
<b>Sender Name (Submission ID)</b> Julie Klassen (58006)		
19849	Wild Rice, fish, & all living creatures need clean water not polluted water from the mine for 500 years.	GEN03
<b>Sender Name (Submission ID)</b> Julie Lochowski-Haney (47223)		
16618	PolyMet's study of the impact of their proposed mine states that water from the mine site will need at least 500 years of treatment.	WR035, WR189
16745	What sane person would believe that a modern company could provide 500 years of protection for Minnesota's waters?	WR037
<b>Sender Name (Submission ID)</b> Julie MacRae (16976)		
11030	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Julie Nester (21381)		
14188	The consequences of our decisions on sulfide mining are guaranteed to affect Minnesotans for at least 500 years. This project is a PONZI SCHEME in which we are all unwilling investors. It uses BORROWED capital, (the fresh water and other natural resources that do not belong to us), and invests them in a risky scheme with the promise of payoff that is too good to be true.	SO01
14189	No sulfide mine has ever operated without polluting its nearby waters. In addition, sulfide mining has never been tested in such a water-rich environment as Minnesota's boundary waters.(...) Polymet can't guarantee that the Partridge River and Embarrass River, which run adjacent to the site and join the St. Louis River on its way to Lake Superior, won't be polluted with acid mine run-off. In addition, DNR hydrology data shows that the SDEIS significantly understates the amount of water flowing in the nearby Partridge River. We should not base approval of the plan on this faulty model.	WR003, WR023
14193	We need to choose better alternatives for our hard earned dollars and precious natural resources. All Minnesotans need to rally around people in Northern Minnesota who need good, safe, healthy jobs. We need training in those communities to prepare people for jobs that provide a sustainable future, instead of obsolete, dirty, wasteful, and short-lived jobs in an industry that is declining. Minnesotans should be investing in sustainable industries and an economy that builds rather than devastates our communities.	NEPA01

<b>Sender Name (Submission ID)</b> Kacie Carlson (44179)		
15384	the current leaders of the DNR uphold their responsibility to carry out these agendas which have been established in the absence of a singular biased event such as this PolyMet proposal, go through numerous government and public layers of review and approval, and are created with purpose - purpose to be utilized and defended in situations like this. Defend the DNR, your, Strategic Conservation Agenda by not allowing vagueness and future uncertainties in PolyMet's promises to be conservation-focused.	NEPA15
15385	stop this cycle of history repeating itself for our future generations by denying PolyMet's proposal to mine until there is absolutely no vagueness or uncertainty, and that all possible situations and unexpected events have established procedure that maintain the responsibilities set forth under the original permitted actions.	PD01
15386	damage to wetlands surrounding the project site and direct destruction of 913 acres of wetlands by the project are inadequately mitigated. The majority of mitigation for direct destruction will take place outside the Lake Superior Basin and therefore does not mitigate the impact of the project on the Lake Superior Basin.	WET03
15387	Deny the Section 404 wetlands destruction permit and require a reassessment in the SDEIS of likely impacts to surrounding wetlands outside the project footprint.	COE05
15388	he SDEIS also fails to explore alternatives such as comparing an underground mining alternative with the proposed open pit mine; placing waste rock back into the pit; placing liners under the waste rock pile and tailings piles; or implementing engineering solutions to reduce water drainage away from Partridge River Watershed wetlands and streams. ... Require an SDEIS which documents these alternatives and compares them with the current proposal for eliminating water contamination of any kind.	ALT01, ALT03, ALT07, ALT10
15389	The PolyMet SDEIS lacks a health risk assessment which sufficiently addresses likely impacts and effects of airborne and seepage contaminants on drinking water wells, surface waters and human-consumable resources of fish and wild rice, and on aquatic and terrestrial wildlife throughout the watershed, including threatened and special concern species. Leaders of the DNR, demand that PolyMet include a health risk assessment that adequately demonstrates their project will have no health impacts on Minnesota residents, fish and wildlife.	HU01
15390	Deny PolyMet a mining permit until all of its inadequacies are corrected with well-substantiated data and with guaranteed measures to negate adverse impacts for the entire expected duration of the problem.	NEPA09
15391	The precedent that you set in allowing a hard rock mining permit in sulfide-bearing rock will set the bar for any subsequent applications for similar mining. Insufficient regulatory attention to human and environmental safety will not only be a failure of your responsibility to Minnesota, but to those looking at your actions as a model across the United States.	PER07

**Sender Name (Submission ID)**    Kai` Hoffman (4288)

1876 If sulfide mining starts, all those lakes [in and around the Boundary Waters] ... will eventually be polluted. After many years Lake Superior will be polluted as well.... The lakes will no longer be safe to drink. WILD02

**Sender Name (Submission ID)**    Kaia Anderson (44603)

12057 This mine will destroy an area, leave harmful pollutants, and create an unfit environment for the animals living around the area. PD01

12058 Even if it brings slight economic benefit do you really think Polynet will remain relevant and support the clean up for 200-500 years? FIN01

**Sender Name (Submission ID)**    Kaia Knutson (42754)

14442 I am opposed to the proposed sulfide copper mine. I want our Minnesota wetlands to be protected from pollution. I want our wild rice lakes to thrive without threatening the water quality or fluctuating water levels that may be caused by this copper mining. WR115, WR195

14444 I ask you to deny the land exchange and preserve the current Superior National Forest for wild life habitat and human low-impact recreation. LU06, WI02

14445 Please stop this Polymet project and Section 404 Permit. We need to prevent further pollution and destruction of Minnesota's precious wetlands. COE03

**Sender Name (Submission ID)**    Kaia Lindquist (54534)

19067 The mining will inevitably negatively effect the MN environment far into the future. Forever effecting the pH and polluting the waters. WR115

19068 The plans for protecting this pollution are not complete enough to be a safeguard. If the mining were to continue and pollute there are not concrete plans of who would be responsible nor sufficient safeguards to fix what would go wrong. FIN01

**Sender Name (Submission ID)**    Kaia Svien (54650)

17981 Clearly, the people of northern MN want and need jobs. This very real need, of an urgent short term nature, seems to be blinding folks to long term destruction and the drying up of most jobs that will happen after construction is completed. Can we not, as a state, be creative enough to look at the issue of what kind of environmentally-friendly jobs can be brought to the Range? It sounds to me like the fiscal investment needed to do so will be far less than what we all pay for damages to the environment, tourism, and natural beauty, that can never be restored, only contained. SO02

19991 The PolyMet mine sounds too destructive of our natural resources to be allowed to go through. Let's put attention to brining in jobs for the Iron Range that are not detrimental to the environment. GT01

**Sender Name (Submission ID)**    Kaija Ornes (44587)

11827 I can say that it is to dense with resources and beauty to ruin it for an economics gain for about 20 years. The consequences far out live the economic gain. SO01

11828 Do we really think that this company will be around to make sure the clean up is up to par, in 500 years? FIN01

17315	[The mine] would affect the Ojibwe people. They are native to the land and I don't think it's fair for them to take their land away. It would also affect the Beaver Bay which could possibly ruin their habitat. Like they said in the fact sheet of cultural resources, is they are not sure whether or not it would affect animals.	CR01
17559	This land exchange would gain a lot of things such as: 2 plant species, vegetation, 9 additional plant species, etc. I think it's cool how they would gain so many things, but there are also a lot of things that they would lose. Something big that we would lose is 11 plant species. They would also lose about 1,000 acres of floodplains which they aren't super worried about.	VEG01, VEG03
17561	The Ojibwe people had the land for a long time and that's their land to have. I would decrease about 1,000 acres in different spots and let the Ojibwe people stay on their land.	CR01
<b>Sender Name (Submission ID)</b> Kane Jeffery And Melissa Rust (18241)		
13619	We are against this because we purchased this property in the effort to wipe off our carbon footprint for what we use, and we feel that the actions taken by the mine undermine our personal beliefs in that area, and they outweigh -- our beliefs outweigh the proposed economic input to that area compared to the saving of the natural environment.	SO02
<b>Sender Name (Submission ID)</b> Karen & Kalen Johnson (11571)		
2220	Perpetual pollution at the Mine Site and Plant Site (estimated at a minimum of 200 to 500 years) this is totally unacceptable	WR035
2222	We do not want our children and grandchildren's health compromised.	HU03
3241	There is not a sulfide mine in existence which has not negatively impacted the environment. We do not want Minnesota to become a huge future superfund clean-up site at taxpayer expense.	PD26
14355	Perpetual pollution at the Mine Site and Plant Site (estimated at a minimum of 200 to 500 years) this is totally unacceptable. A few, limited jobs are not worth centuries of environmental degradation.	FIN01
<b>Sender Name (Submission ID)</b> Karen B Holden (42721)		
9904	Who will positively insure for 500 years that State and Federal regulations are being followed in terms of preventing environmental and ecological degradation to some of the last near-wilderness quality areas in the United States?	PER06
<b>Sender Name (Submission ID)</b> Karen Bell-Brugger (41961)		
2158	the company will conveniently declare bankruptcy when it comes time to pay for the damage it has created. Then our children will get to pay for the horrible mess left behind.	FIN01
12880	There is a lot of talk about PolyMet having to have a fund for future clean-up of our water. What I imagine is the reality of the situation- after PolyMet has retrieved all it can from our land, it will go bankrupt to avoid having to pay for 500 years of polluted water clean-up.	WR037
12881	Then, Minnesotans in the future will have the opportunity of paying endlessly to do the clean-up work themselves, or they learn to live with a devastated landscape	LU06

16929	We see the proposed 500 year damage to the environment as absurd. Our Nation is less than 500 years old. There is not a company that has lasted that length of time yet you are considering allowing this mining company to do that kind of damage with their assurance they will clean it up. (...) no amount of money can really reasonably guarantee the clean up and safety of the earth and its people.	FIN01
16930	The small number of jobs dangled before our eyes does not come anywhere close to the jobs that will be lost due to the loss of environment that no doubt will occur	SO01
<b>Sender Name (Submission ID)</b> Karen Gardner (57981)		
19844	Toxic sulfates will destroy Minnesota's streams, river, and watersheds.	GEN01
<b>Sender Name (Submission ID)</b> Karen Graham (38865)		
5355	The plan is flawed, vague handling of data and specifications, and oblique assurances of PolyMet being a good partner in a 500+ year environmental disaster.	PD01
5356	I respectfully request that the MNDNR and PolyMet answer the questions raised by the Fond du Lac tribe of Chippewa, Water Legacy organization, and the Audubon society to their satisfaction.	CR06
5358	Write a concentration range of sulfide contamination in water treated through the reverse osmosis plant to provide clean water: - specification on the reverse osmosis system for handling the waste water; - purity of treated water in holding water.	WR143
5359	Recalculate the number of reverse osmosis systems needed to handle water purification treatment.	WR143
5360	Rewrite to require water treatment facilities be built before mining commences...Proposal stipulates that facilities won't be built for 40 years after the mining process begins. As the mine is expected to operate for about 30 years. It is also only designated to handle the mine's intentional surface water discharge.	WR143
5361	Develop program to treat seepage from mine pits, waste rock, and tailings piles to be treated to produce clean water. The contaminants will not decrease. Be sure to check the plan for these details using real numbers from outside non-mining expert sources such as environmental experts studying hydrology.	WR035, WR070, WR143
5362	Rewrite to be in high risk Category specification for permanent 526 acre, 25 story waste rock piles generated by the mining process.	PD16
5363	Rewrite to be in high risk Category specification for pile tailings on old LTV tailings site also unlined. The 1950s tailings dump site were built on top of streams to allow water to drain through the tailings. Surface and groundwater seepage at these sites currently violate water quality standards.	WR054, WR070
5364	Rewrite to be in high risk Category specification for sulfate and mercury levels. Sulfate increases methyl mercury formation. Our waters are already at high risk doesn't mean that no control is acceptable.	MERC08
5365	Rewrite specification for manganese to meet level set by MN Dept. of Health to prevent brain damage in infants, children, and adults. Current specification of 1506 micrograms/L in the tailings. This spec is 15x higher limit than set by the MN D of Health to prevent brain damage in infants, children, and adults.	WR110, WR123

<b>Sender Name (Submission ID)</b>	Karen Graham (38865)	
5366	Rewrite specification for arsenic output to meet level set by Minnesota's cancer risk rule. Current specification allows arsenic contamination at the tailings to increase by 417% resulting in 38.5% allowable increase for water at Colby Lake used for drinking by Hoyt Lake residents.	WR110, WR123
5367	Rewrite specification for surface water quality to meet MN water quality standards for toxic pollution in the wetlands. Proposal allows overall degradation of Minnesota surface water quality near the mine and tailings significantly below set standards.	WR112
5368	Rewrite specification to identify volume of clean water used for mining processes. No estimate of clean water tonnage used in mining process and replaced with contaminated water	WR056, WR181
5369	Rewrite proposal including detailed analyses and detailed information on mitigation to allow study of other water quality and quantity issues. USA EPA commented on lack of detailed analyses and detailed information on mitigation prevent the analyses of other water quality and water quantity issues.	WR130
5370	Undergo reevaluation of fractures and fissures using current geologic data including the report from US Geological Survey (2000-2010), MN Geologic survey, and Fond du Lac tribe of the Chippewa.	WR010, WR011, WR014, WR087, WR168, WR169
5371	Assess rock fractures due to blast vibrations at the mine site. No assessment of blast vibrations effects at mine site in proposal.	WR016
5372	Reevaluate rock conductivity for specific areas that are more sensitive such as at fissures, and fractures. Proposal only averages rock conductivity entire area.	WR010
5374	Reevaluate mine process using underground extraction which would greatly reduce forest, rare habitat, and wetland losses. The cost of maintaining water quality facilities and safeguards for 500+ years may offset the initial cost of underground mining.	ALT01, ALT13
5375	Reevaluate land exchange for loss of high biological and biodiversity significant land as classified by the MN Biological Survey. The proposal describes the impacts of their land usage as too small to consider significant for the 3014 acre mine site.	VEG02
7779	PolyMet's proposal to mine low grade ore by open pit as the only option for the company's economic advantage. Rejecting the SDEIS proposal doesn't necessarily stop bring jobs to the state only bringing jobs by the option favored by PolyMet.	SO01
10495	A DNR Hydrology memo shows that the average flow of the Partridge River is 1.5 CFS, while the GoldSim model uses a 0.5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS.	WR003
10501	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	WR067
10511	Rewrite to require water treatment facilities be built before mining commences. Proposal stipulates that facilities won't be built for 40 years after the mining process begins. As the mine is expected to operate for about 30 years -- this action is too little too late.	PD03, WR143
10513	Rewrite proposal defining how the centuries of operations, maintenance, monitoring, and reconstruction of water treatment facilities will be handled and financed. No details are provided in proposal addressing these issues.	PD09, PD35

10522	Rewrite the specifications for the following to meet acceptable environmental protection as determined by state agencies, state and federal laws, and state and federal standards: a. Rewrite to be in high risk Category specification for permanent 526 acre, 25 story waste rock piles generated by the mining process...b. Rewrite to be in high risk Category specification for 2 mile wide tailing piles also unlined...c. Rewrite to be in high risk Category specification for pile tailings on old LTV tailings site also unlined. ...d. Rewrite to be in high risk Category specification for sulfate and mercury levels...e. Rewrite specification for manganese to meet level set by MN Dept.of Health to prevent brain damage in infants, children, and adults...f. Rewrite specification for arsenic output to meet level set by Minnesota's cancer risk rule...g. Rewrite specification for surface water quality to meet MN water quality standards for toxic pollution in the wetlands...h. Rewrite specification to identify volume of clean water used for mining processes.	PD03, PD07, PD08, PD11, PD16
10531	Undergo reevaluation of fractures and fissures using current geologic data... Assess rock fractures due to blast vibrations at the mine site. Reevaluate rock conductivity for specific areas that are more sensitive such as at fissures, and fractures.	WR010, WR011, WR012, WR014, WR016, WR071, WR087, WR090, WR099, WR168, WR169, WR179
10534	Reevaluate mine process using underground extraction which would greatly reduce forest, rare habitat, and wetland losses.	ALT01, ALT13
10537	Reevaluate land exchange for loss of high biological and biodiversity significant land as classified by the MN Biological Survey.The proposal describes the impacts of their land usage as too small to consider significant for the 3014 acre mine site.	WI02
10586	If [Polymet] won't accept responsibility for producing a quality report, what makes you think they "plan" to do anything different when operating the mine?...Think of this again, it will take maintaining environmental processing of tons of waste spread out over acres, twice the age of country and then some....	FIN01
11506	The option for underground mining must be considered because the open pit mine has not been projected.	ALT01, ALT06
13331	The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1.5 CFS, while the GoldSim model uses a 0.5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area.	WR003
13332	If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment	FIN05
13335	Write a concentration range of sulfide contamination in water treated through the reverse osmosis plant to provide clean water:- specification on the reverse osmosis system for handling the waste water- purity of treated water in holding water.	WR143
13341	Rewrite the specifications for the following to meet acceptable environmental protection as determined by state agencies, state and federal laws, and state and federal standards: a. Rewrite to be in high risk Category specification for permanent 526 acre, 25 story waste rock piles generated by the mining process...b. Rewrite to be in high risk Category specification for 2 mile wide tailing piles also unlined...c. Rewrite to be in high risk Category specification for pile tailings on old LTV tailings site also unlined. ...d. Rewrite to be in high risk Category specification for sulfate and mercury levels...e. Rewrite specification for manganese to meet level set by MN Dept.of Health to prevent brain damage in infants, children, and adults...f. Rewrite specification for arsenic output to meet level set by Minnesota's cancer risk rule...g. Rewrite specification for surface water quality to meet MN water quality standards for toxic pollution in the wetlands...h. Rewrite specification to identify volume of clean water used for mining processes.	PD29

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Karen Graham (38865)	
16954	If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment.	WR003, WR091
16955	the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions... Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity	WR065, WR173, WR177, WR189
16956	Redo the GoldSim water model using assumptions based on adequate and accurate field data	WR071, WR189
16957	Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013	WR003, WR086, WR091
16958	Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance	WR180
16959	Write a concentration range of sulfide contamination in water treated through the reverse osmosis plant to provide clean water:- specification on the reverse osmosis system for handling the waste water- purity of treated water in holding water.	WR063, WR143, WR147
16960	Recalculate the number of reverse osmosis systems needed to handle water purification treatment.	PD03
16961	Develop program to treat seepage from mine pits, waste rock, and tailings piles to be treated to produce clean water. The contaminants will not decrease.	PD04
16962	Assess rock fractures due to blast vibrations at the mine site. No assessment of blast vibrations effects at mine site in proposal.	WR016
16963	Reevaluate rock conductivity for specific areas that are more sensitive such as at fissures, and fractures. Proposal only averages rock conductivity entire area.	WR010, WR011, WR012, WR014, WR071, WR087, WR090, WR099, WR168, WR169, WR179
17131	Rewrite proposal defining how the centuries of operations, maintenance, monitoring, and reconstruction of water treatment facilities will be handled and financed.	FIN01, FIN11
17685	Write a concentration range of sulfide contamination in water treated through the reverse osmosis plant to provide clean water:- specification on the reverse osmosis system for handling the waste water- purity of treated water in holding water.	PD03
17686	Recalculate the number of reverse osmosis systems needed to handle water purification treatment.	WR143
17687	Rewrite to require water treatment facilities be built before mining commences. Proposal stipulates that facilities won't be built for 40 years after the mining process begins. As the mine is expected to operate for about 30 years -- this action is too little too late. It is also only designated to handle the mine's intentional surface water discharge.	PD03
17688	Rewrite proposal defining how the centuries of operations, maintenance, monitoring, and reconstruction of water treatment facilities will be handled and financed.	FIN01, FIN11

<b>Sender Name (Submission ID)</b>	Karen Graham (38865)	
17689	Develop program to treat seepage from mine pits, waste rock, and tailings piles to be treated to produce clean water. Be sure to check the plan for these details using real numbers from outside non-mining expert sources such as environmental experts studying hydrology. We have many of these experts in this state alone.	WR035, WR070, WR143
17690	Rewrite to be in high risk Category specification for permanent 526 acre, 25 story waste rock piles generated by the mining process.	PD16
17691	Rewrite to be in high risk Category specification for 2 mile wide tailing piles also unlined.	PD07
17692	Rewrite to be in high risk Category specification for pile tailings on old LTV tailings site also unlined. The 1950s tailings dump site were built on top of streams to allow water to drain through the tailings. Surface and groundwater seepage at these sites currently violate water quality standards.	PD07, PD08
17693	Rewrite to be in high risk Category specification for sulfate and mercury levels. Sulfate increases methyl mercury formation.	PD11
17694	Rewrite specification for manganese to meet level set by MN Dept. of Health to prevent brain damage in infants, children, and adults. Current specification of 1506 micrograms/L in the tailings. This spec is 15x higher limit than set by the MN D of Health to prevent brain damage in infants, children, and adults.	HU03
17695	Rewrite specification for arsenic output to meet level set by Minnesota's cancer risk rule. Current specification allows arsenic contamination at the tailings to increase by 417% resulting in 38.5% allowable increase for water at Colby Lake used for drinking by Hoyt Lake residents.	HU03
17696	Rewrite specification for surface water quality to meet MN water quality standards for toxic pollution in the wetlands. Proposal allows overall degradation of Minnesota surface water quality near the mine and tailings significantly below set standards.	PD03
17697	Rewrite specification to identify volume of clean water used for mining processes. No estimate of clean water tonnage used in mining process and replaced with contaminated water	PD30
17698	Rewrite proposal including detailed analyses and detailed information on mitigation to allow study of other water quality and quantity issues.	WR023, WR042, WR128, WR130
17699	Undergo reevaluation of fractures and fissures using current geologic data including the report from US Geological Survey (2000-2010), MN Geologic survey, and Fond du Lac tribe of the Chippewa. Proposal assumes no fractures under waste holding site and peat bed will never leak.	WR012
17700	Assess rock fractures due to blast vibrations at the mine site. No assessment of blast vibrations effects at mine site in proposal.	WR016
17701	Reevaluate rock conductivity for specific areas that are more sensitive such as at fissures, and fractures.	WR007, WR008
17702	Reevaluate mine process using underground extraction which would greatly reduce forest, rare habitat, and wetland losses.	ALT01, ALT13
17703	Reevaluate land exchange for loss of high biological and biodiversity significant land as classified by the MN Biological Survey.	VEG02
19037	The option for underground mining must be considered because the overall cost of the open pit mine has not been projected. PolyMet has considered initial costs only. PolyMet has their profits as prime consideration. They are not partners with the state of Minnesota.	ALT01

14460	Polymet could be gone in 20 years, or less, and MN will have a massive pollution issue to deal with. Will those jobs even be for our existing MN people?	FIN10
<b>Sender Name (Submission ID)</b> Karen Ringsrud (39277)		
7204	sulfide mining of this sort has never been done safely, without environmental damage, anywhere in the world.	SO01
<b>Sender Name (Submission ID)</b> Karen Stady (57179)		
18667	I strongly believe that the BWCA needs to be preserved and protected for the enjoyment of all people, now and for future generations. Mining near this area isn't worth the risk of contaminating it.	WILD02
18669	If there is mining in the watershed, contaminants will be washed into the bodies of water. Please put the environment ahead of profits.	SO02
<b>Sender Name (Submission ID)</b> Karen Thompson (35164)		
13052	And, the possibility of a few jobs being prevented doesn't equal hundreds of thousands of people losing their natural resources which were purposely saved for their enjoyment and healthy living.	SO01
<b>Sender Name (Submission ID)</b> Karen Williams (45874)		
10267	Nonferrous sulfide mining with its consistent historical record of pollution and SDEIS projected 500 years of water cleanup should never be seriously considered. ... This kind of mining has never been successfully nonpolluting in similar environments. A brief Internet search reveals numerous lawsuits against mining companies for environmental damage, water pollution, and human health issues.	HU03, WR023, WR115
10271	...sulfuric acid pollution is toxic to aquatic ecosystems...Dangerous contamination of water is inevitable which would destroy wetlands, pollute underground water, rivers, and lakes, and endanger fish and animal habitat. The current decline of the moose population may be related to water issues.	AQ08
10273	Of course, human health would be in jeopardy.	HU03
10277	Loss of tourism dollars would negatively impact the economy when the recreational opportunities and beauty are lost due to sulfide mining.	SO02
10279	...only 25% of the proposed 360 permanent jobs would be local hires. Much is in jeopardy for only 90 jobs. Little financial security has been provided by NorthMet for the inevitable clean up - expected to be more than 500 years worth! It appears that taxpayers...would be responsible for the burden of cleanup at astronomical expense. Other states now require hundreds of billions of dollars to be held for reclamation and clean up.	FIN01
<b>Sender Name (Submission ID)</b> Kari Block (44300)		
11849	I do not want this in our water supply. Nothing is 100% safe. This could cause severe ecological consequences.	WR195

<b>Sender Name (Submission ID)</b> Kari G Wenger (54516)		
19178	My first concern is around the ability for the MDNR to secure the compensatory measures for the detrimental aspects of this mining project.	FIN01
19180	Even if Polymet did bring 300 jobs at \$50,000 a year to StLouis County for the 16 years of the project that would be \$300 million... We have an estimate of environmental costs up to \$160 million for the first 16 years followed by \$3.5-6M a year there after for a estimated minimum of 200 years so that is \$1.360 billion (yes, that's a "B" for "Billion").	SO07
19182	The environmental methods for minimizing the water pollution have not been used before and are un-tested in real life situations. There is a real possibility that the clean up could cost substantially more. How can the MNDNR secure this need? What if clean up costs more than Polymet made on it's mining? Or even the worth of the whole company?	FIN05
19183	Financially how is the MNDNR going to get a company to put aside and continue to pay for their environmental impact when the people and the company are long gone and the environmental costs are hard to estimate?	FIN01, FIN05
19184	How is the MNDNR going to guarantee that the next 17 generations of people (taxpayers) are not going to be paying for the mess Poly Met leaves behind?	FIN01
19185	in no way is there enough money put aside by Poly Met to pay for the decades-- and even centuries-- of clean-up it will require.	FIN05
<b>Sender Name (Submission ID)</b> Kari Jacobson (38849)		
5127	I am deeply concerned by the modeling results in the SDEIS that show water must be treated in perpetuity to prevent the St. Louis, Partridge, and Embarrass Rivers from becoming heavily polluted by copper, lead, sulfate, aluminum, and other pollutants.	WR115
5128	However, NEPA documents such as the SDEIS for PolyMet have repeatedly shown that they are not reliable in predicting water quality problems (Maest and Kuipers, 2005 Predicting Water Quality at Hardrock Mines).	WR023
5129	This is glaringly clear in PolyMet's SDEIS, as it was recently discovered that the models predicting flow rates and hydrology in the Partridge River are deeply flawed. The claim in the SDEIS that no water quality exceedances will occur during or after mining is based on this flawed model, and so any predictions about water quality and quantity based on these models must now be ruled out as false. The groundwater models in the SDEIS are also flawed and seem to claim that no impacts will occur outside the area of permitted action.	PD29, WR003
5130	The Minnesota Pollution Control Agency's track record in regulating taconite mines on the Iron Range is not good, and it is likely that there will be little political will to enforce regulations when PolyMet begins to have its own water quality exceedances.	PER06
5132	Water treatment for centuries has never been done, and the probability of such long-term water treatment being successful is highly unlikely. To propose such a thing as a matter of course is deeply immoral and saddles future generations with a terrible burden.	WR128, WR195
5134	PolyMet and mines like it are allowed to dump toxic tailings and overburden into streams and wetlands because of two mining loopholes in the Clean Water Act. I support the National Wildlife Federation's call to the EPA and the US Army Corps of Engineers to close these two loopholes through a rule change.	PER09
5138	The Clean Water Act's "waste treatment system exclusion" should apply only to manmade waters and the definition of "fill" should be amended to exclude waste disposal.	PER09

<b>Sender Name (Submission ID)</b> Kari Jacobson (38849)		
5141	PolyMet downplays the direct and cumulative impacts the mine will have on the landscape. Losses will include 1,741 acres of Minnesota Biological Survey sites of High Biodiversity Significance; 698 acres of Jack pine/black spruce forest, which are considered imperiled/vulnerable in Minnesota; 912 acres of high quality wetlands; and portions of one of only twelve known populations of floating marsh marigold in the state.	VEG01, VEG02, VEG03
5143	PolyMet's operations will constitute a significant barrier to wildlife migration, and the wetlands lost will both release the carbon stored in these systems and prevent future carbon sequestration.	WET13, WI03
5149	The loss of both land and access for band members from the Bois Forte, Grand Portage, and Fond du Lac Bands is of deep concern. Not only will access to these areas be lost, but as the surrounding natural systems become degraded, the fish, game and wild rice resources will continue decline.	VEG04
5151	The Iron Range and surrounding areas support a strong economy based on tourism, hunting and fishing, and enjoyment of high-quality natural resources. We should be in a mindset of preserving these natural resources, not discussing ways to degrade them for the sake of extractive industry and the short-term (20 years) economic impacts that PolyMet claims will come with the construction of a mine.	SO01
<b>Sender Name (Submission ID)</b> Kari Sealund (34650)		
13252	Also in the Penokee Range Mining done by GTAC, rocks containing asbestos form minerals have been found causing much alarm about mining in that area.I have grave concerns about these project's potential impacts on our region's natural resources and public health...	HU03
<b>Sender Name (Submission ID)</b> Karin Winegar (10751)		
8052	The mine will have tragic environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR115
10766	It seems to me that it would be saner, safer, cleaner and cheaper to use state funds to employ all these willing workers in green or at least neutral jobs than to allow the destruction of our north country water. Jobs, certainly, are a priority, but not short term and not at this cost.	SO02
10768	The mine would be in our Superior National Forest lands--how can the state consider allowing public lands to be exploited (and certainly polluted, possibly permanently) for private investor profit?	LAN02
12254	I learned that the numbers used for stream flow were hugely underestimated by the company and the first Environmental Impact Statement therefore got a failure grade by the EPA.	WR003
19940	It would be wise and more economical both the short and long term to provide good jobs (using state funds of necessary) than to expect or trust a mining company to provide well paying, long term significant numbers of jobs in northern Minnesota.	SO01
19956	Our northern water and Superior National Forrest should stay protected and intact. It is a public resource, not a site for corporate exploitation and profit of international investors.	GT01
<b>Sender Name (Submission ID)</b> Karl Koenig (1942)

<b>Sender Name (Submission ID)</b> Karla Faith (40168)		
6280	Mapping done by the PolyMet miss represent the boundary of the 100 mile swamp implying that the drainage of the swamp is in one the direction only and away from the boundary waters. In the maps drawn in the US government atlas <a href="http://www.nationalatlas.gov/streamer">www.nationalatlas.gov/streamer</a> the 100 mile swamp flows into two watershed areas. One of which drains to the boundary waters.This contradiction in mapping presents evidence that danger to the boundary waters is being under reported in the environmental impact statement .	WET19, WR024, WR080, WR081, WR175
6291	At a minimum plans for hydrologic testing before operations and continual monitoring of water during mining operations flowing from the swamp in both directions is nessasary...Lacking this basic protection PolyMets proposal is deficient for clear assessment of the danger to the water flowing to the boundary waters.	WR071, WR080, WR081, WR139, WR167
<b>Sender Name (Submission ID)</b> karlene plante Jim Etzel (44897)		
8173	This new proposal should not be considered as it will cause a significant amount of damage to many acres of wild habitat for many creatures, both terrestrial and aquatic.	WI01, WI02
17106	Tell the mining company to start mining the many dumps throughout the United states for the metals they seek. There should be plenty of it there.	NEPA06
<b>Sender Name (Submission ID)</b> Karol Gresser (54642)		
18012	The biggest loss to me will be the enjoyment, beyond a dollar vlue, of our wilderness and the birds, fish, animals, plants and trees on the polluted land and water.	WILD02
18014	The consequences...to our people if this pollution is allowed, may be economic loss, loss of property values, physical health, mental health, and morale. We will also have economic losses to the state and our people from the loss of tourism and summer residents.	SO01
<b>Sender Name (Submission ID)</b> Kate Crowley (6112)		
1038	The owners of this proposed mine can offer us all the assurances in the world that they will be good stewards and guarantee us that the pollution created by the dangerous chemicals created by and used in this mining process will not impact or impair our waters. There WILL be pollution and it WILL make its way into our waters, whether surface or underground. The studies have shown that these polluted waters would have to be treated for hundreds of years.	WR035
1039	This proposed mining project will give short term financial gain to an international company and some residents of the region, but the overall benefit will be far, far less than the overall negative impact.	SO01
1083	The studies have shown that these polluted waters would have to be treated for hundreds of years. Who of us alive today can guarantee that people in the future will have the funds or ability to sustain this sort of mitigation?	FIN01
<b>Sender Name (Submission ID)</b> Kate Fitzgerald (44597)		
11841	I believe the project's risks to human health ...One of my top concerns is mercury.Having attended a very detailed and well-supported presentation by NE Minnesotans for Wilderness advocate Jane Reyer and former State Representative Frank Moe in Grand Marais on Feb. 19, everything I learned leads me to the conclusion that the PolyMet SDEIS analysis of mercury risks is misleading and inadequate. I learned that impact of lead, aluminum, and manganese in water causes damage to the human brain. That air emissions of nickel and other particulates, diesel, and asbestos-like fibers can lead to cancer, as can arsenic.	HU01

*Alphabetical by sender's first name*

**Sender Name (Submission ID)**    Kate Fitzgerald (44597)

11843 I am alarmed that there is no reference in the SDEIS to potential human harm--notably our most vulnerable community members: infants, children and elderly people. Additionally, the SDEIS does not asses worker at-site risks or residential well risks. Its lifetime risk assessment of 30 to 40 years is half what it should be. HU01

11845 The SDEIS does not take into account the effect of toxic pollutants when accumulated in fish, game, and wild rice--notably the effects these toxins have on high-level consumers of these products, including regional tribal members, low-income families, hunters, fishermen, and countless children and elderly people. SO04

15296 That air emissions of nickel and other particulates, diesel, and asbestos-like fibers can lead to cancer, as can arsenic. AIR07

**Sender Name (Submission ID)**    Kate Flynn-Kitzmann (22678)

3435 There is no way this company will be in existence to cover cleanup costs and the money they set aside will not be enough. FIN01

3436 Many businesses in that area depend on tourism; pollution of the area would cause them to fail. SO02

14889 Due to the unavoidable pollution effects of sulfide mining and high environmental and monetary costs I strongly urge Minnesota to say NO to this mine. GEN01

**Sender Name (Submission ID)**    Kate Mahonen (54348)

17614 The Copper-Sulfate Mining is a big project and I don't think it will benefit Minnesota enough to make it worth the tune, land, and money that it would take to go through with the mining. Yes, it would create jobs in Northern Minnesota, but is that really the only positive thing that will come out of all this? We use all of this land to create jobs in Northern Minnesota and it's not like the jobs will be there forever. They will be filled for the 20 year span when the mining will take place but after that it will be back to square one with 13,000 acres of land destroyed from mining. SO06

17615 The Polymet Mining will have a large effect on the cultural resources being that there are four or five locations that would be affected from this mining process. CR05

17616 The Land Exchange is another big problem I see coming from the mining. The company PolyMet, would like to use a bunch of public land as well as gain private land. I don' t think it makes one bit of sense to lose a bunch of public land so that a company can mine it, and then leave it as a piece of crap that will never be the same agan1. This mining would affect me in major ways. We use this land and its what makes Minnesota, Minnesota. LAN01

17684 [Because of my exposure to this project] now I realize how many dumb things could happen to our state without the voices of our local citizens being heard. GEN03

**Sender Name (Submission ID)**    Kate Smith (58152)

20028 What seems to be missing in the EIS is an accounting for the flow of money both as future costs and benefits. Without that information, it is impossible to know if the project is viable and environmentally sound. SO07

<b>Sender Name (Submission ID)</b> Kate Winsor (44051)		
7589	I am especially concerned about the impact such a mine will have on resident, nesting, and migratory birds.	WI01
7601	I am also concerned about the impact to the Superior National Forest.	WILD02
<b>Sender Name (Submission ID)</b> Kate Zimmerman (54360)		
18220	the proposed project could affect the endangered or threatened species that live in this area. They could be affected by the noise, traffic or vibrations caused to their habitats by the projects. Their habitats could also be destroyed or removed by the construction of the mine. They could also be affected by water pollution or changes in the quality of the water or the air caused by the waste products of the proposed mine.	WI01, WI02, WI04, WI05
18221	Another reason that I do not support the project is the effect it could have on the Ojibwa that live in this area. The waste products from the project could affect the animals and plants in that area. Some resources that they use could be affected as a result of the proposed project. The proposed project could also affect other cultural resources that are located in or near the area of the project.	SO02
18222	the project will affect the quality of the water in that area. ...The project could add to the water Mercury that might be present in waste materials. Metals could also be released that will affect organism in the water even if it is a low concentration of the metals. It could also add sulfate to the water from the chemical reactions of the waste products. This sulfate could affect the growth and viability of wild rice that is grown on the rivers.	WR107, WR108, WR156
18223	The proposed project could also affect the wild rice that is grown downstream of the site for the project. Wild rice is an important environmental resource of Minnesota and also has a cultural significance to the Ojibwa people of Minnesota.	CR01
<b>Sender Name (Submission ID)</b> Katelyn Soukkala (15080)		
366	Sulfuric acid will lead to the production of toxic heavy metals in water. This will lead to the methylation of mercury. Methylmercury is the kind that accumulates in fish which can put humans in danger of having mercury toxicity.	HU03
375	Another reason that I disagree with letting PolyMet mine in Minnesota is ... Cutting down the forest would not only kill many plants and animals, it also would destroy peatlands.	VEG03
376	The final reason that I oppose mining near Babbitt and Hoyt lakes, Minnesota, is because the mine would only be open for twenty years and there would be over five hundred years of environmental damage.	WR115
379	It seems like a huge habitat loss for such little gain.	VEG03
383	If [PolyMet] were to figure out a way to protect the environment, I would reconsider my opinion. Too much of our ecosystem is at risk with the current mining plan.	PD01
1816	Sulfide mining has a few benefits, however I believe the detrimental impact it will have on our environment outweighs all of the potential gains.	SO01
<b>Sender Name (Submission ID)</b> Katharine Rauk (52349)		
17014	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies	WR060, WR181, WR182, WR189, WR195

1620	I am shocked that the state of Minnesota is considering this proposal in light of evidence that this project threatens the quality of a major water shed and would create serious air pollution in a highly valued tourist area.	AIR11
1621	Please consider the value of our state’s public health, especially the air and water resources, which would be prohibitively costly to rectify, if damaged.	HU01
1622	The long term costs to our northern communities with the loss of safe drinking, bathing water and breathable air cannot be overlooked. The idea that providing jobs is worth such a trade off is ludicrous and very short sighted	SO01
<b>Sender Name (Submission ID)</b> Katherine Doyle (41813)		
2040	If this does become mechanically and financially feasible, please make sure the mining companies are able to pay for the substantial costs of dealing with the pollution. The unmeasurable and unpredictable long term costs should not be shifted to the tax payers.	FIN01
2041	Although mining jobs are important to Northern Minnesota, a healthy habitat for humans, animals, and plants is certainly more important.	SO02
15423	the Minnesota DNR's first job should be to do no harm and protect the environment.	PER35
15424	the risk is very real and should not be tolerated by an agency with the responsibility of protecting our precious environmental resources. Pollution is not progress, and jobs which pollute the environment are not blessings.	SO01
<b>Sender Name (Submission ID)</b> Katherine G Lewis (54807)		
18310	The pollution could go on for years, maybe hundreds of years, into the future counting the public to be taxed for cleanup	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Katherine G. Lewis (39022)		
4989	Please do not let centuries of environmental damage occur in exchange for brief commercial gain. We should be recycling our copper rather than selling it abroad and doing unnecessary mining here.	NEPA06
<b>Sender Name (Submission ID)</b> Katherine G. Pohlman (43022)		
9562	the biggest damage to the environment would be allowing PolyMet Mining, Inc. to tear down more than 6,000 acres of federally protected land to further its profits. The proposed land exchange with the United States Forest Service does not meet the same standards the other enhancements in the new draft were held up to. PolyMet should not request a land exchange for some of the surrounding forest. The mine would make do without the land swap, and there is no reason to remove part of a natural forest when there is plenty of land to be developed around the proposed sight that does not belong to the forest.	LAN01
9567	NorthMet itself is located in the St. Louis River watershed, so although the project would not directly contaminate Lake Superior, it would aid the lowering of the water quality in the St. Louis River watershed, which eventually leads to Lake Superior. Practices at the mine would lead to an increased level of minerals and metals in the lake and in the river and its surrounding watershed.	WR111

<b>Sender Name (Submission ID)</b> Katherine G. Pohlman (43022)		
9568	Once Mercury gets into the water, it would be ingested by fish and other animals living there and eventually ingested by humans who eat the food produced by Lake Superior and the St. Louis River. Bioaccumulation would occur and the human population in Minnesota and surrounding areas that rely on food from the Lake Superior area would eventually be affected as well. Major plans to prevent this situation from occurring should be a prerequisite to allowing the mine to be built in the first place.	MERC02, MERC03
9569	By constantly digging for more natural resources, topsoil would have to be removed, the amount of runoff would increase and the stability of the soil would decrease in surrounding areas.	GT15
9570	... it would take years for the soil to be in the correct condition for trees to once again grow there after PolyMet Mining, Inc. has collected all the "usable" resources it could find. ... PolyMet should develop a plan to restore the land to proper uses before being allowed to use it for the company's own purposes...there should be an effort made to restore the land usability instead of leaving it as a barren wasteland once there is nothing else to be mined	VEG05
9576	Deforesting this area in order to mine it for its natural resources would reduce the air quality of the region and the surrounding ones.	AIR01, VEG03
9577	The NorthMet mine would produce toxins such as sulfur dioxide, nitrogen oxides, greenhouse gases, particulate matter and dust.	VEG07
9579	Although foliage cannot help extract harmful particulate matter and dust from the air, it can contribute some protection from the other three emissions [sulfur dioxide, nitrogen oxides, greenhouse gases] from the mine. Without the trees, no matter what plans are put in place to reduce the emission of toxins, the amount will always be greater than if the trees were never cut down in the first place.	VEG07
9580	There are other alternatives to the proposed plan ...One possibility is that PolyMet Mining, Inc. does not build NorthMet or has a land exchange in the area at all and has its plan rejected completely. This would leave the land the way it is now and have no detrimental effects on the surrounding environment. It would hurt the economy that would get a boost from the jobs offered at the mine, but those jobs can be made up somewhere else.	SO02
9590	...there are already mines in the area of the future NorthMet one, so the detrimental actions of this mine would build upon those of the already existing ones. This is not a problem of creating the first mine in the area, but creating yet another one.	CU04
9591	The stress another mine in the area will put on the environment is already big enough without the stress of deforesting more than 6,000 acres of forest that could otherwise attempt to offset the detrimental effects the mine will have on the environment. Accept the building of the mine, but not the deforestation of the Superior National Forest.	LAN01
<b>Sender Name (Submission ID)</b> katherine lewis (41821)		
2043	Please do not let centuries of environmental damage occur in exchange for brief commercial gain. We should be recycling our copper rather than selling it abroad and doing some unnecessary mining here.	PD01
2045	Please do not allow centuries of environmental damage to occur in exchange for short-term personal gain. We need to recycle copper, not sell it overseas, and not mine it unnecessarily here. This mine will create some temporary jobs but cause enormous damage on public lands.	SO01

6927	The poses too much of a danger of contaminating the precious waters and watershed of the area that is our one last hope of unspoiled wilderness.	WR195
<b>Sender Name (Submission ID)</b> Kathleen McGee (58126)		
20031	Why...would anyone agree to risk polluting this amazing wilderness area in order to realize short-term profits that benefit a multi-national company- Glencoe? Would the state really prefer to have jobs in the short term but a polluted landscape in the long run?The negatives are just too great	SO01
<b>Sender Name (Submission ID)</b> Kathleen Miller (43035)		
12617	The Polymet SDEIS does not contain any analysis of the health effects for workers or adults and children who would be working and living in close proximity to the proposed mining site. It does not address the health effects on community members who would have chronic exposure to polluted air, to polluted drinking water or in the fish caught for personal consumption.	HU04
12619	...[mine] workers (especially those of child bearing age) will need protection from the harmful effects from toxic metal exposure on their unborn and future children. Women who are exposed to toxic metals before, during or after pregnancy pass high levels of metals through their bodies to their unborn children during critical stages of brain development and through breast milk to their infants. Children's brains are very susceptible to the effects of toxic metals.	HU04
12620	Communities who drink from this watershed need ongoing treatment and reliable monitoring of the water quality and their health to ensure that the people of Minnesota will not suffer long term health problems. Who will provide financial assurance for the long term health care needs of children and their parents? What if Range cities and lake front property owners can no longer use their wells for drinking water? Who will bear the cost of providing clean water to residents and property owners?	HU01, SO07
12623	The Polymet proposal does not address the runoff from the waste piles that will directly enter into the watershed. This is a major omission in their plan.	WR173
12625	An adequate SDEIS plan would also provide for the long term treatment and care of individuals and families exposed to toxic metals in the workplace and the community.	HU04
13937	I expect that these meetings will be very well attended and not likely to accurately reflect the interest by residents unless more opportunities are offered. Three meetings is ridiculously few for this important issue.	NEPA10
17145	I am writing comments today out of my concern for the very real negative health effects on workers and the community that would occur if this mining project is permitted. Noticeably absent from the review of this proposal is an Environmental Health Assessment. It is well documented in health care and industry literature that heavy metal exposure poses long term health risks to men, women and children.	HU03
17147	I have witnessed firsthand the irreversible harm to the nervous system caused by exposure to toxic metals. These conditions are disabling and irreversible. Exposure to toxic metals either as a worker, a community member or as a vulnerable member of our society (our children and our elderly) will cause chronic disabling illnesses and cognitive decline.	HU03

<b>Sender Name (Submission ID)</b>	Kathryn Hanson (40941)	
7887	[Text from SDEIS] "533 million tons of waste rock and ore would be removed from the NorthMet Deposit. This includes a total of 225 million tons of ore and 308 million tons of waste rock." - There are no examples of open pit mining of this nature and scale that have not produced environmental degradation and pollution.	PD26
7891	[Text from SDEIS] "After mining planned at the East Pit ends by year 11, the waste rock in the temporary Category 2/3 and 4 stockpiles would be removed into the East Pit for subaqueous disposal" - Reactive waste material will be stored temporarily –concern about length of time before preferred method can be implemented. In the interim—how closely monitored will these temporary waste rock sites be by the State?	HAZ01
7892	permits and regulations are only as good as the regulatory environment and agencies that will be responsible. In economic downturns, budgets for such activities commonly are reduced. Upfront financial funds sufficient to cover unforeseen or poorly modeled negative consequences should be built into any permits.	FIN05, FIN08
7896	[Text from SDEIS] "...Tailings Basin as it is built up to create a barrier that would limit oxidation of sulfide minerals. This limiting of oxygen transfer would reduce pollutants generated from the Tailings Basin." - Terms such as ‘would limit’ and ‘would reduce’ do not indicate how much oxidation and transfer of pollutants will not be prevented.	PD07
7902	[Text from SDEIS] "Based on the results...would not exceed applicable environmental evaluation criteria except for two water constituents as a side effect of the project." - [should read] Would exceed applicable environmental evaluation criteria for two water constituents.	EDIT01
7905	[Text from SDEIS] "Therefore, the increase in the magnitude of the aluminum exceedance at these Plant Site evaluation locations is not attributable to process water from the NorthMet Project Proposed Action." - Increased aluminum is still a by-product of the planned NorthMet activities.	PD08
7913	[Text from SDEIS] "The engineering controls would not result in significant changes to sulfate concentrations in the Partridge River, but would significantly decrease sulfate concentrations in the Embarrass River" - It is my understanding from media coverage that input parameters for flow in the Partridge River may be incorrect in the model. Therefore, this statement may be based on incorrect modeling parameters.	WR165
7917	[Text from SDEIS] "Actual compensatory ratios determined during permitting may vary from these assumptions. The determination of final mitigation... would be determined by the agencies during wetland permitting." - There seems to be a lot of pressure on the EPA and other regulatory agencies to make regulations less onerous for materials deemed to have Strategic importance. Why should we believe that protection of wetlands will not be endangered by these acts and mining pressures?	COE02
7921	[Text from SDEIS] "At this time, the Co-lead Agencies have not identified a preferred alternative, and for the USACE, Appendix B of 33 CFR Part 325 supersedes the CEQ requirement to identify an agency-preferred" - It is not clear exactly what Appendix B of 33 CFR Part 325 says about selection of a preferred alternative.	ALT06
7924	Fig 3.2-28: Conceptual diagram-Tailings Basin Groundwater Containment - What is the basis for assuming no fracture flow in bedrock? Why is it assumed that all of the blasting will not have some impact on the underlying fracture flow system at the site? There will be potential release of pollutants into bedrock at the mine site and likely within the Tailings Pond areas.	WR011, WR012, WR016
7953	[Text from SDEIS] "Post-reclamation activities would include monitoring and maintenance of reclamation and water quality until the various facility features were deemed environmentally acceptable, in a self-sustaining and stable condition." - Statements that make promises of monitoring and maintenance into the future are vague promises. What is the true expectation of Polymet being a viable entity that will have the incentive to pay out for decades to tens of decades after plant closure?...how will recycling and substitutes for such metals impact the financial stability of the company in charge of post-closure.	FIN01, FIN11

8050	[Text from SDEIS] "...at least 90 percent of seepage from the Tailings Basin and either return it to the tailings pond for reuse or treat it for discharge. In closure, all of the captured seepage would be delivered to the WWTP for treatment prior to discharge to surface water" - What about the other 10 percent of seepage? What about fracture flow in bedrock? Has this been factored into the seepage assessment?	WR010, WR018, WR090, WR108
8058	[Text from SDEIS] "...However, implementation of non-mechanical systems is considered a long-term goal for closure." - The public is being asked to take PolyMet's word that they will be an economically viable entity who will implement appropriate but not defined long-term passive systems.	FIN01
8067	[Text from SDEIS] "The magnitude of deviation from existing conditions, based on XP-SWMM modeling, in the mean values of the hydrologic parameters helps determine the degree of potential effect on stream ecology..." - Please confirm that the input parameters for streamflow in the Partridge River are correct. If reported values are higher than modeled, how can I believe the model outputs?	WR003
8069	Meteoric input parameter - As noted above, if questionable values are used as inputs, how can you trust probabilistic results. At a minimum the public should have an opportunity to review sensitivity results showing the impact of different input parameters if in fact the range in river flow estimates are not adequately parameterized in the model.	WR022, WR175
8070	Table 5.2.2.7 - Calibration of MODFLOW model - How would changes in estimated flow within the Partridge River affect the calibration of MODFLOW model. What would be the effect of using a range of values for bedrock rather than just one	WR003, WR052, WR086, WR087, WR091, WR179
8080	Table 5.2.2-11 - [Text from SDEIS] "Uncertain inputs are hydraulic conductivity and net meteoric recharge." - Are P(50) values appropriately conservative?	WR189
8089	[Text from SDEIS] "A description of the XP-SWMM model for the Mine Site is provided in the Mine Site Water Modeling Data Package (PolyMet 2013j)." As noted above—it is not sufficient for the SDEIS to conclude that values the DNR says are reasonable for surface flow would not make a difference in the final analysis. Best estimates should be used if the study seeks to claim the P(90) results are valid.	WR003
8093	Table 5.2.2-13 [Text from SDEIS] "Uncertain input with triangular distribution. Minimum, mode, and maximum values, respectively." - Please justify use of a triangular distribution. From the three parameter values, it would appear that a mean value may be significantly skewed from the mode. Is this technically defensible?	WR189
8106	500 Monte Carlo simulations - What is the general standard of practice regarding number of realizations needed for critical projects? %00 simulations doesn't seem to be adequate.	SO04
8112	[Text from SDEIS] "Transitions to the nonmechanical treatment systems would begin after the performance of the non-mechanical treatment methods have been proven." - Why are we supposed to assume that If nonmechanical treatment systems are not yet proven will be reliable?	PD06
8120	[Text from SDEIS] "Modeling of aquifer response at the Canisteo site using MODFLOW resulted in differences between simulated and measured water levels ranging from +28 ft to -4 ft (reference USGS Report 02-4198)... Therefore, it was concluded that it was not reasonable to attempt to quantify drawdown at the Mine Site using the MODFLOW model." - Given the heterogeneity of conditions at the site and at the Canisteo site, why is it reasonable to assume that the Canisteo site is a good analogy.	WR086, WR179

<b>Sender Name (Submission ID)</b>	Kathryn Hanson (40941)	
8132	[Text from SDEIS] "The initial arrival of West Pit solutes at the Partridge River would occur at about year 90, and peak concentrations in groundwater discharging to the river would occur at about year 160." - We are being asked to assume that PolyMet will still be an entity capable of monitoring the mine closure in 160 years. There should be sufficient financial vehicles in place such that the State and taxpayers will not be left holding the bag for these costs.	FIN01, FIN10
8142	[Text from SDEIS] "There are concerns that the presence of the NorthMet Project Proposed Action could reduce housing demand (and thus housing value) in the study area..."- The potential development of sulfide mining has already had the effect of diminishing market interest in lake front property that might be impacted by mining. The SDEIS downplays this effect. The potential tax revenues cited in the SDEIS would be offset by the reduction in lake-front property values regionally. As a property owner I have already seen the impact of proposed mining on prime lake front on lakes that may potentially be impacted by future mining.	SO03
8146	[Text from SDEIS, App A - WR4A] "Quantitative modeling of methylmercury is beyond the scope of the SDEIS, due to the inherent complexity of the fate and transport of methylmercury in the environment..." - At what stage of the permitting will quantification of this potential hazard be considered. Given the potential profits expected from this 'world class' ore body—cost should not be a factor in providing sufficient quantitative modeling.	PER11
8179	[Text from SDEIS, App B] "While low-confidence mineralization is known to extend along the strike beyond the proposed open pit outline, this material has not been evaluated in detail, there is no mine plan for it, and it is not included as part of the proposed NorthMet Project..." - This suggests that PolyMet is not making an effort to adequately evaluate the underground option.	ALT01, ALT06
8181	[Text from SDEIS, App C] "Neither the direct field observations (minimum of 3.4 cfs) nor the values calculated from the DNR rating curve, support the baseflow predicted by XP-SWMM at SW003 of 0.51 cfs..." - As a scientist/consultant working familiar with probabilistic modeling, it is not always clear what the end result of incorrect input parameters to a model may be. It would seem prudent to provide the public with a reanalysis of the modeling results prior to approval of this EIS.	WR003
8209	[Text from SDEIS, App C] "The hydrologic models for the Polymet mine site have been calibrated to targets that under-represent true baseflow. Models should be calibrated to a strong set of observational data. Construction of the site's basic hydrologic model to unrealistically low baseflows has ramifications for all the flow and contaminant modeling at the site." - If as news reports suggest, these alternative parameters have not been incorporated into the model, I am concerned that schedule may have been given precedence over good science and accuracy.	WR003
17361	The public was not given sufficient time to digest the very long document.	NEPA07
17362	Input parameters going into the various numerical models may not reflect the true range of uncertainty and hence the results of the modeling may not accurately represent the hazard. It would seem that additional analyses or sensitivity studies are warranted to show that the model results are sound.	WR189
17363	The economic downsides of sulfide mining-impact on recreational property value, tourism, short-term negative impacts on communities of transient workers-are not adequately accounted for.	SO01
17364	There is no reason to assume that the State of Minnesota will not be left paying for the pollution that will ultimately ensue. I am not willing to bank on yet unproven mitigation measures and non-mechanical post-closure promises.	FIN10

17674 Please do not approve the copper mine so that future generations can enjoy the wilderness like I have. Any amount of degradation or habitat loss is too high a price to pay WILD02

17675 The proposed copper mine would produce 99% waste, far too high a price to pay for the pine trees. It could pollute one of the purest watersheds in the area, far too high a price to pay for the fish. The degradation of the environment would diminish future revenues from ecotourism. Far too high a price to pay for short term, dirty, unsustainable jobs. SO01

**Sender Name (Submission ID)**    Kathy Alvig (19999)

1627 We know there is significant damage to the earth, ground water, and also wildlife habitat that comes from the greed mining operations bring. There is no such thing as real recovery from this. WI02

1655 Do we want that area looking like a huge open sore? LU04

14844 All of the mining companies profits will go to South America on the backs of the people who live up near Hoyt Lakes. South American companies and share holders will profit on the backs of our childrens safety and good health. PD25

14845 This area that makes northern Mn a tourist destination will suffer from air and water pollution, congestion from transportation of the ore, and company controls and bullying. SO02

**Sender Name (Submission ID)**    Kathy Burkett (52195)

12931 Acid mine drainage can stick around for more than a millennium. Many sulfide mining companies have failed to provide financially for dealing with this long lasting pollution and then go belly up. As a taxpayer I am not willing to be responsible for the liability of clean up. FIN01

12932 In early 2010 the EPA gave the rating of Environmentally Unsatisfactory and Inadequate for this project plan PolyMet set forth and I am leery that the standards even come close to protecting our waters and environment for the long term. NEPA08

12933 It is disturbing that there were no contingency plans included with their proposal for accidents from failures of collection and treatment systems, tailings basin failure, accidental releases, etc. Where is the plan regarding treatment of the water should a plant break down and what is the plan for where the toxic polluted water will go when this inevitably happens? WR130

12935 200 years, 500 years and 1000's of years of treating the toxic pollution created by this mine is a long term commitment with long term consequences ...consequences that we would be forcing upon our future generations. FIN08, FIN10

16225 With something so obviously needed to safeguard environmental safety, yet not included in their proposal, I see no indication that PolyMet is committed to clean mining. I find this of grave concern especially when the waste water treatment plant located off site would need to run for the next 200 years and a long 500 years for the water treatment plant on site. PD03

**Sender Name (Submission ID)**    Kathy Glover (39405)

13184 Hoping that long term values (healthy waters, wilderness, respect for the land) will weigh greater than short term goals (money, money, money). SO01

<b>Sender Name (Submission ID)</b> Kathy Holander (18243)		
13622	I would like to know how much fresh water, both ground and underground this project is scheduled to use. I am not aware of anywhere in the SDEIS where the amount is specified. With climate change coming, there will be areas of drought and areas of heavier-than-normal rainfall that quickly run off. In a drought year, will there be enough water for people and animals to use for drinking water? Will the streams still flow? Will the stream-fed lakes dry up? Will the mining company be able to take all they want even in a drought year?	WR181, WR182, WR188
13623	By law, an appraisal [for the land exc hange] must be done on the land being lost in the Superior National Forest, and on the new land that will be exchanged to make sure that the new land is worth at least 75 percent of the value of the land being given up...What kind of people are we that we do this to the native people of our land. The forest service should disclose to us, the public, all land appraisal information now and extend the comment period so we the taxpayers can comment on this land-exchange issue.	LAN03
13624	On the current land, the state owns the mineral rights. The new lands have split mineral rights. There are no covenants to prevent mining. The land exchange proposed by PolyMet should be rejected since it's not in the public interest. PolyMet must find land where the public owns the mineral rights. No split mineral leases to sell off.	LAN04
13625	And the swap is not equal. We will have a net loss of over 6,000 acres of lands with high biodiversity. We will have a net loss of over 2,000 acres of mature forests and be given less mature forests in exchange. We will lose over 1,400 acres of flood plains. The exchange should be denied as we, the taxpayers, end up with a lot less.	LAN03
<b>Sender Name (Submission ID)</b> Kathy Hollander (18228)		
2194	I would like to know how much fresh water, both ground and underground, this project is scheduled to use.	WR181, WR182
2195	Will the mining company be able to take all the water they want, even in a drought year.	WR188
2196	Also, I'm concerned about the land exchange. By law, an appraisal must be done on the land being given up in the Superior National Forest, and on the new land that will be exchanged to make sure that the new land is worth at least 75 percent of the value of the lands being given up. We the people of Minnesota own that land now, although it belonged to the native people before the European settlers. The native people retained their rights to hunting, fishing and gathering on this land and now even that will be taken from them.	CR01
2197	The forest service should disclose to the public all land appraisal information now and extend the comment period so we taxpayers can comment on this land exchange issue. On the current land, the state owns the surface minerals rights. The new lands have split mineral rights. There are no covenants to prevent mining. The PolyMet must find land where the public owns the mineral rights. No mineral leases to sell off.	LAN03, LAN04
2198	It's [land exchange] not in the public interest.	LAN01
<b>Sender Name (Submission ID)</b> Kathy Iverson (18274)		
13901	And so the thought that there are countless lakes and rivers that could be contaminated just, you know, to me is No. 1. That is something so precious that we cannot put a dollar figure on that. It is about heritage.	SO01
<b>Sender Name (Submission ID)</b> Kathy Kahn (47661)		
7883	All the plans for cleaning up the pollution caused by mining can never make nature as it was before.	NEPA15

<b>Sender Name (Submission ID)</b> Kathy Magnuson (42969)		
15126	i understand the need for good jobs. I also know that jobs come and go but when clean water and virgin land goes, it is gone. Forever. I also understand the vibrant tourism industry in northern Minnesota and would not want to jeopardize that as well.	SO01
<b>Sender Name (Submission ID)</b> Kathy Ogle (46728)		
9261	We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water.	HU03
9262	We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (“PolyMet SDEIS”) fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling.	HU01
9263	We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health.	HU01
9265	We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St. Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury.	MERC02
9266	Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	MERC20
9268	The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water.	HU01
9269	The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential sites.	HU04
9270	The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate.	HU01
9275	For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project.	MERC16, MERC20

<b>Sender Name (Submission ID)</b> Kathy Ogle (46728)		
9278	We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the Minnesota Health Department. This Health Impact Assessment should include at least the following: 1. Description of the known human health impacts of all pollutants in PolyMet’s air emissions and water discharges based on reliable toxicity and epidemiology data. 2. Assessment of potential health impacts on residential wells from tailings seepage. 3. Health impact assessment for on-site workers at both the PolyMet mine and plant. 4. Assessment of cumulative mercury risks, including hazard levels in bodies of water that are already impaired for mercury in fish and risks posed by mercury concentration downstream in the St. Louis River. 5. Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis and an appropriate “lifetime” for exposure. 6. Assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice	HU01
9279	HIAs are a tool used in the environmental review process. Environmental Impact Statements, such as the PolyMet SDEIS, are required by the National Environmental Policy Act to contain analysis of impacts on human health. However, human health is subordinated to environmental impacts, is addressed in a piecemeal fashion, and there is no examination of the social determinants of health in the SDEIS. An HIA would integrate human health into the environmental review for the PolyMet NorthMet proposal, allow consideration of mitigation measures, and involve the community in planning for the project.	HU01
<b>Sender Name (Submission ID)</b> Kathy Sidles (9678)		
281	I’m against allowing the mining because the acid concentration of the waste water is too high and persists too long.	WR001, WR115, WR195
1364	Wildlife is sensitive to acid level, and the potential for destroying the water-dependant wildlife is too great.	WI04
1365	There is no way the company can guarantee they will pay for what the public - including other private companies - can loose.	FIN01
<b>Sender Name (Submission ID)</b> Kathy Thonvold (41494)		
9331	I am opposed to such an operation in that area and am gravely concerned in regard to the effect on not only the pristine Boundary Waters Canoe Area, a national treasure to be sure, but all water in the area and the safeguarding of that area for the generations who follow us.	WILD02
9332	From what I have read, PolyMet does not seem to be able to give 100% guarantees that money will be there for the cleanup after the mining has ended...	FIN01
<b>Sender Name (Submission ID)</b> Katie Feterl (41039)		
7553	20 years of jobs is not worth lifetimes of a destroyed environment that presently largely contributes to the tourism industry of Northern Minnesota.	SO01
7555	The construction of this mine will only expedite the implementation of future mines in the area, accelerating environmental degradation.	CU04
7556	Tourism will most likely tank if the area is unhealthy and unsafe.	SO02
7559	The mine is not the only option for providing jobs. It does not mean the end of Ely if it is not constructed.	SO01

7565	However, it [Northmet Mine] could put Ely in a much worse position in a few decades should there be large health consequences and/or reduced tourism due to acidic water supply that destroys the life system around it.	SO02, WI04
<b>Sender Name (Submission ID)</b> Katie Fournier (58097)		
19981	The limited number of jobs provided by this project for a limited number of years is not a valid trade for the prospect of another economic bust in NE Minn when the mining is finished. We have seen the boom/bust cycle too often from extractive industries in this part of the state. When you add the prospect of remediating, pollution for centuries (when our Republic itself is only ca 230 years old), it seems clear that we in Minn and elsewhere in the world should focus on reuse and recycling of needed materials, rather than putting our waters and landscape at risk.	SO01
<b>Sender Name (Submission ID)</b> Katie Haws (42882)		
6815	the water would need to be treated for as many as 200 years in the future for the Mine site, and 500 years for the Plant site. There are not enough economic safeguards to prevent the company from bankruptcy and the possibility that they could not guarantee this continue expensive active water treatment regime for the number of years necessary,	FIN01
6816	I am very concerned with protecting the clean water currently flowing in the Partride River and Yelp Creek (located only feet from the storage pond), and the Embarrass River, as well as down stream concerns for the entire St. Louis watershed	WR081
6818	Although the XP swim and gold sim [models] were used, these are not accurate predators of potential pollutant inputs into these riverine systems. The potential for overflow during large storm events such as recently happened in Duluth for example, were not part of these model calculations.	WR193
6820	Although [wetland] mitigation is described and revegetation mentioned, these types of plant communities cannot be restored. Restoration as mentioned is not an adequate mitigation strategy for the large scale destruction of these unique plant communities; the conifer bog, shrub swamp, conifer swamp, and shallow and deep marsh, and open bogs communities.	WET05
6825	The impacts on [terrestrial and aquatic] threatened and endangered species to be affected by the project is vastly under represented.	WI01
6827	Mercury can be released into the environment from wetland drainage...potential impacts in terms of human life and reduced quality of life are immeasurable, should these toxins bioaccumulate in species such as game fish within the Rabbitt, Embarrass and St. Louis river systems.	HU03
16988	the estimates of costs of [water] treatment are not particularly accurate.	FIN05
16990	I do not believe that seepage was adequately modeled.	WR019
16991	sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream.	AQ05
16993	Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons.	WI01
16994	Species of Greatest Conservation Need including the Ruffed Grouse, Spruce Grouse, and Black-backed Woodpecker also will be impacted by their habitat being destroyed by the creation of the mine.	WI01, WI02

13970	Their proposal contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. It is time for these analysis to look at the implications to humans... The health of all Minnesotans is at stake here--so a health impact assessment for the PolyMet project needs to be done and the results included in the EIS. The time for leaving out essential studies and information is over. We are tired of incomplete impact studies being done on human and environmental health effects. It is time to start worrying about the health of the citizens of the state of MN. The HIA needs to include an analysis of the social determinants of health.	HU01
<b>Sender Name (Submission ID)</b> Kay Erickson (41880)		
2128	The SDEIS is inadequate and doesn't provide any assurance that it won't be harmful to northern Minnesota. Any project that would require treating water for 200-500 years should be rejected out of hand because there is absolutely no guarantee that this will be done.	FIN01
2129	This kind of mining has resulted in contamination of surface and or ground water with heavy metals and sulfates all over the world. PolyMet tailings will be added to an existing tailings basin that is already leaking polluted water.	WR023, WR070
2130	It will destroy bogs, tamarack swamps and degrade 7,300 acres of wetlands. It will leak polluted water into the St. Louis River and eventually into Lake Superior.	WET24, WR111, WR115
16475	It isn't worth 500 years of cleanup for 20 years of mining.	SO01
16476	I would be somewhat more confident about the project if the companies that pollute our air, water and land would actually pay for the clean up they promise when these projects are approved...The track record is abysmal.	FIN01
16477	The cumulative effect of all these projects needs to be considered, especially because it is inevitable that, like pipeline projects, once they get their "foot in the door," they will want to expand and destroy more our forests, waterways and lakes.	CU04
<b>Sender Name (Submission ID)</b> Kay Kieval (58005)		
19855	MN regularly ships copper to China in the form of old alternators & motors which China recycles for use in tech mfg. Instead of mining we could do this here.	NEPA06
<b>Sender Name (Submission ID)</b> Kay Kurt-Jankofsky (42755)		
14447	Especially of worry is the question of the sensitive nature of the water sources and our dependence on the continued quality of it for us and those who will come after us. The Clean Water Act is precisely in place for protecting our waters and should be upheld and honored. Every time so far, as I understand, mining of sulfide [ILLEGIBLE] has been tried in a water sensitive environment, it has resulted in surface and/or ground water contamination by sulfates and heavy metals.	WR023, WR070, WR195
14449	Mining is projected to last 20 years, but who is going to be responsible for monitoring and control of the water quality for this time, 200 years, and 500 years out? I believe concrete, reliable and proven procedures need to be in place for any pollution due to PolyMet et al to even think of mining activity in Minnesota.	FIN01

418	Keeping the water supply clean is too big of a risk for the State of MN to take.	WR128
<b>Sender Name (Submission ID)</b> Kayellen Taylor (47142)		
12862	This project should not go forward unless a third-party insurer, such as Lloyd’s of London, can be found. The simple fact is, if a third-party private entity will not take on PolyMet, the state shouldn’t.	FIN08
15760	The source cited is “Foth 2013.” I’ve looked at the Foth memocited in the SDEIS. The Minnesota DNR has simply copied information from PolyMet’s hired consultant without confirming or fact-checking their work. If the Minnesota DNR and its co-lead agencies are unable to fact-check the work they presented on financial assurance, how are we to expect that they are capable of the adequately protecting the citizens of Minnesota?	FIN08, FIN09
15767	This project shouldn’t go forward without robust public debate, and the opportunity for legislative hearings, if what we can expect is a paragraph from the DNR in the Permit to Mine phase. You must ensure that the public, including financial experts and those elected to represent the citizens of Minnesota, have a chance to weigh in on financial assurance	NEPA03
<b>Sender Name (Submission ID)</b> Keelin Kane (58114)		
19983	The long term pollution is unacceptable. The “assurances” are more than inadequate – they’re ludicrous. To imagine that twenty years of jobs is enough to offset permanent destruction of an irreplaceable landscape! The international conglomerate will reap the money and the benefits and leave a mess behind. Boom, then bust. Northern Minnesota has a thriving tourist industry. People come from all over the world to enjoy it. Don’t sell it out. It’s a world treasure.	SO01, SO02
<b>Sender Name (Submission ID)</b> Keith A Haglin (57145)		
16840	I don’t think we should permit this mine as clean-up will cost more than the value of the ore...Taxpayers should not get stuck at the end of the mining	FIN10
<b>Sender Name (Submission ID)</b> Keith Goetzman (43201)		
11548	I urge the DNR to require that the PolyMet EIS include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate, and to require that any permit to mine for PolyMet include Glencore.	FIN02
11549	We simply do not have enough information yet, and this comment period is closing before key pieces of information are even in hand.	NEPA07
11551	To begin with, the SDEIS is overly long and inaccessible as a document to encourage public comment. ... it at once presents an abundance of data and a dearth of basic, understandable information.	NEPA07
11552	The SDEIS does not address exactly how long water treatment will be needed at the mine site, instead presenting a theoretical 500-year model that has done little except to sow public confusion about the actual duration of treatment.	PD03

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Keith Goetzman (43201)		
11553	The SDEIS uses a flawed model for the amount of contaminated water flowing from the mine site, meaning the project’s planned treatment plants may have to process larger volumes of water than expected. The document describes long-term reverse osmosis water treatment that is yet unproven at the scale, use, and time frame proposed.	WR143, WR148
11554	The SDEIS does not describe adequate safeguards against worst-case scenarios that could compromise the integrity the waste and water retention and treatment systems.	WR130, WR131, WR202
11556	The SDEIS also describes an unacceptable amount of wetlands loss. Mining at the site would destroy approximately 1,500 acres of wetlands, one of the largest wetlands destructions ever permitted by the Army Corps of Engineers.	COE03, WET23
16180	Financial assurances of Polymet’s long-term commitment to cleanup and mitigation are key to the proposed project’s environmental impact, and yet the public has been asked to let the DNR and Polymet work out financial assurance details after the comment period is closed. The current financial “assurances” outlined in the SDEIS are wholly insubstantial and not assuring to this citizen.	FIN13
16181	the SDEIS does not account for or even mention Glencore, which will own the first five years of minerals from the proposed NorthMet mine.	PD23
<b>Sender Name (Submission ID)</b> Keith Haas (58103)		
19922	I believe the study was done complete and with the best [information] available.	NEPA16
<b>Sender Name (Submission ID)</b> Keith Jentoft (40992)		
6851	I believe that the study is flawed and unfairly promotes the interests of the mining industry.	NEPA15
6854	Specifically, the company proposes to excavate three enormous pits up to 696 feet deep.	PD30
6856	Waste rock would be stored next to the pits in 20-story high piles covering 526 acres.	PD15
6859	The mine will destroy 900 acres of high quality wetlands, e.g., coniferous bogs and tamarack swamps, and impact an additional 7,000 acres.	WET24
6860	The mine has a projected lifespan of 20 years; polluted water must be treated for 500 years.	WR035
6861	Leaking polluted water will flow into tributaries of the St. Louis River and finally into Lake Superior.	WR070, WR111
6863	I strongly object to the impact the Sulfate releases will have on the wild rice in the drainage area.	VEG04, WR156
<b>Sender Name (Submission ID)</b> Keith Laken (18231)		
13580	What I would like to see, if any mining permits are approved, that the mining company provide a surety bond for 10 times the estimated reclamation -- cost of the reclamation project, so 10 times... So the idea is that the companies that are granted these permits cannot just create a shell corporation, issue their dividends to their investors and then walk away from the public.	FIN01, FIN05, FIN08

<b>Sender Name (Submission ID)</b> Keith Laken (18231)		
13581	The second thing is that those people that are responsible for approving the -- the project and for running the project, that violation of any federal or state law is a capital offense, not just a minor offense. That individuals and corporations are held accountable from a capital standpoint; in other words, these are severe crimes against humanity.	PER06
<b>Sender Name (Submission ID)</b> Keith Morris (54817)		
18348	Mining in general is an unsustainable industry. There exists a finite, nonrenewable mineral deposit, and when that is gone, so are the jobs. Even though these jobs may last 20 years, the infrastructure of the area has to expand to accommodate this temporary work force. When the mine closes, the government will have to be the safety net for all these mining families	SO02
18413	... it will be the people who do not profit from this in any way that will be paying for this for the next 500 years, not only financially, but esthetically and environmentally as well...Minnesotans will be saddled with a 500 year liability and no guarantee that the destruction and pollution won't be forced on generations to come. How can you guarantee anything for that time period?	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Keith Nelson (42733)		
14395	The metals that PolyMet is proposing to mine are essential to our way of life. Minnesota, with its strict state and federal regulations, long history of mining, and a shuttered facility waiting to be recycled, is the best place to do this mining.	PER34
14396	I also want people of northeastern Minnesota to earn a living in a part of our state that needs well-paying jobs – careers that will support families and communities. Mining currently makes up 30% of the economy and miners are some of the highest paid workers in the state.	SO10
14398	I particularly like the following statement from the SDEIS: "The NorthMet Project Proposed Action would not directly, indirectly, or cumulatively affect the water quality of these areas (BWCAW and Voyageurs National Park)."	AIR08
14399	The air emissions from the operation will be minimal. The process PolyMet will use does not generate hazardous waste and, in fact, can be used to create a useful product out of waste material.	AIR14
<b>Sender Name (Submission ID)</b> Kel (43696)		
11923	I don't believe there are enough safety measures in place to adequately protect our wetlands and groundwater sources.	WR128, WR130
15097	Too many companies continue to dump their waste into nearby lakes and wetlands because of loopholes in current regulations. I fear this will end up just the same and cause catastrophic damage to our northern wilderness.	PER35
<b>Sender Name (Submission ID)</b> Kellen Giblette (44378)		
10430	I feel that the mine will have extremely detrimental effects on the Boundary Waters Wilderness Area... I do not feel that any amount of jobs for any amount of time is worth the possible (and in my opinion inevitable) destruction of such a special piece of land.	WILD02
10432	I personally do not feel that it is reasonable to say that you will be financially stable to oversee the mine for 500 years, or even that you as an entity will exist in 500 years.	FIN01
<b>Sender Name (Submission ID)</b> Kellen Roberts (1774)

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Ken Engelhart (40936)		
7592	Toxic pollution has happened at every sulfide mine site in the world to date, including the Flambeau mine site near Ladysmith, Wisconsin. Other sulfide mine sites have been declared Superfund sites. With this type of record, it is extremely doubtful that the outcome would be different for [the NorthMet Mining Project in] Minnesota, even though we are all “above average”	PD26
7597	By comparison, this mine would leave a legacy of millions of gallons of polluted water for hundreds of years in one of the more water-rich areas of the world. Sulfide mining would require measures to “treat” this polluted water for up to 500 years or more. It is unlikely that PolyMet and other current mining companies will exist in 100 years, and unimaginable that they will exist in 500 years. However, it is likely that Minnesota taxpayers will exist, and will ultimately will be the ones left to pay for the cleanup, if possible, of the toxic mess that is left behind after the mining companies are long gone. Other states with sulfide mines have been saddled with billions of dollars in clean-up costs.	FIN01, FIN05, FIN10, WR037, WR115
13927	In summary, sulfide mining is a highly toxic process that has caused pollution at every sulfide mine site in the world. It is a type of mining that has never been done in Minnesota and that would leave a toxic legacy of millions of gallons of polluted water in one of the most unique and precious water regions of the world. The short term “benefits” of mining do not outweigh the disastrous long-term consequences to our pristine northeastern Minnesota waters and land. I urge you to resist the allure of short-term “gain” for what ultimately will be long-term pain that Minnesotans will deeply regret.	SO01
<b>Sender Name (Submission ID)</b> Ken Halfmann (35232)		
14090	While I haven't yet been to the Boundary Waters Wilderness, I have visited a number of other beautiful sites on the Lake Superior shoreline from the Apostle Islands to Tahquomenon Falls, and can't imagine subjecting any of these places to the degradation that this mining project would bring.	WILD02
<b>Sender Name (Submission ID)</b> Ken Hanson (37145)		
15918	I understand the industrial need for copper and nickel and the significance of job creation but I find it difficult to accept that either of those issues should take precedence over the preservation of our natural environment-particularly water quality.	SO01
15919	I don't find in all the literature I've read (for and against the project) any suggestion Polymet or any other mining operation can even begin to assure the beautiful lakes region of northern Minnesota won't be significantly, negatively altered by their sulfide mining operations.	WR023
<b>Sender Name (Submission ID)</b> Ken Illegible (57279)		
16072	Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred.	WR023
16074	I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality.	WR111
16076	I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including:...loss of wetlands	WET24
16077	I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including:...harm to wildlife such as lynx and moose	WI01
16079	I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including:...cumulative impacts from mining.	CU11

<b>Sender Name (Submission ID)</b> Ken Illegible (57279)		
16080	I am concerned that a decision around jobs will outweigh the potential impact on the environment. Concerns around the impact on the environment should be a priority.	SO01
<b>Sender Name (Submission ID)</b> Ken Kaseforth (48088)		
12093	All of these long-term risks for about 20 years of mining...When you also factor in the inevitable and long-term off-setting losses to neighboring recreational business, this proposal becomes absurd on its face. It is not one that will benefit Minnesota or US citizens in the long-term.	SO01
13234	This project would present unacceptable risks to Minnesotans well into the future, in terms of health, environmental contamination and financial liability.	HU03
13235	All of these long-term risks for about 20 years of mining by a Canadian company funded primarily by a Swiss commodities trading firm, and whose chief customer will be China? When you also factor in the inevitable and long-term off-setting losses to neighboring recreational business, this proposal becomes absurd on its face. It is not one that will benefit Minnesota or US citizens in the long-term.	SO01
16194	us tax-payers will be left holding an empty but foul bag if this mine is permitted.	FIN10
<b>Sender Name (Submission ID)</b> Ken Klein (21257)		
933	Please consider health risks associated with the proposed Polymet mining operation. I am requesting that you confer with our Mn. Dept of Health and the MPCA in your deliberations, and commission independent research to evaluate human habitat (eg. health) consequences from mining residues. This is just one very troubling report re: heavy mining in South America. <a href="http://www.worstpolluted.org/projects_reports/display/89">http://www.worstpolluted.org/projects_reports/display/89</a>	HU01
1276	I am very concerned that sulfide mining poses unacceptable risks to "human habitat" in the form of long term health risks from cumulative residues & byproducts (Including methylmercury) which can infiltrate the water supply, food chain, air emissions... I implore you to commission independent studies to evaluate these risks, to incorporate already known research findings in your deliberations and permitting process, and to very carefully weigh the costs in human terms (as well as financial burden) if health damage ensues from these operations. Reliance upon industry's own studies and assurances has shown time and again to be myopic.	PER06
1487	Posting of bonds (no matter the amount) might guarantee some degree of comfort to those contemplating monitoring costs, clean up costs, etc., but will not begin to cover the actual medical, legal, economic, and emotional toll if the health of current and future generations (in Minnesota, & in the surrounding area, eg. Lake Superior region) is imperiled or damaged.	FIN05, FIN08, FIN11
1692	I believe from reading the SDEIS that assessment of plausible neurotoxic risks associated with the Polymet project(s) has been inadequate.	HU01
1693	Methyl-mercury contaminants can migrate into water, soil, and air, and their cumulative effects need to be evaluated in the context of other likely discharges (e.g. other approved mines, industry discharges, ambient pollution, baseline levels of neurotoxins in Lake Superior watershed, etc.)	MERC10, MERC20
1694	No bond or financial guarantee will begin to cover health related sequelae if neurotoxic damage ensues. No mitigation, monitoring, abatement, restoration, reclamation processes and funding can address permanent neurological damage that residues from sulfide mining are known to occasion.	HU03
1695	The economic benefits to the region and state are paltry when they are viewed in juxtaposition to public health risks lasting centuries into the future.	SO01

8314 Please involve the CDC & other reputable experts to provide you an independent analysis of these risks before approving any mining permits. This is the only responsible course, given the long term cumulative risks to human habitat associated with heavy metal mining.    HU01

10824 No increased risk of neurotoxic exposure to future generations of children in Minnesota & in the surrounding sulfide mining watershed can be deemed acceptable. ... Please involve the CDC & other health experts to provide you an independent analysis of these risks before approving any mining permits. This is the only responsible course, given long term cumulative risks to human habitat associated with heavy metal mining.    HU01

13985 Regulators in Minnesota need to base their decisions upon worst case scenarios, not upon political pressures, or upon incomplete (at best) projections from vested interests which minimize long term risks to our state and future generations.    PER35

13986 Human habitat (e.g. health risks) must be foremost in your analysis, relying upon independent comprehensive studies from multiple impartial and knowledgeable experts....    HU01

14838 Industry reassurances mean little when "accidents" happen. Do more than due diligence to keep this type of tragedy from happening in our great state.    PD22

18860 I believe that several independent analyses (by respected experts) must underpin the SDEIS, and that the models thus far presented have relied too much upon industry data and statements.    NEPA15

18862 Methyl-mercury contaminants, as you know, can migrate into water, soil, air. Their cumulative effects can only be evaluated in the context of other likely discharges (e.g. other approved mines, industry discharges, ambient pollution, baseline levels of neurotoxins in the Lake Superior watershed, etc.)    MERC10

18863 No bond or financial guarantee will begin to cover health related costs if neurotoxic damage ensues. No mitigation, monitoring, abatement, restoration, reclamation processes and funding can address permanent neurological damage caused by residues associated with sulfide mining.    FIN05, FIN10

18871 The economic benefits to the region and state are paltry when juxtaposed with public health risks lasting long into the future. (Needless to add, tourism will decline significantly if any "accidents" do occur, given the current pristine nature and allure of this unique wilderness area.)    SO01

18875 Thank you for your attention and consideration. I would appreciate an acknowledgement of this comment, and a copy of the final summary report.    RFI01

**Sender Name (Submission ID)**    Ken Swanson (37456)

16326 From all the information I've seen to date poly-met does not have a firm plan for keeping run off within limits and they for sure cannot explain what or how to do it in the future.    WR129, WR130

16327 WE want GOOD JOBS BUT NOT TO RUIN OUR STATE AND OR OUR WATER SUPPLY FOR GENERATIONS!    SO01

**Sender Name (Submission ID)**    Ken Wainionpaa (36814)

8705 Overly strict laws on mining and manufacturing have forced many American producers to out-source to another country. The MPCA is one of the causes of companies out-sourcing their manufacturing to other countries. The USA cannot survive if all of our products are out-sourced.    NEPA05

818	This is not the time for intelligent people to permit another massive extraction process risking lasting environmental degradation.	PER35
<b>Sender Name (Submission ID)</b> Kent Simon (44067)		
7723	Despite the application of the best modeling tools science has to offer, there is no consensus on the rate of climate change over the next fifty years, let alone five hundred. Simply stated, water flows cannot be predicted with reliable accuracy.	WR196
7724	well-considered contingency plans and replacement plans are critical. The lack of such plans in your report is glaring in its omission....	PD22
12308	It's hard to believe that allowing copper sulfide mining is even being considered, given the following:the public hearing period 90 days;but the clean-up period may be up to 500 years!!!	PD01
12309	only 300+ mining jobs will be created; but how many more jobs rely on tourism, based on the natural beauty of the place, will be lost!!	SO02
13455	only 300+ mining jobs will be created;but how many more jobs rely on tourism, based on the natural beauty of the place, will be lost!!!	SO02
15157	there will be a serious detrimental environmental impact when failure occurs. And we're not just talking about one mine here; this decision will be precedent-setting and if the Polymet venture is approved, the gate will be open. How many more mines will we be saddled with maintaining for 500 years?	CU04
15158	The time will come when the right proposal is made and we will recognize it as such. It will be a proposal that offers considerable economic benefits for all Minnesotans and preserves the environment, Minnesota's most precious natural resource. This is not that this proposal and this is not the time.	PD25
<b>Sender Name (Submission ID)</b> Kenzie (54346)		
17610	This will affect cultural resources. A segment of the Mesabe Widjiu known as a sacred place to the Ojibwe people, occurs within the project area so it would be affected. A segment of the Beaver Bay to Lake Vermilion Trail, It also exists within the project area so it would be affected. The Project is also located on land that was awarded to the U.S by the Bands under the 1854 Treaty. The Bands reserved the right to hunt, fish, and gather on these lands. Resources like fish, plants, and animals might be affected by the project.	CR01, CR05
17680	I think that this land exchange is ok. I think that the land that was public that would become private is unfair. I don't know what the public uses the land for , but for example: if I walked my dogs through this public land every day and then all of a sudden they built and mining project on it I wouldn't be happy. This project will not affect me. I think that this is for a good cause and if it needs to happen, it should. I just think that the land exchange should be more fair to the public.	LAN03
17681	The advantages to this would be that there would be less unemployment, and better lives for many Minnesotans. But there would also be some disadvantages; there is always a risk of population considering how close the mining project would be tho many rivers, lakes, and wildlife.	SO01
17682	I think that the PolyMet Mining has a very good plan in place. I think that it is well thought out, I also think that they have planned every aspect of the project out very thoroughly. I think that this copper-sulfate mining process will definitely benefit Minnesota in some ways.	PD28

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Keri Lynn Igo (54501)		
19043	I am concerned that I don't see mention in the SDEIS of linings for the tailings basin or mine pit, other than bentonite in a small area of the tailings basin. (I can 't imagine that bentonite would make a longlasting seal- seems like it would break down, erode away, or slide down fairly soon.) It seems likely that any lining material would eventually break down over time, allowing water with heavy concentrations of metals to seep out.	PD07, PD15
19044	[In the SDEIS, I] didn't find any protections in place to keep water from seeping through the ground from the mine pits and tailings basin. This seeping water would pollute both groundwater and/or surface water.	PD04
19045	The SDEIS should include provisions to prevent contaminated water from seeping out of the tailings basin, mine pit, and anywhere else on the premises that contaminated water stands. These provisions should include liners and plans for monitoring the condition of the liners and repairing/replacing them as they break down.	PD04
19047	If Poly Met is creating water that will be contaminated for the next 500 years, they need to have a plan in place to contain that water when natural and man-made disasters happen.	FIN01, FIN11
19048	The SDEIS should include a plan to collect runoff in case of extreme rainfall that causes flash flooding, prolonged rainfall that temporarily (or permanently) raises the water table, and spring rain that falls before the ground thaws (causing runoff to abandon its normal courses).	WR202
19049	The SDEIS should include measures to protect our groundwater, nearby rivers, and nearby wetlands if there is an earthquake...before the NorthMet project should be allowed to produce contaminated water, a plan needs to be in place to deal with the water for its entire lifespan.	PD22
19051	[Reverse osmosis] systems rely on electricity, and to my knowledge, can't function without electricity. Poly Met should have a plan in place to protect water in the case of an extended power outagewhether due to war, vandalism, terrorism, or massive infrastructure failure.	FIN05
19052	Any of the mine's premises, facilities, or equipment could also certainly be damaged by forest fire, tornado, lightning strike, collapse due to excessive weight of snow, ice storms, or other factors. The SDEIS should include analysis of the potential ways these forces of nature or manmade disasters could affect mine operations, safety, and potential for pollution, and adequate contingency plans to mitigate these risks.	PD22
19055	It is not acceptable for the SDEIS to be written with best-case-scenario language. The planned methods and SDEIS document should be revised to rely on redundant systems to protect our water quality and other environmental factors.	PD03
19056	Our economy here and the quality of life I enjoy are built on accessibility to clean water, vibrant plant and animal populations, and beautiful natural scenery.	SO02
<b>Sender Name (Submission ID)</b> Kerry Carter (54117)

14512	My family has successfully owned and operated an Auto Dealership in Virginia, MN for over 30 years. We certainly understand the economics of our local region, and the positive effects Polymet will have. My business won't necessarily serve PolyMet directly, but my business will be enhanced by the additional economic activity – construction workers, vendors, employees – that will come about as a result of the project. My community will be stronger because of that economic activity; frankly, the whole state will benefit.	SO01
<b>Sender Name (Submission ID)</b> Kevin (43027)		
12692	The SDEIS does not include a study of the costs to existing industries in the State of Minnesota, most importantly, tourism in the NE portion of the state....Tourism supports 20,000+ jobs in NE Minnesota. If this mine pollutes and impacts the region in a negative way, how will those jobs and revenue be affected? When people decide they don't want to vacation in and around both water and air pollution how many jobs will be lost and how much money will the State of MN lose in revenue?	SO02
12694	The SDEIS does not take into account health risks to people living in the area of the mine. NE Minnesota already has a higher cancer rate than any other part of the state. The SDEIS needs to identify these risks and potential mitigations. Health risks arise from both air and water pollution at the site and processing plant.	HU01
12695	What precautions are in place in the event of a 100 year rain or flood on the mine site and processing plant?	WR202
12696	How accurate is the flow model for the Partridge River? Reports are that it is underestimating actual water flow by 3 times. The entire model needs to be re-run over the course of many years in both below average, normal, and above average rain/snow fall years. How can Polymet put forth accurate pollution data when they don't even know the water flow in the primary discharge river?	WR003, WR077
12697	What proof is there in the SDEIS that earthen walls dug down to bedrock to contain the tailings piles water runoff will hold?	PD07
12700	In the event that Polymet declares bankruptcy who is financially responsible for the 200-500 years of clean up? What inflation factor was used in the calculation of yearly estimated costs? How can Polymet propose clean- up costs of three and a half to six million dollars per year will stay the same for each of the next 200-500 years? Inflation alone will multiply those numbers and costs. SDEIS needs to include information on financial assurances. This should not be handled at the permitting stage.	FIN01, FIN05, FIN08, FIN13
12701	Polymet should exchange the same quality of wetland for the amount that they are destroying. If this cannot be done, then the SDEIS needs to be revised and a new plan needs to be made. An acre for acre exchange is not right, as the 100 year wetland is a unique wetland and cannot be replaced once dug out of the Earth.	WET14
12702	The SDEIS does not accurately study the flow of water leaving the mine site. There is some flow ultimately leading into Birch Lake and into the BWCA that needs to be examined and included in the SDEIS.	WR081
17022	What is the projected ground seepage and how will Polymet propose to handle that form of water pollution exiting the tailings piles into underground aquifers? SDEIS does not answer this.	WR059, WR060
17024	Where has reverse osmosis been used on this grand of a scale (3 million gallons per day) to treat water tainted in sulfuric acid? What assurances does the public have that this will work? Where in the SDEIS does it state the back-up plan in case of catastrophic damage to this system? Reverse osmosis...[has] never proved successful on this type of scale. I need hard proof that this will work, not just assurances from Polymet executives.	WR143, WR144

<b>Sender Name (Submission ID)</b> Kevin Viken (43110)		
10169	I do not see anywhere within the SDEIS ... a survey of the microbiota currently present in the ecosystem and how those organisms will respond to the potential levels of leachate from the tailings ponds.	AQ01
11640	The water in the tailings ponds will be highly toxic without regard to the eventual pH of the water.	WR057
11643	Because the tailings are created from pulverized rock which has had its surface area increased infinitely and exposed to air/water, even slow rates of leaching will result in toxic levels of heavy metals/sulfides that will harm native flora, fauna, microbiota that are all critical for the proper functioning of the local ecosystem.	VEG06
11645	the magnitude of time the toxic water within the tailings ponds has to be determined. At some point it will escape because nothing can be contained in perpetuity.	WR057, WR128
11647	Financial assurance needs to be addressed and well laid out with adequate resources and adequate protections... To have adequate funds 2 things are necessary: a. Ensure adequate funds given different scenarios for the long term economic possibilities. B. Adequate protections of the money that is set aside is critical and requires that how it is handled must enshrined in the constitution.	FIN05, FIN08
11657	Waste from the NorthMet project that is leached in the water will be forever toxic because it doesn't have the advantage of radioactive decay that nuclear waste has.	WR070
11658	I would like it to be considered that the mine be required to be underground below the water table and the waste be used to backfill the mined tunnels. In my view we currently have the technology for this to be done safely for the very long-term.	ALT06
<b>Sender Name (Submission ID)</b> Khang Le (54225)		
16736	I don't know is it illegal if you changing the map and information that provide for the construction. The map that the polymet company providing is wrong, absolutely wrong, they had been rewriting the map of the swap where the mine, are going to be place on.	PD38
17359	The mining company dumping their rock into a swpp that having sulfite init and when sulfite meet with water they'll produce sulfuride acid that can make a huge damage the impact of the environmental that can change the ecosystem of living species inthere.	AQ08, AQ12
<b>Sender Name (Submission ID)</b> Kiersten Wilson (54359)		
18216	the amount of endangered wildlife is horrendous. If there is any chance, which there is, of destroying or affecting this wildlife, the project should come to an immediate halt. We cannot afford to risk losing any wildlife.	WI01
18217	what about the endangered mammals, reptiles and birds? What will they do during this project? Even if it doesn't directly affect the animals, the sound, water pollution and deposition of dust will surely affect their lives.	N04
18218	I also realize that you plan to plant more wildlife and trees at the site after the mining is over, but what about those twenty years when the animals may be deprived of their homes? What happens when they drink polluted water? As I have said before, we cannot risk the lives of these innocent animals over one mining site in Minnesota.	VEG05, WI02, WI04
18219	As you can see, it would be a great loss not to have this wonderful mining site in Minnesota, but the lives of the wildlife should come first. The lives of these creatures are at great risk, and it would be silly not to disengage this mining project.	WI01

<b>Sender Name (Submission ID)</b> Kirby (44497)		
10647	I never see anything published in local newspapers or voiced on the radio as to what the mines do to meet NAAQS & Clean Water Act requirements.	PER35
10649	Lead & mercury will be leached into the land, air & water.	AIR05, MERC20, WR070
<b>Sender Name (Submission ID)</b> Kirk Haldorson (18369)		
14674	I don't want to be dependent on China or another world. Everybody that took us down here today used copper. Everybody that has a phone has copper. Where are we going to get this from? Our country – our state and our country needs to be independent. So give them a chance.	SO10
<b>Sender Name (Submission ID)</b> Kirsten Anne (11515)		
2467	The jobs will only last twenty or so years but the cleanup could last more than 500.	FIN10
<b>Sender Name (Submission ID)</b> Kirstin van den Berg (47081)		
11224	My biggest concern with a copper nickel mine is the potential for contamination of our natural water systems. I understand that a potential water contamination analysis was done, but that it did not reflect the appropriate depths of drilling/mining and its effects on the surrounding water tables. Water tables are infinitely connected...I am worried that if a contamination situation should occur, that it could be dangerous. I do not believe that Polymet could control the contamination even if they had the financial resources to do it.	WR037, WR071
11225	More and more of our population (especially young people) are getting sick with cancers and other body systems disorders. Everything that we put into our air, soil and water contributes to our well-being. A copper-nickel mine that has so many risk factors is not an industry that will contribute to a healthy living environment in our state.	HU03
11227	Copper-nickel mining may seem like a good short-term solution for local jobs, but is not a good long-term solution for a state where we pride ourselves on our clean air and clean water.	SO01
<b>Sender Name (Submission ID)</b> Kit Richardson (54827)		
18543	I am very concerned about the potential negative impact on...the other business which creates many more jobs in this region than the 350 jobs touted by Polymet; the tourism industry, which could disappear with the potential destruction of the Boundary Waters, the St Louis River watershed, and other protected wilderness areas in this state.	SO02
18545	the evidence included in the Polymet SDEIS suggests very clearly that there are still too many unanswered questions and concerns for you to permit this project, and any others like it, to move forward.	NEPA09
18546	I urge you to reject the Polymet application and to rather encourage job creation by protecting our natural resources and promoting environmental tourism in the area.	SO02
18547	if you feel strongly that we need more copper and nickel, perhaps you could support a greater degree of recycling of all our existing machines and devices which contain those metals.	ALT09, ALT16

<b>Sender Name (Submission ID)</b>	Kristan A Wegerson (38584)	
9749	The tracts of land that are proposed for transfer are small ... and don't compare to the size and quality of the lands that would be transferred. Tract 1 has hazardous waste material on premises, ... and was logged in the past 60 years and has immature forest. Tracts 2, 3 and 4 have limited accessibility. ... have outstanding mineral subsurface rights. Because the land exchange involves the transfer of unequal valued land, it is in violation of the FLPMA.	LAN03, LAN04
9766	Mercury deposition would degrade the water resources of the Partridge and Embarrass River watersheds in violation of Minnesota law.	MERC23
9771	Figure 5.2.2-53 shows that annual maximum concentration of sulfate in the Embarrass River downstream of the PolyMet Plant site would be well over 100 mg/L for the 200 year modeling period. 5-200 This would be in violation of Minnesota's wild rice standard.	WR162
9774	GLIFWC notes... for example the cumulative effects section for the Partridge River, the test states all water evaluation criteria would be met, though water quality standards would be exceeded for several constituents."The proposed project does not meet water quality standards.	WR107, WR109
9796	The wetlands to replace those at the Mine Site would be out-of-kind and off-site and are significantly inferior to those being lost. Because the land exchange is not in compliance with EO 11990, it can not proceed.	WET04, WET14, WET15
9797	The data in Table 5.2.7-14 indicate that calculated visibility impacts greater than 5 or 10 percent could occur at some point within the BWCAW on a small number of days each year." 5-415 This would appear to be in violation of the Class I airspace protections.	AIR08
9801	I have serious doubts about the geotechnical stability of putting millions of tons of material on the aged and deficient current tailings basin...the geotechnical stability of the stockpiles and liners is still unknown...The SDEIS is incomplete and deficient	GT01, GT04, GT10
9803	The omission of financial assurance from the SDEIS is a fatal flaw...Does financial assurance cover the cost of a major environmental disaster during mining if the company can't afford to pay? Will the public pay?...If you assume that the post-closure period would be 480 years (500 years at the Plant Site-20 years of closure) you get \$2.256 billion dollars (\$4.7 x 480). And these estimates are in 2014 dollars! This is inconceivable! Read SUPERFUND SITE.	FIN01, FIN13
9806	"Cancer risk from monitored background air concentrations (3E-05) is greater than the incremental cancer risk guideline value of 1E-05, thus cumulative risk is also above this value." 6-88 This is saying that Polymet will be hazardous to your health.	HU05
14036	...the solution to pollution is dilution, and we don't have any other plans to contain this. Without a plan to prevent this acid mine drainage in the first place, and without a plan for "adaptive water management" if it does occur, the SDEIS is deficient.	WR130
14037	If the XP-SWMM and GoldSim models are inaccurate, the entire water quality evaluation is unreliable and should be rejected. ...the model used by PolyMet underestimated low flows during winter by as much as a factor of five in many cases...DNR hydrologist Mike Liljegren said it is "more than likely" that a new water quality model will need to be developed before a final version of the SDEIS can be issued. And new modeling on water quality could well impact other results in the study, requiring new runs of the other models in the SDEIS. "	WR003
14039	[non-native invasive] plants should not be used for revegetation	VEG05
14040	Destroying [Canada lynx] habitat in LAU 12 or causing a decrease in its quality or quantity would be in violation of the ESA as enforced by the USFWS.	WI02, WI11
14044	The PolyMet Proposed Action has not determined how it will safeguard...protected resources [that are important to Ojibwe culture]. The SDEIS is deficient.	CR01

316	EIS is not clear on how long pollution control, reclamation and water treatment will take after the mining operations cease.	PD05
317	I am gravely concerned about initiating a multi-million dollar project which will have a centuries-long impact on Minnesotans without hard, concrete facts regarding the potential harm to water and river flow in the region.	WR038, WR128

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b> Kristin White (9848)		
318	I am concerned the EIS itself contains flawed and/or inaccurate data concerning the effect the mine will have on the Partridge River flow. Recent developments have shown the DNR has admitted that estimates of the proposed mine's impact on the river are nearly three times too low.	WR003, WR086, WR091
319	Third, I believe that the costs of the mine greatly outweigh the benefits and am concerned the DNR did not conduct a proper cost-benefits analysis.	SO01
320	If PolyMet is not around to restore water and forests, who will pay for this? I believe that until we can answer that with certainty we should move forward with this plan.	FIN01
321	I would request the DNR take the No Action Alternative wherein the NorthMet project is not implemented and no land transfer takes place because: (1) the parties cannot concretely determine how long the environmental damage will last; (2) the EIS contains flawed river flow data; (3) the costs greatly outweigh any limited benefits; (4) PolyMet cannot guarantee it will be in existence for the duration of the environmental restoration; and (5) PolyMet has not posted a bond to ensure funds are available for pollution problems and mine reclamation.	ALT01
1398	I would propose that PolyMet post a bond, estimated in the amount of \$500 million in order to provide financial assurances that it will be able to pay for the long-term water treatment and that, even if the company goes out of business, it will continue its commitment to the state of Minnesota. Absent a bond in an amount that would cover any environmental degradation and subsequent litigation, I would recommend not moving forward with the planned project.	FIN01, FIN08
<b>Sender Name (Submission ID)</b> Kristina Pogorelc (42087)		
2018	the SDEIS is insufficient ... because it is lacking vital information about long-term water treatment and how it will be paid for -- information that is necessary to decision-makers.	FIN01
2020	Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl.	WI01, WI02
2021	Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk.	SO01
<b>Sender Name (Submission ID)</b> Kristina Smitten (44371)		
10404	We cannot continue to favor short-lived economic gains compared to long-lived environmental fragility; as the real long-term economic costs are almost incalculable.	SO01
10407	The lack of clarity in long-term environmental and human impacts as well as lack of full analysis of alternatives, leaves large gaps in ability to provide a solid decision. A decision to approve is not acceptable.	HU01
10415	Deny PolyMet a state permit to mine.	PER35
10416	Reject the SDEIS as inadequate and the PolyMet project as environmentally harmful.	GEN01

11344	Minnesota is home to so many beautiful ecosystems and places that are treasured by millions of people and I feel it is only just that these ecosystems are protected and preserved so that future generations of Minnesotans can enjoy and observe them in the same condition and capacity as we do today.	LU06
11347	Evidence from peer-reviewed research and the environmental consequences observed in states where sulfide mining has been employed, strongly suggest that allowing this type of mining operation to exist in the same watershed as some of Minnesota's most valued wilderness areas and sensitive ecosystems will be catastrophic to the legacy and condition of these areas.	WR023, WR195
11354	Many of the lakes in Northern Minnesota, including Lake Superior and those in the Boundary Waters, have low alkalinity and therefore have a low buffering capacity against changes in pH. When pH decreases (becomes more acidic), say as a result of sulfuric acid in mining effluence, calcium carbonate becomes less available and the solubility of silica is reduced.	WR001, WR111
11359	These consequences of increased acidity can reduce the viability and success of biota such and snails and clams which need calcium carbonate to build their shells, and to diatoms which need silica to build cell walls. Studies have demonstrated that waters acidified by acid mining drainage (AMD) can cause complete changes in the community composition of diatoms. Diatoms are a main primary producer in oligotrophic (low primary production) systems and alterations in their community composition could cascade into issues and changes throughout the food web.	AQ08, AQ21
11364	Because water bodies in northern Minnesota are oligotrophic and often have long water residency times, the influences of mining contaminants can be long-lasting. Decomposition and growth is slow in these systems which can equate to more accumulation of toxins in sediments and increased bioaccumulation of toxins in the tissues of animals such as fish. These consequences could impact the fishing industry and the health of those who consume fish (e.g., humans, birds, other wildlife) from areas exposed to AMD.	AQ08, AQ21
11369	Wetlands are like ecological kidneys; filtering and decomposing contaminants and retaining sediments that could otherwise end up in streams, rivers, and groundwater. As a result, they play an invaluable role in the condition and safety of municipal water. Removing over 1,000 acres of wetlands for mining would reduce key habitat for migratory birds and would be detrimental to water quality in the surrounding watershed.	WET24, WI02
11372	I recognize there is potential for job development with the success of sulfide mining. However, its economic return is short term. Like hydraulic fracking, sulfide mining is unsustainable and in the end will leave in its wake irreversible and costly destruction.	SO01
11373	I urge you to think of the billions of dollars the wilderness areas and ecosystems in northeast Minnesota are worth, not only for their tourism and industry value, but for the ecosystem services they provide (e.g., mitigating floods, cleaning ground and surface waters, providing critical habitat), and the intrinsic value they have.	SO02
11375	Please love this state as much as I do and refuse to let sulfide mining rape the integrity and condition of the irreplaceable habitat and wilderness areas in northeast Minnesota.	WILD02
<b>Sender Name (Submission ID)</b> Kristine Mosher (54488)		
18020	I have reviewed a few sections of the SDEIS and found that there is no provision to monitor Mercury pollutants that could be present in the water that is returned to the environment.	MERC16, MERC17
<b>Sender Name (Submission ID)</b> Kristine Norton (46911)		
10822	I understand that this company has little experience, is not focused on Minnesota and keeping the area free of contamination, but is instead happy to dig up the land near our pristine wilderness and lakes.	SO02

10823	I read, today, in the Star Tribune that PolyMet has a poor environmental and human rights record and has an agreement to sell copper concentrate to China. ...This is NOT a good move for the State of Minnesota!	SO02
<b>Sender Name (Submission ID)</b> Kristine Osbakken (18381)		
2858	PolyMet claims that this increase in mercury to the Embarrass River won't affect mercury in fish in the St. Louis River because of the water treatment plant that will operate when the mine is closed and the west pit is flooded. Referring to SDEIS page 5-8. However, it will be 40 years until the treatment plant kicks in. What about all the mercury pollution within that 40 years? The fish are not fit to eat in the already heavily polluted lower St. Louis River.	MERC02
2864	the PolyMet SDEIS does not adequately address [mercury] effect the lower St. Louis River.	MERC19
2869	The PolyMet SDEIS should not be finalized, nor the project approved, until a full study of the TDML of mercury in the St. Louis River proves that PolyMet increased mercury loadings will not increase fish contamination.	MERC22
3206	How much polluted wastewater is going back and forth through nine miles of pipes? What is the total volume wastewater in the tailings and the processing residue? Just how polluted is the wastewater and waste rock piles in the pits, pump ponds, tailings basin and the hydro-metallic waste dump? These answers are missing.	PD15, PD30, PD36
3207	Once pollution is in the groundwater, it will be too late to fix. It will affect the Partridge, Embarrass, it will affect the whole entire St. Louis watershed	WR115
<b>Sender Name (Submission ID)</b> Kristine Vesley (43225)		
15820	All in all, I believe that the risks and wetland losses outweigh the possible (and short-term) economic benefits.	SO01
15821	The wetlands and waterways that would be lost and/or contaminated are precious to everyone in Minnesota.	WET24
15822	There is no way PolyMet could provide financial assurances sufficient for a real disaster, and we all know real disasters can and do happen. Some disasters cannot be cleaned up with dollar bills.	FIN01
15823	I have learned enough to worry about the water issues, including any potential mercury and other pollution of the treasure that is Lake Superior.	WR111

11924	I am not convinced that the SDEIS adequately considered alternatives to the project as designed. The option of an underground mine needs more consideration.	ALT06
11925	The SDEIS did not demonstrate that the technology proposed to prevent acid mine drainage will work at scale and over the many decades necessary to protect Minnesota's water quality.	WR129
15095	[The SDEIS did not] demonstrate that the funding will be available to implement that technology over the next several centuries.	FIN01
<b>Sender Name (Submission ID)</b> Kurt Seaberg (44647)		
12241	The number of jobs generated will be small and temporary and the risk of irreparable damage to Minnesota's environment will be enormous.	SO01
<b>Sender Name (Submission ID)</b> Kurt Wetzel (54911)		
19236	This document fails to place the prospective mine within a larger historical, economic, and environmental perspective--the big picture (tbp)--necessary for comprehensive understanding and evaluation of its proposals; without such contextual broadening the document is reduced to a mere roster of data. Indeed, the SDEIS itself eschews any such contextual analysis (p. 6-1, "It is not possible, however ....").	CU14
19245	The primary failing of the SDEIS is that, seen from a broader perspective, it is internally inconsistent, reflecting a larger social schizophrenia wherein we demand both economic growth and a functional environment. Because the planet is already overpopulated and over-engineered, environmental impact must inescapably accelerate as function of economic growth. The proposed mine is but an increment in both these latter processes.	SO04
19246	At some scale the costs of growth outweighs the benefits and additional economic expansion becomes irrational: we end up poorer rather than richer, worse off rather than better off. This is happening because many costs are not being internalized, primarily, though not exclusively, environmental.	SO01
19256	Polymet, besides its main business focus of concentrating various metals from low grade ores, is additionally mandated to concentrate and contain a host of substances from its waste streams. In order to do this it must disperse something else, i.e. create and release a compensatory high-entropy flow into the environment. This stream in turn is chosen so as to avoid regulation: atmospheric carbon. Technology can thus shift the specific form of compensatory entropy, but not its required (by the second law of thermodynamics) amount. Until we throttle the rate of atmospheric carbonization to that which nature can cycle it, we will not be serious about impact control; we don't do that because in an industrial society based on fossil fuels, as that would stop growth. The SDEIS simply trades one form of impact for another, it does not reduce its quantity, and transforms it to a form that is not as localized and not as immediate. Carbon dioxide is transparent and therefore out of sight.	AIR01
19259	The SDEIS has a glaring omission: enforcement of the conditions of the permit. The entire document is strewn with verbs in the future, subjunctive, and intentional verb tenses--what Polymet will do, how they would respond, and what actions they will take to address changing conditions. Promises being cheap, actions and solutions being expensive, enforcement is critical.	PER06

<b>Sender Name (Submission ID)</b>	Kurt Wetzel (54911)	
19261	The land trade proposal is the primary failing of the SDEIS with respect to enforcement; in our society property endows the owner with power. Owners have dominion over their land. Once the surface property is traded away the SDEIS will become only so much meaningless paper, and the mine site will be immediately fenced, gated, and guarded (fgg). A split estate gives wtp leverage; a united estate reduces public inspectors and regulators to either guest or trespasser status. This is forewarned by language of the SDEIS in reference to areas of the project now owned by Polymet, stressing that it is private property (pp.4-166, 4-314, 4-350, 5-513).	LAN04
19263	There still ought be a fence and a gate for security and safety considerations, but the guardhouse must be staffed by a public employee. Polymet will still own the minerals, but the mine must remain property of wtp. If mining is inconsistent with the management goals of the USFS, then management of the the mine site lands ought be transferred a more appropriate federal agency, say, the Environmental Protection Agency. In any case, the federal government would have to be reimbursed either in land or money for the surface degradation inherent to such a mine.	LAN04, PD30
19265	The regulating personnel would have to have an office or trailer on site, and be staffed by a rotating team of specialists, from construction inspectors, hydrologists, air quality specialists, to environmental chemists. They would be intimately familiar with the permit conditions and see that they are being fulfilled. Their reports, photos, and videos would be put on-line weekly so that wtp could be satisfied that our property interests are being upheld. Unrestricted access to the privately owned plant site and transport route by the inspection staff would have to be guaranteed as a condition of Polymet using public land at the mine site. This inspection team would be public employees and all their expenses would be paid from public funds, with both reimbursed by Polymet.	PER24
19272	The SDEIS must also require a financial assurance package, not only for shutdown and cleanup (after the company has extracted and sold their subsurface mineral property and can leave), but also for construction and operation. This gives wtp leverage which private companies respect: each permit violation would result in, for instance, a per-diem fine until the violation is corrected. At mine closure Polymet would re-coop all funds remaining in escrow. Thus there would be two financial assurance accounts, both fully funded, before any mining activity begins.	FIN05, FIN08
19277	The Cumulative Effects portion of the SDEIS not only fails, but fails spectacularly. The directive is to consider "reasonably foreseeable future actions" in the region. The joint preparers must be in need of strong corrective lenses if they cannot foresee as a direct consequence of the acceptance of this proposal a flood of subsequent sulfide mines in Northeast Minnesota. Approval of the SDEIS would be but a starting-gun trigger for a northern Minnesota copper-nickel rush. The cumulative environmental degradation would be disastrous.	CU04
19283	If wtp and our representative agencies were serious about environmental protection, we would, in lieu of outright rejection, cap-and-trade this type of mining: we would put up for auction one and only one (the cap) right-to-mine permit (rtmp) for sulfide mining. This would be the single and only such rtmp let. Any person, any company, or any organization could bid on the permit. Once the high bidder paid the winning bid price, the permit would become their property, which they could sell (the trade), lease, exercise, or hold indefinitely without exercising their rtm. Once a company acquired the rtmp, through either auction or subsequent purchase, and exercised that right to mine( subject, of course, to all regulations and standards within the permit), both the permit and the mine would have to stay in the same estate--until the mine was closed and successfully re-claimed according to permit prescription, including a specified post-closure span. Then and only then could the rtmp be re-exercised, sold, leased, or held.	NEPA01
19286	In lieu of a cap-and-trade scheme, the regulatory agencies ought minimally issue a moratorium on any subsequent mine once an initial permit has been granted. Granting of subsequent permits would depend upon the land stewardship success of the initial mining and closure operation. Thus the first sulfide mine would be an environmental test-case. For a host of economic efficiency considerations, this is a much less desirable option than cap-and-trade.	NEPA01

<b>Sender Name (Submission ID)</b>	Kurt Wetzel (54911)	
19292	The minutia within the land trade scheme was largely a smoke-screen for the central issue: what is the final environmental loss, not whether or not the land trade balances with respect to land types, functions or value. Nature doesn't care to which estate it belongs, or whether it is public or private. These are but scribblings in a county ledger. The SDEIS should have included a concise summary of how much of the planet's ecosystem would be destroyed and compromised if this proposal is realized. In addition it should have given the global rates of such destruction so that the public could better understand that this unsustainable global trend just is the cumulative effect of such incremental impact as in the proposal.	LAN01
19299	The SDEIS omits a whole class of external costs, namely the social costs associated with the potential industrialization of northeast Minnesota. Indeed the Socioeconomics (p.S-493) portion of the document shows how slippery and subjective the whole concept of cost actually is; what is one person's benefit is another's cost. For a large portion of the residents of the Minnesota Arrowhead the reason they choose to live there is the relatively undeveloped quality of the environment. More people, more jobs jobs jobs, more roads, more traffic, more extraction, more commerce, man camps, rising crime ..... these represent what many of the current residents would have to give up, not what is gained. Ely, Minn. as Williston, N.D. I see no provision in the SDEIS which outlines a system of shunting money from the pockets of the beneficiaries of this new industry--mine employees, investors/owners, support businesses, etc.—into the pockets of those who bear the social costs.	SO04
19301	The title history of Tract 2 of the land exchange seems odd, even suspicious. Its title was in the public domain (Lake County), passed into the private domain by purchase, and then is to be used in exchange for public lands (p. 4-396). So what was once public becomes public again to offset loss of Federal land to Polymet. The purchase of county land by Lake Forest Enterprise, Inc. should have been detailed and made transparent in the SDEIS. Was this by auction as is usually required? or by backroom deal? What gives?	LAN04
19302	As the three lead agencies "have jointly prepared the SDEIS" (opening sentence of the COVER SHEET), how can it be that these same agencies that will issue the critical Record of Decision? So, they will be determining the adequacy of their own work? Is not approval a foregone conclusion? Who designed this arrangement? In any case, it is unacceptable. It would inspire much more confidence if an independent agency (the EPA for instance) or an independent committee appointed by Governor Dayton made the final decision to accept or reject the proposal.	NEPA08
19304	The several sections of the SDEIS dealing with GHG emissions are confusing and contorted. First it is noted that the annual GHGe emissions are under the USEPA threshold (Table 5.2.7-7), but we later are told that the threshold is not a limit, but rather would simply require BACT for these emissions (p. 5-429). So apparently Polymet will not be required to apply such technologies to its GHG emission sources. This is further egregious since the limit, $1.0 \times 10^5$ tpy, is arbitrarily applied to "stationary sources" only; if all the Polymet sources are totaled, they are nearly double the threshold (table 5.2.7-8). But still would be of no consequence, since the threshold is not a cap. The threshold is toothless, even silly. And if the indirect sources are totaled, the threshold is exceeded by a factor of over 7, with the same non-effect. The SDEIS is a permit to spew GHGs without limit and with the nod of our regulatory agencies, and thereby with the permission of all citizens. This ought be simply and directly stated.	AIR13
19305	But since the GHG emission rate totals are so enormous, the SDEIS attempts a rear-guard apology in the form of minimizing the numbers by comparison to state, national, and global rates: .44%, .01 %, and .0014% respectively. Note first that these would be hypothetical additions to the respective base rates. The Northmet Project would emit GHGs at a rate of nearly one half of one percent of the whole rest of the state! Just this one mine!	AIR01
19306	Why aren't some other emission comparisons listed? For instance, how many units of GHGe are emitted per unit value produced by this mine? and then give the number of units of GHGe/GDP for comparison.	AIR01
19307	These GHG numbers are especially troublesome given the (albeit, denied) likelihood of a half dozen or more of such new mines. Because these likely mines are not considered, the cumulative numbers are not "done".	AIR01

7656 [I] feel like the mining could open up more job opportunities and could be very beneficial. SO10

**Sender Name (Submission ID)**    Lance Groth (45639)

12846 Opposed to sulfide mining in Minnesota. 300 jobs is not worth trashing the ecosystem. SO01

12847 Centuries of waste water treatment, 200-500 years worth. Long after everyone involved today is dead, future generations will be left holding the bag for a polluted mess, and what recourse will they have? None at all. WR037

12848 Polymet says they will build a five mile cutoff wall anchored in bedrock to contain water that flows through the tailings. [Polymet's plan] can not guarantee there will be no fractures anywhere in the bedrock or the wall, before, during or after construction [ to contain the contaminant] WR019

12849 [No financial guarantees]. At a recent legislative hearing, talk of financial guarantees amounted to vague hand waving about financial instruments and an admonition that "this will be addressed during permitting." FIN08, FIN13

12850 benefits do not stay in Minnesota. PolyMet is a Canadian company that has never operated a mine (!) and that's where the profits will go. Glencore is a Swiss company with commitments to sell copper to China, and that's where the copper will go. Minnesota gets some crumbs in exchange for trashing its environment. SO06

12851 8) In terms of resource extraction, the mine simply isn't needed. The ore deposits are not even in the top 10. The world will have plenty of metals without Minnesota's ore. NEPA02

**Sender Name (Submission ID)**    Lance Johnson (18227)

2192 I would like to state that in my opinion, this -- is that the SDEIS is more than sufficient and it is time to expedite the final EIS in preparation for this project. NEPA16

2193 PolyMet will provide fantastic opportunities on the Iron Range by providing great-paying jobs for their direct-hire employees and -- and not just those 320 jobs, but -- and employees of Iron Range contractors and engineering firms, vendors, and other support industries. PolyMet will also generate millions of dollars in taxes for the State of Minnesota, and more importantly, millions of dollars that will go directly to the school districts and improving educational opportunities for our children. SO10

**Sender Name (Submission ID)**    Lance Kupka (18097)

3225 It is estimated that PolyMet will pay 15 million dollars in state taxes annually, once mining begins. ...this money will help provide more programs for our schools, more technology for our schools, and ultimately more opportunities once -- for the children once they graduate. SO10

13464 We know that the mine can operate safely and that PolyMet has committed to monitoring and treating the water for as long as need be. What is the decision? This mine will be safe. It will generate great income for the local workforce, and as I have outlined in detail above, it will have a tremendous positive impact on our schools and on our children for decades to come. SO10

**Sender Name (Submission ID)**    Larry (9503)

180 The SDEIS does not address any contingencies for possible problems for the next 200 years at the mine site and the next 500 years at the tailings pond. PD22

<b>Sender Name (Submission ID)</b> Laska Nygaard (43233)		
16135	Forcing 500 years' of Minnesotans to suffer for the decision of making money now over a period of a mere 20 years - ONE generation - is illogical.	SO01
16136	Money is good. I do not begrudge PolyMet it's wanting to make money. I begrudge it wanting to make money in such an inherently dangerous fashion, in an area of vulnerable environment, in an industry in which the history of cleanup is poor, such that states in which such mines exist/have existed before (and so suffer from pollution, particularly water pollution) have suffered from the pollution AND companies have failed to pay for and ensure the cleanups.	FIN01
16137	All cleanup costs - those for the 200 and 500 year durations - should be paid by PolyMet up front. If this is not feasible for PolyMet, then Polymet should understand that the plan is not feasible. Note in addition that the costs of clean up are often underestimated, particularly given the impossibility of knowing actual damages to be addressed and actual inflation 200/500 years in the future.	FIN01, FIN05
16139	Contractual obligations, laws and regulations to ensure environmental protection/clean up only go so far. We should not bet 500 years of our environmental quality of contractual, legal and regulatory provisions hopefully being met. This project is too big an too dangerous to approve it based on betting that we know all that could go wrong over 500 years.	GT14
<b>Sender Name (Submission ID)</b> Laura and Mr. Neal Deaton (40138)		
15306	he most precious and life-giving commodity that we have on the planet is water. No amount of rationalizing can prove that this proposed project will bring about more benefits than irreparable damage.S	GEN01
<b>Sender Name (Submission ID)</b> Laura B Melander (54740)		
18880	It will bring water pollution and tax payer cost.	WR037
<b>Sender Name (Submission ID)</b> Laura Berglund (44483)		
11295	Summitville Gold Mine, Colorado The company filed for bankruptcy, leaving cleanup costs to the public. Zortman Landusky Mine, Montana In 1998, the company abandoned the site and filed for bankruptcy. After several lawsuits against the mining company and its creditors following the company's bankruptcy, Montana's taxpayers are still liable for anywhere from \$8 million to \$90 million. Gilt Edge Mine, South Dakota The parent company, Dakota Mining, went bankrupt and abandoned the mine in 1999 with only a \$6 million bond in place, an amount insufficient to cover water treatment for even a single year. Please ensure that Minnesota taxpayers are not left with a similar burden as a result of the PolyMet project.	FIN01
11303	In order to adequately protect public health and provide adequate water treatment for mine runoff, it is absolutely critical to have accurate data regarding speed, quantity, and direction of water flow. Basing a water flow model on data gathered during one atypical year is neither responsible nor defensible. Without an accurate estimate of water flow, there is no way to provide for adequate water runoff treatment.	WR003, WR052, WR071, WR081, WR086, WR091
11329	Given the track record of smaller, similar mines elsewhere in the U.S., and the fact that the mining companies went bankrupt and left state taxpayers the bill for perpetual remediation and abatement, I am not confident that PolyMet will be able to meet its obligations under Minnesota law.	FIN01
12818	Nobody wants to wonder whether living downwind of a mine means having to breathe carcinogens. Air doesn't respect political boundaries like state lines or national borders....	AIR11

- 13019 Economically, the PolyMet mining would create many jobs for local citizens. This is an incredibly valuable reason to establish the mining operation. Citizens of Northern Minnesota need jobs and there would be \$332 million made per year from the extracted minerals. Although these are significant short-term benefits they are outweighed by the long-term costs.    SO01
- 13025 NorthMet mine operation should not be built in Superior National Forest. Consider more alternatives. Is there a site around the same area that would not affect Lake Superior or other water bodies? An underground mine may have less impact on the streams and rivers and would preserve the natural wetlands.    ALT01
- 15928 First, the amount of wetlands that would be destroyed is incredibly significant and would affect the organisms that inhabit them.    WET24
- 15929 Many species such as the lynx, bald eagle, gray wolf, eastern heather vole, wood turtle, yellow rail and many more could be affected by the mining.    WI01
- 15930 Aquatic organisms that find their home in the streams and rivers connected to the wetland would most likely be adversely affected with the change in streamflow, loss of connectivity of the streams and the poor water quality.    AQ05, AQ24
- 15931 Another concern is the affect on the water quality in the area. There are already high levels of mercury in fish tissue without mining operations. The copper-nickel is locked in to the rock with sulfides. When sulfide comes into contact with oxygen, it produces sulfuric acid and releases soluble metals including mercury, iron, copper and nickel. This would increase the already high levels of mercury in the water.    WR001
- 15932 I am mainly concerned with the effects that the copper-nickel mining would have on wildlife habitat, native species of the area, nature of the land, and water quality.    WI01, WI02

**Sender Name (Submission ID)**    Laura Millberg (40882)

17590 I have serious concerns about the inadequate Financial assurance and the careless disregard for potential disastrous environmental effects. ...Legislator Kahn has brought up the need for a third party insurer. FIN01, FIN08

17591 The proposal is sorely lacking in [discussion of financial assurances and potential disastrous environmental effects], it's inadequacies are dangerous. Please do not proceed with such a poorly thought out proposal. You owe further examination of these issues to the citizens of Minnesota PER03

**Sender Name (Submission ID)**    Laurie Bailey (42715)

14330 We're talking about 300 jobs for 20 years with ~500 years (or more?) of water treatment required. Based on the water samples taken at PolyMet's model mine site, we should expect that not all water contamination will be prevented. It is absurd -- short term benefits for some, with very long term consequences for many, many more. SO01

14331 it is not fair to push this cost on to future generations. Our kids and their kids and their kids...will pay for centuries to come, or the water will go untreated. Neither is acceptable. GEN01

14332 Taxpayers in other states are paying millions of dollars to clean up streams and rivers at other copper mining sites across the country. FIN10

**Sender Name (Submission ID)**    Lawrence A Martin (54486)

18006 Although the economic conditions of NorthEast Minnesota merit attention and support from all Minnesotans, those needs are not well addressed by the proposed mine, which will generate a very modest number of good paying jobs at the expense of its natural resources in creating a Sudbury-type area of desolation. SO01

18007 Incomplete/Inadequate Plans For Handling Reverse Osmosis Brine.(...) The reverse osmosis technology has not been demonstrated to be capable of handling the magnitude or duration of the treatment required to handle the waste dump. In particular, the reverse osmosis process will generate a brine from its operation. The current Supplemental Draft Environmental Impact Statement for the Poly Met North Met sulfide mine appears to dismiss concerns about the disposal of the brine, without quantifying the amount of the brine over time, by indicating that it would be transported offsite, to an undisclosed location, using an undisclosed method of transportation, to that presumably contract disposal facility. WR143, WR145

18009 Ill-Suited Location for Sulfide Mining. (...) Sulfide mining appears to be viable in dry areas such as Arizona, but the exposure as proposed of the bedrock bearing dispersed low quantities of ore to air and to the abundant surface and ground water of NorthEast Minnesota can only be accomplished with technologies that are currently undeveloped or, if developed, have never been utilized to handle the size of the proposed project and the duration of the pollution threat already documented. PD26

**Sender Name (Submission ID)**    Lawrence Aho (54718)

18513 We have trusted the DNR and the MPCA thus far to keep our water and air clean. I don't understand why we don't trust them now. I understand that this is a new type of mining but I believe that it has been thoroughly checked out. We need new industry on the Mesabi and Vermilion Iron Ranges that keeps the environment safe. The roadblocks that we have put on Polymet Mining and other nonferrous mining companies I believe have gone overboard. PER34

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Len & Mimi Jennings (21834)		
9555	The proposed Poly Met mine should not go forward because the SDEIS, which is seriously flawed, has not shown that mining of precious metals in rocks with sulfide can be done safely in this environment, without serious water contamination and destruction to wetlands and habitat.	PD01
9556	Recent DNR documents agree that the water flow model of the current SDEIS is inaccurate. This calls into question many of the forecasted impacts to water quality, wetlands, and rare habitats. With more water moving through the site, polluted water from pits and waste rock will more easily and quickly reach lakes and rivers. It is thus likely that more area will be polluted, and that the pollution will be greater than anticipated.	WR003, WR165
9583	The SDEIS seriously underestimates the destruction of wetlands, and has an almost “fantastical” proposal for mitigation. The size of the potential wetland destruction (up to 6000 acres) is breathtaking. Much of the modeling was based on inaccurate water flows, so more wetlands would likely be destroyed.	WET04, WET07
9603	[B]ogs and coniferous swamps which will be affected, are extremely difficult to restore. Do we actually know it can be done?	WET05
9605	[T]he land swap is not a swap of equal value.	LAN03
9606	Habitat destruction is also not adequately addressed. In addition to the issue of more water flow than expected destroying more wetlands than expected, the number of trucks going back and forth, the 24/7 noise and vibrations of running the plant and the mine will disrupt habitat.	WI02, WI05
9608	The assumed performance of water capture systems in the SDEIS is of 90% or greater. This high level of performance is not realistic. Engineering controls include the seepage capture system at the flotation tailings basin, the cap and liner system and the hydrometallurgical tailings basin, and the discharge control feature for the west pit lake. Failure or under-performance of any of these features will result in water quality impacts that are not described in the SDEIS.	WR018, WR129
9610	How can we know we can treat polluted water for several hundreds of years, let alone into “perpetuity”? Think of how much change occurs in our lives in just 50 years, let alone 500! The assumption that human constructed water capture and treatment facilities will last 100 years is not believable. Do we seriously think Poly Met is going to be around 300, or 500 years from now?	WR037, WR129
9613	False Assumption: We’ve studied this for so long that we know enough and should just get going. Actually, the opposite is true. If Poly Met were able to mine without problems, their project would have been approved years ago.	NEPA15
<b>Sender Name (Submission ID)</b> Len Anderson (19512)		
13246	Cumulative impact is mandated by NEPA, and I think the attempts at cumulative impact were not adequate to what NEPA policy demands.	CU14
13258	Cumulative impact for sulfate and methylation of mercury I think is one of the biggest weaknesses of the document. The cumulative impact is calculated and discussed for the Partridge River and the Embarrass River and then stops at the mouth of each of those rivers, and it appears that the authors think that the movement of sulfate stops at the mouth of those rivers, but in fact, it continues all the way down the St. Louis River to the estuary, and the modeling for cumulative impact of sulfate on methylation of mercury needs to be done all the way down to the estuary.	MERC10
13259	[The St. Louis River] is listed under 303(D) of the Clean Water Act as impaired from mercury, and our children are being born with dangerous levels of mercury in their cord blood. There is no TMDL yet for the St. Louis River, even though it has been a work in progress for 16 years.	MERC22
13260	The MPCA said in February of 2013 that we do not know enough to do a mercury TMDL for this watershed, but now as I read the SDEIS, they claim that we know enough about mercury in this watershed to permit this mine which will be generating mercury and sulfate.	MERC22

6970	the release, distribution, metabolism, and ecological fate of mercury in the wetlands, ground water, and surface waters that include not just the Partridge and Embarrass rivers, but also the St. Louis (which has a TMDL for Hg) and the Lake Superior Basin is not addressed to most observers' satisfaction.	MERC19
6994	The SDEIS does not address the loss of and degradation to critical moose habitat, or the likely dramatic impact on moose migration and life stages from the actual mine area industrial disturbances. ... A similar issue exists regarding assessment of impacts to lynx.	WI01, WI02, WI03
6999	The wetland destruction and replacement proposed in this SDEIS and the USACE 404 Plan may meet technical legal requirements. However, ecological functions of the large, intact, and unique boreal wetland to be destroyed at the mine site will not be replaced.....The USFS-Polymet land exchange provides for new national forest lands purchased in isolated patches that don't simulate the current intact block of large forested wetland.	COE03
7005	Specific analysis of the economic costs that should be weighed alongside the projected economic income and revenue the to public treasury which this project brings. Are opportunity costs addressed? Are the prospects considered, and quantitative estimates made, of the degree to which new heavy industrial zone activities that this and future sulfide-copper-nickel mines require will reduce investment opportunities for "green" tourism, recreation ,or other less landscape- intensive and more long-lived, sustainable businesses?	SO04
7016	Future environmental assessments should consider whether a more sustainable option should be first evaluated, that being the value-added domestic recycling of such commonly used metals as copper and nickel.	NEPA06
15446	First off I must urge you to give you citizens more time to digest, discuss, research and respond intelligently to this mountain of technicality. Ninety days to comment and three hearings held within the the first seven weeks of the SDEIS release is not enough.	NEPA07
15447	Studying the past performance and the scope of past problems resulting from comparable mines may prove to better predictors of what to expect from copper nickel mines in sulfide ore bodies. This is crucial for those of us who understand that our region's future water, air, wildlife and human communities will be affected by not only this mine but by the cumulative impacts of the mining district some leaders envision for the Duluth Complex.	CU04, PD26
15448	We have no adequate local prototype of the mining and mineral extraction step from which to study all the waste handling and subsequent mine drainage and water treatment factors that will play out over time. The reason for all the concern is the sheer volume of what we are challenging our very fallible human business and engineering capacity to manage in just this one mie: over 400 billion pounds of ore, and 800 billion pounds of waste rock. Over a trillion pounds of material removed, NOT INCLUDING surface vegetation and soil. If the ore alone has just 1% elemental sulfur by weight, there would be over 2 million tons of sulfur disturbed (without considering the waste rock) and moved from its stable underground state to processing and storage on the surface where it is highly susceptible to oxidation by air water and microbial action to form sulfuric acid.	HAZ01, PD30
15450	The SDEIS considers these concens in a time frame that is longer than our country has existed. Clearly, we need modeling tools for water flow and acid mine drainage generation for more than the short run. Ideally, we'd create and use a valid predictor to track concentrations and volumes and distribution of possible contaminants on site and in the receiving streams and other hydrologic compartments like wetlands and ground water. We would need to apply this model to the hundreds of acres of process facilities and waste stockpiles and run those projections out for centuries after the mine is closed and the active treatment facilities are closed.	WR189

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Leo Babeu (42517)	
15451	The original 2009 DEIS was judged inadequate because it showed that the project will exceed water quality standards because of discharges during the life of mining and long-term, including the post-closure period. Any conclusion in the new SDEIS that the project is acceptable has to be based on improvements in proposed waste handling, treatment, and prevention of acid mine drainage generation. The effectiveness of those modifications would then need to be verified through the predictions of models that can be tested and validated against known conditions.	WR021
15461	We know that our existing iron mines in non-sulfide ore bodies have already created water quality problems that include wild rice dead zones, and mercury levels of concern. Without conclusive evidence to the contrary, we have to look to the past performance of similar mines and scope of pollution problems that the discharges from existing and past mines in sulfide ore bodies have created.	WR158
15463	On page 2064 The Tribal Cooperative Agencies point out that a lack of scientific information is explicitly stated throughout the PSDEIS and is what led the Minnesota Pollution Control Agency (MPCA) early this year to delay the establishment of a St. Louis River TMDL until further mercury cycling data could be collected. I'm left to conclude that the science isn't there to say that this mine is fine or in the end any safer in our water rich environment than previous sulfide ore body mines, even if you can find scientists who publicly assert that it does.	MERC22
16111	I do not mean to say that any lead agency's employees willfully produced an overly optimistic or inadequate document, rather that a host of factors led to a collective process and product that portrays an unprecedented project and proponent, whose outcome is fraught with risk and uncertainty, as technically and ecologically tenable for the proposed project area.	NEPA15
16113	How will you weigh the validity of those most frequently and intensely expressed concerns as you move forward? Reliance on reference in the thematic responses to the section and page where an issue is addressed becomes, at some threshold of expressed public concern, an insufficient response to a broadly perceived weakness in the evaluation of the project. What are the metrics and feedback built into the next stage of environmental review that could give weight to public perception of future mine related externalized financial and environmental costs, such that additional supporting materials should be made public, or further studies and revision and ground-truthing of models required?	NEPA11
16114	all the quantitative analysis, modeling, and efforts to reconcile the mining operations and post-closure activities with appropriate regulatory frames, are actually not contingencies that the co-lead agencies can know or anticipate with any confidence in evaluating the project. It calls into question the point of the review, since all terms of the analysis that the co-lead agencies have labored over for years are subject to arbitrary revision by the proponent at any time. Is there any provision for re-opening of the impact statement process should such changes in plan affect the input data for any of a number of predictions or other assumptions that lead to the current SDEIS conclusions?	NEPA15
16119	The risk of an increase in arsenic levels in the Colby Lake drinking water supply for Hoyt Lakes is remarkable and demands analysis of the costs and steps adequate to prevent such damage to the public resource and risk to public health.	HU01
16120	Does the document consider volatilization of mercury from blasting or from aqueous flotation processing media or heat stages like autoclaving? The directing of mercury releases away from adjacent water systems may lead to mercury increases elsewhere in the air shed that must be accounted for.	MERC16, MERC17
16121	methylation of mercury all the way downstream to Lake Superior is given inadequate consideration, largely based on a conclusion that sulfate levels will not exceed standards during operations or post-closure.	MERC19
16122	a lack of scientific information is explicitly stated throughout the SDEIS and is what led the Minnesota Pollution Control Agency in 2013 to delay the establishment of a St. Louis River TMDL for mercury until further mercury cycling data could be collected. This conservative approach would seem to be warrant for review and permitting of the NorthMet Mine.	MERC04, MERC22

16123	A high number of water quality-dependent wild rice beds that may be affected from the main stem of the St. Louis all the way up to the already sulfate-impaired (regardless of technical distinction) sections of the Embarrass River. That prospect should require the SDEIS to be expanded to address the concerns relevant under the provisions applicable in the 1854 treaty ceded territory.	CU01
16124	The impact to cultural and historical assets of the Ojibway bands will be far more substantial than the document anticipates. Legal action in pursuit of the tribes' interests will almost certainly be necessary to seek sufficient attention to these constitutionally secured interests.	SO02
16125	The SDEIS does not use an adequate method to assess surface and ground water hydrology disruptions surrounding the mine, nor does it reference data adequate to developing a better analysis such as the cooperating agencies have encouraged to be done.	WR007, WR008, WR071, WR086, WR093
16597	I want to see considerably more analysis of the details of the greenhouse gas emissions impact of all the activities, from electrical to mechanical to long-term treatment systems of the 200 plus year horizon of all activities related to the project.	AIR01
16599	I would like to see better details and more complete impact analysis on the health risks from the following: fugitive air emissions of dust and asbestos-like fibers, the exposure profiles for workers and residents of the area... evaluation of the cancer risk from the exposures to fibers, dust, nickel, and other contaminants expected to arise from the mine activity. ... the risk to drinking water from priority pollutants like arsenic and other minerals (e.g. manganese), both in local surface waters such as Colby Lake, and in ground water susceptible to mine and waste rock pad and tailings pond leaks and seepage ... the risk of both new sources of mercury and the prospects for increased mobilization of mercury already in the receiving waters, e.g. the Embarrass River, the Partridge River, the St. Louis River, and the Lake Superior Basin. That mobilization can be expected to involve both increased methylation of historical loads of mercury and new mercury inputs, as well as bioaccumulation by migrating and resident fish species.	HU02
16600	I would like to have the authors justify the use of active treatment processes for resolving potential contamination over the 200-500 year horizon. This is in direct conflict with stated statutory provisions for permitting a mine project.	PD02
16601	I object to the replacement of intact functioning wetlands with less diverse and healthy wetlands within the watershed and find the replacement of over 2/3 of the acreage of wetlands outside the Lake Superior basin to be of very low functional ecological benefit. Additionally, the 5,000 plus acres that will be indirectly impacted by redirection of ground water and other impacts are not subject to replacement or a mitigation plan in the SDEIS.	WET03, WET05
16602	The land exchange with USFS provides fragmented tracts, does not maintain the value of public assets, gives us public land with severed mineral rights and thus poor protections, and comes nowhere near replacing the ecological functions lost in the St. Louis River Watershed.	LAN04, LAN07
16603	I find the use of a water quality model that can't predict current WQ parameters to be highly problematic. Please beef up and redo the application of the GoldSim if necessary.	WR049
16604	Accurate groundwater flow rates are crucial to realistically predict pollution and seepage from PolyMet's mine pits and waste rock piles to the Partridge River. As I understand it, the XPSWMM model underestimates by at least three-fold the volume and rate of flow across the relevant site terrain.	WR086
16605	Please amend the SDEIS to adequately enumerate fully the direct and indirect potential losses to hunting, fishing, and gathering rights, as well as access to culturally sensitive areas, for the tribal members who have reserved these rights in the territory ceded in the 1854 Treaty.	SO04

16606	Much more needs to be done to understand the effectiveness, reliability, and operational challenges and limitations of the reverse osmosis treatment system. The analysis needs to consider treatment regimes envisioned post closure. ... It is critical as well to validate that the hydraulic network will bring close to 100 % of the waste water into contact with the R.O. membranes in order to realize the treatment efficiency optimistically projected.	WR128, WR143
16607	Clearly the citizens of this state needed more time, a longer comment period, in which to contemplate what the release of this SDEIS means. This case takes more time than the typical EIS process to try to comprehend the essence of a project that's cloaked in a massive volume of detail and reference material that is very difficult for the average citizen to verify, critically analyze, and reach a definitive opinion about.	NEPA07
<b>Sender Name (Submission ID)</b> leo gross (6606)		
1091	I have family and friends that live on the range and they could use the good paying jobs in that area and we all know the state can use the extra revenue.	SO10
1199	I believe the SDEIS is complete and gives regulators what they need to give polymet the permits to move forward.	PER34
<b>Sender Name (Submission ID)</b> Leo Trunt (54618)		
18104	At its February 13, 2014 meeting, a motion was made, seconded, and following discussion was approved for WMMPB to submit this letter indicating WMMPB support of the proposed Polymet project as described in the SDEIS.	PD28
<b>Sender Name (Submission ID)</b> Leonard Anderson (47782)		
8670	[Polymet has] no data to show a complete year long surface water sulfate-porewater sulfide mass balance to support such a high sulfate release after the growing season [of wild rice]. They must be forced to meet the wild rice sulfate standard of 10 mg/L at a minimum, at all times.	WR153
8693	Sulfate levels below 10 mg/L produced sulfide concentrations between 150 and 300 [µg/L]. The EPA National Recommended Water Quality Criteria for sulfide is only 2 [µg/L]...the SDEIS has to be expanded to include an analysis of the impact of their sulfate releases on the success and reproduction of local fauna as well as wild rice.	AQ12
8703	[W]e know that the same sulfate reducing bacteria that produce the toxic sulfide also methylate mercury and that moves through the food web from invertebrates to vertebrates to man at ever increasing levels of toxicity.	HU03
11283	EPA [announced] that they have dropped their approval of the Mesabi Nugget variance [which would] allow them to store high sulfate waters during the summer growing season and then dump high sulfate loadings in the fall. The PolyMet proposal submits on page 5-216 of the SDEIS that they will use the same seasonality approach for their release of sulfate to waters used for the production of wild rice. They have no data to show a complete year long surface water sulfate-porewater sulfide mass balance to support such a high sulfate release after the growing season.	WR153
11287	the SDEIS has to be expanded to include an analysis of the impact of their sulfate releases on the success and reproduction of local fauna as well as wild rice.	VEG04, WI04
11536	They have no data to show a complete year long surface water sulfate-porewater sulfide mass balance to support such a high sulfate release after the growing season. They must be forced to meet the wild rice sulfate standard of 10 mg/L at a minimum, at all times.	WR153
11540	Now that we are relating sulfate to sulfide, we need to look at the impacts to freshwater fauna as well.	AQ12

11544	So from what we now know, the SDEIS has to be expanded to include an analysis of the impact of their sulfate releases on the success and reproduction of local fauna as well as wild rice.	VEG04, WI01
<b>Sender Name (Submission ID)</b> Leonard Madsen (9818)		
15371	the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR115
15372	the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003
15375	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts.	GEN03
15377	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
15378	The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.	WR023, WR189
15395	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR017, WR018
15396	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.	WR012
15397	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	WR189, WR202
15407	This project would violate water quality standards for generations to come.	WR109, WR195
<b>Sender Name (Submission ID)</b> Leonard Major (45027)		
17285	address the issues of 1) the long-term need for protection from the toxic material in the crushed and pulverized mining wastes produced by the proposed PolyMet mine and 2) the degree of effectiveness of their proposed system for keeping the entirety of the wastes produced over the lifetime of the mine separated from and completely sealed off from the natural environment over the time-period the wastes will remain toxic.	PD35

<b>Sender Name (Submission ID)</b> Linda Forcier (7055)		
455	...it [the Project] will bring 300 jobs for 20 years to the area. This is very shortsighted compared to the hundreds of years of possible pollution. After 20 years the area will not only be possibly devastated by pollution but also be more destitute of jobs than now. Especially if the mining decreases tourism.	SO01
456	The risks to trees, wild rice, animals, birds, and even people cannot be ignored.	VEG10, WI13
457	With the global threats related to earth warming, this is not the right time to add to the problems.	AIR01
<b>Sender Name (Submission ID)</b> Linda Glaser (42798)		
12761	The SDEIS admits that every year over 5 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated.	WR070
13953	No amount of clean up money can restore the loss and contamination of ground and surface waters, along with the loss of forests, wetlands, and wildlife.	VEG03, WET24, WI01, WR070
13954	Land dominated by leaching mine waste rock piles, tailings basins, and open pits is no longer usable	LU06
14428	I am very concerned with the proposed Land Exchange. The Federal US Army Corp of Engineers Mitigation rules require that compensatory mitigation replaces the lost wetlands within the same 8 {ILLEGIBLE} hydrological unit code, HUC. Yet the Polymet plan does not compensate for wetlands destruction at the Polymet site, or do the same job and serve the same habitat and the same streams.	WET03, WET15
14429	On page 327, chapter 5 of SDEIS, 68% of the wetlands replacement acres are outside the Lake Superior basin and 72% of the “credits” are outside the Lake Superior basin. That is NOT right!Please make sure that Polymet’s plan is redone so that it compensates properly for the loss and injury – wetlands in Lake Superior basin.	COE01
14430	I am very concerned that there are no contingency plans outlined for expected accidents that occur at all mines of this type such as pipeline spills, accidental releases, failures of water collection and treatment systems, and tailings basin failure.An emergency plan must be developed and articulated so that the public can see that the company can and will respond to a crisis.	PD22
14431	...the mining proposal...is an irresponsible plan that allows 11 million gallons of polluted seepage from the tailings basin to enter groundwater and the environment without being treated.	WR070, WR117
18957	I am very concerned that the SDEIS states that 200-500 years of clean up will be required. Yet the MN Rule 6132.3200 does not allow perpetual treatment. It requires that once a mine is closed, it must be maintenance free	PER04
<b>Sender Name (Submission ID)</b> Linda Hendrickson (54139)		
16035	If this project goes ahead, it will pave the way to mine even lower grade ore bodies causing even more damage.	CU04
<b>Sender Name (Submission ID)</b> Linda Herron (43058)		
11467	I am concerned about the loss of high-quality wetlands in exchange for moderate and low-quality wetlands in the land exchange....some 6,000+ acres will be adversely affected ...by the NorthMet Mine.	WET14

13816	I believe it is in the best interest of our State and the Country to say no; or at least not until you can prove a more successful mitigation for this project.	PD01
<b>Sender Name (Submission ID)</b> Linda Laumb (45949)		
10377	The proposal made by PolyMet, if approved, opens the door to mining all along Birch Lake, South Kawishiwi and other areas on north to the BWCA. We have seen the devastation that copper/nickel mining has caused in areas such as Sudbury, Ontario, Canada and how a community suffers when left to clean up the waste of companies who have no interest in the area once they have taken from it what they want. We do not feel that any precautions PolyMet is proposing will be adequate to prevent devastation to the land and waterways as well as the economy in our beautiful area.	WILD02
10381	... if there is the slightest chance that waters will be polluted the fishing guides, resorts and outfitters will lose much more revenue than the region will gain from the few hundred permanent jobs PolyMet is proposing for the area.	SO01
10384	Had we known of the proposed copper/nickel mining eleven years ago, we would not have chosen this area to build our cabin. Real estate values could suffer dramatically, which will affect the tax base for waterfront properties in the region as well as homes and businesses in the cities in these regions.	SO03
10398	If the drinking water is affected, that will add even more devastation to the area.	WR041
10401	the effects from noise and air pollution [need to be considered]. With the amount of mining that is proposed, this type of pollution is inevitable to an area where people come to enjoy clean air and peaceful quiet days.	N01
<b>Sender Name (Submission ID)</b> Linda Malick (39296)		
7239	The Boundary Waters Canoe Area Wilderness is America's most visited wilderness area and one of the oldest designated wilderness areas in the nation. Despite what proponents of the copper-nickel mines say, creating new mines within 50 miles of Ely would be extremely detrimental to our local economy.	SO02
7243	The mines will not only be an eyesore, they will also increase rail and truck traffic, which would negatively affect tourism in the area. The noise from drilling and moving material destroys the wilderness experience on the southern end of the Wilderness area near Spruce Road and Birch Lake.	SO02, WILD02
7249	Most importantly, there is no evidence that our most precious resource, the interconnected system of pristine waterways, will adequately be protected. Acid mine drainage in our waters is unacceptable.	WR111, WR115
7251	Sulfide-bearing rock brought to the surface will turn into sulfuric acid and leach into our waterways, resulting in irreparable damage to our biotic community.	WR001, WR113
12830	The noise from drilling and moving material destroys the wilderness experience on the southern end of the Wilderness area near Spruce Road and Birch Lake.	N02

11027	The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.	FIN01, FIN10
<b>Sender Name (Submission ID)</b> Lisa Luttinen (2075)		
556	keeping our water safe for 20 years let alone 500.	WR115, WR195
<b>Sender Name (Submission ID)</b> Lisa Proechel (42817)		
7184	Polymet started the planning/permitting process before the economic slow-down, but now the demand for new copper is not so great, and it could be adequately met by greater effort to recycle used copper....Is there a "Plan B" to mine platinum and gold if copper does not generate the expected revenue? The so-called PGE's (platinum group elements) are more toxic to mine, gold sometimes using cyanide for it.	SO02
7192	Do treaties with Native-American sovereign nations take precedence over other U.S. laws?	PER08
7194	Members of my family and I have vacationed along the North Shore of Lake Superior, once on Isle Royale, and have canoed in the BWCA many summers. The Polymet project admits they will be mining "low to medium grade copper", with tons of waste and huge open pits (scars) on the landscape which will require large (estimated) quantities of water, possible requiring clean- up for hundreds of years.	WILD02
<b>Sender Name (Submission ID)</b> Lisa Pugh (21449)		
1246	Even though the mines will not be located within the BWCAW, their proposed locations have the potential to cause irreversible harm to the surrounding watershed(s)	WR111
14203	I am asking for the best possible collection and analysis of data from unbiased sources about how this mining operation could impact our environment and thus, our quality of life.	NEPA09
<b>Sender Name (Submission ID)</b> Lisa Wersal (6147)		
1048	by their own admission, Polymet's system will allow millions of gallons of untreated wastewater, with heavy metals and acid, into our surface and groundwaters. Eventually, this water may make its way even to Lake Superior.	WR070, WR111
1049	Are we prepared, not only for the cleanup costs, but for the inevitable lawsuits that we will face, from residents and businesses, and possibly other states surrounding Lake Superior? We just don't know how bad the damage will be..	FIN10
14418	The relationship between two front-page stories needs to be underscore ("Divisive copper mine draws full house and strong views," and "Climate risk is critical, U.N. Warns," 1/17/14).	REF01
14419	When we analyze the copper mine proposal, there is at least one highly volatile variable that should put us on high alert -- climate change. Already, our state has seen torrential rains and flooding, rivaling and surpassing historical records (as one instance, think of Duluth a couple years ago). How would severe flooding affect the proposed cleanup operations at the mining site? Would facilities be overrun, releasing polluted water in massive quantities? Might the cleanup facilities be rendered inoperable?	AIR01
17892	PolyMet's open-pit sulfide mine would impact as much as 8,000 acres of high quality wetlands. These wetlands ensure clean water and protect fishing in the St. Louis River and Lake Superior. This would be the largest permitted destruction of wetlands in Minnesota history.	WET23

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Lisa Wersal (6147)		
17893	PolyMet's sulfide mine would create a permanent waste rock heap of 168,000,000 tons and dump 228,000,000 tons of tailings on top of a tailings basin that is already leaking and violating water quality standards.	WR070
17894	Pollutants from PolyMet's waste rock heaps, mine pits and tailings dump are likely to seep, leak and propagate through fractures in rock. These pollutants include arsenic, lead, manganese and mercury, which harm human health, as well as sulfates and metals that are toxic to wild rice or aquatic species.	WR070, WR107, WR108, WR126
17895	Pollutants at the PolyMet mine site and tailings dump would exceed water quality standards for 500 hundred years if not eternity.	WR035, WR144
17896	PolyMet is suggesting that it will treat some of its mining pollution essentially forever - using untested technology.	PD32
17897	Glencore, a global commodities giant with a record of environmental, financial, and human and workerrights violations, now owns about 34.9% of PolyMet and is likely to own more. In its merger with Xstrata, Glencore committed to provide copper concentrate to China for the next 8 years. Metals and profits would go abroad, leaving pollution for local communities. Benefits to the community? PolyMet claims it would hire a few hundred local residents at the mine. The mine is currently proposed to operate for 20 years. This will be followed by an eternity of pollution.	SO06
19374	It's ludicrous to suggest that water can be contained well enough for over 500 years to make this project safe.	WR128, WR129
19375	There's no precedent anywhere of a mining company being able to capture all the contaminated water and treat it properly, least of all a company like PolyMet that has never operated a mine before.	PD26
<b>Sender Name (Submission ID)</b> Liz Nordling (21227)		
907	I believe that our water is our most precious resource in Minnesota and this mine would do irreparable harm to it.	WR115
<b>Sender Name (Submission ID)</b> Liz White (14406)		
13742	Clean water and natural lands are not something that can be replaced, and every loss needs to be viewed as cumulative	CU11
13743	Please consider the long term effects, and weigh these relatively short-term benefits against the permanent losses that will occur	PER35
<b>Sender Name (Submission ID)</b> lizz (46924)		
10827	While we might all want to assume that Minnesota is water-rich and that our state has no issues with water-quality or quantity, that is simply not true. The threats to our water that are part and parcel of the PolyMet proposal are real. We ask that this proposal be denied and that further investigation be ordered.	WR195
<b>Sender Name (Submission ID)</b> LK Woodruff (35700)		
11285	Sulfide mining has never been done in Minnesota. Why? Because it threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness.-->There goes tourism!	SO02

**Sender Name (Submission ID)**    Logan Olson (54349)

- 18169 I know that the mining project would create jobs and a potentially stronger economy for Minnesota, but what will we be left with after the twenty years? We'll be left with people who no longer have jobs, and one of the state's treasured natural habitats left nearly destroyed. SO06
- 18170 the current land exchange offers wouldn't be able to make up for this loss of land and habitat for Minnesota's beloved wildlife. LAN01
- 18171 Not only could wildlife on land be affected, but also the wildlife of surrounding lakes, rivers, and streams. The waterways of this state are important to all of its citizens and we all want to ensure that they are kept safe from pollution and harmful chemicals that could create potentially deadly chemical reactions. AQ06
- 18172 There are also many sites of cultural importance to Minnesotans that could be at risk by the mining project. The three identified sites are The Sugarbush, Beaver Bay to Lake Vermilion Trail, and Mesabe Widjiu which is sacred to the Ojibwe people. Losing these lands would be a huge loss for the people of the area. Also, there are several historical sites in the area. We should try to protect these important sites instead of putting them at risk. CR05
- 18173 mercury that rubs off when the ore comes into contact can pollute water, killing fish and vegetation. MERC02

**Sender Name (Submission ID)**    Loi Kemp (44092)

- 14906 The threat of sulfide water pollution, the unique and nearly everlasting concern of acid drainage from metal mining and the waste rock it leaves behind, will multiply in its impacts on the region's waters, beginning with how it increases mercury in the food chain. WR001, WR113
- 14907 A promise to "control" or "capture" [seepage] is meaningless. We need precise information on untreated versus treated levels, and detailed scientific information on how the capture takes place, and where residues end up. PD04
- 14908 The SDEIS apparently halved the normal 70-year "lifetime" used for cancer analyses to 30 or 40 years, and I urge you to investigate and correct that assumption. HU06
- 14909 Is the social and economic benefit large enough to justify an acceptable amount of environment harm? My prediction is that a couple of decades of modest numbers of jobs will never justify the environmental and human health tragedies left behind after hundreds of years. SO01
- 14910 My second major concern with the SDEIS Is that it fails to carry out a full analysis of a range of alternatives. ... Significant alterations in activity or scope or mitigation should be fully disclosed and analyzed as to their impact on all aspects of the project. The "Do Nothing" alternative, to not build a mine at all, is to always be included and compared to the impacts of the proposal. ALT21

**Sender Name (Submission ID)**    Lois Braun (6191)

- 9343 Even if we could manage this seepage in the present, there is no way that any human being alive today can guarantee continued management that far in the future. FIN01
- 10524 I find it astounding that a copper sulfide mine of the type proposed by PolyMet is even being considered in a part of the country dominated by wetlands. Copper sulfide mining has never been carried out safely in wet ecosystems. WET24

**Sender Name (Submission ID)**    Lois I Hamilton (54889)

- 18816 Water is a basic for all life -- human and non-human. It is not an unlimited resource. We cannot afford to pollute the Boundary Waters. PER12

18817	Trying to restore the [Boundary Waters] area after mining is not a good idea economically.	SO01
<b>Sender Name (Submission ID)</b> Lois Norrgard (16101)		
1231	I am asking for an extension to the comment period on the Polymet Northmet SDEIS. March is fast approaching and I find that reading 2000 + pages - and trying to understand all that this project means to Minnesotans, it time consuming.	NEPA07
1232	This project has far-reaching implications for the future of Minnesota, our arrowhead region, and I need to understand better the economics of a short term and very destructive extraction process	SO04
1233	Please extend the timeframe for Minnesotans to understand this project. We really need at least double the time that has been given so far.	NEPA07
15946	I believe that the SDEIS has shown that this project should not move forward, there are many instances of missing, inadequate, and even false information contained within this document....	NEPA15
15947	what is included has proven that this project is too great a risk to our waters, wildlife, air, environment and local communities to move forward and must be denied.	PD01
15948	I urge the United States Army Corps of Engineers (Corps) to deny the Section 404 permit due to the unacceptable adverse impacts to thousands of acres of wetlands and inadequate replacement plans.	COE03
15949	We are using up the planet and cannot continue down this path. Projects, like this one, that bring far more costs, impacts, and destruction than they do value to us and future generations should be stopped.	PER35
15950	We need to have foresight and create jobs yes, but make sure these jobs are good jobs, livable wage jobs, and HEALTHY jobs.	SO06
15951	500 years of increasing risk and threat to peak and then maybe start to dissipate at the 500 year mark to continue to pollute for another 500 years and probably beyond. This fact alone should be all that it takes to deny this project. And yet, we continue to discuss this !?	PD01
15952	The mercury, lead, arsenic, copper, nickel and other toxic metals that escape from the mining site and any water collection and treatment process will affect aquatic life and accumulate in birds and people who eat the fish or wild rice found in the river. This risk of toxic aquatic pollution will last for centuries.	WR115
15953	We also have no information within the SDEIS about what pollutants and at what concentrations PolyMet will be addressing in the captured waters or how this “magical” reverse osmosis is supposed to work and be trusted to keep the discharged water within state standards.	PD03
15954	The SDEIS is inadequate due to the fact that climate change was not analyzed.	PD22
15955	the pit itself is a source of toxic runoff that will not be captured and treated. This area will fill with groundwater, rain and snow. Increasing “100 year” rainfall events will occur more consistently due to our changing climate. There is no way that PolyMet would have been able to address the amount of water that fell during the recent Duluth flood that washed out roads and bridges.	WR077, WR173, WR176, WR180
15956	The land exchange does not protect the public trust or public land values – the proposed new land parcels (yes multiple parcels not a contiguous large patch of habitat like what we would be losing) the Forest Service would receive under this agreement are also “severed”, the public citizens will not have the mineral rights under these new lands.	LAN04

15957	This project is far too great a risk for some of Minnesota's most precious wildlife and still natural places – many places that are on the national radar as outstanding places to vacation and visit.	LU06
15958	The mine will destroy 900 acres of high quality wetlands, e.g., rare coniferous bogs and tamarack swamps, and degrade an additional 7,300 acres of wetlands – perhaps the largest wetland loss in MN history.	WET23
15959	leaking polluted water will impact the Superior National Forest, the Sax-Zim Bog, the Saint Louis River Estuary, the BWCA ..., and one of a few remaining natural wildlife corridors – these corridors are extremely important as safe movement zones for our wildlife.	WI03, WI04
15960	Sulfate releases will exceed the state standard for wild rice and will likely eliminate wild rice in the St. Louis River and its tributaries.	VEG04, WR162
15961	[The "Special Concern"] listing should trigger analysis of PolymMet's impact on moose habitat, but that analysis is lacking. Thousands of acres of moose habitat would be destroyed at the PolyMet mine site, and moose have been observed there. Protecting moose is a particular concern for tribal members, and there is no analysis of the cumulative impact on moose from the PolyMet project and other habitat disruptions.	WI01, WI02
15962	the PolyMet mine plan fails to analyze the cumulative impact on lynx from the proposal and other nearby projects. The mine plan also fails to consider ways to mitigate the risk to lynx from road traffic.	WI01, WI08
15963	overly optimistic assumptions falsify the entire document and allow the entire document to show the most minimal of impact – though incredible even in what is admitted to - that could possibly be to water, wildlife and human health. All of this is false and unrealistic – flawing the whole analysis.	GT14
15964	Lack of alternatives! – the SDEIS does not do an adequate (actually any, Really – which is federally required) alternatives analysis.	ALT23
15965	The SDEIS avoids discussion of the detailed performance of the proposed active water treatment systems. The lack of information about design and expected performance, operational effectiveness, and contingency plans for water treatment when the plants are down for maintenance, repairs or replacement is critical.	WR131, WR143, WR148, WR176
15966	The SDEIS avoids analysis of possible failure scenarios for tailings dams and waste rock stockpiles that will become permanent landscape features. These will fail – the public needs our agencies to do a realistic analysis of these failures and what action(s) would be taken to address this.	PD11
15967	Acid Mine Drainage – the full analysis and the impact of this on our water world of northern MN. The fact that nowhere in the world has this type of mining been done without toxic impacts to water is not clearly laid out for us	PD26
15968	The human health and safety impacts are completely missing from the SDEIS and must be addressed. One of which is PolyMet would produce mineral dust smaller than what is regulated and has been studied. ... Mercury and other toxic leaching to human health should also be realistically analyzed.	HU01
15969	The 11 other companies waiting in the wings for additional mines (are well known and not speculative) should be addressed in a cumulative impacts analysis. This is completely missing in this SDEIS and should be addressed.	CU02, CU04
15970	Missing is an analysis regarding the impacts to local communities through loss of existing jobs – tourism and recreation is a substantial and growing component of the regional economy generating over \$825 million in economic output and nearly 15,000 full-time equivalent jobs in 2011. These are the types of jobs that are healthy, and could exist in perpetuity IF WE DO NOT DESTROY THE ENVIRONMENT.	SO02

15218 The idea that anyone could create or restore a peat bog on some other site is laughable. ... I didn't see a mention of the moose in this factsheet, but they will also lose habitat if this land exchange goes through, and they are already so threatened that the DNR won't allow a hunting season on them as there has been in past years. While there might be an argument in favor of the replacement land also providing habitat, that argument would prove meaningless for the northern long-eared bat, the wood turtle and the eastern heather vole that would all lose their lives for this project and who don't have the ability to run out of the way, as you might argue for a lynx, wolf or moose.

WI02

15219 this proposed mine is unacceptable because of the destruction of wetlands and wildlife habitat that would occur.

WET24, WI02

**Sender Name (Submission ID)**    Lora Wichser (45467)

11435 We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal

HU01

11436 We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health

HU01

11441 Assessment of cumulative mercury risks, including hazard levels in bodies of water that are already impaired for mercury in fish and risks posed by mercury concentration downstream in the St. Louis River.

MERC10

11449 Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis and an appropriate "lifetime" for exposure.

HU05

11453 Assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice.

AQ08

11454 Assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice.

HU01

15728 We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. ... The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling.

HU03

15729 HIAs are a tool used in the environmental review process. Environmental Impact Statements, such as the PolyMet SDEIS, are required by the National Environmental Policy Act to contain analysis of impacts on human health. However, human health is subordinated to environmental impacts, is addressed in a piecemeal fashion, and there is no examination of the social determinants of health in the SDEIS.

HU01

**Sender Name (Submission ID)**    Loree Kalliainen (42453)

6790 The proximity to both the Boundary Waters and to Lake Superior mean that the risk benefit ratio needs to lean heavily to benefit over risk.

WR111

6791 The benefits: a relatively small # of jobs for a few decades, maximum, benefit to the mining company's profit. The risks:contamination of 10% of the world's fresh water, long term risk and need for active management (for longer than the US has been a nation), damage to a heritage site. This will not help the residents in the region and has unacceptable risk of harm.

408	Our water quality must not be jeopardized for a few mining jobs. The BWCA and Lake Superior are more important than the mining and the jobs it will bring.	SO01
410	This interest leads me to object to mining that has even a chance of harming our environment and water quality!	WR195
1063	It would greatly benefit an international company, permanently scare the landscape, provide only a few jobs for a short time, and forever destroy Minnesota's water quality.	SO01
1065	There are just no proven and time tested methods to treat the amount of acid that needs to be processed over such a long period of time. Once the water quality is gone, no amount of money and "insurance" from PolyMet will bring it back.	WR128
1066	The few jobs that it would bring to the Ely area would be drastically over shadowed by the NEGATVE impact the PolyMet Mining operation would have on Minnesota, Lake Superior, the Boundary Waters Canoe Area Wilderness and surrounding area lakes. Please do not jeopardize our water quality for a short 20-30 year gain.	SO01
<b>Sender Name (Submission ID)</b> Lori Olinger (45007)		
17298	A wild rice-sulfate study was recently released that could result in a change in the state's current level of 10 parts per million sulfate in waters that hold wild rice stands. I think the permit should not be issued to PolyMet until the decision is made regarding current limits and whether or not they should be updated.	PER10
17299	An organization other than PolyMet should also have responsibility for monitoring groundwater and surface water so that any problems be identified and mitigated as soon possible. If PolyMet does a good job monitoring, that is great but a separate group should also verify since so much is at stake with this project.	PD24
17300	The Wild Rice Fact sheet also stated that the PolyMet project would be expected to increase [sulfate] concentrations in the Partridge River but only by .1 percent over existing levels. The current level in the Partridge River is currently above the required limit. PolyMet should not be allowed to contribute to the problem with the Partridge River even if it is expected to be a small amount.	WR083, WR149, WR158, WR159, WR162
17301	The tribe has sovereign authority, under the Clean Water Act, to protect its wild rice from mining pollution. This project should not move forward if there is going to be any negative impact on wild rice.	PER08
17302	Before approving the PolyMet permit, the DNR should take a field trip to Butte to see first-hand the result of copper mining. Talk to the residents of Butte. Ask about the long-term financial impact it has had. They certainly never expected anything like that to happen there. I would hate to have something similar happen in Minnesota.	SO04
17303	The PolyMet site is in a water rich part of the country that is subjected to freeze and thaw conditions. This will cause extreme challenges to be able to prevent pollution.	WR198
17304	I am a concerned Minnesotan who wants to ensure that we don't overestimate the benefits of this project and underestimate the potential problems.	SO04

<b>Sender Name (Submission ID)</b> Lucy Knoll (49934)		
16914	the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever.	WR115
16915	In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science.	WR003, WR086, WR091
16917	The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.	AQ01
16918	The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures.	WR012
16919	The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the “west equalization basin,” which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic “basin” would contain, long after the mine shuts down.	WR202
16920	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs	WR003, WR091, WR165
16921	The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.	WR017
16922	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won’t allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards... This project would violate water quality standards for generations to come.	WR189, WR202
<b>Sender Name (Submission ID)</b> Lucy Sedgwick (19529)		
13448	For instance, PolyMet claims to have made minimized -- claims to have minimized destruction of wetlands in their mining plan. They basically say, "This is the best thing we've got." However, an underground mine would actually disturb far fewer acres to access the ore in the headwaters of the St. Louis River.	ALT01
13449	. I don't think that it fully protects and replaces loss of significant habitats and species. For instance, the entire 3,013-acre mine site had been classified by the Minnesota Biological Survey as of high biodiversity significance. So basically, there are two state-endangered, two state-threatened and seven state-special concern plant species that are actually found on the mine site. So six regional forester-sensitive species -- and what that basically means is they're a federal forest plant species of concern.	VEG01, VEG02

<b>Sender Name (Submission ID)</b> Lyn Yount (46868)		
8612	Please do not authorize PolyMet’s draft mine plan. There is too much at stake to accept a plan that does not take into account, and will damage the health of Minnesotan citizens, will cause damage to already stressed Lynx and Moose populations as well as other wildlife, and will poison and destroy wetlands, forest and our water table. We don’t want more air and water pollution, and even if PolyMet does manage to provide so called “safeguards” against large scale mercury or asbestos disasters, no mine is able to cause no pollution.	SO02
8613	Every water source, table, creek, lake, pond, and wetland in the area of the mine will be affected, with wide reaching effects to the aquifer. Whether from direct pollution and chemical runoff or spills, or poisoned by the chemicals in the air from the machines and mining extraction processes, Minnesota’s water will be harmed, and the people, animals and plants that depend on it as well.	WR111, WR115
8614	PolyMet will make a great deal of money, share a comparatively small amount with their “new employees,” and leave Minnesota scarred, dirty, with centuries of cleanup, especially water treatment, untold health issues, and with all the bills.	SO02
<b>Sender Name (Submission ID)</b> Lynda Fedeler (38129)		
14545	The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project.	AIR01
14546	The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0.5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025.	AIR01
14547	Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan.	AIR01
14548	Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation.	PD39
14549	Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project.	ALT13
14550	Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project.	ALT13
<b>Sender Name (Submission ID)</b> Lynda Haemig (41660)		
2154	Maybe denying this permit will force the mining companies to research alternative methods of extracting the metals.	PD32

14248	I recognize that northeastern Minnesota badly needs good jobs for its people and communities. But increased spending for high-speed internet service and other strategic investments seems far wiser and more productive than authorizing a mining project that could endanger our water, forests, animals and people.	SO01
<b>Sender Name (Submission ID)</b> Lynda Withbroe (54776)		
19477	Only 360 jobs will be created while hundreds of years of damage will result.	SO01
19479	I am writing to ask you to reject the PolyMet mine's proposal / mine in one of our state's greatest natural resources, the BWCA.	WILD02
<b>Sender Name (Submission ID)</b> Lynden Gerdes (36800)		
8638	NorthMet would emit 4.6 pounds of mercury into the air from their operations every year, and the coal power they rely on would add even more. The NorthMet mine plan also increases mercury in the Embarrass River, and sulfate pollution from the site could increase methylmercury, the form of mercury most dangerous to people. (Mining Truth).	AIR02, MERC08
8647	Maybe it is simple; just have PolyMet assure you they will restore the landscape as they received it. Give them maybe 100 years. Ecosystem function, biological diversity, aquatic life, and species composition at least as good as they inherited it. I am not talking about spreading a clover mix on a wetlands tailings pile and calling it restored.	VEG03, VEG05
8656	Some Tribal and GLIFWC analyses and concerns do not appear to be fully valued or addressed in the SDEIS (Chapter 8 and Appendix C), including mercury levels, water models, manoomin (wild rice) standards, wetlands, waterfowl concerns, etc.	VEG04, WET24, WI04, WR115, WR160, WR189
8664	If more time would have been granted for public review I may have been able to provide a more detailed response.	NEPA07
12377	Fractures in the bedrock are highly likely to currently exist in the project area or potentially result from mining activities. We can't trust a dated bedrock study on this critical issue when the consequences of being wrong in the analysis allows contaminated waters to move deeply through the bedrock and aquifers to the Rainy River watershed and local water tables.	WR011, WR012, WR014, WR016, WR061, WR071, WR085, WR087, WR090, WR099, WR168, WR169
12378	The NorthMet water model assumes that there is little groundwater moving through the site. The result is that the model shows water moving very slowly, and pollutants sticking to soil instead of moving with the water. DNR hydrology data show that the NorthMet water model significantly understates the amount of water flowing in the nearby Partridge River.	WR003
12382	There are many acres of assorted uplands and wetlands within the project area recognized and mapped as having Biological Significance (Minnesota Biological Survey), including the 100 Mile Swamp. Some of the native plant communities in the project area are considered rare or of special concern in the state. Rare species are present including a significant, large population of Floating marsh marigold ( <i>Caltha natans</i> ) with habitat and populations to be destroyed.	VEG01, VEG02
12383	Moose, lynx and other species and their habitats will be will be impacted.	WI01, WI02
12384	Waterflow and water quality will be greatly altered in the landscape and will negatively affect many more wetlands, uplands and waters in the greater area than currently acknowledged in the SDEIS). Current acreages stated below are likely underestimated.	PD03, WET10, WET24

<b>Sender Name (Submission ID)</b>	Lynden Gerdes (36800)	
12390	The NorthMet mine plan also increases mercury in the Embarrass River, and sulfate pollution from the site could increase methylmercury, the form of mercury most dangerous to people. (Mining Truth).	MERC23
12391	NorthMet would emit 707,342 metric tons of carbon dioxide into the atmosphere every year. This would contradict Minnesota’s goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota’s greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota” (Mining Truth).	AIR02
12404	As noted earlier, there is no dollar amount that can substitute for the existing, ecologically functioning landscape that would be lost and degraded if these SNF lands are lost and the mining project proceeds. My point being, regardless of what you ask of PolyMet, in the end you are not likely to get it. Whether it is fully restored ecosystems or lump sums of money to treat water in an otherwise devastated landscape future generations will pay the price.	SO01
12413	Some Tribal and GLIFWC analyses and concerns do not appear to be fully valued or addressed in the SDEIS (Chapter 8 and Appendix C), including mercury levels, water models, manoomin (wild rice) standards, wetlands, waterfowl concerns, etc. I don’t understand the specifics of 1854 Treaty or the rights of the Fond Du Lac Reservation downstream of the proposed mine but destroying and degrading their tribal lands and way of life truly concerns me.	CR01
13928	All the lighting associated with this project will have significant impacts to not only residents but all those global citizens that will lose this local opportunity to have an experience that is becoming quite rare.	LU06
13929	Earth tremor – For the lack of another term, I am using this referring to how the earth shakes and windows rattle when the earth’s bedrock is being blasted. This is currently happening as a result of the Harris Lake quarry and I suspect the Babbitt mines. This issue needs to be further addressed for I feel the impacts are much more distant from the mines than what is currently being acknowledged. The social, economic (including land values, property values, etc.) and environmental effects of this needs further assessment and publicly addressed.	N05
13930	I also request the long-term psychological effects of light pollution (especially to those that have lost dark skies in their living environments) and the psychological effects of human caused earth tremor receive full attention, discussion and disclosure relative to the short and long term effects of this project. Conversely, I request the long-term benefits of the dark skies in this part of Minnesota are assessed for their contributions to society and our economy.	LU04, SO04
14567	I would have more to comment on if more time had been allowed for public SDEIS review.	NEPA07
14881	I believe the Superior National Forest (SNF) wants to steward our National Forest lands and would also be interested in acquiring industrial owned lands that would potentially complement the Forests long term forest management and conservation goals. Pursue some of these acres for acquisition if at all possible but don’t trade away a core portion of our Forest to accomplish it.	LAN06, WILD03
14913	Minnesota law requires that a closed mine site be “maintenance free.” It is clearly presented in the SDEIS that water pollution will be long term, likely for hundreds or more years and likely require active treatment. One can’t assume that passive treatment will become a reality, if so, it likely won’t occur before environmental damage has already occurred and becomes widespread.	PER04, WR137

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Lynden Gerdes (36800)		
16507	The United States Forest Service (USFS) should not allow for the permanent destruction and degradation of hundreds - thousands of acres of our National Forests lands and waters...One can analytically isolate these Forest lands from all other lands and waters in the area but we know they are all critically connected and complement each other and function as a whole, especially when assessing biological biodiversity, climate change, and ecosystem health at various scales..."Land Exchange" is very misleading. Our National Forest lands would be traded to industry and allowed to be permanently destroyed.	LAN01
16509	The Bureau of Land Management has very different goals and objectives regarding both surface resources and mineral extraction (as observed on BLM lands in our southwestern states) and their management approaches and practices should not supersede the long established ecosystem goals the SNF has tried to achieve balancing the values of forest, wildlife and recreation.	PER26
16512	The NorthMet water model assumes that there is little groundwater moving through the site. The result is that the model shows water moving very slowly, and pollutants sticking to soil instead of moving with the water. DNR hydrology data show that the NorthMet water model significantly understates the amount of water flowing in the nearby Partridge River. If this information is wrong, predictions about water pollution are in question. If the model is incorrect, and there is more water flowing through the site than it assumes, the polluted water from pits and waste rock will move more easily through the soil, and reach lakes and rivers more quickly. The water could also carry more pollutants than the NorthMet model predicts.	WR003, WR005, WR006, WR165
16513	when so much is at long term environmental risk, they provide not much more than a best guess. ... Questions centered around the inaccuracies of the water model place serious doubt on the validity of the entire analysis.	PD29
16517	It is bewildering that the SDEIS can generally state the air, water and noise levels resulting from this project and their cumulative effects are acceptable.	CU11
16518	Levels of energy consumption and contributions to climate change are unacceptable.	AIR01
<b>Sender Name (Submission ID)</b> Lynette Peterson (54490)		
18035	The long term health effects of allowing the mining proposed by Polymet are substantial. More research is needed as well as more answers.	HU01, HU03
<b>Sender Name (Submission ID)</b> Lynn Boggie (54694)		
17799	Sulfide mines ALWAYS pollute. Sulfide mines ALWAYS end up costing the tax payers. After the mining is done "they" ALWAYS mysteriously go bankrupt and can't pay the costs for clean up which takes FOREVER.	FIN01
17801	you know the facts of why the Poly Met SDEIS is inadequate. It doesn't analyze the effect on pollution; on workers health; on drinking water; and there are the arsenic and mercury issues.	HU01
17803	We live downstream from the proposed PolyMet project. Will our water "change" in my lifetime? How many years will it take, do you tb.i.nf, before we can't drink our precious water?	WR036
17804	Yes, jobs are important, but not at the cost of the eternal and irrefutable damage to our lands and waters. Not at the cost of our health. We who live in this area are the ones who will pay dearly.	SO01

<b>Sender Name (Submission ID)</b> LynnAnne Vesper (38810)		
4977	My primary concern is in the area of economic impacts, mainly in the area of financial assurance. Polymet routinely cites figures indicating how much they have spent so far on the permitting process, as if this number should justify the issuance of a permit. The DNR and other agencies have a responsibility to see to it that issues are addressed during the planning phase; otherwise no permit should be issued, regardless of the amount Polymet has spent on analysis.	FIN08
17011	Further, regarding the proposed land exchange, the Forest Supervisor bears the responsibility for determining if the proposed land exchange benefits the public. The Forest Supervisor must make the determination that the land exchange is for the express purpose of directly furthering the financial interests of private and foreign economic interests and is clearly NOT in the public interest.	LAN01
17017	These wetlands created for the purpose of the wetland crediting system are by far inferior to those created over many hundreds if not thousands of years by natural processes. The artificiality of the wetland crediting system must be taken into consideration when determining the quality and quantity of wetlands to be exchanged for wetlands permanently destroyed or disabled by mining processes.	WET04
<b>Sender Name (Submission ID)</b> Lynne Markus (54810)		
18346	I am especially concerned that the state is considering a land trade of lowland coniferous forest for lesser value coniferous swamp forest which is not an even trade and therefore, not in the best interest of the public.	LAN03
<b>Sender Name (Submission ID)</b> M Negus (47383)		
10188	[EIS] does not go into the detail necessary to answer critical questions of sulfide run-off and potential long term effects on the aquatic environment (wild rice, invertebrate, fish and wildlife).	VEG04, WI01
10190	At the very least this company under the supervision of the MNDNR needs answer the critical and unanswered questions on sulfide mining and potential for sulfide runoff posed by the chemical and ecological experts.	WR115
10196	[EIS] needs to expand on the contingency plans which are vague in the EIS, should an unforeseen event such as a train derailment, extreme precipitation event, or explosion occurs.	PD22, PD36
10198	Details need to be shared with the public on what process and how much funding will be set aside to address the long term clean up after this main development occurs and the mine is no longer operating and the company has either been sold, dismantled or gone into bankruptcy.	FIN01
10199	Allowing the Poly-met mine with only the information provided in the EIS appears to be another example of short sighted gains vs long term detrimental consequences. I hope you look out for future generations, not just the short term job gains that will only last 15-20 years at the most.	SO01

<b>Sender Name (Submission ID)</b> Maja Black (45921)		
10326	if we look back to the SDEIS, we can find beyond a reasonable doubt cause to postpone the mine. It is one thing to trust the DNR to identify the potential impacts of the mine, it is another thing to trust the DNR to interpret this information adequately, in a way that keeps us, as the residents and caretakers of this land, safe.	NEPA08
10331	Those who are speaking in defense of the Boundary Waters are not only concerned about the aesthetic beauty of a wilderness area. If the toxic water projected to be treated for upwards of 500 years were to be released in an accident, it not only would destroy the Boundary Waters, but it would destroy the watershed that we all rely on to have good, clean water. In the coming years, having potable water is going to become a more expensive problem, and the resource that the lakes of Minnesota provide is invaluable to protect.	WILD02
10334	...the wilderness of the Boundary Waters has helped to create an entire economy based upon eco-tourism and the people who visit Northern Minnesota every year in search for a wilderness experience. If that wilderness were to be contaminated, who would come to visit it and support the businesses that exist on tourist profits?	SO02
10338	the SDEIS states some very scary predictions...wouldn't it be safer and more beneficial to wait until we have a foolproof method of extracting the material without endangering our watershed?... I don't believe that the intended procedures of this mine are safe.	PD32, WR195
<b>Sender Name (Submission ID)</b> Malcolm McCutcheon (7682)		
817	Chancing a long term contamination of Lake Superior, the largest fresh water source in the country for a 20 year mining project seems illogical. Because of its size and volume the Lake cannot cleanse itself of contamination the way shallower Great Lakes can.	WR111
<b>Sender Name (Submission ID)</b> Mandy Marshall (42551)		
6870	I DO NOT support the mining project. It seems it will disrupt the wildlife (those whose species are threatened and not) & possible watersheds more that it could benefit with temporary jobs. If ( like 75% of other companies) water control fails, it could cost the wildlife and taxpayers greatly to try and fix the issue.	FIN01, SO01, WI01
<b>Sender Name (Submission ID)</b> Mao Vang (54232)		
16805	The environmental Impact Statement also should that there are high levels of toxic in the water after the mining. That'll stay for about 500 years and will cost billions of dollars to clean up and which is impossible because when sulfuric acid gest into the water it can't be removed. So it'll just keep flowing down the streams and lakes. Which will kill off many species of plants and animals.	WR001, WR113
16806	the map that was done that [shows] the drainage at the mining not affecting other lakes and streams in the marsh. From this view, people would mine in okay. But it actually not because the map is wrong which can fool more who don't know the natural lakes.	PD38
<b>Sender Name (Submission ID)</b> Mao Vue (54233)		
16808	The map in the environmental impact statement is wrong. PolyMet people drew maps of the one hundred mile swamp; their map compared with the U.S. National Atlas shows that the PolyMet has left out half of the swamp. They are immorally lying just to get jobs and it is affecting the BWCA in a very negative way.	PD38

<b>Sender Name (Submission ID)</b> Marco Good (42922)		
9601	Even if...sulfates and sulfides somehow do not mix with oxygen (as PolyMet's EIS contends they will magically be isolated from it in the surface waters and aquifers after they leave the tailings ponds through overflow or leakage through liners that inevitably leak) these sulfur bearing compounds will surely methylate mercury wherever they reside in wetlands, compounding the mercury poisoning our waterways and all the aquatic life that lives in our watershed downstream from the proposed site.	AQ12, AQ28
9602	PolyMet's promise to contain and treat with reverse osmosis the trillions of gallons of pure water they will contaminate (not may... nor could...) our surface waters and aquifers for thousands, not hundreds of years-- is nothing but a lie, like all the mining company lies that have gone before it.	WR035, WR128
9604	Like all mining companies before them... PolyMet will not honor their obligation to do anything past the date they close their operations and declare bankruptcy, as they have always done.	FIN01
9612	There is no way to ever clean up or remediate disasters like this, and if our government permits them, they will have only themselves to blame for accepting the bribes these conglomerates have given them, whether they come under the table, or with the complicity of the "Citizens United" decision by the Roberts Court, in the form of "PAC contributions".	NEPA18
9614	the Treaties our forebears made with the original human beings of this beautiful bountiful State are promises we ought to keep, which we have never done. It is illegal, unlawful, and immoral to further deny Anishinabe ("Ojibwa") and Dakota ("Sioux") people their rights to hunt and gather unpolluted fish, wildlife, medicinal plants, and Manoomin ("wild rice") in the ceded territories, a denial and an abrogation of those treaties which antedate and supersede all subsequent legal and local manipulations of the legislature (who seems only to regard the corporate agenda) which such mining will surely accelerate.	PER08
9618	Dear officials of the DNR, I ask only that you re-examine your mission statement which says to Protect, Conserve, Manage and Regulate, NOT to exploit or advocate for the institution of extractive resource colonies by multinational corporations. I ask that you consider the value of resources we have and enjoy, the living, breathing Land, Water, and Air, which are too limited to consider ruining them forever for short term profit	NEPA15
<b>Sender Name (Submission ID)</b> Marcus Imes (40098)		
6459	I know the Iron range needs jobs, but this project will only provide jobs for around 20 years and will leave us with cleanup for centuries.	SO01
6460	Polymet has a decent plan for containing the acidic and heavy metal waste, but few things in life go perfectly to plan... my concern about the mitigation plan; if any little thing goes wrong, a lot of toxic water or slurry will be released into a nearly pristine watershed, which is irreversible. I believe the cleanup plan calls for 200-400 years of water treatment.	WR132
6461	I encourage the DNR to deny the permit, or get a very very substantial up front payment to ensure the future health of our environment (a larger payment than currently proposed).	FIN08
<b>Sender Name (Submission ID)</b> Maren Anderson (41275)		
9313	There are not enough jobs that will be created to validate the absolute destruction of our natural resources.	SO01
<b>Sender Name (Submission ID)</b> Margaret (18125)		
3430	Mining brings economic opportunity to places like the Arrowhead, Hoyt Lakes. The opportunities for a quality of life here that is too often only available in the largest cities. (Inaudible) tremendous opportunity to create high quality employment for people living a high quality of life here.	SO10

13505	(inaudible) after the professional and public review of the PolyMet EIS through this process I am a confident state and federal agencies (inaudible) and confident because I know our agencies carry out regulatory responsibilities competently and thoroughly and with the highest integrity.	NEPA16
<b>Sender Name (Submission ID)</b>	Margaret a. Gillen (39916)	
14293	I have lived in the Twin Cities for 23 years and I love the beautiful lakes, trees, wildlife, and clean air. My family has camped in the Boundary Waters and experienced its beauty and peacefulness. We cannot afford to have this resource polluted by mining companies who lamely promote job growth but are really counting profits.	WILD02
<b>Sender Name (Submission ID)</b>	Margaret A. Redmond (39221)	
6046	There are several issues in the SDEIS that leave me very concerned regarding its basic usefulness as a tool to even assess the CURRENT status of the areas to be mined and to be utilized for waste rock disposal and for treatment ponds. Those insufficiencies lead me to real disbelief about its valid use as a predictive instrument for future conditions once mining actually begins.	PD01
6047	C. Although the DNR (in its other divisions, eg Forestry) does acknowledge the reality of climate change, this SDEIS and the models it is built on barely acknowledge any possible impacts. Clearly, there ARE some climate change impacts which would need advance contingency planning to avoid environmental contamination.	AIR01
6050	D. Previous mining in Minnesota—ie, taconite—has had to take measures to protect the population from harmful fibers released in mining and milling. Specifically, asbestiform minerals are found in some of the rock bodies. There is not much discussion of this potential hazard.	HU01
6071	The Water Quality modeling for the mine area is NOT based on the actual MEASURED flows in the Partridge River. Flows measured by the DNR exist, but the model vastly understates (underestimates) the amount coming in as groundwater... Yet, there is no data presented (and to our knowledge, very little was collected) during the 3 years between EIS's. Why not? The need for data could not have come as a surprise. Why should the SDEIS model be taken seriously if the data needed was not collected?	PD29
6073	The largest extreme rainfall event provided for in the model is 4.1-5.2 inches (25 year & 100 year probability events)... What difference would a real-world event of between 6-10 inches make for the contingency plans?...with 3 more years of global and regional climate observations, modeling, and statistics available—the failure to address drought impacts on a sensitive and water-dependent system for mitigating pollution flow stocks is utterly inexplicable.	PD29
6076	...there remain unanswered questions about air quality issues—ie, the content of the rock and and tailings dust that will result from mining, milling, and chemical treatment to extract the ore.	AIR10
6084	The permitting process should be able to proceed from an SDEIS that will give the agencies charged with protecting Minnesota's air, land, and water resources a scientific and legal position of comprehensiveness and strength.	PER34
6085	And, if harm occurs which was ignored in the SDEIS—or was much greater than the sketchy contingency plans could mitigate, we could be looking at legal battles and expenses beyond belief—especially considering the monumental financial resources of PolyMet's major foreign investor, Glencore Xstrata.	PER03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Margaret A. Redmond (39221)		
13756	The underlying science is supposed to be the basis for mitigation efforts for mining impacts and for contingency planning for a range of complicating (and foreseeable) situations that might arise. When the science, modeling, and serious degree of omitted factors is at the substandard level of this SDEIS report, a decision to allow mining to take place can become a very grim forecast for serious resultant environmental and/or health problems. Further analysis of several issues is essential to be able to avoid them or plan for realistic and effective solutions.	NEPA09
13759	C. Time Span for Treatment. The plans for the mitigation/amelioration measures required to run for 200-500 years are simply not credible. What history is there of pollution containment on this scale for even 100 years? What kind of funds would have to be in reserve to even handle a 50-year "insurance" against the citizens of Minnesota picking up the tab for an extractive industry that digs & runs? Or digs and declares bankruptcy?	FIN01
13760	I also assume that any finding from a regulatory agency which would require changes in operations or temporary shutdowns would immediately be met by an attempt by the mine to get a court-issued injunction blocking those consequences, and whatever violation would continue while bureaucracies haggle it out. Such an ongoing event would have potential to produce major damage to the surrounding environment. Does anyone really believe that the mine would cease operations to fix a problem?	PER06
13761	Mining jobs, while welcome, cannot come at the expense of the environment in Northern Minnesota. The point is not to degrade nor sacrifice the environmental qualities that fuel the more lucrative tourist industry. If credible protections to reduce or eliminate the risk to the resource (ie, the water, air, land, and natural beauty) cannot be assured—guaranteed, even—then everybody (except for PolyMet and its foreign investors) loses.	SO01
13762	G. Setting a Precedent. Because, as we all know, the PolyMet application is only the first of many coming applications for mining permits, this application (and of course the EIS supporting it) have to be exemplary. Any sloppiness or overlooked or weakly planned items/issues/studies in this application (and EIS and permitting process) will, obviously, set a precedent.	PER07
13763	Legal challenges are already mounting to the sulfate limits that are in place to protect Minnesota's wild rice. Basing permitting on this inadequate EIS will most certainly embroil Minnesota agencies in unprecedented levels of litigation and acrimony.	PER10
<b>Sender Name (Submission ID)</b> Margaret Ann Nelson (47080)		
11215	This is way too dangerous, with way too many unknowns, for our state to risk the future health of our lands for relatively short-term gain. Many more jobs would eventually be lost as we lose the wilderness we are so fortunate to be the stewards of.	SO01
<b>Sender Name (Submission ID)</b> Margaret Bujold (42762)		
14516	The PolyMet SDEIS...doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells	HU04, WR041
14517	The PolyMet SDEIS...doesn't explore alternatives that could reduce PolyMet's destruction of wetlands.	WET20
14518	The PolyMet SDEIS...doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish.	AQ28
14519	PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity."	PD01

<b>Sender Name (Submission ID)</b>	Margot Monson (18208)	
4068	...any wetland compensation should occur within the same watershed and include the St. Louis River watershed at the Lake Superior Basin. According to Chapter 5 in the Supplemental EIS, 68 percent of the wetland replacement areas are outside the Lake Superior Basin, 72 percent of the credits are off. The Supplemental EIS only commits to replacement of 26.9 acres out of the over 7,000 acres. These losses will mean that the very serious destruction of peatlands found in this ecosystem, and these take hundreds, thousands of years, sometimes, to develop.	WET03
4073	...as scientists responsible for making these decisions to ask, to the future of our variable wetlands, how can you in good conscience allow the destruction of thousands of wetlands knowing they are truly irreplaceable? If this kind of destruction is permitted, it will be not based on real science, but wishful thinking	WET24
11481	The BWCA and Lake Superior watersheds attract thousands of visitors...every year, ...and provide valuable economic resources to northern communities. The destruction that this mining will bring will certainly mean fewer people attracted to this region, and 20 years of jobs, is a poor excuse for permanent loss of such valuable wilderness	SO02
11486	My other concerns involve the potential impacts on healthy stands of wild rice growing in the St. Louis River that will eventually be reached by the tributaries containing the sulfuric acid drainage...What assures me or the Native Americans that there will be adequate protection for the remaining stands of wild rice still growing in these rivers?	VEG04, WR156
11488	If the idea that perpetual treatment of water contaminated by the sulfuric acid produced by the mining processes may be necessary for centuries is not outrageous enough to stop you dead in your tracks and cause you to reject it, the very fact that the financial assurances will not be stated publicly until the permitting process begins is disingenuous and an insult to Minnesotans.	FIN13
11489	I am most disturbed by the inevitable loss of wetlands, so critical to the function of aquatic ecosystems...The fact that the pan calls for the "replacement" of the destroyed wetlands with land far removed and in different counties, much apparently in previously drained and farmed land, is ludicrous from a scientific perspective.	WET03
13441	In order for an agency to determine wetlands to use for replacement, they must have data that documents the biodiversity of these lands, and having done wetlands research, I know that Minnesota does not have any comprehensive inventories of such diversity	WET06
15449	The Wetland Conservation Act states that there be "no net loss in quantity, quality and biological diversity" for the land chosed to replace the destroyed wetlands. Where are the biological inventories of all the critical species of wetland plants, animals, fungi, etc. that would have to be used to determine equal biological diversity? ...Just because our agencies may be able to legally get by with such artificial wetland replacements; does not mean that it is the ethical or right thing to do.	COE01
19057	If the idea that perpetual treatment of water contaminated by the sulfuric acid produced by the mining processes may be necessary for centuries is not outrageous enough to stop you dead in your tracks and cause you to veto it,	WR195
19059	the very fact that the financial assurances will not be stated publicly until thepermitting process begins is disingenuous and an insult to Minnesotans.	FIN13
19060	The fact that 80% of sulfide mining operations in the U.S. have closed with massive environmental degradation, all have left water pollution behind, and some filed for bankruptcy leaving taxpayers to foot the bill.	SO01
19062	For these reasons and that PolyMet has never operated a sulfide mine, is owned by foreign companies, and Glencore has horrific environmental and financial track records in foreign countries, should be more than enoughevidence for Minnesotans to reject this type of mining and this company at the outset.	PER02

<b>Sender Name (Submission ID)</b> Margot Monson (18208)		
19065	How in the world as a scientist can you accept and approve of any activities that result in the permanent destruction of thousands of acres of valuable and irreplaceable wetlands? ... You know as well as I do that even if the natural waters enter the land again it will be hundreds of years before it functions as it originally evolved, nor will it be the same in quality and biodiversity as the destroyed wetlands. There may be a plan to increase the acreage of the "replaced" land, but increasing it does not justify it because it is different land in a different habitat ecologically, and is an insulting mollification.	WET05
19074	Where are the biological inventories of all the critical species of wetland plants, animals, fungi, that would have to be used to determine equal biologicaldiversity? ... There is no way to judge the biodiversity of wetland organisms well enough to state that two regions are equal, without extensive detailed analyses by qualified biologists.	AQ01
19079	My other concerns involve the potential impacts of healthy stands of wild rice growing in the St. Louis River that will eventually be reached by the tributaries containing the sulfuric acid drainage. There have previously been many miles of wild rice destroyed in the St. Louis River by ferrous/taconite mine drainage and somehow, no one has taken responsibility for this. What assures me or the Native Americans that there will be adequate protection for the wild rice still growing in these rivers? At least our legal system and recent research has protected and affirmed the 10mg/L sulfate standards that are currently in place.	VEG04, WR159, WR162
19082	The destruction that this mining will bring will certainly mean fewer people attracted to this region, and 20 years of jobs, is a poor excuse for permanent loss of such valuable wilderness.	WILD02
<b>Sender Name (Submission ID)</b> Maria E. May (45714)		
13059	The number of jobs temporarily created are not enough to justify ruining the watershed, one of our most vital and irreplaceable resources.	SO01
16355	Foreign mining interests and big money should not determine how we manage public land in Minnesota.	NEPA15
16356	There's no amount of compensation that would be enough for the kind of damage this kind of mining could cause.	FIN05
16357	The SDEIS report released to the public failed to report accurately on the inadequacy of collection pumps to catch all or most of surface and ground water waste,.	WR017, WR018
16358	The same report made no mention of the geologic fractures under the tailings basin itself.	WR012
<b>Sender Name (Submission ID)</b> Maria Freund (38376)		
9595	I am not in favor of a plan that would: Elevate aluminum and lead levels in our water	WR064
9597	I recognize that implementing the proposed plan would create jobs and positively impact the greater Minnesota economy; however, I believe that PolyMet can produce a better project plan for this mining initiative, one that involves less environmental damage/risk, does not threaten our state's defining clean fresh water characteristic, and does not require 500 years of water treatment post-mining operations.	PD01

<b>Sender Name (Submission ID)</b> Mark Hall (42993)		
8999	The development of billions of dollars worth of necessary metals contained in the Polymet project, will provide high paying and rewarding union jobs directly and for the associated industries located in northern Minnesota...Compare that to the diminishing tourism industry where employment is house-keeping /service oriented, at limited wages and is typically seasonal.	SO10
15235	Minnesota and its people have greatly benefited from iron mining for over 100 years and copper nickel mining may be even more beneficial....The failing economic conditions of communities in northern Minnesota need to be addressed in order to allow our young people to remain in the communities they grew up in and not have to migrate out of state to find rewarding employment.	SO10
15236	The review of the Polymet project should include an overall evaluation of the economic impact. That should include the economic consequence of driving mineral resource development out of the country...The elevated cost of importing our metals from other countries, the loss of wages, unemployment and other social programs costs for those that would have otherwise been employed, should be included in the overall decision	SO04
15237	The [economic] review should also evaluate the revenues generated for the government and in particular for our educational institutions...A thriving mining industry would be a substantial source of revenue to the state to help prevent cuts to social and other programs.	SO10
15238	The evaluation should also consider the legal consequences of prohibiting the development of very valuable private mineral rights on the Polymet and other lands in the Duluth Complex... [This would deny] private parties the benefits of their properties	SO04
<b>Sender Name (Submission ID)</b> Mark Harris (22931)		
12167	If approved the mine will pollute the largest of our Great Lakes, Lake Superior, threaten local clean water and wildlands, and endanger public health for generations to come.	HU03
<b>Sender Name (Submission ID)</b> Mark Haugland, MD (45856)		
10192	We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water.	HU01
10195	We also believe that the [PolyMet SDEIS] fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling.	HU01
10200	We ...request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal [and that] a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health.	HU01
10202	Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota...1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. ... many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St. Louis River...contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury.	HU03
10204	...we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.	MERC16, MERC20

<b>Sender Name (Submission ID)</b>	Mark Haugland, MD (45856)	
10207	The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water.	HU01
10208	The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant	HU04
10211	The PolyMet SDEIS fails to ... assess impacts of tailings groundwater seepage on nearby residential [wells].	HU01, WR041, WR064
10212	The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate.	HU03, VEG04, WI04, WI09
10213	we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project.	MERC08, WR197
10214	We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the Minnesota Health Department.	HU01
10215	This Health Impact Assessment should include [a] description of the known human health impacts of all pollutants in PolyMet’s air emissions and water discharges based on reliable toxicity and epidemiology data.	HU01
10216	This Health Impact Assessment should include [an] assessment of potential health impacts on residential wells from tailings seepage.	HU01, WR010, WR041
10218	[A] Health Impact Assessment should [be conducted] for on-site workers at both the PolyMet mine and plant.	HU04
10219	This Health Impact Assessment should include [an] assessment of cumulative mercury risks, including hazard levels in bodies of water that are already impaired for mercury in fish and risks posed by mercury concentration downstream in the St. Louis River.	HU01
10221	This Health Impact Assessment should include [an] assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis and an appropriate “lifetime” for exposure.	HU01
10223	This Health Impact Assessment should include [an] assessment of cumulative risks of multiple chemicals and exposure routes on vulnerable populations, including infants, children, the elderly and populations who have higher rates of consumption of affected foods, such as fish and wild rice.	HU01
10224	Environmental Impact Statements...are required by the National Environmental Policy Act to contain analysis of impacts on human health. However, human health is subordinated to environmental impacts, is addressed in a piecemeal fashion, and there is no examination of the social determinants of health in the SDEIS. [ A Health Impact Assessment] would integrate human health into the environmental review for the PolyMet NorthMet proposal, allow consideration of mitigation measures, and involve the community in planning for the project.	HU01

10226	The State of Alaska has adopted [Health Impact Assessments] as a best practice for environmental review of mining and natural resource extraction proposals, and has established procedures and a toolkit for conducting an HIA in that context. The U.S. Centers for Disease Control and Prevention also has a number of resources for integrating HIAs into the environmental review process. In Minnesota, HIAs have also been conducted as part of projects such as the Central Corridor LRT in the Twin Cities. In addition, Blue Cross and Blue Shield Minnesota recently has announced they would be interested in funding HIA's for the state.	HU01
<b>Sender Name (Submission ID)</b> Mark Imsdahl (9640)		
253	Please, do not let them mine until they have the technology to immediately, cleanly, and completely dispose of the waste products.	PD32
582	I have no faith in ANY proposed system that is required to monitor and safeguard the waste for 500+ years.	PD29
1359	I have no faith in ANY proposed system that is required to monitor and safeguard the waste for 500+ years. A year of two... maybe, but 500 years. Seriously? If indeed, that it what is required, that is ridiculous, and we all know it. Frankly, I'd like to know what incentives Polymet will have to maintain an abandoned mine 400 years after any person who benefitted from it or had anything to do with it is dead! I saw a sign last night that read "500 Years Ago, Martin Luther Was a Catholic". Sarcastic, but it makes another good point.	PD01, PD29
1470	Please, do not let them mine until they have the technology to immediately, cleanly, and completely dispose of the waste products.	PD32
<b>Sender Name (Submission ID)</b> Mark Larson (43023)		
12427	The \$3.5 to \$6.0 million level of anticipated annual long-term costs after Polymet closures does not encompass major contingent events. This low level does not meet the reasonableness test of an informed citizen or third-party expert analyst – such as an insurance actuary, or financial risk manager.	FIN05
12435	Intelligent decision-making must take into account the experience of the industry, and not rely only on models that can't fully describe what would happen around Polymer's proposed facilities...The record of the copper-nickel industry is one of contamination consistently exceeding their permits and technologies. This empirical track record should be weighed heavily by DNR relative to the prospective models and plans in the PolyMet SDEIS.	PER35
12446	Unlike in many western states, the proposed mining area in NE Minnesota is water-intensive, and feeds into Lake Superior and potentially the pristine BWCA Wilderness and border lakes.	WR111
12452	The standards used for the PolyMet Projects will set the precedent. Approval would accelerate the additional copper-nickel projects. They could expand the mining footprint, proliferate groundwater and surface water exposure, and multiply water and air impacts. Hence, there is a need for a generic EIS for copper nickel and precious metal mining, such as those carried out by the Environmental Quality Board for Forest Management (1994) and for Animal Agriculture (2002).	CU19
12453	FINANCIAL ASSURANCES DO NOT ENCOMPASS ALL RISKS: Unlike the State of Minnesota, the responsible corporate entities, Polymet and Glencore, will not exist in perpetuity...that entities such as Polymet are designed as shells to execute a project and deflect long-term financial risk. Glencore may not exist in fifty years...any financial assurance plan should name Glencore and its successors and shareholders as responsible.	FIN01

<b>Sender Name (Submission ID)</b> Mark Larson (43023)		
12454	DNR has stated that financial assurance could be adjusted annually. That reactive approach does not seem adequate given the magnitude of risks and potential impacts. If major watersheds were poisoned on a significant scale, damage could escalate and severely compromise the quality of life and outdoor recreation competitiveness of the region. Such contingencies might overwhelm any corrective plan.	FIN05, FIN08
12456	It is not clear that they [Minnesota's strong environmental laws] provide protection from tragic impacts of very long-term unpredicted contingencies and cumulative impacts of multiple copper-nickel mining installations.	CU11
16980	UNACCEPTABLE RISK THAT GOES BEYOND MODELS AND SDEIS: Models used for understanding water and toxins' interactions with natural systems and built infrastructure are useful, but they are tools. ...They cannot fully predict contingent events such as infiltration through fractured bedrock or 100- or 500-year rainfall events. Storm events in Minnesota and the country have frequently exceeded existing climate models and infrastructure designs in recent years, causing catastrophic failures	WR180
16984	...technologies as reverse osmosis have limits. The SDEIS states that reverse osmosis will only treat part of the contaminants from the Polymet facility – not water going into the containment basin. My understanding is that reverse osmosis that has not solved water pollution issues at Minnesota taconite mines.	WR143
16987	PUBLIC AGENCIES MUST THINK STRATEGICALLY AND RECOGNIZE LONG-TERM CUMULATIVE IMPACTS...Additional non-ferrous mining projects are in pending. Effective stewardship requires that we plan beyond single cases, anticipate emerging long-term developments and risks, and hold all players accountable for end outcomes.	CU02
16989	the financial assurance approach in the SDEIS does not include the following contingencies: ?All forms of long-term seepage from pits and basins into groundwater. ?Events such as overflows from catastrophic storms or infrastructure failures. ?Direct damages and highly challenging if not impossible containment or remediation of wells, lakes, wildlife and forests in the region from unforeseen groundwater or surface water contamination beyond the PolyMet site. ?Economic damage to residents, recreational property owners, cities, and industries in the region from unforeseen contaminated groundwater or surface water flows into local or eventually into major watersheds (St. Louis River, Kawishiwi River, Rainy River, etc.) and iconic lakes (Lake Superior, BWCAW, border lakes).	FIN11
<b>Sender Name (Submission ID)</b> Mark Lauderbaugh (42909)		
7805	There is nothing requiring the State of Minnesota to allow the development of the copper veins in northern Minnesota at all, especially at the insistence of the Polymet Corporation or any other developer.	PER35
7808	There is a major difference in the value of job salaries ( limited to a 20 year time span for the mine) versus the life time environmental value of this area.	SO01
7815	Approval of the present proposal from Polymet opens the door for fairly automatic approval of the Twin Metals proposal in the BWCA watershed.	CU04
7818	Recently the EPA moved to curb the development of the Pebble Mine in the Bristol Bay area of Alaska due to "ample reason to believe that the Pebble Mine would likely have significant and irreversible negative impacts" on the Bristol Bay watershed. The same potential impacts exist with the proposal by Polymet for their open pit copper mine in the Babbitt area involving the Lake Superior watershed and eventually the BWCA watershed.	WR023, WR071
7820	The very stated requirement for extended (50, 100, 200 years) waste water treatment on this project speaks to the recognition by Polymet and our MPCA that there will be negative impacts on our environment.	WR115

<b>Sender Name (Submission ID)</b> Mark Lauderbaugh (42909)		
7824	Any environmental study needs to include all future impacts for a fully developed copper mining industry in northern Minnesota. It [environmental study] needs to address future proposed mines in the BWCA watershed, such as Twin Metals.	CU02
7829	Nowhere has an open pit copper mine such as the proposed NorthMet Mining Project (Polymet) been successfully operated without polluting the environment and costing taxpayers millions of dollars to clean up.	FIN01, FIN10
7831	The mining of copper - sulfide mining is not like the environmental impact created by iron ore mining in northern Minnesota.	PD27
7833	The EIS does not address the smell which will be created by "sulfur" laden waste water in the open pits and rivers.	AIR10
7834	The EIS does not address the modeling problem on the base water flows.	WR003
8861	The EIS does not address the modeling problem on the base water flows. This needs to be address so a more accurate picture of the environmental problems can be identified and addressed.	WR003
8869	our environmental leaders [forestry service, MPCA and DNR] will be making a decision as to whether to create potentially one or several potential Superfund sites in northern Minnesota or not. Nowhere has an open pit copper mine such as the proposed NorthMet Mining Project (Polymet) been successfully operated without polluting the environment and costing taxpayers millions of dollars to clean up.	FIN01
15202	What does the State or the region stand to gain? Improved regional economy due to 350 permanent mining jobs, not all filled by local residents? What about the job loss created in the recreational industry serving the BWCA?	SO02
15203	[The potential for significant and irreversible negative] impacts exist with the proposal by Polymet for their open pit copper mine...The very stated requirement for extended (50, 100, 200 years) waste water treatment on this project speaks to the recognition by Polymet and our MPCA that there will be negative impacts on our environment. Why would Minnesota move forward with these risks?	COE04
15204	Has there been any discussion about preventing the mining of copper in the BWCA watershed? Recent denial to extent comment period seems to indicate a rush to get this important decision behind us. Any environmental study needs to include all future impacts for a fully developed copper mining industry in northern Minnesota. It needs to address future proposed mines in the BWCA watershed, such as Twin Metals. Permitting Polymet opens the door which cannot be shut.	CU18
15205	Polymet has never developed a copper mine of any type according to comments provided at the Duluth hearings. Should we not as a State require proven experience and track record on such an important issue for Minnesota?	PD23
<b>Sender Name (Submission ID)</b> Mark Lundberg (6625)		
1093	If the Polymet mining goes through, there should be aggressive measures created to police the air, water, and land issues. Measures that will shut down the mining operation, if there is evidence of any possible breaches in Polymet's assurances.	PER06
1094	I could get into the jobs, the local and state taxes, the future of our children, Polymet's being a good custodian	SO10
1200	I believe Polymet corporation's due diligence has been over and above. I believe their plans on keeping the mining and run-off areas environmentally safe are legitimate.	PD28
1201	I also believe that Minnesota's checks and balances and Polymet's pro-activeness will make this venture work.	PD28

<b>Sender Name (Submission ID)</b> Mark Luttinen (689)		
42	[There is not] adequate funding set aside to cover the 200 to 500 years of waste water cleaning, monitoring. This will eventually fall into the hands of the state when the cost overruns what is set aside and the mining companies have provided what they can afford to cover without going bankrupt. It looks like a planned superfund cleanup site is the result of this mine.	FIN11
43	There isn't enough information about how [the holding pond] would hold up to huge rainfalls and sudden flooding conditions[...]There is no secondary capture in place and if a overflow or breach occurred, it would flow into the St. Louis River watershed.	PD11
44	Not enough information on the reverse osmosis process to clean the water. The idea is great but it will require a huge amount of energy to run this type of system. Is this within the ability of the local power grid? Are they going to create electricity onsite to power this? Has this been tested on the scale that will allow them to profitably process the volume of ore that is planned?	PD03, PD39
<b>Sender Name (Submission ID)</b> Mark Lystig (18245)		
13634	It's not just a matter of there being minerals up there. There are minerals up there, true, but there are other aesthetic features of the area that do not occur anywhere else, and we need, as a community, as a country, as a world, to protect the earth, and this the time to do it.	SO02
<b>Sender Name (Submission ID)</b> Mark Moehlenbrock (43025)		
12657	Minnesota laws governing mine permitting expressly forbid granting a permit to any project that requires perpetual water treatment. By Polymet's own calculations, their waste water would require water treatment for at least 500 years; their models didn't calculate what would happen after that. Surely this is in violation of Minnesota's mine permitting laws.	PER04
12661	The SDEIS vaguely references non-mechanical [waste water] treatment, but doesn't explain what that treatment method might be or when it will be able to be employed.	PD06
12681	Mercury loading in the Embarrass River is expected to increase. The Embarrass River watershed is already impaired by excess mercury in fish tissue. The SDEIS justifies this by saying that, because mercury loading to the Partridge River will decrease, the net effect is less mercury in the Saint Louis River...Because of the existing impairment for excess mercury in fish tissue, any project that anticipates adding further mercury to the Embarrass River should not be deemed acceptable.	MERC22
12688	The document [SDEIS] contains two critically important pieces of information: 1) Polymet really has no idea how long their waste rock piles and tailings basins will leach toxic water, and 2) They have no idea how they will treat that water non-mechanically after mine closure.	WR035
17000	Polymet claims to be very concerned with post-reclamation water quality, but in 50 years, when there is no more money to be made, who is going to make them accountable? 500 years is longer than any of us can fathom, and the idea that Polymet will be on site for half a millennium, diligently maintaining their waste water treatment facility, is absurd.	FIN01
17003	[Regarding] the uncertainty of the mathematical models Polymet used...Their calculations were off by factors of "approximately 2 to 4" and they simply applied a linear "calibration factor" without having any idea what caused the discrepancy. They assumed the mistake was of a simple factor of 2 or 4, but what if this factor varies exponentially with some other independent variable? They admit that the discrepancy is "not completely accounted for." When I combine this with the much-publicized mistake in the Partridge River base flow rate model, I have very little confidence in any of their water quality conclusions.	WR049, WR060

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Mark Rieder (11341)		
272	The short term economic benefits do not outweigh the long term environmental cost.	SO01
<b>Sender Name (Submission ID)</b> Mark Roalson (57340)		
18433	my main concern is if the regulating agencies, like the MPCA and the Minnesota DNR cannot make Cliffs Natural Resources clean this up before PolyMet, how are they going to regulate PolyMet, that is going to be a lot bigger operation?	PER06
18435	Another thing that concerns me about the PolyMet mine is that there doesn't appear to be any emergency plans in case of catastrophic events, like heavy rainfall, heavy winds that might damage or cause leaking in tailings ponds or in any treatment plants.	PD22
18437	there is going to be large containers of chemicals stored, like sulfuric acid and other chemicals to process the mine ore. And these things need to be bermed and contained, and there needs to be emergency plans in case some of those break, from whatever cause it might be.	PD22
18438	Minnesota has a law on the books stating that when you sink a hole in the ground, like exploratory drilling, to take ore samples out in the form of a core, that these exploratory holes have to be grouted, cemented from the bottom to the top to prevent cross aquifer contamination. But the Minnesota Department of Health has issued a waiver to the exploratory drilling companies that they don't have to grout these holes for ten years. So, one of my concerns is if they are giving waivers now and making exceptions, what other exceptions are they going to make in the mining process if things don't go according to plan?	PER06
19608	One factor that I couldn't find addressed in the latest PolyMet SDEIS is the issue of mitigating the results of natural disasters. While dealing with the acid water, heavy metals, waste rock and other concerns are listed, none take into account of what emergency efforts would take effect if there was a major flood... if you check the records at the MPCA, you will find that an already existing stockpile of copper-nickel ore stored within a berm (set aside by the former LTV mine on what is now Polymet) has several times had acid drainage wash over its walls and into tributaries going north to Birch Lake.	HAZ01
19609	Flooding ...should definitely be considered in the emergency plans to contain waste and untreated water of all types.	HAZ01
<b>Sender Name (Submission ID)</b> Mark S Jensen (54521)		
18736	PolyMet has not proven that they can contain or dispose of the waste rock and other materials associated with the mining process.	PD15, PD23
<b>Sender Name (Submission ID)</b> Mark S Roalson (42805)		
7032	After asking DNR, Forest Service, and Army Corps of Engineer staff, no one could tell me for sure if there is an established data baseline of just exactly what the biological makeup of the PolyMet watershed is. I didn't see it in the SDEIS. This would include all freshwater zoo plankton, invertebrates, plants, minnows, fish, and insects. This baseline should be checked on a regular basis for comparison ( if mining is permitted) and checked for indication of die-offs or population changes and absorption of all pollutants, especially heavy metals. WICOLA has done this in Ely for the White Iron Chain of Lakes, and it should be done for the PolyMet Project	VEG09
7037	The base water flow table used by PolyMet (page 4-67) apparently underestimates low flows during winter. Real data needs to be obtained, not estimations. ...There is no mention of containing leakage into the water table from the bottom of the mining [pit] itself...The PolyMet SDEIS does not address these essential issues [ground water treatment/reuse]...	WR003, WR130

12653	The statistical model which was used to determine the mine’s environmental impact is flawed in that it does not take into account the worst case scenario but only outcomes with the greatest probabilities. Consequently, the SDEIS underestimates the potential human, environmental, and remediation costs....	NEPA08
15091	The probable scenarios in the NorthMet/PolyMet SDEIS do not account for less frequent but certainly occurring real events, such as Duluth’s recent 500-year flood which could cause an overflow of the tailings ponds. The tailings ponds and mining and mitigation plans in the NorthMet/PolyMet proposal do not adequately protect the public or the environment against the effects of such infrequent but certainly occurring events.	WR057, WR077, WR180, WR193
<b>Sender Name (Submission ID)</b> Martha Roberts (43118)		
16584	We need to recognize that not only our economic well-being and sustainability, but also human survival, depends on protecting and restoring the natural environment and the biological systems that create and maintain life. Minnesota is part of a global ecosystem and climate, and we will not exist as a species without this ecosystem remaining in balance.	SO01
16585	There is no level of “financial assurance” that PolyMet can give Minnesota that will assure the ongoing LONG TERM protection of northern Minnesota’s wetlands, Superior Forest land, surface water and ground water quality, and the protection of threatened wildlife that depend on these natural habitats.	FIN11
16586	Humans exposed to mining ground water pollutants face serious long-term health risks, and we have already seen (and should have learned from) the increased Mesothelioma Cancer risk for miners exposed to toxic air quality in mining work sites in northern Minnesota.	HU03
16588	the proposed plan for water treatment of surface waters does not address the very high risk of polluting ground water, especially when you consider what the plan is for “reclamation.” The DNR’s description of PolyMet supposedly “reclaiming” its buried waste by covering it with a plastic membrane, filling up the mining pits with back water and then topping them off with a “reclaimed wetland” is science fiction! This is a ground water disaster waiting to happen.	WR067, WR195
16589	The proposed plan does NOT comply with the Superior Forest Land and Resource Management Plan! Locating a highly-polluting mine site that will produce 20 years (probably more) of unimaginable amounts of sulfate, heavy metals and mercury run off from stock pits, mining pits and tailings basins, as well as wipe out over 6,000 acres of natural wetlands and forests and make our rivers, streams, Lake Superior and ground water toxic, does not protect valuable ecosystems!	LAN04
16590	Exchanging multiple parcels of private land for a large tract of publicly-owned Superior National Forest Land is NOT “in the long-term public interest of the people of Minnesota,” or of the other wildlife and living organisms that also rightfully reside in our state. ...Nor does this proposed mine “consolidate federal ownership.” How does excavating over 6,000 acres of preserved forest and wetlands in a trade for MULTIPLE scattered parcel sites of private land (some of which has to still be restored to a natural wetland state) in any way provide “consolidation” of lands, or protect large enough habitat tracts that wildlife can actually survive and live in an undisturbed ecosystem?	LAN01, LAN04
16592	So, the BIG QUESTION is: Will Minnesota will just continue the escalation of land development and disturbance, splitting up wild lands into smaller and smaller parcels due to human population pressures and intensive pit mining financial interests, and other resource removal, until we have no wild lands left?	SO04

<b>Sender Name (Submission ID)</b> Mary Disch (18266)		
13882	I'm concerned whether PolyMet is -- I know it is a new company, but it is funded by other companies' money, and what their track record has been.	PD23
13883	My concern, too, is that opening this area to copper sulfide mining might open it up to more of that, and what the cumulative effects might be, and my concerns of the cumulative effects on the people that live nearby and the water quality of the Hoyt Lakes, which I think is pretty close.	CU04
13884	I would just like to see more concern and overseeing what -- my question is when PolyMet says they are going to do this, how often does that happen? And is there a way of assuring that that happens?	PD22
13885	And my concern, too, that wild rice, when I talk to people, it moves around, so it is not like you can say this specific area has wild rice. So it is essential that the area has clean water so that wild rice can move to where it needs to move.	WR154
13886	And I heard that the mercury is more up, and fish, with the higher sulfate levels, and so that's part of my concern, whether those levels will be safe enough for fish.	MERC02
<b>Sender Name (Submission ID)</b> Mary Dosch (19508)		
2853	The SDEIS says on pages 5 through 377 that impacts on moose will be discussed in the cultural resources section 5.2.9. However, neither in that culture resources section nor in the cumulative impact section mention even one word about moose.	WI01
9087	I respectfully ask that ALTERNATIVES to the open pit mine, specifically an UNDERGROUND MINE, be studied. Since PolyMet has acknowledged that an underground mine could access copper and nickel, and since an underground mine would be far less destructive to the habitats of wildlife species in impacted areas.	ALT06
14814	The PolyMet project would harm moose due to habitat, fragmentation, and loss...Moose are important to the Indian bands under treaties and (inaudible)...The PolyMet SDEIS is inadequate in that it needs to be redone to reflect the cultural affects of loss of moose habitat at the PolyMet mine site and also the cumulative adverse impacts on the endangered moose.	WI01, WI02, WI09
16339	For example, moose are already in substantial decline and the habitat loss that would inevitably occur if PolyMet were to mine would expedite further losses for our priceless moose population.	WI01, WI02
16340	In addition, many species of birds whose homes would be in harm's way, e.g., birds in the St. Louis River Estuary like Common Loons, Hooded Mergansers and Belted Kingfishers, need to be considered when weighing the pros and cons of this proposed mining project.	WI01
16341	PolyMet's plan for an open pit mine would directly destroy more than 900 acres of wetlands and could indirectly destroy more than 7,351 additional acres of wetlands in the Partridge and Embarrass River watersheds due to pollution and changes in hydrology.	WET10
16342	The proposed wetland mitigation only covers the 912.5 acres of direct wetland impacts. Therefore, the more than ten miles of additional wetlands projected to be "indirectly" impacted by water drawdowns and toxic materials will likely be permanently harmed as the bogs and coniferous swamps in harm's way are extremely difficult to restore. Thus the SDEIS, by not addressing the impacts on these "indirectly" impacted wetlands, is INADEQUATE in that respect.	WET01
16343	Also, where pollution from the mine pits, mine wastes and tailings piles seeps up from surface ground water flow to wetlands, it is virtually certain that PolyMet's discharge would violate water quality standards.	WR064, WR070
16344	Furthermore, PolyMet's excavation and thus changing hydrology in wetlands would increase mercury loading to wetlands and streams and increase mercury bioaccumulation in fish, thus putting human health at risk.	HU03

<b>Sender Name (Submission ID)</b> Mary Dosch (19508)		
16347	Given that PolyMet's own mine plan admits that millions of gallons of polluted water will seep off site, uncaptured and untreated, and that this will continue for hundreds of years, I have to ask how we can even consider giving PolyMet the green light.	WR195
16348	...by giving PolyMet the go-ahead, we would be getting 20 years worth of mining jobs (SHORT-TERM GAIN) while incurring at least 500 years of pollution and perpetual water treatment (LONG-TERM LOSS). Furthermore, perpetual water treatment is not maintenance free.	PER04, SO01
16350	Currently the region that would be impacted by the PolyMet mine is a haven for tourists, fishermen, and outdoor enthusiasts like me... By giving PolyMet the green light and thus setting a precedent for numerous other mining companies to follow suit, the seeds of our own destruction as a place of retreat and purity and sanity will be sown.	WILD02
16351	Furthermore, the SDEIS should be rejected as it gives no detailed information as to how 500 years of water treatment will be paid for.	FIN01
<b>Sender Name (Submission ID)</b> Mary E. Dosch (10336)		
9347	On page after page it says that in the event that modeling shows violations of water quality, PolyMet will "adaptively manage" the problem. Once pollution is in groundwater it is TOO LATE to fix.	WR130
10684	The SDEIS doesn't provide even the most basic information to support its predictions. How much polluted wastewater would be going back and forth through nine miles of pipes? What is the total volume of wastewater in tailings and processing residue? Just how polluted is the wastewater in waste rock piles, pits, sump ponds, the tailings basin and the hydrometallic waste dump? Without this basic information, we can't estimate what would happen if PolyMet's almost perfect assumptions - not based on anything in the real world - don't come true.	PD03, PD15, PD30, PD36, WR057, WR060, WR182, WR189
10694	Access to clean water should be the birthright of all - humans and non-humans alike. We have no right to jeopardize that birthright.	WR195
<b>Sender Name (Submission ID)</b> Mary Ellen Kremposky (22900)		
12164	Lake Superior retains water for about 200 years. Any mining waste inputs would last for centuries.	WR111
13971	Also, tourism is a big source of income and should be protected not damaged by mining operations.	SO02
<b>Sender Name (Submission ID)</b> Mary Everest (44551)		
11775	The PolyMet mine would violate the 1854 Treaty between the United States and Minnesota Ojibwe bands. This treaty guarantees the right to hunt, fish, and gather in the location of the proposed mine. The land must remain intact, including the animals and plants that the Ojibwe hunt, fish, and gather.	CR01
11781	However, the proposed mine would destroy wetlands and habitat for animals and plants fundamental to Ojibwe life.	VEG03, WI02, WI09
11783	In addition to habitat destruction and removal, the proposed mine would generate unacceptable levels of mercury and sulfuric acid contamination in the watershed, subsequently turning food into poison.	MERC02
<b>Sender Name (Submission ID)</b> Mary Gallet (42507)

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Mary Gallet (42507)		
15400	The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	HAZ02
<b>Sender Name (Submission ID)</b> Mary Gover (40969)		
8358	[The SDEIS] fails to give appropriate weight to the fact that every copper/nickel sulfide mine located in a watery environment has resulted in contamination of surface and/or ground water.	WR023
8367	I understand (from the program on MPR) that large piles of tailings remain from past PolyMet mining, and that the effluent from these tailings fails to meet MN water standards. Accordingly, I urge the DNR to require that PolyMet clean up the existing tailings before it is allowed to generate any more.	HAZ01
<b>Sender Name (Submission ID)</b> Mary Haltvick (47379)		
12281	I believe that PolyMet's plan for sulfide mining does not sufficiently address its potential to do irreversible damage to the environment and the health of the people who live and work in the communities that would be affected.	HU03
12293	My first concern refers to the permitting required by Section 404 of the Clean Water Act. The wetlands proposed for destruction are priceless and form part of a broader biotic system. The 913 acres to be destroyed and the additional over 7000 acres at risk of being degraded by subsequent air and water pollution from the mining operations represent an unprecedented loss of wetlands for Minnesota.	COE03
12299	The SDEIS does not factor the real value of the lost ecosystem into its calculations. Land has value but so do nature and natural processes. The science of economics rarely makes this kind of calculation.	SO04
12305	The historical record... shows that sulfide mining in a water-rich environment has historically resulted in surface and ground water pollution with toxins that are harmful to human life. I don't believe the SDEIS sufficiently addresses the risks of this kind of mining in a water-rich environment.	HU01, WR023
17876	On paper the plan to replace these precious wetlands might look like a fair "exchange" if one is just counting acreage and size, but what is lost is an aquatic ecosystem of rivers, creeks, streams, ponds, swamps, land and vegetation that provide habitat for wildlife and maintain the quality of the watershed. Can the lands offered in the land exchange proposal really compensate for a lost ecosystem, especially if those lands are outside the affected watershed?	LAN03
17878	This area is rich in water but unfortunately many of the bodies of water in the area are already identified by the MPCA as "impaired waters" due to elevated levels of mercury. This, therefore, is a proposal to mine in an already compromised area that mining will put at further risk. The water quality models used by PolyMet are guesses and assumptions about how mining might affect the water, but they are unsubstantiated and without evidence.	WR158, WR189
<b>Sender Name (Submission ID)</b> Mary Halvorson (44630)		
15926	I am not at all convinced in plans for clean up and oversight	PD01
<b>Sender Name (Submission ID)</b> Mary Heise (46594)		
9154	I have serious concerns and doubt that adequate funding will be available to address any accidents or incidents that occur during mine operations and especially after the mine closes. Secured funding also needs to be available for the lengthy water treatment process after mine closure.	FIN01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Mary Heise (46594)		
9155	How is the funding guaranteed to be there even hundreds of years after mine operations cease?	FIN01
9156	It is important to have all of the necessary funds readily available throughout the entire water treatment period of 500+ years so that clean-up costs do not become a burden on Minnesotan residents.	FIN01
9157	How is inflation and any unforeseen complications of treatment being calculated into Polymet's closure costs? How can a person predict the value of the dollar that far in the future?	FIN05, FIN08
9158	It does not adequately look at reducing impacts to wetlands by considering underground mining vs. open pit mining. Economic feasibility is not supposed to be the primary factor for alternative methods in an EIS.	ALT01, ALT06
9160	What evidence is there that the proposed treatment of contaminated water by reverse osmosis actually works on projects of this scale?The water treatment process is not specific enough. What are the plans for the toxic sludge generated by reverse osmosis? How is the reverse osmosis system guaranteed to keep up with the quantity and continuous supply of contaminated water?	PD03
9161	The proposed wetland reclamation and regeneration would not equal the high quality wetlands that the mine will destroy.	WET05
9162	What are the effects on human health, especially in the unborn and very young, of exposure to the pollutants emitted into the air and water, especially as these pollutants accumulate to higher levels?	HU01
9165	What insurance is there against underground drinking water contamination and what procedures will be followed to clean up any contamination that occurs?	HU01
9166	As abundant clean water becomes more scarce world-wide and thus more valuable, this resource should be weighted higher for impact considerations the farther the timeline of impacts goes into the future. For example, clean water is likely to be more economically and environmentally valuable 100 years from now than it is today, therefore, any long term negative impacts done now should be assessed as more harmful than is currently considered.	WR195
9168	What are the health risks to employees who are exposed to sulfide mining conditions?	HU04
9173	What is the potential for soil contamination away from the mine site and what health risks are present for people who come into contact with this soil, especially for those growing their own food?	HU01
9174	The Superior National Forest is a national asset and the proposed land exchange is not adequate compensation for U.S. citizens.	LAN03
9175	How will the survival and reintroduction of rare species found in the disturbed wetlands be assured after mine closure?	WI01
<b>Sender Name (Submission ID)</b> Mary Helen Stephens (38874)		
5381	Since we know that water continues to flow downstream forever till it reaches oceans, how can we protect those, especially children who live downstream from this proposed mine from the Mercury that will follow the waterways out of Minn. There must be some way to collect the chemical before it leaves the mine site, forever, not in a land based ground storage pit.	PD15

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Mary St. Michael (49434)	
16881	The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks.	MERC20, WR158, WR197
16883	The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution.	HU02
16884	The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant.	HU04
16885	The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage.	WR041
16886	The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary.	HU06
16887	The SDEIS arbitrarily denies effects of water pollution on the St Louis River.	WR111
16889	The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence.	SO01
16890	Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence.	SO01
16891	Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources.	WR158
16893	Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured.	WR018, WR022
16896	Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution.	AIR05
16897	Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including:... Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public.	HU01
16898	[The EIS should include a Health Risk Assessment that incorporates an] Assessment of potential impacts on residential wells from tailings seepage.	WR041
16899	[The EIS should include a Health Risk Assessment that incorporates a] Health risk assessment for on-site workers at both the PolyMet mine and plant.	HU04
16900	[The EIS should include a Health Risk Assessment that incorporates an] Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury in fish.	HU01, MERC03, MERC10

11572 There would be 500 years of cleanup. Who will pay for that? ... Just imagine, in the year 2540, PolyMet is still standing by, guarding the water supply! It is far more likely, though, that after mine is no longer producing maximum profit, or maybe a little while after that, PolyMet, or its parent corporation, Glencore, will tire of pumping water and will just abandon the mine. We have a name for orphan mines like this — Superfund sites.

FIN01

11743 The path of pollution will flow into Basswood Lake, damaging a world-class fisheries and exposing humans to the toxic effects of methymercury.

MERC02

11761 One effect of mining has been the corresponding removal of other employment options. When the minerals are gone, the mines close, and there is little reason for other businesses to locate in areas stripped of a landscape that draws people to a community. Mining is the only option, but without minerals that option no longer exists either.

SO02

15788 Sulfide mining will not bring stability. The minerals are finite. When they are gone the mining areas will again be left struggling to find viable options. And this time our lakes will need perpetual treatment for acid and toxic heavy metals. Is this what we want for future generations?

WR195

15789 Let us assume for a moment that PolyMet manages against the odds — and they are really long odds — to contain all the sulfuric acid that it produces during mine operation. What happens when the mine closes?

PD01

15790 If Freedom Industries, the Department of Homeland Security and other government entities can't keep track of one storage tank in West Virginia for less than a quarter century, how are we going to keep track of a toxic site on Lake Superior for five centuries?

GT10

15892 today, Ely has seen an upswing in industries based on the natural beauty (Boundary Waters and Superior NF) including manufacturing, a large increase in summer home development with its associated construction jobs and ongoing service jobs and support of main street businesses...But the big problem is sulfide-ore mining. If current prospecting and mining holdings are developed, the Northwoods will be surrounded by a massive industrial mining district. The forests would be transformed and lost forever. No sulfide-ore mine has avoided extensive toxic pollution to waters, and the Northwoods is a high risk area for water pollution.

SO02

15894 Is mining inevitable? I think not. These are low grade deposits and are dependent on high prices and low costs. If China slows down, the numbers won't work unless the costs drop dramatically. The trend is for recycling (at least 1/3 of every product). All of this is the reason I say our Northwoods area is too valuable to gamble on the most toxic form of mining with little return and a lot of cost to us.

NEPA06

**Sender Name (Submission ID)**    marylougofcfp@aol.com (43230)

15817 THIS CORPORATION HAS NO ALLEGIANCE TO OUR STATE, AND AS A MULTINATIONAL WILL TAKE ITS PROFITS AND LEAVE US WITH THE RECLAMATION.

FIN01

15818 I FIND IT IRONIC THAT WE ARE SPENDING MILLIONS OF DOLLARS IN RESTORING OUR POLLUTED WATERS, WHILE CONTEMPLATING A COPPER SULFATE MINE IN NORTHERN MINNESOTA. THE MINE HAS THE POTENTIAL TO DESTROY EFFORTS THAT ARE BEING UNDERTAKEN AT THIS TIME

NEPA15

15819 WE WOULD BETTER OFF RECYCLING THE TONS OF PRECIOUS METALS THAT ARE BEING DUMPED IN LANDFILLS; AND IN THE PROCESS EMPLOYING PEOPLE IN AN INDUSTRY THAT RECLAIMS RATHER THAN ADDS TO THE DEVASTATION OF OUR ENVIRONMENT.

NEPA06

10284	Fissures in the bed rock that may open to the aquifer are incompletely and inaccurately mapped; better data is reported to be available from Canadian maps. I ASK that the SDEIS include accurate fissure mapping.	WR007, WR008
10286	Reusing Storage Site: Sulfide process tailings will be stored on an existing taconite tailings site that is known already to be leaking to the environment. Sulfide leakage should be expected.	HAZ01
10288	I attended the meeting in St. Paul and saw the diagram of the proposed system of sealing the bottom of a storage basin. The diagram showed a subterranean geomembrane intended to prevent leakage down to the aquifer and another geomembrane covering the pile to prevent rain from entering it. Very little made by man has survived 200 years and I doubt these membranes have been so tested. The cover is available for replacement but the underground one is not. The protection intended seems inadequate. I ASK that the SDEIS include consideration of leakage control with a punctured underground membrane.	PD17, WR127
10291	I understand the SDEIS does not address the possible failure of storage site containment methods, whereas the history of containing dangerous materials is a litany of failure... Failure should be expected at this site sometime in 200 years, if not during actual operations. I ASK that the SDEIS Consider modes of failure and demonstrate capability to respond so as to protect the environment.	PD22
10294	Model Flaw: The design model makes assumptions that seem intended to deliver the desired result, for instance, that 90% of drainage from storage basins will be captured and delivered to a treatment facility. This would require that underground piping would be installed and maintained so as not to fail in 200 years. It seems an overoptimistic assumption. ... I ASK that the SDEIS include the costs of repairing/replacing the system piping at 30 year intervals to account for breakage due to settlement of the piles.	WR131
10298	Reverse Osmosis: ... I learned that the product stream is about 10% of the input, the concentrated 90% discard stream presents disposal problems, the input stream must be pumped through the separation membrane at high pressure, that the membranes are fragile and require frequent replacement. I ASK that the SDEIS be expanded to include a line item-by-line item estimate of facility maintenance costs, including at least 3% inflation, for the 200 year period and that the proposed method of disposing of the 90% concentrated sludge stream residue be identified. Simply trucking it off-site is not adequate description.	PD03
10301	.. the SDEIS does not address control of fugitive, mineral dust from the mining operation or from the various transport operations involving ore and tailings. I would expect the wind-blown dust from sulfide ore and tailings to acidify the surrounding area and lakes ... I ASK that the SDEIS be extended to assess the expected damage to lakes and forests from fugitive dust.	VEG07
10314	The SDEIS admits to some pollution of the Partridge and Embarrass Rivers but the extent of it is calculated from a flawed model; the press reported that the rate of underground water transfer was erroneously measured. Combined with the overoptimistic assumptions for success of control of acid mine drainage the rate of stream pollution cannot be correct. I ASK that the SDEIS be revised to study accurately the stream pollution possible from the site.	WR003, WR189
10317	Putting a mine on top of a wetland will destroy a large and nationally important one. The concept of mitigating the loss by developing a wetland elsewhere is politically expedient but I doubt the hydrological feasibility of it. ... I ASK that the SDEIS designate the location of the mitigating wetland and include a hydrological report of its feasibility. And, it must be in the same watershed.	WET03, WET06, WET19

<b>Sender Name (Submission ID)</b> Mason and Gwen Myers (45918)		
10321	Another problem with a wetland-located mine is that the upwelling water is moved upward by a long-established pressure gradient. Putting a mine on top of it will not shut off that pressure gradient; and digging a 600 foot hole there will reduce the resistance against which the gradient must work. I would expect that the result would be a mine filled with water; which will need to be dewatered continuously; and the pumps will deliver the water to the nearest stream. But the water has been exposed to the sulfide bearing ore so it is now a contributor to acid mine drainage. And the aquifer is drained. And I would expect that the 600 foot hole would act as a drain sump for any ground water in the area. The effect would be to dewater the entire area and kill life in the receiving stream. I ASK that the SDEIS be extended to assess the effect of the mine on the aquifer and surrounding ground water.	WR086, WR120, WR171, WR179
10323	Water is Minnesota's most important commodity. ... it seems a poor idea to introduce sulfide mining into the wettest, most interconnected region of a state that sits at the headwaters of much of the continent and then proceed to open mine pits and build processing plants that will surely contaminate land and water in perpetuity.	WR195
<b>Sender Name (Submission ID)</b> Mason C and Gwen S Myers (21552)		
10074	(...), the proposed project, located in the Lake Superior watershed, will destroy or degrade thousands of acres of high-quality wetlands and cause permanent water pollution with sulfuric acid and toxic wastes.	WR001, WR115
10076	(...) the PolyMet Project would completely destroy 912 acres of wetlands, 65% of which the DNR describes as high-quality.(...) the SDEIS admits that an additional 7,351 acres of wetlands would be degraded due to air and water pollution, mine dewatering and diverting water from wetlands.(...)The wetlands that would be destroyed or harmed by the PolyMet mine are water resources of national and international importance. Though the environmental review process should propose alternatives, nothing is suggested to reduce impacts to wetlands in the SDEIS.(...) There is no mitigation for the indirect wetland destruction and 2/3 of the replacement wetlands are outside the Lake Superior watershed.	WET01, WET03, WET19, WET20

<b>Sender Name (Submission ID)</b> Matt Tyler (18354)		
2536	If you look at Appendix C, it is about 250 or 200 pages of the tribe saying all of the things that are wrong with the EIS, based on science and citations with their own models. Now, if we are going to say that that [SDEIS] is adequate, and we have that much dissent, then that is purely illogical and ridiculous	NEPA12
2537	And I think one thing that doesn't get talked about a lot, you know, is the mesothelioma and the increased risk of heart attack and stroke, you know, that a lot of people have experienced. And that is not really reflected in here [SDEIS] very well.	HU01
2538	I will just point out, the way they analyzed the wetlands impact on this thing is kind of ridiculous. I am friends with a professional hydrologist and he has told me time and time again, if you want to look at a wetlands study, you have to do a hydrological study, do a pump test, you have to do a laser test. They didn't do that. Why?	WET08
3208	...one thing I'd want to focus on is that something that's not been talked about is that this SDEIS, if you actually work through it, didn't have any analysis of worker safety in there.	HU04

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Matt Tyler (18354)	
1209	...I think we have to look at this critically and one of the reasons they might not have put worker safety in there is because their own data in the SDEIS, page 5 -- 439 -- to 4 -- 438 to 439, points out that about nine percent of the ore tailing and process water have those asbestos-like fibers in them, and you know, they didn't really look at what's that going to go to folks in the plant. They didn't really look at what the air treatment mechanisms are going to be.	HU04
14636	very rarely do you see an EIS that has its own chapter where the agencies say, "We disagree with this, we disagree with this, we disagree with this." If you look at Appendix C, it is about 250 or 200 pages of the tribe saying all of the things that are wrong with the EIS, based on science and citations with their own models. Now, if we are going to say that that is adequate, and we have that much dissent, then that is purely illogical and ridiculous.	NEPA12
14637	And I think one thing that doesn't get talked about a lot, you know, is the mesothelioma and the increased risk of heart attack and stroke, you know, that a lot of people have experienced. And that is not really reflected in here very well.	HU01
14638	No other EIS has this little mention in it to workers' safety.	HU04
14639	the way they analyzed the wetlands impact on this thing is kind of ridiculous. I am friends with a professional hydrologist and he has told me time and time again, if you want to look at a wetlands study, you have to do a hydrological study, do a pump test, you have to do a laser test. They didn't do that. Why? Because they were lazy. They wanted to rush to get this done, and now it is still incomplete.	WET08
18349	To protect taxpayers from bearing the cost of long term treatment, a portion of the financial assurance required by the State of Minnesota should be set aside to create a non-refundable trust fund dedicated solely to paying for the operations and maintenance of long term treatment.	FIN01, FIN08, FIN10
18350	Although the NorthMet SDEIS gives estimates of \$3.5-\$6 million annually for post-closure operations and maintenance (O&M) (SDEIS, pg. 3-138), the source of these estimates is not documented.	FIN05
18351	The annual long-term operating and maintenance post-closure cost estimates in the PolyMet SDEIS are significantly lower than the lowest estimates calculated from published estimates for similar reverse osmosis plants on the LTV property... Independent estimates of long-term annual O&M post-closure costs range from \$6.1 to \$10.6 million.	FIN05
18352	Stochastic simulation of volatile investment returns and inflation rates show that the minimum beginning balance for the Long Term Treatment Fund required to ensure water treatment for 500 years after closure is \$333 million, and quite possibly \$500 million or more.	FIN05, FIN08
18353	Lacking specific, detailed treatment water treatment plant plans specific to the NorthMet Project, there is still considerable uncertainty about annual long-term treatment costs.	FIN05
18355	The SDEIS also fails to include an estimate of a financial assurance funds for accidents, natural disasters, and other unforeseen events.	FIN05
18356	Not including additional contingency funds, the total financial assurance package should be at least \$383-\$700 million.	FIN05
18358	The NorthMet FEIS and permit applications should include financial assurance trust funds requirements for long-term treatment based on probabilistic analysis of investment return and inflation volatility similar to that presented here.	FIN05, FIN08
18359	Future probabilistic financial analyses should ideally use alpha-stable or other nonnormal distributions.	FIN05, FIN08

11533	<p>A response to preventing release of such substances is to use a Hydrometallurgical Residue Facility (HRF), a large scale storage facility (SDEIS pp. 5-545, 569) to control disposed waste from the HP, waste sludge from Waste Water Treatment Facility at the Mine Site either directly or after processing through the HP, HP spill wastes that cannot be reintroduced to the HP, and other mine and plant wastes that require similar isolation from the environment....The SDEIS should develop alternatives to the current disposal system. One alternative to develop is a facility in which the waste is dried and permanently stabilized for disposal, either during operations or at closure. In this scenario, a waste-draining and treatment facility might route HP process waste water to a lower-elevation surficial impoundment for recycling to the HP. HRF contains hazardous waste and must be regulated appropriately Residue waste in the HRF has the potential to acidify and leach metals.</p>	ALT09
11535	<p>The SDEIS p. 5-545 declares “no significant adverse effects from the proposed use or generation of hazardous wastes by the NorthMet Project Proposed Action” but provides little data, evidence and commitment to demonstrate that the long term, perpetual containment of the wastes will not fail....I believe this facility is a hazardous waste facility based on:...- The gypsum sludge at PolyMet met the TCLP test, but the all wastes have not been tested for lethality and the process water is basic, with high chlorides...- By understanding that the purpose of the WWTF is to filter out metals and other constituents that prevent compliance with NPDES requirements, we can use our judgment that the waste sludge has potential to be hazardous....Unlike the hydrometallurgical wastes that were tested by TCLP for hazardous characteristic, the hydrometallurgical process waste water anticipated for full production was not [tested] during pilot tests (SRK, RS33/RS65 Hydrometallurgical Residue Characterization and Water Quality Model, February 21, 2007, Appendix B, p. 3...Although TCLP (EPA 1311) tests for the hazardous waste corrosivity characteristic on each of the solid form residues and their combination indicated these were not hazardous (SRK RS33/RS65, 2007, p. 23), the hydrometallurgical process waste water was not [TCLP] tested, and no indication of required testing of these wastes for the Minnesota lethality characteristic was found in the supporting documents...The SDEIS does not propose treating the residue in the HRF. However, “there is potential for acid generation to exceed neutralizing capacity in the long term, therefore lime or limestone will be blended with the Residue prior to disposal in the lined HRF.” (PolyMet, Residue Management Plan V. 2, December 14, 2012, p. 6). This will be a giant experiment using theoretical calculations for the volume of limestone to mix in with the residue, with some risk of failure....The HP process is said to “extract and isolate platinum group metals (PGM), precious metals, and base metals” (SDEIS, p. 3-107), but this list of products is inconsistent with the products from this process described elsewhere as gold/PGM product, copper concentrate product, and Nickel/Cobalt product (SDEIS Fig. 3.2-26, p. 3-109). The processes producing each of these sets of products require different chemicals, so it is important to be clear about which products will be produced, using which chemicals....The SDEIS must discuss the fate and risks of impacts of remnants of thickeners, flocculants, explosives, and such, some of which might cause impact different from their elemental makeup. Whether the waste is deposited in the HRF or in the FTB, at the stockpiles and the mine pits, all are subject to risks of release in the long term future because the wastes are not stable, and water and weather will cause wear on the covers.</p>	AQ27, HAZ02, PD17, PD18

<b>Sender Name (Submission ID)</b>	Maureen Johnson (43006)	
11537	No one in the List of Preparers shows RCRA solid and hazardous waste training...Listing the permits and their functions in the SDEIS is a way to provide the information. The list should include which permits cover which wastes, especially wastes presenting risks that meet or come close to the Minnesota definition of hazardous waste. If PolyMet will need a Hazardous Waste Generator's License, this should also be listed, even if the waste is exempt from other parts of chapter 7045. A large operation such as this often has its own industrial waste landfill. If PolyMet will have one or will continue to use SW-619, the permit should also be listed...The proposed location violates the location standards...The SDEIS avoids the requirement to provide information prepared for the NPDES and SDS and RCRA permitting that is required by Minn. Stat. 4410.2300 CONTENT OF EIS...The SDEIS completely ignores the narrative state standards, which are more difficult and complex than meeting the chemical numbers...The proposed location of the HRF does not comply with Minn. R. 7001 with the location requirements for hazardous waste at 7045.0538 LANDFILLS...The SDEIS text is insufficiently referenced, which meant we must search through the text pages of multiple reference documents listed at the end to find information about a particular subject in 2 full CDs (disks) of reference content amounting to 50,000 to 80,000 pages. Some references contained important references that were not included. This is an enormous amount of wasted time on the part of the reviewers and is a major reason we complained we need more time. There are many SDEIS statements that are not cited to references where references are available. This purposely makes it difficult to find references that apply to confirm the veracity of the statements. The index is usually useless. For example there is no entry for Waste Water Treatment Facility...PolyMet needs to make a statement of commitment in the SDEIS as to what it will do and what it might do to create a basis for the Record of Decision and for special appropriate conditions to be placed in its permits.	HAZ01, PER09, PER12
11546	the surface impoundment on closure will require maintenance that is not adequately planned or financed...- the lack of sufficient cover replacement plan and financing.- uncertainties in the production, and risk to environment when mismanaged, especially if not maintained and the cover not replaced- maintenance and replacement must be conducted into perpetuity, raising concern about the stability of the company over hundreds of years...The SDEIS must discuss the permanency of the Hydrometallurgical Residue Facility [HRF] and the perpetual nature of maintenance required, in contrast to the time over which the HRF is modeled...Financial Assurance should require annual contributions to a closure/maintenance and post-closure maintenance escrow funds during the 20 years of operation, with each year including provision for 1/20th of the total amount of maintenance costs for 500 years. Notwithstanding the current rules on financial insurance, this would be the only way to guarantee the proposer pays for these costs.The SDEIS must include a plan of sufficient detail for post-reclamation repair/ replacement/ other action in the case that the bottom liner composite system fails as indicated by quantity of leachate or HRF monitoring wells data.The SDEIS cost estimates must include post-reclamation periodic replacement of the cover liner and action costs in the case of bottom liner composite system failure.	FIN01, FIN05, FIN08

<b>Sender Name (Submission ID)</b>	Maureen Johnson (43006)	
11547	I believe this facility is a hazardous waste facility based on:- EPA's determination that liquids in a surface impoundment represents a hazardous waste stream, - a surface impoundment is governed only under the hazardous waste rules in Minnesota,the surface impoundment on closure will require maintenance that is not adequately planned or financed,- the site risk to ground water is very high. The rosy projections for a mostly compliant discharge are hardly believable, mostly because the cost will be very high, but also because PolyMet has lowered the quality of the product it will produce by selling concentrates of mixed products rather than separating out each metal, likely reducing its projected income. (see the ground water section below.)- that the surface impoundment contains the unstable natrojarosite, which will dissolve and cause acidity in a domino effect; that the cover is not planned for replacement in a reasonable amount of time. - the lack of a monitoring plan including wells...The SDEIS underestimates the impacts of the project on ground water by orders of magnitude for some parameters by improperly assessing impact using criteria that are not all risk criteria.... Provide the documentation for [maintaining surface flows]. Maintaining existing aquatic ecology is not only providing water, it is providing the minerals, nutrients and conditions that the aquatic ecological organisms require....The SDEIS does not acknowledge that the lower geomembrane liner has the similar chances of structural flaws as either the upper geomembrane or the cover geomembrane. Leaks can happen in any of the liners, some, perhaps most, because of accidental flaws in installation. The enhanced clay liner beneath the lowest membrane will slow leakage but may not stop it, especially if the residue is ionic and/or acidifying and changing the form of some of the wastes to mobilize.	AQ24, HAZ02, PD17, WR001, WR060, WR064, WR107, WR108, WR126, WR127, WR138, WR142, WR185
11550	The [Hydrometallurgical Residue Facility] HRF may contain .7 to 1.5 tons of mercury....Another unknown is mercury, which has much lacking data, it was not a parameter analyzed on a standard basis, it was not included in modeling and it should have been. The affected downstream receiving waters are mercury impaired. Mercury is included in Table 5-2 Elemental Composition of Residues for each residue and the combination at .11 ppm (SRK, RS33/RS65), which, based on only this information, would be almost .7 ton mercury if the full 6,170,000 tons of residue are produced....The SDEIS p. proposes no action on mercury in discharges, asserting they will meet the standard of 1.3 ng/l Hg. The standards must not be exceeded therefore the effluent limit should be set at less than the standard of 1.3 ng/l Hg, a level that will ensure the standard will not be exceeded....7052.0220 requires that the NPDES permit contain WQBELs for GLI pollutants that exceed standards in fish tissue (below). This means if PolyMet intends to discharge to a water body with the mercury fish tissue level already exceeding the standard, each facility including PolyMet that discharges to the water body must assume it has reasonable potential to cause or contribute to excursion above a water quality standard or criterion....The SDEIS should include: HRF leakage in the water modeling including mercury; a discussion of mercury speciation versus changes in the HRF should acid conditions develop; [and] a discussion increased risk of mercury release to ground water should the aging liner(s) fail.	MERC01, MERC04, MERC13, MERC14
11555	3.2.2.3.4 Ore crushing and grinding buildings emission control systems are planned to meet or exceed the particulate emission standard required of new sources at taconite plants. That particulates are not taconite particulates and the grind is smaller than taconite likely makes this standard insufficient. The SDEIS should address these differences from taconite emissions....The SDEIS must acknowledge that this project will produce heavy metal particulates subject to OSHA & MSHA worker exposure standards, such as Ni, which has been identified as cancer-causing at specific concentrations and particulate size.NEPA requires that impacts to the human environment be evaluated. The impacts of the heavy metal nature of particulates should be described for human and environmental receptors both outside and inside the buildings, both when well managed and when mismanaged.	AIR10, HU01, HU04
12698	Section 5.2.13 of the SDEIS states, "If present, other hazardous or potentially hazardous materials or wastes will be characterized, managed, and disposed of or recycled per the Hazardous Materials Management Plan (to be completed), which will follow requirements of Minnesota Rules, Chapter 7045: Hazardous Waste. This implies that, if operators think that wastes might be hazardous then they will test. This is not sufficient.	HAZ01
12706	This is a proposed mine in a mostly wet place, much different from almost all other non-ferrous mines located in dry areas with little to no water to worry about contaminating....Location standards are listed at Facility standards 7045.0460: No facility may be established or constructed in a location where the topography, geology, hydrology, or soil is unsuitable for the protection of the ground water and the surface water.	PER12

12711	PoyMet should develop an alternative to disposing of the hydrometallurgical waste on site; such as hauling the waste to an off-site industrial or hazardous waste disposal site. The discussion should include determinations of whether an industrial waste disposal site would accept the waste and whether a hazardous waste disposal site would accept the waste, and the appropriate comparisons of risk, cost, and other factors among all three alternatives.	ALT09
12715	The SDEIS has no mention of lime included in the residues as treatment. The volume of lime that would be needed would have to be sufficient to contact any acid water formed from jarosite decomposition at the site where the acid was formed...The total volume of the treatment lime or hydrated lime must be stated and assure the volume can be accommodated in the 6,400,000 cu yd capacity of the HRF.	PD18
12728	If the hydrometallurgical process waste water is determined to be hazardous, it cannot be exempted from compliance with 7045 due to recycling because the surface impoundment system is not totally enclosed.	HAZ02
12733	Other wastes proposed for disposal in the HRF are likely hazardous and need testing, including the reject concentrate hazardous wastes, and sludge from the WWTF.Each new waste proposed for disposal in the HRF must be tested for composition, determined whether hazardous waste or not, and evaluated for compatibility with the existing combination of wastes.	HAZ02
12738	With regard to surface impoundment and preventing dike failure, hazardous waste rules state, "In ensuring structural integrity, it must not be presumed that the liner system will function without leakage during the active life of the unit." (7045.0532 Subp. 3. E.) Actually, "minor amounts of leakage to groundwater" are expected (PolyMet, Geotechnical Data Package Vol. 2 - Hydrometallurgical Residue Facility V. 3, October 12, 2012, p. 8).	HAZ01
12744	PolyMet presents Minnesota with a dilemma on assuring long-term financial stability for long-term maintenance. Currently accepted financing tools can disappear when the company bankrupts	FIN01, FIN08
12747	The SDEIS underestimates the impacts of the project on ground water by orders of magnitude for some parameters by improperly assessing impact using criteria that are not all risk criteria	WR071, WR110, WR177
16503	Ten other copper-nickel-platinum group deposits will be mined eventually if this project proceeds to operations. The people of our state have a right to be informed about the cumulative effects of these mines before any decision is made for an individual mine....A separate cumulative EIS analysis on these eleven similar copper-nickel-platinum group deposits is necessary before a Record of Decision and permits are issued for PolyMet....This data is needed before we proceed further with PolyMet.	CU04, CU19
16583	Of the potential violations listed at 7045.0538 for hazardous waste landfills, the proposed HRF is located 1) where degraded wetlands are present and also over tailings on top of peat where wetlands once existed; 2) where the topography, geology, hydrology, or soil is unsuitable for the protection of the ground water and the surface water including proximity to lakes, streams, or ponds, bedrock; value as drinking water supply, ground water flow patterns related to recharge to aquifers for drinking water.	WR069
16587	identified faults, including a formerly inferred fault [run] through the HRF location .... All of these faults in the Plant site and nearby cannot be ignored and should be thoroughly analyzed for integrity, fractures, weakness and effects on the faults and other faults, permanent structures, and plant infrastructure should any size of movement occur. The uncertainty around these faults puts at risk the integrity of the hazardous waste disposal facility.	GT11, WR008, WR012, WR067
16591	The text should discuss the potential for weak occurrences [of earthquakes] and the effect of a small shift in the area of the HRF on the liners especially when they age and weaken, and cause leakage not controlled by the leakage collection system.	GT12

<b>Sender Name (Submission ID)</b>	Maureen Johnson (43006)	
16609	HRF location and management of wastes does not meet requirements of MN law, facility should be relocated	PER12
16617	The liquid process water will pond over the settled wastes in the surface impoundment and be reused in the HP. The surface impoundment is open to any wildlife, swans, ducks, other birds, rodents, or flying butterflies and insects. The characteristics of the waste water is likely to be a risk to these biota. Note some individual chemicals are common but in high concentrations: high salt concentrations will dehydrate; magnesium sulfate will have a laxative effect; hydrochloric acid and sulfuric acid will burn; we do not know what the combined impact this would be on wildlife. ...Appropriate tests would be the lethality hazardous waste characteristic and the Whole Effluent Toxicity.	WI04
16631	the SDEIS does not propose a well system to monitor ground water for HRF leakage to the ground water. Any leakage would be unlikely to be detected because there are no monitoring wells in a monitoring plan specific to the HRF. The SDEIS does not include a contingency plan and cost estimates for liner failure.	PD18
16636	Liner leakage must be evaluated for changes in acidity, pH, and quantification of leachate water quality characteristics including but not limited to metals, so that appropriate action can be taken if the content of the HRF is acidifying and enabling release of contaminants.Liner leakage is dismissed as negligible and not included in models, but in the post-reclamation period leakage is much more likely.	PD18
16640	...hazardous waste rules state, "it must not be presumed that the liner system will function without leakage during the active life of the unit." (7045.0532 Subp. 3. E.) The hazardous waste rules is the only location where governance of a surface impoundment is found. Disposal of waste under 7035 does not allow liquids. One might conclude that a surface impoundment containing waste including sludge from non-sewage waste water treatment is a hazardous waste facility in Minnesota, and this would be appropriate.	PER12
16643	The SDEIS should provide examples of liner provider warranties and installer warranties, and discuss what other mines do to provide for replacement of the HRF liners. This will provide an idea of what site specific life these liners have, and a basis for estimate of replacement costs. It will also provide a better basis on which to consider stabilization of the waste as an alternative, during operations, at closure, or when the lower liner system needs replacement.	PD18
16650	SDEIS p. 5-201 dismisses mercury in groundwater, but at a release rate of 5-7 ng/L mercury for about 500 grams of rock, exposure of mercury increases exponentially when the total amount of rock surface from mining is exposed. ...- The SDEIS must address not only the results but also the inadequacies of the tests that it says supports the dismissal of mercury in groundwater with an uncertainty analysis.	MERC04
16654	The ground water evaluation points provided at SDEIS Fig. 5.2.2-4 may be appropriate to model potential effects, but they are not appropriate as monitoring points to identify surficial ground water pollution. If the property boundary or a receiving surface water is used as a pollute-up-to-boundary, the ground water of property beyond or the receiving water will be affected. It will have been too late before it gets to other properties or a receiving surface water.	WR039
16655	Minn. R. 7060 does not permit the concept of allowing dilution of ground water contamination until it gets to a property boundary. ...additional groundwater monitoring points should also be located at points where early detection and cost-conservative control of contamination is still reasonably possible.	PER09
16656	Ground water monitoring points must be located at points at a sufficient distance before the property boundary or before the river so that the responsible mining company can mitigate pollution before it impairs other persons' uses of the ground water that begin at the property boundary or before it discharges to a surface water.	WR039

15363	Minnesota's interconnected water table, lakes, rivers, streams and watersheds (including Lake Superior) are too precious to the future of Minnesota to allow feckless exploitation. Sulfide producing mines are better managed in dry regions.	SO01
15365	The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.	WR003
15366	The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards.	PD03
<b>Sender Name (Submission ID)</b> Maxwell Helmberger (57259)		
17393	This project threatens to destroy wetlands, pollute our waters, and kill our wild rice stands.	WET24
17394	The loss of these ecological and cultural resources is not worth the metal from the ground, especially if the pollution remains here in the state long after the last speck of ore is carted away.	SO01
<b>Sender Name (Submission ID)</b> McLaughlins (6527)		
1086	The Iron Range needs an economic boost and Polymet will have a huge positive impact in our area of the state.	SO10
<b>Sender Name (Submission ID)</b> Megan McGuire (44862)		
8059	While the standard processes may call for detailed risk analysis during a later stage of permitting, that would provide inadequate opportunity for the public to review and comment on the risk analysis. I would implore the agencies to conduct a thorough, detailed, and complete risk analysis to be included in the EIS to allow the public to comment on the analysis.	NEPA08
8060	A risk analysis is needed for many areas of the EIS and should be added [i.e., for:] potential impacts to water quality, habitat, and human health. I suggest that the risk assessment should follow the principles used by the Corps of Engineers for risk analysis. The analysis should include all potential avenues for harm to public health, environmental resources, and workers...These risks should then be described based on the likelihood of each risk occurring, the consequences, and the response.	HU01
<b>Sender Name (Submission ID)</b> megan williamson (28957)		
13872	Please DO NOT endanger Lake Superior!!! How can protecting our largest body of fresh water not be a top priority?	WR111
<b>Sender Name (Submission ID)</b> Meghan Ihfe (54341)		
17447	[The PolyMet mine is] going to benefit us it is also going to give us some disadvantages. If we do this project, we will be getting rid of some waste that is found in our earth. I think that the plan that they have right now would work out perfectly fine. I think it will also help Minnesota by, getting rid of our wastes and also earning more money for the copper-sulfate.	SO10

2484	Why are only local environmental impacts considered in the EIS, when the commodities (i.e. metals mined) are traded on a global market. For example, does this project, mined in an area with a functioning elective government and strong environmental and labor regulations, has the potential (through the use of hydrometallurgy) to offset global emissions from smelters by displacing in the marketplace metals delivered by mining/smelting elsewhere in the world? Would the development of hydrometallurgy, in general, drive technological improvements that could help curb global emissions from mines?	PD33

10543	Levels of contamination, acidity and corrosion that will result from the waste which would go into the HRF (hydrometallurgical residue facility) are not revealed in this report. We know that the waste will be hazardous though and therefore the site should be regulated as a hazardous waste landfill. Storage and disposal of such waste requires a separate permit in Minnesota. (Minn. Stat. 116.06, subd. 11)	HAZ02
10546	Minnesota rules protect water quality and human health by requiring that wastes must be solidified and stabilized after closure so they won't leak but PolyMet is proposing to use various types of liners including Geomembrane (which is known to degrade over time) and leave the waste in a toxic pond. PolyMet must be required to specify all HRF wastes and plan to treat their wastes as hazardous.	HAZ02, WR067
10553	The EIS states, "adaptive management would be implemented, if necessary, to protect the environment for the long term." ... What if something happens in 40 years? Or 100 years? It is unlikely PolyMet still be around to practice this adaptive management? Other industries with similar risks, such as offshore drilling and nuclear industries, must include a Safety Emergency Management System (SEMS). PolyMet should also be required to layout safety precautions for possible scenarios instead of just saying we will use "adaptive management" when the time comes.	FIN01
<b>Sender Name (Submission ID)</b> Melanie Erickson (52294)		
10739	The risk to ruining this precious area and even more precious water out weighs the benefits by far.	SO01
16983	The damage to water [from the NorthMet Project] m[a]y be devastating and last for hundreds of years.	WR071, WR115

2371	What is "adaptive management"? What if something happens in 40 or 100 years? It is unlikely PolyMet will still be around to practice this adaptive management...Other industries...must include a safety and emergency management system...PolyMet should also be required to layout safety precautions for possible scenarios instead of just saying, "We will use adaptive management when it happens."	PD22
<b>Sender Name (Submission ID)</b> Melanie Peterson-Nafziger (40559)		
14309	the exchange of protected wilderness lands in tracts 3, 4 and 5 increase the risk of pollution in the Boundary Waters Wilderness Area, the most pristine waters we have in Minnesota. Of course, the proposed PolyMet sites also endanger Lake Superior and the rivers that flow into it in that region of Minnesota.	WR111
14310	The trade off to create short-term jobs and tax revenue in Minnesota by permanently damaging our land; endangering our most precious wilderness areas; potentially endangering our human health and our resources due to acid mine drainage, sulfates pollution, and mercury and other heavy metals release; and exposing our region to unforeseen but somewhat predictable long-term impacts of the mine is not worth it.	SO01
<b>Sender Name (Submission ID)</b> Melinda Sueflow (43590)		
15688	It is wrong to assume that the PolyMet tailings site has no potential to transport pollution through fractures. Existing tailings seepage already exceeds groundwater standards. In addition, on the LTV site, adjacent to the tailings, the SDEIS has documented that Area of Concern #8 has a plume of pollution propagating through fractures. (SDEIS, p. 4-12).	WR168
15689	Another problem is the lack of analysis of tailings seepage to residential wells. The SDEIS reports that there are 27 residential wells downstream of the tailings basin, before the Embarrass River. Some of these drinking water wells already have high levels of toxic metals (SDEIS chapter 4, page 403-411).	WR041
15690	I am also concerned about sulfates being released from the mine site and impacting the already impaired wild rice waters and fish in the St. Louis River.	WR158
15691	PolyMet also doesn't tell us how much mercury pollution will be seeping out of the PolyMetoverburden, tailings into surficial waters flowpaths right next to the huge new tailings piles.	MERC20
15692	The SDEIS should be redone to reveal how much mercury will be released directly or indirectly from the mine site into surface waters, and to show how much mercury seeps out of mine pits, waste rock pile, and liners to surface water flowpaths starting at year one and to identify the first place that mine site surface groundwater reaches the surface.	MERC16, MERC20
15693	The PolyMet SDEIS should not be finalized or the project approved until a mercury TMDL study in the St. Louis proves that PolyMet's increased mercury loadings won't increase fish contamination.	MERC22
15694	the SDEIS should be redone to use the best scientific data available and model PolyMet's mercury bioaccumulation effects.	MERC02, MERC04
15695	The SDEIS doesn't disclose cancer risks to on-site workers, but it should. The SDEIS should analyze particles and fibers in the air inside the crushing plant, not just outside the property boundary. And it must explain cancer risks intelligibly, assess on-site worker risk and recalculate cancer risks with a 70-year, not a 30-year lifetime. The SDEIS currently says that 30 years is a "lifetime" for cancer exposures, although both EPA and MN use 70 years. With this tweak, the total cancer risk at the property line for the mine and the plant is just exactly at MN's cancer limit (SDEIS pps. 5-421, 5-424, 5-426). Too convenient.	HU05

<b>Sender Name (Submission ID)</b>	Michael D. McNally (40448)	
10525	In my view Northmet propoonents have underestimated the likely costs of securing the state-mandated water quality standards on the waters involving wild rice....	FIN11
10533	The 1854 Treaty of LaPointe guarantees usufruct rights to the Minnesota tribes in ceded territories, not only on public lands but on all lands in the ceded territories.	PER08
10536	[The proposed NorthMet mine site] lies entirely within this ceded territory, and while clearly there has been evident consultation with the tribes, it is also clear that their concerns are plainly sequestered and “managed” in the “MDO” section of the SDEIS Chapter 8 in a manner not consistent with federal obligations to the tribes.	CR01
10538	For example, as is recorded in the letter at Appendix C, p 89 ff of the SDEIS, the Fond du Lac, Grand Portage Tribes, the GLIFWC, and the 1854 Treaty Authority were diligent in their participation in the but were ultimately rebuffed in their concern that the Cumulative Effects Analysis did not extend as it reasonably might to the St. Louis River watershed	CR03, CR06
10539	Despite the tribes’ diligent consultation and considerable expenditure toward that consultation of resources for study, the co-lead agencies did not follow the best practices – indeed did not even use – the EPA’s 2011 best practices tool, Applying Cumulative Impact Analysis Tools to Tribes and Tribal Lands, in the work.	CU03
10550	In my research, I have seen evidence aplenty...to reduce tribal consultation to a perfunctory exchange of ideas, and to understate or under-examine the effects on cultural resources, or natural resources that are also cultural resources.	CR01, CR05, CR06
10555	The scoping for the EIS review did not identifyany cumulative impact issues on the identified cultural resources, but the tribes were not invited to participate in that scoping process.	CR03, CR06
10558	I believe that a proper orientation...cannot reduce to MDOs such concerns of the tribes, the 1854 Treaty Authority, and the GLIFWC on the scope and reach of cumulative effects impact, cultural resource impact, especially when there is science provided by the tribes and tribal agencies that specifically contends with the assumptions and models retained by the SDEIS.	CR01, CR03, CR05, CR06
14587	[I am concerned] that the SDEIS, in relegating the well reasoned, well-substantiated concerns of the Fond du Lac and Grand Portage tribes, the GLIFWC, and the 1854 Treaty Authority to “Major Differences of Opinion” and mere Appendix C without changing the geographic or conceptual parameters of the effect analysis itself is not only unwise; it is not in keeping with the federal obligation to the tribes.	NEPA12
14594	as a taxpayer, I do not want to be underwriting the cleanup of contaminated waters over time of choices that were ultimately injudicious because based on assumptions tending toward best case, rather than worse case, scenarios.	FIN10
14595	I am concerned with numerous turns of phrase in the SDEIS and broader analytical frames guiding it that dramatically understate the significance of tribal claims involved. To be sure the SDEIS dutifully identifies what it references (and in my view dismissively so) as MDOs, major differences of opinion. In places, the SDEIS language presume incorrect understandings of treaty law, including the potential reach of Anishinaabe claims to wild rice and other affected species in the land in question.	CR01

14208	Recently, PolyMet's Vice President Brad Moore, at a House committee hearing was questioned whether PolyMet had adequate financial assets to cover the long range environmental problems that would or could occur when the mine closes down. Moore was asked: "What is the true value of PolyMet's assets?" Moore replied that he didn't know. Also, the annual report shows that PolyMet has less than \$10 million in cash. This would not be even a fraction of what is needed according to the company's own report.	FIN01
14208	Recently, PolyMet's Vice President Brad Moore, at a House committee hearing was questioned whether PolyMet had adequate financial assets to cover the long range environmental problems that would or could occur when the mine closes down. Moore was asked: "What is the true value of PolyMet's assets?" Moore replied that he didn't know. Also, the annual report shows that PolyMet has less than \$10 million in cash. This would not be even a fraction of what is needed according to the company's own report.	FIN01
14209	Even PolyMet's own figures show they will need \$200 million for the closing and \$6 million for every year thereafter. How do you figure the cost for Perpetuity? This would leave us, the tax payers of Minnesota holding the bill. The PolyMet financials are inadequate. Please reject the PolyMet mine project.	WET03, WET15
14209	Even PolyMet's own figures show they will need \$200 million for the closing and \$6 million for every year thereafter. How do you figure the cost for Perpetuity? This would leave us, the tax payers of Minnesota holding the bill. The PolyMet financials are inadequate. Please reject the PolyMet mine project.	FIN01, FIN05, FIN10
14373	My understanding is that 99% of the rock mined will be waste and will go back into the ground as powder. This waste rock bears sulfides which will produce sulfuric acid when exposed to air and water.	PD15
14374	Other pollution will also rise such as mercury, lead, arsenic, and others. We live in Minnesota, the land of 10,000 lakes (more like 13,000) and next to the biggest fresh water lake in the world, Lake Superior. We also have the water rich environment of the BWCA. I do not want to take a chance of losing these unbelievable resources.	WR111
14375	This waste rock will have to be monitored 24/7 for 500 years. Who will pay for this? How will a cost be set when even our State Auditor, Rebecca Otto, cannot come up with a cost?	FIN01
14376	I realize that the lure of jobs is pushing this mining project. But this project will last 20 years at best. Do we want to risk one of the state's top nature resources (water) and the tourism that goes with it?	SO01
14377	Glencore has an agreement with Xstrata which states that the minerals out of PolyMet will go to China for the next five years. That means any value added to the minerals will occur not here, but in China. Glencore is also a 200 billion dollar company. That makes its revenues much larger than the state of Minnesota.	SO06
14378	What happens when the state has environmental problems? How will the state of Minnesota stand up to the goliath lawyers of Glencore in court? This will cost the tax payer more than we can ever hope to get out of this project.	FIN10
14568	99% of the rock mines will be waste. Other waste sites of copper-nickel operations have had large pollution problems. This waste rock bears sulfides, which will produce sulfuric acid when exposed to air and water. PolyMet states that their new technology will prevent pollution. This new technology has not been proven on an industrial scale.	AIR11

14569	This waste rock will have to be monitored for 500 years. Who will pay for this? How will an accurate cost be determined when even our State Auditor, Rebecca Otto, cannot figure the cost?	FIN01, FIN05, FIN11
14570	I realize that the lure of jobs is pushing this mining project. But this project will last 20 years at best. Do we want to risk one of the state's top nature resources (water) and the tourism that goes with it? There are four times as many jobs in tourism as in mining. We take for granted the abundance of our fresh water. According to the World Health Organization over one-fifth of the 1.6 billion people face economic water shortages. Water scarcity has been growing at almost twice the rate of the world's population. With the existing climate change scenario, almost half of the world's population will be living in water stressed areas by 2030 according to the World Health Organization. In another 20 years water may be as valuable as oil.	SO01
14571	Glencore is also a 200 billion dollar company. That makes its revenues much larger than Minnesota's. What happens when the state has environmental problems? How will the state of Minnesota stand up to the goliath lawyers of Glencore in court? This will cost the tax payer more than we can ever hope to get out of this project.	FIN01, FIN10
14572	PolyMet is a Shell Corporation of Glencore, a Swiss company with an abysmal environmental record. Xstrata, a Chinese company, in is partnership with Glencore. Glencore has an agreement with Xstrata which states that the mineral out of PolyMet will go to China for the next five years.	SO06
18002	PolyMet will not even consider underground mining which could avoid much of the environmental damage that this open pit will cause. The SDEIS doesn't suggest any alternatives to reducing impacts on wetlands at the mine site.	ALT01, ALT13
18003	As much as 913 acres will be directly destroyed and 7,350 acres impacted with water and air pollution, and diverting water from these wetlands according to the SDEIS from PolyMet. The high value wetlands in the 100 Mile Swamp has not be touched for thousands of years and will undoubtedly have a negative impacted on wildlife. This could be the biggest wetlands loss ever proposed.	WET23
18004	It is clear that PolyMet is a Shell company and will declare bankruptcy when the mining is done and their officials are not being honest with us. Even PolyMet's own figures show they will need \$200 million for the closing and \$6 million for every year thereafter. How do you figure the cost for Perpetuity? This would leave us, the tax payers of Minnesota holding the bill.	FIN01, FIN02, FIN05, FIN10
<b>Sender Name (Submission ID)</b> Michael L Karels (6631)		
1096	Environmentalists want solar and wind energy and various other energy alternatives but don't take into account where the guts of these products come from or what minerals are used. If you are an environmentalist but you are ok with these minerals coming from China or elsewhere but don't care how they extract it they you are a hypocrite.	ALT16
<b>Sender Name (Submission ID)</b> Michael Larmee (32791)		
13829	Please do not harm Lake Superior and all the waters down flow from the lake.	WR111
<b>Sender Name (Submission ID)</b> Michael Latvala (38422)		
13642	The depth and breadth of study in relation to the NorthMet project has been well conducted and thorough...The project will set new benchmarks for safely extracting and processing these minerals, and should become the new benchmark for copper-nickel mining worldwide.	PD28

<b>Sender Name (Submission ID)</b> Michael Latvala (38422)		
13643	I believe that the NorthMet project can be permitted in a way that thoroughly addresses potential environmental impacts while putting a vast, untapped natural resource to greatly beneficial use. This project will provide minerals that are unquestionably necessary for the existence of modern humans, and of critical importance for the future of “green” economies.	SO10
<b>Sender Name (Submission ID)</b> Michael Lieberman (11372)		
12552	The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project.	AIR01
12553	The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0.5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025. Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan.	AIR01
<b>Sender Name (Submission ID)</b> Michael Line (47163)		
8415	Lets get people to work... lets have the mine here and benefit from the jobs and the economic impact for our state.	SO10
8421	It’s a fact that these metals will be mined someplace in the world if we don't open this mine. It is almost assured that it will be done with less environmental regulation if that happens in another country.	NEPA05
<b>Sender Name (Submission ID)</b> Michael McCormick (43224)		
11575	The effects on workers’ health and drinking water are not addressed.	HU04
16142	The PolyMet mine would destroy thousands of acres of wetlands, create an immense and permanent industrial mining district in Minnesota's uniquely beautiful and most environmentally sensitive areas, and create a burden of environmental damage of mine dumps, pits, tailings ponds and acid runoff that would blight the landscape for generations and generations, and probably forever.	PD01
16144	Local economies built on mining are boom and bust economies. First, the claimed short-term economic benefits of mining are dubious. PolyMet's claims of job creation deserve skepticism, as automation on the mines reduces the number of jobs, produces short-term low skill jobs, or requires workers with special skills from outside Minnesota. Then invariably the bust comes - relative to the lasting burden of damage, that bust comes in the very short term of 5 or 10 or 20 years. And the bust then endures in the form of impaired communities that people do not want to live in.	SO06
16145	The essential impossibility of capturing acid runoff from the equivalent of thousands of football fields of waste rock has not been addressed - PolyMet's assumptions about seepage are woefully lacking. The effects of runoff on subsurface water flows, about which there is inadequate information and which may well go toward the BWCAW side of the watershed, are not addressed.	WR019, WR070, WR167
16146	The disruption to our national forest lands are not in any way addressed through the proposed land swap, which is a laughably inadequate measure to address the physical damage of the proposed mine. The loss of wetlands, which are ever more rare in Minnesota due to agricultural practices, drainage tiling in fields, urban development and the like, is not addressed. Toxic pollution, in the form of mercury contamination and other heavy metals, is a threat that calls for the highest possible scrutiny.	LU01

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Michael McCormick (43224)		
16147	PolyMet also appeals to the demand for copper and other metals: undeniably there is demand, but this needs to be dealt with through recycling and more efficient use of those metals, and through locating mines in places that are less vulnerable than our water-rich environment.	NEPA06
16148	The debate should not, however, be about a cleaner mine, or a better permit. Please do not permit hard rock mining, which is one of the most polluting of all industrial activities even when it is done in desert environments, to come into our profoundly vulnerable water environment of northern Minnesota and create irreversible, permanent damage.	PER35
<b>Sender Name (Submission ID)</b> Michael McKenna (11007)		
15462	The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes.	PER08
15464	The Land Exchange serves only the private interest of a foreign corporation, not the public interest.	LAN01
15465	The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining.	LAN04
15466	The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species.	VEG01, VEG02, VEG03
15468	The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade.	VEG03
15470	The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region.	WI01, WI02, WI03
15473	The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013. Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project.	WI01, WI02
15475	The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St. Louis River and tribal resources.	CR01, WR115, WR189
15477	Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice.	CR01
15491	Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines	LAN04
15493	Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value.	LAN01
15494	Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes.	VEG08

1461	I question the financial commitment of ... assurance to clean up the [possible pollution on land and water] they will make in the future... We must require them to put up greater sums of money to ensure their honesty and truth, so they don't walk away with the profits and leave the tax payers with the clean up.	FIN01, FIN05, FIN10
8916	Heavy Metal rock piles, rained on, make pollution. Heavy metal rock piles rained on create water pollution for many years.	WR130
8918	The Polymet proposal must provide details on financial assurance that the pollution they create they can take care of properly.	FIN01
8919	Sulphide mining will create huge amounts of waste rock.	GEN01
8921	There is no rush to start such a high risk operation. The rocks have been there a long time. They are not going anywhere.	NEPA01
8922	The science and analysis of the Polymet proposal must be done correctly. Because the downside, the risk factor to the water, is too great.	WR189
8926	The time period of polluting too long. The methods and techniques are not proven. Polymet has never operated a mine before. The lead agencies must require any potential sulfide mining operators to demonstrate a successful sulphide mining facility. Based on the information, and lack of information provided by Polymet I do not believe Polymet can operate its proposed facility without damaging the surrounding water, nor take care of the waste rock and tailings for the hundred some years required.	PER35, WR115, WR129
8927	Another point no one is talking about is the amount of coal that will be burned in 20 years of operation. This should be calculated and be a consideration of this proposal.	PD39
8928	Polymet has little to lose and privatized profits to gain. The State of Minnesota and its water has much to lose. Let the minerals stay in the ground until they can be safely harvested. It appears they will only go up in value.	NEPA01
8930	The lead agencies should reject the Polymet project as environmentally harmful. The lead agencies should not allow Polymet a state permit to mine.	PER35
8931	The lead agencies should not allow any sulphide mining operations until the operator has a proven facility and provides proper financial assurance.	FIN01
<b>Sender Name (Submission ID)</b> Michael Overend (6027)		
9339	In contrast, Lake Superior, the single largest body of fresh water on the face of the planet stands at potential risk of becoming adversely affected for generations of future citizens.	WR111
10507	If [Lake Superior], or its neighboring watersheds, are damaged by this mining operation, the costs to reverse the damage will dwarf the potential economic benefits to the region.	SO01
10508	These potential environmental costs should be borne by the individuals that seek to profit from the mining. However, the mining industry has a history that does not inspire confidence in carrying out this responsibility...Due to the risk for centuries of potential work necessary to address the potential damage, there is no conceivable way that PolyMet can guarantee that they will address any and all damage that results from their mine.	FIN01, FIN08

14515	I'm writing to ask you to not permit the PolyMet mine until ALL questions regarding water safety in the Lake Superior Basin are answered with more scientific certainty....PolyMet's suggestion that the likelihood of water pollution at the site will be in the 0.63 percentile region relies on mere conjecture that pumps around the tailings ponds and piles will be efficient, reliable, and sustainable for...how long? a few decades? A hundred years? A thousand years? Well, pumps fail and employees neglect maintenance.	WR021, WR036, WR195
<b>Sender Name (Submission ID)</b> Michael P. Carlin (19974)		
1563	I am in opposition of the mine due to copper cobalt mines history of pollution. I also think that past performance is a direct indication of future output. ... it would be a poor decision to jeopardize the water quality.	WR195
16328	The idea of testing the water quality for 500 years is quite daunting considering the benefit of jobs in the short-term.	SO01
16329	Currently we are using fresh water at a rate faster than aquifers can replenish, and to threaten the little amount of clean fresh water we have would be detrimental. We would be doing irrevocable damage to our ecosystems, threatening wildlife as well as industry centered around a healthy environment.	WI01
<b>Sender Name (Submission ID)</b> Michael Patchin (10069)		
10845	It is my opinion that the PolyMet project has been analyzed and studied extensively by the various government bodies with expertise to provide the necessary safeguards.	NEPA16
10847	My opinion is that the Iron Range area needs the economic stimulus that would be provided by the PolyMet project, together with the various spinoff industries.	SO10
10849	The project will also contribute an economic benefit to the remaining portions of the State of Minnesota and to our country in providing jobs, tax revenues, and positively affecting this country's balance of trade.	SO10
10850	I believe that the environmental safeguards that will be required by the governmental agencies will be designed to protect our environment, and will certainly be a lot stronger than any environmental safeguards established in foreign countries.	PER34
10851	I believe that environmental concerns and economic benefits should be balanced so as to provide well paying jobs with fringe benefits, tax revenues, and necessary minerals that will be consumed in our country and elsewhere, while providing more than reasonable environmental safeguards.	SO06
10854	it is my request that the Minnesota Department of Natural Resources, the US Army Corps of Engineers, and the US Forest Service, complete their review of the environmental impact statement, and their review of this project as a whole, and that permits be issued promptly, so that this overdue project may continue to the construction phase and the operation phase.	NEPA16
<b>Sender Name (Submission ID)</b> michael PRIEST (38898)		
5405	The project presents acceptable environmental risks and should be allowed. This sulfide mining operation IS needed for the future of America.If approved, this first-ever sulfide mine in Minnesota would open the door for future mines . For all these reasons, I urge you to accept the PolyMet mine.	SO10
<b>Sender Name (Submission ID)</b> Michael R Boyd (57235)

<b>Sender Name (Submission ID)</b> Michael R Boyd (57235)		
17180	However, how can any corp put aside money to treat water for the next 200-500 years for a mining operation that will last 30-40 years? How do you invest that money over that time period?	FIN01
17181	We need mining jobs for at least 2 reasons: 1. Minerals needed for our industry coming from inside the US (national defense) 2. Jobs for Americans.	SO10
<b>Sender Name (Submission ID)</b> Michael R. Huber (20182)		
1773	Major points of concern harvested from the document revolve around the centuries long period during which remediation will be required as a consequence of planned mining operations, and the speculative nature of the proposed remediation measures.	PD03
1774	The ultimate costs in human terms alone will far exceed whatever employment/economic benefits might be realized in the next few decades.	SO01
15196	The sustained pollution from proposed operations can, over a five century period, be expected to escape. To pursue such an operation at the headwaters of some of the largest freshwater reserves in North America strikes me as the height of folly.	WR129
<b>Sender Name (Submission ID)</b> Michael Rentz (43123)		
10296	Also, as units considered to be of “High Biodiversity Significance” they cannot simply be swapped out with less significant examples of the same habitat that are, by definition, of lesser ecological integrity.	VEG02
10297	Several of the proposed re-vegetation species are known to be invasive, and simply co-planting with native species and hoping the natives win out is unacceptable.	VEG05
10299	No mention is made, however, of the impact on [lynx] of increased noise. If the animal is “spooked” by the mining noise, the effectively lost habitat could be greater than that which is simply within the direct footprint of the mine.	WI05
15863	[There is] a fundamental misunderstanding of what a site of “High Biodiversity Significance” means. These sites are identified as areas that are among the best examples of the habitat in the state. It is not meaningful to compare these habitats with others in other parts of the state, as they do not perform the same ecological function.	WI02
15864	I was pleased to see the effect of noise on wildlife considered. However I would like to see this concern married with the noise level maps from previous sections to determine the total possible habitat loss, or lower use of habitat by mobile species such as the lynx, eagle, and other birds.	N04
15869	Little mention is made of moose in the wildlife section. What affect would the increased noise have on moose in the surrounding Forest? ... Given the decline in moose in Minnesota, any action which impacts this species needs to be approached with caution. I would like to see some effort made to address noise and vehicle/rail impacts on this animal.	WI01, WI05
15870	The list of possible SGCN does include the heather vole, but does not include 3 other SGCN mammals that may inhabit the region: 1) Microtus chrotorrhinus, 2) Mustela nivalis, 3) Sorex fumeus. The DNR does sample small mammals in the area of the mine (John Erb) and while none of us have captured these species near the mine, an absence of proof is not proof of absence.	WI01
<b>Sender Name (Submission ID)</b> Michael Ripberger (27520)

<b>Sender Name (Submission ID)</b>	Michael Ripberger (27520)	
14744	How many citizens, industries, farms and how much wildlife, water sources and acres of soil would this adversely affect, not just in Minnesota but neighboring states as well?	PD01
<b>Sender Name (Submission ID)</b>	Michael Rota (14905)	
13806	Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats.	WI13, WR115
<b>Sender Name (Submission ID)</b>	Michael Saima (9663)	
1363	I hope you make the right decision and decide against this project and the potential damage it would do to the water system, that should not be overlooked.	WR195
<b>Sender Name (Submission ID)</b>	Michael Schelmeske (54829)	
18549	The treatment of waste water for 200 to 500 years is incredible. The United States of America is about 237 years old. How can you possibly believe that this company will be around long enough to take responsibility for the long term treatment of the mine site and waste rock site!	FIN01
18551	Wetland mitigation in same watershed has not been followed. You treat our wetland areas as wastelands of no value	WET03
18552	Loss of wildlife corridors with the completed mine and waste rock treatment area and additional roads and infrastructure concern me.	WI03
18553	More light, noise and air pollution will result with this operation.	N01
18554	No study of mercury impacts to Partridge or Embarrass Rivers	MERC02
18561	I have no confidence in this company to take care of this site for 2 to 5 centuries, it will end up in the laps of the Minnesota tax payers. Once the mine is closed it will only be a matter of time till it ends up as a superfund site.	FIN01, FIN10
18567	Windborne dust with fibers from the waste rock will end up in the air downwind of the site. If I have heard correctly the existing taconite waste rock piles on the site are twenty stories high and two and one half miles square. Will the waste rock from the Polymet mine be placed on top of his site? If so this will make this site more exposed to the wind. The prevailing winds in this area are west, northwest, blowing this fiber laden dust towards Beaver Bay, Silver Bay, Isabella, Finland Little Marais, Schroder, Toffe, Lutsen, Grand Marais, Houland, and Grand Portage. Will there be monitoring of these communities for health related problems for 200 to 500 years! Would this company be responsible for this?	AIR03
18568	If the Polymet mine is allowed to go ahead this just opens the rest of Northeast Minnesota to other mine sites that will be right up against the BWCAW and in that watershed. How will all of these mine operations affect the water quality of this area?	CU02, CU04
18569	What effect will this have on local businesses that count on this area to be clean and quiet.	SO04
18572	I am tired of the state using the case that we need to mine these site's to fund our schools, it comes at too high a price... I would gladly pay more money for my child's education given the potential for future health risks that could result from this operation.	SO02
18580	I feel that MNDNR has been heavily influenced by Polymet and their lobbying. The MNDNR is responsible to protect our resources as well as generate income for the state, but I question there protection of resources on this issue.	NEPA18

<b>Sender Name (Submission ID)</b> Michelle Raskovich (19526)		
13942	There is no guarantee of containment, there is no follow-up on how they're going to pay for all that, and when we're talking about our environment and our children and the generations to come, the 20 years of mining is a small, ridiculous suggestion	SO01
<b>Sender Name (Submission ID)</b> Mick (44373)		
10422	In conclusion your mine will only hurt people, the economy, and most importantly the land and water surrounding our beautiful state	SO03
<b>Sender Name (Submission ID)</b> Miguel Bordayo (54176)		
16400	The reason why you shouldn't drill for copper and nickel is because all the rocks and dirt has sulfuric acid and you are going to wash that into a river, and all that water will turn yellow and kill so much water life.	WR203
16401	And the TNT you are going to use, to make a 20 story building and a length of 5 football field you are going to kill everything.	WI13
16402	All that damage is going to hurt the environment. It's never gonna come too life, its gonna stay dead forever.	WI04
<b>Sender Name (Submission ID)</b> Mikayla Rue (54352)		
18179	Some advantages are that it would upgrade utilities, roads, and railroads. It could also benefit the economy! The project could make 18,000 tons of nickel/copper hydroxide, 113,000 tons of copper concentrate, 32,000 tons of ore, and 500 tons of PGE precipitate each year. In some ways this can be bad, but for our growing economy we need to collect this stuff for manufacturing	SO10
18180	there are some disadvantages with this project. There is land-clearing, which can be hard on the environment. We need to protect the land, it helps us in several ways. If the land is cleared this could allow erosion to happen without the trees there to protect the earth.	VEG03
18181	This project could also affect cultural resources. The land is important to the Indian people for hunting, fishing, and planting.	CR01, CR05
18182	People also, don't like the noise, dust, earth-moving, vibration, visual obstruction, and excavation.	N01
18183	The land exchanges would make sense. It would involve the transfer of 6,650.2 acres of federal lands from public to private ownership, and up to 6,722.5 acres of land to private to public ownership. But this would depend upon the results of the environmental analysis and federal real estate appraisals.	LAN11
<b>Sender Name (Submission ID)</b> Mike (4268)		
10679	PolyMet has done their research. They have systems in place that not only will meet or exceed standards for environmental protection, but they may actually set the bar higher for other mining companies to keep our natural resources intact.	PD28
10681	The local job creation is directly obvious. The indirect job creation this country will see by having the combination of cheaper energy alternatives, as well as the domestic resources mined by PolyMet for building and retooling American companies will be impressive.	SO10

<b>Sender Name (Submission ID)</b> Mike Geisdorf (4011)		
724	In the past 40 years, I have seen the promise of numerous “big” projects come and go with the potential of hundreds or even thousands of jobs come and go right with them...Besides the wood products industry, the only reliable economic development in Northern Minnesota was in the mining industry. They would come, plan, study and then build, with hundreds or thousands of jobs that came directly from the project.	SO10
726	With the recent release of the SDEIS, the issues once troubling both residents and environmentalist alike have been addressed. The studies and engineering completed by the US Army Corps of Engineers, Minnesota Pollution Control Agency, Minnesota DNR, Barr Engineering, ERM and others have finally addressed the numerous water effluent issues of the active mine site.	NEPA16
758	The studies completed by Polymet Mining with the reverse osmosis systems answers the water quality problems with a system that’s quite simple.	PD28, WR190
759	The money Polymet will be setting aside address’s the legacy water issues for generations to come.	FIN16
769	This project and the resulting economic boom that comes with it, represents far more than just a few hundred jobs, it represents vibrant thriving communities with local business districts bustling! It represents modern environmentally friendly sewer systems and potable water treatment systems in our towns on par with the best in the state. It represents residents and travelers driving on clean new intact streets with modern storm sewer systems that direct heavy rains and runoff into proper drainage systems that don’t overflow our sewage plants. It represents school systems with modern amenities’ of fiber optics, high tech computer systems and modern science departments. But most important, our kids have hope! They have hope that remaining in our area will not lead to poverty on their part to remain up north, their home! They have hope that they will be able to raise families on incomes that will afford them a decent standard of living. That having a large family won’t penalize them allowing them to remain around parents and grand parents. That our schools will again become revitalized with children of people who have chose to stay up north for the clean air and water.	SO10
<b>Sender Name (Submission ID)</b> Mike Higgins (42534)		
15583	I feel all the regulations will keep the pollution in check and this is far too great of an opportunity of progress to pass up. The amount of jobs and economical growth is unfathomable.	PER34, SO10
15584	The amount of jobs and economical growth is unfathomable.	SO10
15585	I am an outdoorsmen and fully support a clean environment and I believe Polymet would be able to maintain the best of both worlds both in making a living and supporting a family as well as keeping my hunting/fishing environment safe.	LU07
<b>Sender Name (Submission ID)</b> Mike Johnson (18109)		
3356	Minnesota and the United States of America have a process for approving projects such as this. PolyMet has gone to incredible lengths to satisfy the regulations and the law. It is time for the DNR and other agencies to create a positive decision (inaudible) will allow the benefits of the project to be one step closer to reality for the individual businesses and communities for Minnesota and the United States.	NEPA16
<b>Sender Name (Submission ID)</b> Mike Klein (39444)		
7839	... I propose that a trust fund be established by the mining interest, in an amount determined by a third party assessor, and to be administered by the state, to set aside adequate funds to cover potential environmental impacts over the entire span of project - and subsequent impact - upon the land and waters of the project area. 1041	The impact of the mine will have a positive economic impact for the community in the short run, however, let's be clear – these are International companies and as we know the laborers do not get the majority of earnings.	SO01
1042	These companies have no concern, no commitment to our resources – they simply see profit. But profit for the mines actually means loss to the state and nation. Our resources will be diminished and our state and federal taxes will be required for the infinite treatment of their wastes.	FIN01
<b>Sender Name (Submission ID)</b> mike love & jeanine kelley (41359)		
9318	PolyMet proposes to create 913 acres of destroyed wetlands, but manmade wetlands never have nearly the biodiversity of natural ones that have developed over hundreds of years. In addition, there is no plan to repair damage from pollution & reduced water flow to several thousand acres of other wetlands	WET05
9319	Lake Superior is the most vulnerable of the great lake to pollution because of its cold temperature and lessened ability to clean itself. The Lake Superior Basin needs more wetlands, not less. Sulfide mining has never been done before in water abundant areas without causing pollution. We don't believe that the cumulative effects analysis area was large enough. Along with the Partridge and Embarrass Rivers, the St. Louis River should be studied for the cumulative effects from the proposed NorthMet mine.	WET18, WR023, WR024
9320	Minnesota Rule 6132.3200 states that a mine must be maintenance free when it is shut down. The timeframe for treating the water from the mining site and the tailings site is several centuries. How can this plan comply with state law and how can it be taken seriously?	PER04
9321	We are troubled that the local Minnesota Indian tribes disagree with many of the findings in the SDEIS. The rights of Native Americans should not be impeded to live off of their lands without serious concerns about the water quality for drinking, fishing and wild rice harvesting.	CR01
9322	We don't believe that the alternative of an underground mine was fully studied.	ALT06
<b>Sender Name (Submission ID)</b> Mike Lundstrom (6136)		
1095	I take solace in the fact that Minnesota has some of the most stringent policies in the nation regarding the permitting of mining.	PER34
<b>Sender Name (Submission ID)</b> Mike Maleska (19525)		
14369	What I want to know is what entity will have the authority, or more specifically, the courage to call a halt to this mine when a disaster occurs? Who will tell the workers in their communities that it's all over? What politician wants that responsibility? Is it going to be the Forest Service? Is it going to be the DNR? Is it going to be the U.S. Army Corps of Engineers?	NEPA02
14370	What magnitude of disaster will it take to have this mining process stopped and halted and repaired forever? Is a little poison for a little while okay? Is a little poison for a long time okay? Is a lot of poison for a little while okay?	PD22
14371	What magnitude of disaster does it take to make people realize that this is a permanent change to the ecology and the environment?	GEN01
<b>Sender Name (Submission ID)</b> Mike Malling (52314)		
10797	I'm concerned about the long term impacts of the project. Noise, water pollution, long term contingency plans if the project fails, the endangered lynx, and the fact that this type of mining has never been done without impacts to water are concerns.	PD22

1463	There is no scientific evidence that the waters of the BWCAW will be protected and preserved under this proposal ... I'm not convinced that the cleanup projected to take maybe 500 years (hard to comprehend) is even viable.	WR035, WR111
1464	how can we ensure that there are enough funds to first, protect Minnesota's treasured lands and waters and second, if the proposed project is approved that there will be enough dollars to for protection in the short term and clean up longterm.	FIN05
1465	If we need 300 jobs in Northern Minnesota let's have the Legislature approve a CCC type project (with corresponding funding) of good paying jobs rather than use that as an argument to approve this project. Give the IRRRB the funds and have conservation related jobs created.	SO06
<b>Sender Name (Submission ID)</b> Mike McGill (39236)		
16662	Local property values will be negatively impacted by this project under any and all circumstances. If disaster occurs, and the groundwater and lakes are poisoned, property owners will see the value of their real estate become all but worthless.	SO01
16664	The PolyMet proposal does not adequately address how the inevitable damage will be corrected and paid for. ... How does PolyMet intend to compensate property owners for the loss in value of their land?	FIN01
16665	We have a right to enjoy our property without having the water in our well and / or the lakes being poisoned for the sake of corporate profits.	SO01
<b>Sender Name (Submission ID)</b> Mike Menzel (43033)		
12576	Habitat losses from this [land exchange] include over 6000 acres scored as "high biological diversity", and 1400 acres of floodplains, home to 11 rare species and known habitat for the Moose and Canada Lynx.	VEG01, VEG02, WI02
12583	What are the details of the proposed water treatment systems?Claims in the SDEIS that mercury and sulfate pollution will decrease in nearbywaterways as a result of mining are dependent in large part on operation of water treatment system(s) that are not detailed.	WR035, WR137, WR143
12585	No details are provided as to how the centuries of operations, maintenance, monitoring, and reconstruction of water treatment facilities will be paid for. What financial institution has ever lasted even one century, much less five?	FIN01
12589	Why was an underground mine, which would greatly reduce forest, rare habitat and wetland losses eliminated from consideration as a alternative action due to present economics, alone?...an underground mine would disturb many fewer acres to access the ore in the headwaters of the St. Louis River.	ALT01, ALT06
12591	What is going to be done to correct the inaccurate water flow model that underestimates the amount of water exposed to toxic pollution at the mine site, and that also underrepresents the impact to wetlands in the area?	WR003
13898	However, I feel that we need to explore other job opportunities for the folks up north because this mine has great potential for being an environmental catastrophe.	SO01
13899	And I understand that there has never been a sulfide mine in a water intensive area ever before that has not resulted in contamination or pollution to our waters.	WR023
13900	One point I have not seen brought up is, that I feel needs to be addressed in the EIS, is the high likelihood of catastrophic climate events. And I am referring to the fact that we have already had four one thousand year floods since 2004 in the State of Minnesota. We have seen massive winds, with terrific blow downs up in northern Minnesota, leaving the potential for epic fires.	WR180

<b>Sender Name (Submission ID)</b> Mike Menzel (43033)		
17127	Climate change will greatly affect this project, yet climate change was not even considered in the SDEIS. The project is highly dependent on water. Whether we have a climate that produces too much water or too little water - either way, this important reality must be factored into the statement.	WR180
17128	The proposed US Forest Service land exchange must be rejected: it is not in the public interest. The lands offered in trades do not include mineral rights- setting up future mining conflicts. The existing law prohibiting surface mining in the Poly Met area (Weeks Act) will not apply for nearly all of the traded lands - weakening protections for our national forest.	LAN02, LAN04
17130	The proposed wetland mitigation only covers the 912.5 acres of direct wetland impacts. The Section 404 wetland permit must be rejected. With more than ten square miles of additional wetlands projected to be “indirectly” impacted by water drawdowns and toxic materials, what will be done to assure that wetland impacts will be replaced before these effects are noticed by monitoring? Bogs and coniferous swamps of the sort likely to be affected are extremely difficult to restore. It is insufficient to propose a monitoring plan - with any replacement to be determined in the future. (SDEIS 5.2.3.3.4)	WET01, WET02
17132	The entire 3014 acre mine site has been classified by the Minnesota Biological Survey as of “High Biodiversity Significance”. Two state endangered, two state threatened and seven state special concern plant species have been found on the mine site. Six “Regional Foresters Sensitive Species” (federal forest plant species of concern) are found on the mine site. (SDEIS Section 4 pp 173- 188) The SDEIS generally describes the impacts as too small to consider significant. (SDEIS Section 5 pp 339-354).	VEG01, VEG02
17135	the inaccuracy of the water model...throws into question assumptions about future mercury levels in the Partridge and St. Louis Rivers.	MERC11
<b>Sender Name (Submission ID)</b> Mike Neaton (17576)		
9355	The [SDEIS] has many failures: 1)to address the correct flow of base water, 2)specify the under water crevices that will allow water to flow in pathways that are sited as clay, 3)show the correct flow to the 100 mile swamp feeding eventually to the WCA	HU01, WR003, WR010, WR011, WR012, WR024, WR052, WR061, WR071, WR080, WR081, WR090, WR091, WR111, WR167, WR175
9356	[T]he purposed operation is expecting a public monitoring for 500 years and counting!! No business enters a contract with liabilities that extend for a time period of this length.	PD01
12824	The [SDEIS] fails to address the health regarding the working conditions.	HU04
12825	If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness.	WILD02
<b>Sender Name (Submission ID)</b> Mike Perala (18105)		
13471	I speak tonight in support of the review process managed by the Minnesota DNR. Some people think it a long process. I think that the length of the process has been dictated appropriately by the complexity of the project and the robustness of the area mine site.	NEPA16

7614	The lead agencies should at least give full consideration to the costs and benefits of extracting this ore by other means including underground mining.	ALT01
7615	I don't feel the SDEIS adequately considered the costs and benefits of alternatives (including not doing the project at all) to open pit mining.	ALT20
7616	I don't believe the SDEIS has provided adequate financial assurances the residents of Minnesota won't be stuck with clean up and reclamation costs following the mine's closure.	FIN01
7621	The proposed land exchange should not include 382 acres of Lake County land. This represents a net loss of public land opened for hunting, fishing, trapping and other forms of outdoor recreation. ... No part of this or future mining projects should result in a decrease of public lands.	LAN06
7624	The SDEIS does not adequately discuss impacts to outdoor recreational pursuits such as hunting and trapping nor does it adequately discuss impacts to traditional game and furbearer populations. This is a major discrepancy in these documents as healthy wildlife populations of all species, not just rare or sensitive ones, is critical for many residents and visitors to northeast Minnesota.	WI09
7626	The existing wildlife corridors are inadequate to maintain connectivity across the Iron Range. ... The SDEIS admits increasing development of urban areas alongside the corridors will render some of the existing corridors less suitable for wildlife in the future. Increased urban development and associated transportation and utility infrastructure should be expected if the project provides the economic benefits stated in the SDEIS. This issue should be mitigated before NorthMet or additional mine development goes forward through the establishment of dedicated and protected wildlife corridors and the reclamation of existing mine land.	WI03
7628	As more mines are developed, fish and wildlife populations are going to increasingly suffer negative impacts either through direct loss of habitat or indirectly through disturbance.	WI01, WI02
7633	There should be a mine reclamation aspect to this project and all mining projects going forward. There is no apparent reclamation aspect of existing mine lands to this project and this is also a discrepancy of this SDEIS.	PD09, PD35
7638	nor does [NorthMet] offer sufficient assurance that the economic costs of cleanup and monitoring following closure are adequate and won't have to be picked up by taxpayers.	FIN01
16968	The greatest natural resources we have are our abundant public lands, clean water and healthy populations of fish and wildlife. These resources have both economic and intrinsic value and properly cared for they are infinitely renewable. They should not be put at risk for comparatively short term profits.	SO01
17009	Simply exchanging private land for public land isn't enough. The only way to begin to counter balance this loss is to reclaim existing mine lands and work to reestablish public access and healthy fish and wildlife populations on them.	LAN01
<b>Sender Name (Submission ID)</b>	Mike Zicus (42908)	
10138	an underground mine should not have been eliminated from consideration as an alternative action. It seems to have been dismissed solely due to present economics (e.g., Table 8.1 MDO #5, Appendix C pp. 43 - 46). (...) An underground mine would certainly destroy many fewer acres of natural habitat, having a lower cost associated with habitat destruction.	ALT01, ALT06
10140	Two state endangered, two state threatened and seven state special concern plant species have been found in the immediate vicinity of the proposed mine site. The SDEIS generally describes the impacts as too small to consider significant (SDEIS Section 5 pp. 339 – 354.)	VEG01

<b>Sender Name (Submission ID)</b> Mike Zicus (42908)		
10142	The proposed wetland mitigation for the open pit mine covers only 900 acres of wetlands directly impacted by the operation. Yet between 6,500 and 7,350 acres of additional wetlands are projected to be “indirectly” affected by water loss and/or accumulation of toxic materials. What will be done to assure that the full ecological function of these wetland will be restored or replaced? Many of these wetlands will be bogs and coniferous swamps which are extremely difficult to restore or replace	WET01
10146	Discussion of the possible impacts to stream flow are also inadequate. Page 39 of the Executive Summary has misleading statements regarding flows of water into the Embarrass River. (...) What would happen if we actually experienced a severe drought on top of the acknowledged dewatering that is proposed? (...) The consequences of long-term de-watering of tributary streams (especially effects on temperature regimes) must be included and assessed as an impact. Descriptions of mitigations are needed to address the dewatering that the SDEIS acknowledges would occur.	WR048, WR130, WR138, WR180, WR182, WR188
10151	The document acknowledges that the proposed mine site would generate contaminated runoff for 200 years and that the proposed processing site will contaminate runoff for 500 years. (...) What mining company is going to operate for even 200 years? The risks to our water resources are just too great and PolyMet’s assurances too problematic to take a chance with this level of future contamination without more specific description of the remediation (and associated costs) that will be undertaken.	FIN01, FIN05
10161	The SDEIS also states that the “...potential exists for the release of amphibole mineral fibers from the proposed operations which could pose a potential public health risk of uncertain magnitude.” Medical professionals ( <a href="http://www.duluthnewstribune.com/event/article/id/292659/group/Outdoors/">http://www.duluthnewstribune.com/event/article/id/292659/group/Outdoors/</a> ) recently identified these asbestos-like fibers as a significant potential for risk to human health that must be addressed by the SDEIS. Effective mitigation measures for air-borne amphibole mineral fibers and the costs associated with these measures must be included in the SDEIS.	AIR03
19089	There are also Major Differences in Opinion regarding the stream base flows modelled in the analysis (Appendix C, Subsection 1) that need to be better resolved. These modelled values have a critical effect on estimated concentrations of contaminant in the watershed and leave unanswered questions regarding the consequences to water quality. Discrepancies in the hydrologic models must be resolved.	WR003
19097	there is insufficient information regarding how PolyMet proposes to conduct water treatment such that mercury and sulfate levels might be reduced in the affected streams and wetlands. In fact, information in the SDEIS suggests that these contaminants might increase.	MERC15, MERC23
<b>Sender Name (Submission ID)</b> mikem28 (39660)		
7365	I don't want MN to end of looking like Detroit.	LU04
13652	The financial benefits are a deciding factor in my opinion to approve. You just need to make sure the environmental factors are accounted for. As long as the company can take responsibility for their actions, the economy needs a boost in jobs and tax revenue.	FIN16
<b>Sender Name (Submission ID)</b> miles holets (21979)		
3309	I support the development primarily for two reasons: ... 1. Our country is stronger when we do not need to rely on foreign countries for our infrastructure minerals and materials.	NEPA05
3310	I support the development primarily for two reasons: (...) 2. Economic strength jobs and taxes will provide.	SO10

<b>Sender Name (Submission ID)</b> Miles Kramer (41828)		
15444	•The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.	PD17, WR067
<b>Sender Name (Submission ID)</b> Mimi Jennings (10715)		
1482	I'll focus on its parent company. Most galling: while PolyMet has never operated a mine anywhere, it's owned primarily a known quantity with an abysmal environmental, ethical and labor record: the Swiss international commodities and mining giant (50% of all mines worldwide), GlencoreXstrata. Glencore was originally called the Marc Rich Company (charged with tax evasion, accused of doing business with Iran during the hostage crisis, pardoned by President Clinton right before he left office – that Marc Rich). Now Tony Hayward is chairman of Glencore's Board of Directors. He's the guy who was running BP at the time of the Deepwater Horizon oil spill. Remember that he botched the handling of the fire and then attended a yacht race while oil polluted the Gulf, announcing that he "wanted his life back?" That Tony Hayward. Some Glencore history:· BBC investigation accusing Glencore of dumping copper refinery acid into a river in the Democratic Republic of Congo· more than a million dollars in environmental fines worldwide since 2010· 500,000 Euro Belgian court fine in a corruption case· various contracts with Iran during sanctions· named the number one most difficult company to do business with by an international coalition of environmentalists· Glencore subsidiary fined for violating copper trading rules. Why do we even want these guys in our state, let alone undertaking such delicate operations in our pristine waters? It's like letting a known child molester babysit your own kid. Not wise. Wrong. Bad decision.	PER02
13959	This is an exceedingly risky proposal with little upside, which is reason enough to distrust estimates provided by PolyMet without independent state verification. In addition, its parent company's checkered history and that of its board chair demand extra vigilance.	PD01
14212	The Supplemental Draft Environmental Impact Statement (SDEIS) is insufficient and should not be approved because, among many reasons, it lacks vital information about centuries-long water treatment and how it might be assured--information that is necessary to evaluate the environmental effects of this proposal.	WR036
<b>Sender Name (Submission ID)</b> Minh Cat Thai (54229)		
16798	Environment is very important. To able to live a healthy life, we need a fresh environment and clean water to survive. The Poly Met Mine needs to test the water's quality to make sure the water is still fresh and clean. Pollution in water not only affects the fish and small animals. It is also affected our life negatively.	WR115, WR195
<b>Sender Name (Submission ID)</b> Mining Minnesota (42956)		
12663	The Proposed Project Will Have No Impact on the Boundary Waters Canoe Area. The SDEIS clearly points out, BWCA and Voyageurs National Park are located in a different watershed than the NorthMet Project area, and lie 20 miles and 50 miles away, respectively. The NorthMet Project Proposed Action would not directly, indirectly, or cumulatively affect the water quality of these areas.	CU20
12664	The Proposed Project Will Not Create Acid Rock Drainage. Almost all the water PolyMet's NorthMet project will manage on its property is in the pH neutral range, including all the water in the tailings basin, the mine pit, and water from the largest and only permanent stockpile on the mine site. The small portion of waste rock will be returned to the open pit during reclamation and it will be covered by water, no longer able to generate acid.	WR190

<b>Sender Name (Submission ID)</b>	Mining Minnesota (42956)	
12666	Sulfate and Mercury Standards Will Be Met by the Proposed Project. The project will meet the strict Minnesota standard for wild rice waters, and the project will meet the Great Lakes mercury standard of 1.3 nanograms per liter. The SDEIS makes very clear that there will be a net decrease in both sulfate and mercury loadings as a result of this project. The water will not be hazardous and will be swimmable and fishable water.	WR161
12671	The Proposed Water Treatment Works...the water control and treatment methods proposed in the PolyMet NorthMet project work. The extensive monitoring and modeling demonstrate that, regardless of flow rate, and regardless of length of treatment needed, the project will always be in compliance with water quality standards.	WR190
12677	Financial Assurance is More Than Adequately Discussed in the SDEIS...Financial Assurance that covers all costs related to closure and post closure maintenance are clearly required in Minnesota statute and rule before a permit to mine can be issued. Financial assurance is properly addressed during the permit to mine stage of permitting.	PER03
12680	The proposed Land Exchange will exchange certain lands in the Superior National Forest (SNF) for equivalent value non-federal lands that will be provided by PolyMet. The SDEIS provides adequate support for the conclusion that this Land Exchange is consistent with the management of the SNF and governing Land Exchange requirements.	LAN11
12685	Agencies Should Move Quickly to Publish a Final EIS and Proceed to Permitting. The SDEIS is comprehensive and adequately addresses all potential impacts...The SDEIS identifies how all impacts will be mitigated, and the project will be in compliance with all air and water quality standards.	NEPA16
14965	Jobs and Economic Development Resulting from the PolyMet NorthMet Project are Essential to Minnesota's Future...The PolyMet NorthMet project will provide the following economic impact:•\$720 million in wages and benefits•\$10.3 billion in economic benefit to St. Louis County•\$300 million in new local and state tax revenues estimated•\$900 million in new federal tax revenues estimated•\$500 million in capital construction approximately, requiring 2 million construction hours•360 full-time jobs in the mining operation•600 plus related indirect jobs	SO10
14966	PolyMet NorthMet project will produce copper, nickel, platinum, palladium, cobalt, and gold. All of these metals are essential to our economy, and metals that we are import dependent for a significant percent of our domestic consumption.	SO10
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5614	In the SDEIS, waste rock is defined as the rock “without economic value that surrounds ore.” However, MCEA does not agree with this definition. Waste rock is better defined as rock surrounding ore from which any metals or other minerals cannot be economically processed.	PD15
5615	PolyMet’s model predicts that this structure would collect over 90 percent of the seepage. However, PolyMet’s modeling assumes that no water will flow into the bedrock. The success of this collection system depends upon zero fracturing in the bedrock, the efficacy of construction of the barrier, and the ongoing operation of the pumps inside the barrier to prevent overflow.	WR018, WR021, WR099, WR131
5616	The water that would need to be collected and treated at both the plant site and the mine site after closure (Year 40 and beyond) would include at least 22 metals. PolyMet predicts that some of these metals will be present at levels that exceed water quality standards, including arsenic, cobalt, copper, nickel, zinc and sulfate. Many of these constituents are toxic to aquatic life and can pose a public health threat.	WR109
5617	PolyMet constructed a water quality model to run for 200 years at the mine site and 500 years at the plant site. At the end of the duration of the model, pollutants in the water are still high, in some cases many times the applicable state water quality standard.	WR035, WR037

*Alphabetical by sender's first name*

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5618	Figures 1 and 2 [of water quality modeling in full comment letter] demonstrate that copper and sulfate persist at high levels in the Year 200, and do not appear to be on a downward trend. Figures 3 and 4 only extend out to Year 80 – PolyMet did not produce graphs showing constituents through Year 500, although the model extended for that period.	WR035
5619	There is substantial uncertainty surrounding the length and type of water treatment that may be required at this mine after closure. In MCEA’s opinion, such uncertainty means that, from a policy perspective, water treatment must be considered to be perpetual.	WR035
5620	The SDEIS also states that development and implementation of “non-mechanical” water treatment systems would be part of the long-term activities at the site. To date, PolyMet has not proven a successful “non-mechanical” water quality treatment strategy.	WR137
5621	The SDEIS does not examine any Action Alternatives as to the mine plan. There is an alternative to the land exchange, although this alternative appears to be aimed more at achieving Forest Service Management objectives, as opposed to offering any particular environmental benefits.	ALT06
5623	Overall, the NorthMet SDEIS does not take the “hard look” required by law. Rather, much of the information provided is encyclopedic, describing ways in which the Project purports to fit within various regulatory regimes. In many areas the SDEIS lacks real assessment of the environmental and health impacts resulting from the Project. It assumes that all mitigation measures perform perfectly, not merely for the 20-year life of the mine, but for hundreds of years afterwards. This is simply not a supportable assumption, and the SDEIS fails to evaluate both the effectiveness of mitigation measures, and the impacts in the event that they fail.	NEPA09
5624	As discussed, below, MCEA has identified substantial inadequacies in the SDEIS. As a result of these inadequacies, it is not sufficient for the co-lead agencies to merely prepare a Final EIS. The Co-Lead Agencies must first submit a revised Draft EIS for public review and comment. MCEA urges the Co-Lead Agencies to require additional evaluation of environmental effects consistent with these comments prior to publishing a final EIS for the NorthMet Project.	NEPA15
5625	If the state does not obtain adequate financial assurance to pay for that maintenance and water quality treatment, than the prediction in the SDEIS that the project has minimal environmental impacts will be flatly incorrect. ... Minnesota law requires that an EIS “shall identify those measures that could reasonably eliminate or minimize any adverse environmental, economic, employment, or sociological effects of the proposed project.” Similarly, under federal law, an EIS must include a discussion of “means to mitigate adverse environmental impacts...” ...Financial assurance is a mitigation measure designed to avoid the impacts altogether because adequate financial resources must be available in order for many of the other mitigation measures – such as water collection and treatment – to stay in place after closure.	PER03
5628	Additionally, financial assurance must be included in the EIS because the potential impact on Minnesota taxpayers is the type of economic and sociological effect that falls within the ambit of MEPA and NEPA.	FIN13
5629	Finally, the inclusion of information regarding financial assurance is critical to allow the public to fully understand and assess the effectiveness of reclamation and closure activities.	FIN13
5630	Including financial assurance information in an Environmental Impact Statement is becoming standard practice, especially for mining operations that are reasonably anticipated to require long-term water treatment. (See attached letters from EPA, Region 9, and Region 10, concerning mining operations in which the EPA sought financial assurance information as part of the environmental review process.)	FIN13

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5631	Indeed, while the Co-Lead Agencies state that financial assurance is “typically made available at the permitting stage,” it is unclear what the basis of this “typicality” might be, since federal EIS commonly do include financial assurance (Chambers p. 5). One example of reclamation plan with an appropriate level of planning detail and cost estimates is the Pogo Project in Alaska (Chambers p. 6). Another example, cited by U.S. EPA in its comments on the NorthMet DEIS in 2010, is the Idaho Cobalt Mine.	FIN13
5632	The Co-Lead Agencies have not provided a sufficient basis or explanation for being unable to estimate financial assurance requirements associated with reclamation at the SDEIS stage. If the adequate “level of engineering design and planning” is not available for financial assurance purposes, how is it available for determining the extent of significant environmental impacts of the project, whether during operation, reclamation or closure? The SDEIS offers no reasonable distinction between the amount of design detail required for financial assurance and the amount of design detail to evaluate the project’s environmental impacts.	FIN05
5633	Complete financial assurance analysis and projections must include not only the final cost estimates, but also all supporting calculations.	FIN05
5634	The Co-Lead Agencies Must Explain Why They Have Included The Projections of PolyMet’s Consultant, Foth Engineering, In The Document, If It Is Not Possible To Make Financial Assurance Calculations At This Stage. ... for a company to bring a project to this stage without having performed some internal calculations related to financial assurance would be fiscally irresponsible to the company’s shareholders and board of directors ... Yet, the co-lead agencies expect the public to take on potential liability without similar information. The public is owed at least as much as PolyMet’s shareholders and board of directors. The calculations underlying the numbers in Table 3.2-15 in the SDEIS should be disclosed to the public, or similar calculations made by the Co-Lead Agencies.	FIN05
5635	While DNR has insisted that financial assurance may not be calculated at this phase (a proposition with which MCEA disagrees), that should not prevent the Co-Lead Agencies from including information that is not dependent upon whether the details of the proposal are finalized, including the discount rate.	FIN05, FIN08, FIN13
5636	There are five options typically mentioned in associated with financial assurance: trust funds; surety bonds; letters of credit; certificates of deposit; and insurance policies. (Thometz, p. 1). Of these, only trust funds meet the statutory requirements [MR 6132.1200] and are likely available and economical for PolyMet.	FIN08
5637	No third-party guarantee instrument, whether it be a bank letter of credit, a surety bond, or an insurance policy, can meet the requirement in Minnesota’s rules that the instrument not be “dischargeable through bankruptcy,” ... First, banks, sureties, and insurers can go bankrupt themselves. ... Second, bankruptcy courts can and do release non-debtor guarantors from liability for a bankrupt debtor’s obligations, using their broad injunctive power under 11 U.S.C. sec. 105, which authorizes the court to issue “any order, process, or judgment that is necessary or appropriate to carry out the provisions” of the U.S. Bankruptcy Code.	FIN01, FIN03, FIN08
5638	It is also not clear that an insurance policy, surety bond or even Letter of Credit meets the requirement that “the funds will be available and made payable to the commissioner when needed.” ... If the insurance company or bank perceives a weakness in the state’s claim to collect on the instrument or contract, or the circumstances that require the state to step in on cleanup at the site do not precisely match the contractual language that obligates the insurer or bank to pay out, then a contractual dispute may ensue and the state may not have immediate access to the money.	FIN08
5639	Letters of credit, surety bonds, insurance policies, or perhaps hybrid instruments could offer a form of reinsurance to back up trust funds created for reclamation, contingency response, and long-term water quality treatment. Similarly, corporate guarantees (by parents, affiliates, or financiers) and periodic financial tests can bolster a financial assurance arrangement. They simply cannot be a substitute for a trust fund arrangement, the only mechanism that meets the rule’s requirements.	FIN08

5640	no investment is truly “risk-free,” especially over the time frames contemplated by the state in the SDEIS. (Thometz, p. 1-2). Major banks and insurance companies fail, and governments default on debt. Indeed, it is impossible to even assess the credit-worthiness of an institution over 200 years. (Thometz p. 2). Moreover, it unlikely that financial instruments other than a trust fund would be economical, assuming they are even available. ... Thus, only U.S. Treasury Bonds, held in a trust fund by the state, offers the security required by Minnesota Rules.	FIN03, FIN08
5641	MCEA strongly urges the state to set a value for financial assurance obligations and require PolyMet to show that it could meet that obligation as early in the process as possible. The state should not simply assume that a variety of financing options are available to PolyMet.	FIN07
5642	Federal NEPA regulations state that an agency may use information submitted by an applicant in an EIS, but “[t]he agency shall independently evaluate the information submitted and shall be responsible for its accuracy.” ... In this case, the Co-Lead Agencies have merely reprinted a range of reclamation costs and post-closure costs directly from a memo produced by Foth Engineering, PolyMet’s consultant. ... MCEA must presume that DNR has never asked PolyMet’s consultant to “show its work” on how it arrived at the numbers in Table 3.2-15. Thus, the agencies have not “independently evaluate[d]” the information in Table 3.2-15, nor have they “verified” that work is acceptable.	FIN05, PER03
5643	First, it violates Minnesota Rule 6132.3200, promulgated by the MDNR in 1992. ... [The] “objective” of closure for the NorthMet mine is not to close the area so that it is maintenance free, as prescribed by Minnesota Rule 6132.3200. Rather, it is to “provide mechanical or non-mechanical treatment for as long as necessary to meet regulatory standards at applicable groundwater and surface water compliance points.” Indeed, this objective is precisely the opposite of the regulatory requirement.	PER04
5644	MDNR cannot force PolyMet to fulfill the legal obligations necessary for it or its Canadian parent to continue to exist as a corporation. Nor can it require PolyMet to hold any amount of assets within the corporation that could potentially be available to pay for long-term water quality treatment, let alone penalties for failure to perform any cleanup activities at the site. Keeping PolyMet on the Permit to Mine will not change the fate – financial or otherwise - of the NorthMet site after closure.	PER02
5647	An agency may not disregard an alternative merely because it does not offer a complete solution to the problem. As discussed below, the SDEIS failed to meet the requirements of NEPA by failing to adequately evaluate reasonable alternatives to the NorthMet Project, including the West Pit Backfill Alternative, and the Underground Mine Alternative.	ALT20
5649	In addition, MCEA proposes a new alternative that has not previously been considered based on the expert analysis of the water quality model – allowing the West Pit to refill without pumping.	ALT05
5650	The Co-Lead Agencies’ conclusion that the underground mine alternative is not economically feasible is based on an economic assessment performed by Foth, a PolyMet Consultant. However, as noted by Dr. Chambers, the economic assessment performed does not analyze the sensitivity of the assessment to changes in metals prices. (Chambers p. 18). Underground mining may well be economically in the future with an increase in metals prices and refinement in the processing technology costs. (Chambers p. 18). ... MCEA also notes that an underground mine may still fulfill this purpose, even if the project is delayed until mineral prices rise.	ALT01
5651	Under Minnesota law, an alternative in the EIS process cannot be rejected solely due to financial considerations. The Minnesota Environmental Policy Act (MEPA), under which this environmental review is conducted, and the Minnesota Environmental Rights Act (MERA) both prohibit projects that cause or are likely to cause pollution, impairment or destruction of Minnesota’s environment where feasible and prudent alternatives exist. ... In other words, an alternative cannot be rejected merely on the basis of cost.	ALT21

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5652	Appendix B of the SDEIS notes that the Underground Mine Alternative would result in fewer socioeconomic benefits because it would reduce the life of the mine, as well as tax benefits. MCEA notes that the tax benefits described in the SDEIS are unsupported; therefore it is difficult if not impossible to quantify this potential drawback without further information about projected tax revenues.	ALT01
5653	The Co-Lead Agencies screened and rejected the West Pit Backfill alternative, in part because the agencies concluded that it did not provide significant environmental benefits as compared to the project, and in part because of economic infeasibility. In fact, the Co-Lead Agencies have identified merely speculative reasons why the West Pit Backfill would not provide environmental benefits. The Co-Lead Agencies did not ask PolyMet to any water quality monitoring or projects associated with backfilling the pit, detailed cost/savings estimates, or projected configurations of shallow-water wetlands that may be feasible. MCEA agrees that these are steps more appropriately associated with the consideration of an alternative in the SDEIS, rather than a screening process. However, MCEA contends that the Co-Lead Agencies' conclusions regarding the West Pit Backfill were premature, and full consideration of the West Pit Backfill as an alternative in the SDEIS is warranted.	ALT03
5654	even though the Category 1 stockpile would still impact wetlands in the short-term as a temporary stockpile, removing the stockpile provides an excellent opportunity to reclaim a large portion of the site after closure. The Co-Lead Agencies note that wetland restoration at the removed Category 1 stockpile site would not provide PolyMet with wetlands credits. ... While wetlands restoration in 20 years at the site may not provide a financial benefit to PolyMet because it already had to mitigate wetlands losses, it will still provide an environmental benefit.	ALT13
5659	Additionally, the conclusion that PolyMet will not gain wetlands credits from the restoration at the removed Category 1 stockpile site may not be correct. Wetlands restoration at the site may well provide PolyMet with needed wetlands credits for indirect wetlands impacts at closure. ... Rather than require mitigation in advance, PolyMet proposes to monitor for wetlands impacts and mitigate as needed. While MCEA has concerns about this approach ... it may well be that PolyMet will need additional credits at closure due to continued indirect impacts on wetlands, and the acres under the removed Category 1 stockpile will provide a good opportunity for in-watershed restoration.	ALT06
5661	The Co-Lead Agencies conclusion that a West Pit Backfill would increase constituent loading to groundwater fails to compare any increase in constituent loading from subaqueous disposal to the constituent loading from the Category 1 stockpile, left on the site into perpetuity. In other words, while subaqueous disposal of the Category 1 stockpile may increase constituent loading in the West Pit, it will also eliminate a source of pollution on the site (Myers SDEIS Review, p. 1-2).	ALT03
5663	A West Pit Backfill alternative may provide advantages for water quality. ... The Co-Lead Agencies may contend that the Category 1 stockpile is not a source of pollution because of the Category 1 Waste Rock Stockpile Groundwater Containment System and Cover. ... If the Category 1 Stockpile Containment system does not perform as designed, the seepage will travel to the West Pit. The seepage from the Category 1 Stockpile will have extremely high contaminant levels. Sulfate in the stockpile drainage, for instance, is projected to be anywhere between 2,500,000 and 4,000,000 ug/l.	ALT03
5665	A West Pit Backfill alternative may provide advantages for water quality. ... It may well be that Category 2,3 or 4 rock will be inadvertently stored in the Category 1 stockpile due to limitations in sorting technology (Maest p. 14). However, constituent loading from the Category 1 rock stored subaqueously in the West Pit may be less because the material will no longer be exposed to oxygen. (Maest p. 14)(Miller p. 5).	ALT03
5667	A West Pit Backfill alternative may provide advantages for water quality. ... A complete analysis of whether the West Pit Backfill Alternative improves water quality must compare the effects of loading from the Category 1 stockpile to the effects of subaqueous storage.	ALT03
5669	The West Pit Backfill Alternative may provide other benefits. ... MCEA agrees that the reclamation, from an aesthetic standpoint, has been successful [at the Flambeau Mine]. Removal of the Category 1 stockpile may provide similar results at the PolyMet site.	ALT03

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5671	PolyMet has not provided evidence of encumbrance of mineral leases. PolyMet must support its claim by providing contractual agreements or other evidence. PolyMet must also provide some evidence that this pit could ever be remined, which would be quite unusual. (Miller p. 5). Nor is it clear that backfilling the pit imposes additional encumbrances beyond filling the pit with water. (Miller p. 5). It would already need to be dewatered because it would become a pit lake; under the West Pit Backfill Alternative, it would also need to be excavated (Myers SDEIS Review p. 2). In either case, substantial expense will need to be incurred if the mineral rights adjacent to or beneath the West Pit were to be accessed. (Miller p. 5) ... The Co-Lead Agencies must provide additional support for the claim that there is a difference in encumbrance of the leases between a pit lake and a backfilled pit lake.	ALT03
5673	The West Pit Backfill Alternative may also reduce costs post-closure. For instance, it would eliminate the cost of maintaining the geomembrane over Category 1 stockpile, as well as the Category 1 Containment system, including pumps. It may reduce or even eliminate the need for wastewater treatment at the mine site.	ALT03
5675	The Co-Lead Agencies seem to agree with PolyMet that the West Pit Backfill alternative may “affect the ability of the Project Proposer to secure financing for the action, thus rendering it economically infeasible.” First, this statement is extremely speculative.... The Co-Lead Agencies should require additional support for this claim. Second, financial viability alone is not a valid reason to reject an Alternative in an EIS. ... Third, the West Pit Backfill may result in decreased water treatment needed over time, actually decreasing costs. ... Thus, if the cost of backfilling the West Pit increases the capital costs, but decreases the bond that PolyMet must offer as financial assurance, the West Pit Backfill alternative may, in fact, be a net reduction in costs of the project, or at least increase costs less than is assumed.	ALT03
5676	Dr. Myers has found that West Pit pumping causes water quality exceedances between years 20 and 40 because it forces water through the surficial aquifer north, into Yelp Creek. Discharges into Yelp Creek would include uncollected runoff from the Category 1 stockpile. This can be avoided by allowing the West Pit to refill naturally.	ALT05
5679	Allowing the West Pit to refill without pumping may also cause a decrease in flow to the Partridge River because the West Pit will draw water from a larger area, and for longer, than if it is pumped full. However, it is not clear how significant this impact is. Also, PolyMet may be able to mitigate this impact by supplementing flow in the Partridge with discharge from the WWTP.	ALT05
5681	The Land Exchange alternative does not appear to fulfill the requirements of NEPA. ... The land exchange alternative does not appear to offer any environmental benefits. According to the SDEIS, it was included because some commenters raised the question of whether fewer federal lands need to be exchanged early during the scoping process. ... Land Exchange Proposed Action and Land Exchange Alternative B, it does not discuss whether federal ownership is more or less likely to be protective of those resources. Indeed, it appears that the purpose of the Land Exchange Proposed Action is to fulfill the purposes of the Forest Service planning goals, such as avoiding land fragmentation. And while the US Forest Service is free to pursue its own goals and interests, it is not clear that this particular alternative meets the purposes of an Alternative as defined by NEPA. If this alternative provides environmental benefits, those benefits should be identified in the SDEIS. Otherwise, this should not be considered an alternative for the purposes of the SDEIS.	ALT23
5683	In order to determine the potential for significant environmental effects, the water quality models compare the effects of the project to a Continuation of Existing Conditions scenario. The SDEIS acknowledges that additional management and mitigation would take place under the No Action Alternative. Yet it fails to take this into account when evaluating the environmental effects of the project under its water quality model	ALT14

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5685	The SDEIS fails to evaluate the potential effectiveness of mitigation measures. Instead, it assumes that mitigation measures perform perfectly for hundreds of years. ... The PolyMet SDEIS is replete with mitigation measures; however it fails to address the potential effectiveness of those mitigation measures....The point here isn't that the Co-Lead Agencies haven't adequately described the mitigation measures. It is that the Co-Lead Agencies haven't adequately evaluated their effectiveness. The SDEIS simply makes conclusory statements about the effectiveness of mitigation measures. ... MCEA emphasizes that the effectiveness of any mitigation measure that will need to last for decades or centuries after closure should be considered uncertain, and the impacts of failure analyzed.	PD01
5689	NEPA therefore suggests that an agency must attempt to quantify the risk of environmental harm from a reasonably foreseeable accident. An accident that occurs with some frequency may be called 'reasonably foreseeable'; its occurrence is a matter of probability and risk, but it is a known risk. ...The SDEIS's failure to address accident risks in this case is unique. In other industries, and in other mining projects, a probabilistic accident assessment is a routine procedure, one that is vital to reasoned and informed decisionmaking. It is, in other words, central to the very heart of NEPA. ...The environmental assessment of the PolyMet proposal – in contrast - does not contain any analysis of the probabilities of accidents occurring at the mining site or with the facility's equipment, past or future. This failure is a clear violation of NEPA.	PD22
5690	Compliance with NEPA requires an assessment of the environmental harm resulting from a tailings pond failure ... The assessment of environmental harm from accidents is an undertaking that must be completed by all federal agencies ... Any agency that fails to consider accident risks falls short of the "hard look" required by NEPA, and the failure to consider similar risks in the context of a mining operation is therefore a clear violation of NEPA.	GT15
5693	The risks of accidents can be clearly identified with specificity, and the individual risks are significant enough that a decisionmaker of reasonable prudence would certainly take them into account in making a decision on the proposed project. ... Indeed, the failure of the SDEIS to consider the environmental impacts from accidents occurring in connection with the PolyMet proposal is all the more surprising considering the risk of such accidents is so high. ...The risks of accident occurrence at the PolyMet site, clearly, can be specified and quantified with some degree of reliability. Clear case law establishes that failure to take into account the environmental impacts of the occurrence of such accidents is a violation of NEPA.	PD22
5695	an EIS, to avoid falling into the same trap as so many EISs for sulfide mines have before, must take into account the possibility that mitigation measures will not be as effective as predicted. The SDEIS for the PolyMet project fails this test. ...MCEA is not asking the co-lead agencies to consider worst-case scenarios, a requirement that no longer exists under federal rules. Rather, MCEA is asking the co-lead agencies to consider scenarios that are reasonably foreseeable and are more likely to occur because of the state and federal action under consideration.	PD01, PD22
5697	The EPA recently released an assessment of the potential impacts of a proposed mining project on the salmon ecosystems of Bristol Bay, Alaska (hereinafter "Bristol Bay Report"). ... this analysis does a thorough job of analyzing reasonably foreseeable problems at a mine site in a way that is instructive for an EIS such as this one.	WR023, WR074
5699	The SDEIS must analyze the probability and impacts of a WWTF failure, including (a) potential problems that arise during operation, resulting in discharges that do not meet water quality standards, and (b) abandonment of treatment after closure. ... wastewater treatment could fail during operations, or it could fail after operations. ... A failure after operations has a different implication because it may be that there is no longer an entity to hold responsible, and the costs will be borne by the state. Recovery of costs or damages is extremely unlikely. If the state does not or will not provide the funds to address failure after operations, the impact on the environment will be unabated.	FIN01, FIN05, WR144, WR202

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5702	The SDEIS must analyze the probability and impact of an unexpected release of untreated tailings or wastewater from the tailings basin. ... The most pertinent for PolyMet might be the North Fork scenario, in which the tailings impoundment at the Nixon Fork Mine overtopped. ... A series of unforeseen, but not unlikely, events led to the release of 34,200 gallons of tailings basin water. ... Thus, the Bristol Bay Report acknowledges the potential failure and analyzes the potential impact. In contrast, the PolyMet SDEIS does not address overtopping or accidental release from the tailings basin at all.	WR202
5703	The SDEIS must analyze the probability and impact potential aquatic toxicity impact of an accidentally release of chemicals and untreated water at the site. ...In contrast, the PolyMet SDEIS contains a list of hazardous materials used on the site but this list only covers human health impacts from chemicals. The SDEIS does not, at any point, address aquatic toxicity or impacts to aquatic life from chemicals or other constituents in the tailings basin leachate or water leaving the mine site. Nor does the SDEIS address any scenario in which additional constituents are released inadvertently, and what the potential impacts might be.	AQ22
5707	The SDEIS must analyze the probability and impact of a tailings dam failure. ...MCEA suggests that the SDEIS examine not only the probability of such a [tailings dam] failure, but also the potential impacts were it to occur, rather than ignoring potential impacts. ... A risk cannot be mitigated to zero. Tailings basin dam failures, while still low probability, are common enough, and severe enough, to warrant further discussion.	WR132
5708	The SDEIS must analyze the probability and impact of a pipeline failure at the mine site. ... It is possible, and recommended, to assign the probability of pipeline failure based on the type and length of pipeline at the site. While the probabilities are likely higher at the Bristol Bay site due to the length of pipeline, the impacts may be no less severe at the PolyMet site and should be addressed.	PD22
5710	While the SDEIS describes extensive mitigation measures to avoid such scenarios, it makes no effort to identify mitigation measures built into the project to decrease the impacts of such failures. Such mitigation measures may include, for example, capture ponds and barriers to prevent materials from pipeline breaks or tailings spills from entering nearby surface waters; a consideration of alternate locations for pipelines, as well as a list of situations in which the mine would slow or cease operation in order to avoid additional impacts. Proper contingency planning requires foresight, which is lacking in the SDEIS.	PD01, PD22
5714	The water quality model also demonstrates how heavily the SDEIS predictions rely on the engineered solutions of liner systems for the wasterock stockpiles, slurry walls and pumps around the Category 1 wasterock stockpile and tailings basin, and wastewater treatment of millions of gallons of water per day. It demonstrates, therefore, the need for the SDEIS to consider the possibility that these systems will fail or will not perform as expected, resulting in a scenario that has not been considered by the water quality model or any other part of the SDEIS	WR021, WR127, WR128, WR144, WR202
5715	the Co-Lead Agencies did not require PolyMet to consider the stochastic modeling capabilities of MODFLOW and MT3DMS (the transport module available for use with MODFLOW). PolyMet never compared any of these qualities to the most widely used publicly available model, MODFLOW. Nor does PolyMet provide any support for its statement that GoldSim is “widely used in the industry.”	WR193
5716	The Co-Lead Agencies have not demonstrated why a publicly available model, such as MODFLOW, which was used in the initial DEIS in 2009, is not adequate and more accepted to characterize the water quality and quantity at the PolyMet site. Dr. Myers ... found it not only adequate to the task, but superior in some ways because GoldSim required oversimplification in other areas, such as dispersivity (Myers Water Quality Review p. 11), the length of time steps (Myers Water Quality Review p. 11), and use of a one-dimensional flowpath (Myers Water Quality Review p. 24). Use of a publicly available model, such as MODFLOW, rather than a proprietary one, would have made review and analysis of the PolyMet model far easier for the public.	WR193

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5717	The calculated conductivity for both surficial aquifers and the bedrock is too low. The GoldSim model ignores the uncertainty in their conductivity parameters related to scale. ... PolyMet also assigned a K value based on a geometric mean that was much too low.	WR167, WR168
5718	The model assumes that the Peter Mitchell Pit is dewatering, but this is not a natural background condition. If the discharge does not continue, it may significantly change the predictions of the model. PolyMet should model a scenario without continued discharge from the Peter Mitchell Pit.	WR024
5720	The baseflow in the Partridge River is calculated incorrectly, and may be too low. The baseflow used by PolyMet in its model does not consider the variability in annual 30-day low flows, does not accurately consider the impacts of the Peter Mitchell Pit dewatering, and does not consider mine dewatering impacts on the river's baseflow.	WR003
5722	The calculated recharge rate for the entire watershed is too low. Recharge is a significant input that drives the results of the model. When calculating recharge, PolyMet used the 30-day low flow in the watershed, but the 30-day low flow in this watershed took place at a time when most water is frozen, and groundwater is depleted (Myers Water Quality Review p. 5-6). The recharge therefore does not consider recharge for the entire watershed. Dr. Myers conducted his own estimate of the recharge and found that the recharge rate is three to five times too low.	WR052, WR062, WR091
5723	The model does not consider pathways north to Yelp Creek. The groundwater contours show a divide under the proposed location of the Category 1 stockpile, suggesting that some water from this site could travel north, yet the PolyMet model does not address this possibility	WR081, WR089, WR167
5724	The PolyMet model assumes constant thickness in the surficial aquifer, while the thickness is in fact not constant. (Myers Water Quality Review p. 9). The PolyMet model also assumes constant conductivity (k) along flowpaths, which is not realistic.	WR023, WR058, WR167
5725	Dispersivity is unrealistic, with lateral dispersion greater than longitudinal dispersion, when in reality lateral and vertical dispersion are a fraction of longitudinal dispersion. This results in greater dilution of contaminants along the pathway to surface water that may be unrealistic.	WR058, WR061, WR062, WR167
5727	The model assumes that seepage that enters the wasterock stockpiles is not stored but travels through immediately. However, in reality it could be stored, resulting in larger discharges of contaminated water in some years.	WR173
5728	PolyMet's model assumes that bedrock is impervious. This is not only incorrect based on the actual pump test results (Myers Water Quality Review, p. 3), but it leads to inaccurate results. For instance, pumping into the West Pit may increase loads to groundwater through the bedrock, but PolyMet's model would not reflect it because it allows almost no discharge until the level of the water rises above the bedrock into the surficial aquifer, which is not correct	WR087
5730	PolyMet's mine plan results in over 50,000 tons of sulfate added to the East Pit by the time mining operations have ceased, most of it between years 10 and 20. Yet, the modeling shows that almost none of it ever leaves the East Pit. In fact, PolyMet's model limits the concentration of sulfate in the East Pit water at 2600 mg/l based on its "concentration caps," discussed further in Section 10 of MCEA's comments. In reality, the sulfate concentrations could be much higher. (Miller, p. 2-3). PolyMet's water model assumes that the pH of the East Pit porewater can be effectively controlled, but PolyMet fails to demonstrate this.	WR029, WR033
5731	PolyMet's model has extremely high sorption values for Cu, As, Sb and Ni that may not be justified. This is another example of a large load of constituents that does not travel to surface waters, according to PolyMet, but simply remains in the East and West Pits. However, sorption is highly depending upon other factors, such as pH, contact time, or surface area of particles. (Maest, p. 26) If the sorption factor is not correct, Cu and other constituents may reach the river in concentrations and loads much higher than predicted.	WR167

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5733	The strategy of using a Monte Carlo simulation is designed to test a range of scenarios. But the Monte Carlo simulation only works if the conceptual model is correct and the inputs represent a reasonable range. ...The limitations of PolyMet's model are significant, and cannot be corrected merely by applying the Monte Carlo approach to account for a range of inputs. The entire model must be reconsidered and rerun to address these concerns.	WR189
5734	The SDEIS does not adequately describe, let alone support, PolyMet's plan to pump and treat pore water from the backfilled East Pit during reclamation. ... Neither the SDEIS nor the reference documents make any effort to establish whether it is realistic or feasible to pump at such a high rate. Nor do they include description of significant details of this proposal, such as how PolyMet plans to return water to the East Pit to maintain saturation.	WR171, WR173
5735	First, it may not be possible to pump water at that rate from a backfilled pit due to conductivity of the pit and surrounding bedrock. ... The SDEIS must contain an analysis of whether it is even possible to pump water at that rate from the East Pit when backfilled.	WR088
5736	The entire purpose of the East Pit backfill is to achieve subaqueous disposal of the most reactive rock (Category 2, 3 and 4). When water is removed at that rate, however, the contents of the pit may not remain saturated. ... water that is added back into a backfilled pit will choose preferential flowpaths and some areas may remain unsaturated.	WR088
5737	the East Pit may not remain a sink during this time due to the pumping. Dr. Myers's model shows that loads may reach the river from the East Pit over time, even during pumping. ...MCEA experts have not identified any instance where rinsing of a pit was successfully achieved in the manner in which PolyMet proposes. (Miller p. 8). While it may reduce pollutants over time, it is highly unlikely that PolyMet will be able to achieve its goal of bringing the concentration of sulfate in the East Pit down to 250 mg/l. (Miller p. 8).	WR171, WR173
5738	The SDEIS should (1) provide evidence that pumping the East Pit is feasible; (2) take the pumping into account in its modeling to determine whether the East Pit may be discharging groundwater during pumping; (3) provide evidence, either through examples or modeling, that the rock in the East Pit can remain saturated; and (4) consider the possibility that it will not remain saturated, and make plans for addressing impacts to groundwater that would result, as well as, considering the likelihood that pumping and treating the water for a much longer period of time.	WR023, WR088, WR171
5739	Dr. Myers ... three methods yielded different results, but the three estimates confirmed that PolyMet's estimate is much too low. (Myers Groundwater Model p. 1-16). Dr. Myers concluded that the baseflow method was most accurate, but used a different approach to account for the errors in PolyMet's model	WR003, WR165
5740	For sulfate, Dr. Myers' model shows that contaminated water from the pit starts moving north toward Yelp Creek, a tributary of the Partridge River, between Years 11 and 14. (Myers Groundwater Model, p. 3-30). By Year 20, the sulfate concentration in that branch of the river may exceed 30 mg/l. (Myers Part 3, p. 3-32). On the south side of the mine site, sulfate levels are likely to exceed the water quality standard for sulfate between years 50 and 80. (Myers Groundwater Model, p. 3-34, 3-35. Concentrations at the Partridge River may be as high as 80 mg/l by Year 100.	WR089, WR167, WR171
5741	For copper, Dr. Myers's model shows that it advances more slowly than sulfate but still ultimately reaches the Partridge River before the modeling run is complete. By year 133, water quality standards for copper, which is toxic to aquatic life, will be exceeded over a significant stretch of the Partridge River south of the mine site. ...Thus, Dr. Myers' model demonstrates that over time, water quality impacts are likely even if PolyMet's engineered solutions do perform perfectly. As Dr. Myers points out, if the seepage rates from the stockpiles and other features are higher than those estimated by PolyMet, the concentrations of pollutants that reach surface water are likely to be higher, and reach surface water faster. Myers Part 3, p. 3-44....	WR171

5742	Dr. Myers’s work at the plant site demonstrates that (1) even small defects in the slurry wall may make a significant difference; and (2) the water quality model may underestimate the volume and concentration of pollutants traveling to the Embarrass River due to its over-simplified	WR019, WR189
5743	PolyMet’s Water Modeling Uses A High Sorption Factor That Strongly Influences The Outcome Of Its Model And May Not Be Justified. PolyMet’s water quality model concludes, rather surprising, that building a copper mine on the Partridge River will lower copper concentrations in the river. ...Although some adsorption may occur, it may not be a significant factor if the water travels along a bedrock flow path or a preferential flow path in sedimentary or unconsolidated material. ...A conservative approach would be to run the model without adsorption along flowpaths.	WR010, WR011, WR012, WR014, WR058, WR071, WR087, WR090, WR099, WR167, WR168, WR169, WR179
5744	The SDEIS Likely Underestimates Impacts On Wild Rice. Recent studies completed by Drs. John Pastor and Amy Myrbo at the University of Minnesota-Duluth confirm that wild rice is unlikely to thrive at concentrations above 10 mg/l. As shown above, the SDEIS, which relies upon PolyMet’s water quality model, likely underestimates the sulfate concentrations in nearby surface waters	WR064, WR124, WR149, WR152, WR160, WR162, WR177
5745	In order to ensure that wild rice is protected in the immediate receiving waters and downstream, the SDEIS must assume that all waters surrounding the PolyMet site are wild rice waters. ...First, they [recommendations from MPCA] are based on limited information. For instance, the upper Partridge was not identified as a water used for production of wild rice based solely on aerial photos. Other designations were based on surveys performed by the company. Additional information may come to light about the presence of wild rice in the waters around the PolyMet site prior to permitting. ...Second, they are based on information collected over a limited time period. ... Simply because wild rice was not present in the one, two or three years surveyed does not mean that these are not wild rice waters, as defined by the regulation. ... Third, the definition of “waters used for the production of wild rice” is under review at MPCA. ... Even if the rule-making process is not complete at the time that this project would be permitted, it would be complete shortly thereafter and would be applicable to all waters, including the receiving waters around the PolyMet site. Thus, the SDEIS should not rely on a preliminary draft recommendation from MPCA based on incomplete knowledge. ...The SDEIS must, therefore, assume that all waters around the PolyMet site are wild rice waters.	WR152, WR154
5750	It [water model] generally assumes that there is an impermeable barrier between the surficial aquifer and the bedrock. This assumption is likely inaccurate, and may result in significant inaccuracies in the conclusions of the water model. Water may flow through the bedrock, despite the SDEIS conclusion that gouges are filled, which is based on a literature review and not an adequate fracture analysis. There may also be fracture connections between the pit and the Biwabik Formation,... The water quality model should be reworked to include the possibility of bedrock permeability and fractures.	WR010, WR011, WR012, WR014, WR071, WR087, WR090, WR099, WR168, WR169, WR179
5751	PolyMet does not have sufficient information to conclude that saline water will not be drawn into the mine site. ... PolyMet should establish a series of deep groundwater monitoring wells below the pit bottom. These wells should include continuous electrical conductivity monitoring to detect salinity changes.	WR071, WR078
5752	The PolyMet Site Would Need Far More Monitoring In Order To Implement Proposed Adaptive Water Management Strategies. While the SDEIS lacks contingency planning, as discussed in Section 6, it does include what it called adaptive management strategies. ... However, this strategy for adaptive management only works with a robust monitoring system.	WR130, WR139

5753	MCEA’s primary concern here is that the SDEIS and supporting documentation provide scant detail on the design and implementation of this containment system, yet relies heavily upon the success of this containment system in its water modeling. In order to PolyMet to conclude in its water model that this system will capture between 93 and 99 percent of groundwater, PolyMet must commit to design specifications to ensure that it matches the assumptions of the model. Yet the SDEIS fails to commit to soil materials that be effective (Malusis Comment 1, 3), is unclear about whether a liner will be used (Malusis Comment 2), fails to commit to the level of hydraulic conductivity necessary for such a barrier to be effective (Malusis Comment 4), and does not specify whether the cutoff wall will be keyed into the bedrock, a necessary condition to prevent underseepage	WR017, WR093, WR133
5754	In addition, the Category 1 Cover slope of merely 1.0% may permit ponding and do not meet the industry standard of 2-5% slope to promote runoff and minimize ponding	PD15
5755	The SDEIS Lacks Sufficient Detail On The Tailings Basin Groundwater Containment System. ... as with the Category 1 stockpile containment system, the SDEIS fails to commit to maintaining a particular magnitude of inward gradient or head difference across the wall, or establishing a minimum depth of the key into underlying bedrock (Malusis Comment 8). Nor does the schematic suggest any key at all. These are critical design elements that the SDEIS should specify.	WR021
5756	If the bedrock is more fractured than assumed, the bedrock may have higher conductivity and slurry wall may capture less of the seepage. The SDEIS should consider this possibility.	WR019
5757	While the PolyMet 2013f (Water Management Plan – Plant) states that open trenching may be used where “subsurface obstructions” are encountered, it is nevertheless very difficult to ensure uniform conductivity , and obstructions that don’t disrupt the construction process may nevertheless disrupt the conductivity and uniformity of the slurry wall material. Second, such a method does not appear to involve any key into underlying bedrock, which means that the cutoff wall will not prevent underseepage.The in situ method would only involve digging down to bedrock, not keying into bedrock.	PD07, WR019
5758	the SDEIS and supporting documentation lack details necessary to ensure that the bentonite-amended barriers will operate as designed. In particular, it is unlikely that PolyMet proposes to add enough bentonite to create a uniform barrier. (Malusis Comment 12). In addition, it is unclear that the bentonite layers can stay saturated over time as required to remain effective. ... In addition, these appear to be novel strategies for limiting oxidation at a tailings basin. (Malusis Comment 16). The SDEIS should discuss whether these strategies have been deployed elsewhere, and whether PolyMet or DNR has information about the success of other efforts.	PD07
5759	The materials contained within the HRF may be among the most dangerous on the site. Yet the discussion of potential environmental impacts from the HRF earns four sentences in the SDEIS, culminating with this dismissive statement: ... The SDEIS and supporting materials do not sufficiently address settling and consolidation of materials under the HRF ... PolyMet should commit to rigorous construction quality assurance procedures to increase the likelihood that its optimistic assumptions are put into practice	PD19

5760	Even though these liners are temporary, rather than permanent, it is extremely important that they function as proposed. ... as with other structures, the SDEIS makes highly optimistic assumptions about the performance of these liners. PolyMet should commit to rigorous construction quality assurance procedures, or PolyMet's assumptions about the very low leakage rate may vastly underestimate true leakage through these [stockpile] liners ... In addition, these liners are placed on soil, and waste rock is placed on top. Waste rock is irregular in shape and may easily puncture the liner. The SDEIS should describe procedures that will place restrictions on the waste rock to decrease the chances of defects in the liner after it is laid down ... Finally, the recommended hydraulic conductivity of 10-6 should be prescribed for both the Category 4 and Category 2/3 liner. There is no justification for a higher conductivity around the Category 2/3 stockpile	GT10
5761	Therefore, it is insufficient for the SDEIS to describe merely how these systems will perform at installation, and assume that this will remain true for the decades or centuries following closure. Rather, the SDEIS must analyze the longevity of these installations, as well as the maintenance required to achieve that longevity. ... Therefore, the SDEIS should provide both the expected longevity of all systems described herein ... as well as the maintenance activities required to achieve that longevity. Finally, the SDEIS should address the environmental impacts that may arise if these systems do not perform as predicted.	PD22
5762	While reverse osmosis (RO) treatment has been successfully implemented in many locations, ... this system must be closely monitored for potential problems due to scale and longevity.	WR143
5763	Dr. Miller points out that the Category 1 Stockpile will likely generate and release sulfates and potentially sulfuric acid for timeframes well beyond our limited experience. ... The SDEIS should acknowledge that treatment will most likely be required for long after the 200-500 year time frame described in the SDEIS.	WR035
5764	The SDEIS must provide a solid basis for its assumption that these sulfate concentrations are achievable without RO, such as a pilot project or successful operations at another facility. The SDEIS should consider the possibility that sulfate concentrations could be quite high in the influent, up to 2000-3000 mg/l.	WR023, WR137, WR143, WR147
5765	West Pit Lake water quality may be much worse than predicted. The SDEIS must consider this possibility in its analysis. ... If sulfate levels are much higher than predicted, the result will be that treatment will be required for much longer than predicted. Groundwater discharge could also be considerably more contaminated.	WR035, WR038, WR173
5766	The SDEIS should analyze the experience of RO at the Eagle Mine, and determine whether there are lessons to be learned from that could improve the wastewater treatment strategy for the NorthMet project. ...The SDEIS should (1) analyze the problems at the Eagle Mine to determine whether there are lessons to be learned from its experience; and (2) take into account the possibility that the WWTP will not meet water quality targets for unforeseen reasons.	WR023, WR143
5767	PolyMet has not taken a sufficient number of samples to adequately characterize the wasterock (Maest, p. 10). PolyMet also performed almost no acid-based accounting (ABA) analyses, which would provide additional information about whether the rock samples are acid-forming.	WR025
5768	PolyMet only modeled average conditions, but its model does not consider scenarios in which the concentrations of pollution leaching from the mine features are significantly higher than the average.	WR026, WR060, WR126

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5769	PolyMet has taken a convoluted and confusing approach to its geochemistry calculations... PolyMet must (1) provide a complete explanation for its approach, for instance by choosing a constituent and explaining their entire process for calculating geochemistry inputs; and (2) provide a justification for its convoluted and seemingly inconsistent approach. ...MCEA recommends that the entire geochemistry approach be re-examined and more fully explained before the FEIS.	WR025
5770	The fault lies squarely with the Co-Lead Agencies, who should have included all geochemistry data with the SDEIS and reference documents. MCEA should not have been forced to make multiple requests to obtain multiple datasets that may, or may not, constitute the entire universe of relevant data. The Co-Lead Agencies' approach was not transparent, as is required by federal law.	NEPA07
5771	In response to MCEA's request for additional time to evaluate the geochemistry data, some of which was not received until less than 10 days from the comment deadline, the Co-Lead-Agency heads responded that the 90 comment period already reflects their "recognition that the SDEIS is a complex document," but that the "comment period is not designed to provide for extensive independent analyses of the project's technical documents in addition to the SDEIS." ...The Co-Agencies' characterization of the purpose of the comment period is not correct, and its denial of extra time, which would have cost the Co-Lead Agencies little or nothing, was not justified. ...The notion that the comment period is for review of the SDEIS alone, and that the technical documents referenced in the SDEIS are not part of that review, is absurd. The SDEIS and the citations upon which it relies are inseparable. ...MCEA should not have had to spend six weeks of the comment period requesting that data, which was omitted from the SDEIS documents and instead relegated to obscure footnotes and stored in an incomplete and hard-to-use fashion.	NEPA07
5772	First, the number of samples in the waste characterization program is inadequate for the volume of wastes predicted to result from mining. (Maest, p. 10). Dr. Maest reports that this among the fewest samples she has seen among approximately 200 mining EISs, and does not conform with the recommendations of the GARD Guide.	WR025
5773	Second, assumptions about lack of acid generation or delay in acid generation and lack of substantially metal/contaminant leaching are poorly substantiated and conflict with actual results.No traditional acid-based accounting (ABA) analyses was conducted, and almost all ABA results may well have shown that all samples were potentially acid-generating. ... As a result, the SDEIS cannot rule out the possibility that all wastes, including Category 1 wasterock, may be acid-generating, even within the 20 years of the mining operation.	WR025
5774	Third, the SDEIS does not address the collection and treatment of dewatering around the pits during mining. ... PolyMet's wastewater treatment strategy does not appear to treat the process water for nitrate and ammonium.The SDEIS should consider the possibility that dewatering will need to take place, adding water to the total to be treated. It should also consider the possibility that ammonium and nitrate will be present, and will need to be removed from the process water.	WR013
5775	Fourth, releases from the Category 1 stockpile would likely be more polluted than predicted because PolyMet will not be able to sort the wasterock by category without error.	WR134, WR173
5776	Fifth, the modeling approach ignores the results of field and lab tests. PolyMet ignores circumstances that could result in acidic conditions and/or significant metals leaching from the mine features and stockpiles by eliminating test results with pH values below 6 from consideration	WR025
5777	Sixth, PolyMet negates the advantage of the Monte Carlo approach by using a high adsorption factor that prevents contaminants from moving along flowpaths.	WR167
5778	the SDEIS may have overestimated the time before the onset of acidic conditions in the Category 2/3 and 4 wasterock stockpiles, and ore.	WR071

5779	The SDEIS Should Consider Other Forms Of Construction Than Upstream Construction, Which Poses The Highest Risk For Seismic And Static Failure Of Tailings Dams.PolyMet likely chose this this method because it is the least-expensive dam construction approach. But it is susceptible to failure during earthquakes. PolyMet should consider other methods of dam construction. (	GT01
5780	Dr. Chambers suggests several ways in which the geotechnical analysis could be improved, including:(1) Use of a Maximum Credible Earthquake scenario, as opposed to a 2,475-year return seismic event;(2) An overly generous assumption about the mean distance to the nearfield earthquake;(3) The lack of dynamic modeling in the evaluation of dam stability. (Chambers p. 14-15).Similarly, the hydrometallurgical residue facility (HRF) should be placed on compacted fill, rather than original soil and taconite waste.	GT05
5781	the SDEIS fails to address the safe transport and disposal of the materials recovered from the process/contact water at the site as part of the wastewater treatment process. ... Thus, at a minimum, for the first few years of operation and all of reclamation in to the “long term,” the filtered sludge will need to go “offsite.” The AWMP also states that the residual solids from the WWTF will be sent to “offsite disposal” during the “long term.” ...The transportation and disposal of these waste streams is a direct effect of the proposed action and must be analyzed in the SDEIS.	WR145
5782	None of these waste streams – the filtered sludge from the WWTF, the residual solids from the WWTF, the residual solids from the WWTP, or the pore water from the HRF – receive any attention in the SDEIS or the reference documents. ... The SDEIS should provide a profile of these [WWTF, WWTP, HRF] waste streams – what constituents they contain, in what concentrations, and the dangers those constituents pose to the environment or human health.	WR068, WR145, WR146
5783	Both transportation and disposal involve risks that must be analyzed in the SDEIS... Disposal risks include ground and surface water contamination from a landfill or treatment facility. The risks would depend, in part, on the location of the facility, which is why the SDEIS should identify potential options with specificity....there remains the possibility that there is no facility in the state that would accept this [waste] material. If that is the case, PolyMet would be forced to come up with other options that may significantly increase costs, not mention increased environmental and human health risks if the other options involve longer shipping times, for instance.	WR145
5784	The SDEIS fails to examine risks associated with shipping the reject concentrate from the WWTP to the WWTF via “rail tank car.”...There is no analysis of the contaminants in the reject concentrate, spills that would occur inevitably as a result of transferring the material to and from the rail tank car, more catastrophic spills that could occur accidentally, or the impacts of those spills on human health, groundwater, surface water, vegetation, or other natural resources. These are direct effects of the proposed action and must be included in the SDEIS.	HAZ01, WR145
5785	The SDEIS must analyze the “fate” of each of these chemicals [in Table 5.2.13-1] – how they are used, and when and how they leave the site, if they do, in what volumes or concentrations, and the risks they may pose.	HAZ01
5786	nowhere in the entire Environmental Consequences chapter are the environmental consequences of the loss of wetlands that may be aquatic resources of national importance (or any quality of wetlands) described. This is a significant omission.	WET19
5787	the SDEIS contains no discussion on the significance of the loss of wetland functions and acres. This determination should be based both the context and intensity of the impact to wetlands.	WET07

5788	Use of a conceptual ecological model is a well-accepted, scientifically defensible method that can also be used to develop a long-term monitoring program to assess indirect impacts to wetlands. ... This type of analysis, supported by the research already completed on the potential direct and indirect wetland impacts and new, more detailed analysis would improve the usefulness of the information presented in the SDEIS and would be consistent with the requirements of both NEPA and MEPA. Documenting the environmental effects in both a graphic and narrative format, methods central to conceptual ecological model, would improve the communication of the science and analysis and would ensure that readers are aware of the "issues that are truly significant to the actions in question." As the SDEIS is written now, it would be impossible for a member of the public to review the document and receive an answer to the question: what are the environmental effects of the loss of 900 acres of wetlands to the St. Louis River watershed?	WET02, WET03
5789	If the Co-Lead-Agencies are relying on mitigation to reduce the environmental consequences of the permanent loss of wetlands, it is not clear in the SDEIS how that proposed mitigation sites would replace loss of wetland acreage and function within the St. Louis River watershed (especially considering the majority of the replacement would occur outside the watershed). Unless it is clear what functional losses at the NorthMet site and to the greater St. Louis River watershed... Simply put, without knowing the impacts to the affected environment resulting from the direct loss of over 900 acres of wetlands and the indirect loss of thousands of acres of wetlands, no one can ensure the proposed replacement will mitigate the effects.	WET01, WET03
5790	Of the three wetland mitigation site proposed by PolyMet, two are located out of the project's watershed and would fail to provide in-watershed ecosystem functions such as terrestrial and aquatic habitat, water quality and water storage.	WET03
5791	A total of 56% (509.1 acres) of the proposed direct wetland impacts would occur to coniferous bog wetlands, yet no in-kind mitigation for the loss of these unique wetland plant communities is proposed.	WET05
5795	If the primary target for the Zim site is a forested wetland community, the statement that "[t]he majority of the credits would be in-kind mitigation and nearly one-half of the credits would be from within the NorthMet Project area" is false. This information must be corrected in the SDEIS and it should be clear to the public that the target wetland plant community at the Zim site is not coniferous bog but forested wetland. ... If bog wetland restoration is determined to be impracticable at the Zim site, the SDEIS should clearly state that the coniferous bog wetland impacts at the NorthMet site would NOT be replaced in kind, and the replacement ratio should be adjusted accordingly.	WET04
5798	MCEA requests that the replacement ratio for the mitigation of the loss of high quality wetlands, and difficult to replace forested and bog wetland plant communities be set at a minimum of 2:1 (and not reduced below 2:1) to account for the high potential for temporal and functional loss of those difficult to replace wetland plant communities that are high functioning wetland plant communities.	WET04
5799	MCEA asks the Lead Agencies to require PolyMet to continue to investigate in-watershed mitigation options for mitigation opportunities that would almost certainly be needed to mitigate for the loss of wetland functions that are likely to occur as a result of indirect effects to wetlands.	WET03
5800	Since no wetland bank is being developed by PolyMet, no "excess wetland mitigation credits" would be available. Permittee responsible mitigation sites do not generate credits. The sites serve only to produce the compensatory mitigation required by a condition of a permit or wetland replacement plan.	WET04
5802	In-watershed wetland mitigation opportunities for the indirect wetland effects should be identified and proposed in the final EIS. If additional large scale mitigation sites cannot be located for the mitigation of the direct effects of the potential NorthMet project, additional actions such as wildlife corridor preservation and water quality projects within the St. Louis River watershed should be considered to off-set the adverse and significant loss of in-watershed wetland functions.	WET01, WET03

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5804	Based on PolyMet’s unknown success with rehabilitating bog and forested wetland a community (or any type of permittee responsible mitigation) necessitates the need for long-term financial assurance to provide a level of certainty that wetland mitigation will be provided and accomplished as proposed in their wetland mitigation plans. The requirement for financial assurance would be consistent with both state and federal rules.	FIN11
5805	In order to ensure that enough funds are available to improve an unsuccessful wetland mitigation project, Co-Lead-Agencies should require a financial assurance that covers remediation costs at the three identified wetland mitigation sites and any additional sites that are added, including: costs for surveys; project re-design and engineering, site construction and planting, monitoring and maintenance, remedial work and other contingencies (e.g. extreme weather or berm failure), and legal and administrative tasks. This amount should be based on submitted bids by contractors and consultants capable of doing the above tasks and include an adjustment for inflation and increasing costs. ... Another alternative for costing a financial assurance would be to use credit prices charged by mitigation banks for similar types of compensation in the same watershed, including an adjustment for inflation. The DNR and Corps should ensure that the money remains set aside during the time that the project may be determined unsuccessful. To do this, the bulk of the funds should only be released after all wetland mitigation performance milestones are met.	FIN05, FIN08, FIN11
5807	MCEA believes that many of the bog wetlands may have been misclassified. The DNR Field Guide to the Native Plant Communities of Northeastern Minnesota, which is used by DNR biological survey staff to classify wetlands in northeastern Minnesota, separates bogs from fens by the absence of fen indicator species. Further, scientific literature distinguishes ombrotrophic bogs from minerotrophic fens on the presence or absence of fen indicator species and different ranges in surface water chemistry. Neither of these well accepted and in one case, agency developed, approaches were used to distinguish between ombrotrophic and minerotrophic bogs. MCEA requests that the bog wetlands within the affect environment be re-evaluated using the methods identified in the report “Supplemental Draft Environmental Impact Statement March 2014 Report on wetland components of the EIS” submitted by Paul Glaser...MCEA also requests that if this re-evaluation results in changes in the classification of bogs, the indirect effects analysis be rerun.	WET09
5809	The SDEIS should use the same classification method used by the County Biological Survey scientists and peer reviewed indicators of ombrotrophic bogs in classifying wetland plant communities. Our concerns and recommendations on this topic are addressed in the attached “Supplemental Draft Environmental Impact Statement March 2014 Report on wetland components of the EIS” by Paul Glaser,	WET21
5810	The site specific wetland plant community data collected is very minimal.... Since very little baseline hydrology and vegetation monitoring has occurred, future indirect wetland impacts to misidentified bogs would go unnoticed and unmitigated. ...Relying on a two-day site visit of the bog wetlands and on the data collected in to support wetland delineation will not provide the detail needed to track changes in site-specific wetland plant communities and hydrology. Lack of vegetative plot data across the areas where indirect wetland impacts are possible make it impossible to scientifically track changes in the plant communities. Reliance on wetland vegetation data collected for the purposes of a wetland delineation is a unreliable and non-repeatable method for detecting indirect effects to wetlands. The susceptibility of correctly identified ombrotrophic bogs to indirect impacts is also underrepresented and failure to monitor these sites for indirect effects, if the project is permitted, would likely result in significant unidentified and unmitigated impacts to high quality wetlands.	WET09

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5814	A comprehensive monitoring plan for all the wetlands within the affected environment should also be developed. ...Since many of the conclusions made in the SDEIS regarding indirect wetland impacts were made without comprehensive site specific data, PolyMet should be required to monitor all wetlands, including ombrotrophic bogs, for changes in hydrology and wetland plant diversity, assemblage and peat depth. This should be done using a scientifically accepted and easily repeatable method such as relevé plots or randomized grid of sample points. No monitoring of ombrotrophic wetlands is proposed. This is a significant oversight. ... MCEA agrees that if the NorthMet project is permitted, monitoring of hydrology, water chemistry and vegetation would be the best method for documenting change. However, identifying change without sufficient baseline data or comprehensive monitoring data is impossible.	WET02, WET22
5816	The SDEIS points to the Section 404 permit application for detail on how indirect wetland impacts would be determined and when mitigation would occur, yet the information in the 404 permit application is extremely limited and does not provide assurance that significant impacts to wetlands will be mitigated in a timely manner.	COE02
5818	the indirect monitoring plan should require vegetation plot observations every other growing season by a botanist with experience in identifying peatland plants. Reporting to a regulatory agency should also be required within four months of the observed change, to allow for timely mitigative actions (adaptive management or wetland mitigation). All wetland mitigation should occur within 1 growing season of the observed change. Monitoring should continue for the life of the mine at all locations, even if indirect effects have been mitigated to ensure that the completed mitigation projects offset the eventual loss of wetland function and area. The results of this comprehensive long-term monitoring of indirect impacts should be shared with the public to allow for the development of improved datasets and information supporting indirect impact analyses at mine sites surrounded by wetland resources.	WET02, WET22
5820	The 404 permit application has an inadequately describes at what point regulatory agencies will determine that an indirect impact has occurred. ...how, once an indirect effect is observed at a monitoring point, will indirect impacts to wetlands beyond that monitoring point will be determined? If no baseline data exists on wetlands further out from the observed indirect exists, how would changes be observed and mitigation required?	COE02
5822	Second, only three reference wetlands are proposed for the seven distinct wetland plant communities that would be impacted as a result of the NorthMet project. ... It is not stated in the SDEIS, wetlands data package (PolyMet 2013q) or the 404 permit application what plant communities the reference wetlands are. ... Neither the SDEIS nor the 404 permit application provides an explanation why the reverence sites chosen would accurately represent the range of wetlands that may be indirectly impacted by the NorthMet project. In addition, two of the three reference wetlands will not have background or pre-project data to compare the post-project hydrologic monitoring against.... MCEA requests that additional reference sites be located.	COE02
5823	No mention on the potential loss of a specific quality or type of wetland is made and how that may affect the needed wetland mitigation. The SDEIS should clearly state what quality of wetlands may be affected by indirect effects and how observed loss of function or quality will be mitigated, taking into account that many of the wetlands susceptible to indirect impacts are difficult to replace wetland plant communities.	WET01, WET05

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5826	The SDEIS contains inadequate analysis of the cumulative effects of wetland loss. The outdated list of reasonably foreseeable projects does not account for projects which have been proposed, planned or permitted in the last four years. ... Further, no mining or road improvement projects that would impact wetlands were identified. Northshore Mining Company has proposed to impact wetlands south of their existing pit. This information can be found in their existing state Permit to Mine. Those wetland impacts have not been permitted and should be included in the cumulative impacts analysis. upgrades to roads not within the mine boundary would be necessary to accommodate additional traffic. Yet no projects have been identified in the cumulative impacts analysis, even though it is highly likely that St. Louis County and local road authorities have identified the need and extent of future road upgrades and realignments. MCEA believes that information on reasonably foreseeable projects should have been requested and or updated between the completion of the Draft EIS (DEIS) and the SDEIS. MECA requests that the cumulative effects analysis for wetlands be updated to address those projects which may have been developed since the completion of the DEIS.	WET18
5828	<font color="#1F497D">The SDEIS fails to take a hard look at the potential socioeconomic consequences of the NorthMet Project by focusing exclusively on the beneficial effects of the Project by focusing on jobs and tax revenue. Because the SDEIS fails to recognize potentially significant negative impacts on socioeconomics from the Project beyond a potential housing shortage, the SDEIS does not identify any mitigation measures which would address potential negative socioeconomic impacts from the Project. The failure of the SDEIS to analyze the potential negative socioeconomic impacts associated with the Project is a serious shortcoming of the SDEIS.</font>	SO04
5831	the SDEIS fails to recognize the socioeconomic risks associated with the impact on other employment sectors as a result of the environmental degradation and destruction accompanying the Project. Specifically, the NorthMet project and the reasonably foreseeable development of additional sulfide mines in the region creates a significant risk to sustainable economies in Northeast Minnesota that rely on wilderness, recreational and access to unspoiled public lands. In addition, the lifestyle and economies of tribal communities, from wild rice harvesting and reliance on other cultural and natural resources, are also threatened as a result of the NorthMet Project and reasonably foreseeable sulfide mining activity in the region.	SO04
5834	The SDEIS also fails to recognize the socioeconomic benefit associated with tourism from maintaining wildlife habitat and wildlife corridors, which ensure that populations of endangered species are maintained or increased. ... While many of these jobs may not be directly affected by mining operations, the SDEIS makes no effort to determine whether any of these jobs or associated revenue would be affected.	SO02
5841	the SDEIS for the Project cannot rely upon the operation of the RES to accomplish state policy on GHG emissions...the SDEIS fails to analyze a green power alternative under which the Project would run on low- or no-carbon electricity, thereby minimizing the Project's biggest single source of emissions. The SDEIS does discuss methods of increasing efficiency of vehicles and equipment on site, but none that address switching from coal to green power. Coal-fired electricity is the only form of generation that is mentioned. Consequently, the SDEIS ignores an opportunity to use widely available, existing technology to reduce or eliminate the biggest source of GHG emissions, simply by changing the way the power used by the Project is produced....The failure to analyze and discuss a wind energy option is unfortunate,...Moreover, even the assertion that the Project must use Minnesota Power is not entirely correct.	PD39
5843	The SDEIS must analyze, as an indirect impact, whether increased demand will change Minnesota Power's baseload, and prolong the life of one of its coal plants.	PD39

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5929	This analysis establishes that the increased copper smelting caused by the removal of copper ore at the PolyMet mine is a reasonably foreseeable impact that should be addressed in the SDEIS. ... Copper smelting is clearly certain to occur; for without it the copper precipitate is worthless as an industrial commodity....The smelting of PolyMet’s copper precipitate is therefore also an incremental impact, in that the smelting will continue to occur even if PolyMet’s mine is rejected, but the addition of their ore will cause an incremental increase in the amount of precipitate being smelted overall.	PD33
5930	the Co-Lead Agencies can and must refine this analysis by requiring PolyMet or Glencore to reveal known or likely locations where the copper precipitate from the PolyMet mine would be smelted.	PD33
5931	Although the SDEIS does not specify where the copper concentrates will go, the issue of adverse environmental effects from smelting the Polymet output is a matter of ‘how much,’ not ‘if.’ The environmental difference between two smelters, in other words, will be a matter of quantity, not quality....the environmental impacts of smelting are well-known and must be addressed in the SDEIS.	PD33
5932	The SDEIS must analyze potential air emission impacts from smelting. The type of smelting that would take place after Glencore takes possession of the ore concentrate produced at the NorthMet site is a significant source of air pollutants, including sulfur dioxide, particulate matter, mercury and dioxins....These emissions have a significant social, economic, and environmental cost.	AIR10
5933	The SDEIS must analyze the impacts of water and soil contamination from copper smelting...Wastewater from the smelting process typically contains toxic metal compounds, oil and organic material. ... There is also considerable evidence that leaching from the slag waste piles at smelting facilities may “extract and concentrate soluble radioactive materials” that can then be introduced into drinking water supplies.	WR055
5934	the SDEIS should nevertheless analyze the potential impacts of additional transportation of the copper and nickel concentrates to smelters. ... The SDEIS should address potential transportation modes (rail, truck, freighter) as well as potential routes over land and water....At a minimum, where information about a potential environmental impact is incomplete and cannot be obtained, the RGU must include, by law, the following information in the EIS: A. A statement that the information is incomplete or unavailable and a brief explanation of why it is lacking; B. An explanation of the relevance of the lacking information to evaluation of potentially significant environmental impacts and their mitigation and to a reasoned choice among alternatives; C. A brief summary of existing credible scientific evidence that is relevant to evaluating the potential significant environmental impacts; and D. The RGU’s evaluation of such impacts from the project and its alternatives based upon theoretical approaches or research methods generally accepted in the scientific community.	PD33, PD37
5935	the project is proposed to impact over 8,000 acres of designated critical habitat for the Canada lynx, habitat that contains features essential to the conservation of a threatened species. In spite of these facts, the SDEIS does not accurately disclose the potential effects to the Canada lynx and the significance of those effects to the survival of the species.	WI01, WI02
5936	Using the 2009 Minnesota population estimate of 200 Canada lynx, 20 individual lynx located within 18 square miles of the project site equates to 10% of all the lynx in the state. This is a significant number of Canada lynx concentrated in an 18 square mile area and should not be considered “low.”	WI01
5937	the EIS should provide a table and map displaying the locations of known and reported lynx tracks, sightings, scat, dens and deaths (incidental or other) between 2000-2014 within a 58 square mile area (the home territory of a male lynx) of the NorthMet site. The data used should be collected from from multiple sources including: the Natural Resources Research Institute’s Canada lynx project, USFWS, USFS, National Park Service, DNR, PolyMet and Tribes.	WI01

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5938	the NorthMet project would generate 1,734.9 miles of vehicle traffic between the mine and plant sites daily. It is unclear how that information equates the number of vehicles and trains along the transportation corridor and the number of trips those modes of transportation would take. The type of vehicle also makes a difference in the likelihood of a driver seeing and avoiding a lynx on the roadway or tracks, yet the traffic information is presented in tons. It would make sense to also present traffic information as the projected numbers of passenger vehicles, fuel trucks, haul trucks, etc that would travel the transportation corridor daily. There is also no description if there are times of day that when traffic would be more concentrated.	WI01
5939	The SDEIS Does Not Provide Mitigation Commitments That Could Reduce Significant And Adverse Effects On Canada Lynx That Would Occur As A Result Of The NorthMet Project. Due to the size of mining trucks, it is doubtful they will see, or be able to stop in time if a lynx crosses the road in front of the truck. The SDEIS states "there is the potential for incidental take as a result of the of vehicle collisions with lynx," there yet there is no discussion in the on possible mitigative actions to avoid the harm, harassment or take of a lynx that could occur as a result of the NorthMet project. This is not consistent with the requirements of both NEPA and MEPA.... MCEA requests that the SDEIS more accurately disclose the potential environmental impacts to the Canada lynx that could occur as a result of the proposed NorthMet project, including "[m]eans to mitigate adverse environmental impacts....MCEA believes that actions that may mitigate the potential adverse impact to the lynx should be identified, thoroughly discussed and included in the NorthMet project's design	WI01
5940	In many instances, the information presented in the DBA differs from the information presented in the SDEIS. MCEA requests that these discrepancies be corrected and the potential effects to the Canada lynx should be accurately, clearly and thoroughly disclosed. At a bare minimum, the information presented in the SDEIS should not contradict information presented in a final BA or potentially, the final Biological Opinion prepared by the US Fish and Wildlife Service (USFWS).	WI01, WI11
5941	The draft BA states "... ENSR (2006) concluded that at least three lynx resided near the Mine Site." However, the SDEIS states that "...no lynx were identified during the ENSR 2006 surveys."	WI01, WI11
5942	the SDIES makes incorrect conclusions on the research completed by Dr. Ron Moen and Lauren Terwilliger at the Center for Water and the Environment at the University of Minnesota- Duluth. Although it is correct that lynx do not rely on roads for travel, lynx use of roads or proximity to roads is well documented.	WI01
5943	MCEA believes that the risk factors of lynx take discussed in the SDEIS should match the factors addressed in the DEA [should be DBA - Draft Biological Assessment] and that the analysis on the potential effects to the Canada lynx should summarize the same information that is presented in the DEA.	WI01, WI11
5944	MCEA requests that a new wildlife corridor study be completed to update the outdated 2006 or 2009 corridor studies. This re-evaluation the wildlife corridors should also address each corridors value and functionality and potential impacts in the foreseeable future (e.g. transportation projects or mining related expansions). Without this new analysis, the Co-Lead-Agencies would be relying on outdated data to determine the effects to Canada lynx and other species that rely on wildlife corridors to access habitat, prey, mates and refugia between features north and south of the Iron Range. These comments also apply to the "Wildlife Corridors" section of Chapter 6, Cumulative Effects which relied on out-of-date and incomplete reasonably foreseeable projects identification that has not been updated since 2009.	WI03

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5945	the SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation on Canada lynx. The outdated wildlife corridor analysis was the only source of reasonably foreseeable projects and did not account for planned transportation projects under the jurisdiction of the St. Louis County Highway Department, the Minnesota Department of Transportation, the Forest Service or cities within the scope of review....MCEA requests that the cumulative effects analysis for the Canada lynx and other wildlife species be updated to address those projects which have been proposed within the last five years. Sources of data MCEA would expect to be consulted include: state and federal agencies, Tribes, local government, counties, mining companies, local zoning and water plans, economic development plans and permitting records.	WI02, WI08
5946	PolyMet's Future Expansion Plans Are A Phased And Connected Action. PolyMet's plans for this site are not limited to the 20-year proposal included in the SDEIS....A financial report commissioned by PolyMet and based on information provided by PolyMet has predicted that PolyMet will submit permit applications for expansion within six months after permitting....DNR may not simply ignore this evidence merely because PolyMet's proposal to DNR is for a 20-year project. Perhaps PolyMet has assured the Co-Lead Agencies that they have no plans for expansion beyond a 20-year mine, but PolyMet appears to be telling its investors otherwise. It is an error for the agency to accept the project proposer's statements without independent evaluation.	PD30
5947	the SDEIS must evaluate whether the wetlands restoration projects, which are highly undeveloped at this time, will require 404 permits. If they do, they must be included in this SDEIS as connected actions.	COE10
5948	the SDEIS inexplicably provides a cumulative impact analysis for the NorthMet project (Ch. 6.2) and then separate cumulative impact analysis for the Land Exchange (Ch. 6.3). The segregation results in an inadequate cumulative impact analysis because it does not do what NEPA and MEPA require...The failure to look at the connected actions in one cumulative impact analysis is clearly contrary to the purpose of NEPA/MEPA's requirement for an assessment of the cumulative impact on resources.	CU15
5949	SDEIS must consider all other "actions" not just "projects." The SDEIS has to consider the direct and indirect effects of past, current, and reasonably foreseeable future actions in its cumulative impacts analysis...the SDEIS appears to limit its consideration of effects from other "actions" only to effects from "projects." Table 6.2-1 contains a list of projects. The SDEIS does not explain why it has been so limited.	CU07
5950	Other sulfide mining actions have been inappropriately excluded. The list of projects considered excludes all other activities related to sulfide mining, both those activities that are current and on-going and those that are reasonably foreseeable. The failure of the SDEIS to provide a thorough consideration of such activities is a major inadequacy.	CU02
5951	The cumulative impacts analysis makes no mention of direct and indirect effects from widespread exploration and prospecting activities across the relevant area. ... The direct and indirect effects of prospecting were evaluated in an EIS conducted by the Forest Service. At a minimum, the environmental effects identified in that EIS need to be incorporated into the SDEIS's cumulative impacts analysis. ... The State has also issued leases for sulfide mining exploration and prospecting. ... Clearly there are direct and indirect effects from the exploration resulting from DNR's lease sale and those effects must be evaluated as part of the cumulative effects for this SDEIS.	CU02
5952	Polymet's proposal is the first in what will be a long line of proposals to come, should it be permitted. The failure to address the precedent setting nature of this decision has led to an inadequate EIS. The impacts of multiple other proposals will have on Minnesota's natural resources are an indirect effect of the decision to allow Polymet's proposal to move forward. The Agencies have not explained why this indirect impact – one that is obvious to anyone engaged in this process – has been completely ignored.	CU04

<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
5953	In addition, the SDEIS identifies but then excludes from its analysis other sulfide mining projects that are reasonably foreseeable, including the Twin Metals project, and the Teck Mesaba project. Exclusion of these other projects makes the cumulative impacts analysis in the SDEIS inadequate....At a minimum the Agencies have not explained why such projects are not reasonably foreseeable. Even if specific project details are not yet available, sufficient information shows that the projects are reasonably foreseeable. Plans do not have to be so far along as to “constitute actual proposals” to conclude that a project under current consideration is a “reasonably foreseeable future action.”	CU02
5955	Foth Engineering, Barr Engineering, And Other PolyMet Consultants Must Execute A Disclosure Statement Specifying That They Have No Financial Or Other Interest In The Outcome Of The Project. These statements should be reproduced in the SDEIS or made readily available to the public....Reprinting statements from private consultants without verification is an abdication of the Co-Lead Agencies’ duties in any event.	NEPA18
5956	The Purpose and Need Statement does not reflect DNR’s statutory and regulatory responsibilities. ... MDNR’s Purpose and Need statement should include its statutory mandate to regulate mining operations and control adverse environmental effects. ... MDNR is tasked with promoting mineral extraction and exploration to diversify Minnesota’s mineral economy, not to fulfill global demand.	NEPA02
5957	MDNR [and USACE] provides no support for its proposed Purpose and Need Statement, lending support to the No Action Alternative...to show that the extraction is necessary, MDNR [and USACE] must, at a minimum, make a showing that such extraction is necessary. Nowhere does MDNR [and USACE] demonstrate that there is a domestic or global shortage of copper, nickel or other metals to be produced at this mine.	NEPA02
5958	An overly narrow Purpose and Need Statement does not meet the requirements of NEPA and MEPA...it is a violation of NEPA to define the agency’s purpose and need in unreasonably narrow terms. If the agency constricts the definition of the project’s purpose and thereby excludes what truly are reasonable alternatives, the EIS cannot fulfill its role. Nor can the agency satisfy the Act.	NEPA01
5959	Even within MDNR’s [and USACE’s] inappropriately narrow Purpose and Need, MDNR [and USACE] should have considered other more sustainable means of meeting that need. MDNR [and USACE] should have considered other alternative means of achieving the goal of meeting domestic and global demand. In particular, the SDEIS should consider whether (1) increased recycling of copper and other metals and (2) increased conservation efforts would also meet the need defined by the agency for this project.	NEPA01
5961	The SDEIS should analyze the human health impacts of decreased water quality in Colby Lake....The SDEIS states that as a result of the NorthMet project, increases in several contaminants would increase for Colby Lake. ... Arsenic is a carcinogen, and it may well be that increased arsenic exposure, even within the water quality standard, may have an impact on the health of residents of Hoyt Lakes. The same may be true of the other constituents that are predicted to increase in the water body. Any human health impacts must be put into context of the potential problems with the mine	HU01
5962	While the SDEIS occasionally mentions that there are human health concerns related to air emissions, it contains no rigorous, comprehensive analysis of human health impacts. Nor may the SDEIS ignore potential impacts to human health by relying on mitigation measures, as discussed in Section 6. A Health Impact Assessment or similar approach is required under NEPA and would greatly improve the analysis in the SDEIS.	HU01
7304	In the case of PolyMet, the criteria for achieving financial assurance and the instruments available are limited. We believe only one option, U.S. government Treasury securities held within a trust fund under the complete control of the MDNR, meets the objectives outlined in Minnesota’s Rules.	FIN08

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
7306	U.S. bonds carry less risk than any other security issued because the full faith and credit of the government stands behind these securities and, hence, the full taxing power of the U.S. No other security issued in the U.S. can make this same claim. No security issued by any bank or insurance company has the taxing authority of the U.S. government supporting its repayment. ... If the intent of Minnesota Rules (Chapter 6132) is to provide sufficient funds with minimal investment risk to meet PolyMet’s estimated closure and reclamation costs up to 200 years into the future, only U.S. government bonds will meet the definition of a risk-free investment. No other issuer will protect Minnesota taxpayers from PolyMet’s environmental risk.	FIN03, FIN08
7308	Banks and insurance companies do not meet the definition of risk-free and are inefficient from an economic perspective. The only remaining financial instrument option is a bankruptcy-proof trust dedicated to MDNR. It alone achieves four of the five criteria of the Minnesota Rules	FIN03, FIN08
7309	More independent technical analysis and confirmation of PolyMet’s assumptions must be done to determine this amount. Given PolyMet’s current estimate, satisfying financial assurance will require hundreds of millions of dollars. Several alternatives for meeting the requirements of financial assurance are outlined in Minnesota Rules. In this case, only U.S. government Treasury securities held within a bankruptcy-proof trust fund under the complete control of the MDNR meets the objectives outlined in Minnesota’s Rules and protects the Minnesota taxpayer. Only U.S. Treasury securities are risk-free and introducing unnecessary third-parties entails fees which makes the economics of the net investment rate of return inefficient and impractical.	FIN03, FIN05, FIN08
9363	this definition [of ore] is unclear. It seems to imply that all rock containing metals will be “economically extracted,” when in reality much of the waste rock contains metals as well, but in amounts too small to be considered economical by PolyMet. Thus, the definition provided above is clearer.	PD30
9364	While MDNR and PolyMet officials have attempted to disclaim this language [200/500 years] in later drafts, MCEA believes that this language in fact represented the zenith of clarity in describing the water model, while later attempts have fueled confusion and fallen short in helping the public understand precisely what the model’s purpose and results are. Indeed, PolyMet and MDNR officials have, at times, suggested that the modeling results are not correct, and that water treatment will not be required for nearly as long as their own model demonstrates. Regardless of the reasons why PolyMet and DNR chose to run a modeling scenario for 200 years at the mine site and 500 years at the plant site, the water quality predictions are unequivocal. At the end of those time periods, the water in the mine features – the mine pit and the tailings basin – still do not meet water quality standards, and cannot be released without some sort of treatment.	WR035
9365	The Department of Natural Resources contends that it need not address financial assurance in the SDEIS. Therefore, the SDEIS does not contain any final estimates on how much financial assurance must be provided, nor does it provide information on the specific financial instrument (such as a bond or surety) that might be required. ... The SDEIS does not provide a total number that might be required for financial assurance, but it does provide a few preliminary cost estimates. ... These numbers come from PolyMet’s consultant, Foth Engineering. Neither DNR nor Foth have provided any information regarding the underlying assumptions or calculations that may have gone into this number, and DNR does not provide any of its own estimates.	FIN05, FIN08, FIN13
9366	Regions 9 and 10 have far more experience with mining operations and reclamation costs than Region 5, and it is appropriate to turn to them for guidance on inclusion of financial assurance at the EIS stage.	PER03
9367	when PolyMet was asked by Minnesota legislators to “show its work” at a hearing on financial assurance on February 11, 2014, PolyMet refused that request as well. Thus, PolyMet has kept its calculations concealed from the public as well as the Co-Lead Agencies.	FIN05

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
9368	The Co-Lead Agencies did not question these assumptions and their consistency with Minnesota law. In fact, if PolyMet and MDNR’s statements in the media are to be believed, the Co-Lead Agencies have yet to require PolyMet to answer a fundamental question: How long will water quality treatment be required at the NorthMet site after closure?	WR036
9370	Finally, it should be noted that the Co-Lead Agencies ultimately changed their mind, and concluded that there would be no additional constituent loading to the surficial aquifer and Partridge River as a result of the West Pit Backfill. ...The current purpose of pumping in the West Pit is not to decrease constituent concentration; it is avoid overflow. However, this purpose could be changed if constituent loads were higher in the West Pit, and pumping increased, to avoid environmental impacts.	ALT03
9384	Finally, a total failure after operations (abandonment) is a scenario that must be explored. ...In any event, the Co-Lead Agencies’ failure to address the possibility that monitoring and maintenance will cease at this site at some point is best described as hubris, assuming prescience about future conditions that no human can have. And it constitutes a failure to address the potential impacts of this project under NEPA and MEPA.	PD22
9399	The geochemistry approach in the SDEIS is complicated and opaque. Yet this analysis underpins the oft-stated claim that there will be no acid mine drainage at the NorthMet Mine. The SDEIS should clarify the approach used for geochemistry analysis, including the use of humidity cell tests (HCT) and the calculation of concentration caps. ...While the Co-Lead Agencies have stated with confidence that the NorthMet Mine would not produce AMD, the data on which this claim is based is far less clear.	WR025, WR033
9400	The Co-Lead Agencies omitted the results of many lab and field tests from consideration by using “concentration caps” and averages. The Co-Lead Agencies should fully consider the results from the HCT and field tests that they disregarded in the SDEIS. The use of the concept of “concentration caps” and average values in the SDEIS distorts the results, does not capture the heterogeneity of the rock or seasonal variability, and likely underestimates the environmental impacts. ...Even more concerning, in some cases the Co-Lead Agencies and PolyMet257 have disregarded results from HCT and field tests altogether. PolyMet and its consultants used two methods that tended to eliminate the more damning results from consideration. First, PolyMet used the concept of “concentration caps,” ...Second, Barr Engineering used average values that do not consider the wide range of variability in field and laboratory tests.	WR033, WR034, WR071
9405	Ordinarily, geochemistry data, including all HCT and field test results, would be included as an attachment to the SDEIS or reference documents. ...Instead, MCEA had to make multiple document requests, and MCEA experts and staff are still not confident that we have obtained all relevant data. The Waste Characterization Data Package, one of the reference documents to the SDEIS, includes only summaries, not the actual results (Maest, p. 2). MCEA requested the documents referenced in the WCDA, but some of the data was missing. Another data request resulted in the remaining data. ...As seen in the attached documents, MCEA made specific requests to the Co-Lead Agencies asking for additional time given the difficulty in obtaining geochemistry documents	RFI01
9416	MCEA asks that you fully and clearly disclose the environmental impacts of the direct and indirect loss of wetlands and assess the significance of those impacts prior to assuming that the proposed mitigation measures would eliminate those impacts. This request is the only scientifically defensible environmental impact analysis approach and is required by both the NEPA and MEPA.	WET07
9422	In addition, pre-project monitoring locations only include three reference wetlands to document the natural hydrologic fluctuations in wetlands that would not be affected by the NorthMet project. Additional reference wetlands that represent the wide variance of wetland plant communities, chemistry and hydrologic regimes would be necessary to effectively correlate the natural fluctuations of wetlands outside of the NorthMet site with wetlands that may be affected by the NorthMet project.	WET22

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Center for Environmental Advocacy (MCEA) (52185)	
9907	The NorthMet SDEIS must include a fair and balanced evaluation of the socioeconomic benefits and risks associated with the NorthMet Project, including the reasonably foreseeable impact from unemployment associated with the well-established boom and bust cycle of the mining industry. In addition, the SDEIS must also provide an analysis of the potential negative impacts from the Project on the tourist industry and sustainable economies in Northeastern Minnesota and include a discussion of mitigation measures which would be available to address the negative socioeconomic impacts from the Project.	SO04
9908	The SDEIS also fails to consider alternatives for electricity consumption which would significantly affect the project's impact on the environment. Consideration of alternative energy sources should be a major component of the EIS given the enormous variation in environmental impacts between different sources. See	AIR02
9909	the SDIES does not address the indirect effects of additional vehicles on the road outside of the project area. Many of the routes employees take to get to the mine could result in an increased potential of a lynx being hit and killed. A daily increase of thousands of vehicles on roads to the NorthMet site is not an insignificant or immeasurable indirect effect. MCEA believes the SDEIS should provide a discussion on the increased traffic on local roadways could affect lynx.	WI01, WI03
9912	past biological assessments completed by Federal agencies in Minnesota and biological opinions completed by the USFWS have identified road and train traffic as major potential effects to lynx. However, the SDEIS glosses over these effects and does not disclose the significance of traffic (vehicle or rail) on the lynx...Multiple times in the Chapter 5 discussion in the SDEIS the potential for incidental take along the roadway is noted. However, no detail on why roadways or train tracks at the NorthMet could result in the harm, harassment or take of lynx is described or how lynx use roadways or train tracks for travel.	WI01, WI03
9915	The SDEIS's cumulative effects analysis is inadequate for several reasons, including but not limited to the following, which are discussed in more detail below: The SDEIS fails to analyze the cumulative impacts of the direct and indirect effects of the proposed mine and proposed land exchange together; The SDEIS inappropriately excludes several reasonably foreseeable actions from the analysis.	CU02, CU03
10004	MCEA expects that the co-lead agencies will respond to each of Dr. Chambers's and Mr. Thometz's comments individually on all topics, just as it would any submission from the public...MCEA incorporates these reports by reference and expects the Co-Lead Agencies to respond to those reports separately as part of the record...MCEA expects DNR to respond to all comments in Dr. Miller's report as part of the public record... MCEA hereby incorporates this report by reference, and expects the Co-Lead Agencies to respond to Dr. Maest's report as part of the record...MCEA expects DNR to respond to all comments in Dr. Glaser's report as part of the public record.	NEPA11
10006	The financial assurance analysis must contain, at minimum, the following: Calculation of maximum amounts needed to address reasonably foreseeable problems and accidents, with detail on how those estimates were made; Calculation of amounts needed to address reasonably foreseeable contingencies (using list from Bristol Bay report discussed in Section 6.0 as a starting point); Determination of discount rates and inflation rates, and sources used to set those figures; Analysis of project proponent's financial ability to pay for reclamation, including long-term water quality treatment, and to provide adequate financial assurance prior to receiving a permit to mine; and A thorough analysis of forms of financial assurance that will be acceptable under Minnesota law. Trust funds held for the sole benefit of the State of Minnesota must cover the entire amount needed, with instruments such as surety bonds, letters of credit, or insurance only usable as backups.	FIN05, FIN08, FIN12
10007	The agencies should assess the probability and impact of each of those kinds of accidents occurring, and also make a holistic assessment of accident risk at the mine.	PD22

10008	In addition, the Co-Lead Agencies should reevaluate their estimates of environmental impacts in light of previous experience with mining project environmental impact statements, particularly the chronic underestimation of negative water quality impacts.	WR023
10010	Finally, the agencies should not assume that there will be no errors in categorizing the waste rock, and should assess the consequences of reasonably foreseeable mistakes.	PD15, PD22
<b>Sender Name (Submission ID)</b> Minnesota COLA (38649)		
9962	the hydrological models used to predict hydrological events attendant to both extraction and refining are inadequate as the geology of the Virginia formation-the source of the metals to be mined-is not fully understood....	WR007, WR026, WR105
9963	it clearly states that it is not feasible to replace all affected wetlands through compensatory mitigation thus is contrary to both state and federal regulations....	WET01, WET04
9964	does not directly state the source or quantity of water to be diverted for use in the refining process; (It does speak to drawdown on both the Embarrass and Partridge rivers but how much and for how long is not stated.)	WR086, WR182
9965	critical computer modeling of runoff from tailings piles into nearby waters has shown to be inaccurate and underestimated;	WR056, WR060
9969	proposes unrealistic expectations that water treatment, projected/calculated by PolyMet to last some 200 to 500 years in duration, can actually be accomplished; ... and proposing that pit lakes are to be lined with a product guaranteed for only 20 years while the contained contaminate will exist in perpetuity.	FIN01
16680	There is no question that the waters of the state of Minnesota are a more valuable resource to the state than are the few minerals that could be mined for a relatively short period. PolyMet has not shown that it can effectively mitigate the risk to water quality and habitat that its proposed operation will create, nearly into perpetuity.	SO01, WR115
16682	it does not present sufficient evidence that lakes, rivers, streams, aquifers and wetlands would be protected during and after mining....	PD01
16684	examples of non-ferrous mining cited and used as comparables are those of mines located in the dryer, water poor areas of the U.S. and are therefore of questionable value in assessing how best to protect existing water resources....	PD26
16685	The wetland-rich area at the top of two continental watersheds is simply not a location where an operation like this should be allowed.	WET14
<b>Sender Name (Submission ID)</b> Minnesota Department of Health (42933)		
3563	The forces that created the fracture pattern in Lake and Cook counties would have also affected the Duluth Complex in St. Louis County, suggesting that local- to regional-scale fractures could be present and may act as possible conduits for higher rates of groundwater flow in the Precambrian bedrock. These fractures were not taken into account in the SDEIS. It would therefore be more conservative to assume higher flow rates when modeling groundwater and contaminant transport for this project... Assume higher flow rates for groundwater and contaminant transport modeling to account for local- to regional-scale fractures within the Duluth Complex.	WR009, WR012, WR087

<b>Sender Name (Submission ID)</b>	Minnesota Department of Health (42933)	
3637	In most cases, either the federal MCL or the Minnesota Health Risk Limit (HRL) is selected, but higher SDEIS evaluation criteria were chosen for beryllium, manganese and thallium "...based on background water quality". Although manganese exceeded the federal MCL of 50 µg/L in most samples, Table 4.2.2-6 in the SDEIS indicates most of the groundwater samples collected near the proposed Mine Site were near or below the state Risk Assessment Advice (RAA) levels of 100 µg/L for infants and 300 µg/L for children and adults. MDH recommends the RAA values be used as the groundwater evaluation criterion for manganese...Use 100 µg/L for infants and 300 µg/L for children and adults as the groundwater evaluation criterion for manganese.	EDIT01
3638	[T]he detections of beryllium near the proposed Mine Site indicate background concentrations in the aquifers are generally below the federal MCL of 0.4 µg/L and only slightly above the MDH HRL of 0.08 µg/L. MDH recommends the HRL be used as the groundwater evaluation criterion, as beryllium concentrations in the Plant Site flow paths are also predicted to exceed the HRL in areas where domestic wells are present...Use 0.08 µg/L as the groundwater evaluation criterion for beryllium.	EDIT01
3646	Clarify inconsistencies between field leaching test results and modeling predictions that indicate no change in groundwater quality compared to existing conditions with no exceedances of groundwater evaluation criteria.	WR023, WR025
3690	An HIA on the project could provide additional health information for policy makers in determining how to balance health and citizens' concerns with economic benefits of the project. An HIA could be scaled according to available resources and still answer some of the health questions posed by the community. An HIA could provide recommendations to policy makers to support possible positive health outcomes and to mitigate or prevent possible negative health outcomes to improve the public's health and to inform zoning, permitting, monitoring, and reclamation policies...Consider preparation of a Health Impact Assessment.	HU01
12376	Groundwater discharge from the Mine Site to the Partridge River could impact the Hoyt Lake drinking water supply (via Colby Lake) and alter geochemical conditions that affect mercury availability to fish, creating another potential human exposure pathway. Therefore, conservative modeling of potential impacts to the river that incorporate all possible contaminant sources is critical.	HU03, WR024, WR042, WR043, WR046, WR125, WR158
12379	The SDEIS does not adequately address possible impacts of groundwater contamination on local domestic wells. A thorough inventory and baseline water quality assessment of existing wells should be conducted prior to the initiation of any mining activities so that any future degradation of drinking water quality related to mining activities can be identified and remediated.	WR040, WR041
12380	Air quality modeling for crystalline silica in the SDEIS is based on predicted PM10 and PM2.5 emissions. However, when discussing the toxicity of crystalline silica, the real concern is with respirable crystalline silica particles with a diameter of 4 micrometers (4 µm or 4 microns) or smaller, also referred to as PM4...PM2.5 measurements may underestimate health risks from crystalline silica exposures. MDH has established a chronic Health Based Value (HBV) of 3 µg/m3 for respirable PM4 crystalline silica and recommends using this as a screening value for assessing potential health risks associated with respirable crystalline silica.	AIR04, AIR10
12381	Table 5.2.7-8 in the SDEIS indicates that the NorthMet project will result in 196,341 metric tons per year (mtpy) direct and 511,000 mtpy indirect greenhouse gas (GHG) emissions...MDH recommends that all projects in Minnesota evaluate options for reducing GHG emissions, through energy conservation and use of renewable energy sources, to limit contributions to climate change and help achieve Minnesota's GHG emissions reduction targets	AIR01, AIR10

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Minnesota Department of Health (42933)	
14478	The proposed groundwater monitoring network for the Embarrass River Watershed (SDEIS Table 5.2.2-54) includes only the existing monitoring wells installed around the Tailings Basin, which apparently are the wells shown in SDEIS Figure 4.2.2-13. Construction details for these wells are not included in the SDEIS and only two have records in the Minnesota County Well Index (CWI) (GW006, UN 625042; GW008, UN 625044)...[The Minnesota Department of Health] recommends that additional monitoring wells be installed within the bedrock aquifer to evaluate potential impacts to this aquifer.	PD05, WR079
14480	the SDEIS estimates that over 90% of seepage from the Category 1 Stockpile will be captured by the groundwater containment system with the remaining 10% following the groundwater flow to the West Pit where the water will be cycled through the Waste Water Treatment Facility (WWTF). However, the west end of the stockpile is located on a groundwater “high” (Fig. 4.2.2-5 in the SDEIS) from which some of the flow may be to the north and northeast and could discharge to Yelp Creek and then the Partridge River. This needs to be accounted for in the evaluation of potential migration of contaminants to groundwater and surface water and planning of the Mine Site groundwater monitoring network.	WR017, WR089, WR167
14482	the SDEIS notes that the national primary drinking water standards for copper and lead are treatment-based, “at-the-tap” values for public water supplies and not “in situ” groundwater values. Therefore, the SDEIS proposes that the secondary Maximum Contaminant Level (sMCL) of 1,000 µg/L for copper be used as the groundwater evaluation criterion. This value is protective only for acute health effects resulting from short-term, high level exposures and is not considered protective for infants, children, or other sensitive individuals. MDH is currently evaluating its advice for copper in drinking water. In the interim, MDH recommends that 300 µg/L be used as the groundwater evaluation criterion for the NorthMet project, as this appears to be protective for infants, children, and other sensitive individuals	HU14, WR110
14485	Given the presence of domestic water supply wells near the site, MDH recommends the national primary drinking water standard of 15 µg/L be used as a groundwater evaluation criterion in monitoring near the site.	PER29, WR110
14487	Table 4.2.2-24 of the SDEIS indicates higher manganese concentrations downgradient of the existing LTV Steel Mining Company Tailings Basin, but this simply suggests contamination of the surficial and bedrock aquifers from previous activities at this site that need to be considered in evaluating impacts to groundwater, not background concentrations for the aquifers. This is important as the maximum 90th percentile probability (P90) concentrations predicted in the 500-year model simulation suggests manganese concentrations in the groundwater in all of the flow paths from the Plant Site will exceed the MDH RAAs, including areas where domestic wells are present (Table 5.2.2-38 in the SDEIS).	PER29
14489	Seepage from the Category 2/3 and 4 waste rock stockpiles and Ore Surge Piles primarily will be captured by leachate collection systems and treated, but some will reach the groundwater along with seepage from the mine pits, WWTF equalization basins and Overburden Storage and Laydown Area and eventually discharge to the Partridge River (Table 5.2.2-26 of the SDEIS). Table 5.2.2-22 of the SDEIS suggests that this will result in little, if any, change in groundwater quality compared to the continued existing conditions and that none of the groundwater evaluation criteria will be exceeded... This seems inconsistent with field leaching test results on locally sourced Duluth Complex Gabbro	WR023
14490	Several untreated wastewater streams from the Plant Site appear to be directed to the Mine Site during the early phases of reclamation. These include untreated seepage from the Tailings Basin, blended with seepage that has passed through the Waste Water Treatment Plant (WWTP), which is to be discharged to the West Pit to accelerate its flooding...No information is provided regarding likely contaminant concentrations in these wastewater streams, so it is not clear how their possible contribution to groundwater contamination was evaluated.	WR173
14491	It is also unclear how constituent leaching was accounted for during the period while the pits are being flooded during the reclamation phase. Table 5.2.2-19 of the SDEIS seems to suggest the oxidation will occur before flooding, but ... fluctuating water levels result in conditions more conducive to acid mine drainage and metal leaching than full exposure to oxygen. The flooding of each pit will take approximately 20 days during which time it is likely water levels will fluctuate within the pits.	WR173

<b>Sender Name (Submission ID)</b>	Minnesota Department of Health (42933)	
14492	it is not clear whether the waste rock from the stockpiles will simply be deposited in the East Pit in year 11 and remain partly exposed for 20 years while the water rises around it, or if the placement of the waste rock will occur in stages to ensure the rock is either still on the stockpile liner (and leachate is collected and treated) or entirely submerged within the pit to minimize acid production and metal leaching.	WR029
14493	On p. 5-104, the SDEIS indicates that once flooded, groundwater inflow to the pits will limit the exposure of the wall rock to oxygen. However, no dissolved oxygen data was presented in Section 4 of the report. Has it been measured?	WR002, WR029
14494	Our assessment shows that there were no well records in CWI between the mine site and the Partridge River. However, Figure 1 (attached) shows that 19 located and eight unlocated wells with records currently within CWI met our search criteria for the area between the Plant Site and the Embarrass River, and by inference could be impacted by this mining activity...[and] there may be unlocated wells in the area that pre-date the Minnesota state Well Code in either of the modeled zones. These wells that pre-date the code would need to be inventoried, located and input into CWI. Any unused and unsealed wells found during the inventory could be conduits through which a contaminant plume could more quickly propagate, and therefore would need to be sealed as per current Well Code by the parcel owner, possibly with PolyMet Mining, Inc.'s assistance. Also, PolyMet Mining, Inc. should take every opportunity to collect baseline samples for any new wells that might be drilled in the area.	WR040, WR078, WR079
14495	Sample analytes and frequency of resampling are two aspects for which MDH would like to be consulted if permitting for the project moves forward. MDH is also interested in accessing the baseline data results archive and would ask to be included in those discussions as well.	GT04, WR039, WR142
14496	Water Supply Contingency Planning: The city of Hoyt Lakes relies upon Colby Lake as its drinking water source... in the event of unanticipated water quality degradation of Colby Lake related to the proposed mining activities...PolyMet Mining, Inc., as the owner and operator of the NorthMet mine, should assist with water supply contingency planning for the city. This contingency plan should address ongoing water quality and quantity monitoring and set up protocols for gradually changing conditions and emergencies, should they occur.	WR043, WR140
<b>Sender Name (Submission ID)</b>	Minnesota Environmental Partnership (18173)	
3948	The 90-day comment period is simply inadequate for the public to really understand this project...Without 180 days this process is flawed.	NEPA07
3951	There is a complete lack of backup plans from if something goes wrong with the tailings piles and basins, the pumps, the pipelines, the filters of the water system that needs to operate for hundreds of years.	PD22, WR090, WR130, WR131
3953	...the SDEIS relies on unreliable water modeling, including the flow of water that will be treated and the time frame for continued cleanup of the water from the mining.	PD29, WR035, WR063, WR147, WR189
14810	reuests an extenstion of the NorthMet Supplemental Draft Environmental Impact Statemetn (SDEIS) comment period, from the current 90 days to 180 days.	NEPA07
14811	The SDEIS is overly long...The SDEIS is complex and substantive conflicts are unresolved...The SDIES is not written by or for laypersons...Critical information in thousands of pages of references is not publicly available	NEPA07
14812	The SDEIS cumulative effects assessment is insufficient..Tribal cooperating agenices emphasized the need for a more thorough cumulative effects assessment of mining on Lake Superior Basin resources.	CU18

<b>Sender Name (Submission ID)</b>	Minnesota Environmental Partnership (18173)	
17498	Minnesota Environmental Partnership requests an extension of the NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) comment period, from the current 90 days to 180 days. We also request that the co-lead agencies reschedule the public meetings for later in the comment period. At very least, a single additional public hearing should be scheduled toward the end of this extended comment period, in May 2014, to allow citizens to base their comments on a more thorough examination of the SDEIS.	NEPA07
17499	An extension of the comment period is required [because]: ...The SDEIS is overly long The document is 2200 pages long. Commissioner Tom Landwehr, at the December 6, 2013 press event, urged Minnesotans to take a "hard look" at it. An individual would have to read 25 pages a day before the end of the comment period to read the entire document and make informed decisions...Additional time is required for adequate review by any individual.	NEPA07
17500	An extension of the comment period is required [because]: ... The SDEIS is complex and substantive conflicts are unresolved . The SDEIS encompasses multiple projects, including the mine plant, the mine site, a tailings pond, a land exchange, transportation between the sites, financial assurance and offsite wetlands replacement projects. The document also contains substantive dissenting views, the Major Differences of Opinion documented extensively in Chapter 8.	NEPA07
17501	An extension of the comment period is required [because]: ... The SDEIS is not written by or for laypersons.... The current document is not readily understandable, clear or concise. As written, it excludes many members of society from meaningfully participating in its review. Time is required for technical experts and communications experts to fully understand the material and make it accessible for a broader range of audiences.	NEPA07
17502	An extension of the comment period is required [because]: ...Critical information in thousands of pages of references is not publicly available.The public cannot meaningfully analyze and evaluate the co-lead agencies' conclusions about the impacts of the mine without also evaluating the underlying references. Since these have not been provided to the public, it will take additional time for organizations and individuals to. Request the supporting documents, read, understand and disseminate these critical references.	NEPA07
17503	An extension of the comment period is required [because]: ...The SDEIS Cumulative Effects Assessment is insufficient. Tribal cooperating agencies emphasized the need for a more thorough cumulative effects assessment of mining on Lake Superior Basin resources. The undersigned groups and many others recently asked EPA Region 5 to engage in a new, broader analysis of the impacts of mining on Lake Superior and the Great Lakes.	NEPA07
18984	Thousands of acres of moose habitat would be destroyed at the PolyMet mine site, and moose have been observed there.	WI01, WI02
18985	PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. PolyMet would dig up nearly 1,000 acres of high value peat bogs, part of the 100 Mile Swamp, a critical habitat for many plants and animals. This wetland is designated an Area of High Biodiversity Significance by the Minnesota Biological Survey.	WET19, WET23
18986	The Poly Met operation will be a huge contributor of greenhouse gasses. Emissions from PolyMet would increase Minnesota's annual statewide emissions by 0.44%. All this when Minnesota has set a goal of reducing Minnesota's greenhouse gas emissions 30% from 2005 levels by 2025.	AIR01
18987	PolyMet would emit 4.6 pounds of mercury into the air from their operations every year, and the coal power they rely on would add even more. Water and air pollution from mine pits, waste rock and tailings piles and PolyMet's excavation and changing hydrology in wetlands would increase mercury loading to wetlands and streams and increase mercury bioaccumulation in fish, putting human health at risk. The PolyMet mine plan also increases mercury in the Embarrass River, and sulfate pollution from the site could increase methylmercury, the form of mercury most dangerous to people.	MERC02, MERC08, MERC09, MERC23

<b>Sender Name (Submission ID)</b>	Minnesota Environmental Partnership (18173)	
19076	It is clear that the 90-day comment period was too short for adequate review of the complex SDEIS documents. When the comment period stops prematurely on March 13, important public comment will be absent from the record. As a result, the entire SDEIS process is inadequate and therefore the Final EIS should not be determined to be adequate.	NEPA07
19077	The SDEIS is overly long. The document is 2200 pages long... An individual would have to read 25 pages a day before the end of the comment period to read the entire document and make informed decisions. The Executive Summary alone is 58 pages. Additional time is required for adequate review by any individual.	NEPA07
19080	The SDEIS is multifaceted. The SDEIS encompasses multiple projects, including the mine plant, the mine site, a tailings pond, a land exchange, transportation between the sites, financial assurance and offsite wetlands replacement projects [which should require an extension to the comment period].	NEPA07
19081	The document also contains dissenting views, the Major Differences of Opinion documented extensively in Chapter 8.	NEPA12
19083	The SDEIS is not written by or for laypersons...The current document is not readily understandable, clear or concise. As written it excludes many members of society from meaningfully participating in its review. This technical and complex SDEIS will, unfortunately, likely not be rewritten to be readily understandable. Therefore, more time is required for both technical experts and communications experts to fully understand the material and make it accessible for a broader range of audiences.	NEPA07
19084	The public cannot meaningfully analyze and evaluate the co-lead agencies' conclusions about the impacts of the mine without also evaluating the underlying documentation. This will take additional time both for organizations and individuals to request the supporting documents, to read and understand them, and to disseminate them to the interested public.	NEPA07
19085	The SDEIS does not include ongoing Cumulative Effects Assessment...An extended comment period will allow the NorthMet project to be understood and analyzed in a broader context.	NEPA06
19086	MDNR's December 2013 assessments of Partridge River base flow pertinent to mine site recharge and pollution transport was acknowledged by the MDNR in late January 2014 to diverge from the base flow used for modeling in the SDEIS.	WR004
19087	Basic information on water balance and water chemistry is missing from both the SDEIS and from documents referenced in the SDEIS. Additional time may have allowed agencies to provide the missing information in time for public review.	NEPA07
19088	Basic information on mine site and tailings site geological conditions, including but not limited to fractures, is missing from the SDEIS or inaccurate. Additional time may have allowed agencies to provide the missing information in time for public review.	WR007, WR008
19090	Basic information on constituents in and management of reject concentrate, filtered sludge and Hydrometallurgical Residue Facility waste is missing from both the SDEIS and from documents referenced in the SDEIS. Additional time may have allowed agencies to provide the missing information in time for public review.	WR066, WR143, WR145, WR146
19092	Basic information on mercury in ore, waste rock, tailings, peat, process water, tailings pore water, liner leaks and groundwater flow paths is missing from both the SDEIS and from documents referenced in the SDEIS. Additional time may have allowed agencies to provide the missing information in time for public review.	MERC06, MERC16, MERC20, MERC21

Comment ID	Comment Text	Theme Codes
	<b>Sender Name (Submission ID)</b> Minnesota Environmental Partnership (18173)	
19094	Citizens who testified at the public hearings had just five weeks to review the SDEIS and prepare their testimony. Those that did refer to the SDEIS made statements such as: "I haven't read the whole thing but I did look at the executive summary." "I can't understand this myself, but. ... " "I trust the agencies that developed this." Blind trust in governmental agencies shortcircuits the public review process.	NEPA07
19095	A number of professional conservation organizations, despite having access to the preliminary documents and significant staff resources and contracted experts, will not be able to meet the deadline. Flaws in the SDEIS are buried deeply and have required detailed analysis just to identify, leaving inadequate time to frame comments. This will leave detailed and important comments unheard.	NEPA07
19098	As a result of the Co-Lead Agencies' refusal to extend the comment period, the public review of the SDEIS is lacking in the depth and comprehensiveness essential to a project as complex as this. Therefore, the Final EIS cannot be considered to be adequate and must be rejected.	NEPA07
19101	Minnesotans favor requiring that when a mine is closed, it be left in a condition where it will not pose an ongoing threat to water quality. This mine, as described in the SDEIS, clearly does pose an ongoing threat.	FIN14
19103	The overall environmental review process has had some serious flaws. The Poly Met SDEIS compares no alternatives other than two sizes of land exchange. It does not compare an underground mining alternative or avoiding a permanent waste rock pile by putting waste rock back into the west pit. It doesn't analyze alternatives like a liner under the permanent waste rock pile, a liner under the tailings piles, or ways to reduce water drained away from Partridge River watershed wetlands and streams.	ALT01, ALT03, ALT06, ALT07, ALT23
19110	Cumulative impacts of the PolyMet project and other existing and expanding mines would impair wild rice, fish and aquatic ecosystems and violate the treaty rights of Indian tribes to hunt, fish and gather in Superior National Forest lands ceded to the United States.	AQ10, AQ27, CU11
19111	The company's own computer models show that hundreds of years after the mine closes, water seeping into groundwater and flowing into streams and rivers at the site will be polluted with heavy metals and sulfates. Unless all of this water is captured and treated, the mine will pollute surrounding waters.	WR107, WR108, WR111, WR115
19112	Minnesota law requires that a closed mine site be "maintenance free," but PolyMet's mine plan calls for hundreds of years of monitoring and expensive water treatment. Worse, these models don't demonstrate that the pollution stops after 500 years. The modeling simply ends at 500 years.	FIN14, WR037, WR195
19113	PolyMet's predictions regarding water pollution rely on unsubstantiated assumptions that no pollution will seep from the 526-acre permanent mine site waste rock pile into the 100 Mile Swamp, and that pumps on the edge of the 2-mile-wide tailings pile will capture 99.37 percent of the seepage.	WR010, WR018, WR060, WR080, WR167, WR175
19114	The SDEIS is flawed because it does not provide accurate information about how long polluted water will require treatment.	WR035
19115	The SDEIS is flawed because the Poly Met mine plan does not take into account the destruction of moose habitat.	WI02
19116	Protecting moose is a particular concern for tribal members, and there is no analysis of the cumulative impact on moose from the Poly Met project and other habitat disruptions.	WI09
19117	PolyMet is required to replace lost wetlands, but they understate the area of wetlands they would affect, they fail to replace the unique habitat offered by peat bogs, and they propose replacements that are far from the mine site. The SDEIS is flawed because the mine plan needs improved wetland protection and replacement.	WET05

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b> Minnesota Environmental Partnership (18173)		
19119	The SDEIS is flawed because the mine plan counteracts Minnesota's stated carbon emissions reduction goals. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution.	AIR01
19121	The SDEIS is flawed because the mine plan increases the risks of mercury pollution/or Minnesota children.	MERC03
19122	It is clear that the 90-day comment period was too short for adequate review of the complex SDEIS documents. When the comment period stops prematurely on March 13, important public comment will be absent from the record. As a result, the entire SDEIS process is inadequate and therefore the Final EIS should not be determined to be adequate.	NEPA07
19123	Some critical background documents, such as the Wetland Impact Assessment Technical Memorandum -Appendix B, were not made available until February 24, 2014, less than three weeks before the end of the comment period.	NEPA07
19126	During the course of the 90-day comment period, substantive issues with the PolyMet SDEIS became apparent, each of which could have been addressed by a longer comment period. We learned that the water models in the document didn't match with current conditions on the ground, not to mention the mine area after it's impacted. Researchers found that basic information on water balance, water chemistry, geological conditions of the mine site, and potential pollutants was missing.	NEPA07
19127	The SDEIS is flawed because the public review of the SDEIS is lacking in the depth and comprehensiveness essential to a project as complex as this.	NEPA07
19128	PolyMet's SDEIS is not accurate and must be redone.	NEPA15
19130	PolyMet's plan threatens the waters of northeastern Minnesota and must be rejected.	WR107, WR108
19133	Unless there are very substantial changes to the SDEIS, the final EIS will fail to reach the minimum standard needed to be deemed adequate.	NEPA09
<b>Sender Name (Submission ID)</b> Minnesota Geological Survey (43014)		
3721	The current conceptual models in the SDEIS characterize the Duluth Complex and Giants Range Batholith bedrock as bulk masses of rock with low, uniform permeability. Although this type of characterization is sometimes deemed sufficient for some purposes, ... it has well known deficiencies when applied to numerical modelling of smaller-scale sites, especially for predicting solute transport. Instead, the development of conceptual models that employ techniques whereby discrete fractures or fracture zones are more fully considered, results in improved prediction of solute transport, including better estimates of travel times, and recognition of variation in flow directions and discrete pathways in three dimensions.	WR194
3770	The data collected thus far from the proposed NorthMet Mine Site and Plant Site/Tailings Basin area are not sufficient to recognize the kinds of hydrogeologic features known to be characteristic of other crystalline bedrock settings on the Canadian Shield... Nor are the data sufficient to adequately support the simpler conceptual model currently depicted in the SDEIS.	WR008, WR009, WR011, WR012, WR014, WR019, WR056, WR061, WR071, WR087, WR097, WR098, WR168, WR169, WR170

<b>Sender Name (Submission ID)</b>	Minnesota Geological Survey (43014)	
3782	The SDEIS conceptual model for the Mine Site could be much better supported. First, inferences about the likelihood of extensive fractures of hydraulic significance in the Duluth complex are based on the incorrect premise of insufficient post-emplacement tectonic activity to generate such features in the region.	WR008, WR009, WR011, WR012, WR014, WR019, WR056, WR061, WR071, WR087, WR097, WR098, WR168, WR169, WR170
3785	No subsurface hydrogeologic information was collected from the Giants Range Batholith, which underlies the Plant Site/Tailings Basin area. Instead, the hydrogeologic characterization of the Giants Range Batholith relies on a number of general observations and inferences based on geologic context... The SDEIS would be considerably improved by providing stronger support for the conceptual model of the Giants Range Batholith...	WR072, WR168
3990	Improving the quality of the conceptual model will lead to improved prediction of potential impacts to groundwater, engineering of containment systems, and design of monitoring systems.	WR071
4000	Characterization of fractures at the Mine Site is based largely on inferences drawn from geologic context.	WR007, WR010
4002	[The SDEIS conceptual model for the Mine Site could be much better supported.]... Second, the manner in which data were collected at the Mine Site, especially the use of long open hole intervals for hydraulic testing and water sampling, is insufficient to test the hypothesis that extensive high transmissivity fractures or fractured zones are absent... Scale effect is also a factor. Boreholes are less likely to intercept hydraulically active fractures than the proposed pit walls. This also should be discussed as part of the SDEIS.	WR012, WR071, WR087, WR168, WR169, WR179
4003	Information from outside of the Mine Site area appears to be inconsistent with the SDEIS suggestion that densely fractured uppermost bedrock has been removed by glacial scouring in the area. A site-specific example is a well-known contamination site in a younger Midcontinent Rift intrusive complex near Finland Minnesota where abundant fractures in the uppermost 100 feet of bedrock serve as fast-flow groundwater conduits (e.g. Harza Engineering Company, 1999)... specific capacity data from Duluth Complex water wells ((County Well Index (CWI)) in northeastern Minnesota also are suggestive of enhanced fracturing in uppermost bedrock.	WR011
4018	Improved understanding of the hydrogeologic system in the Duluth Complex at the Mine site could be achieved by the acquisition of hydraulic and water chemistry data at much more discrete intervals. This would include testing and sampling of boreholes with shorter open hole intervals at variable depths (e.g. "nested" wells) and/or discrete interval packer testing and water sampling of long open holes... The hydraulic and water chemistry information from these discrete intervals in a number of boreholes would ultimately lead to an improved conceptual model for the prediction of solute transport.	WR071
4020	The use of the Duluth Complex as a hydrogeologic analogue is difficult to support. The Giants Range Batholith is Archean in age, more than 1.5 billion years older than the Duluth Complex, and therefore the assumption that the two units have similar stress, weathering, and erosional histories is not valid.	WR194
4027	Hydraulic and water chemistry data from discrete intervals in shallow (<50 feet) bedrock conditions [at the Plant Site/Tailings Basin area] would be particularly useful to test the inference of a no-flow boundary. Bedrock groundwater chemistry could be particularly useful at this site, because constituents derived from past activities at the existing Tailings Basin may serve as a tracer to better understand solute transport through the bedrock. Such constituents have already been recognized in groundwater sampled from unconsolidated sediment in the area (SDEIS page 4-114).	WR008

4505	IWLA believes that a substantial amount of the work on this subject [financial assurance] needs to appear in the SDEIS... IWLA understands that the Permit to Mine process will include a good deal of negotiation around financial assurances, but IWLA also believes that a very thorough initial discussion is needed in the SDEIS...Deferring to the permit to mine process eliminates adequate opportunity for understanding the key elements involved in financial assurances.	FIN13
4506	IWLA states that the information provided by Foth Engineering to PolyMet, including the menu of financial alternatives and the possible closing cost at various time scenarios, is inadequate to enable a person reading the SDEIS to have enough information on financial assurances to confirm that amounts, timing, and safety are going to be met...nor does IWLA concede that DNR Division of Lands & Minerals is the only authority for protecting Minnesota taxpayers and Minnesota natural resources from the consequences of inadequate financial assurances.	FIN05, FIN10, FIN13
4507	Public access to important financial assurance information will be inadequate given a very high likelihood that the Permit to Mine process will include significant pressure to issue permits and focus on moving the project forward.	PER03
4508	DNR by virtue of its mission charge is a conflicted agency. The State of MN directs the DNR to "develop" these mineral resources in addition to the charge that the development meets environmentally acceptable outcomes.	PER42
4510	Foth Engineering scenarios in the SDEIS do not include any supporting assumptions used to drive their alternatives. Such info is very important to NGO groups like IWLA.	FIN05, FIN08
4512	North Met should be required to complete the reclamation, and remainder treatment phase of NorthMet in no more than 10-15 years after mining is done. The SDEIS should require such project design and build financial assurances on that basis. Allowing up to a decade and a half for post mining obligations are reasonable. Allowing a project design in the SDEIS that accepts 200-500 years of post operation treatment is not acceptable. IWLA understands and agrees however, that post operation monitoring paid for by Polymet is necessary for as long as is needed.	PD01
4517	3.1.1.7 Project closure overview. Comment: Who would be responsible for this judgment..[of how long monitoring and maintenance of reclamation and operation of mechanical water-treatment infrastructure is needed]? The Co-Lead Agencies or their successors?	PD24
4521	3.1.1.7 Project closure overview. "PolyMet would be held accountable [for] maintenance and monitoring required under permit and would not be released until all conditions have been met." [To be guaranteed by Financial Assurance agreement.] Comment: A lot to take on faith.	FIN11
4522	3.2.2.5: Mining..Such potential expansion of mining [outside planned pits beyond the NorthMet Project due to known mineralization] should be addressed in Chapter 6, Cumulative Effects.	CU02, PD30
4523	3.2.2.1.7: Overburden and Waste Rock Management. Each of these three types [of overburden (unsaturated, peat, and saturated)] must be segregated in stockpiles since they will have different uses.	PD15
4524	3.2.2.1.7: Overburden and Waste Rock Management. Why separate Categories 2 and 3? Will they be mixed, or segregated, and why (in each case)? Why is there a need to capture the drainage from Cat. 1 stockpile if it is so low in S? Why else was the 0.12%S cutoff established? What experimental data support this value? If the cutoff value were reduced to 0.10%S, would this eliminate the "necessity" to capture and treat seepage? Lowering the cutoff value to 0.10%S would increase the size of the Category 2/3 stockpile, but if no permanent capture and treatment is required wouldn't this dramatically lower the long-term post-closure costs? What is the experimental evidence for the long-term integrity of the geomembranes used in the waste rock stockpiles for Cats 2,3,4?	PD15
4525	Would peat beneath the dikes present stability problems?	GT01, GT06

4527	This facility [Wastewater Treatment Facility] is to be maintained “as long as necessary”, including possibly adding to its capabilities if found necessary (perhaps including reverse osmosis, RO). Question: Hundreds of years?	PD03
4529	3.2.2.1.8: Reject concentrate from the WWTF to be evaporated/crystallized and disposed of offsite. Needs explanation: Where? How? By whom? Moving a pollutant elsewhere doesn’t eliminate it.	WR145
4530	3.2.2.1.9: Water Management. Recommend: overdesigning for extreme weather/climate events or conditions (drought, 200 year precipitation event, snowmelt).	PD22
4531	3.2.2.1.10: Reclamation and Closure...Recommend: lime or limestone should (not “could”) be added to East Pit as it is backfilled with Cat. 2,3,4 waste rock to help neutralize pore water.	WR027
4532	West Pit: Question: Where is the rationale for flooding to a pond? No liner or bentonite? Won’t the water react with mineralized pit wall rock? What is the predicted water quality of this water over time? Such pit lakes in other mining districts with sulfide mineralization are often highly acidic and toxic.	PD03, PD15, WR057
4533	Category 1: well-engineered cap with local soils, vegetation, and geomembrane to lessen infiltration – but hazard of long-term succession to forest in this climate, with deep roots that could penetrate geomembrane. Needs a discussion! Question: What is the risk associated with such root penetration over centuries? PolyMet plan is to cut woody vegetation in perpetuity, apparently! This issue needs to be investigated at depth.	PD16
4534	“PolyMet has committed to conduct demonstration projects during the Life of Mine and Reclamation phases (total of est. 40 years) to establish non-mechanical water treatment systems to be used at the Mine Site.” Comment: They should have started long ago! How will this commitment be enforced?	PD06
4535	Table 3.2-12....here will these chemicals end up? In the tailings? Will there be release to the Embarrass River watershed? What is the toxicity of these materials?	PD03
4536	3.2.2.3.5: Tailings Management: Rock buttresses along north tailings basin dam seem much too small to be effective for stability. Comment: Re-do stability modeling?	GT03
4545	3.2.2.3.6: Hydrometallurgical process: Table 3.2-13. Question: what will be the fate of the potentially noxious chemicals Sulfuric and Hydrochloric acids, liquid SO <sub>2</sub> , and Sodium Hydrosulfide? Same question as for flotation chemicals above.	PD18
4546	3.2.2.3.10: Engineered water controls: Seepage interception systems would require pumps to route drainage to Tailings Basin or the WWTP. Comment: In perpetuity, apparently. A tall order.	PD03, PD07
4547	3.2.2.3.12: Reclamation and Long-term Closure Management: Hydrometallurgical Residue Facility Reclamation (p. 3-130) - Dewatering sounds complicated and difficult, including “early in the . . . process. Access to the residue surface may be somewhat difficult due to the fine-grained characteristics.” Questions: Slime? How will this be dealt with? Revegetation also includes yearly mowing “or as needed”. Again, rationale for no woody succession? For 200 years? Inspection for plugged inlet structures and piping systems (p. 3-131) also perpetual?	PD20
4548	3.2.3.4.2, West Pit Backfill...Several arguments presented for not backfilling, but others not explained: “It was determined [how?] that it would not offer substantial environmental or socioeconomic benefits.” Comments: The economic factors (potential inaccessibility of mineral value; cost of moving waste rock for fill) seem to have trumped others.	ALT03

4549	Duluth Complex waste rock is made mostly of silicate minerals, which “would help neutralize some acid generated by the sulfide minerals, such that the Category 1 stockpile and the Tailings Basin are predicted to remain at neutral pH.” Question: Then why collect and treat seepage?	PD15
4550	Both Category 1 waste rock stockpile and Tailings to have a seepage containment and treatment system; discharge not to exceed the 10 mg/L SO4 standard. Cat. 1 stockpile also to be capped with geomembrane and vegetation to lessen infiltration. See above Question [Then why collect and treat seepage?]. Is it the SO4 limit, not the acidity, which requires long-term treatment?	WR035, WR134
4551	Post-closure non-mechanical treatments anticipated but not here specified might include “constructed wetlands, permeable reactive barriers, permeable sorptive barriers, and/or other technologies to be identified.” Comment: These are “considered a long-term goal for closure”, and therefore should be thoroughly described and discussed well ahead of time (in the EIS).	PD06
4552	Does this also mean that the SO4 standard is the limit driving the whole seepage treatment plan? What dilution factor (from tributaries) is valid for the St. Louis River between the Embarrass River and Fond du Lac Reservation?	PER22
4553	5.2.2.1.2 Surface Waters. Hydrology: The DNR “has recommended that maintaining surface flows within about +/- 20 percent of existing conditions in mining-affected streams should be a management objective where reasonably practical in order to maintain existing aquatic ecology”. Questions: What baseline information is available on “existing aquatic ecology”? It’s impossible to judge this “requirement” without known present conditions baseline.	WR071, WR185
4554	5.2.2.2.1 Groundwater Hydrologic Modeling:… Table 4.2.2-5 presents data from limited studies. Question: Did anyone examine the miles of bedrock drill core or core logs thereof for fractures?	WR014
4555	5.2.2.2.2 Surface water Hydrologic Modeling: One input factor is a “rainfall database” (p. 5-45). Questions: How long-term is this? How sensitive is the model? Does it consider 200 years? Climate change? In Table 5.2.2-13, only the 20-year annual low and high flows are modeled. This EIS should be valid for MUCH longer.	WR077, WR180
4556	5.2.2.2.3 Water Quality Modeling (GoldSim)NorthMet Waste Rock Geochemistry: PolyMet claims that “Within the pit walls the blasting effects [on fracture permeability] are limited in terms of lateral extent and do not have much effect on solute transport in bedrock”. Question: What actual measurements support this statement? Any data – or a hunch?	WR016
4557	5.2.2.2.3 Water Quality Modeling (GoldSim)Claim (p. 5-51): the acid-generating sulfides in rock with <0.12%S would be “completely neutralized” by the basic components of the dominant silicate rock minerals during oxidation. “Category 1 waste rock . . . is predicted to never generate acidic leachate”. This conclusion apparently comes from 4 years of experimental simulated weathering cycles, plus further testing and analyses. Question: Then why collect and treat drainage/seepage from the Cat. 1 waste rock and tailings?	WR134
4558	5.2.2.2.3 Water Quality Modeling (GoldSim)Virginia Formation rock contains high S (0.4-5.0%S) and is similar to Class 4 Waste Rock but predicted to “produce acidic leachate immediately upon weathering”. Question: Where would this material be encountered in these pits? Virginia Formation is not found on the pit cross-section diagrams. Would it be combined with Cat. 4 waste rock and disposed of in the East Pit, or how? Why isn’t it simply included in Waste Rock Category 4?	WR034
4559	PolyMet states that “not all sulfide sulfur has the same potential for release” Explain, including management implications.	PD15
4560	On p. 5-54 the concept of “concentration caps” is introduced, on the basis apparently of empirical field and lab observations and relied on to minimize solute loadings of effluent in the modeling calculations. Question: what is the theoretical basis or rationale for such “concentration caps”? Is it a valid concept on which to base environmental standards?	WR033

4561	“... four solutes are assumed to be attenuated by adsorption in the aquifer: As, Sb, Cu, and Ni.” Kd values from the literature are used to describe this attenuation. Questions: Do the media through which these leachates pass never become saturated in these solutes? This seems unlikely. Therefore how can this adsorption process be counted on to act on the long term of this project? What is the experience from the Dunka Pit waste rock experiment?	WR023, WR058, WR167
4563	LTV tailings (on which the NorthMet tailings are to be placed) contain carbonate minerals and produce a basic leachate in lab tests. Modeling predicted much higher solute loads for many components than observed empirically, apparently due to adsorption, and models were adjusted correspondingly by “calibration factors” [fudge factors] to produce results closer to those measured. Comment: This should be explainable scientifically. Questions: What is the rationale for the size of the pond on top of the tailings? What is the basis for the rates of recharge given in Table 5.2.2-17? This certainly would be seasonably variable. Have weather/climate extremes been taken into account? Global warming? What is the “closure beach” as opposed to the others?	WR050, WR057, WR060, WR065, WR180
4564	“Regarding the selection of the P90 threshold, “the Co-Lead Agencies also retain the flexibility to modify this evaluation criteria based on consideration of low-flow modeling analyses, site-specific factors, and model predictions in consideration of applicable permitting regulations and guidance” (p. 5-77). Question: Isn’t this a big loophole for future enforcement? Of course, it also could be economically beneficial if long-term experience shows permit requirements to be stricter than necessary to maintain water quality. Can we trust Agencies to enforce the permits?	PER06, PER37
4565	5.2.2.3.1 Water Budget Overview Operations (years 1-20):...What will be the oxygen content of this flooding water? Won’t it be at least initially oxidized as it contacts waste rock and pit walls? This will generate acid immediately. What do experiments show for this with time? How will the pore water in the pit be kept from diffusion or replacement by lateral infiltration of more oxygenated groundwater, thus continuing acidification?	WR029, WR173
4566	5.2.2.3.1 Water Budget Overview Reclamation (yrs 20-40)...West Pit to be allowed to flood naturally. When level reaches top of bedrock, pit water would enter the surficial flowpath, migrating slowly towards the Partridge R. Questions: Will there be no surface overflow? [Next section calls for pumping excess to WWTP] Will there be no attempt to minimize reaction with wallrock sulfides? What predictions have been made for water quality in this unlined pond in mineralized rock? Many examples in other mining districts of such pit lakes becoming seriously acid and toxic. Add limestone? Bentonite?	WR027, WR088
4567	5.2.2.3.1 Water Budget Overview Reclamation (yrs 20-40)...Plant Site – Question: What modeling has been done for water balance in the Tailings Basin? Will pond require augmentation during drought? If so, where from? Or is this not important? If so, why not?	WR056, WR182, WR188
4568	5.2.2.3.1 Water Budget Overview Closure (after 40 yrs)...Mine Site Continued (possible perpetual) monitoring of seepage; operation of WWTF with RO; disposal of solids offsite...; treated effluent released on surface to Partridge R drainage; pumping of excess West Pit water to WWTF. Possible modification of dikes and surface water flows “as necessary”. Question: As necessary according to whom? Could high pumping rates of excess West Pit water exceed capacity of the WWTF?	WR128, WR130
4597	5.2.7.5.1 Environmental Consequences...Using the “MN-fiber” definition would be a highly conservative standard, since in my experience the great majority of particles likely to cleave with that aspect ratio in igneous rocks such as the Duluth Complex would be hornblende, the most common amphibole and one that is not implicated in health issues (see list on p. 5-436-437).	AIR03
4598	5.2.7.5.2 Evaluation Criteria: “However, amphibole minerals are present in the Duluth Complex and in close proximity to the NorthMet Deposit” (p. 5-440). Comment: Considering the intensive sampling that has been done of the rocks proposed to be mined, by drill core and for bulk metallurgical testing, the amphiboles should have been – and must be – identified to evaluate their potential carcinogenicity. Then any necessity for treatment could be better evaluated.	AIR03

4599	5.2.7.5.3 North Met Project Proposed Action. Comment: Again, a “small fraction of <2.5 micrometer fibers have been identified as amphibole” from flotation pilot testing. These should have been identified as to amphibole type. Questions: (last line p. 5-441) “. . . Wet and minimize wind erosion.”	AIR03
4601	5.2.14.2.1 Waste Rock Stockpiles. Design Criteria: Much depends on future PolyMet analysis of stockpile subgrade settlement including behavior of the stockpile liner system. These will depend on the physical characteristics of the materials used, especially the geomembranes as “determined from the manufacturer’s specifications”. Question: What is the long-term (100 year, 300 yr) empirical basis for such specifications, under saturated, in-ground conditions? Of course, great care must be taken in laying down these geomembranes to prevent punctures and local strains.	PD15
4602	5.2.14.2.1 Waste Rock Stockpiles. Design - Category 1 Stockpile - Questions: What is the angle of repose for each lift? How is it to be determined for modeling/planning? Empirical observation during construction? Long-term stability?	PD15
4603	5.2.14.2.1 Waste Rock Stockpiles. Category 2/3/4 Stockpile: PolyMet commits to investigate and test in the future appropriate stability relations and design. Stability analyses of stockpile cross-sections “indicated that all sections analyzed met the minimum required Factors of Safety”. Question: What Factors of Safety are required?	GT04
4604	5.2.14.2.1 Waste Rock Stockpiles. Proposed Monitoring, Maintenance, and Mitigation. Plan requires continued monitoring and maintenance and adaptive management through the Life of the Mine and beyond “until the DNR determines that the cover is stable”, with an annual compliance report. Some “excess” waste rock or overburden might be put in the West Pit. Question: Why only monitor the waste cover? Not the	PD15
4605	5.2.14.2.2 Tailings BasinDesign Criteria: Factors of Safety required are taken from State Rules, and adopted by NorthMet Geotechnical Modeling Work Plan: Factor of Safety of 1.5 for long-term (?), drained conditions; 1.3 for short-term (?), undrained conditions; and 1.1 minimum for materials deemed subject to liquefaction. This latter value seems much too low!	GT02
4607	5.2.14.2.2 Tailings BasinDesign: Plans use “upstream” method of building tailings disposal over LTV tailings, with drainage layers beneath the NorthMet tailings. Rock buttresses to be added at base of N and S slopes. Questions: Will these small-looking rock buttresses be large enough to confidently maintain stability post-closure? Where would the LTV tailings to be used in adding to the dams come from? The adjacent W cell?	GT03
4608	5.2.14.2.2 Tailings BasinExterior dam faces to be augmented with bentonite to lessen oxygen and water infiltration, and vegetated. Vegetation to be maintained in perpetuity in non-woody condition (!) Question: Again, is this necessary? Is it possible?	GT09
4609	5.2.14.2.2 Tailings BasinLong-term Closure Stability Conditions: . . .But since these tailings are supposed to be non-acid-forming, why is it necessary to keep them water saturated?	WR002, WR029, WR057
4610	5.2.14.2.2 Tailings BasinDam safety reports should be done more often than every 5 years.	PER21
4611	5.2.14.2.2 Tailings BasinProposed Maintenance and Mitigation: “Where monitoring or model updates indicate that the Factor of Safety . . . no longer meets design criteria, appropriate modifications to the Tailings Basin would be considered, modeled, and, if necessary, undertaken.” “A Contingency Action Plan has been prepared.” (p. 5-569) Actual possible physical modifications to the Tailings Basin in case of a problem are not described.	GT07

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4613	5.2.14.2.3 Hydrometallurgical Residue Facility Design: Site preparation includes installation of a granular drainage layer and wick drains, then temporary loading with imported material to compact the substrate and increase stability. Questions: What kind? Where from? To be mostly removed, and remainder used as more stable base for the HRF waste and liner system. Design Cross-sections. These show waste to be underlain by potentially unstable saturated LTV slimes and fine tailings and peat (see above Design element).	GT08, GT11
4614	5.2.14.2.3 Hydrometallurgical Residue Facility Stress Deformation and Strain in the Liner System: (see Design element above) HRF waste expected/modeled to compact/consolidate after basin is filled, producing a concave surface. Differential compaction would stress the liner system, but modeled strain would fall “within acceptable limits of most geosynthetics.” (p. 5-575). Comment: Need better assurance than this.	GT12
4615	5.2.14.2.3 Hydrometallurgical Residue Facility Global Slope Stability: “Analysis of the new [HRF] dams . . . at their greatest height (at year 20) resulted in a computed Factor of Safety for the ESSA of 2.32, which is greater than the “required” minimum of 1.5.” (p. 5-575). Surface failures are not expected by the modeling. Liquefaction analysis was not performed. Question: What is the strength of the HRF residue/waste? Might it not be at risk of liquefaction?	GT11
4616	5.2.14.2.3 Hydrometallurgical Residue Facility Infinite Slope Stability: Important that “the liner layers must not be allowed to slide relative to one another.” (p. 5-575). Modeling of slope stability using material types, slope angle and predicted friction angle gives predicted Factor of Safety ranging from 1.56 to 1.86, above the minimum required of 1.5 (Table 5.2.14-5). Questions: Again, will the synthetic geomembrane and geocomposite drainage net deteriorate over the long term? With what effects on the Factors of Safety?	GT12
4617	6.2.1 Cumulative Effects Analysis Approach:..This is a too-restrictive definition [of reasonably foreseeable]	CU02
4618	6.2.3.2.2 Cumulative Effects Assessment Area – Spatial Comments: This discussion appears to limit the CEAA to projects “located within the portion of the Mesabi Iron Range encompassed by St. Louis County (see Figure 6.2.2-1)” (p. 6-14-5) Since the NorthMet Project is geologically contained within the Duluth Complex, not the Iron Range, this is an illogical limitation. Although the Iron Range mines and extensions are obviously part of the picture, clearly the CEAA should also cover the area south and east of the Iron Range underlain by the Duluth Complex (outside of the BWCAW), and would include, for instance, the Twin Metals, Teck, Cardero, and Encampment projects. The farther-afield Kennecott Tamarack and Cooperative Mineral resources projects, located in Aitkin and Crow Wing Counties, would not appear to be spatially related to NorthMet. And the Cumulative Effects also clearly extend all the way down the main stem of the St. Louis River to St. Louis Bay.	CU01, CU05
4619	Chapter 8, Major Differences of Opinion.#5, Underground Mining Alternative: Comments: The standard economic factors of fewer jobs for shorter time, and less resource extractable are mentioned in Appendix C, but more analysis should be done on the surface impacts of underground mining versus the open pit plan. The benefits of underground mining may not be as great as claimed...However, any decrease in disturbance of the natural surface by the underground alternative would be beneficial.	ALT01
4620	Chapter 8, Major Differences of Opinion.#6, West Pit Backfill: If mining were to resume adjacent to the West Pit at the end of the Project’s 20 years, one could assume that the pit would have to be either pumped out (if left as a pond) or re-excavated (if backfilled and saturated). Question: Where would this material (especially the water) be disposed of? Again, wouldn’t this water be degraded (acidified to some extent) by contact with mineralized rock? What would be the water quality impacts to the receiving stream (Partridge R.)?	ALT03, ALT06
4621	Chapter 8, Major Differences of Opinion.Other MDOs: Comments: For many of the MDOs (e.g. #1, 7, 8, 9, 13) the Co-Lead Agencies fall back on an adaptive management approach (“If the plan isn’t working properly, we’ll fix it”). While adaptive management is essential, it depends on a high level of trust. Such actions could be necessitated well after the Closure period, and thus come under the responsibility of the State through Financial Assurance funding.	FIN05

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4635	The discussion of methyl mercury is in my judgment, the most significant inadequacy of the PolyMet SDEIS and if the project were to be approved, would be one of the greatest threats of harm from the proposal.	MERC01
4636	The hundreds of acres of peat bogs that will be destroyed in this watershed by the proposed mine, means that hundreds of acres of mercury (Hg) sequestering surface will be permanently lost to the Lake Superior watershed...Therefore bog mitigation must be brought back to this watershed. The PolyMet proposal to replace this loss of wetlands with artificially constructed wetlands in Aitkin and Pine counties having disproportionately less peat bog surface and located in other watersheds, will result in substantial mercury impacts to the Lake Superior watershed. The Sax-Zim Bog wetland mitigation plan shows that there is more than enough wetland mitigation potential in the St. Louis River watershed. (1) Therefore their wetland mitigation proposal should be rejected or modified through the Section 404 permit process with USACE.	COE01
4637	what happens to this mercury-rich peat at the mine site when it is dug up and stockpiled?... The stockpile should be capped unless moved within one year. Such mitigation measures are not discussed in the SDEIS. The SDEIS suggests such a potential major problem with methyl mercury from the mine site. In PolyMet documents under Peatland Disruption we read, "NorthMet mine site would result in a nominally estimated increase of 7- 42% in export of methyl mercury from the watershed". (2) This methyl mercury would be transported down the Partridge River to Colby Lake, both of which already have prohibitively high fish tissue mercury. Is this acceptable to the state and federal agencies involved?	MERC20
4638	The atmospheric Hg emissions from the proposed PolyMet mine and processing plant would contain three species of Hg: elemental Hg, ionic Hg, and Hg attached to particles. The ionic Hg and Hg attached to particles, which are the most chemically reactive, will be deposited locally and the local wind rose (DEIS Figure 4.6-1) shows that the prevailing winds will deposit those species disproportionately within the Lake Superior watershed. This is not what the Clean Water Act demands for the watershed. The Clean Water Act - Section 303 demands the implementation of a mercury TMDL that results in the delisting of waterbodies contaminated for fish tissue mercury. (3) Will the company have to buy "off sets" as defined by the State Mercury Implementation Plan, for any new mercury source?	MERC22
4640	Another mercury problem for these waterbodies that are already listed for fish tissue consumption advisories by the Minnesota Health Department (Colby Lake, Whitewater Reservoir and St Louis River) is the proposed water level fluctuations, due to drawdown at the Whitewater Reservoir...This SDEIS does not discuss all the reasonable design and operating strategies needed to reduce these draw downs. There needs to be an attempt to schedule the water releases and withdrawals of the three mining operations, one city and one power plant that use this river, to minimize sediment exposure and therefore methylation...(4) There needs to be a serious scientific attempt to quantify mercury methylation from water level fluctuations. That has not been done.	MERC20
4641	How will the EIS consider sulfate loading to floodplains, reservoirs and the estuary in the down river reaches where the potential sulfate loading will push concentrations towards and above 10 mg/L which is the wild rice standard and also push to levels that support higher rates of methylation?	WR156, WR162
4642	[St. Louis River estuary fishery] is where the excess sulfate from PolyMet may have its worst impact and it is not even mentioned in the SDEIS let alone analyzed to evaluate cumulative harms to natural resources. This is where sulfate levels are currently low enough so that often the lack of sulfate inhibits the sulfate-reducing bacteria that methylate mercury...Section 303(d) of the Clean Water Act demands that it be addressed...I maintain that it is a violation of the Clean Water Act to permit this mining proposal, knowing that the potential excess sulfate ions are likely to enhance methylation to the point that it would preclude the successful implementation of a mercury TMDL.	MERC01

4643	There must be a discussion of the quantity of mercury added to these [treatment] systems from precipitation and the waste stream. All the ingredients are there for enhanced methylation in an artificially created and perpetually maintained wetland... Any of these proposed mines in water rich environments would be massive sulfate generators.(6) Will you add this discussion to the section Future Transition from Mechanical to Non-Mechanical Treatment Systems?	MERC15, WR137, WR146
4644	Currently, sulfate concentrations are often a limiting factor on mercury methylation and therefore on fish tissue mercury throughout Northeastern Minnesota...Five hundred years of sulfate loading would clearly increase fish tissue mercury and that is not acceptable in such high quality watersheds. (7) Is this acceptable to the MPCA?	MERC02, MERC08
4645	The SDEIS uses muddled modeling. The consultants have used reaches of the Partridge and Embarrass Rivers that are already badly polluted by excess sulfate, to evaluate the potential for methylation to occur...On page 6-30 we see the NorthMet sulfate load to the Partridge river averages out to 5 Kg/d and on page 6-32 the Embarrass loading of sulfate is 94 Kg/d. Do the math, that is over 79,000 pounds/y. What they should have modeled would have been impacts of all that sulfate on downstream wetland methylation where the sulfate concentration is below 8 mg/L. Such a place would be the Scanlon Dam in Cloquet at river mile 35, according to the DNR research by Lindgren and Shuldt, published in 2007...(8) Will there be any modeling of mercury methylation in these waters in the final EIS?	MERC13
4646	Most of our watersheds have a riparian flood plain that typically is inundated each spring and then the water slowly recedes...any sulfate added to this system [lowland swamps and forests] has the potential to enhance mercury methylation in the floodplain of over 100 miles of river. This issue must be addressed as indicated by the MPCA in “MPCA Strategy to Address Indirect Effects of Elevated Sulfate on Methylmercury Production and Phosphorus Availability” adopted 10-19-06.	MERC08
4647	That MPCA Strategy document defines “high risk” for mercury methylation as:...The important sentence “Rising water levels would introduce sulfate into the high-organic wetland matrix, followed by falling water levels that hydraulically deliver elevated MeHg and/or phosphate to the stream,” is the perfect statement of modeling that must be done for the floodplains and multiple backwaters and bays of the entire watershed. It has not been done in this SDEIS. (9) Will that modeling be included in the final EIS?	MERC11
4648	[T]he St Louis River and estuary are such an exceptional sustainable resource that we have to make a better effort to protect it from this new even more dangerous form of mining. The SDEIS needs data and modeling to show the risks to this resource.	WR024, WR072, WR111
4649	[W]ould it ever be possible to complete a mercury TMDL that would get the St Louis River delisted for fish tissue mercury if a “no action” decision were made and the PolyMet project was rejected? The answer is yes, because the science is showing us that what is unique about the St Louis is the significance of anthropomorphic impacts...(10) How do you reconcile the sulfate releases from this mining activity, with the mandate from Sect 303(d) of the Clean Water Act, that a TMDL process should result in delisting these waterbodies for fish tissue mercury?	MERC22
4650	the mercury and sulfates produced by the PolyMet proposal and possible future mining proposals, must be considered in light of the cumulative impacts of mercury and sulfates of all the Iron Range tributaries to a watershed. That has not yet been done. (11) When will that be completed?	MERC10
4651	The current documents consider the area of interest to be limited to the Partridge and Embarrass River sub-watersheds. The area of interest for direct, indirect and cumulative impacts of sulfates on the aquatic resources in this watershed should be the St Louis River from river mile 179, and downstream to its mouth. That has not yet been done.	CU01

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4652	Finally, PolyMet has done an inadequate analysis of the impacts of the PolyMet project on mercury releases, mercury methylation, delisting of water bodies, wild rice and aquatic species. It has artificially limited its analysis of sulfate impacts to portions of the watershed that are already at excessive sulfate levels. (12) Given the requirements of the Clean Water Act for mercury delisting and the cumulative impacts of sulfates on wild rice and game fish, is it not likely that permitting the PolyMet project would violate water quality laws as well as irreversibly harm watersheds?	WR083, WR149, WR152, WR189
4653	Adequate modeling of sulfate impacts on the lower St Louis River will be possible now that we have the data from LCMR proposal #028-A3. At the present it appears that we have a choice, either perpetual water treatment for sulfate at the Partridge River or perpetual fish tissue consumption advisories for the St Louis River..You have chosen perpetual treatment (500 years). That of course is apparently the best choice, however it is a recipe for failure. No one really believes there will be the money or political will to continue the expensive Reverse Osmosis treatment for hundreds of years... (13) Will the EIS address all the issues that will occur when we as a society choose not to continue costly treatment? Shouldn't the EIS consider all likely possibilities, such as a failure to continue costly treatment?	WR037, WR129
4654	The SDEIS proposes to release high concentrations of sulfate to the watershed during the months of September and October assuming that those are not months when wild rice is susceptible to damage from sulfate...In the meantime it is premature to speculate that the sulfate released in September and October will have been consumed and dissipated from the sediments before germination in the spring...(14) Will the state enforce the 10 mg/L sulfate criterion to any new discharges to the Partridge River for the next 500 years?	WR153, WR160
4655	Will this study [Effects of Sulfate on the Biomass and Seed Production of Wild Rice” by Bradley Dewey and John Pastor, University of Duluth, December 20, 2009] be incorporated into the final EIS?	WR152
4656	In my judgment, as a professional biologist, the water velocity, sunlight and substrate were similar at all three sites. The big difference was sulfate, and that made all the difference. How valid is the Wild Rice Standard of 10 mg/L? Put your hip boots on and walk and observe those three miles and you will know. According to all the supporting documents from PolyMet, this was never done. (16) Will this deficiency in the SDEIS be corrected in the EIS?	WR152
4657	In Sources and Fate of Sulfate in NE Minnesota Watersheds, May 16, 2008, Travis Bavin and Mike Berndt say on page 13, “however, increased sulfate loading from mining could potentially have a negative impact on many wild rice beds in the area.” According to NEPA, the area of concern for this project should extend down the estuary, where important stands still survive but could be even more threatened by the PolyMet releases. Adequate data, collecting and modeling have to be completed before this SDEIS can be called complete.	WR157
4658	The lead agencies working on the PolyMet EIS have been asked to do a cumulative analysis of the impact of sulfates on wild rice. That has not been done. Instead, the SDEIS has done individual sulfate analysis on the Partridge River by itself and the Embarrass River by itself. That is hardly cumulative. Based on the observations I have made, as well as guidance from the National CEQ, cumulative analysis must involve the St Louis River as well.	WR159
4659	With loading of sulfate projected to be as high as 5 Kg/d in the Partridge and 94 Kg/d in the Embarrass River which gives 79,497 pounds of sulfate loading per year at closure of the PolyMet operation, the area of influence will definitely extend a considerable distance down the St Louis River. In fact, because of the many other sources of anthropogenic sulfates along the St. Louis River, the “area of interest” for sulfates must go all the way down to Lake Superior. (17) Will this cumulative impact analysis be done before permits are issued?	WR111

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4660	The Schedule of Compliance, dated November 2007, between United States Steel Corporation and the Minnesota Pollution Control Agency, suggests appropriate boundaries for a detailed investigation and analysis in the PolyMet environmental review process. That Schedule stipulates that U.S. Steel shall model sulfate concentrations in the St Louis River and that “Modeling shall be done to the St Louis Bay.” (18) Since the St Louis Bay is the site of well-documented decline in wild rice production, it only makes sense that PolyMet, the biggest sulfate generator proposed for this watershed, must be required to model cumulative sulfate impacts all the way to the Bay. Will that be done in the EIS?	CU01
4661	The remnant stands of wild rice in the Partridge, Embarrass and St Louis Rivers must be protected with enforcement of the Minnesota Wild Rice Standard. Detailed investigation correlating wild rice conditions with sulfate concentrations and modeling impacts of the PolyMet project on wild rice throughout the entire watershed to Lake Superior must be included in the SDEIS.	WR054, WR157
4662	To protect wild rice and avoid unnecessary methylation of mercury, that leachate [at closure] must be and can be collected and treated. The question of course is will it be treated for 500 years? Looking at the Minntac and Dunka and Nugget Plant sulfide releases, we know it will not be treated for 500 years.	WR035, WR156
4664	In this wet environment, the DNR, Army Corp and PolyMet have to explicitly outline what practices will be implemented to kill beavers that dam up flowages and build bank lodges in dikes and ditch banks. Also, the EIS should mention that control of beaver colonies will have to be done in perpetuity.	WI06
4665	Another beaver problem that was not discussed is the impact the beaver ponds have on mercury methylation and how we can legally control these beaver colonies...If the dams are left intact, the ponds will be methylation hotspots with organic carbon, low oxygen, mercury in sediments, sulfate reducing bacteria, and in this river, a surplus of sulfate from mines and tailings basins...However, if you decide to blow those dams you will get a rinsing of methylmercury as appeared to have happen on Second Creek...Beaver can find and obstruct even very subtle flows and could turn wetland treatment facilities into a methylation hotspot. (19) This problem will be around for hundreds of years, will it be addressed in the final EIS?	MERC20, WI06
4666	I would like to address the adequacy of the models used in the SDEIS, from the perspective of the data that is used as input...there seems to be a consistent weakness that reflects lack of rigor in actual field generated data...Two poorly chosen sampling sites missed an important indicator species [Ligumia recta] that could be threatened by this proposal and the alternative proposal. Mussels are sensitive to sulfate levels. Copper sulfate is widely used to kill mussels. When that doesn't work, calcium arsenate does. (20) With all the calcium and arsenic and copper and sulfate leaching out of this mine site, the EIS must address the impacts on Ligumia recta in the Partridge River, or it will be inadequate.	AQ06, AQ18
4668	Biomes are climate dependant. As climatic zones move, biomes move. The climatic underpinnings of our present biomes are shifting to the north. How does climate change relate to the PolyMet proposal? ...the “Federal Court Requires the Fish and Wildlife Service to Analyze Climate Change Effects during ESA consultations” and “Ninth Circuit Court Requires Climate Change Analysis during NEPA”. I fail to find any reference in the SDEIS of the interaction of global climate change and movements of biomes, and especially how this proposal impacts wildlife corridors that are necessary for that movement.	AIR01
4669	That brings us to the analysis of corridors through which all the thousands of species associated with the Eastern Broadleaf Forest must move if it is going to replace the receding Boreal Forest...the SDEIS must address the cumulative effects on corridors for organisms that are much less mobile and there many of them...The SDEIS just plain doesn't do a cumulative corridor impact analysis for plant species...Because of all the proposed expansions on the Iron Range, a cumulative analysis of corridor impacts for a wide variety of impacted organisms is needed.	WI03
4670	Because of the disruption and fragmentation of wood turtle habitat by the PolyMet proposal, this threatened animal (listed as a RFSS by the USFS and listed ETSC species) will be prevented from moving into suitable habitat farther north as the climate warms.	WI01, WI02, WI03

4672	We also read “a total of 94 acres of impacts are predicted in alder thicket communities”...If the wood turtle is going to respond to global climate change and move north, its movement could be blocked by a gigantic mining operation situated at the top of the most northerly watershed with wood turtles...The already severely impacted corridors 16 and 17 will be further “pinched off” by the PolyMet plant, mine and transportation corridor. In Sect. 6.2.3.2.3 we read that the project will consume 6,498 acres!	WI02, WI03
4673	These reasonable management strategies [of the St. Louis River Management Plan] must be addressed in the EIS.	PER35
4674	Of much greater importance is the myriad of other small vertebrates, invertebrates and plants with limited seed and spore dispersal that will have to make their way up this wet corridor as the climate warms and the Boreal Forest retreats. (23) The EIS must try to identify these species and design the proposal in such a way as to have the least obstruction to their access to the few remaining wildlife corridors through the Mesabi Range.	WI03
4675	The SDEIS uses an escape clause...known as the Adaptive Water Management Plan...what would be the options when the company is unable to ensure compliance with applicable water quality standards well after closure, when we lose the money and political will to continue to operate expensive WWT strategies?... It should be considered a very possible catastrophic failure of the plan... Will these horrible options be finally addressed in the FEIS?	WR130
4677	Perceived Benefits: Due to the restrictive and cumbersome access to the Federal lands at the NorthMet Project Site, the Izaak Walton League acknowledges the exchange would improve overall access for both USFS management activities, and for public use and enjoyment, should the USFS acquires these privately held lands as proposed in this exchange.	LAN11
4678	Perceived Benefits: The Izaak Walton League acknowledges a benefit is seen for the USFS in exchanging all of the Federal lands in the exchange proposal, as opposed to exchanging only those lands proposed for the mining footprint (see 3.3.3.2 Land Exchange Alternative B). Retention of the lands outside the mining footprint would result in increased management cost for the USFS, and these lands could potentially be degraded over time due the drift of large quantities of potential toxic dust and fumes produced in close proximity to the mine and processing plant.	LAN11
4679	Perceived Benefits: The Izaak Walton League acknowledges the lands involved in the exchange meet most of the Desired Condition criteria, as outlined in G-LA-2, Forest Plan, pgs. 51-52.	LAN11
4680	Perceived Benefits: The Izaak Walton League acknowledges that a reasonable effort is being proposed that would seek an even exchange of wetlands acres directly impacted by the mine, acre for acre, therefore no net loss of wetlands for the USFS estate, as specified in EO 11990 (see 3.3.1.1 Development of Land Exchange Proposal, pg.3-159, 4th para.).	LAN11
4681	Perceived Benefits: The Izaak Walton League acknowledges a benefit in receiving additional acres (72.3 acres based on GLO records, and 579.6 acres based on GIS analysis) of public land as a result of this exchange.	LAN11
4683	As stated in 3.3.2.1 para. 4, “The United States owns 181 acres of the mineral rights on lands that are not part of the NorthMet Project Proposed Action mine pits (see Figure 3.2-3)”. The plan (see Figure 3.2-3) fails to identify where these lands are located. Figure 3.2-3 does however show two forties of USFS land within or partially within the proposed mining area, and it’s unclear in the SDEIS report if the US will retain the mineral rights, and receive royalty payments for their use, or if the USFS is proposing to sell or exchange these mineral rights as part of the land exchange.	LAN04, LAN06

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4684	The SDEIS in 3.3.2.2 Non-Federal Lands Proposed for Exchange- para. 2, states that “PolyMet currently owns a portion of the non-federal lands proposed for exchange...And in para. 3, “There are no activities proposed on the non-federal lands...From this first statement, the Izaak Walton League believes there should be a detailed map, along with a table, listing mineral ownership or other encumbrances for each parcel (by Forty or Govt. Lot) in the exchange. The table should also indicate if mineral exploration has been done on each forty, and whether there appears to be any merchantable, recoverable minerals present.	LAN04
4685	saying there are “no activities proposed on the non-federal lands” is not the same as saying there is no potential for mining activities in the future on these lands. To avoid the possibility of going through another land exchange involving these same parcels in the future, and to protect the public interest, lands in the exchange should have little or no mineral mining potential, or if there is potential for future minerals development, the mineral rights on these private parcels should be included in the exchanged to the US. If it appears the mineral rights cannot be obtained, alternate lands containing the surface rights along with their intact mineral rights (consolidated ownership) should be offered, and those lands presently proposed in the SDEIS should be rejected as too risky.	LAN04
4686	Land Exchange Alternative B (3.3.3.2) ...The Izaak Walton League proposes adding both Tracts 4 and 5 (192.1 total acres) to Alternative B to achieve a closer acre-for-acre exchange. Once appraisals are completed an evaluation can be made of the relative values, and adjustments can be made in the parcels each is offering, so they are as close as possible in appraised value. This would meet standards established by law (Sec. 206 a.).	ALT24
4687	A review of the environmental impacts including vegetation, shows obvious differences and in vegetative types, age class distributions, as well as major a disruption to the security for threatened plant communities, and species listed as ETSC (endangered, threatened or, of special concern)...It’s assumed that this analysis includes areas withdrawn from timber harvesting such as the BWCAW, cRNA, etc., so this will distort the analysis significantly. Additional analysis using only acres available for timber management/harvesting should be done for the Final EIS, and that data should be displayed in table form and broken down by individual management units. Then a more critically analysis of these changes can be made...cover type changes in the proposed exchange will have little short or long term impact on overall timber market supply, nor will it serve as any economic stimulus, since both the Federal lands and the non-Federal lands were capable of contributing to the local wood basket, with neither in a “no-harvest” status and each having an equal opportunity for current and /or future harvests.	VEG01, VEG03
4688	A review of the truly unique forest components found on the Federal lands is much more concerning than a shift in cover types. There seems to be a somewhat callus lack of due regard for the eleven (11) ETSC species that will be lost, including 10 that are found nowhere else on the Superior National Forest, along with the loss of three imperiled or vulnerable native plant communities that also may be found nowhere else on the Forest, plus a 6100+ acre loss in sites ranked as MCBS High Biodiversity Sites...these losses would be significant to the Forest and the environment, and a serious reconsideration of this exchange is warranted. Even the loss of the MCBS site will result in a permanent loss, since a post-mining site, even following reclamation, will never be the same rich forest as the one it’s attempts to replace.	VEG01, VEG02, VEG03
4702	The SDEIS fails to include sufficiently detailed information about the types of aggregates found, along with their estimated volumes and values, on each of the non-Federal tracts. The SDEIS has also left unresolved an largely unexplained the encumbrance questions in the titles of ownership for aggregate (sand, gravel, stone, etc) resources, as well as a reservations of timber rights in Tract 3...Information should be provided in a table in the Final EIS clarifying the types, and estimated volumes, and values of the aggregates, and it must settle the issue of ownership of all aggregates following the exchange. If aggregates are being reserved on any of the private parcels, this should be considered as a cause for rejecting a parcel prior to the exchange. If the USFS chooses to continue the exchange, and chooses to give up the rights to these aggregates in exchange for considerations in the land appraisal values, it should also then clarify in the Final EIS their position on the prohibition of “surface mining”. Otherwise, management by the USFS of the surface estate will again be in conflict and subject yet again to another land exchange.	LAN03

*Alphabetical by sender's first name*

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4703	There also needs to be a more detailed explanation than what is provided, concerning the reservation of timber rights in the title on Tract 3, in 5.3.1.2.5 pg. 5-586. This would seem to be at odds with both USFS management of the surface estate and the Weeks Law acquisition status, which will be transferred to the exchanged lands. If in fact the timber rights are being reserved and are unavailable for USFS management, this tract must be withdrawn from the exchange.	LAN04
4704	The Izaak Walton League also differs with the SDEIS conclusion dawn in 5.3.1.2.5 pg. 5-587 that the exchange will resolve the conflict “by exchanging the high-risk federal lands for predominantly low-risk non-federal lands. The non-federal lands are predominantly “moderate-risk”, due to the fact that Tract 1, which comprises almost 70% of the acreage in the exchange, is considered at moderate-risk for both “conflict” and “quality of title”.	LAN04
4705	Finally, in regards to title encumbrances, an issue that will need some study and resolution is the conflict between outstanding severed aggregate rights in the northeastern portion of Tract 1, and the plan to extend cRNA status to the Loka Lake cRNA, also located in the northeast corner of Tract 1. (See pg 5-586 2nd para. and pg 5-610 4th para.) Gravel extraction and a cRNA at the same location seem incompatible.	WILD01
4713	The rejection of alternative 3.3.3.3.6 Underground Mining Alternative fails to take into consideration language found in both the deed and the law during the acquisition, which transferred surface ownership of these lands to the Federal government... statements protecting and limiting damage to the surface estate, and the purposeful inclusion of language discussing underground mining, make it evident that the rights of the surface owner to enjoyment of the land and providing limitations under which the owner of the reservation (mineral rights) must abide in any and all types of operations when exercising their rights to the minerals found within, were central to the acquisition of these lands. Therefore, an open pit mine was considered incompatible with the rights of the surface owner, the Federal government. In order to exercise their mining rights, there can only be an underground mine.	LAN04
4717	EO 11990 specifies a “no net loss of wetlands” for compliance. While the USFS is balancing the wetland losses with gains within the Forest, the State of Minnesota would still lose a significant number of acres of high quality wetland at the proposed mining site... None of these indirect wetland loses are calculated in the land exchange, nor are there proposed wetland mitigations for these types of losses. So, Minnesota will still lose 7000 acres of wetlands, even after mitigation for the direct impacts. Indirect impacts must be addressed in the final EIS, to achieve a “no-net loss of wetlands”, in both the exchange and in the wetland mitigation strategies[.]	WET14
4718	The Land Exchange fact sheet extols the benefits of this exchange with multiple [bullet points for various resources]...All of these resources already exist, and are serving the people of the State of Minnesota, so there is no real gain in this exchange for the citizens of the state...they should not be touted as a “Net increase”, but should be viewed as an existing resource... Unfortunately, all of these natural resources are being viewed from inside the USFS silo, when a more appropriate view would be from the balcony, where the whole picture of Minnesota can be seen. The citizens of the state would be better served if the SDEIS dealt with the project’s cumulative impacts resulting from this proposed land exchange.	LAN01
4720	Provisions of the Weeks Law, particularly Sec. 9 and 11, seem to impact the decision making in this exchange, but neither section are addressed in the SDEIS...This [Section 9] could be interpreted to say that the USFS as surface owner may establish and publish rules and regulations under which the subsurface owner must operate, and that all actions by the reserve owner must follow these rules and regulations. Clearly, the original intent of Congress in passing the Weeks Law was for these lands to be permanently reserved, held, and administered by the USFS. To do otherwise is to disregard the intent of the Law.	LAN02

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4721	As a Federal agency it is the responsibility of the USFS, the EPA and the USACE to uphold and protect all provisions of the Treaty of 1854...The land exchange would eliminate forever the potential use of the existing Federal lands for hunting and gathering, and exchanging the non-Federal lands for Federal lands, would still result in a loss of acreage on which to carry out these rights within the ceded Territory... Therefore, the Final EIS must address the issues stated here, such that the Final plan and its implementation do not infringe upon any of the rights of the Tribes.	CR01
4722	The SDEIS gives inadequate consideration to the “No Action Alternative” of the land exchange. The No Action Alternative must be reconsidered because: •The mining proposal as currently outlined in the SDEIS fails to meet multiple environmental regulations which would lead to destruction of the land and pollution of the waters for many centuries •It fails to protect the rights of the tribes as guaranteed in the Treaty of 1854 •There is inadequate review of human health impacts at the mine, in surrounding communities, and in the watersheds below the mine  •There is inadequate review of cumulative impacts resulting from all previous and existing mines, and for all proposed mines that could be permitted over the next 10-15 years in this watershed •The economic analysis was biased by only modeling the benefits, with inadequate analysis of the practical projects costs •The intent of Congress in acquiring the lands within the Superior National Forest under the Weeks Law were to protect the waters and promote the growth of forests, in perpetuity •The exchange only marginally improves the conflict in the severed estates, and fails to fully resolve this conflict in the future because of uncertainties over aggregate rights on the non-federal lands •Overall, the sum of these failures constitutes a failure to meet the obligation by law, that the public benefit must be well served by the exchange	LAN01, LAN02, LAN05
4723	under the “Purpose and Needs Statements” 1.3.2, there are several references to “resolve this fundamental conflict”, which we must assume is referencing the rights of the mineral estate and that of the surface estate. Under 3.1.2 it states “PolyMet leases the NorthMet Deposit’s private subsurface rights. However, under the Weeks Act of 1911, the USFS is restricted from allowing, by decision (see 5 above), surface mining on Federal land, such as that purposed by PolyMet.” It appears the “conflict” is a result of actions knowingly and intentionally taken by PolyMet that are in direct conflict with the long-standing decision by the USFS to protect their surface interests by not permitting surface mining. There is no discussion in the SDEIS of PolyMet choosing to relinquish its lease of the NorthMet site to resolve “the conflict”.	NEPA04
4724	The Final EIS will need a thorough reconsideration of the “No Action Alternative” including an expanded discussion of the rejected underground option. Such an analysis should result in a more thorough examination of the economic services provided by the existing surface acres at the mine site...If accommodating the broader responsibilities the Co-lead agencies are charged with meeting under the Weeks Act, and, under the DNR mission statement, results in an unprofitable project currently, it may be best in the long run to defer development of the proposal until a date when the technology exists to accommodate return on equity in the marketplace, and, achieve the smaller footprint.	ALT14
4725	The main reason given for establishment of the Superior National Forest and the purchase of Federal lands through the Weeks Act was to protect the headwaters of the St. Louis River. The proposed land exchange and destruction of wetlands in these headwaters is a violation of the intended purpose of these Federal lands...As a result, our citizens will lose the watershed protection values that were intended by the establishment of the Superior National Forest...We question the validity and wisdom of this land exchange because it will nullify the protection of watershed values in the Partridge and Embarrass rivers; the lands obtained through the exchange may not be covered by the Weeks Act, and it will set a bad precedent that opens the door for future land exchanges.	LAN02
4726	The land exchange sets a bad precedent and it is unknown how many additional land exchanges may be needed for future mine proposals...We question the validity and wisdom of this land exchange because it will nullify the protection of watershed values in the Partridge and Embarrass rivers; the lands obtained through the exchange may not be covered by the Weeks Act, and it will set a bad precedent that opens the door for future land exchanges...Before the PolyMet exchange is approved, we would ask that the Superior National Forest evaluate how many more land exchanges may occur, and determine what the cumulative impacts would be upon watershed values and land ownership patterns in the Forest.	LAN02

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4727	Allowing the loss of so much forest and wetland cover in these headwaters and the potential impacts to their hydrology and water quality are counter-productive to the MN DNR's mission of long-term protection of the state's surface and groundwater resources...We ask that the DNR follow the recommendations of their own report and evaluate the PolyMet project in a watershed context...Based on the extent of forest and wetland destruction, the likely changes in groundwater hydrology, and the potential for water quality impacts, as documented in the SDEIS, it seems clear that the PolyMet project would not meet these standards for watershed protection.	WR195
4728	Too much wetland and stream area will be destroyed or impacted by this project to be considered an environmentally responsible mine...These wetlands are located in the headwaters of the Partridge and Embarrass rivers where they play an important role in maintaining the health of these watersheds. Many of the wetlands are acid peatlands that are perched above the shallow water table and depend upon precipitation rather than groundwater for their water supply. The functions and values of these types of wetlands are very difficult to mitigate or replace.	WET05
4729	It is evident from reading the SDEIS that the extent and severity of these indirect impacts are basically unknown and difficult to predict. The SDEIS says that it was not feasible to model the effects of mine dewatering on wetlands due to the complexity of the bed rock and soils at the mine site, and the wide variety of groundwater flow rates through these soils and fractured bedrock. As a result the indirect wetland impacts will have to be determined by monitoring after the mine is permitted. This leaves us with a huge question mark about the ultimate extent of wetland impacts that will result from the mine.	WET01
4732	The ecological quality of the stream and wetland complex that would be impacted by this project is very high and deserves the highest level of wetland mitigation...All of the above factors lead us to conclude that the diversity of wetland habitat and river systems found around the NorthMet project are providing significant ecosystem services. We believe that they should be considered a high-quality wetland complex, and should receive the highest level of protection and wetland mitigation possible.	WET24
4733	However, due to the large area and high quality of wetlands in the project area, we believe that the known wetland impacts are still far too great and the potential for unanticipated impacts is significant. We recommend that underground mining and the placing of as much of the reactive waste rock as possible back into the mineshafts be given serious consideration and evaluation in the Final EIS. This option should not be rejected solely on an economic basis...The underground mine option could substantially reduce the level of wetland and water quality impacts in the headwaters of the St. Louis River, and may eliminate or reduce the need for a land exchange.	ALT01, ALT13
4736	The proposed mitigation does not compensate for the loss of wetland functions and values in these headwaters...mitigation will occur outside of the St. Louis River watershed and fails to compensate for the watershed functions and values that will be lost in the Partridge and Embarrass rivers, which had been protected by the Weeks Act...Because of the high-quality of the wetlands on the Mine Site, the difficulty in restoring or creating bog and forested wetlands, and the lack of adequate mitigation within the impacted watersheds, we would ask that the Corp of Engineers require a mitigation ratio of 2:1 for mining impacts to these wetlands.	COE12
4737	analysis [of fugitive dust impacts on wetlands] seems too conservative and does not appear to consider the huge volumes of dust that would be released by blasting activities which would almost certainly cast a significant dust cloud downwind of the mine in the prevailing wind directions (NW and SE of the mine site). We would like to see a description and evaluation of how blasting activities might affect dusting of wetland vegetation in the Final EIS.	WET11
4738	The potential toxic effects of sulfur and heavy metals upon wetland vegetation from fugitive dust are not adequately considered or evaluated...The SDEIS also does not appear to consider the potential toxic effects that sulfur or heavy metals in the dust might have on wetland vegetation... We would like to see an analysis of this chemical impact upon wetland vegetation, and an explanation of the potential toxic impacts to vegetation by sulfur and heavy metal contamination from fugitive dust.	WET11

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4739	It is not accurate to use the natural range of variation of stream levels as a way to measure potential impacts to riparian wetlands from long-term water level changes caused by mining...We also question the analysis of the level of impacts expected to wetlands in the riparian zone of the Partridge River...Water levels can vary dramatically from spring highs to summer lows and can be nearly dry during droughts. Saying that the changes in average annual flow will be within this dramatic range of variation leaves us with little confidence that the abutting wetlands would not be significantly impacted.	WET08, WR183
4740	The failure of state agency regulation of iron and taconite mines to correct current pollution issues does not give us confidence that future problems with sulfide mines will be adequately addressed...This leaves us with little confidence that a new mine in the same general location with much larger quantities of reactive rock can be built and managed without causing significant damage to wetlands, water quality and the surrounding environment.	WR023
4742	Page 5-16 states, "Because the NorthMet Project area is located in the Lake Superior Basin..." The Great Lakes-St Lawrence River Basin Water Resources Compact (the GL Compact) applies. The GL Compact includes the St Louis River.	PER27
4743	SDEIS Executive Summary (ES) Page 39 "Four additional state-listed species -..." Does not include moose, recently listed as a species of Special Concern.	WI01
4744	Page 4-201 states on Canada Lynx, "...not listed as an ETSC species in Minnesota..." Lynx are listed as a species of Special Concern in MN.	WI01
4745	Page 4-204 lists Wood Turtle as "globally vulnerable" and "imperiled in MN". Wood Turtles are listed as Threatened in MN which confers special status for takings on them similar to that of Endangered Species. The St Louis River and its tributaries provide some of the most important nesting sites and populations of Wood Turtles in the state.	WI01, WI02
4746	Page 4-207 lists Black-backed Woodpecker, Boreal Owl and Spruce Grouse as Species of Greatest Conservation Need (SGCN) in MN. All are dependent on mature coniferous forest.	WI01, WI02
4747	Page 4-212 mentions that the LTVSMC Tailings Basin attracts waterfowl, loons, etc but makes no mention of the ingestion of contaminants as an issue for these birds or other predators consuming them that are higher on the food chain.	WI04
4751	Since many of these plants are state-listed as endangered, threatened or special concern due to their rare status it seems implausible that removal of even 1 percent of their known populations could possibly be considered as sustainable resource management. It constitutes a "taking" under state law, and is completely unacceptable. Simply stating that these are small populations or that other populations may be located elsewhere in the future is no guarantee of their continued existence on the landscape and is a loss of natural resources to the people of MN for generations.	VEG01
4752	SDEIS Executive Summary (ES) Page 35 states, "The NorthMet Project Mine Site drains to the Partridge River and the Plant Site drains to the Embarrass River. Both rivers are tributaries to the St Louis River, which flows to Lake Superior." The GL Compact language on protecting these finite resources applies here as well.	PER27
4753	Page ES-37 Several of these wetland types make up critical habitat for several of the ETSC wildlife species mentioned in the Wildlife portions of the SDEIS. A mitigation ratio of more than 2:1 should be used for replacement of these state and federal resources.	WET04
4754	Page ES-50 states, "4,016.3-acre decrease in vegetation and wildlife habitat in the NorthMet Project area." and "Wildlife corridors at and adjacent to the NorthMet Project area would be affected through the reduction of access to these corridors." In light of increasing climate change stressors on these already rare populations, reducing the ability for these organisms to migrate through actual individual animal movement or plant seeding and genetic distribution is an unacceptable loss to our state's natural heritage.	WI03

<b>Sender Name (Submission ID)</b>	Minnesota Izaak Walton League (38074)	
4755	Page 4-46 states, "...approximately 90 percent of the wetlands within the Mine Site are ombrotrophic.... Again, these types make up critical habitat components for some of the ETSC species listed in the Wildlife portions of the SDEIS and will either be completely eliminated by the proposed action or adversely impacted directly or indirectly through hydrologic impacts (water level fluctuation and ground and surface water contamination).	WI02, WI06
4756	Page 4-133 states, "Further downstream, most of the St Louis River is also listed for "mercury in fish tissue" impairment..." There is no mention of limiting the further contributions of mercury to the system and the implication seems to be that the rivers are already impaired so any additional mercury loading is not a problem. This is unacceptable.	MERC02
4768	These mitigation projects [Aitkin, Hunckley, Zim] assume that permitting agencies will allow "restoration" and "preservation" credit for "restoring" and "protecting" coniferous bog and swamp that are already functioning as wetland communities.	WET04
4769	Page 5-320 describes the site near Floodwood that was originally proposed for wetlands mitigation efforts and credits but later dropped for several reasons. This site is similar to the proposed mitigation site at Zim... There has been no change in the level of peat mining operations or the forest practice of tree-topping in St Louis County since that time so why would mitigation credit be given for the proposed Zim site with similar vegetation, plant community and resource use history?	WET06
4770	Again, the implication is that only a small percentage of these state-listed rare plants and "imperiled" communities will be impacted through this project and that other populations, "may be found" at some unspecified point and place in the future. Baseless, illogical rationalization for destroying these state and federal resources.	VEG01
4771	The SDEIS goes on to describe that there will be a decrease to the federal estate of 6,142.7 acres of areas High Biodiversity Significance and an increase of 767.9 acres in areas of Moderate Biodiversity Significance. By their definition, areas of High Biodiversity Significance are "the best of the rest" and areas of Moderate Biodiversity Significance are "the best of what's left". Why should the citizens of MN settle for "what's left" at the expense of some of the best?	VEG02
4772	The document goes onto describe the impacts of the proposed project on area natural resources (wildlife, native plants and plant communities) and generally minimizes the impacts to these finite, rare, imperiled, and diverse organisms and habitats. These are public resources as well as important habitat elements that "will be permanently lost". Coniferous bogs and swamps, as well as shrub swamps, are critical habitat components for moose (calving, thermal cover and feeding areas) and several other ETSC and SGCN species. These plant community types are almost impossible to re-create through mitigation techniques. The areas of Biodiversity Significance are just that. They cannot be recreated or restored in our lifetimes or even our grandchildren's lifetimes. These losses to our water resources and natural heritage, as proposed, are unacceptable and must be mitigated at the highest levels or this project should not proceed to permitting.	PD01
4773	In the review and discussion of the present SDEIS, Izaak Walton League is encouraged that the SDEIS is improved. New subjects are added. Adaptive management has potential merit. However as noted, many significant mitigations remain unclear. Izaak Walton League does appreciate the hard work involved in the SDEIS. Three public meetings have been well conducted and well attended. Passionate and well-informed comments have been offered. Friends and neighbors with very different perspectives have conducted themselves admirably on average. There is a good deal of information in the SDEIS. However, we believe that there is more work to be done before the NorthMet SDEIS becomes final.	NEPA15, NEPA17
4775	Our overall conclusion is that the SDEIS for NorthMet is significantly deficient in meeting its assessment, environmental disclosure and public trust responsibilities.	NEPA09

4776	Slope Stability: Modeling results for Factor of Safety during construction and long-term closure are given in Table 5.2.14-1; they appear adequate. Liquefaction: Potential for this extreme hazard was evaluated under various scenarios, showing that the “design would meet the minimum Factors of Safety deemed acceptable by the Co-Lead agencies” (see Tables 5.2.14-3, 5.2.14-4) However, those minimum Factors of Safety seem dangerously low to this reviewer.	GT02
5106	MN DNR Director of Lands & Minerals has recently testified before the House Environment, Natural Resources, and Agriculture Committee (2-11-14) that it is in a position to successfully regulate PolyMet, secure adequate financial assurances, etc. We have good reason to doubt the confidence represented by MN DNR on that day and believe it is a critically important issue.	PER06
5137	5.2.14.2.2 Tailings Basin Liquefaction: Potential for this extreme hazard was evaluated under various scenarios, showing that the “design would meet the minimum Factors of Safety deemed acceptable by the Co-Lead agencies” (see Tables 5.2.14-3, 5.2.14-4) However, those minimum Factors of Safety seem dangerously low to this reviewer.	GT02
5140	6.2.2.1.21 Speculative Actions: Comment: Although the mineral resource projects listed here have not developed to the public proposal or scoping stage, a great deal of drilling, sample analysis and other exploratory work and engineering studies have been invested in many of them, and proposed development is likely within the active period (40 years?) of the NorthMet Project. At the least, this Chapter should show on maps the mineral holdings of each of the eleven companies or projects mentioned under Speculative Actions.	CU02
5155	All of the new sulfate produced in the proposed mine waste heaps, tailings basin, sulfuric acid mist and acid rain, has to go somewhere. Of course, it is headed downstream to river reaches and associated wetlands that are lower in sulfates... That is correctable and PolyMet can either exacerbate the problem and push the sulfate impact all the way to Lake Superior or improve the situation, depending on how long they treat or don't treat their leachate.	WR036, WR111
5181	As mentioned earlier, the SDEIS proposes to release high sulfate loading during the months of September and October when in fact, the MPCA is in the process right now of determining when sulfate releases do actually raise the sediment sulfide levels such that it damages wild rice roots.	PER10, WR152
5188	Under the Law (The Act of March 1, 1911 aka the Weeks Law) the lands were purchased with appropriations allocated for the express and stated purpose of “protection of the watershed of navigable streams, and ... for the acquisition of lands for the purpose of conserving the navigability of navigable rivers.” These monies were spent with the chief intent of protecting the waters and the timber within the watershed. While subsequent revisions to the original law (16 U.S.C. 516) have been written to permit land exchanges of Weeks Law lands “When the public interests will be benefitted...”, it is easy to see that this proposed exchange fails that test, because it negatively impacts the very waters the Law was passed to protect, and would lead to both public health and the environmental harm lasting for hundreds of years or longer. Therefore this exchange does not benefit the public and must be reconsidered.	LAN02
5189	Page 4-210 mentions moose declines and low populations but does not discuss the implications of habitat loss particularly summer and winter thermal cover provided by mature conifer forest and forested wetlands.	WI01, WI02
5350	These [SDEIS wetland impact] numbers clearly suggest that a substantial area of additional wetland impacts can be expected beyond that destroyed by construction. And if the SDEIS has underestimated the assessment of impact, the additional wetland loss could be huge.	WET24
5351	Also, since suitable wetland mitigation has not been found for these watersheds, we would ask that the regulators request that PolyMet use measures in addition to wetland mitigation to replace the lost watershed values. This could include measures such as water retention ponds, shore land buffers, and other “green” technology to collect and store runoff in these watersheds.	COE01

<b>Sender Name (Submission ID)</b> Minnesota Izaak Walton League (38074)		
5352	We are concerned that this language is too vague and does not provide enough assurance that mitigation for indirect impacts would actually occur.	WET01
5353	From information contained in the SDEIS it seems likely that at a minimum another 500 or more acres of wetland are likely to be significantly affected by so called “indirect” impacts. We would like to see up-front wetland mitigation be required for these additional impacts or at least a demonstration in the Final EIS that sites have been identified and secured where this mitigation could take place when needed.	WET01
5354	We would encourage the regulatory agencies to focus wetland mitigation efforts to wetlands that have been completely or significantly drained, or significantly modified by agricultural practices... We would like to see an independent agency, such as BWSR, be given the task of monitoring and determining the mitigation required for these mining projects.	COE01, COE06
<b>Sender Name (Submission ID)</b> Minnesota Nurses Association (40485)		
5462	The co-lead agencies should conduct and include a health impact assessment (HIA) in the Environmental Impact Statement to fully analyze the public health implications of PolyMet's proposed mine... A HIA would integrate human health into the environmental review for the PolyMet NorthMet proposal, allow consideration of mitigation measures, and involve the community in planning for the project.	HU01
5862	The PolyMet NorthMet Supplemental Draft Environmental ImpactStatement (SDEIS) contains inadequate analysis of the impacts onpublic health from the proposal.	HU01
5865	The [requested] HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health.	HU01

17060	Today's modern mining operations are automates with unmanned, driverless trucks, trains, and drills, reducing the instances of exposure to death in the mines. The results are an increase in safety, reduction of contact with health hazards, and improved productivity.	HU03
17061	The implementation of automated, robotic mining allows operation of mines from remote locations. So it may be that Duluth or Minneapolis will get the high paying jobs generated from Ely's mining operations and not the local population.	SO06
17062	Although the safety of mine personnel and equipment emissions reduction should be improved by automation, we are likely to get increased pollution from the coal fired utilities supplying enormous amount of electricity for the mines' processing facilities.	AIR02
17063	One important issue in the mining controversy is the method of taxing the mining companies. The present method for iron ore, created in 1941, is called the "production tax". The regulations for this taxing system are antiquated and complex. The do not appear easily applicable to a company mining multiple minerals consisting of copper, nickel, cobalt, platinum and gold. And if history is any guide, we will get decreasing production taxes in what is likely to be an inflationary economy. Most of the billions of dollars will go to foreign companies and they will also be shipping this wealth abroad with little return for Minnesota citizens.	SO06
<b>Sender Name (Submission ID)</b> nan stevenson (7164)		
530	Yes, it creates jobs, but only in the short-term and it will pollute the watershed for hundreds of years. Not a good trade-off. We have the ability to recycle old minerals and use renewable sources for energy.	SO01
681	We have the ability to recycle old minerals and use renewable sources for energy.	ALT16
<b>Sender Name (Submission ID)</b> nanakay@unitelc.com (39824)		
6907	If MN DNR approves this project, it will be authorizing acid mine drainage which includes cancer causing heavy metals to enter the pristine environment of Minnesota.	HU07
6923	[The SDEIS] does not indicate a contingency plan for mechanical break-downs in the complicated filtration system that Poly-Met proposed to treat wastewater, even though it would have to operate for centuries. There are no contingency plans for the smallest or biggest failure of this complex mechanical system of pumps, pipelines and filters...This plan also does not assess the impact of more frequent heavy rain on operations which is likely to happen due to climate change.	PD22, WR128, WR130, WR131
14272	According to Poly-Mets own data, the mine would be in operation for approximately 20 years, but would generate toxic water pollution in the headwaters of the Lake Superior basin potentially over 500 years. This demonstrates an unconscionable disregard for our environment, water resources, wildlife and human health of MN citizens.	WR115
14273	The mining company will likely go bankrupt after it has left it's destruction to our precious environment, and leave the cost of the clean-up to Minnesotan's for the next 500 years or more.	FIN01
14274	This plant which will be coal fired, will add to greenhouse gases and have negative impact on climate change.	AIR01
14275	The health effects of copper mining have not been adequately addressed in the Poly-Met environmental review. There will be increased mercury emissions, exposure to asbestos like mineral fibers and arsenic. The World Health Organization has listed 5 or the 10 chemicals used in this process project of majoy public health concern.	HU01

488	Any project that relies on several hundred years of continuous water treatment should not be given a moment's consideration.	PD03
<b>Sender Name (Submission ID)</b>	Nancy Dowling (36801)	
8669	The SDEIS is insufficient. . .It does not provide important information, such as the details of the proposed water treatment systems or how the centuries of operations, maintenance, monitoring and reconstruction of water treatment facilities will be paid for.	FIN01, FIN05, WR128, WR143
<b>Sender Name (Submission ID)</b>	Nancy Ellis (38713)	
16391	I care about jobs, of course, but not mining sulfide ore in the Boundary Waters watershed and the Lake Superior watershed.	WR111, WR115
<b>Sender Name (Submission ID)</b>	Nancy Gibson (18336)	
2417	The geological complexity of northeastern Minnesota lacks a high level of investigation, execution me, and testing to achieve stringent management of potential contaminants.	WR071
2419	the monitoring for potential contaminant releases will be difficult or ineffective, yet needs to be examined	PD05
2420	lack of effective groundwater maps above the bedrock need to be assessed to better understand the distribution of aquifer and non-aquifer sediments.	WR071
11240	Polymet needs to address the sulfate standards and how they will comply to protect the existing stands of water bodies that were previously documented stands present within a water body dating back to November 28, 1975. The SDEIS lack this compliance issue.	WR154
14618	there needs to be a development of approximate containment of monitoring systems.	PD01
19897	A critical omission of the SDEIS is the study of moose and the impact on its population dynamics. The initial Polymet project proposes to drain 93 wetlands in moose habitat. Where will those wetlands be replaced? The trade-off in wetlands may or more likely not aid our dwindling moose population...The SDEIS does not mention Minnesota's latest designation of moose as a species of special concern: a species that has been decreasing in alarming numbers	WI01
19941	Lack of effective groundwater maps above the bedrock needs to be assessed to better understand the distribution of aquifer and non-aquifer sediment types. In summa this is a complex system and must be mapped as effectively as possible. This includes the subsurface areas if containment of contaminants and meaningful monitoring are to be achieved. Therefore, I advocate for additional work to characterize these systems.	WR135
19979	The geologic complexity of northeastern Minnesota lacks a high level of investigation and testing to achieve stringent management of potential contaminants.	WR099
20007	The work to date doesn't address fractures in the subsurface areas and their effects to an adequate level...There are no robust characterizations of those fractures at mine and processing sites.	WR099
20009	There are no guarantees that there will not be an unforeseen mishap.	AQ22

13635	I have been going to the BWCA off and on for many years, and I can't believe that mining as described will in any way NOT affect the BWCA area, the water and the future for that area.	WILD02
13636	The small amount of jobs that would occur with the mining for the short period of time that they are mining does not seem like a good balance for the state and nation in this area. There is also NO confirmation that the people getting the jobs would be from the northern area of Minnesota at all.	SO01
13637	Even if they set aside a billion dollars for clean-up of the area after the mining, it will no longer be the pristine area that it is now. You can't take back what you destroy in nature! We want to preserve that area for our grandchildren and beyond, so that they can learn to appreciate and enjoy what a national treasure that is there.	WILD02
<b>Sender Name (Submission ID)</b> Nancy Hauer (14806)		
13793	No number of mining jobs are worth 500+ years of water pollution in Minnesota.	SO01
<b>Sender Name (Submission ID)</b> Nancy L Eisinger (54726)		
18712	I think the risks are not worth the price of compromising the land and lakes near the BWCA. There is no way Poly Met can guarantee clean water, soil and air for us and our future generations.	SO01
18715	The potential scope for pollution from this proposed mining operation is mind-boggling. The proposed site is precariously close to some of ourstate's most pristine area for leisure and tourism- the BWCA.	CU11
<b>Sender Name (Submission ID)</b> nancy It rosenbower (47667)		
17272	the short-term fix to the economic difficulties on "the range" will not give lasting value to the area. and, on top of that, it will leave the area less able to support the tourism and small niche businesses already active in the area.	SO02
<b>Sender Name (Submission ID)</b> Nancy Mcready (18124)		
3426	"It's never been done before." "All copper-nickel mines pollute." [Environmental groups] have become extreme preservation groups against economic development. These preservation groups refuse to acknowledge advances in mining technology instead of embracing new technology and working with PolyMet and others...The environmental community should be ashamed of themselves. They should be embracing new technology and working together to make this project happen.	SO10
7480	[M]ining these strategic metals here in Minnesota, where there are strict environmental regulations, is a matter of national security!...We believe the new technology is available and PolyMet...will be able to aid the Pentagon with recovery of these precious metals and make the United State strategic metal independent.	NEPA05
10641	We believe the SDEIS prepared by the three agencies is a good document and addresses environmental issues thoroughly.	NEPA16
10642	There are several precious metal mines that are operating today, or which have operated recently, without harm to the surrounding environment.	GEN02

17601	I am for responsible mining, and the proposed mine will further pollute our waters. I know 2 men who died from cancer within the past 9 months who lived in Aurora. In my own neighborhood near Eveleth, 5 people within a 3 block radius have died from various cancers and another 5 others who have had cancer / or tumors including myself twice, who are surviving.	HU05
17602	Please listen to us- these decisions are irreversible in our lifetime, have little economic benefit, and definitely have a heavy financial and health cost that seriously outweighs the economic benefit. Please listen to reason!	SO01
<b>Sender Name (Submission ID)</b> Nancy Norr (47282)		
9293	The three public events were very well managed and provided the public with incredible resources. The web site information, fact sheets and videos have also raised the bar on how projects of complex and often controversial nature should be handled.	NEPA17
9294	A significant economic base for this region is and will remain mining. The growth of this industry is critical to the long term success of the region and will support a way of life for generations to come... As the public comment period for the project's Supplemental Draft Environmental Impact Statement (SDEIS) comes to a close, we are one step closer to bringing 360 full-time mining jobs to the Range and more than 600 spinoff jobs in other industries.	SO10
9295	Every development – from new office buildings to housing developments to airports to the highways that bring vacationers to northern Minnesota – impacts the landscape... Our former mines are now lakes that enhance our environment and by bringing mining companies and communities together, the Laurentian Vision Partnership guides future land use after mining closure.	LU07
9296	Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and educational systems and will create a domestic source for metals essential to our quality of life.	SO10
9297	Our state has some of the strictest environmental regulations in the country, and the environmental review process for the NorthMet project has been sound and thorough.	PER34
9299	Keeping jobs here and doing mining the right way is arguably the real definition of economic and environmental justice. It would be irresponsible to import these metals from countries that do not have strict environmental standards when Minnesota has the opportunity to mine responsibly.	SO10
14635	I see the no-action alternative. The "no-action alternative" is a death sentence for the communities of the east Iron Range. I don't know how you quantify empty storefronts and classrooms and boarded up houses. I don't know how you quantify families moving away.	SO10
<b>Sender Name (Submission ID)</b> Nancy Pius (6178)		
1153	The SDEIS contains no cost/benefit analysis of the PolyMet mine.	SO04
1154	The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota.	SO04
1155	The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable	SO04
1156	The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment.	SO04

<b>Sender Name (Submission ID)</b> Nancy Pius (6178)		
1157	The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees.	SO04
1158	What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear?	SO04
1159	PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. Not all of the polluted water will be captured for treatment.	WR021
1160	The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water.	WR070
1161	The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations.	PD22
1162	Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties.	PD22
1163	The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged.	HU01, WR060, WR130
1164	Minnesota Rules 6132.3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment.	PD02
1166	The SDEIS contains no credible information about the actual cost of monitoring, maintaining, and replacing the equipment needed to treat polluted water for 500 years or more. It provides no details about the nature or guarantees of a financial assurance scheme that would remain viable for 500 years	FIN01, FIN05, FIN11
1168	Finally, even though the SDEIS admits that water pollution will last for a minimum of 500 years, its financial assurance section is an exercise in generalities. The actual cost of water treatment, monitoring, maintenance, repair, and reclamation is completely unknowable. The SDEIS says that PolyMet estimates initial closure costs of up to \$200 million, with post-closure monitoring and maintenance costs of up to \$6 million annually.	FIN01, FIN05, FIN11
<b>Sender Name (Submission ID)</b> Nancy Sampson (57214)		
17150	Let clean water be our legacy – not toxic pollution from mining! NO to PolyMet’s 20 years of mining @ the headwaters of the St. Louis River – NO to 500 years of toxic runoff.	WR195
<b>Sender Name (Submission ID)</b> Nancy Schultz (40897)		
6696	All the proposed methods in this SDEIS [to preform extraction of sulfide containing metals safely] are not new, and if they were, testing them in a highly sensitive wetland and environmentally rich native wild rice ecosystem sounds like a really bad idea. The consequences of polluting our water, with its highly varied flow patterns and rates system, is too great for the short term gains of a mining economy.	VEG04, VEG06, WET24
6703	Why doesn’t the [SDEIS] require that the 939 acres of wetland being destroyed, at the very least be replaced with wetlands that do the same job and serve the same habitat and the same streams. It doesn’t deliver this hence destroying 68% of the wetlands by not having them associated with the Lake Superior Basin at all.	WET03

<b>Sender Name (Submission ID)</b>	Nancy Schultz (40897)	
6706	The SDEIS admits that the sulfide mine will directly destroy 913 acres of wetlands. It then says that as much as another 7,351 acres of wetlands could be lost due to pollution and changes to water patterns in the mine and tailings site. Why aren't there alternatives provided in the SDEIS to avoid or minimize this wetlands loss?	WET20
6715	PolyMet sulfide mine tailings will be stored on top of the old, already leaking, LTV tailings dump. This site is an unlined pile about two miles across set on top of peat and streams. It was built for taconite, not for sulfide mining, at a time when they wanted tailings piles to leak so they would be less unstable. There will be no liner under the new sulfide mine tailings. This tailings pile will need to be treated forever, how do you put a cost and sureties on forever?	FIN05, FIN11
6717	When flooding occurs during the 10 and 100-year rains, why isn't there a plan or indication of impacts for how the waste area will impact the waters when this massive acres of waste storage is flooded?	WR130
6725	The tailings basin is proposed to be completely unlined, there is no indication that fractures beneath the tailings site would transport pollutants, which is completely unrealistic...Existing tailings seepage already exceeds groundwater standards. In addition, on the LTV site, adjacent to the tailings, the SDEIS has documented that Area of Concern #8 has plume of pollution propagating through fractures. How did PolyMet arrive at the assumption that seepage will not happen through these fractures?	WR010, WR012, WR070
6728	Why isn't there an analysis done on the levels of manganese and lead that will in all likelihood make their way into the drinking water wells? Levels downstream of the tailings basin already indicate they have high levels of toxic metals. What will happen when we introduce a tailings pile? How does this risk get managed without some sort of analysis and benchmarking?	WR204
6743	The SDEIS claims that PolyMets sulfide mine pits, waste rock piles and tailings won't significantly increase water pollution. But to make that claim, PolyMet assumes waste rock piles won't seep to the 100 Mile Swamp, that there are no fractures under waste rock or under tailings or in mine pits and that a few pumps can collect more than 99% of the seeps from huge tailings dump. There isn't a mine on the the planet that works this way	PD03, WR007, WR008, WR010, WR012, WR019, WR020, WR080, WR167
6745	Why are there no predictive amounts of mercury pollutions that will be coming from the PolyMet tailings in the SDEIS?	MERC20
6747	The potential greenhouse gas emissions from the PolyMet sulfide mine and processing facility are staggering. It is stated that 7,07efw metric tons per year will occur.	AIR01
6748	The fact that no cumulative effects analysis of mining has been done is another indication of how disconnected this SDEIS is in dealing with how integrated ecosystems function. How does PolyMet plan on dealing with the impact of mercury contamination of fish in the St. Louis River estuary, and the habitats and tribal resources in the region?	CR01, CR03
10436	The consequences of polluting our water, with its highly varied flow patterns and rates system, is too great for the short term gains of a mining economy.	SO01
10444	Why doesn't the statement require that the 939 acres of wetland being destroyed, at the very least be replaced with wetlands that do the same job and serve the same habitat and the same streams.	WET05
10446	The SDEIS admits that the sulfide mine will directly destroy 913 acres of wetlands. It then says that as much as another 7,351 acres of wetlands could be lost due to pollution and changes to water patterns in the mine and tailings site. 14400	Polymet's plan acknowledges that millions of gallons of polluted water will seep into the environment untreated, and the water they contain will need active treatment for hundreds of years.	WR035, WR070
14402	Polymet does not have a plan for mediating environmental disasters if they occur. Polymet's primary investors have a long history of environmental destruction and failure to clean up messes such as the BP oil spill.	PD22
14420	If any contaminated water is released (which Polymet acknowledges will occur), the wild rice crop will see severe negative effects.	WR156
14421	The majority of profits will not remain in the state of Minnesota, and Polymet provides insufficient details as to financial assurance needed to protect taxpayers in the future. Its not worth the risks...	FIN10
<b>Sender Name (Submission ID)</b> Natalie Griffith (58102)		
19938	Inadequate mitigation designation for controlling solute concentrations above class 2135.	AQ13
19966	Replacement Wetlands have not been demonstrated to be of equal quality to original for support of vertebrae and invertebrate life and effect on water quality, run off, and re-charging water table – regardless of replacement credits.	WET05
19971	Sustained reduced stream flows do not have the same impact on aquatic life, [ILLEGIBLE] envisions, and wildlife causing them a seasonal fluctuations.	WR065
<b>Sender Name (Submission ID)</b> Natalie Hoidal (47018)		
10903	As you are well aware, sulfates and sulfides are incredibly toxic under the proper conditions, primarily in wetlands. If anything were to go wrong with this project as sulfides were to leak faster or in greater quantities than expected, the surrounding habitats would be forever lost. Sulfides are directly toxic to the arenchyma tissue of aquatic plants like wild rice.	WR001, WR156
10905	In addition, while the project will inevitably create jobs, the wild rice in its proximity also supports the livelihoods and cultural identity of hundreds of individuals. If this company impacts the wild rice, will the jobs be worth it?	CR01
10907	Secondly, the EPA estimates that Americans only recycle 25% of their electronics. This means that as we stand currently, there is no need to mine these metals. We already have abundant metals in our homes and in landfills. Before mining, why don't we set up better recycling programs (which would create jobs) and prove that we actually know how to use our resources before exploiting our fragile ecosystems for more?	NEPA06
10908	In addition, the fact that Polymet has asked the state to reconsider the sulfide standard, which has been universally accepted in the scientific community since John Moyle's discovery of sulfide toxicity in wetlands in the 1930s and 40s, begs the question of whether or not it is truly in Polymet's best interest to follow our state's standards.	AQ13
10909	Minnesota has great regulations, but Polymet does not. Their subsidiary Glencore has a horrible human rights record as well as a poor environmental record. The company has no financial incentives to invest in keeping Minnesota clean and beautiful, to employ local workers, or to keep the money generated in our communities.	SO02
16711	Polymet admits in its plan that 1600 acres of wetlands will be impaired by the process, which will lead to the destruction of current habitat, but will also allow more invasive species to take hold, which will have impacts far beyond the 1600 acres.	WET24

<b>Sender Name (Submission ID)</b> Nathan Mielke (1777)		
13788	the long-awaited Supplemental Draft Environmental Impact Statement has now been released that could lead to the permitting of Minnesota's first copper-nickel mine, an industry the Environmental Protection Agency has pegged as one of the nation's most polluting.	PER35
13790	PolyMet acknowledges its mine wastes would generate pollution for 500 years. Its long-term treatment plan calls for two reverse-osmosis plants. The Barr report indicates these plants would cost about \$20 million each to build and \$2 million each per year to operate over a 20-year lifespan. If both plants ran 500 years, operation and replacement costs would total \$2.8 billion. That \$2.8 billion is just a portion of the true cost of a site generating polluted water for centuries. The Barr report on PolyMet's water treatment doesn't include monitoring expenses and disregards future escalating costs. It does suggest a contingency cost should be included (for technical failures, clean-up of seepage, etc.). So the final tab is likely to be many times the \$2.8 billion. (Water-quality scientists with the Grand Portage tribe calculate PolyMet clean-up at \$90 billion.)	FIN05, FIN08, FIN11, WR037
13795	Because PolyMet has no assets other than the mine, if the deep-pocket parent company is not included on the permits, Minnesota will have no access to assets other than an abandoned, polluted mine site. Glencore Xstrata, PolyMet's "strategic partner," owns nearly a third of the company's stock and the first five years of metals if PolyMet is permitted. Glencore is a multibillion-dollar Swiss corporation chaired by former BP CEO Tony Hayward, whose environmental record is infamous around the world. The corporation stands to profit if PolyMet is permitted; shouldn't it also be responsible for the cost of cleaning up the mess left behind if things go wrong?	FIN01, FIN02
13797	Otherwise our grandkids will be left wondering why we let foreign mining investors take such huge advantage of "Minnesota nice" at the expense of countless generations to come.	SO06
<b>Sender Name (Submission ID)</b> Nathan Peters (9538)		
182	New water modeling is absolutely necessary	WR086, WR093, WR105, WR106, WR189
183	500 years of monitoring and water treatment are ridiculous burdens for the state to take on.	WR115, WR128
955	The head of the parent company that owns PolyMet is Tony Hayward, the former head of BP. He is the chairman of CompactGTL. He was at the helm when BP committed the largest crime against the Earth and against humanity as its Deepwater Horizon rig burst into flames and spewed oil for months. In short, PolyMet cannot be trusted.	PER02
<b>Sender Name (Submission ID)</b> National Parks Conservation Association (42888)		
9024	Given the narrow view taken in the SDEIS of "reasonably foreseeable," the SDEIS fails to include in its Cumulative Effects analysis 11 other projects by mining companies in the region... TMM must be considered in the cumulative effects analysis because of the geographic and temporal proximity to the NorthMet mine.	CU02
12110	The SDEIS should consider cumulative impacts on Lake Superior and the St. Louis River.	CU01
12166	The SDEIS fails to include in its Cumulative Effects analysis, 11 other projects by mining companies in the region. However, the analysis must be expanded to include consideration of some of these projects, particularly the proposed Twin Metals Minnesota (TMM) underground sulfide mine.	CU02
12174	The SDEIS essentially acknowledges there will be an increase of mercury and sulfate loadings to tributaries of the St. Louis River. The SDEIS should not rely on a series of offsets to exclude the St. Louis River, but instead it should undertake a thorough analysis of the negative impacts the project will have on the individual downstream lakes and tributaries to the St. Louis River and the resultant impacts to the river and lake.	WR024

<b>Sender Name (Submission ID)</b>	National Parks Conservation Association (42888)	
12181	The NorthMet project will be contributing a new source of air pollution in an already degraded area. Given that none of the nearby impacted Class I areas are on track to meet regional haze visibility goals, and that violations of the one hour standards for nitrogen oxides (Nox) and sulfur dioxide (SO2) are shown in cumulative modeling, any new emission sources that contribute to these problems should be carefully considered, even if the predicted impacts are small.	AIR09
12182	The cumulative visibility analysis (Section 6.2.3.8.7) is out of date and should be updated. The SDEIS fails to account for the Federal Implementation Plan issued by the U.S. Environmental Protection Agency in 2013 for emissions from taconite facilities, and does not include available visibility data from 2011 for nearby Class I areas.	AIR08
<b>Sender Name (Submission ID)</b>	Ned Bouril (39710)	
6539	...the basic tenets of the current PolyMet Mine project and its inadequate SDEIS proposal beg credulity on an epic scale. Even if every proposed detail of every phase of this project were to be flawlessly implemented for even the first 100 years of the proposed 500, there cannot possibly be any reasonable belief that "we" could predict that the subsequent 400+ years of sulfide mining pollution remediation would continue without issues as planned	PD03
6540	...in the SDEIS, the lack of any substantive financial assurances designated for any toxic seepage which may escape the mine site boundaries or its intended storage facilities should be enough of a red flag to halt and abort this excursion into the absurd.	FIN13
6541	...just the logistics of this proposal alone are incredulous, as it has all of the earmarks of a classic "cut and run", in this case most likely realized by some form of an "unanticipated" bankruptcy, leaving not PolyMet, but the State's citizens to pick up the pieces financially	FIN01, FIN10
6542	... on a geo-political level, is it not possible that the bulk of the extraction profits will not only be leaving MN but most likely the USA as well, via the mufti-national PolyMet parent investor Glencore and its partner Xtrata? And after trading 20 years of temporary employment for 500 years of toxic remediation, who, ultimately will benefit from this arrangement?	SO06
6543	... to those who piously declare that it is our own techno-centric culture which is the primary force driving the need for further exploration and extraction of these minerals so necessary to make our electronic gadgets (gizmos) run well, I would ask them to review current metal recycling technologies and their ensuing economies as implemented in many industrialized countries as well as revisit the phenomenon of commodity stock piling and the boom & bust cycles created by international commodity price fluxuations.	NEPA06
6544	... the world of the "extraction industries" has for decades been awash in technical mishaps, catastrophic failures, and the willingness to violate multiple federal, state, provincial, and local safety/health codes and laws, often resulting in the permanent devastation of pristine lands and/or natural resources and the toxification and displacement of local populations.	SO01
6545	I would ask you deny approval of this particular mine as planned in the SDEIS and consider instituting a permanent moratorium on hard rock sulfide mining in the 3 watersheds of the MN Range area.	PER25
6880	Even if every proposed detail of every phase of this project were to be flawlessly implemented for even the first 100 years of the proposed 500, there cannot possibly be any reasonable belief that "we" could predict that the subsequent 400+ years of sulfide mining pollution remediation would continue without issues as planned. <b>Sender Name (Submission ID)</b> Noah Filla (54338)		
17352	I think my biggest concern is your plan to borrow water from Colby Lake if there is a shortage. As stated in your facts document, shortfall in water requirements would be made up by withdrawing raw water from Colby Lake using an existing pump station and pipeline. What happens if there is a problem with the existing pump and pipeline? What happens if they break? How do you then make up the water shortage? What other source do you have as a back-up? I understand the computer models showed it the water requirements would effect the area, but there is no way this can be guaranteed. Colby Lake, as stated in the fact's document has many tributary streams. This project could have negative effects on all of them if there are any problems.	WR131, WR140, WR181
17353	My other big concern is how this project will effect the wetlands. At a minimum if damage, Polymet, is required to replace only 913 acres near, but not on the project site. Also, the document doesn't cover how the wildlife of the wetlands is affected. It only covers the seepage, waste rock, overburden stockpiles. In summary, it seems to only cover the fragmentation of the wetlands, not how it could actually hurt the wildlife of those wetlands.	WET04, WET05
17572	It first appears that many new jobs would be created and that everything possible would be done to protect the environment. However, upon reading the material, there is no solid documentation of how long the clean up after the project would last, exactly what it would entail, and what if there are more issues than are predetermined?	PD01
17573	I am for a project that will create jobs because I understand there is a great need for jobs in this state and all other states. However, I am not for destroying the environment without more documentation on how it will affect water quantity and quality.	SO02
<b>Sender Name (Submission ID)</b> Noah Shavit-Lonstein (58149)		
19934	I think it is absurd to destroy five centuries of water for 360 jobs (or less) that will disappear quickly.	SO01

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4092	The hard look that NEPA and MEPA require is not possible if the impacts of a project are not clearly stated, are hidden away in background materials, or are discounted in the text. NEPA and MEPA’s primary purpose is also thwarted if the discussion of impacts is based on a model that uses inputs that do not reflect reality. The SDEIS uses all these methods to hide the potential impacts of this project from decision makers and the public.	NEPA14
4093	The primary error in modeling lies in the estimate of baseflow in the Partridge River, which is based on a flow gage seventeen miles downstream of the mine site. While models using data with this degree of uncertainty are sometimes accepted when no other information is available, in this case, enough flow data from further upstream was available to let the agencies know early on that the modeling approach would not accurately reflect the site.	WR003
4095	Because PolyMet calibrated other model parameters to erroneous flow data for the Partridge River, the hydraulic conductivity and recharge values likely significantly underestimate the rate at which groundwater flows through the site. See GLIFWC Memo, March 2, 2012, SDEIS App. C, Sub. 1.	WR003, WR052, WR086, WR091
4096	The Agencies must provide an explanation of changes that were made in response to the GLIFWC March 2, 2012 Memo and how those changes are reflected in the modeling and predictions presented in the SDEIS.	WR003
4097	The use of data known to be inaccurate for a key modeling parameter does not comply with NEPA , which requires accurate scientific analysis and integrity. 40 C.F.R. §§ 1500.1(b), 1502.24. Furthermore, the Agencies’ response to GLIFWC’s position does not meet the NEPA requirement that the Agencies consider and respond to “any responsible opposing view,” id. § 1502.9(b), because that response ignores the underlying issue of the inherent inability of the model’s approach to accurately reflect stream flow in a losing stream.	NEPA08, NEPA14, WR003, WR189
4098	In addition to the lack of clarity regarding hydraulic conductivity parameters, the SDEIS is unclear as to whether a range of values were used in the model, and if so, the range of possible outcomes on water quantity, both as inflow to the mine and as flow in the Partridge River. ... in addition, the absence of a discussion of uncertainty is misleading to decision makers and the public, and violates NEPA.	WR189
4099	The predicted changes in stream flow at various monitoring points are given in Table 5.2.2-25, and the predicted inflow to the mine pits is given in Table 5.2.2-18. Unlike water quality predictions, there is no discussion of uncertainty and no discussion of the potential range of pit inflow or of stream flow impacts in the accompanying text for either issue.	WR086
4100	If the model cannot accurately predict the level of groundwater drawdown, how can the impacts on groundwater inputs to the Partridge River or the groundwater inflow to the mine be predicted with any certainty? Yet the SDEIS presents predictions for these parameters as if they were based on solid information.	WR086, WR179
4101	Adding to the problem in regard to river drawdown, the table showing the predicted drawdown to the Partridge River omits information for SW-003. This is a curious omission that does not seem to be reflected anywhere else in the document. In reviewing groundwater elevation contours found in Figure 4.2.2-5, SDEIS 4-49, it appears that groundwater at SW-003 slopes down-gradient to the east, despite the presence of the river. It thus seems likely that there is very little groundwater input from the east side of the river to balance the loss of groundwater to the East Pit during mining. ... The SDEIS should provide both the modeled drawdown at SW-003, and an explanation of the area used for groundwater inputs to the river and how those inputs correlate with the groundwater elevation contour map.	WR179

4102	A review of both the predicted river drawdown and the predicted mine pit inflow is further hindered by a lack of references in the SDEIS text, or possibly the absence of anything other than raw data in the record to provide further explanation. ... Significant drawdown of the Partridge River would be a significant environmental impact pursuant to NEPA and MEPA, and the inability to review the conclusions in the SDEIS is a significant flaw in the document.	WR086
4104	Because all surface discharges are planned to occur at the Tailings Basin during the life of the mine, the amount of inflow has significant implications for the Water Collection System and the amount of contaminated water escaping capture at the Tailings Basin. The amount of inflow is also likely to impact the amount of financial assurance that will be required.	WR019
4117	According to the SDEIS Executive Summary ... wastewater releases from the NorthMet Project “would not cause or increase the magnitude of an exceedance of the groundwater and surface water evaluation criteria at the P90 level for any of 28 solutes at 29 evaluation locations.” ... the “29 evaluation locations” are placed in such a way that they do not assess some of the areas that are most likely to be impacted by the project. One of these areas is a three-mile (or longer) stretch of the Partridge River that is likely to receive discharges above water quality standards.	WR058, WR064, WR086, WR089, WR177
4118	The first “evaluation location” below SW-003 and the Category 2/3 Stockpile and East Pit flowpaths (SW-004) is located more than three miles downstream. As explained above, this stretch is unlikely to have a significant inflow of clean groundwater from east of the river, because the groundwater elevation drops moving east from the river... Thus both the modeling and the monitoring of water quality at SW-004 are unlikely to reflect the water quality of the stretch of the river most impacted by the Category 2/3 Stockpile and East Pit.	WR177
4120	Unfortunately, the table [Table 5.2.2-22] includes only the “Groundwater Evaluation Criterion” and does not reveal the surface water quality standards that actually apply at this point. Despite the clear availability of this information, nothing in the text reveals the fact that discharge to the Partridge River through the East Pit/Category 2/3 Flowpath at the P90 level is predicted to violate water quality standards for both aluminum and cobalt.	WR109, WR177
4123	the SDEIS should disclose that at the P90 level, groundwater in the West Pit flowpath is predicted to violate the surface water quality standard for cobalt (by a factor of 5) and lead at the point of discharge to the river. ... Furthermore, as discussed below it is highly unlikely that mechanical treatment will continue until the point when groundwater outflow from the West Pit meets surface water quality standards.	WR038
4124	Figure 6-126 of the Water Modeling Data Package Vol. 1 (PolyMet Mining 2013i) indicates that the aluminum exceedance in the East Pit flow path would extend over a period of roughly 40 years. A figure that was included in the May 2013 internal review draft (Fig. 5.2.2-19 on page 5-89) (Ex. 16) but does not appear in the final SDEIS indicates that the cobalt exceedance would extend over a period of almost 100 years.	WR177
4128	SDEIS Table 5.2.2-22 under-predicts the level of contaminants in the East Pit flowpath at the earliest point of discharge to the river. ... The modeling apparently assumed that SW-003 would not be impacted by polluted groundwater, but that the point just below it would. ... The importance of this groundwater evaluation location lies in the fact that this is the closest downgradient point that the property line comes to any of the sources of contamination, and thus this is an important point at which to assess potential water quality impacts.	WR177
4131	What is unclear is why this point is not also used to assess surface water quality impacts, as the property line and the Partridge River meet at this point. The SDEIS does not clearly reveal where the solute concentrations shown in Table 5.2.2-22 would occur. However, Table 5.2.2-8 lists the various groundwater flow paths and the distance to where they meet the property line and the Partridge River, and Figure 5.2.2-4 indicates points of discharge of groundwater to the Partridge River and groundwater evaluation locations. According to Table 5.2.2-8, the distance to the property boundary from the Category 2/3 Stockpile is 140 meters, while the distance to the Partridge River is 955 meters. Yet the river is located at the only “groundwater evaluation location” shown on Figure 5.2.2-4.	WR177

4149	There seems to be very little information available on water quality at the property boundary for the East Pit flow path...the Water Modeling Data Package does include a graph for sulfate, Figure 6-69, PolyMet 2013i at 209. The maximum P90 sulfate level at the property boundary is shown as approximately 29 mg/L, while Table 5.2.2-22 shows the sulfate level at the river as 21.6 mg/L. But according to the map, the closest point to the property boundary and the river are the same. It thus appears that the scant information that does exist regarding water quality discharge to the Partridge River from the East Pit Flowpath significantly understates contaminant levels by overstating the distance the contaminated water will travel before it arrives at the river.	WR058, WR167, WR177
4158	In regard to copper, Large Figure 47 from the Water Modeling Data Package Vol. 1 (PolyMet 2013i) indicates that levels will range around 5 ug/L at the property boundary, while Table 5.2.2-22 gives a concentration figure of 3.4 ug/L for discharge to the river. Once again, because the closest distance to the property boundary and to the river is the same, it seems that Table 5.2.2-22 likely understates the level of copper discharging to the river...Based on these figures, we believe that the copper standard may be exceeded in addition to the aluminum and cobalt standards.	WR177
4165	the NorthMet project as proposed will, in fact, contribute aluminum to groundwater flows to the Embarrass River tributaries during the time that Colby Lake water is used to augment flows. See Water Modeling Data Package Vol. 2 (PolyMet 2013j). While this addition of aluminum may be small, and may even be less than the amount of aluminum that would have been added to groundwater under the continuation of existing conditions, aluminum from the NorthMet project will add to aluminum in downstream waters, thus contributing to the violation of the water quality standard.	WR082, WR177
4168	The SDEIS discussion of lead exceedances in Embarrass River tributary streams appears to be downright dishonest...The SDEIS does not tell us what the quality of the WWTP discharge will be, but apparently PolyMet expects to be allowed to discharge at the water quality standard based on the hardness of its discharge, see id. Table 5-17, i.e., 3.0 ug/L.	WR063, WR147
4169	Furthermore, the statement that lead in surface runoff shows a ten percent chance of exceeding the standard at any given time appears to be incorrect; Water Modeling Data Package Vol. 1 Figure 6-108 shows an exceedance probability of about five percent. If this was a discussion of lead levels in water from the NorthMet project, this five percent probability would be eliminated from discussion as being above the P90 probability level. If one hundred percent of modeled exceedances for natural runoff are included in the analysis, one hundred percent of the modeled exceedances for the Proposed Project should also be included.	WR110, WR189
4170	In any event, the highest lead concentration shown for natural runoff is 1.8 ug/L, at an approximately 99% probability level. Id. Fig. 6-108. This is significantly below the presumed level of the WWTP discharge and the maximum predicted lead levels in Embarrass River tributary creeks, which range as high as 3 ug/L. Table 5.2.2-32, SDEIS 5-183. In comparison, the highest predicted lead concentration in the creeks under the "continuation of existing conditions" scenario is 1.3 ug/L. The gist of the whole situation appears to be that PolyMet will discharge lead at a level just below the standard based on the hardness of its discharge, and that natural conditions will reduce the hardness of the water to the point where the lead exceeds the water quality standard. Blaming that scenario on natural runoff is disingenuous in the extreme.	WR059
4171	Under the Clean Water Act, the application of hardness-dependent water quality standards is based on the receiving water, and downstream standards must be met even where the hardness of the water varies. If downstream waters have a lower hardness level and thus a lower standard, pollutants in the discharge must be reduced to the point where they will meet the lower standard.	PER09
4174	The Minnesota Environmental Policy Act precludes the DNR and Minnesota Pollution Control Agency (MPCA) from issuing permits that would result in the pollution, impairment, or destruction of natural resources. Minn. Stat. §116D.04(6). Neither statute is limited to situations where the proposed activity violates some other environmental protection statute or regulation. Thus regardless of whether the predicted exceedances are deemed compliant with the Clean Water Act, they do not comply with Minnesota law.	PER09

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4176	The Embarrass River is listed as impaired for Fishes Bioassessments...any increase in pollution that might contribute to the impairment cannot be permitted. The SDEIS provides no information about the impact of aluminum on aquatic organisms, and in regard to lead says only that “Effects on aquatic biota from the lead exceedance due to changes in hardness are not well-understood, but would likely increase the potential to adversely affect aquatic life.” SDEIS 5-380. To comply with NEPA and MEPA, the SDEIS must provide substantially more information on the likely impacts of aluminum and lead exceedances on the aquatic community.	AQ07, AQ11, WR064
4179	The SDEIS fails to assess the impacts on any of these [Plant Site] tributary streams at the point where the water collection system, discharge water, and groundwater seeping from the Tailings Basin will first impact them. ... All of these [evaluation points shown on Figure 5.2.2-6] points are significantly downstream of the point where the Tailings Basin currently impacts them (i.e., at their headwaters).	WR063, WR064, WR115, WR124
4181	the discussion on groundwater travel distances at the Plant Site does not disclose whether a range of values were used in modeling this critical parameter, nor what those values were. The SDEIS must explain what parameters and variables were used to obtain the predictions shown on Table 5.2.2-42, including the point or range of points at which contaminated groundwater is first presumed to release to surface water.	WR167
4182	The apparent idea seems to be that any water escaping the collection system would escape at the bottom of the barrier, and would move a significant distance before emerging at the surface. However, the SDEIS does not actually say this, or explain the barrier system sufficiently to support the hypothesis. Figure 3.2-28 shows a “Cutoff Wall,” and the text directs the reader to the description of the Cutoff Wall for the Category 1 Waste Rock Stockpile, which it describes as “similar.” In both places, details are scant as to what the wall will be made of; how it will be constructed; what the target permeability means in regards to leakage; how likely it is that PolyMet will achieve the target permeability at all locations of a four-mile, underground wall; and whether occasional breaches in the wall due to construction methods and materials may allow for significant escape of groundwater at locations that cannot be identified before they occur. Furthermore, neither discussion provides any citation to reference materials.	PD15, WR019
4183	Given the current conditions of completely saturated soils and standing water immediately below the basin, and these statements from the SDEIS, it seems likely that groundwater escaping the Collection System will discharge into fully saturated conditions, where it is likely to mix with water discharged to the surface in close proximity down-gradient of the Tailings Basin.	WR060
4186	The Water Modeling Data Package includes figures for only a few of the constituents, which are listed here as examples. The predicted levels of all constituents in groundwater at the base of the Tailings Basin should be included in the SDEIS...The SDEIS needs to clarify the range of distances to where this water is predicted to mix with surface water, and provide adequate explanation to support that range of distances...All surface water evaluation points presented in the SDEIS are located at or beyond the property line, which begs the question of how these points were chosen. Minnesota’s surface waters must be protected regardless of their location on private property.	WR059, WR064, WR177
4187	As for sulfate, although the 10 mg/L standard to protect wild rice is not being applied at this location, this sulfate is likely to be discharged to wetlands at a level that seems very likely to affect the methylation of mercury and resultant level of mercury in fish tissue.	MERC09
4191	For pollutants that are based on hardness, this [WWTP] discharge may meet the standard at the point of discharge but fail to do so once the hardness is diluted by rainwater and natural groundwater. This appears to be the situation for lead; because no analysis of the headwaters was done, no conclusion can be drawn regarding copper, which is also of concern.	WR082

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4196	The Proposed Project will also have a significant impact on water quantity in the headwater streams...the document lacks clarity regarding the amount of water to be discharged [for augmentation], listing minimum requirements and maximum allowances, but providing no discussion of the degree to which the amount of water discharged is expected to maintain the hydrology of wetlands and streams immediately below the discharge point. See SDEIS Tables 5.2.2-40 and 5.2.2-41. Will the minimum required augmentation shown on Table 5.2.2-41 be increased if wetlands and stream flow disappear within the PolyMet property, or will an increase not be required until the flow at MCL-3, TC-1, or PM-11 drops below 80% of its historic flow? And will that 80% be measured in accordance with historic seasonal variation, or will it be based on average or low flow conditions regardless of the season?	WR183, WR185, WR186
4199	Finally, the SDEIS provides virtually no information on planned monitoring points. As discussed below, apparently no monitoring is planned for the tributary streams. The SDEIS must provide a plan for monitoring water quality and aquatic biota as well as flow in the Embarrass River tributaries, beginning at their historic sources.	PD05
4201	Although the SDEIS mentions air deposition as a potential source of metals and sulfur inputs to wetlands, the discussion provides no information about the amount of deposition other than a line delineating the boundary of the area within which deposition will be greater than 100% of background levels. The SDEIS provides no assessment of the impacts on water quality from the predicted amount of deposition...First, the SDEIS does not provide information on the amount of sulfur or metals that will be deposited within the “greater than 100% of background levels” line...Isopleth maps for copper and nickel deposition based on modeling to assess deposition...The type of information is crucial to an understanding of impacts, and must be provided in the NorthMet SDEIS.	WET11
4202	the rationale for using 100% of background level as a cutoff for impacts relates only to designing a monitoring plan. No scientifically valid support whatsoever is given for the assertion that there will be no impacts in areas where deposition is increased by less than 100% of background levels. Whatever its validity as a rough cut-off for monitoring, in regard to impacts this number is clearly arbitrary. Rather than providing a justification for using this cut-off, PolyMet needs to provide an explanation of the impacts on water quality at this level of deposition, and a discussion of why areas with less deposition will neither experience impacts themselves nor contribute to impacts downstream.	WET11
4211	The SDEIS must provide information on the deposition of specific metals and sulfur, especially those that are expected to be emitted in large amounts and/or to present a water quality problem due to other source pathways. The former includes copper, nickel, manganese, and sulfur. The latter includes these plus cadmium, cobalt, lead and zinc. Apparently neither cobalt nor zinc were included in the speciation assessment, yet they are present at higher levels in the emissions than some of the other metals that were included.	AIR10, WR151
4220	the SDEIS makes no predictions about the impacts of air deposition of either metals or sulfur on water quality. The entire point of the exercise is to assess whether this source of metals and sulfur to the environment will result in levels of metals or sulfur in wetlands that would contribute to water quality standard violations or otherwise contribute to environmental effects (such as increased mercury methylation, degradation of high quality waters, or toxicity to aquatic life or wildlife due to metals for which there are no numeric standards)...While we support monitoring to assess the impacts of air deposition should this Project go forward, the promise of monitoring cannot be used to circumvent the requirement that impacts be assessed before the project is approved.	AIR10, WR151
4224	The “100% deposition line” at the Plant Site covers an area of several square miles. SDEIS Figure 5.2.3-23. The area overlaps the headwaters of Second Creek. The statement that “No potential indirect wetland effects from fugitive dust to Second Creek would occur,” SDEIS 5-302, is misleading, primarily because the discussion does not clearly separate impacts due to dust from impacts due to metals. The statement thus leads the reader to believe that there will be no impacts from air deposition on Second Creek. However, the SDEIS cites PolyMet 2013k, which states that metals deposition could have an impact on Second Creek (as opposed to dust, which according to this document, would not).	WET11, WR151

4228	SDEIS Figure 5.2.3-23, which pertains to metals, indicates that there would be effects on Second Creek. Furthermore, it appears from Figure 5.2.3-22 that there could be significant impacts from dust on Spring Mine Creek.	WET11, WR117, WR151
4233	The SDEIS evaluates impacts to groundwater at the property boundary in several locations at both the Mine Site and the Plant Site. It does not disclose the quality of groundwater that will be left at the Mine Site or the Tailings Basin throughout the centuries during which this pollution will continue. ... The SDEIS makes no mention of this requirement [Minn. R. 7060.0500], and thus also does not explain whether or how the project will meet the requirement...While variances are available under the groundwater rules, see Minn. R. 7060.0900, the SDEIS says nothing about PolyMet applying for a variance, and provides no basis whatsoever for the use of the property line as a compliance boundary.... The MPCA has apparently been using property lines as compliance boundaries for groundwater contamination as a matter of standard practice, according to a personal communication with Richard Clark of MPCA on January 11, 2014...the SDEIS must disclose the predicted quality of groundwater at the Mine Site during the proposed mining operations and after closure, including within the East Mine Pit porewater and below each of the mine features. The SDEIS must also disclose the predicted quality of groundwater within the Tailings Basin and immediately below the Tailings Basin Dams and other seepage locations.	PER06, PER09, WR038, WR060, WR109, WR173
4242	the SDEIS predicts a decrease of 1.2 grams in the annual mercury load to the Partridge River, and an increase of 0.6 gram to the Embarrass River, with a net decrease to the St. Louis River of 0.6 gram. The SDEIS does not say what was included in these estimated loads, nor does it explain that the increased load from the project's air emissions will be significantly greater than that 0.6 gram. The SDEIS assesses the increased load from emissions to five area lakes (ignoring the Partridge and Embarrass Rivers) and dismisses the increase as insignificant, in direct contradiction to the clear government policy that any increase in load to the Lake Superior basin must be considered significant.	AIR02, MERC04, MERC20, MERC23
4245	The SDEIS does not so much as mention the Lakewide Management Plan, and it certainly does not address the zero discharge and emission goal. While five pounds of mercury emissions may not seem like a large amount, it does impact the zero discharge goal and it will increase the load to local water bodies. In order to consider all relevant factors and take the required "hard look" at the anticipated environmental consequences, the SDEIS needs to disclose that the Proposed Project will not comply with the LaMP.	MERC01, PER27
4246	In addition, the assessment of mercury releases from the Proposed Project to the Partridge and Embarrass River (and beyond to the St. Louis River) omits mercury from a number of sources. In fact, the only inputs of mercury to the rivers that the SDEIS discloses seem to be those that are discharged from the Waste Water Treatment Plant and Waste Water Treatment Facility. The estimate of increased or decreased loading to the rivers leaves out mercury from air deposition, from leaching to groundwater, and from the transfer of Colby Lake water. When these sources are accounted for, the statement that overall, the project would decrease mercury loading to the Partridge River and to the downstream St. Louis River, e.g. SDEIS 5-8, is simply untrue.	MERC20, MERC23
4247	Despite indications from humidity cell tests that leachate from waste rock will have a mercury level of almost five times the surface water quality standard, PolyMet did not include mercury in its water quality model, and the SDEIS provides no estimate of the potential discharge of mercury from the stockpiles and pit lakes to the Partridge River via groundwater. ... We were unable to find a more thorough description of the NTS lab tests or any quality assurance/quality control information in the record.	MERC04, MERC11, MERC20
4253	While we agree that the low-level mercury data from the humidity cell tests is insufficient, this factor was entirely within the Agencies and PolyMet's control. If the Agencies now want to plead insufficient data, at the very least NEPA regulations require them to explain why they were not able to obtain it, and to provide an evaluation of the potential for increased loading to the Partridge River "based upon theoretical approaches or research methods generally accepted in the scientific community." 40 C.F.R. § 1502.22(b)(4).	MERC06

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4260	[The SDEIS] states that the proposition that “taconite tailings appear to be a sink for mercury in full-scale actual tailings basins in northern Minnesota, at least similar to other media like soils . . . is supported by surface and groundwater monitoring around the existing LTVSMC Tailings Basin, which found mercury concentrations consistent with baseline levels (see Table 4.1-31), generally averaging less than 2.0 ng/L.” SDEIS 5-202. This statement in regards to groundwater appears to be blatantly false. And an attempt to learn more from Table 4.1-31 was thwarted by the fact that there is no Table 4.1-31.	EDIT01
4262	the SDEIS defends the use of 1.1 ng/L [mercury] by reference to a bench study by NTS. SDEIS 5-206. The text provides a reference of NTS (2006), but no corresponding document can be found in the reference list. However, a description of the test is found in Appendix C of Barr 2007e (which we came across in search of something else)...The conclusion that NorthMet tailings will remove mercury from tailings basin water thus appears to be unfounded.	MERC06
4270	[The SDEIS requires] an analysis of mercury discharge to surface water from groundwater using a realistic estimate of mercury concentrations in groundwater leakage from the tailings basin.	MERC20
4278	Inputs to the West Pit mass balance from watershed run-off (from both undisturbed surfaces and from the East Pit) are estimated at 4 ng/L. Table 5.2.2-50, SDEIS 5-203. Despite the availability of an MPCA method for estimating mercury inputs from terrestrial deposition, which was actually used for the air emissions analysis for this project, this number was based on “the total mercury concentrations observed in the Partridge River (the recipient of watershed runoff under current conditions).” PolyMet 2013i at 313. Our understanding of the MPCA method is that it is based on mercury in deposition, one-quarter of which is estimated to enter surface water. While it is unclear how this would ultimately compare to the 4 ng/L for the volume used in the mass balance, the use of the concentration in the river as a proxy seems a poor substitute.	MERC12
4279	Inputs from the East Pit porewater are estimated at either 3 ng/L (as reported in the text of the Water Modeling Data Package, id., or 4 ng/L (as reported in Table 5.2.2-50). The text states that this is based on background groundwater concentrations. As discussed above, it appears that the waste rock (which will fill the East Pit) does leach mercury. Based on the humidity cell tests, a more appropriate value for East Pit porewater would be at least 6.5 ng/L.	MERC12
4290	To comply with NEPA, the SDEIS must provide an analysis of the deposition of mercury from air emissions for the rivers and their tributaries, and that analysis must include mercury emissions from the mine site. . . . At the mine site, all of the area within one kilometer of the ambient air boundary is within the Partridge River watershed. It thus seems likely that close to 100% of the 288 grams of mercury emissions would be deposited within the Partridge River watershed. If twenty-five percent of that mercury reaches surface water, it would amount to 72 grams of mercury. Even if half of it settles in areas where it would be routed to process water and the treatment facility, it would still be a significant amount of mercury, particularly when added to deposition from the Plant Site.	AIR05
4292	According to the analysis done for the lakes based on Plant emissions, between 3.76 and 15 grams of mercury would be added to Colby Lake through the Partridge River watershed and between 4.75 and 19.64 grams would be added to Wynne Lake through the Embarrass River watershed. Barr 2013k, App. F. It appears from Large Figure 7 of the same document that the numbers would be similar for the Partridge and Embarrass Rivers, respectively, because most of the watersheds flow to the rivers before entering the lakes. In other words, most of this mercury enters the rivers before it enters the lakes. The SDEIS needs to provide the same analysis for the rivers that it provides for the lakes. This analysis must also be applied to those tributary streams that would be more heavily impacted than the river as a whole.	WR064, WR177

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4293	The SDEIS must then include input from air deposition in the load analysis. The assessment of mercury load to the Partridge River predicts a net decrease from 24.2 to 23.0 grams per year; the assessment for the Embarrass River predicts a net increase from 22.3 to 22.9 grams per year. These figures apparently do not include deposition; what they do include can only be guessed. It is certainly not clear to the average reader that the largest source of mercury from the project has been left out of the equation entirely.	AIR05
4294	The cumulative impacts assessment points to the statewide TMDL to address this problem. SDEIS at 6-63. But the TMDL has been acknowledged as insufficient to address the problem in Northeastern Minnesota. When the TMDL has been completely implemented and a 93% reduction is achieved, Wynne Lake (for example) will still be subject to fish consumption advisories. If the NorthMet project were operating at that point, it would be contributing 17% of the load to Wynne Lake, which is clearly significant. Yet the same amount of mercury is now being dismissed as too small to contribute to the problem.	MERC22
4467	The SDEIS makes the remarkable statement that the contribution of mercury from Colby Lake makeup water at the Plant Site would be “minor.” SDEIS 5-205. ... Colby Lake is on the impaired waters list for mercury in fish tissue. ... PolyMet plans to release this water to headwater streams at a point where the current mercury levels average 1.0 to 1.2 ng/L. See SDEIS Tables 4.2.2-4 and 4.2.2-34. The change will mean that the streams no longer meet the water quality standard at their headwaters, and downstream exceedances will increase. Ultimately, the use of this water will increase the load to the Embarrass River between 3 and 6.5 grams per year, which is an increase of between 14 and 27 percent. The SDEIS is scant on information about mercury in Second Creek, but the discharge of Colby Lake water would increase the mercury exceedances there as well...discharge is at least regulated under state law.	MERC01
4472	Adding to the mix is a lack of information about the augmentation plan. The SDEIS provides a minimum and maximum release amount, but does not describe how the amount of release will be set or how it will change based on the project’s needs and/or impacts on wetlands and streams. If it is similar to other mining operations, it will fluctuate according to the needs of the project. If this is the case, another factor that increases mercury methylation will also be present, i.e., water level fluctuations.	WR112, WR183
4474	[The SDEIS] concludes that because the WWTP will limit sulfate in its discharge to 9 mg/L, sulfate “would not be expected to promote mercury methylation.” SDEIS 5-208. However, 9 mg/L is significantly above historic background levels, and the SDEIS cites nothing that indicates that a sulfate level of 9 mg/L does not promote mercury methylation. While the science is not yet definitive, it is entirely possible that 9 mg/L sulfate promotes mercury methylation as effectively as does 30 mg/L, and more effectively than does 100 mg/L. While the reduction in sulfate levels in discharges to the environment is overall a positive step, this does not negate the fact that sulfate discharges will continue to promote mercury methylation.	MERC08
4479	The initial stage of preparation for mining will involve stripping the vegetation and soil from the area to be mined. SDEIS 3-2. This material will contain sequestered mercury from historic precipitation and dry deposition. This is a particular concern in regards to the peat overburden, as peat is known to sequester mercury. The SDEIS does not seem to include an estimate of mercury releases from this source. ... In general, the mass balance exercises do not consider the amount of mercury released from rock and other materials in assigning a value to process water concentrations. Rather, mercury concentration values are simply guesses based on current mercury levels in precipitation and (in some cases) groundwater, along with questionable assumptions regarding the adsorption capacity of tailings, rock, and soil.	MERC11, MERC20

Comment ID	Comment Text	Theme Codes
<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4481	Finally, PolyMet plans to use the overburden material for many construction and reclamation activities in many locations. See PolyMet 2012s at 26-30. Uses of unsaturated overburden and peat are not specified; the material would be available for any use in any location where soil or rock is needed. The potential mercury releases from this material must be assessed. Precipitation events and snowmelt are known to cause spikes in mercury levels in local streams, particularly in watersheds that are partially deforested. See MPCA, “An Assessment of Lake Superior Basin Tributaries” (2002) (Ex. 24), and E. M. Ruzycski , R. P. Axler , J. R. Henneck , N. R. Will & G. E. Host, “Estimating mercury concentrations and loads from four western Lake Superior watersheds using continuous in-stream turbidity monitoring,” 14 Aquatic ecosystem 4:422 (2011) (Ex. 25). The potential increases of mercury from disturbed peat and other overburden materials during runoff events must be included in the SDEIS’ assessment of mercury loads to tributary streams and the Partridge and Embarrass Rivers wherever this overburden material might be used.	MERC20, MERC21, REF01
4483	To a great extent, the SDEIS avoids discussion of potential impacts of the Proposed Project by assuming that mitigation measures will be completely successful. In many situations, no support is provided for these assumptions. The SDEIS does not discuss the track record of the mining industry or the success rate of the chosen mitigation measures at other mines. The SDEIS thus does not take the requisite “hard look” at mitigation measures... The PolyMet SDEIS relies heavily on mitigation measures to meet water quality standards and otherwise reduce environmental impacts, with many of these measures needed for decades to hundreds of years. The SDEIS, however, lacks any discussion of the likely effectiveness of the chosen mitigation measures.	WR023, WR130
4484	the SDEIS lacks any discussion of the significant and irreversible environmental impacts that would occur if the chosen mitigation measures prove to be ineffective.	NEPA09
4490	the SDEIS estimates that closure of the mine would cost as much as \$200 million, with postclosure monitoring and maintenance estimated at \$3.5 million to \$6 million per year. SDIES 3-138. ... The SDEIS provides no meaningful discussion as to how these mitigation measures could possibly be fully funded and remain 100 percent effective for hundreds or even thousands of years after closure of the mine.	FIN01, FIN05
4501	we fail to see how a water collection and treatment system that would need to be operated and/or actively maintained for more than 500 years can meet the DNR Permit-to-Mine regulatory requirements concerning closure, continued oversight and financial assurance... Thus aside from the question of whether this situation may be permitted under applicable law, NEPA requires that the impacts be disclosed in the SDEIS... Because it is reasonably foreseeable that water treatment will fail or end prematurely, and as a result untreated water will be discharged to the Partridge River, the Embarrass River, and their tributary streams, the SDEIS must disclose the quality of that water and the impacts on aquatic life and other resources should it occur.	PER04, WR037, WR202
4502	If the water collection and treatment systems do end prematurely, the impact on the Partridge, Embarrass, and St. Louis River systems would likely be catastrophic to fish, wildlife, and wild rice downstream, and possibly to the Hoyt Lakes water supply. ... If the treatment facility ceases to operate, this water will overflow from the West Pit directly into surface water streams. ... The water quality standard for cobalt is 5.0 ug/L; Figure 5.2.2-37 indicates that at year 200, the predicted P90 level for cobalt in the West Pit is about 30 ug/L, and at the P50 level is about 15 ug/L. The water quality standard for nickel is 52 ug/L at an assumed hardness of 100 mg/L; Figure 5.2-38 indicates that at year 200, the predicted P90 level for nickel in the West Pit is about 300 ug/L, and at the P50 level is close to 200 ug/L. Even at the P10 level, it appears that the pit lake water will not meet the nickel water quality standard by year 200.	WR141
4503	The water quality standard for copper at a hardness level of 100 is 9.3 ug/L; the predicted level in the West Pit water at year 200 ranges between 120 and 580 ug/L. Even at the P10 level, the predicted water quality is twelve times the standard. Perhaps even more troubling, the figure does not show any decline in copper levels over time. This is apparently because a concentration cap was applied in the modeling. We question the use of such a cap, particularly in this situation where the result is that the model gives no indication of the water quality trend over time. Taking the figure as it is presented, however, indicates that the West Pit water may indeed need to be treated to remove copper to eternity.	WR033, WR038

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4504	A series of figures in the Water Modeling Data Package Vol. 2 (PolyMet 2013j) show predicted concentrations of various constituents in seeps at the “toes” of the basin over 200 years; this is water that will be collected and treated under the mine plan, and will discharge to the environment if the collection and treatment system ends. First, note that some of these figures show that the water quality will be better after the addition of the NorthMet project tailings than it would be under “continuation of existing conditions.” However, the continuation of existing conditions apparently does not account for dilution by rainwater, does not reflect the lower volume of discharge from the existing facility, and does not reflect any actions that Cliffs Erie (which is legally responsible for violations stemming from the existing tailings basin) must take to address the situation.	WR049, WR108
4509	Figure 6-34 of the Water Modeling Data Package Vol 2 (PolyMet 2013j) indicates that sulfate levels in the discharge from the north toe of the Tailings Basin will range between approximately 100 and 200 mg/L at year 200. At the northwest and west toes, the predicted range is between 200 and more than 400 mg/L. Id. Figures 6-38 and 6-42. The applicable water quality standard to protect wild rice is 10 mg/L. Much of the St. Louis River system is already heavily degraded in regards to sulfate levels and wild rice stands due to leakage and discharge from the mining industry, so the discharge of this water would add to an already intractable problem.	WR107, WR109, WR156
4515	Figure 6-35 indicates that lead levels at the north toe will range between about 15 and 22 ug/L; the surface water quality standard is 3.2 for a hardness level of 100 mg/L. Once again, the figure shows little potential for a decrease to below the water quality standard over the following centuries.	WR110
4516	As with the copper levels at the mine site, the predicted lead levels in seepage from the Tailings Basin appear to be relatively constant over time. This is also true of sulfate at some locations. PolyMet and the DNR have used 500 years as the minimum amount of time that the discharge is likely to need to be collected and treated. The reality appears to be that the need for treatment will extend far beyond 500 years, that in fact the need for treatment has no foreseeable end.	WR035
4526	The SDEIS analysis of water quality impacts appropriately provides a range of potential impacts based on the uncertainty of several parameters. Unfortunately, there are many uncertainties that are not included in the analysis. Deterministic values (or a narrow range of values that does not reflect reality) are used for many parameters for which the value is in fact unknown. These include but are not limited to hydraulic conductivity and the effectiveness of water collection systems. These uncertainties must be disclosed, and the SDEIS must discuss what they mean in regard to impacts on water quality and quantity.	WR026
4528	The statement that the P90 level presents a “worst case” analysis of water quality, SDEIS 5-77, is simply untrue. The P90 level presents a “worst case” scenario if everything goes exactly as intended: if no mistakes were made in designs, calculations, or modeling inputs, if no mistakes are made in operations, if no larger-than-expected storms occur, etc. Presenting the P90 predictions as the worst that things would possibly be is a disservice to the public and to decision makers, both of whom will have to live with the consequences if anything goes wrong.	WR192
4537	Before permitting this type of mining in the state, the agencies must plainly and openly disclose the legacy of this industry in other parts of the country ... Moreover, the SDEIS also fails to disclose the widespread pollution resulting from past and ongoing iron ore and taconite mining in this same region, and the MPCA’s failure to effectively regulate these sites and enforce environmental laws.	PER06
4541	In several places, the SDEIS promises “adaptive management” to address any changes that become necessary due to errors in the SDEIS predictions. The need for some of these changes would not be known until long after the mine has closed and PolyMet Corporation no longer exists. It seems unlikely that financial assurance will be in place to cover these adaptations.	FIN05

4542	NEPA specifically requires that “information [be] available to public officials and citizens before decisions are made and before actions are taken.” 40 C.F.R. § 1500.1(b). Because information concerning financial assurance is directly relevant to the reasonably foreseeable significant adverse impacts of the proposed mine, and is essential to a reasoned choice among alternatives, and because the overall cost of obtaining such information is not “exorbitant,” NEPA requires the agencies to include this information in the SDEIS. 40 C.F.R. § 1502.22(a). Moreover, even if the agencies could demonstrate that detailed information concerning financial assurance cannot yet be obtained, the agencies are still required to include in the SDEIS a statement of the relevance of the incomplete or unavailable information to evaluating the impacts of the proposal, a summary of the information that is available, and the agency’s evaluation of the potential impacts “based upon theoretical approaches or research methods generally accepted in the scientific community.” 40 C.F.R. § 1502.22(b).	FIN05, FIN13
4596	According to PolyMet’s reclamation proposal, during years 22 to 31, PolyMet proposes to pump water out of the East Pit backfill for treatment in the WWTF at 1750 gpm. See PolyMet 2013i at 154. This appears to contradict the information in the SDEIS regarding the East Pit. This is a large amount of water to be pumped and treated, and it appears that it could impact saturation of the waste rock in the East Pit backfill. The agencies must more adequately explain PolyMet’s plans for the pumping of water at the East Pit at all phases of the mine project, including reclamation and postclosure. The additional discussion and analysis must address the feasibility and likelihood of success of PolyMet’s proposal, and the impacts of the pumping on the waste rock that would be backfilled in the East Pit.	PD35
4606	the amount of drawdown in the Partridge River is likely to be underestimated due to inaccuracy in the modeling, and drawdown of the upper reaches of the Embarrass River tributaries has not been addressed at all. PolyMet apparently does plan to discharge water directly to the channel of Unnamed Creek to maintain its flow immediately below the tailings basin. However, the fate of this water is uncertain; drawdown of the water table may cause the stream to lose most of the augmented flow to groundwater. The entire upper reach of the creek is currently lined by riparian wetlands; it is unclear whether the proposed augmentation will be sufficient to support the wetlands as well as the creek flow. As with Trimble and Mud Lake Creeks, discussion of the augmentation plan does not disclose the likely impacts to hydrology in the first mile below the tailings basin. Finally, the SDEIS also does not disclose the predicted drawdown at SW-003 on the Partridge River.	WR004, WR086, WR183, WR186, WR187
4612	The SDEIS provides no details as to the flow augmentation regime, or at what point the decision would be made to increase the augmentation. However, the point must be made that a twenty percent reduction in low flow is in many cases not within the range of natural variation. Low flows occur when there is little or no precipitation. While in wetter years a higher water table may contribute more groundwater than in drier years, the assumption that a twenty percent drawdown in the baseflow of a stream is equivalent to a twenty percent variation in annual precipitation is a misuse of statistics.	WR185
4639	The SDEIS also does not provide any scientific reference for the proposition that a twenty percent reduction in the flow of a stream would not result in significant effects on the aquatic community. See 40 C.F.R. § 1502.24 (agencies “shall make explicit reference by footnote to the scientific and other sources relied upon for conclusions in the statement”); Idaho Sporting Congress v. Thomas, 137 F.3d 1146, 1150 (9th Cir. 1998) (“NEPA requires that the public receive the underlying environmental data from which [an agency] expert derived her opinion”). The conclusion that augmenting flows to within twenty percent of current conditions is sufficient to protect aquatic life is thus unsubstantiated.	WR185

4663	Based on the information that is available, the groundwater elevation contours shown on Fig. 4.2.2-6 are not believable at this location. First, according to the text the elevations were determined from water level measurements in fifteen wells, as shown on Fig. 4.2.2-13. SDEIS 4-99. Figure 4.2.2-13 indicates that there are no groundwater wells on the entire east side of the tailings basin, including not only the Spring Mine Creek watershed but the Mud Lake Creek watershed as well. The SDEIS provides no information as to the basis of the contour map in this entire area. Furthermore, some of the elevation contours cannot be correct. The highest surface elevation contour between Cell 1E and the Spring Mine Creek watershed shown on Figure 4.2.14-2 appears to be about 1635 feet AMSL (although the figure is admittedly incomplete and difficult-to-read). This line is located directly below the location of the planned outflow swale. The groundwater elevation shown on Figure 4.2.2-6 at the same location is between 1700 and 1725 feet AMSL. Obviously this is wrong. Also, the map shows Spring Mine Lake at an elevation of 1775 ft (assuming that the groundwater elevation is no higher than the lake surface), while reference websites give an elevation of approximately 1676 feet. See, e.g., www.geonames.org.	WR054, WR071, WR079
4667	The SDEIS is even more lacking in information on hydrology at the south end of the tailings basin ... No explanation is given as to why or how the surface features prevent groundwater seepage and movement through this area, and none of the figures provide enough detail to show how much of the area consists of bedrock outcrop or what the likely hydrological regime might be. It appears that no monitoring has been done in this area, see SDEIS Figure 4.2.2-13, and the groundwater elevation contour map is completely lacking in detail. See Figure 4.2.2-6. ... The SDEIS states that "A cutoff berm and trench placed approximately 200 to 250 feet downstream of the seepage face would collect this seepage." However, there is no figure illustrating either the placement or the construction of this berm and trench.	PD13, WR071, WR101, WR117
4671	According to the SDEIS, eighty percent of the Mine Site currently drains to the south, while twenty percent "drains north to the One Hundred Mile Swamp and the Partridge River or northeast to the Partridge River." SDEIS 4-151. ... [Figure 4.2.2-5] does not support an interpretation that water does not flow toward Yelp Creek from the stockpile area. ... Whatever the rate of flow would be, the SDEIS and the modeling apparently assume that all of this flow will be toward the West Pit. The information provided does not support this assumption...It cannot be assumed based on the available information that this drainage will not impact wetlands and Yelp Creek.	WR071, WR088, WR089
4676	We agree with the GLIFWC position and incorporate the "GLIFWC Wetlands Attachment" by reference. This includes (but is not limited to) the points that: Groundwater drawdown is likely to result in impacts on ombrotrophic bogs, and these impacts must be included in the SDEIS.? Hydrogeological studies at the mine site are insufficient to support SDEIS assumptions regarding hydrological connections between groundwater and many of the wetlands.? Use of the Canisteo Pit as an analog must be adjusted to account for the difference in depth of the NorthMet pit, and this assessment must use relevant information from other mine pits.? The amount of acreage likely to be impacted, and the acreage likely to be severely or moderately impacted, are all higher than suggested in the SDEIS.? Significant drawdown of the Partridge River is possible, which would in turn impact riparian wetlands.? PolyMet needs to provide sufficient information to allow assessment of the quantity of wetlands that will be impacted.	WET10
4682	The SDEIS explains the use of MnRAM to assess wetland functions, including a list of factors used in the assessment. However, the wetland discussion does not provide information on which functions provided by the wetlands will be destroyed or degraded by this project. As a result, it is impossible to judge whether the functions that will be lost will be replaced by mitigation. The discussion of mitigation focuses only on the quality and type of wetland, and ignores function. ... [Table 4.3.3-2, SDEIS 4-436] is from the reference document AECOM 2011a, which includes MnRAM documentation only for the Federal Lands outside of the Mine Site itself, which were apparently assessed separately from the Mine Site lands. We were unable to find MnRAM documentation for wetlands within the Mine Site, which of course is where the greatest impact will be.	WET21

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4690	Neither the impacts of mercury deposition in wetlands nor the addition of mercury to groundwater flow through wetlands is assessed in the SDEIS. The SDEIS does not include information on current mercury levels in water in the wetlands that would be impacted, particularly at the mine site, but the information that it does include indicates that wetlands almost certainly already violate the applicable mercury water quality standard of 1.3 ng/L. ... Since the SDEIS assumes that changes in groundwater quality may effect wetland water quality, and since the groundwater will include mercury released from mining features, the only possible conclusion is that the project will add to mercury levels in the wetlands, which already exceed the water quality standard. ... Mercury levels in wetland waters are also likely to increase due to mercury in fugitive dust and Plant emissions.	MERC01, MERC09
4691	The SDEIS must assess the total additional load of mercury to wetlands from all sources (air deposition, groundwater transport, and spillage) and the impact it will have both on the violations of the water quality standard and the mercury level in downstream fish. It should be noted that the 1.3 ng/L standard is set to protect wildlife that feed on fish and other aquatic life, and thus the assessment should not be limited to impacts on humans who eat fish from the downstream lakes.	MERC01, MERC09
4692	In addition to mercury, the Proposed Project would likely result in violations of other water quality standards in wetlands, due to both groundwater contamination and air deposition of sulfur and metals...The SDEIS does not fully describe its groundwater quality predictions in regards to the depth at which the pollution is likely to be found, whether the entire flow path is likely to be affected or whether we can expect a narrower plume of contamination, etc...In the absence of adequate rationale for the assumption that groundwater flowing from the mine features would not enter [minerotrophic] wetlands, it must be assumed that contamination would impact all wetlands that are hydrologically connected to groundwater in each flow path.	WET10, WR010, WR112, WR120, WR151
4693	Neither the SDEIS nor the Wetlands Data Package provides the water quality predictions for those locations, however; that information is found in Attachment J of the Water Modeling Data Package Vol. I (PolyMet 2013i). As explained above, the Class 2B standards apply to wetlands. The following table shows the approximate P90 predictions of groundwater quality at the Dunka Road for several flow paths, as compared to the Class 2B standards. Standards that vary based on hardness are given for a hardness of 100 mg/L. All values are ug/L. [see full comment letter for table, pg 57 of 157]...The values in the table above do not refer to the leachate from the various ources.Rather, they reflect very significant dilution by other groundwater. In fact, it is entirely unclear from the discussion in the SDEIS, the Water Modeling Data Package, and the Wetland Data Package that these values do not actually reflect	WR112, WR173, WR177
4694	We have particular concerns about pollutants (such as copper and nickel) for which predictions are based on concentration caps and adsorption rates. The leachate for these pollutants is expected to be extremely concentrated, and we do not believe that the predictions accurately reflect the potential for releases to groundwater and wetlands. The following table shows leachate levels, which are limited to those that are included in Attachment H of the Water Modeling Data Package Vol. 1 (PolyMet 2013i). Once again, all values shown are approximate P90 predictions in ug/L. Standards that vary based on hardness are given for a hardness of 100 mg/L. [see full comment letter for table, page 58 of 157]. It is clear from this table that the potential for water quality violations in wetlands surrounding the stockpiles and pits is significant. While the values given for the Category 1 Stockpile and the pit water are not as high as those for the temporary sources, some of the constituents will remain many times higher than the standard for more than 200 years, which was the extent of the modeling period.	WR058, WR064, WR112, WR166, WR167, WR177
4696	The PolyMet materials do not include predictions for seepage at the east side of the Tailings Basin, but predictions for water quality at the North, Northwest, West, and South toes indicate approximate water quality, shown in the following table. The values are approximate maximum P90 values, in ug/L. Values for standards that vary by hardness are given for a hardness of 100 mg/L. [see full comment letter for table, page 59 of 157]. See Water Modeling Data Package Vol. 2 (PolyMet 2013j), Attachment F. As is clear from this table, if sufficient water escapes collection the water quality standards will be exceeded in wetlands immediately below the tailings basin. This seems particularly inevitable on the east side, where seepage is likely to affect Spring Mine Creek as well as wetlands.	WET12, WR054, WR064, WR100, WR102, WR120

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4697	The SDEIS completely ignores the potential for degradation of plant and aquatic life due to the reduction of sulfate to sulfide within the wetland environment. Considering that several streams within the Plant Site are on the impaired waters list for Fishes and Macroinvertebrates Bioassessments, PolyMet and the Co-Lead agencies need to investigate the role of sulfate in the degradation of aquatic communities before permitting any additional releases.	AQ11, AQ12
4698	As with the metals, the SDEIS relies on attenuation and dilution in its predictions regarding sulfate levels in the Partridge and Embarrass Rivers. And as with the metals, the SDEIS does not disclose the levels of sulfate that will discharge to wetlands, far upstream of the surface water evaluation points. As with the metals, the SDEIS relies on a faulty model of the mine site and unrealistically optimistic predictions of the effectiveness of water collection to minimize the amount of contaminated water predicted to escape into groundwater and wetlands from the mine features. And finally, as with the metals, the SDEIS does not reveal the amount of sulfate that will enter the wetlands through air deposition.	WR017, WR019, WR020, WR021, WR058, WR089, WR120, WR126, WR127, WR151, WR167
4699	The maximum predicted P90 sulfate levels in the groundwater flow paths at the Dunka Road average between 20 and 60 mg/L. Maximum P90 levels in leachate from mine features is presented in the following table, with approximate values taken from the Water Modeling Data Package Vol. 1, Attachment J (PolyMet 2013i). [see full comment letter for table, page 62 of 157]. Sulfate in the Category 1 leachate is of particular concern, because it continues at this level beyond Year 200. Some unknown amount of this water is likely to discharge into the wetland immediately south of Yelp Creek; Yelp Creek itself is located about 1,000 feet from the foot of the stockpile.	WR060, WR071, WR081, WR115, WR120, WR167, WR173
4700	The wetlands cumulative effects discussion begins by including only the direct impacts of the Proposed Project. SDEIS 6-35. This exclusion of most of the impacts of the project is unexplained and unacceptable. If the rationale is that lost wetlands can be expected to reappear once the pits are filled, this is not acceptable. The impacts of forty years of wetland loss and degradation must be included in the cumulative impacts analysis, including the long-term effects of vegetative and other changes. The cumulative impacts requirement is not limited to permanent wetland loss. The analysis should not include the East Pit wetland or the West Pit in its calculations. These areas will not meet water quality standards, and the West Pit, at least, will be fenced. Water will be pumped from the West Pit in part to limit the amount of water flowing out to wetlands. Referring to the West Pit as “deep water habitat,” SDEIS 6-35, begs the question, habitat for what?	WET18
4701	In addition, the [cumulative wetlands] analysis does not include impacts from Northshore Mining. Northshore Mining estimates that its planned expansion will increase inflow to the Peter Mitchell Pit to 280 percent of its current inflow, Golder Assoc., Type II Virginia Formation Stockpile Plan (May 2, 2013) (Ex. 35). This amount of increase will surely have some impact on wetlands. Furthermore, it plans to completely eliminate 6,000 acres of the Partridge River watershed and discharge all pit water to the Rainy River watershed following closure. Northshore Mining Company, “Ultimate Pit Limit – Permit to Mine – December 2010” (April 12, 2013) (Ex. 36). This will also impact wetlands in the Partridge River watershed.	WET18
4706	In many cases, the conclusion that destruction of wetlands will have significant environmental impacts can be avoided by providing compensatory mitigation that addresses those impacts ... most of the proposed mitigation is located in places where it cannot compensate for lost functions. The restoration of wetlands outside of the St. Louis River watershed cannot compensate for the loss of functions such as flood control, water storage to support river and stream base flows, and filtering of pollutants and particulates within the watershed...the SDEIS must provide an assessment of lost functions; that assessment must consider whether mitigation will occur within a geographic scope that would actually address those losses.	COE02, WET03
4707	The destruction of peat bogs will not only release mercury currently stored in peat, it will reduce the mercury sequestration capacity of the watershed, which is likely to have a continuing impact on mercury levels in rivers and streams, and thus on the level of mercury in fish tissue within the St. Louis River system. The loss of this capacity cannot be compensated for by increasing the capacity for mercury sequestration in another watershed (even if the creation of a peat bog were possible).	MERC20

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4708	the mine site provides habitat for a number of wildlife species that do not range as far south as the proposed [wetland] mitigation sites. Two of these are Canada lynx and moose. Moose in particular need wetlands for thermoregulation in summer, and with global warming that need is increasing. Northeastern Minnesota is increasingly becoming the last viable area within the Midwest for northern species as temperatures grow warmer, and many other species could be affected by the loss of habitat in this area. The restoration or rehabilitation of wetlands south of St. Louis County will not compensate for this loss.	WI01, WI02
4709	Another function that will be lost at the site is the loss of biodiversity, particularly in regards to black spruce/Jack pine forest, which is considered imperiled/vulnerable in Minnesota. This ecosystem is disappearing due to global warming, and any attempt to create this ecosystem is unlikely to be successful; that would be particularly true south of St. Louis County [at the wetland mitigation sites].	VEG02, VEG03
4710	the wetland fill would destroy one of the few known Minnesota populations of floating marsh marigold, which is state-listed as endangered and has been found only in St. Louis County. Restoring wetlands in the Aitkin and Hinckley [mitigation site] areas will not replace habitat for this rare plant.	VEG01, VEG03
4711	In addition to the direct destruction of 916 acres of wetlands, the SDEIS acknowledges that the proposed project would destroy or degrade thousands of additional acres. Neither the permit application nor the SDEIS provides a mitigation plan for this significant loss of wetlands. Instead, the SDEIS includes a promise to monitor, with no details regarding parameters, conditions that would trigger a need for additional mitigation, or description of what that additional mitigation would consist of. Without this information, the public (and decision makers) have to assume that an undisclosed amount of wetlands will simply be lost.	COE02, WET01, WET02
4714	What the SDEIS fails to explain is why these impacts [lynx habitat and wildlife corridors] would not violate the Endangered Species Act. ... Even though the agencies have been analyzing this proposed mine for a number of years, the SDEIS states that ESA Section 7 consultation between the action agencies and the U.S. Fish and Wildlife Service is still “ongoing and will continue throughout the EIS process.” SDEIS 5-364. Pursuant to NEPA, the agencies should have waited to release the SDEIS for public comment until after ESA consultation was completed, to allow the concerned public to know the position of the expert wildlife agency regarding the impacts of the proposed mine on Canada lynx during the public comment period. See 40 C.F.R. §§ 1502.25(a), 1502.9(a). ... The proposed mine would likely result in the “take” of Canada lynx, through the destruction of their critical habitat, vehicle and train collisions, and the continued loss and fragmentation of the few remaining wildlife corridors in the area. ... there will undoubtedly be cumulative impacts to lynx and lynx habitat as a result of widespread mining, mineral exploration, and other activities in this region	WI01, WI02, WI03, WI11
4715	The SDEIS’s analysis of the potential impacts of the mine proposal on moose and moose habitat, however, is almost nonexistent. In devoting only one sentence to the decline of the state’s moose population, SDEIS 4-210, the SDEIS vastly understates the dramatic decrease in moose populations across Northern Minnesota. ... The SDEIS also fails to recognize the critical importance of northeastern Minnesota for the remaining moose population in the state. ... In failing to properly recognize the moose’s dramatic decrease in population, the SDEIS’ analysis of the potential environmental consequences to moose is also deficient... The agencies summarily conclude, however, that even though moose would be adversely affected through habitat loss and fragmentation, an adverse affect would be “not likely at the population level.” Id. NEPA prohibits agencies from making such sweeping general statements without providing supporting data or analysis. Idaho Sporting Congress v. Thomas, 137 F.3d 1146, 1150 (9th Cir. 1998); 40 C.F.R. § 1502.24.	WI01, WI02

4716	Moose are likely to be affected by the proposed NorthMet project in a number of ways that the SDEIS fails to sufficiently address or disclose. First, vehicle and train collisions have been recognized for decades as an important source of moose mortality. ... [second] the presence of areas that provide a mosaic of habitat types within close proximity to each other may be an important component of moose survival in Minnesota. Although the Mine Site has apparently not been assessed on this basis, it appears from descriptions to provide such a mosaic of habitat types. Third, moose survival may also be affected by the expenditure of energy when startled by noise or to avoid areas affected by human activity. ... Finally, the same impacts on wildlife corridors that will affect lynx will affect moose, in much the same way.	WI01, WI02, WI03, WI05
4719	the SDEIS analysis of the potential impacts to moose is even more deficient and problematic in the cumulative impacts analysis, where moose are not even mentioned.	WI01
4730	The SDEIS fails, however, to provide a detailed analysis of the environmental consequences to birds and wildlife that would result from the creation of a permanent, polluted pit lake at the Mine Site, and creation of a permanent tailings pond at the Plant Site.	WI01, WI04
4731	The SDEIS's failure to address the proposed mine's compliance with the MBTA [Migratory Bird Treaty Act], despite the proposed creation of a permanent 321 acre pit lake and the acknowledgment that migratory bird species may be adversely affected by this newly created "open water" habitat, violates NEPA and the MBTA.	WI04, WI11
4734	The SDEIS tells us that noise will impact wildlife, and that "Songbird populations have been shown to decrease with noise levels as low as 35dB." SDEIS 5-370. However, the SDEIS says nothing about the magnitude of the impacts. ... [Figure 5.2.8-3] shows a remarkably large area within which songbirds could be affected. It indicates a circular area that appears to be about 20 miles in diameter. It thus appears that the project would affect more than 300 square miles of songbird habitat; if this is the case, the SDEIS needs to say so.	N04
4735	The SDEIS needs to provide an estimate of the acreage of wildlife habitat that will be degraded due to human noise and activity. The effect of noise, traffic, and other human activity in addition to the direct loss of habitat and the blockage of wildlife corridors needs to be addressed to give a complete picture of the impacts of this project on wildlife.	N04
4741	In its cumulative impacts analysis for wildlife, the SDEIS provides very general statements concerning some risk and impacts, which fall far short of the detailed analysis required by NEPA. ... Absent a justification as to why more detailed and quantifiable information cannot be provided, these very general statements are insufficient and fail to comply with NEPA.	WI08
4750	As for the wolf, which until recently was designated as threatened with extinction under the ESA and remains a state species of concern, the SDEIS cumulative impacts analysis devotes only one sentence to potential impacts ... Clearly NEPA requires a more detailed analysis, or the cumulative impacts requirement is rendered meaningless.	WI01
4757	The SDEIS cumulative impacts analysis for wildlife also entirely fails to consider or address impacts of the widespread past, present, and reasonably foreseeable mineral exploration across the region. In May, 2012, the Forest Service completed an EIS for 29 federal hardrock mineral prospecting permits, which acknowledged impacts to wildlife including up to 163 miles of new roads, increased traffic volume, and the increased noise from drilling. While the mineral prospecting EIS was limited to an identified number of projects where the federal government owns the mineral rights, there are many additional mineral exploration projects within and near the Superior National Forest where the mineral rights are owned by private interests or the State. Additionally, the BLM is currently considering potential lease renewals for Twin Metals, which would result in additional exploration and other mining activities. And the Forest Service is in the process of preparing an Environmental Assessment of the impacts of the Twin Metals hydrogeological study. All of these projects will have impacts on wildlife, each of which may not be significant standing alone, but which are very likely to be significant in the aggregate. None of these projects, however, are considered in the SDEIS cumulative impacts analysis.	WI08

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4758	The SDEIS also fails to consider the cumulative impacts of the continued destruction of wetlands in this region, and the resulting impacts to wildlife. This is especially important due to the changes anticipated in the region from global climate change.	WI02
4759	What the SDEIS fails to provide, however, is any analysis as to what this anticipated continued decline in the few remaining travel corridors actually means for wildlife in the region. This is especially problematic for wide ranging species such as wolves, rapidly declining species such as moose, and already endangered species such as the Canada lynx.	WI03
4760	The SDEIS states that a “Take Permit” may be required for impacts to state-listed endangered and threatened species, and that mitigation may be required. As with indirect impacts to wetlands, the lack of a mitigation plan makes it impossible to judge what the impacts on these species will be. NEPA and MEPA both require that if mitigation is relied on to eliminate or lessen impacts, that mitigation and its likely efficacy must be described in the EIS.	VEG01
4761	The cumulative impacts assessment must identify the appropriate scope of review for each issue, and proceed accordingly. ... The discussion of cumulative impacts to state-listed plant species needs to consider threats to the species throughout its range within the state. Without this information, it is impossible to know the full significance of the destruction of populations due to this project. For example, the project is predicted to impact eight percent of the known populations of floating marsh marigold in the state, i.e., it will impact one of only twelve populations. Table 5.2.4.3, SDEIS 5-346. To understand the significance of the loss or degradation of this population, we have to know the status of the other populations.	VEG08
4762	the SDEIS cumulative impacts analysis for a number of resources – including but not limited to water quality, wetlands, and wildlife - is inadequate and fails to comply with NEPA or MEPA. The SDEIS provides only general, mostly non-quantified analysis, which falls far short of the detail required.	CU14
4763	the SDEIS makes a number of fundamental mistakes in its cumulative impacts analysis, including failing to consider certain past, ongoing, and reasonably foreseeable actions. Table 6.2-1 lists the actions that the agencies considered. SDEIS, p. 6-7. Notably absent are the hundreds of exploratory drilling projects taking place in the same region on federal, state, and private lands.	CU02
4764	The SDEIS also fails to include consideration of the major expansion proposed at United Taconite. ... As stated in our comments, the construction and utilization of tailings basin 3 at United Taconite would impact an additional 1,300 acres of wetlands and adjacent waterways in the St. Louis River watershed.	CU02
4765	The SDEIS further fails to address PolyMet’s plans for future expansion and/or for the Plant Site to be utilized for future copper-nickel mining projects in this region. Because the plant will operate only at approximately one-third capacity for the proposed NorthMet project, its use for other projects is likely. ... Of course the additional use of this Plant Site for expansions and other mining proposals would significantly increase the amount of waste that would be deposited into the tailings basin. This would also greatly increase the amount of vehicle and rail traffic and other disturbances in the immediate project area, impacting numerous resources.	CU02
4766	The SDEIS also fails to set forth the proper geographic scope for the cumulative impacts analysis, especially concerning the potential impacts to water, wetlands, and aquatics, where the agencies refuse to extend the scope of analysis to the entire St. Louis River watershed. There can be no dispute that past and ongoing mining and related activities have resulted in major, significant impacts to the St. Louis River watershed, all the way downstream to the estuary which is formally designated as an “Area of Concern.”	CU01

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4767	This is an error that the SDEIS makes again and again, for virtually every type of impact. From the air deposition of mercury to area lakes, to ambient air pollution and regional haze, to the loss of critical habitat, to impacts on state-listed endangered plants, the SDEIS compares the level of impact from this project to the overall impact and deems the impacts from this project insignificant and thus not of concern, even in regards to the cumulative problem. The SDEIS must reveal the level of cumulative impact that all sources together have on impacted resources, and acknowledge that the Proposed Project would be one of many sources that together cause the impacts.	CU15
4812	The [regional haze] analysis must include all Class I areas that could be affected by the cumulative emissions of this and other projects. That would include at least Isle Royale. The analysis makes the further mistake of limiting the foreseeable projects that will have impacts on the Class I areas. The analysis must include all foreseeable projects that are likely to impact visibility in the Class I areas, regardless of where they are located. ... Furthermore, the SDEIS does not include all foreseeable sources even within the study area. The list of included project on SDEIS p. 6-81 does not include mining lease exploration activity. Drilling and other exploration activity can be a significant contributor to haze, especially in winter.	AIR08
4813	The entire analysis of this issue is built on the faulty premise that if reductions are made from some sources, additions will be acceptable from other sources. The point of the haze regulations is to reduce pollutants that affect visibility and most importantly to make reasonable progress on improving visibility in all affected Class I areas such that natural visibility conditions are attained by 2064. The amount of reductions from other facilities is not the relevant number by which to measure the impacts of the Proposed Project. Rather, the impacts must be measured against the visibility targets for all affected Class I areas (including Isle Royale). If that target is unlikely to be met, the pollution from this project must be considered a contributor to a significant cumulative impact.	AIR08
4861	The analysis attempts to describe the current situation with the Regional Haze State Implementation Plan (SIP). SDEIS 6-78. It fails to note, however, that the plan has been challenged in court due to its lack of stringency, and may well be invalidated. Furthermore, the analysis does not tell us what the SIP, the EPA Federal Implementation Plan, the Cross-State Air Pollution Rule, and the litigation involving them mean for this project and its impacts on visibility. ... the goals of the challenged SIP do not meet the requirement to meet natural conditions by 2064 and therefore there is no question that additional reductions will be necessary. It is inconceivable that the agencies could possibly find that the increase from the Proposed Project may be permitted under this scenario.	AIR08
4862	Remarkably, the entire cumulative impacts assessment never describes the actual impacts of haze on Class 1 area visibility, at current levels and at the levels we can expect based on the assessment of emissions levels. One can read the entire assessment and have no idea how much visibility has already been impacted in the national parks and wilderness areas, how much better or worse it will be with the projected reductions and increases, or how close that will come to pristine conditions. PolyMet and the agencies must model and discuss actual visibility impacts. Although emissions are a component of this analysis, emissions reductions do not result in a straight-line visibility impact, and cannot be used as a substitute for impacts on visibility itself.	AIR08
4863	we disagree that “PM10 emissions are not considered to be a concern for visibility impairment in the BWCAW or Voyageurs National Park,” SDEIS 6-83 (and we reiterate that other potentially affected Class I areas must be included in the analysis). It is alarming to learn that considering only the projects that the agencies deem foreseeable, and including reductions, a net increase in PM10 emissions is predicted; the SDEIS needs to provide more information on how this could affect haze and what it means in regard to regulatory requirements.	AIR08
4864	Paragraph 5 of the summary on SDEIS 6-86 is poorly worded, and needs to be clarified. “Based on current projections including the NorthMet Project Proposed Action, the reductions addressed in this section are not projected to be enough to meet the 2018 goal.” That much is clear. Does “The reductions would be enough to meet the 2012 goal” mean that they would be enough even if NorthMet was operating? If not, would the goal be met with the NorthMet project? And at what point in time would the goal be met? The year 2012 has already passed; has the goal in fact been met? If we have not yet met the 2012 goal, it is unclear how this project could be permitted.	AIR08

4865	The NorthMet Proposed Project would emit 700 tons per year of particulate matter-10, SDEIS Table 5.2.7-5, which is quite a substantial amount of a pollutant with already existing impacts on human health. Yet the SDEIS completely fails to tell us about the health impacts of breathing PM10, or the degree to which the Proposed Project would add to existing levels.	AIR07
4866	Table 5.2.7-10 and Table 5.2.7-11, both at SDEIS 5-410, require explanation. The tables appear to include the same information for different purposes. However, although the SO2 and NO2 values are the same, the values for PM are very significantly reduced in Table 5.2.7-10, with no explanation. If this is due to the evaluation location (the property line for Table 5.2.7-10 and an undisclosed location for Table 5.2.7-10), the SDEIS needs to discuss the impacts of this level of particulate matter for workers at the site.	AIR07
4867	The SDEIS includes many pages of discussion about regulatory requirements and why the project will not violate them, but it gives no information whatsoever about the impacts of emissions of criteria pollutants from the Proposed Project on human health. While EIS requirements include a discussion of whether regulatory requirements will be met, that is not the primary point. The point is to describe environmental impacts, whether they are otherwise regulated or not. Regulatory standards are very often compromises that allow some amount of impact in order to accommodate industry. They are generally not cut-off points below which no impacts will occur.	AIR07
4868	While the figures do illustrate a shocking level of exceedances due to taconite facilities, it nonetheless also appears that the NorthMet project is likely to have some impact from the emission of NO2, as ambient levels approach the regulatory standard. Of particular concern is that the analysis completely omits discussion of particulate matter, apparently because it is not modeled to exceed the standard at any receptor. It does, however, come close, at 34 ug/m3 compared to the standard of 35 ug/m3. Particulate matter is likely to have an impact at this level, and it would be instructive to see a modeled receptor map showing where this impact would occur.	AIR07
4869	More generally, the entire cumulative impacts analysis for criteria pollutants is improperly limited to the grid around the site, rather than considering incremental additions to more regional problems. Most of the state of Minnesota has just experienced a health advisory warning from MPCA due to high levels of particulate matter. MPCA, "Eastern two-thirds of Minnesota placed under air pollution health alert" (March 7, 2014) (Ex. 52) accessed at <a href="http://www.pca.state.mn.us">http://www.pca.state.mn.us</a> on March 8, 2014. We reiterate that it is alarming to learn that a net cumulative increase in PM10 emissions is predicted, even with planned reductions from any facilities. The SDEIS must disclose contributions from the Proposed Project to the projected increase, and what that means for human health both locally and in downwind areas.	AIR09
4870	One of the most problematic issues in regard to this and other new mining projects in Northern Minnesota is the impact on global climate change. The SDEIS reveals that this project would represent 0.44 percent of Minnesota's greenhouse gas emissions. SDEIS 5-430. This is an enormous amount for one facility, especially a facility that intends to employ only about 0.012 percent of Minnesota workers.	AIR01
4871	The SDEIS states that Minnesota has established a greenhouse gas emissions reduction target of 15 percent by 2015. ... It is absolutely unconscionable for the State of Minnesota to consider permitting the level of increase in emissions at issue here, in light of our commitments to global welfare.	AIR01

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4872	Although the SDEIS appears to include the loss of terrestrial carbon sequestration in its assessment of greenhouse gas emissions, the number used for this source of greenhouse gases is puzzling. A 2008 report to the DNR states, "A single acre of peatland contains, on average, 750 metric tons of C. Total emission of the carbon contained in just 1,000 acres of peatland would increase Minnesota's 2005 CO2 emissions by almost 2%." Anderson, Jim, et al., "The Potential for Terrestrial Carbon Sequestration in Minnesota" (February 2008) (Ex. 14). The total amount of terrestrial carbon loss reported in Table 5.2.7-9 of the SDEIS is 199,963. This would amount to a loss of 266 acres of peatland if no other losses were counted. However, the SDEIS states that "Most of the wetland vegetation present at the Mine site (69 percent) is indicative of acid peatland systems." It appears that significantly more than 266 acres of peatland will be destroyed. We thus question whether the protocols used to estimate greenhouse gas emissions underestimate impacts from the destruction of peatlands. Furthermore, the SDEIS does not discuss the important role these lands play in long term sequestration of carbon. The value of the lands for that purpose will be permanently lost; we cannot recreate this resource.	WET13
4873	Friends of the Boundary Waters Wilderness commented extensively on state policy in regards to peatlands in its scoping comments on the USFS land exchange ... These state recommendations and policies and the inconsistency and impact of permitting the Proposed Project must be discussed in the SDEIS.	NEPA08
4877	The inventory of greenhouse gas emissions does not appear to include increased emissions from transportation to and from the mine and plant sites. This site is in a relatively remote location, and will necessitate a great deal of transportation of both materials and workers. SDEIS Table 3.2-13 lists shipments of various materials; the greenhouse gas emission impacts should be included for these shipments from their place of origin, not just from Duluth. In addition, the SDEIS assumes that workers will commute long distances for jobs at the site. This assumption also needs to be included in the assessment of greenhouse gas emissions.	AIR01
4878	In addition, some of the processing of these metals will be done in other locations. Earlier estimates of air emissions have been reduced due to this factor, in essence exporting the air pollution impacts to another location. In regards to global pollutants like greenhouse gases and mercury, these impacts must be included in the EIS for the project. The cumulative impacts of these emissions when added to other global sources of pollution will add to the impacts in Northeastern Minnesota just as they would if they were emitted locally. They will also add to the load affecting the entire planet regardless of the emission location.	AIR07
4879	At the very least, PolyMet, the Co-Lead Agencies, and the SDEIS need to consider an alternative energy source. All of the electric power for this project would come from burning coal.	AIR01
4880	In addition, according to the SDEIS, several alternatives that would decrease greenhouse gas emissions (albeit by minor amounts) were considered and rejected by PolyMet. SDEIS 5-433. At least one of the alternatives was rejected on the basis of cost alone; the reference document indicates that an electric tram system for haul trucks would not be considered unless it would be less expensive than diesel power, which emits more greenhouse gases. See Barr 2012s., Att. A. The Co-Lead Agencies need to consider these alternatives themselves, and include them in the SDEIS if they would provide environmental benefits. Under NEPA, the consideration of alternatives is not driven by what the project proposer is willing to do. The Co-Lead Agencies must examine the project objectively and independently to determine whether the applicant could do more to reduce environmental impacts, and must deny the necessary authorizations if they find that it could.	AIR01
4881	For almost every resource that will be impacted by the Proposed Project, the SDEIS fails to account for the impacts of climate change. ... Providing a note of this while not stating what the actual effect of the changing climate will be, see SDEIS 5-430, is not sufficient to cover every issue in the SDEIS. For some of the resources at risk, it is at least predictable that the differences will be significant and that they will move in a particular direction...For these and other impacts with a foreseeable climate change component, the SDEIS must include this factor in its discussion of impacts.	AIR01

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4882	Both PolyMet and earlier investigators have found amphibole material in the area PolyMet seeks to mine. This amphibole can include fibers that produce health effects. Such fibers are also generated when the material is ground and processed as PolyMet plans to do. SDEIS Section 5.2.7.5 and its supporting documents try to explain this away, saying the fibers are not true asbestos and wouldn't cause health harms. In fact, the history of taconite mining in Minnesota and mining in other places proves that fibers deemed "not asbestos" by some experts can sicken and kill humans in large numbers. That is just what could happen if PolyMet is allowed to mine in the Duluth Complex.	HU05
4900	The Expert Statement of Steven J. Ring ... explains that as part of the Minnesota Environmental Quality Board's Regional Copper-Nickel Study, Mr Stevenson found amphibole fibers in the Duluth Complex – including from the Partridge River Intrusion, which PolyMet seeks to mine. ... Stevenson's conclusion was that the Duluth Complex has 1/3 the fibers as the does the Biwabik. Id. at 5. Stevenson also notes the similarity of the formation of amphibole minerals in the Biwabik and Duluth Complex: both can have the same type of sharp, pointed crystals. ... The information and opinions from Mr. Ring's statement must be disclosed and addressed in the Final EIS. An EIS must disclose and respond to "any responsible opposing view."	AIR03
4902	the University of Minnesota School of Public Health and the Natural Resources Research Institute (NRRI) presented findings from their ongoing Taconite Workers Health Study (Ex. 58). They found that in Iron Range Communities mesothelioma was present nearly 200% higher than expected. Ex. 58 at 5. Lung cancer was higher than expected by 20% and heart disease by 11%. Id. All three of these harms were elevated in each of four geologic zones of the Iron Range. Id. Furthermore, the study found that the iron mining worker population of northeastern Minnesota has elevated rates of death from all causes combined, all cancers combined, lung cancer, mesothelioma, and heart disease. If mining in the Duluth Complex might yield a third of this harvest of death and illness, the PolyMet proposal should be rejected.	HU05
4906	The [Barr Engineering, Fibers Data Related to the Processing of NorthMet Deposit Ore (June 2007) (Barr 2007m).] ... Report argues the fibers that would be generated by mining the Duluth Complex would not be asbestiform, and thus would not harmful based on a review of fibers identified in its sampling and Stevenson's earlier work regarding the Duluth Complex. ... the assertion in the PolyMet Fibers Report that EPA requires a 20:1 aspect ratio for a fiber to be deemed asbestos is flatly incorrect. EPA has specifically rejected an identical mining industry claim regarding El Dorado Hills, CA. The 20:1 aspect ratio used in the PolyMet Fibers Report, via the Wylie fibrosity index, should not be used as a determinant of the potential for health effects from a given fiber. In addition, the results from Libby and the Peter Mitchell Pit – where fibers that arguably fail a strict test of what constitutes asbestos still prove deadly – amply demonstrate that such narrow definitions are irrelevant to whether public health will be at risk.	HU05
4913	The companion argument in the PolyMet Fibers Report (as it was at Libby) is that the fibers are cleavage fragments, which are asserted to be not harmful. In fact, there is no basis for this assertion. ... EPA, ATSDR, NIOSH, the American Thoracic Society and leading epidemiologists reject the claim that cleavage fragments cannot cause health effects. Research data also support the notion that small fibers can cause health effects. The Cook PMP Analysis (cited above) found that fibers splitting into smaller pieces can increase the potential for health risk. ... Clearly if surface area is the key determinant of health effects – not aspect ratio alone or number of particles or surface chemistry – then elongated particles of varying size and aspect ratios can be harmful. As important, if surface area is the key determinant, whether a particle arrived at its shape by cleavage or some other mechanism is irrelevant.	AIR03

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4917	A report prepared for the Minnesota Department of Natural Resources and cited in the SDEIS provides support for the notion that short fibers can play an important role in creating disease. Environmental Resources Management, Amphibole Mineral Fiber Toxicological Literature Review 11-12 (March 2009) (ERM2009) [hereinafter MDNR Literature Review]. Citing three studies, the MDNR Literature Review states, “[o]ther studies that examined human tissues have found that the majority of asbestos fibers in mesothelial tissues were shorter than 5 μm in length, thus indicating the ability of shorter fibers to reach the tumor site, remain there, and as a consequence thereby implicating their role in the development of disease.” Id. (citations omitted). The MDNR Literature Review also discusses a series of studies that found short fibers contributed to health effects.	HU05
4918	The PolyMet Fibers Report also cites old preliminary research from 2003 regarding an absence of health effects experienced by Minnesota taconite workers to suggest that no health harms should result from mining the Duluth Complex. PolyMet 2007m at 61. This science is outdated; as presented above, more recent data show elevated mesothelioma, lung cancer and heart disease and overall death rates for taconite workers. In fact, the health effects experienced by those workers rings an alarm bell for the prospect of mining in the Duluth Complex. The PolyMet Fibers Report also asserts that the low levels of fibers Barr Engineering found in samples taken from the Duluth Complex suggest no health harm is likely. Barr 2007m at 65. In fact, even very low levels of mineral fibers can cause substantial health effects.	HU05
4919	The SDEIS asserts that, “[t]he vast majority of potential emissions of MN-fibers for the NorthMet Project Proposed Action would occur from the ore crushing operations at the Plant Site, with minor potential emissions from the Tailings Basin and the Mine Site.” SDEIS 5-441. The authority cited for this proposition is Barr Engineering, Emission Control Technology Review for NorthMet Project Mine Site (September 2007) (Barr2007o) [hereinafter Emission Control Report]. In fact, the Emission Control Report contains no such information. Instead, the report discusses various types of control measures. However, for many of the emission sources no mechanical control is proposed. ... Thus, there is no basis in the record to believe mine workers won’t be exposed to dust at the mine site, if the mine becomes active.	AIR03
4920	It is very troubling that PolyMet used the R.J Lee Group to analyze its samples for asbestos, and that the Co-Lead Agencies accepted this analysis for the SDEIS. This consulting firm consistently represents industry and, as noted above, EPA has demonstrated at Libby and El Dorado Hills how the firm uses inappropriate measures to analyze for asbestos. Further, the similarity between arguments found in the PolyMet Fibers Report and arguments used by the R.J. Lee Group – and rejected by EPA – at other mines undermines the credibility of the entire SDEIS fibers analysis.	AIR03
4921	The unusual preparation of the PolyMet flotation samples also raises credibility concerns. PolyMet’s contractor ground the samples destined for the electron microscope with a mortar and pestle to an unspecified degree – something that neither of the cited test methods calls for. Ex. 52 at 13-14. As Mr. Ring points out, this extra grinding prevents the results from being compared with Stevenson’s similar analysis. Id. Did the grinding remove fibers that PolyMet otherwise would have found? Was that the goal of the exercise? When important public health matters are involved, decision makers should be able to rely on information untainted by such concerns.	AIR03
4922	The discussion of fibers above indicates the need for an assessment of the potential impacts of the Proposed Project on the health of people who would work there. Leaving the protection of workers to OSHA regulation without providing them and the public with an explanation of the risks is a disservice to the entire community. In addition to fibers, it is apparent from the assessment of impacts on ambient air that working at the mine would pose health risks to workers. However, the assessment does not provide any information on air quality within the property line, so it is impossible to judge what the level of those impacts would be. The SDEIS should provide information about the ambient levels of pollutants for workers at various places within the Mine and Plant Sites, along with information about the health impacts of pollutants at those levels. A review of the health effects of particulate matter from the Journal of Toxicology is included as Exhibit 51.	HU04

4925	The numbers drawn from the Economic Impacts Assessment (EIA) do not take account of known limitations of the IMPLAN model, thus inflating the likely economic effects. Some of these limitations are noted in the EIA report itself. BBER 2012 at 3-4. In addition, we are submitting a review of an industry-wide report that was written by the same team at the Labovitz School of Economics. Hjerpe, Evan, and Spencer Phillips, "A Review of 'The economic impact of ferrous and non-ferrous mining on the State of Minnesota and the Arrowhead Region,'" (Dec. 30, 2013) (Ex. 75).	SO04
4926	Despite the caveats included in the EIA, numbers from the report are stated in the SDEIS as if they are neither uncertain, nor inflated. ... In particular, the addition of induced employment, output, and value added to the numbers is misleading. Without a discussion of other forms of economic development that might be expected if the mine were not to be build, the entire practice of adding induced effects will virtually always make the impacts appear greater than they actually will be. ... To put it another way, if these jobs were not induced by the NorthMet project, at least some portion of them would be induced by other economic activity. The counting of induced effects assumes that if the NorthMet project did not happen, the local residents who would work there would either leave the area or remain unemployed. While this might be true for some, it is certainly not true for all. Even if the "Proposed Action could reduce unemployment in the study area by nearly one percent," SDEIS 5-501, it is highly unlikely that the unemployment rate would actually be one percent higher without the mine than it would be if the mine were operating.	SO04
4927	Furthermore, economic researchers and theorists note that dependence on resource extraction can inhibit other economic development. ... The failure of the SDEIS to recognize that other economic development is more likely to occur if the NorthMet project does not proceed makes the project appear to be more important than it actually is to the local economy.	SO04
4929	The SDEIS also does not provide adequate information regarding the number that it presents. ... The SDEIS needs to provide specifics about these assumptions. For example, "profits" are included in the definition of "value added." The analysis does not tell us if this includes PolyMet shareholder profits. If it does, almost all of these profits will be leaving St. Louis County. It would be very helpful to all parties, whether they support this project or oppose it, to be able to compare the economic benefits that would remain in the county to those that would not. Similarly, "output" is defined to include "minerals and processed mineral products," virtually all of which would leave the county.	SO04
4931	The discussion of taxes should include a point of comparison, such as total Minnesota tax revenues for 2011. See SDEIS 5-503. It should also include information on the percentage of taxes paid by mining companies that go back to the mining industry, and the degree to which the project is supported by public services. With no assessment of the cost of this facility to the state in terms of such things as regulatory oversight, emergency services, state-funded research, public education about the dangers of eating fish, and cost savings stemming from the LTV bankruptcy, the tax amounts do not indicate the actual benefit to the public of the Proposed Project. Finally, the way in which these numbers are presented can strongly influence the impression they make. For example, estimated taxes for the project according to the EIA are \$69 million annually, and according to PolyMet are \$37 to \$80 million annually. SDEIS 5-503. ... The Executive Summary takes it one step further: "Federal, state and local taxes would total estimated \$80 million annually." The length of the SDEIS ensures that virtually no one will read beyond the Executive Summary or the initial material at the beginning of each section, and very few people will learn that taxes may be half of what is stated in the summaries. The SDEIS needs to do a better job of presenting an unbiased view of the project.	SO04
4932	Mirroring the way in which environmental impacts are presented, the economic assessment emphasizes positive effects and downplays negative ones. For example, the additional jobs are presented as a clear benefit, "reduc[ing] unemployment in the study area by nearly one percent," SDEIS 5-501. However, after closure, those jobs "account for less than one percent of the overall study area workforce. . . [and a]ny increase in study area unemployment during and after closure . . . would be minimal." Similarly, unemployment during a "bust" could be offset by "the diverse economy of the study area." SDEIS 5-496. A change in industrial productivity is not seen as a situation in which more local resources will be extracted with less local benefit, or as contributing to the ongoing decline in mining employment, but as "lessen[ing] the effect of booms and busts in mining communities." SDEIS 5-497.	SO04

4935	The SDEIS notes that there may be economic costs of environmental degradation, but then conflates that factor with non-market values, which is an entirely different issue. We agree that a monetary value cannot be placed on clean water, clean air, and the continued presence of moose and wild rice in the state of Minnesota. However, these values are in addition to monetary costs of environmental degradation, such as the health care and lost productivity costs of air pollution, the cost of replacing subsistence fishing and hunting with other sources of protein, and the lost value of wild rice. While we recognize that NEPA regulations do not require a quantitative cost/benefit analysis, if economic benefits are quantified as they have been here, economic costs should also be quantified. Not providing comparable quantitative information on costs results in an inevitable bias and inflates the value of the project.	SO04
4936	[The SDEIS] goes on to suggest that workers will commute as far as 80 miles to work on construction. This is not a positive statement; in fact, it is one more reason why the permitting of the project would not be good public policy. Encouraging employment that has people driving this far (and emitting the corresponding amount of greenhouse gases and other pollutants) is exactly the opposite of what we need to be doing as a matter of public policy. State, federal, and local agencies should all be promoting employment situations that eliminate commuting, rather than promoting it as good for the economy.	AIR11
4937	It is unclear what is meant by the statement that “To account for some of these concerns, commodity prices in the IMPLAN model are generally conservative, compared to price trends.” The IMPLAN model explicitly does not address production slowdowns or shutdowns. If it did, the appropriate comparison would not be to average prices, but to recent low prices, because slowdowns or shutdowns would come when prices fall below the average. The average price has not impact on slowdowns and shutdowns; if it did, this would not be a cyclical industry. The low prices for all of the metals are lower than the modeled price. SDEIS 5-496.	SO04
4938	The attitude in the SDEIS toward mine closure is truly remarkable. We have to guess that whoever wrote this section has never lived in a mining community when the mine shut down. The level of enthusiasm for this project in Hoyt Lakes is due in part to the difficulties the community has had since LTV closed. The cavalier assumption that people would simply move away when the mine closes defies belief, especially in light of the rosy picture painted of employing local people who are currently unemployed. The NorthMet mine would simply set the community up for another round of instability, kicking the need to build a sustainable economy down the road to the next generation along with the permanently polluted mine site. ... Table 4.2.10-9 reveals that the entire Iron Range and every community in St. Louis County has a higher unemployment rate than either Lake or Cook Counties, which have no mines. While incomes are not as high in some non-mining communities, it is the lack of stability in employment that creates the larger problem.	SO02
4968	The stated purpose of the Proposed Project includes helping to “meet domestic and global demand by sale of these products to domestic and world markets.” The Co-Lead agencies need to step back and consider whether these metals are actually needed, and whether increasing the supply of metals is actually in the public interest. The assumption that meeting consumer demand is positive and necessary, and that environmental degradation is a by-product that we have to live with, is threatening the viability of the planet. The most positive public policy step that could be taken in this instance is to allow the price of copper and other metals to rise so that they would be recycled more and used less profligately.	NEPA06
4969	The alternatives analysis in the SDEIS violates NEPA and MEPA by (1) defining the purpose and need too narrowly in order to eliminate consideration of other reasonable alternatives; (2) failing to accurately describe the no action alternative; and (3) failing to include the consideration and comparison of reasonable alternatives, including the underground mine alternative and the west pit backfill alternative. ... An agency may not define a project’s purpose “so unreasonably narrow” as to make the EIS “a foreordained formality.” City of Bridgeton v. Slater, 212 F.3d 448, 458 (8th Cir. 2000). ... The Corps and DNR cannot simply adopt the applicant’s stated purpose for a proposed action. ... In doing so, the Corps and DNR have also failed to comply with their NEPA and MEPA obligations in accepting PolyMet’s claim that there are no reasonable alternatives to PolyMet’s proposed open-pit mine plan.	NEPA01

4973	The alternative analysis also violates the Clean Water Act by failing to clearly demonstrate that the proposed action is the least environmentally damaging practicable alternative... The SDEIS includes a “no action” alternative, but its description and analysis of the no action alternative fails to meet NEPA and MEPA requirements. Pursuant to NEPA guidance provided by the Council on Environmental Quality, where the choice of “no action” for a proposed project would result in predictable actions by others, this consequence of the “no action” alternative should be included in the EIS. 46 Fed. Reg. 18026 (March 23, 1981). For PolyMet, the SDEIS briefly discloses that under the no action alternative, Cliffs Erie would be required to complete closure and reclamation activities as specified under state permits and the Cliffs Erie Consent Decree. SDEIS 3-142. However, the SDEIS fails to provide a description of the environmental outcomes once Cliffs Erie comes into full compliance with the Clean Water Act and state water quality standards.	ALT20
4974	Although the SDEIS does state that the “continuation of existing conditions” scenario used in modeling is not the same as the “no action” alternative, the no action alternative was not modeled, so the “continuation of existing conditions” is the only thing available with which to compare predicted impacts of the proposed alternative. This cannot help but confuse readers, and in any event does not comply with NEPA and MEPA requirements.	ALT14
4975	For PolyMet’s NorthMet proposal, the agencies fail to include in the SDEIS any alternatives other than the mandatory no action alternative, in violation of NEPA and MEPA. Moreover, for two alternatives that it chose not to consider – an underground mine and the west pit backfill alternatives – the agencies fail to provide an adequate explanation, again in violation of NEPA and MEPA.	ALT03, ALT06, ALT15
4976	The agencies acknowledge that when compared to the proposed open-pit mine alternative, an underground mine alternative at this site would offer significant environmental benefits ... The agencies further acknowledge that an underground mine is technically feasible at this site. Thus, the only reason provided for not including full consideration of an underground mine as a reasonable alternative within the SDEIS is economic feasibility. ... The SDEIS does not sufficiently disclose what information was considered in determining that an underground mine at this site would not be economically feasible. The assessment does not disclose what costs were included, or how the timing of those costs affected the analysis.	ALT01
4978	What the SDEIS fails to provide but is needed for informed public comment and decisionmaking is a meaningful and understandable side-by-side comparison of the anticipated expenses and profits of an underground mine compared to an open-pit mine. This comparison must address and disclose all relevant factors, including the need for a land exchange, wetland mitigation, and long-term water treatment, maintenance, mitigation and monitoring.	ALT01, ALT06
4981	The SDEIS fails to provide sufficient explanation for not including the alternative of utilizing the West Pit for disposal of mining and processing waste. ... One primary reason provided by the agencies as to why the West Pit Backfill alternative was not considered is “additional mineral resources in the West Pit ... would be effectively lost if the pit was used for waste rock and/or tailings disposal.” SDEIS 3-151.	ALT03
4982	If PolyMet intends to mine additional minerals from the West Pit, this must be analyzed now in the SDEIS for this mine proposal. Clearly additional mining in the same pit would be characterized under NEPA as connected, cumulative, and similar actions, all of which must be analyzed together in a single EIS. 40 C.F.R. § 1508.25. Similarly, if additional mining in the West Pit is foreseeable enough to preclude consideration of a reasonable alternative that would reduce environmental impacts, it is also reasonably foreseeable for the purpose of assessing the potential impacts of the current proposed action. See 40 C.F.R. § 1508.7 (defining “cumulative impacts” to include “reasonably foreseeable future actions”); 40 C.F.R. § 1508.8(b) (defining “indirect effects” to include effects that are later in time “but are still reasonably foreseeable”).	ALT03

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
4985	Another explanation for rejecting this alternative is that the West Pit would not be available for backfilling until the end of mining, and the Category 1 Stockpile would therefore still be required for the 20 year life of the proposed mine. SDEIS 3-151. This ignores the environmental mitigation that would be provided for the many hundreds of years following closure of the mine, when pollution from the Category 1 Stockpile is anticipated to continue. Indeed, the SDEIS acknowledges that the backfilling of the Category 1 Stockpile into the West Pit following closure of the mine would allow for reclamation of the affected surface footprint, including the potential to recreate wetlands areas and restore function. Id. Moreover, removal of the Category 1 Stockpile “would improve visual aesthetics.” SDEIS 3-152.	ALT03
4988	Based on the cursory assessment of this potential alternative provided by the agencies, it is apparent that the West Pit Backfill alternative meets the purpose and need for the proposed action, is technically feasible, and is economically feasible. ... The agencies rejected this alternative based on environmental impacts that have not been modeled or quantified, and thus cannot be compared with other alternatives.	ALT03, ALT06
4991	The SDEIS still fails to demonstrate that there are no practicable alternatives to the proposed action that would result in less adverse impacts to wetlands and the aquatic ecosystem. ... A discussion of the presumption of practicable alternatives, and an analysis as to whether the proposed action is the least environmentally damaging practicable alternative, is absent from the SDEIS. The SDEIS thus fails to demonstrate that there are no practicable alternatives to any of the wetland fills that are proposed for permitting, and fails to demonstrate the absence of other less environmentally damaging alternatives, as required by the Section 404(b) Guidelines and the Clean Water Act. 40 C.F.R. § 230.10(a); 33 C.F.R. § 320.4(a)(2)(ii); Minn. R. 7050.0186(4).	ALT06, ALT13, ALT20
4998	The SDEIS states that the purpose of the Land Exchange is to “consolidate the surface and mineral ownership of the lands involved at the Mine Site.” SDEIS 1-11. ... At the outset, it is important to dispense with the notion that there is some “fundamental conflict” that must be resolved. No such conflict exists. If “the mineral rights that were reserved do not include the right to surface mine as proposed by PolyMet,” then there is no conflict with not allowing that kind of mining to occur. ... Other versions of the Secretary of Agriculture’s rules and regulations for insertion into deeds conveying land to the United States support the fact that PolyMet’s deed did not reserve the right to strip mine. ... The 1937 rules and regulations demonstrate that the Forest Service was aware of and intended to allow “stripping” in that version of the Secretary of Agriculture’s rules and regulations. The absence of similar language in PolyMet’s deed indicates that the parties to that deed did not intend for strip mining to occur on these acquired Federal lands. ... Rather than needlessly giving these lands to PolyMet so that it can destroy them through open pit surface mining, the Forest Service should follow the example that led to the Belville Mining case and protect these lands. ... Beyond the case law on this matter, the Weeks Act itself contains the assumption that strip mining will not be permitted on Weeks Act lands. ... As a special provision is included to allow purchase of lands with reservations when the reservation will not interfere with the use of the encumbered lands, it must be that the purchase of land with reservations that will interfere with the use of the encumbered lands is not authorized. In other words, if the deed allowed mining to interfere with the use of the land for timber and watershed protection, it would not have been accepted in the first place. The actual situation is that PolyMet is asserting a property right that it does not have, and the Forest Service is rolling over. Deeming the situation a “fundamental conflict” that must be resolved simply hides the fact that the Forest Service is letting a private corporation dictate what is done with public land when that corporation has no right to do so. Because there is no “fundamental conflict” that needs to be resolved, the Forest Service should withdraw the Land Exchange Proposed Action and continue managing the Federal lands for national forest purposes.	LAN02, LAN04
5037	The Land Exchange Proposed Action would establish a terrible precedent for the future of the Superior National Forest and other forests that mining companies would like to strip mine. It is unclear whether the Forest Service has ever before considered exchanging forest service lands with a corporation so that the corporation could strip mine those lands, particularly when the deed does not grant that right. According to documents obtained through a Freedom of Information Act (FOIA) request, it appears that actions such as the Land Exchange Proposed Action are at the least uncommon.	LAN02

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5038	As stated in the SDEIS Executive Summary, the purpose of the Proposed Action is to “resolve the conflict between the surface estate owned by the United States and the private mineral estate.” SDEIS at ES-10. However, virtually all of the land that is proposed for exchange contains the same conflict. The Forest Service proposes to resolve a split estate by exchanging land for other land that also has a split estate. ... Unless the current deeds contain clauses that protect the surface (and it appears that few of them do), the titles that the Forest Service receives will be inferior to the title that it holds now. It is extremely difficult to perceive how this will meet the need of resolving a conflict in the title to lands.	LAN04
5039	The Forest Service has no reason of its own to give up the land it is considering transferring to PolyMet, and no reason of its own to prefer the land that PolyMet would transfer to the Forest Service. The entire driver for this exchange is to give a private corporation the means to make as large a profit as possible. This is not a legitimate purpose for an exchange of national forest property, and the Forest Service should thus withdraw the Proposed Action.	LAN01
5043	Before the Forest Service may approve the Land Exchange Proposed Action, it must first make a “determination [] that the public interest will be well served.” 36 C.F.R. § 254.3(b). ... 16 U.S.C. § 521e permits the sale, exchange, or interchange of small parcels (40 acres or less) and road rights-of-way that are “substantially surrounded by lands not owned by the United States and which are no longer needed by the United States.” Such authority is used to convey much smaller parcels of Federal land than the one at issue here.	LAN01
5047	The SDEIS states that seven “impact indicators” regarding land use were used to identify anticipated outcomes of the Land Exchange Proposed Action. SDEIS 5-577. ... It is unclear why these seven factors were chosen or how they fit into the regulatory scheme described above. As a whole, the list seems to address ease of management of federal lands and resources. If that is the intention, however, it seems to have been lost in the SDEIS discussion, which does not include all of the regulatory factors listed above. In fact, we did not find an explicit discussion of the regulatory factors in the SDEIS. The SDEIS also does not specify how the seven impact indicators are weighted, or how they will be used. It is unclear whether the Forest Service intended them simply as criteria that the parcels offered by PolyMet had to meet before the exchange would be considered, or whether they are being weighed in the public interest balance. If they are being weighed in the public interest balance, it is unclear how the regulatory factors will be factored in.	LU01
5048	The factors do not make sense, however, as a list by which to compare the federal and non-federal lands. Using it in this way elevates a few factors of the public interest review above all others. Furthermore, it inappropriately elevates minor considerations regarding ease of management. For instance, the net change in boundary management that would result from the proposed land exchange is a reduction of 33.2 miles. SDEIS 5-580. This represents a net reduction of just 0.003%, and is statistically insignificant.	LU01
5050	Furthermore, the [federal] lands were most likely placed in the General Forest – Longer Rotation MA for a reason. It would be helpful to know what that reason is, and whether it will be served by a land exchange.	LU01
5062	The second factor the Forest Service must consider in its public interest determination is the needs of state and local residents and their economies. 36 C.F.R. § 254.3(b)(1). ...the SDEIS provides no support for the insinuation that these metals are needed.	LAN01
5066	In its consideration of the local community, the Forest Service must give special consideration to the needs of indigenous people in this area, particularly in light of the Federal government’s duties as a trustee. ... The impacts of mercury and sulfate pollution on both the health and the livelihood of native people in Northeastern Minnesota is unconscionable, and the Forest Service should not add to it by facilitating an open pit mine on what is currently Forest Service property.	CR01
5069	The SDEIS further states that there should be little to no employment impacts following closure of the proposed mine “given the relatively small number of jobs” that would be created by NorthMet Project Proposed Action. If any increase in unemployment after the mine closes would be minimal, any increase in employment from the mine would be minimal as well.	SO04

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5074	the Proposed Project would present long-term threats to local water quality should the Forest Service approve the proposed land exchange. Those threats will remain for centuries, and could have an extreme negative impact on local residents and their economy.	WR195
5080	Should the Forest Service approve the proposed land exchange, the NorthMet Project would destroy at least 912.5 acres of very high-quality wetlands, and would indirectly impact thousands more. These wetlands have been recognized by EPA as aquatic resources of national importance. ... The compensatory mitigation plan has not yet been finalized, and is rife with problems. No compensatory mitigation has been identified for indirect impacts, and it is unclear whether such mitigation will be required. If this project is approved as it is currently proposed, the St. Louis River watershed will lose an enormous amount of wetlands. It defies belief that the Forest Service could believe that the minimal public benefit of this project could outweigh the destruction of this amount and quality of wetlands, particularly in conjunction with all of the other environmental impacts of the project. ... Many of the factors identified in the EPA’s 2010 comment letter remain unaddressed. The Forest Service has an independent duty to assess this wetland loss, pursuant to both NEPA and its public interest review. It cannot simply assume that mitigation for any impacts will be addressed by other agencies, when the mitigation plan and the amount of mitigation are far from clear. Rather than addressing impacts on floodplains and wetlands in the SDEIS, the Forest Service assumes that the impacts will be mitigated. SDEIS 5-595; 5-598. ... Without the [wetland] mitigation and monitoring plans, it is impossible to judge what the impacts of the Proposed Project will be. This does not satisfy the Forest Service’s present obligation to determine whether the “public interest will be well served” should the Forest Service approve the proposed land exchange, nor does it satisfy the obligation under NEPA to independently review the impacts of a proposed project.	LAN01, WET01, WET02, WET03, WET04, WET14, WET15, WET19
5085	As the Land Exchange section of the SDEIS focuses on acreage of wetlands in the federal estate, we again emphasize that transferring those parcels to the Forest Service would not increase wetland acreage or mitigate in any way for the wetland losses at the Mine Site. Furthermore, the wetlands at the Mine Site are far more contiguous and of higher overall quality than those scattered across the various parcels of the non-federal land.	WET14
5087	The Co-Lead Agencies must disclose the percentage of the non-Federal lands that contain coniferous bogs just as they did for the Federal lands. Coniferous bogs make up the majority of wetlands on the federal lands. By combining coniferous bogs and coniferous swamps on the non-federal parcels, the SDEIS obscures how many acres of coniferous bogs are potentially being lost to the federal estate due to the NorthMet Project and Land Exchange Proposed Actions.	WET17
5088	In addition to the public interest review, a land exchange that facilitates wetland destruction does not comply with the Forest Plan. The Forest Plan directs that “wetland impacts will be avoided whenever possible.” USFS, Land and Resource Management Plan, Superior National Forest (USFS 2004b) at 2-15. It is clearly “possible” to avoid wetland impacts in this case since PolyMet’s deed does not allow it to open-pit mine, and the Forest Service is not obligated to go forward with the land exchange. Land exchanges are “discretionary and voluntary real estate transaction[s] between the Federal government and a non-Federal party[.]” Forest Service Handbook 5409.13 § 31. Since the impacts to these wetlands are entirely avoidable, the Forest Service has an obligation to protect them rather than facilitating their destruction.	LAN04, WET16
5091	There is no question that the proposed project would destroy more than two square miles of federally-designated critical Canada lynx habitat, and despite wetland mitigation and a proposed land exchange, those two square miles will be a net loss in critical habitat. This loss would violate the Endangered Species Act, and this alone precludes the Forest Service from accepting the land exchange.	WI02, WI11
5092	We also note that the land exchange would result in a very significant loss of General Forest-Longer Rotation management area (MA). This is an area of High Biodiversity Importance; acreage of this quality will also be lost. It thus appears that the forest will lose biodiversity, and the value of biodiversity to wildlife.	VEG02, VEG03, WI02

<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5093	Impacts to cultural resources from the Proposed Project would be extensive, and are important enough that the Forest Service should follow the wishes of the Tribes regarding impacts. The Forest Service must weigh this factor heavily in its public interest review, and must not facilitate a project that would further destroy resources that are so important to Tribes in the region.	CR05, CR06
5094	Regarding scenic integrity objectives (SIOs), the SDEIS states that it used SIO definitions in the Forest Plan for evaluating the Federal lands but used a 1995 Forest Service publication to evaluate the non-Federal lands. SDEIS 4-349. The discrepancy is not explained. The SDEIS needs to provide sufficient information to determine whether this difference could lead to inaccurate comparisons.	EDIT01
5095	Regarding impacts to wilderness, a Class I Visibility Analysis using Method 2 indicated that “visibility impacts greater than 5 to 10 percent could occur at some point within the BWCAW on a small number of days each year.” SDEIS 5-415. The cumulative impacts of air pollution on visibility within the BWCAW are already substantial, and the State admits that its plan will not meet visibility goals. It is thus not in the public interest to facilitate the air emissions that will result from the Proposed Project. Impacts on Class I visibility are discussed above.	AIR08
5098	It is somewhat ironic that the Forest Service seems to be using the excuse of a lack of accessibility to justify disposing of land. Inaccessible land is of great value to wildlife, to the preservation of biodiversity, and for the maintenance of a clean and livable environment. These are all values the Forest Service should foster. We know of no other entity that is more appropriate as the owner and manager of inaccessible forest and wetlands than the U.S. Forest Service.	LU04
5101	Furthermore, the SDEIS admits that the acquisition of the widely scattered non-Federal parcels would have a “small” impact on recreation. We would argue that the effect would be imperceptible. On the other hand, the destruction of thousands of acres for an open pit mine, increased truck traffic, increased noise, air, and water pollution, among other impacts, could have a much larger impact on recreation. Overall, the impact on recreation is more likely to be negative than positive.	LU06
5104	In terms of policy, the Forest Service should primarily consolidate split estates in situations where the Forest Service consolidates its own holdings. The Forest Service should not be in the business of exchanging land that was acquired for national forest purposes in order to consolidate the surface and subsurface to benefit a private corporation. That may well serve PolyMet’s interests, but it does not well serve the public interest. Moreover, the fact that the Forest Service would receive split estate lands in return demonstrates that the objective of consolidating estates would not be served. We have not been able to identify another land exchange situation in which the Forest Service made an administrative decision to accept split-estate land in an action whose stated purpose was to consolidate land holdings.	LAN04
5108	The SDEIS does not adequately describe the nature of the mineral estates underlying the Federal and non-Federal parcels proposed in the exchange. This is an important consideration because of the difference in the ability of the Forest Service to protect the surface estate depending on whether the mineral rights are “reserved” or “outstanding.” This information should have been disclosed in the SDEIS, and must be disclosed before a decision is made regarding the land exchange. ... it appears that most of the privately owned minerals underlying the Federal lands are reserved mineral rights while the mineral rights underlying the non-Federal lands include both reserved and outstanding mineral rights. Furthermore, it is unclear from many of the descriptions of the nonfederal tracts whether mineral rights are outstanding or reserved. Clear information must be disclosed in the EIS and factored into the public interest determination and the equal value determination.	LAN04
5110	First, the Forest Service must disclose how PolyMet plans to satisfy its mortgage [for Tract 1] at closing. In some situations, the Forest Service allows the reservation of timber rights in land exchanges as part of the financial arrangements. Under no circumstances should that happen in this case; any such factor of the proposed transaction must be considered in the EIS process.	LAN03

<b>Comment ID</b>	<b>Comment Text</b>	<b>Theme Codes</b>
<b>Sender Name (Submission ID)</b>	Northeastern Minnesotans for Wilderness (42985)	
5111	Second, the SDEIS must disclose whether the mineral rights underlying Tract 1 are reserved or outstanding. According to an earlier document in this process, 4,591 of 4,650 acres have private outstanding mineral ownership. This is simply not acceptable for the largest non-Federal parcel proposed in the exchange, regardless of whether the Forest Service believes there is a “low potential” for mineral extraction.	LAN04
5112	Furthermore, the SDEIS acknowledges the “potential for aggregate production from the northeastern corner of the tract [Tract 1] along the Pike River.” More information is needed on what this means in regards to the outstanding mineral ownership. For instance, how much of the tract does “the northeastern corner” encompass? It is unclear from either the description of the tract or from state law whether aggregate would go with the surface estate or the mineral estate. ... Thus it appears that on some portion of the Hay Lake lands, the Forest Service may not have the authority to prevent the mineral owner from destroying the surface for aggregate production. Again, it is an unacceptable exchange if this is the case.	LAN04
5113	Here we have a parcel [Tract 2] that apparently includes outstanding mineral rights that explicitly allows the owner to remove the surface. This cannot be considered a stronger title than the title to the Federal lands. ... All of these factors weigh against a finding that exchange for this land well serves the public interest.	LAN04
5114	If Lake County approved or entered into an agreement or contract with PolyMet (or with third parties with the knowledge that the purpose was to further the PolyMet project) to assist PolyMet's NorthMet project in the environmental review process, this agreement or contract violated state law restricting government action or approval prior to completion of the environmental review process. Minnesota law requires that state agencies (including county governments) not take final action on a project prior to the completion of environmental review. Minn. Stat. § 116D.04(2b) and Minn. R. 4410.3100. Moreover, the law requires that an EIS be prepared early in the process and that the information and analysis developed in the EIS be used by the government to inform permitting or approval decisions related to the project or pieces of the project. Minn. Stat. § 116D.04(2a).	LAN09
5116	In considering the Land Exchange Proposed Action, the USFS must address whether the Lake County Lands were acquired in violation of Minnesota law and if so, remove them from consideration in the proposed land exchange.	LAN09
5121	[Tract 3] is subject to deed provisions that allow destruction of the surface by the mineral estate holder. The disclosure that “the title commitment review indicated that this represents a poor condition of title” is interesting, as the title condition is now considered “moderate.” SDEIS Table 5.3.1-3. This statement provides no citation, and we were unable to find a “title commitment review” document in the SDEIS references. The Forest Service must disclose this document and explain why the title ratings have been upgraded. We suspect that a similar situation applies to other tracts; if so, this information must also be disclosed.	LAN04
5123	Regarding Wolf Lands 2, the SDEIS states that there is moderate potential for aggregate mining but that “the parcel’s wetland areas and limited access may restrict this opportunity (Barr 2011c).” SDEIS 4-401 (emphasis added). We reiterate our observations for the Hay Lake lands on this point, and add that the right to “remove the surface” could very well be interpreted by a court to mean that the aggregate resources belong to the mineral estate.	LAN04
5125	There is not enough information to provide informed comments at this time regarding the Tract 4 and the public interest review. It is frustrating to find important pieces of information withheld until the Final EIS. The Forest Service must have all of the pertinent information in front of it before it makes a decision, and informed input from the public is an important component of that decision making process.	LAN03
5131	the Forest Service must disclose how PolyMet plans to satisfy this [Tract 5] mortgage in favor of Iron Range Resources at closing. Under no circumstances should the Forest Service allow PolyMet to reserve timber rights through the exchange as part of its plan to satisfy the mortgage. ... If the Forest Service is unwilling to rely on and defend its rights under similar provisions in the title to the Federal lands, of what value are the provisions of this deed?	LAN04

5133	According to the SDEIS, the construction phase is expected to cause “relatively few” employees to “permanently relocate to the study area, due to the short-term and transient nature of mine construction.” SDEIS 5-504. During the operations phase, there would be “adequate housing to accommodate the influx of workers” due to the “small number of new residents[.]” SDEIS 5-505. Therefore, the proposed land exchange is not needed for an expansion of communities.	SO06
5135	The proposed land exchange does not promote multiple-use values. Rather, it promotes the single value of mining. The lands that would be acquired will not change from their current use as forested property, and none of them seem to be under any threat of conversion to other uses. Furthermore, the consideration of multiple uses has to be informed by the state or the forest as a whole. The Federal land is very valuable for wetland, wildlife, and water quality purposes.	LAN01
5136	Most disturbing is the fact that these Federal lands were acquired pursuant to the Weeks Act for national forest purposes, including watershed protection, and this project will inevitably result in significant degradation of streams and watersheds. ... The Land Exchange Proposed Action would remove that protection at the time when the river needs it the most. In fact, this entire situation calls the purposes of the Weeks Act into question. What does it mean to protect watersheds and forest production if the lands are disposed of as soon as they are threatened?	LAN02
5144	We disagree that the Federal land meets this [G-LA-3] criteria. This is a large, solid block of property with only two small inholdings. It is adjacent to other Forest Service lands on two boundaries, and the exchange of this property would actually increase fragmentation of other adjacent national forest land in the south west corner. ... If it were not for the PolyMet proposal, the Forest Service would not dream of calling this land “not valuable for National Forest System purposes.” The land was identified as appropriate for an RNA site, and has been recognized by everyone involved as a very high quality, important ecosystem and wetland area.	LAN04
5156	The SDEIS applies the criteria of G-LA-2 to some of the lands that would be acquired. While the non-federal lands may meet the criteria, the difficulty is that they do not meet the criteria as well as does the land that is being given up.	LAN04
5157	While the project would temporarily contribute to the local economy, experience and history indicates that this will not amount to “economic growth” over the long term. Moreover, there is no evidence that the proposed mine would contribute to national defense. In fact, the SDEIS suggests that the minerals from the mine will be exported. SDEIS 1-11. Far from implementing D-MN-2, the Land Exchange Proposed Action would violate it, as this management objective directs the Forest Service not to promote mining, but to ensure that it is conducted in an environmentally sound manner.	LAN04
5158	D-AQ-2 states: New and modified industrial facilities do not degrade Forest resources or uses. Id. As explained above in these comments, the Proposed Project would result in conditions that do not meet these goals. Facilitating the project’s air pollution by conducting a land exchange therefore does not comply with this aspect of the Forest Plan.	LAN04
5159	Finally, we note that the Forest Plan objective for Jack pine/black spruce forest is to restore it to historic levels, which involves a significant increase in acreage. Forest Plan 2-61. The Proposed Project would destroy 698 acres of this ecosystem, which would not be replaced by the non-Federal lands.	VEG02, VEG03
5165	The Forest Service must provide its assessment of the [land exchange] properties at issue here, so the public can determine whether these provisions [of the Federal Land Policy and Management Act] have been met. According to Forest Service regulation, “the findings and the supporting rationale [for a land exchange] shall be documented and made part of the administrative record.” 36 C.F.R. § 254.3(b)(3). The appraisal is an absolutely essential “supporting rationale” for the proposed land exchange; the exchange could not go forward without documentation as to value in the record, and cannot go forward if the exchange is not equal. The Forest Service must provide this information with sufficient time for the public to review it before making a decision.	LAN03
